Determines whether redundant separator bars are automatically removed from the menu.

Pascal

```
property AutoLineReduction: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoLineReduction;
```

Description

Set AutoLineReduction to indicate whether the menu should automatically ensure that the menu does not start or end with a separator bar and that two separator bars do not appear next to each other. This ensures that menus built dynamically at runtime do not have separator bars in undesired positions.

Before the menu is displayed, it removes superfluous separator bars when AutoLineReduction is maAutomatic. When AutoLineReduction is maManual, the menu does not remove separators from the top-level menu items, but may remove superfluous separators from submenus, depending on the AutoLineReduction property of the menu item that is the parent of the submenu.

When AutoLineReduction is maManual, an application can still remove superfluous separators by calling the Items property's RethinkLines method. AutoLineReduction merely determines whether this adjustment occurs automatically.

Note: The AutoLineReduction property of a menu is linked to the AutoLineReduction property of the TMenuItems object that implements its Items property. Setting one sets the other.

See Also

AutoLineReduction (see page 16135)

Items (see page 16084)

RethinkLines (see page 16129)

95.1.2.3.3 TMainMenu.AutoMerge Property

Determines if the main menus of secondary forms merge with the main menu of the main form in non-MDI applications at runtime.

Pascal

```
property AutoMerge: Boolean;
```

C++

```
__property Boolean AutoMerge;
```

Description

To merge a form's menus with the main menu in the main form, set the AutoMerge property of each main menu you want merged to true. Make sure that the AutoMerge property of the main menu of the main form (the one other menus are merged into) remains false. How menus merge depends on the value of the GroupIndex property for each menu item.

If the application is an MDI application (the FormStyle properties are set so the main form is a parent form and subsequent forms are child forms), menu merging occurs automatically without using the AutoMerge property.

See Also

FormStyle (see page 13912)

GroupIndex (see page 16146)

Merge (see page 16061)

95.1.2.3.4 TMainMenu.BiDiMode Property

Determines the layout of the menu in Middle East locales.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Set BiDiMode to control the layout of menu items. BiDiMode controls whether the menu items read from left to right or right to left.

See Also

ParentBiDiMode (see page 16089)

IsRightToLeft (see page 16077)

95.1.2.3.5 TMainMenu.Images Property

Lists the images that can appear beside individual menu items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Use Images to hold the set of images that can appear beside menu items in the menu. Individual menu items set their ImageIndex property to indicate which image in the list appears to the left of the menu item caption.

Images in the list should be 16x16. To accommodate every system on which your application runs, it is recommended that you do not use 256 colors.

Tip: If the application uses action lists, this property should be the value of the action list's Images property. This way, menu items and buttons that do the same thing can display the same image.

See Also

ImageIndex (see page 16148)

Images (see page 325)

Items (see page 16084)

95.1.2.3.6 TMainMenu.OwnerDraw Property

Specifies whether the menu items are drawn by the application.

Pascal

```
property OwnerDraw: Boolean;
```

C++

```
__property Boolean OwnerDraw;
```

Description

Set OwnerDraw to true to indicate that the application will draw menu items in an OnDrawItem event handler. When OwnerDraw is true, menu items receive an OnMeasureItem and an OnDrawItem event when they need to be rendered on screen.

Set OwnerDraw to false to accept the default drawing. When OwnerDraw is false, menu items display the caption with an optional image to the left (If the Images and ImageIndex properties are set).

Owner-draw menus are useful for displaying the value that appears when selecting a menu item. For example, in a menu that allows users to choose a color, an owner-draw menu could display rectangles drawn in the designated color, rather than color names.

See Also

OnMeasureItem (see page 16160)

OnDrawItem (see page 16159)

Images (see page 16083)

95.1.2.3.7 TMainMenu.ParentBiDiMode Property

Indicates whether the BiDiMode property is inherited from the control that uses the menu.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

By default, ParentBiDiMode is true, indicating that the layout of menu items follows the BiDiMode setting of the associated form or control. Change ParentBiDiMode to false to override the default BiDiMode setting and control the menu's layout independently.

See Also

BiDiMode (see page 16083)

95.1.2.4 TMainMenu Events

The events of the TMainMenu class are listed here.

Published Events

	Name	Description
	OnChange (see page 16067)	Occurs when the menu changes.

95.1.2.4.1 TMainMenu.OnChange Event

Occurs when the menu changes.

Pascal

```
property OnChange: TMenuChangeEvent;
```

C++

```
__property TMenuChangeEvent OnChange;
```

Description

Write an OnChange event handler to respond to changes in the menu's structure. OnChange occurs when the menu is loaded into memory, and in response to property changes that affect the menu's structure.

See Also

Items (see page 16084)

95.1.3 TMenu Class

TMenu is the base type for menu components such as TMainMenu (see page 16056) and TPopupMenu (see page 16169).

Class Hierarchy

Pascal

```
TMenu = class(TComponent);
```

C++

```
class TMenu : public TComponent;
```

File

Menus

Description

Use TMenu as a base class when defining a component that represents a collection of menu items. TMenu introduces properties and methods to create a Windows menu that represents a set of menu items, dispatch commands associated with those menu items, and locate the help context id for any of those menu items.

95.1.3.1 TMenu Members

The following tables list the members exposed by TMenu.

Protected Events

	Name	Description
	OnChange (see page 16090)	Occurs when the menu changes.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AdjustBiDiBehavior (see page 16073)	Applies the BiDiMode (see page 16083) property to the menu when the Windows control is created.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoBiDiModeChanged (see page 16074)	Updates the menu when the BiDiMode (see page 16083) property changes.
V	DoChange (see page 16075)	Generates an OnChange (see page 16090) event.
	DoGetMenuString (see page 16075)	Returns the caption for an item in the menu.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
V	GetChildren (see page 16076)	Executes a callback for child menu items.
V	GetHandle (see page 16076)	Returns the value of the Handle (see page 16083) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsOwnerDraw (see page 16077)	Indicates whether menu items can contain more than simple captions.
V	Loaded (see page 16078)	Calls the DoChange (see page 16075) method when the menu is first loaded into memory.
V	MenuChanged (see page 16079)	Responds when the menu changes.
V	Notification (see page 16079)	Responds when components are added or deleted.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetChildOrder (see page 16081)	Ensures that the menu item indexes reflect the order in which they are loaded and saved.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateItems (see page 16081)	Causes all menu items to update themselves.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 16072)	Creates an instance of TMenu (see page 16067).
	CreateMenuItem (see page 16073)	This is CreateMenuItem, a member of class TMenu.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 16072)	Destroys the menu component.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DispatchCommand (see page 16074)	Calls the Click method of the menu item with the specified value as its Command property.
	DispatchPopup (see page 16074)	Dispatches a pop-up menu command.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindItem (see page 16076)	Locates and returns a menu item.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHelpContext (see page 16077)	Returns the help context ID associated with a menu item.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 16077)	Indicates whether menu items read from right to left.
	IsShortCut (see page 16078)	Dispatches a key message if it represents a shortcut key for an item in the menu.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentBiDiModeChanged (see page 16079)	This is the overview for the ParentBiDiModeChanged method overload.
	ProcessMenuChar (see page 16080)	Responds to keyboard input for the menu.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	AutoHotkeys (see page 16082)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 16082)	Determines whether redundant separator bars are automatically removed from the menu.
	BiDiMode (see page 16083)	Determines the layout of the menu in Middle East locales.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Handle (see page 16083)	Provides access to the Windows menu handle for the menu.
	Images (see page 16083)	Lists the images that can appear beside individual menu items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	OwnerDraw (see page 16088)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 16089)	Indicates whether the BiDiMode (see page 16083) property is inherited from the control that uses the menu.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	WindowHandle (see page 16089)	Provides access to the handle of the window that uses the menu.

Published Properties

	Name	Description
R	Items (see page 16084)	Describes the elements of the menu.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

95.1.3.2 TMenu.Create Constructor

Creates an instance of TMenu (see page 16067).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMenu(TComponent * AOwner);
```

Description

Call Create to create a menu at runtime. Menus (see page 16053) placed on forms at design time are created automatically. Create calls the inherited Create method, then sets the initial values for the menu component, including creating an Items (see page 16084) property.

The AOwner parameter indicates the component (usually a form) that is responsible for managing the memory associated with the menu.

See Also

Items (see page 16084)

95.1.3.3 TMenu.Destroy Destructor

Destroys the menu component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMenu();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TMenu (see page 16067) reference is not nil, and only then calls Destroy. Destroy frees the Items (see page 16084) property, and then calls the inherited Destroy method.

See Also

Free (see page 22300)

Items (see page 16084)

95.1.3.4 TMenu Methods

The methods of the TMenu class are listed here.

Protected Methods

	Name	Description
	AdjustBiDiBehavior (see page 16073)	Applies the BiDiMode (see page 16083) property to the menu when the Windows control is created.
	DoBiDiModeChanged (see page 16074)	Updates the menu when the BiDiMode (see page 16083) property changes.
V	DoChange (see page 16075)	Generates an OnChange (see page 16090) event.
	DoGetMenuString (see page 16075)	Returns the caption for an item in the menu.

	GetChildren (see page 16076)	Executes a callback for child menu items.
	GetHandle (see page 16076)	Returns the value of the Handle (see page 16083) property.
	IsOwnerDraw (see page 16077)	Indicates whether menu items can contain more than simple captions.
	Loaded (see page 16078)	Calls the DoChange (see page 16075) method when the menu is first loaded into memory.
	MenuChanged (see page 16079)	Responds when the menu changes.
	Notification (see page 16079)	Responds when components are added or deleted.
	SetChildOrder (see page 16081)	Ensures that the menu item indexes reflect the order in which they are loaded and saved.
	UpdateItems (see page 16081)	Causes all menu items to update themselves.

Public Methods

	Name	Description
	CreateMenuItem (see page 16073)	This is CreateMenuItem, a member of class TMenu.
	DispatchCommand (see page 16074)	Calls the Click method of the menu item with the specified value as its Command property.
	DispatchPopup (see page 16074)	Dispatches a pop-up menu command.
	FindItem (see page 16076)	Locates and returns a menu item.
	GetHelpContext (see page 16077)	Returns the help context ID associated with a menu item.
	IsRightToLeft (see page 16077)	Indicates whether menu items read from right to left.
	IsShortCut (see page 16078)	Dispatches a key message if it represents a shortcut key for an item in the menu.
	ParentBiDiModeChanged (see page 16079)	This is the overview for the ParentBiDiModeChanged method overload.
	ProcessMenuChar (see page 16080)	Responds to keyboard input for the menu.

95.1.3.4.1 TMenu.AdjustBiDiBehavior Method

Applies the BiDiMode (see page 16083) property to the menu when the Windows control is created.

Pascal

```
procedure AdjustBiDiBehavior;
```

C++

```
__fastcall AdjustBiDiBehavior();
```

Description

AdjustBiDiBehavior is called automatically when the Windows control for the menu is created. It ensures that the BiDiMode (see page 16083) property is properly reflected in the menu if the application is running in a Middle Eastern locale.

See Also

BiDiMode (see page 16083)

95.1.3.4.2 TMenu.CreateMenuItem Method

Pascal

```
function CreateMenuItem: TMenuItem; dynamic;
```

C++

```
__fastcall TMenuItem CreateMenuItem();
```

Description

This is CreateMenuItem, a member of class TMenu.

95.1.3.4.3 TMenu.DispatchCommand Method

Calls the Click method of the menu item with the specified value as its Command property.

Pascal

```
function DispatchCommand(ACommand: Word): Boolean;
```

C++

```
__fastcall Boolean DispatchCommand(Word ACommand);
```

Description

Call DispatchCommand to simulate a click on the menu item associated with a command ID. If DispatchCommand locates a menu item that matches the command ID, it calls the Click method for that menu item and returns true. If there is no such item, DispatchCommand returns false.

See Also

DispatchPopup (see page 16074)

IsShortCut (see page 16078)

Items (see page 16084)

Click (see page 16116)

Command (see page 16141)

95.1.3.4.4 TMenu.DispatchPopup Method

Dispatches a pop-up menu command.

Pascal

```
function DispatchPopup(AHandle: HMENU): Boolean;
```

C++

```
__fastcall Boolean DispatchPopup(HMENU AHandle);
```

Description

Call DispatchPopup to simulate a click on the menu item associated with the pop-up menu handle. If DispatchPopup locates a menu item that matches the pop-up menu handle, it calls the Click method for that menu item and returns true. If there is no such item, DispatchPopup returns false.

See Also

DispatchCommand (see page 16074)

IsShortCut (see page 16078)

Items (see page 16084)

Click (see page 16116)

95.1.3.4.5 TMenu.DoBiDiModeChanged Method

Updates the menu when the BiDiMode (see page 16083) property changes.

Pascal

```
procedure DoBiDiModeChanged;
```

C++

```
__fastcall DoBiDiModeChanged();
```

Description

Do not call DoBiDiModeChanged. It is called automatically when the menu's BiDiMode (see page 16083) property changes to update the menu to reflect the current setting.

See Also

BiDiMode (see page 16083)

95.1.3.4.6 TMenu.DoChange Method

Generates an OnChange (see page 16090) event.

Pascal

```
procedure DoChange(Source: TMenuItem; Rebuild: Boolean); virtual;
```

C++

```
virtual __fastcall DoChange(TMenuItem Source, Boolean Rebuild);
```

Description

DoChange is called automatically when the properties of any menu items change. The Source parameter specifies the menu item (if any) that changed. The Rebuild parameter indicates whether the change requires the menu to regenerate its items.

See Also

OnChange (see page 16090)

MenuChanged (see page 16079)

95.1.3.4.7 TMenu.DoGetMenuString Method

Returns the caption for an item in the menu.

Pascal

```
function DoGetMenuString(Menu: HMENU; ItemID: UINT; Str: PChar; MaxCount: Integer; Flag:
UINT): Integer;
```

C++

```
__fastcall int DoGetMenuString(HMENU Menu, UINT ItemID, const char * Str, int MaxCount, UINT
Flag);
```

Description

DoGetMenuString is used internally to obtain menu item captions, given the Windows menu handle. The Menu parameter indicates the menu's handle. The ItemID parameter specifies the menu item whose caption is desired. If the Flag parameter is MF_BYCOMMAND, ItemID is the Command property of the menu item. If Flag is MF_BYPOSITION, ItemID is the 0-based index of the menu item. The caption is returned in a buffer pointed to by the Str parameter. MaxCount indicates the size of that buffer.

Unlike the Windows API function GetMenuString, DoGetMenuString returns the correct caption for owner-draw menu items.

See Also

Caption (see page 16136)

Command (see page 16141)

95.1.3.4.8 TMenu.FindItem Method

Locates and returns a menu item.

Pascal

```
function FindItem(Value: Integer; Kind: TFindItemKind): TMenuItem;
```

C++

```
__fastcall TMenuItem FindItem(int Value, TFindItemKind Kind);
```

Description

Call FindItem to locate a menu item in the menu or one of its submenus. The menu item is identified by either a pop-up menu handle, command ID, or menu shortcut value. The Kind parameter specifies how the menu item is to be identified.

See Also

TMenuItem (see page 16102)

Command (see page 16141)

Handle (see page 16147)

ShortCut (see page 16152)

95.1.3.4.9 TMenu.GetChildren Method

Executes a callback for child menu items.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is called automatically by the streaming system so that child menu items are saved and read with their parent menu.

See Also

GetParentComponent

SetChildOrder

95.1.3.4.10 TMenu.GetHandle Method

Returns the value of the Handle (see page 16083) property.

Pascal

```
function GetHandle: HMENU; virtual;
```

C++

```
virtual __fastcall HMENU GetHandle();
```

Description

GetHandle is the protected implementation of the Handle (see page 16083) property. Override this method to change the implementation of the handle property. For example, TMainMenu (see page 16056) overrides GetHandle to adjust for menus added by embedded OLE objects.

See Also

Handle (see page 16083)

95.1.3.4.11 TMenu.GetHelpContext Method

Returns the help context ID associated with a menu item.

Pascal

```
function GetHelpContext(Value: Integer; ByCommand: Boolean): THelpContext;
```

C++

```
__fastcall THelpContext GetHelpContext(int Value, Boolean ByCommand);
```

Description

Call GetHelpContext to obtain the ID for context-sensitive help on a particular menu item. Identify the menu item as the item that matches the Value property. If ByCommand is true, Value is the Command property of the TMenuItem (see page 16102). If ByCommand is false, Value is the Handle (see page 16083) property.

See Also

FindItem (see page 16076)

Command (see page 16141)

Handle (see page 16147)

HelpContext (see page 16148)

HelpContext (see page 5826)

95.1.3.4.12 TMenu.IsOwnerDraw Method

Indicates whether menu items can contain more than simple captions.

Pascal

```
function IsOwnerDraw: Boolean;
```

C++

```
__fastcall Boolean IsOwnerDraw();
```

Description

IsOwnerDraw returns true when the OwnerDraw (see page 16088) property is true or the Images (see page 16083) property is not nil (Delphi) or NULL (C++). This is used internally to determine how the menu should be painted.

See Also

OwnerDraw (see page 16088)

Images (see page 16083)

95.1.3.4.13 TMenu.IsRightToLeft Method

Indicates whether menu items read from right to left.

Pascal

```
function IsRightToLeft: Boolean;
```

C++

```
__fastcall Boolean IsRightToLeft();
```

Description

Call IsRightToLeft to determine the layout of main menu items. IsRightToLeft returns true if the application is running on a system with a Middle Eastern locale and the BiDiMode (see page 16083) property is not bdLeftToRight.

See Also

BiDiMode (see page 16083)

95.1.3.4.14 TMenu.IsShortCut Method

Dispatches a key message if it represents a shortcut key for an item in the menu.

Pascal

```
function IsShortCut(var Message: TWMKey): Boolean; dynamic;
```

C++

```
__fastcall Boolean IsShortCut(TWMKey Message);
```

Description

Call IsShortCut when processing a KeyDown message to identify shortcut keys and trigger the appropriate menu action. IsShortCut decodes the key message passed in the Message parameter. It then encodes the state of the Shift, Control, and Alt keys with the value of the character that was typed to obtain the ShortCut (see page 16193) property of a menu item. If IsShortCut locates a menu item associated with the shortcut key combination, it calls the item's Click method and returns true. If no item in the menu has a shortcut corresponding to the message, IsShortCut returns false.

See Also

DispatchCommand (see page 16074)

DispatchPopup (see page 16074)

FindItem (see page 16076)

Click (see page 16116)

95.1.3.4.15 TMenu.Loaded Method

Calls the DoChange (see page 16075) method when the menu is first loaded into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Loaded is called automatically immediately after the menu is loaded into memory. It calls the DoChange (see page 16075) method to allow any necessary fixup.

See Also

DoChange (see page 16075)

95.1.3.4.16 TMenu.MenuChanged Method

Responds when the menu changes.

Pascal

```
procedure MenuChanged(Sender: TObject; Source: TMenuItem; Rebuild: Boolean); virtual;
```

C++

```
virtual __fastcall MenuChanged(TObject * Sender, TMenuItem Source, Boolean Rebuild);
```

Description

MenuChanged is called automatically when changes occur that affect the structure of the menu. The Sender parameter indicates the object that originates the change. It's value can be nil (Delphi) or NULL (C++). Source indicates which menu item is affected. Rebuild indicates whether the menu must be rebuilt to reflect the change (for example when items are added or deleted).

MenuChanged calls the DoChange (see page 16075) method, which generates an OnChange (see page 16090) event.

Note: Changes that affect individual items rather than the menu as a whole trigger the UpdateItems (see page 16081) method instead of MenuChanged. For example, when the Images (see page 16083) property changes, UpdateItems (see page 16081) is called rather than MenuChanged.

See Also

Items (see page 16084)

UpdateItems (see page 16081)

DoChange (see page 16075)

95.1.3.4.17 TMenu.Notification Method

Responds when components are added or deleted.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

TMenu (see page 16067) overrides the inherited method to set the Images (see page 16083) property to nil (Delphi) or NULL (C++) if the ImageList is deleted.

See Also

Notification (see page 2783)

Images (see page 16083)

95.1.3.4.18 ParentBiDiModeChanged Method

This is the overview for the ParentBiDiModeChanged method overload.

Overload List

	Name	Description
	TMenu.ParentBiDiModeChanged () (see page 16080)	Ensures that the menu's layout follows the current settings of the BiDiMode (see page 16083) and ParentBiDiMode (see page 16089) properties.
	TMenu.ParentBiDiModeChanged (TObject) (see page 16080)	Ensures that the menu's layout follows the current settings of the BiDiMode (see page 16083) and ParentBiDiMode (see page 16089) properties.

95.1.3.4.18.1 TMenu.ParentBiDiModeChanged Method ()

Ensures that the menu's layout follows the current settings of the BiDiMode (see page 16083) and ParentBiDiMode (see page 16089) properties.

Pascal

```
procedure ParentBiDiModeChanged; overload;
procedure ParentBiDiModeChanged(AControl: TObject); overload;
```

C++

```
__fastcall ParentBiDiModeChanged();
__fastcall ParentBiDiModeChanged(TObject * AControl);
```

Description

ParentBiDiMode (see page 16089) changed is called when the menu's BiDiMode (see page 16083) property must be updated to reflect the bi-directional mode of its associated control.

See Also

BiDiMode (see page 16083)

ParentBiDiMode (see page 16089)

DoBiDiModeChanged (see page 16074)

95.1.3.4.19 TMenu.ProcessMenuChar Method

Responds to keyboard input for the menu.

Pascal

```
procedure ProcessMenuChar(var Message: TWMMenuChar);
```

C++

```
__fastcall ProcessMenuChar(TWMMenuChar Message);
```

Description

ProcessMenuChar handles keyboard messages from Windows. It checks whether the character typed is an accelerator character from one of the menu's items. If so, ProcessMenuChar executes the menu item (or, if the item is disabled, selects it). If the key is not an accelerator, ProcessMenuChar checks for captions that begin with the character. If there is only one, it is treated like an accelerator. Otherwise, the first item beginning with that character is selected.

When calling ProcessMenuChar programmatically, the User, MenuFlag, and Menu fields of Message parameter must be supplied.

See Also

Caption (see page 16136)

95.1.3.4.20 TMenu.SetChildOrder Method

Ensures that the menu item indexes reflect the order in which they are loaded and saved.

Pascal

```
procedure SetChildOrder(Child: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Child, int Order);
```

Description

SetChildOrder is called automatically when menus are loaded into memory. The Child parameter specifies the child object that was just loaded. The Order parameter specifies the order in which it was loaded. SetChildOrder assigns the MenuIndex for each child to match the order in which the items are loaded.

See Also

MenuIndex (see page 16150)

95.1.3.4.21 TMenu.UpdateItems Method

Causes all menu items to update themselves.

Pascal

```
procedure UpdateItems;
```

C++

```
__fastcall UpdateItems();
```

Description

UpdateItems is called automatically when changes occur that must be reflected by individual menu items. Changes that affect the menu as a whole trigger the MenuChanged (see page 16079) method instead.

See Also

MenuChanged (see page 16079)

95.1.3.5 TMenu Properties

The properties of the TMenu class are listed here.

Public Properties

	Name	Description
	AutoHotkeys (see page 16082)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 16082)	Determines whether redundant separator bars are automatically removed from the menu.
	BiDiMode (see page 16083)	Determines the layout of the menu in Middle East locales.
R	Handle (see page 16083)	Provides access to the Windows menu handle for the menu.
	Images (see page 16083)	Lists the images that can appear beside individual menu items.
	OwnerDraw (see page 16088)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 16089)	Indicates whether the BiDiMode (see page 16083) property is inherited from the control that uses the menu.
	WindowHandle (see page 16089)	Provides access to the handle of the window that uses the menu.

Published Properties

	Name	Description
	Items (see page 16084)	Describes the elements of the menu.

95.1.3.5.1 TMenu.AutoHotkeys Property

Determines whether the accelerator keys for menu items can be reset automatically.

Pascal

```
property AutoHotkeys: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoHotkeys;
```

Description

Set AutoHotkeys to indicate whether the menu should automatically ensure that accelerator keys for its items are reset if necessary so that every menu item has an accelerator key and no two items have the same accelerator key. This ensures that menu items added dynamically at runtime can have accelerator keys that do not introduce conflicts. TMenu (see page 16067) tries to preserve all existing accelerator key mappings when adjusting the accelerator keys, but may be forced to change some in order to ensure that every item has a unique accelerator.

Before the menu is displayed, the menu checks and adjusts the accelerator key mappings if AutoHotkeys is maAutomatic. When AutoHotkeys is maManual, the menu does not alter the top-level menu items, but may adjust the accelerator keys for submenus, depending on the AutoHotkeys property of the menu item that is the parent of the submenu.

When AutoHotkeys is maManual, an application can still adjust the menu items by calling the Items (see page 16084) property's RethinkHotkeys method. AutoHotkeys merely controls whether this adjustment occurs automatically.

Note: The AutoHotkeys property of a menu is linked to the AutoHotkeys property of the TMenuItems object that implements its Items (see page 16084) property. Setting one sets the other.

See Also

AutoHotkeys (see page 16134)

Items (see page 16084)

RethinkHotkeys (see page 16128)

95.1.3.5.2 TMenu.AutoLineReduction Property

Determines whether redundant separator bars are automatically removed from the menu.

Pascal

```
property AutoLineReduction: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoLineReduction;
```

Description

Set AutoLineReduction to indicate whether the menu should automatically ensure that the menu does not start or end with a separator bar and that two separator bars do not appear next to each other. This ensures that menus built dynamically at runtime do not have separator bars in undesired positions.

Before the menu is displayed, it removes superfluous separator bars when AutoLineReduction is maAutomatic. When AutoLineReduction is maManual, the menu does not remove separators from the top-level menu items, but may remove

superfluous separators from submenus, depending on the AutoLineReduction property of the menu item that is the parent of the submenu.

When AutoLineReduction is maManual, an application can still remove superfluous separators by calling the Items (see page 16084) property's RethinkLines method. AutoLineReduction merely determines whether this adjustment occurs automatically.

Note: The AutoLineReduction property of a menu is linked to the AutoLineReduction property of the TMenuItems object that implements its Items (see page 16084) property. Setting one sets the other.

See Also

AutoLineReduction (see page 16135)

Items (see page 16084)

RethinkLines (see page 16129)

95.1.3.5.3 TMenu.BiDiMode Property

Determines the layout of the menu in Middle East locales.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Set BiDiMode to control the layout of menu items. BiDiMode controls whether the menu items read from left to right or right to left.

See Also

ParentBiDiMode (see page 16089)

IsRightToLeft (see page 16077)

95.1.3.5.4 TMenu.Handle Property

Provides access to the Windows menu handle for the menu.

Pascal

```
property Handle: HMENU;
```

C++

```
__property HMENU Handle;
```

Description

Use Handle to call a Windows API function that requires a menu handle. Handle is the handle for the menu that contains only the items described by the Items (see page 16084) property. If no other menus have been merged with this menu, this is the same as the WindowHandle (see page 16089) property.

See Also

WindowHandle (see page 16089)

95.1.3.5.5 TMenu.Images Property

Lists the images that can appear beside individual menu items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Use Images to hold the set of images that can appear beside menu items in the menu. Individual menu items set their ImageIndex property to indicate which image in the list appears to the left of the menu item caption.

Images in the list should be 16x16. To accommodate every system on which your application runs, it is recommended that you do not use 256 colors.

Tip: If the application uses action lists, this property should be the value of the action list's Images property. This way, menu items and buttons that do the same thing can display the same image.

See Also

ImageIndex (see page 16148)

Images (see page 325)

Items (see page 16084)

95.1.3.5.6 TMenu.Items Property

Describes the elements of the menu.

Pascal

```
property Items: TMenuItem;
```

C++

```
__property TMenuItem Items;
```

Description

Use Items to access information about the elements in the menu. Items is a single TMenuItem (see page 16102) object that describes the elements of the menu in its own Items property.

Note: Because Items is the default property of TMenuItem (see page 16102), the Items property of TMenu (see page 16067) can be treated as an indexed array of menu items that describe the individual items in the menu. That is, instead of writing

Note: FirstItem := Menu1.Items.Items[0];

Note: you can use

Note: FirstItem := Menu1.Items[0];

Set the Items property at design time by clicking on the Items property in the Property Inspector. The Menu Designer automatically inserts a menu item. As each menu item is entered, outlined regions appear at the possible locations of additional menu items. Click in those regions to specify additional menu items. At runtime, create a TMenuItem (see page 16102) that describes the elements of the menu programmatically, and set the Items property of the menu.

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *NewItem;
  // first create the separator
  NewItem = new TMenuItem(this); // If you change the AOwner (this) to MainMenu1->Items[1] and
then you add the new menu you will get "Menu inserted twice"?  Doesn't happen in Delphi.
  NewItem->Name = "Separator";
  NewItem->Caption = "-";
  // add the new item to the Windows menu
  MainMenu1->Items[1].Add(NewItem);
  // now create and add a menu item for each form
  for  (int I = 0; I < Screen->FormCount; I++)
  {
    NewItem = new TMenuItem(this);
    NewItem->Caption = Screen->Forms[I]->Name + "Item";
    NewItem->Name = Screen->Forms[I]->Name;
    MainMenu1->Items[1].Add(NewItem);
  }
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  // Count down, not up!
  for  (int I = MainMenu1->Items[1].Count - 1; I >= 0; I--)
  {
    delete MainMenu1->Items[1].Items[I];
  }
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
```

```
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
}
procedure TForm1.Button1Click(Sender: TObject);
var
  NewItem: TMenuItem;
  I : integer;
begin
  { first create the separator }
  NewItem := TMenuItem.Create(MainMenu1.Items[1]);
  NewItem.Name:= 'Separator';
  NewItem.Caption := '-';
  { add the new item to the Windows menu }
  MainMenu1.Items[1].Add(NewItem);
  { now create and add a menu item for each form }
  for  I := 0 to Screen.FormCount-1 do
  begin
    NewItem := TMenuItem.Create(MainMenu1.Items[1]);
```

```
    NewItem.Caption := Screen.Forms[I].Name + 'Item';
    NewItem.Name := Screen.Forms[I].Name;
    MainMenu1.Items[1].Add(NewItem);
   end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I : Integer;
begin
  // Count down, not up!
  for  I := MainMenu1.Items[1].Count - 1 downto 0 do
  begin
    MainMenu1.Items[1].Items[I].Free;
  end;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

```

See Also

TMenuItem (see page 16102)

Items (see page 16149)

95.1.3.5.7 TMenu.OwnerDraw Property

Specifies whether the menu items are drawn by the application.

Pascal

```
property OwnerDraw: Boolean;
```

C++

```
__property Boolean OwnerDraw;
```

Description

Set OwnerDraw to true to indicate that the application will draw menu items in an OnDrawItem event handler. When OwnerDraw is true, menu items receive an OnMeasureItem and an OnDrawItem event when they need to be rendered on screen.

Set OwnerDraw to false to accept the default drawing. When OwnerDraw is false, menu items display the caption with an optional image to the left (If the Images (see page 16083) and ImageIndex properties are set).

Owner-draw menus are useful for displaying the value that appears when selecting a menu item. For example, in a menu that allows users to choose a color, an owner-draw menu could display rectangles drawn in the designated color, rather than color names.

See Also

OnMeasureItem (see page 16160)

OnDrawItem (see page 16159)

Images (see page 16083)

95.1.3.5.8 TMenu.ParentBiDiMode Property

Indicates whether the BiDiMode (see page 16083) property is inherited from the control that uses the menu.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

By default, ParentBiDiMode is true, indicating that the layout of menu items follows the BiDiMode (see page 16083) setting of the associated form or control. Change ParentBiDiMode to false to override the default BiDiMode (see page 16083) setting and control the menu's layout independently.

See Also

BiDiMode (see page 16083)

95.1.3.5.9 TMenu.WindowHandle Property

Provides access to the handle of the window that uses the menu.

Pascal

```
property WindowHandle: HWND;
```

C++

```
__property HWND WindowHandle;
```

Description

Read WindowHandle to get the window handle of the control that receives WM_COMMAND messages when the user clicks on an item in the menu. When menu items are selected, use this handle in an OnClick event handler to send messages to the control that uses the menu or to make Windows API calls that affect the control.

Set WindowHandle to associate the menu with a control.

See Also

DispatchCommand (see page 16074)

Command (see page 16141)

OnClick (see page 16154)

95.1.3.6 TMenu Events

The events of the TMenu class are listed here.

Protected Events

	Name	Description
	OnChange (see page 16090)	Occurs when the menu changes.

95.1.3.6.1 TMenu.OnChange Event

Occurs when the menu changes.

Pascal

```
property OnChange: TMenuChangeEvent;
```

C++

```
__property TMenuChangeEvent OnChange;
```

Description

Write an OnChange event handler to respond to changes in the menu's structure. OnChange occurs when the menu is loaded into memory, and in response to property changes that affect the menu's structure.

See Also

Items (see page 16084)

95.1.4 TMenuActionLink Class

TMenuActionLink links menu item clients to the corresponding menu action.

Class Hierarchy

Pascal

```
TMenuActionLink = class(TActionLink);
```

C++

```
class TMenuActionLink : public TActionLink;
```

File

Menus

Description

TMenuActionLink is designed to link actions to menu item clients. TMenuActionLink overrides methods to determine whether the action and client are linked, and to ensure that action events are appropriate for properties of and events of menu item clients.

TMenuActionLink overrides methods to support linking the following properties and events with menu item client properties or events, most of which have the same name:

Caption

Checked

Enabled

HelpContext

Hint

ImageIndex

ShortCut (see page 16193)

Visible

OnExecute

95.1.4.1 TMenuActionLink Members

The following tables list the members exposed by TMenuActionLink.

Protected Fields

	Name	Description
	FAction (see page 2722)	This is FAction, a member of class TBasicActionLink.
	FClient (see page 16093)	This is FClient, a member of class TMenuActionLink.

Protected Methods

	Name	Description
	AssignClient (see page 16093)	Assigns a client menu item that is linked to the associated action.
	Change (see page 2723)	This is Change, a member of class TBasicActionLink.
	IsAutoCheckLinked (see page 16094)	Indicates whether the AutoCheck state for the action and the client are linked.
	IsCaptionLinked (see page 16094)	Indicates whether the caption for the action and the client are linked.
	IsCheckedLinked (see page 16095)	Indicates whether the checked state for the action and the client are linked.
	IsEnabledLinked (see page 16095)	Indicates whether the enabled state for the action and the client are linked.
	IsGroupIndexLinked (see page 16095)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsHelpContextLinked (see page 16096)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHelpLinked (see page 271)	Indicates whether the help properties for the action and client are linked.
	IsHintLinked (see page 16096)	Indicates whether the Hint property for the action and the client are linked.
	IsImageIndexLinked (see page 16097)	Indicates whether the image index for the action and the client are linked.
	IsOnExecuteLinked (see page 16097)	Indicates whether the OnExecute event handler for the action and the client are linked.
	IsShortCutLinked (see page 16097)	Indicates whether the ShortCut (see page 16193) property for the action and the client are linked.
	IsVisibleLinked (see page 16098)	Indicates whether the visible state for the action and the client are linked.
	SetAction (see page 2724)	This is SetAction, a member of class TBasicActionLink.
	SetAutoCheck (see page 16098)	Sets the AutoCheck property of a menu item if the client is linked to the action for this property.
	SetCaption (see page 16099)	Sets the caption of a menu item if the client is linked to the action for this property.
	SetChecked (see page 16099)	Sets the checked state of a menu item if the client is linked to the action for this property.
	SetEnabled (see page 16099)	Sets the enabled state of a menu item if the client is linked to the action for this property.
	SetGroupIndex (see page 275)	Introduces an interface for setting the GroupIndex property of a client.
	SetHelpContext (see page 16100)	Sets the Help context of a menu item that is the client of this action link.
	SetHelpKeyword (see page 276)	Introduces an interface for setting the help keyword of a client.
	SetHelpType (see page 277)	Introduces an interface for setting the HelpType property of a client.
	SetHint (see page 16100)	Sets the hint of a menu item if the client is linked to the action for this property.
	SetImageIndex (see page 16100)	Sets the image index of a menu item if the client is linked to the action for this property.
	SetOnExecute (see page 16101)	Sets the execution event handler for a menu item if the client is linked to the action for this property.
	SetShortCut (see page 16101)	Sets the shortcut of a menu item if the client is linked to the action for this property.
	SetVisible (see page 16102)	Sets the visible state of a menu item if the client is linked to the action for this property.

Public Events

	Name	Description
	OnChange (see page 2725)	Occurs when an OnChange event is triggered on the action.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2721)	Instantiates and initializes a TBasicActionLink (see page 2720) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2722)	Destroys an instance of an action link object.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 2723)	Invokes the action's Execute method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Update (see page 2724)	Invokes the action's Update method.

Public Properties

	Name	Description
	Action (see page 2725)	Indicates which action the link connects to its client.

95.1.4.2 TMenuActionLink Fields

The fields of the TMenuActionLink class are listed here.

Protected Fields

	Name	Description
	FClient (see page 16093)	This is FClient, a member of class TMenuActionLink.

95.1.4.2.1 TMenuActionLink.FClient Field

Pascal

```
FClient: TMenuItem;
```

C++

```
TMenuItem FClient;
```

Description

This is FClient, a member of class TMenuActionLink.

95.1.4.3 TMenuActionLink Methods

The methods of the TMenuActionLink class are listed here.

Protected Methods

	Name	Description
	AssignClient (see page 16093)	Assigns a client menu item that is linked to the associated action.
	IsAutoCheckLinked (see page 16094)	Indicates whether the AutoCheck state for the action and the client are linked.
	IsCaptionLinked (see page 16094)	Indicates whether the caption for the action and the client are linked.
	IsCheckedLinked (see page 16095)	Indicates whether the checked state for the action and the client are linked.
	IsEnabledLinked (see page 16095)	Indicates whether the enabled state for the action and the client are linked.
	IsGroupIndexLinked (see page 16095)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsHelpContextLinked (see page 16096)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHintLinked (see page 16096)	Indicates whether the Hint property for the action and the client are linked.
	IsImageIndexLinked (see page 16097)	Indicates whether the image index for the action and the client are linked.
	IsOnExecuteLinked (see page 16097)	Indicates whether the OnExecute event handler for the action and the client are linked.
	IsShortCutLinked (see page 16097)	Indicates whether the ShortCut (see page 16193) property for the action and the client are linked.
	IsVisibleLinked (see page 16098)	Indicates whether the visible state for the action and the client are linked.
	SetAutoCheck (see page 16098)	Sets the AutoCheck property of a menu item if the client is linked to the action for this property.
	SetCaption (see page 16099)	Sets the caption of a menu item if the client is linked to the action for this property.
	SetChecked (see page 16099)	Sets the checked state of a menu item if the client is linked to the action for this property.
	SetEnabled (see page 16099)	Sets the enabled state of a menu item if the client is linked to the action for this property.
	SetHelpContext (see page 16100)	Sets the Help context of a menu item that is the client of this action link.
	SetHint (see page 16100)	Sets the hint of a menu item if the client is linked to the action for this property.
	SetImageIndex (see page 16100)	Sets the image index of a menu item if the client is linked to the action for this property.
	SetOnExecute (see page 16101)	Sets the execution event handler for a menu item if the client is linked to the action for this property.
	SetShortCut (see page 16101)	Sets the shortcut of a menu item if the client is linked to the action for this property.
	SetVisible (see page 16102)	Sets the visible state of a menu item if the client is linked to the action for this property.

95.1.4.3.1 TMenuActionLink.AssignClient Method

Assigns a client menu item that is linked to the associated action.

Pascal

```
procedure AssignClient(AClient: TObject); override;
```

C++

```
virtual __fastcall AssignClient(TObject * AClient);
```

Description

TMenuActionLink (see page 16090) overrides AssignClient to ensure that the client for the link is a menu item.

See Also

Action (see page 16133)

Create (see page 2721)

95.1.4.3.2 TMenuActionLink.IsAutoCheckLinked Method

Indicates whether the AutoCheck state for the action and the client are linked.

Pascal

```
function IsAutoCheckLinked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsAutoCheckLinked();
```

Description

IsAutoCheckLinked indicates whether the AutoCheck property is linked to the appropriate client property. IsAutoCheckLinked returns true if the client requests that the action control this property, false otherwise.

See Also

AutoCheck (see page 308)

AutoCheck (see page 16134)

SetAutoCheck (see page 16098)

95.1.4.3.3 TMenuActionLink.IsCaptionLinked Method

Indicates whether the caption for the action and the client are linked.

Pascal

```
function IsCaptionLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCaptionLinked();
```

Description

IsCaptionLinked indicates whether the Caption property is linked to the appropriate client property. IsCaptionLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Caption (see page 308)

Caption (see page 16136)

SetCaption (see page 16099)

95.1.4.3.4 TMenuActionLink.IsCheckedLinked Method

Indicates whether the checked state for the action and the client are linked.

Pascal

```
function IsCheckedLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCheckedLinked();
```

Description

IsCheckedLinked indicates whether the Checked property is linked to the appropriate client property. IsCheckedLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Checked (see page 308)

Checked (see page 16140)

SetChecked (see page 16099)

95.1.4.3.5 TMenuActionLink.IsEnabledLinked Method

Indicates whether the enabled state for the action and the client are linked.

Pascal

```
function IsEnabledLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsEnabledLinked();
```

Description

IsEnabledLinked indicates whether the Enabled property is linked to the appropriate client property. IsEnabledLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Enabled (see page 310)

Enabled (see page 16145)

SetEnabled (see page 16099)

95.1.4.3.6 TMenuActionLink.IsGroupIndexLinked Method

Indicates whether the GroupIndex property for the action controls client behavior.

Pascal

```
function IsGroupIndexLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsGroupIndexLinked();
```

Description

TActionLink descendants can call IsGroupIndexLinked to determine whether they need to propagate changes to the GroupIndex property of the action so that they are reflected by the client object. When IsGroupIndexLinked returns true, the action controls

the GroupIndex property: Changes to the GroupIndex property of the action are reflected in the client object. When IsGroupIndexLinked returns false, the client object is not influenced by the GroupIndex property of its action.

As implemented in TActionLink, IsGroupIndexLinked merely checks that the Action property specifies a descendant of TCustomAction, and if so, returns true.

See Also

GroupIndex (see page 311)

SetGroupIndex (see page 275)

Action (see page 2725)

95.1.4.3.7 TMenuActionLink.IsHelpContextLinked Method

Indicates whether the HelpContext properties for the action and client controls are linked.

Pascal

```
function IsHelpContextLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsHelpContextLinked();
```

Description

TActionLink descendants can call IsHelpContextLinked to determine whether they need to propagate changes to the HelpContext property of the action so that they are reflected by the client object. When IsHelpContextLinked returns true, the action controls the HelpContext property: Changes to the HelpContext property of the action are reflected in the client object. When IsHelpContextLinked returns false, the client object is not influenced by the HelpContext property of its action.

As implemented in TActionLink, IsHelpContextLinked merely checks that the Action property specifies a descendant of TCustomAction, and if so, returns true.

See Also

HelpContext (see page 311)

SetHelpContext (see page 276)

Action (see page 2725)

IsHelpLinked (see page 271)

95.1.4.3.8 TMenuActionLink.IsHintLinked Method

Indicates whether the Hint property for the action and the client are linked.

Pascal

```
function IsHintLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsHintLinked();
```

Description

IsHintLinked indicates whether the Hint property is linked to the appropriate client property. IsHintLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Hint (see page 312)

Hint (see page 16148)

SetHint (see page 16100)

95.1.4.3.9 TMenuActionLink.IsImageIndexLinked Method

Indicates whether the image index for the action and the client are linked.

Pascal

```
function IsImageIndexLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsImageIndexLinked();
```

Description

IsImageIndexLinked indicates whether the ImageIndex property is linked to the appropriate client property. IsImageIndexLinked returns true if the client requests that the action control this property, false otherwise.

See Also

ImageIndex (see page 313)

ImageIndex (see page 16148)

SetImageIndex (see page 16100)

95.1.4.3.10 TMenuActionLink.IsOnExecuteLinked Method

Indicates whether the OnExecute event handler for the action and the client are linked.

Pascal

```
function IsOnExecuteLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsOnExecuteLinked();
```

Description

IsOnExecuteLinked indicates whether the OnExecute event handler is linked to the appropriate client event. IsOnExecuteLinked returns true if the client requests that the action control this event, false otherwise.

See Also

OnExecute (see page 2716)

OnClick (see page 16154)

SetOnExecute (see page 16101)

95.1.4.3.11 TMenuActionLink.IsShortCutLinked Method

Indicates whether the ShortCut (see page 16193) property for the action and the client are linked.

Pascal

```
function IsShortCutLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsShortCutLinked();
```

Description

IsShortCutLinked indicates whether the ShortCut (see page 16193) property is linked to the appropriate client property. IsVisibleLinked (see page 16098) returns true if the client requests that the action control this property, false otherwise.

See Also

ShortCut (see page 314)

ShortCut (see page 16152)

SetShortCut (see page 16101)

95.1.4.3.12 TMenuActionLink.IsVisibleLinked Method

Indicates whether the visible state for the action and the client are linked.

Pascal

```
function IsVisibleLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsVisibleLinked();
```

Description

IsVisibleLinked indicates whether the Visible property is linked to the appropriate client property. IsVisibleLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Visible (see page 314)

Visible (see page 16153)

SetVisible (see page 16102)

95.1.4.3.13 TMenuActionLink.SetAutoCheck Method

Sets the AutoCheck property of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetAutoCheck(Value: Boolean); override;
```

C++

```
virtual __fastcall SetAutoCheck(Boolean Value);
```

Description

SetAutoCheck sets the AutoCheck property of a menu item, and is called only if the client is linked for this event. Value specifies the AutoCheck new value of AutoCheck.

See Also

AutoCheck (see page 308)

AutoCheck (see page 16134)

IsAutoCheckLinked (see page 16094)

95.1.4.3.14 TMenuActionLink.SetCaption Method

Sets the caption of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetCaption(const Value: string); override;
```

C++

```
virtual __fastcall SetCaption(const AnsiString Value);
```

Description

SetCaption sets the caption of a menu item, and is called only if the client is linked for this event. Value is the string to which the caption should be set.

See Also

Caption (see page 308)

Caption (see page 16136)

IsCaptionLinked (see page 16094)

95.1.4.3.15 TMenuActionLink.SetChecked Method

Sets the checked state of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetChecked(Value: Boolean); override;
```

C++

```
virtual __fastcall SetChecked(Boolean Value);
```

Description

SetChecked sets the checked state of a menu item, and is called only if the client is linked for this event. Value specifies whether the checked state should be set.

See Also

Checked (see page 308)

Checked (see page 16140)

IsCheckedLinked (see page 16095)

95.1.4.3.16 TMenuActionLink.SetEnabled Method

Sets the enabled state of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetEnabled(Value: Boolean); override;
```

C++

```
virtual __fastcall SetEnabled(Boolean Value);
```

Description

SetEnabled sets the enabled state of a menu item, and is called only if the client is linked for this event. Value specifies whether the enabled state should be set.

See Also

Enabled (see page 310)

Enabled (see page 16145)

IsEnabledLinked (see page 16095)

95.1.4.3.17 TMenuActionLink.SetHelpContext Method

Sets the Help context of a menu item that is the client of this action link.

Pascal

```
procedure SetHelpContext(Value: THelpContext); override;
```

C++

```
virtual __fastcall SetHelpContext(THelpContext Value);
```

Description

SetHelpContext sets the help context of a client menu item, and is called only if the client is linked for this property. Value specifies what the help context should be.

See Also

HelpContext (see page 311)

HelpContext (see page 16148)

IsHelpLinked

95.1.4.3.18 TMenuActionLink.SetHint Method

Sets the hint of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetHint(const Value: string); override;
```

C++

```
virtual __fastcall SetHint(const AnsiString Value);
```

Description

SetHint sets the hint of a menu item, and is called only if the client is linked for this event. Value is the string that to which the hint should be set.

See Also

Hint (see page 312)

Hint (see page 16148)

IsHintLinked (see page 16096)

95.1.4.3.19 TMenuActionLink.SetImageIndex Method

Sets the image index of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetImageIndex(Value: Integer); override;
```

C++

```
virtual __fastcall SetImageIndex(int Value);
```

Description

SetImageIndex sets the image index of a menu item, and is called only if the client is linked for this event. Value specifies what the image index should be.

See Also

ImageIndex (see page 313)

ImageIndex (see page 16148)

IsImageIndexLinked (see page 16097)

95.1.4.3.20 TMenuActionLink.SetOnExecute Method

Sets the execution event handler for a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetOnExecute(Value: TNotifyEvent); override;
```

C++

```
virtual __fastcall SetOnExecute(TNotifyEvent Value);
```

Description

SetOnExecute sets the appropriate execution event handler of a menu item, and is called only if the client is linked for this event. Value specifies the procedure that should be used for this event.

See Also

OnExecute (see page 2716)

OnClick (see page 16154)

IsOnExecuteLinked (see page 16097)

95.1.4.3.21 TMenuActionLink.SetShortCut Method

Sets the shortcut of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetShortCut(Value: TShortCut); override;
```

C++

```
virtual __fastcall SetShortCut(TShortCut Value);
```

Description

SetShortCut sets the shortcut of a menu item, and is called only if the client is linked for this event. Value specifies what the shortcut should be.

See Also

ShortCut (see page 314)

ShortCut (see page 16152)

IsShortCutLinked (see page 16097)

95.1.4.3.22 TMenuActionLink.SetVisible Method

Sets the visible state of a menu item if the client is linked to the action for this property.

Pascal

```
procedure SetVisible(Value: Boolean); override;
```

C++

```
virtual __fastcall SetVisible(Boolean Value);
```

Description

SetVisible sets the visible state of a menu item, and is called only if the client is linked for this event. Value specifies whether the visible state should be set.

See Also

Visible (see page 314)

Visible (see page 16153)

IsVisibleLinked (see page 16098)

95.1.5 TMenuItem Class

TMenuItem describes the properties of an item in a menu.

Class Hierarchy

Pascal

```
TMenuItem = class(TComponent);
```

C++

```
class TMenuItem : public TComponent;
```

File

Menus

Description

Use TMenuItem to specify the appearance and behavior of an item in a menu. Each TMainMenu (see page 16056) or TPopupMenu (see page 16169) component can contain multiple menu items. When a menu is defined at design time, the Menu Designer automatically creates menu item objects for each command on the menu.

See Also

TMainMenu (see page 16056)

TPopupMenu (see page 16169)

NewItem (see page 16188)

NewLine (see page 16189)

NewSubMenu (see page 16192)

95.1.5.1 TMenuItem Members

The following tables list the members exposed by TMenuItem.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 16110)	This is ActionChange, a member of class TMenuItem.
V	AdvancedDrawItem (see page 16115)	This is AdvancedDrawItem, a member of class TMenuItem.
V	AssignTo (see page 16115)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 16116)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoDrawText (see page 16117)	This is DoDrawText, a member of class TMenuItem.
V	DrawItem (see page 16118)	This is DrawItem, a member of class TMenuItem.
	GetActionLinkClass (see page 16118)	This is GetActionLinkClass, a member of class TMenuItem.
	GetAutoHotkeys (see page 16118)	This is GetAutoHotkeys, a member of class TMenuItem.
	GetAutoLineReduction (see page 16119)	This is GetAutoLineReduction, a member of class TMenuItem.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
V	GetChildren (see page 16119)	This is GetChildren, a member of class TMenuItem.
	GetCount (see page 16119)	This is GetCount, a member of class TMenuItem.
	GetHandle (see page 16120)	This is GetHandle, a member of class TMenuItem.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetItem (see page 16120)	This is GetItem, a member of class TMenuItem.
	GetMenuIndex (see page 16121)	This is GetMenuIndex, a member of class TMenuItem.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InsertNewLine (see page 16124)	This is InsertNewLine, a member of class TMenuItem.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 16125)	Initializes the component after the form file has been read into memory.
V	MeasureItem (see page 16126)	This is MeasureItem, a member of class TMenuItem.
V	MenuChanged (see page 16126)	This is MenuChanged, a member of class TMenuItem.
V	Notification (see page 16127)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBreak (see page 16129)	This is SetBreak, a member of class TMenuItem.
	SetCaption (see page 16130)	This is SetCaption, a member of class TMenuItem.
	SetChecked (see page 16130)	This is SetChecked, a member of class TMenuItem.

	SetChildOrder (see page 16130)	This is SetChildOrder, a member of class TMenuItem.
	SetDefault (see page 16130)	This is SetDefault, a member of class TMenuItem.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEnabled (see page 16131)	This is SetEnabled, a member of class TMenuItem.
	SetGroupIndex (see page 16131)	This is SetGroupIndex, a member of class TMenuItem.
	SetImageIndex (see page 16131)	This is SetImageIndex, a member of class TMenuItem.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetMenuIndex (see page 16131)	This is SetMenuIndex, a member of class TMenuItem.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 16131)	This is SetParentComponent, a member of class TMenuItem.
	SetRadioItem (see page 16132)	This is SetRadioItem, a member of class TMenuItem.
	SetShortCut (see page 16132)	This is SetShortCut, a member of class TMenuItem.
	SetVisible (see page 16132)	This is SetVisible, a member of class TMenuItem.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateItems (see page 16132)	This is UpdateItems, a member of class TMenuItem.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 16134)	This is ActionLink, a member of class TMenuItem.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Add (see page 16110)	This is the overview for the Add method overload.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 16115)	Removes and frees all menu items listed in the Items (see page 16149) property.
	Click (see page 16116)	Simulates a mouse click.
	Create (see page 16107)	Creates an instance of TMenuItem (see page 16102).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 16117)	Removes a menu item from the Items (see page 16149) property array.
	Destroy (see page 16108)	Destroys an instance of TMenuItem (see page 16102).

	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Find (see page 16118)	Locates a menu item in the Items (see page 16149) property array given its caption.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 16119)	Returns a TComponent enumerator.
	GetImageList (see page 16120)	Returns the Image list that supplies an image for the menu item.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 16121)	Returns the parent component of the menu item.
	GetParentMenu (see page 16121)	Returns the main menu of which the menu item is part.
V	HasParent (see page 16121)	Indicates that the menu item has a parent that is responsible for loading and saving its data.
	IndexOf (see page 16122)	Returns the position of a menu item within the Items (see page 16149) array.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 16122)	Calls the action link's Update method if the menu item is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 16123)	Inserts a menu item into a specified position in the Items (see page 16149) array.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertNewLineAfter (see page 16124)	Inserts a separator bar after a specified item from the Items (see page 16149) property array.
	InsertNewLineBefore (see page 16124)	Inserts a separator bar before a specified item from the Items (see page 16149) property array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLine (see page 16125)	Indicates whether the menu item represents a separator bar.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewBottomLine (see page 16126)	Inserts a separator bar at the end of the Items (see page 16149) property array.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NewTopLine (see page 16127)	Inserts a separator bar at the beginning of the Items (see page 16149) property array.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Remove (see page 16128)	Removes a menu item from the Items (see page 16149) property array
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RethinkHotkeys (see page 16128)	Adjusts the captions of subitems so that every item has an accelerator and there are no duplicate accelerator keys.
	RethinkLines (see page 16129)	Removes superfluous separator lines from the Items (see page 16149) property array.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	Command (see page 16141)	Specifies the Windows Command ID associated with the menu item.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Count (see page 16141)	Indicates the number of subitems of the menu item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Handle (see page 16147)	Indicates the Windows menu handle of the drop-down menu associated with the menu item.
R	Items (see page 16149)	Lists the menu items in the submenu of the menu item.
	MenuIndex (see page 16150)	Indicates the index of the menu item within its parent menu.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Parent (see page 16151)	Identifies the parent menu item of this menu item.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnAdvancedDrawItem (see page 16154)	Occurs when an owner-draw menu needs to be drawn.
	OnClick (see page 16154)	Occurs when the user clicks menu item.
	OnDrawItem (see page 16159)	Occurs when an owner-draw menu needs to be drawn.
	OnMeasureItem (see page 16160)	Occurs on owner-draw menu items to determine menu item size before the menu is drawn.

Published Properties

	Name	Description
	Action (see page 16133)	Designates the action associated with the menu item.
	AutoCheck (see page 16134)	Indicates whether the menu item's checked state toggles automatically when the item is clicked.
	AutoHotkeys (see page 16134)	Determines whether the accelerator keys for submenu items can be reset automatically.
	AutoLineReduction (see page 16135)	Determines whether redundant separator bars are automatically removed from the submenu.
	Bitmap (see page 16135)	Designates a bitmap that is drawn for the menu item.
	Break (see page 16136)	Determines whether the menu item starts a new column in the menu.
	Caption (see page 16136)	Specifies the text of the menu item.
	Checked (see page 16140)	Specifies whether a check mark should appear beside the Caption (see page 16136).
	Default (see page 16145)	Specifies whether the menu item is invoked when the parent item is double clicked.
	Enabled (see page 16145)	Specifies whether the menu item is enabled.

	GroupIndex (see page 16146)	Identifies the logical group to which the menu item belongs.
	HelpContext (see page 16148)	Specifies the help context ID associated with the menu item.
	Hint (see page 16148)	Specifies the text string that can appear when the user moves the mouse pointer over a menu item.
	ImageIndex (see page 16148)	Indicates which image maintained by the parent menu appears next to the menu item.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RadioItem (see page 16151)	Specifies whether the menu item is mutually exclusive with other menu items in its group.
	ShortCut (see page 16152)	Specifies the key combination users can type to quickly access the menu item.
	SubMenuImages (see page 16152)	Lists the images that can appear beside individual items in a submenu of this menu item.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 16153)	Specifies whether the menu item appears in the menu.

95.1.5.2 TMenuItem.Create Constructor

Creates an instance of TMenuItem (see page 16102).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMenuItem(TComponent * AOwner);
```

Description

Use Create to create a menu item at runtime. Menu items defined at design time using the Menu designer are created automatically.

AOwner is the component that is responsible for freeing the menu item. It becomes the value of the Owner property.

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *NewItem;
  // first create the separator
  NewItem = new TMenuItem(this); // If you change the AOwner (this) to MainMenu1->Items[1] and
then you add the new menu you will get "Menu inserted twice"?  Doesn't happen in Delphi.
  NewItem->Name = "Separator";
  NewItem->Caption = "-";
  // add the new item to the Windows menu
  MainMenu1->Items[1].Add(NewItem);
  // now create and add a menu item for each form
  for  (int I = 0; I < Screen->FormCount; I++)
  {
    NewItem = new TMenuItem(this);
    NewItem->Caption = Screen->Forms[I]->Name + "Item";
    NewItem->Name = Screen->Forms[I]->Name;
    MainMenu1->Items[1].Add(NewItem);
  }
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
```

```
{
  // Count down, not up!
  for  (int I = MainMenu1->Items[1].Count - 1; I >= 0; I--)
  {
    delete MainMenu1->Items[1].Items[I];
  }
}
```

Delphi Examples:

```
{
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
}
procedure TForm1.Button1Click(Sender: TObject);
var
  NewItem: TMenuItem;
  I : integer;
begin
  { first create the separator }
  NewItem := TMenuItem.Create(MainMenu1.Items[1]);
  NewItem.Name:= 'Separator';
  NewItem.Caption := '-';
  { add the new item to the Windows menu }
  MainMenu1.Items[1].Add(NewItem);
  { now create and add a menu item for each form }
  for  I := 0 to Screen.FormCount-1 do
  begin
    NewItem := TMenuItem.Create(MainMenu1.Items[1]);
    NewItem.Caption := Screen.Forms[I].Name + 'Item';
    NewItem.Name := Screen.Forms[I].Name;
    MainMenu1.Items[1].Add(NewItem);
   end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I : Integer;
begin
  // Count down, not up!
  for  I := MainMenu1.Items[1].Count - 1 downto 0 do
  begin
    MainMenu1.Items[1].Items[I].Free;
  end;
end;
```

See Also

Owner (see page 2807)

NewItem (see page 16188)

95.1.5.3 TMenuItem.Destroy Destructor

Destroys an instance of TMenuItem (see page 16102).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMenuItem();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TMenuItem (see page 16102) reference is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

95.1.5.4 TMenuItem Methods

The methods of the TMenuItem class are listed here.

Protected Methods

	Name	Description
	ActionChange (see page 16110)	This is ActionChange, a member of class TMenuItem.
V	AdvancedDrawItem (see page 16115)	This is AdvancedDrawItem, a member of class TMenuItem.
V	AssignTo (see page 16115)	Copies the properties of an object to a destination object.
V	DefineProperties (see page 16116)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoDrawText (see page 16117)	This is DoDrawText, a member of class TMenuItem.
V	DrawItem (see page 16118)	This is DrawItem, a member of class TMenuItem.
	GetActionLinkClass (see page 16118)	This is GetActionLinkClass, a member of class TMenuItem.
	GetAutoHotkeys (see page 16118)	This is GetAutoHotkeys, a member of class TMenuItem.
	GetAutoLineReduction (see page 16119)	This is GetAutoLineReduction, a member of class TMenuItem.
V	GetChildren (see page 16119)	This is GetChildren, a member of class TMenuItem.
	GetCount (see page 16119)	This is GetCount, a member of class TMenuItem.
	GetHandle (see page 16120)	This is GetHandle, a member of class TMenuItem.
	GetItem (see page 16120)	This is GetItem, a member of class TMenuItem.
	GetMenuIndex (see page 16121)	This is GetMenuIndex, a member of class TMenuItem.
	InsertNewLine (see page 16124)	This is InsertNewLine, a member of class TMenuItem.
V	Loaded (see page 16125)	Initializes the component after the form file has been read into memory.
V	MeasureItem (see page 16126)	This is MeasureItem, a member of class TMenuItem.
V	MenuChanged (see page 16126)	This is MenuChanged, a member of class TMenuItem.
V	Notification (see page 16127)	Forwards notification messages to all owned components.
	SetBreak (see page 16129)	This is SetBreak, a member of class TMenuItem.
	SetCaption (see page 16130)	This is SetCaption, a member of class TMenuItem.
	SetChecked (see page 16130)	This is SetChecked, a member of class TMenuItem.
V	SetChildOrder (see page 16130)	This is SetChildOrder, a member of class TMenuItem.
	SetDefault (see page 16130)	This is SetDefault, a member of class TMenuItem.
	SetEnabled (see page 16131)	This is SetEnabled, a member of class TMenuItem.
	SetGroupIndex (see page 16131)	This is SetGroupIndex, a member of class TMenuItem.
	SetImageIndex (see page 16131)	This is SetImageIndex, a member of class TMenuItem.
	SetMenuIndex (see page 16131)	This is SetMenuIndex, a member of class TMenuItem.
V	SetParentComponent (see page 16131)	This is SetParentComponent, a member of class TMenuItem.
	SetRadioItem (see page 16132)	This is SetRadioItem, a member of class TMenuItem.
	SetShortCut (see page 16132)	This is SetShortCut, a member of class TMenuItem.
	SetVisible (see page 16132)	This is SetVisible, a member of class TMenuItem.
	UpdateItems (see page 16132)	This is UpdateItems, a member of class TMenuItem.

Public Methods

	Name	Description
	Add (see page 16110)	This is the overview for the Add method overload.
	Clear (see page 16115)	Removes and frees all menu items listed in the Items (see page 16149) property.

	Click (see page 16116)	Simulates a mouse click.
	Delete (see page 16117)	Removes a menu item from the Items (see page 16149) property array.
	Find (see page 16118)	Locates a menu item in the Items (see page 16149) property array given its caption.
	GetEnumerator (see page 16119)	Returns a TComponent enumerator.
	GetImageList (see page 16120)	Returns the Image list that supplies an image for the menu item.
	GetParentComponent (see page 16121)	Returns the parent component of the menu item.
	GetParentMenu (see page 16121)	Returns the main menu of which the menu item is part.
	HasParent (see page 16121)	Indicates that the menu item has a parent that is responsible for loading and saving its data.
	IndexOf (see page 16122)	Returns the position of a menu item within the Items (see page 16149) array.
	InitiateAction (see page 16122)	Calls the action link's Update method if the menu item is associated with an action link.
	Insert (see page 16123)	Inserts a menu item into a specified position in the Items (see page 16149) array.
	InsertNewLineAfter (see page 16124)	Inserts a separator bar after a specified item from the Items (see page 16149) property array.
	InsertNewLineBefore (see page 16124)	Inserts a separator bar before a specified item from the Items (see page 16149) property array.
	IsLine (see page 16125)	Indicates whether the menu item represents a separator bar.
	NewBottomLine (see page 16126)	Inserts a separator bar at the end of the Items (see page 16149) property array.
	NewTopLine (see page 16127)	Inserts a separator bar at the beginning of the Items (see page 16149) property array.
	Remove (see page 16128)	Removes a menu item from the Items (see page 16149) property array
	RethinkHotkeys (see page 16128)	Adjusts the captions of subitems so that every item has an accelerator and there are no duplicate accelerator keys.
	RethinkLines (see page 16129)	Removes superfluous separator lines from the Items (see page 16149) property array.

95.1.5.4.1 TMenuItem.ActionChange Method

Pascal

```
procedure ActionChange(Sender: TObject; CheckDefaults: Boolean); dynamic;
```

C++

```
__fastcall ActionChange(TObject * Sender, Boolean CheckDefaults);
```

Description

This is ActionChange, a member of class TMenuItem.

95.1.5.4.2 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	TMenuItem.Add (array of TMenuItem) (see page 16110)	Adds one or more menu items to the end of the Items (see page 16149) property array.
	TMenuItem.Add (TMenuItem) (see page 16110)	Adds one or more menu items to the end of the Items (see page 16149) property array.

95.1.5.4.2.1 TMenuItem.Add Method (TMenuItem)

Adds one or more menu items to the end of the Items (see page 16149) property array.

Pascal

```
procedure Add(Item: TMenuItem); overload;
procedure Add(const AItems: array of TMenuItem); overload;
```

C++

```
__fastcall Add(TMenuItem Item);
__fastcall Add(const array of TMenuItem AItems);
```

Description

Use Add to add new menu items to the dropdown menu for this menu item. If this menu item is the value of the Items (see page 16149) property of a main menu or pop-up menu, Add adds the items to the end of the menu.

Specify a single new menu item to add as the value of the Item parameter, or an array of new menu items as the value of the AItems parameter. AItems_Size is the index of the last item in the AItems array (one less than the number of items).

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *NewItem;
  // first create the separator
  NewItem = new TMenuItem(this); // If you change the AOwner (this) to MainMenu1->Items[1] and
then you add the new menu you will get "Menu inserted twice"?  Doesn't happen in Delphi.
  NewItem->Name = "Separator";
  NewItem->Caption = "-";
  // add the new item to the Windows menu
  MainMenu1->Items[1].Add(NewItem);
  // now create and add a menu item for each form
  for  (int I = 0; I < Screen->FormCount; I++)
  {

            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
```

```
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
}
procedure TForm1.Button1Click(Sender: TObject);
var
  NewItem: TMenuItem;
  I : integer;
begin
  { first create the separator }
  NewItem := TMenuItem.Create(MainMenu1.Items[1]);
  NewItem.Name:= 'Separator';
  NewItem.Caption := '-';
  { add the new item to the Windows menu }
  MainMenu1.Items[1].Add(NewItem);
  { now create and add a menu item for each form }
  for  I := 0 to Screen.FormCount-1 do
  begin
    NewItem := TMenuItem.Create(MainMenu1.Items[1]);
    NewItem.Caption := Screen.Forms[I].Name + 'Item';
    NewItem.Name := Screen.Forms[I].Name;
    MainMenu1.Items[1].Add(NewItem);
   end;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I : Integer;
begin
  // Count down, not up!
  for  I := MainMenu1.Items[1].Count - 1 downto 0 do
  begin
    MainMenu1.Items[1].Items[I].Free;
  end;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type

95.1.5.4.3 TMenuItem.AdvancedDrawItem Method

Pascal

```
procedure AdvancedDrawItem(ACanvas: TCanvas; ARect: TRect; State: TOwnerDrawState; TopLevel:
Boolean); virtual;
```

C++

```
virtual __fastcall AdvancedDrawItem(TCanvas ACanvas, TRect ARect, TOwnerDrawState State,
Boolean TopLevel);
```

Description

This is AdvancedDrawItem, a member of class TMenuItem.

95.1.5.4.4 TMenuItem.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign (see page 2930)

EConvertError (see page 22724)

95.1.5.4.5 TMenuItem.Clear Method

Removes and frees all menu items listed in the Items (see page 16149) property.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Use Clear to free all the items listed in the Items (see page 16149) property array.

See Also

Items (see page 16149)

Delete (see page 16117)

95.1.5.4.6 TMenuItem.Click Method

Simulates a mouse click.

Pascal

```
procedure Click; virtual;
```

C++

```
virtual __fastcall Click();
```

Description

Click generates an OnClick (see page 16154) event, as if the user had clicked the menu item. Unlike a real mouse click, Click does not generate a WM_COMMAND message to the window associated with the menu.

Component writers can override click to provide a different response when the user selects the menu item.

See Also

Command (see page 16141)

OnClick (see page 16154)

95.1.5.4.7 TMenuItem.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

See Also

Ancestor (see page 2839)

DefineBinaryProperty (see page 2837)

DefineProperties (see page 2931)

DefineProperty (see page 2838)

95.1.5.4.8 TMenuItem.Delete Method

Removes a menu item from the Items (see page 16149) property array.

Pascal

```
procedure Delete(Index: Integer);
```

C++

```
__fastcall Delete(int Index);
```

Description

Call Delete to remove a menu item and all its submenus from a menu. The Index parameter is the index of the item to be deleted, where 0 specifies the first item in the menu, 1 specifies the second item, and so on.

Delete does not free the removed item's memory. To remove an item from the menu and free its memory, call the Free method in the item you want to remove.

To temporarily hide a menu item, without deleting it, use the Visible (see page 16153) property.

See Also

Add (see page 16110)

Insert (see page 16123)

Items (see page 16149)

Remove (see page 16128)

Visible (see page 16153)

Free (see page 22300)

95.1.5.4.9 TMenuItem.DoDrawText Method

Pascal

```
procedure DoDrawText(ACanvas: TCanvas; const ACaption: string; var Rect: TRect; Selected:
Boolean; Flags: Longint);
```

C++

```
__fastcall DoDrawText(TCanvas ACanvas, const AnsiString ACaption, TRect Rect, Boolean
Selected, Longint Flags);
```

Description

This is DoDrawText, a member of class TMenuItem.

95.1.5.4.10 TMenuItem.DrawItem Method

Pascal

```
procedure DrawItem(ACanvas: TCanvas; ARect: TRect; Selected: Boolean); virtual;
```

C++

```
virtual __fastcall DrawItem(TCanvas ACanvas, TRect ARect, Boolean Selected);
```

Description

This is DrawItem, a member of class TMenuItem.

95.1.5.4.11 TMenuItem.Find Method

Locates a menu item in the Items (see page 16149) property array given its caption.

Pascal

```
function Find(ACaption: string): TMenuItem;
```

C++

```
__fastcall TMenuItem Find(AnsiString ACaption);
```

Description

Use Find to locate the menu item in the Items (see page 16149) property array with the caption specified by the ACaption parameter. Find ignores accelerator characters when comparing item captions to the ACaption parameter.

Find returns the first menu item in the Items (see page 16149) property array with the specified caption. If no item is found, Find returns nil (Delphi) or NULL (C++).

See Also

Items (see page 16149)

Caption (see page 16136)

95.1.5.4.12 TMenuItem.GetActionLinkClass Method

Pascal

```
function GetActionLinkClass: TMenuActionLinkClass; dynamic;
```

C++

```
__fastcall TMenuActionLinkClass GetActionLinkClass();
```

Description

This is GetActionLinkClass, a member of class TMenuItem.

95.1.5.4.13 TMenuItem.GetAutoHotkeys Method

Pascal

```
function GetAutoHotkeys: Boolean;
```

C++

```
__fastcall Boolean GetAutoHotkeys();
```

Description

This is GetAutoHotkeys, a member of class TMenuItem.

95.1.5.4.14 TMenuItem.GetAutoLineReduction Method

Pascal

```
function GetAutoLineReduction: Boolean;
```

C++

```
__fastcall Boolean GetAutoLineReduction();
```

Description

This is GetAutoLineReduction, a member of class TMenuItem.

95.1.5.4.15 TMenuItem.GetChildren Method

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

This is GetChildren, a member of class TMenuItem.

95.1.5.4.16 TMenuItem.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class TMenuItem.

95.1.5.4.17 TMenuItem.GetEnumerator Method

Returns a TComponent enumerator.

Pascal

```
function GetEnumerator: TMenuItemEnumerator;
```

C++

```
__fastcall TMenuItemEnumerator GetEnumerator();
```

Description

GetEnumerator returns a TComponentEnumerator reference, which enumerates the components contained within a specified containing component.

To process all these sub components, call the TComponentEnumerator GetCurrent method within a While MoveNext do loop.

See Also

TComponentEnumerator (see page 2812)

95.1.5.4.18 TMenuItem.GetHandle Method

Pascal

```
function GetHandle: HMENU;
```

C++

```
__fastcall HMENU GetHandle();
```

Description

This is GetHandle, a member of class TMenuItem.

95.1.5.4.19 TMenuItem.GetImageList Method

Returns the Image list that supplies an image for the menu item.

Pascal

```
function GetImageList: TCustomImageList;
```

C++

```
__fastcall TCustomImageList GetImageList();
```

Description

Use GetImageList to access the list of images that contains the image for this menu item. The ImageIndex (see page 16148) property identifies a specific image from the list that GetImageList returns.

GetImageList first checks the Parent (see page 16151) of this menu item for a SubMenuImages (see page 16152) property. If the parent menu item does not maintain a list of images, it checks that menu item's parent, and so on until reaching a top-level menu item (a menu item where Parent (see page 16151) is not set). If none of the parent menu items has a SubMenuImages (see page 16152) property, GetImageList checks the top-level menu for an Images property.

GetImageList returns the first image list it finds. If it doesn't find an image list, GetImageList returns nil (Delphi) or NULL (C++).

See Also

ImageIndex (see page 16148)

SubMenuImages (see page 16152)

Images (see page 16083)

Parent (see page 16151)

95.1.5.4.20 TMenuItem.GetItem Method

Pascal

```
function GetItem(Index: Integer): TMenuItem;
```

C++

```
__fastcall TMenuItem GetItem(int Index);
```

Description

This is GetItem, a member of class TMenuItem.

95.1.5.4.21 TMenuItem.GetMenuIndex Method

Pascal

```
function GetMenuIndex: Integer;
```

C++

```
__fastcall int GetMenuIndex();
```

Description

This is GetMenuIndex, a member of class TMenuItem.

95.1.5.4.22 TMenuItem.GetParentComponent Method

Returns the parent component of the menu item.

Pascal

```
function GetParentComponent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetParentComponent();
```

Description

GetParentComponent is called by the streaming system that loads and saves components. It ensures that objects are loaded and saved with their parent objects. GetParentComponent is overridden in descendant classes to return the appropriate parent for their particular type of component. TMenuItem (see page 16102) overrides it to identify its associated menu, if it has one, as its parent.

95.1.5.4.23 TMenuItem.GetParentMenu Method

Returns the main menu of which the menu item is part.

Pascal

```
function GetParentMenu: TMenu;
```

C++

```
__fastcall TMenu GetParentMenu();
```

Description

GetParentMenu returns the menu that contains the menu item.

See Also

Free (see page 22300)

95.1.5.4.24 TMenuItem.HasParent Method

Indicates that the menu item has a parent that is responsible for loading and saving its data.

Pascal

```
function HasParent: Boolean; override;
```

C++

```
virtual __fastcall Boolean HasParent();
```

Description

TMenuItem (see page 16102) overrides HasParent to return true, indicating that menu items have a parent. Applications seldom call the HasParent method. It is used by the streaming system that loads and saves forms to determine when another object is responsible for writing a component to a stream.

See Also

Parent (see page 16151)

HasParent

95.1.5.4.25 TMenuItem.IndexOf Method

Returns the position of a menu item within the Items (see page 16149) array.

Pascal

```
function IndexOf(Item: TMenuItem): Integer;
```

C++

```
__fastcall int IndexOf(TMenuItem Item);
```

Description

Call IndexOf to locate a menu item in the submenu headed by this menu item. IndexOf returns 0 for the first menu item, 1 for the second menu item, and so on. If the menu item is not in the submenu, IndexOf returns -1.

Note: IndexOf may not correspond to the position of the item in the menu the user sees if the menu includes some items that are not visible.

See Also

Items (see page 16149)

MenuIndex (see page 16150)

Visible (see page 16153)

95.1.5.4.26 TMenuItem.InitiateAction Method

Calls the action link's Update method if the menu item is associated with an action link.

Pascal

```
procedure InitiateAction; virtual;
```

C++

```
virtual __fastcall InitiateAction();
```

Description

InitiateAction calls the action link, if there is one for the menu item, to update the association between the action and the menu item.

See Also

Items (see page 16149)

MenuIndex (see page 16150)

Visible (see page 16153)

95.1.5.4.27 TMenuItem.Insert Method

Inserts a menu item into a specified position in the Items (see page 16149) array.

Pascal

```
procedure Insert(Index: Integer; Item: TMenuItem);
```

C++

```
__fastcall Insert(int Index, TMenuItem Item);
```

Description

Use Insert to insert a new menu item to the dropdown menu for this menu item. If this menu item is the value of the Items (see page 16149) property of a main menu or pop-up menu, Insert inserts an item into that menu. Specify the new menu item to add as the value of the Item parameter, and the position in the Items (see page 16149) array as the value of the Index parameter.

Delphi Examples:

```
{
This code inserts a menu item after the first item in a menu
named FileMenu:
}
procedure TForm1.InsertMenuItemClick(Sender: TObject);
var
  NewItem: TMenuItem;
begin
  NewItem := TMenuItem.Create(FileMenu);
  try
    NewItem.Caption := 'Do this';
    FileMenu.Insert(1, NewItem);
  except
    NewItem.Free; // Throw away the menu item if there is an error.
    raise; // reraise the exception
  end;
  // Don't free the menu item on success.  Need it for the menu!
end;

// Free all the menu items that we have created dynamically.
procedure TForm1.FormDestroy(Sender: TObject);
var
  I : Integer;
begin
  for I := FileMenu.Count - 1 downto 0 do  // Index backwards because Count changes as you
remove items.
    if FileMenu.Items[I].Name = '' then  // Items created dynamically have not name.
      FileMenu.Items[I].Free;
end;
```

See Also

Add (see page 16110)

Delete (see page 16117)

Items (see page 16149)

Remove (see page 16128)

Items (see page 16084)

95.1.5.4.28 TMenuItem.InsertNewLine Method

Pascal

```
function InsertNewLine(ABefore: Boolean; AItem: TMenuItem): Integer;
```

C++

```
__fastcall int InsertNewLine(Boolean ABefore, TMenuItem AItem);
```

Description

This is InsertNewLine, a member of class TMenuItem.

95.1.5.4.29 TMenuItem.InsertNewLineAfter Method

Inserts a separator bar after a specified item from the Items (see page 16149) property array.

Pascal

```
function InsertNewLineAfter(AItem: TMenuItem): Integer;
```

C++

```
__fastcall int InsertNewLineAfter(TMenuItem AItem);
```

Description

Use InsertNewLineAfter to insert a separator bar after the menu item specified by AItem. If AItem is not an item in the Items (see page 16149) property array, InsertNewLineAfter raises an exception.

InsertNewLineAfter returns the index of the newly inserted separator item in the Items (see page 16149) property array.

Tip: When inserting separator bars at runtime, it is a good idea to set AutoLineReduction (see page 16135) to true so that superfluous separators can be automatically removed.

See Also

Insert (see page 16123)

InsertNewLineBefore (see page 16124)

Items (see page 16149)

NewBottomLine (see page 16126)

NewTopLine (see page 16127)

AutoLineReduction (see page 16135)

95.1.5.4.30 TMenuItem.InsertNewLineBefore Method

Inserts a separator bar before a specified item from the Items (see page 16149) property array.

Pascal

```
function InsertNewLineBefore(AItem: TMenuItem): Integer;
```

C++

```
__fastcall int InsertNewLineBefore(TMenuItem AItem);
```

Description

Use InsertNewLineBefore to insert a separator bar before the menu item specified by AItem. If AItem is not an item in the Items (see page 16149) property array, InsertNewLineBefore raises an exception.

InsertNewLineBefore returns the index of the newly inserted separator item in the Items (see page 16149) property array.

Tip: When inserting separator bars at runtime, it is a good idea to set AutoLineReduction (see page 16135) to true so that superfluous separators can be automatically removed.

See Also

Insert (see page 16123)

InsertNewLineAfter (see page 16124)

Items (see page 16149)

NewBottomLine (see page 16126)

NewTopLine (see page 16127)

AutoLineReduction (see page 16135)

95.1.5.4.31 TMenuItem.IsLine Method

Indicates whether the menu item represents a separator bar.

Pascal

```
function IsLine: Boolean;
```

C++

```
__fastcall Boolean IsLine();
```

Description

Call IsLine to determine whether the menu item is a separator bar. IsLine checks the Caption (see page 16136) of the menu item and returns true if the value of Caption (see page 16136) is '-'. Menu items with this Caption (see page 16136) appear as separator bars.

See Also

Caption (see page 16136)

95.1.5.4.32 TMenuItem.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

See Also

95.1.5.4.33 TMenuItem.MeasureItem Method

Pascal

```
procedure MeasureItem(ACanvas: TCanvas; var Width: Integer; var Height: Integer); virtual;
```

C++

```
virtual __fastcall MeasureItem(TCanvas ACanvas, int Width, int Height);
```

Description

This is MeasureItem, a member of class TMenuItem.

95.1.5.4.34 TMenuItem.MenuChanged Method

Pascal

```
procedure MenuChanged(Rebuild: Boolean); virtual;
```

C++

```
virtual __fastcall MenuChanged(Boolean Rebuild);
```

Description

This is MenuChanged, a member of class TMenuItem.

95.1.5.4.35 TMenuItem.NewBottomLine Method

Inserts a separator bar at the end of the Items (see page 16149) property array.

Pascal

```
function NewBottomLine: Integer;
```

C++

```
__fastcall int NewBottomLine();
```

Description

Use NewBottomLine to insert a separator bar at the end of the items property array. This is useful when building up submenus dynamically at runtime.

NewBottomLine returns the index of the newly inserted separator item in the Items (see page 16149) property array.

Tip: When inserting separator bars at runtime, it is a good idea to set AutoLineReduction (see page 16135) to true so that superfluous separators can be automatically removed.

See Also

Add (see page 16110)

InsertNewLineBefore (see page 16124)

Items (see page 16149)

InsertNewLineAfter (see page 16124)

NewTopLine (see page 16127)

AutoLineReduction (see page 16135)

95.1.5.4.36 TMenuItem.NewTopLine Method

Inserts a separator bar at the beginning of the Items (see page 16149) property array.

Pascal

```
function NewTopLine: Integer;
```

C++

```
__fastcall int NewTopLine();
```

Description

Use NewTopLine to insert a separator bar at the beginning of the items property array. This is useful when building up submenus dynamically at runtime.

NewTopLine returns the index of the newly inserted separator item in the Items (see page 16149) property array.

Tip: When inserting separator bars at runtime, it is a good idea to set AutoLineReduction (see page 16135) to true so that superfluous separators can be automatically removed.

See Also

Add (see page 16110)

InsertNewLineBefore (see page 16124)

Items (see page 16149)

InsertNewLineAfter (see page 16124)

NewBottomLine (see page 16126)

AutoLineReduction (see page 16135)

95.1.5.4.37 TMenuItem.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification

to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

95.1.5.4.38 TMenuItem.Remove Method

Removes a menu item from the Items (see page 16149) property array

Pascal

```
procedure Remove(Item: TMenuItem);
```

C++

```
__fastcall Remove(TMenuItem Item);
```

Description

Call Remove to remove a menu item and all its submenus from a menu. The Item parameter is the item to be removed. If Item is not a menu item in the Items (see page 16149) array, Remove raises an exception.

Remove does not free the item's memory. To remove an item from the menu and free its memory, call the Free method in the item you want to remove.

To temporarily hide a menu item, without deleting it, use the Visible (see page 16153) property.

See Also

Add (see page 16110)

Delete (see page 16117)

EMenuError (see page 16055)

Insert (see page 16123)

Items (see page 16149)

Visible (see page 16153)

95.1.5.4.39 TMenuItem.RethinkHotkeys Method

Adjusts the captions of subitems so that every item has an accelerator and there are no duplicate accelerator keys.

Pascal

```
function RethinkHotkeys: Boolean;
```

C++

```
__fastcall Boolean RethinkHotkeys();
```

Description

Call RethinkHotkeys to adjust the accelerator keys for the items in the Items (see page 16149) property and in any submenu of those items. RethinkHotkeys checks for items that do not have an accelerator key or that have duplicate accelerator keys. It then replaces any duplicate accelerators with unique characters and adds accelerator keys to items that don't have them. RethinkHotkeys gives first priority to existing accelerator key mappings, but may change them if necessary to ensure uniqueness.

RethinkHotkeys lets a menu adjust the accelerator keys when the AutoHotkeys (see page 16134) property is false. For any menu or submenu that has AutoHotkeys (see page 16134) set to true, this adjustment occurs automatically.

RethinkHotkeys returns true if RethinkHotkeys changed the Caption (see page 16136) property of any menu items, false otherwise.

See Also

AutoHotkeys (see page 16134)

AutoHotkeys (see page 16082)

Caption (see page 16136)

Items (see page 16149)

95.1.5.4.40 TMenuItem.RethinkLines Method

Removes superfluous separator lines from the Items (see page 16149) property array.

Pascal

```
function RethinkLines: Boolean;
```

C++

```
__fastcall Boolean RethinkLines();
```

Description

Call RethinkLines to remove superfluous separators from the items in the Items (see page 16149) property and in any submenu of those items. RethinkLines removes separators that appear at the very beginning or end of a submenu and separators that immediately follow another separator.

RethinkLines lets a menu remove superfluous separators when the AutoLineReduction (see page 16135) property is false. For any menu or submenu that has AutoLineReduction (see page 16135) set to true, this adjustment occurs automatically.

RethinkLines returns true if RethinkLines removed any menu items, false otherwise.

See Also

AutoLineReduction (see page 16135)

AutoLineReduction (see page 16082)

IsLine (see page 16125)

Items (see page 16149)

95.1.5.4.41 TMenuItem.SetBreak Method

Pascal

```
procedure SetBreak(Value: TMenuBreak);
```

C++

```
__fastcall SetBreak(TMenuBreak Value);
```

Description

This is SetBreak, a member of class TMenuItem.

95.1.5.4.42 TMenuItem.SetCaption Method

Pascal

```
procedure SetCaption(const Value: string);
```

C++

```
__fastcall SetCaption(const AnsiString Value);
```

Description

This is SetCaption, a member of class TMenuItem.

95.1.5.4.43 TMenuItem.SetChecked Method

Pascal

```
procedure SetChecked(Value: Boolean);
```

C++

```
__fastcall SetChecked(Boolean Value);
```

Description

This is SetChecked, a member of class TMenuItem.

95.1.5.4.44 TMenuItem.SetChildOrder Method

Pascal

```
procedure SetChildOrder(Child: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Child, int Order);
```

Description

This is SetChildOrder, a member of class TMenuItem.

95.1.5.4.45 TMenuItem.SetDefault Method

Pascal

```
procedure SetDefault(Value: Boolean);
```

C++

```
__fastcall SetDefault(Boolean Value);
```

Description

This is SetDefault, a member of class TMenuItem.

95.1.5.4.46 TMenuItem.SetEnabled Method

Pascal

```
procedure SetEnabled(Value: Boolean);
```

C++

```
__fastcall SetEnabled(Boolean Value);
```

Description

This is SetEnabled, a member of class TMenuItem.

95.1.5.4.47 TMenuItem.SetGroupIndex Method

Pascal

```
procedure SetGroupIndex(Value: Byte);
```

C++

```
__fastcall SetGroupIndex(Byte Value);
```

Description

This is SetGroupIndex, a member of class TMenuItem.

95.1.5.4.48 TMenuItem.SetImageIndex Method

Pascal

```
procedure SetImageIndex(Value: TImageIndex);
```

C++

```
__fastcall SetImageIndex(TImageIndex Value);
```

Description

This is SetImageIndex, a member of class TMenuItem.

95.1.5.4.49 TMenuItem.SetMenuIndex Method

Pascal

```
procedure SetMenuIndex(Value: Integer);
```

C++

```
__fastcall SetMenuIndex(int Value);
```

Description

This is SetMenuIndex, a member of class TMenuItem.

95.1.5.4.50 TMenuItem.SetParentComponent Method

Pascal

```
procedure SetParentComponent(Value: TComponent); override;
```

C++

```
virtual __fastcall SetParentComponent(TComponent * Value);
```

Description

This is SetParentComponent, a member of class TMenuItem.

95.1.5.4.51 TMenuItem.SetRadioItem Method

Pascal

```
procedure SetRadioItem(Value: Boolean);
```

C++

```
__fastcall SetRadioItem(Boolean Value);
```

Description

This is SetRadioItem, a member of class TMenuItem.

95.1.5.4.52 TMenuItem.SetShortCut Method

Pascal

```
procedure SetShortCut(Value: TShortCut);
```

C++

```
__fastcall SetShortCut(TShortCut Value);
```

Description

This is SetShortCut, a member of class TMenuItem.

95.1.5.4.53 TMenuItem.SetVisible Method

Pascal

```
procedure SetVisible(Value: Boolean);
```

C++

```
__fastcall SetVisible(Boolean Value);
```

Description

This is SetVisible, a member of class TMenuItem.

95.1.5.4.54 TMenuItem.UpdateItems Method

Pascal

```
procedure UpdateItems;
```

C++

```
__fastcall UpdateItems();
```

Description

This is UpdateItems, a member of class TMenuItem.

95.1.5.5 TMenuItem Properties

The properties of the TMenuItem class are listed here.

Protected Properties

	Name	Description
	ActionLink (see page 16134)	This is ActionLink, a member of class TMenuItem.

Public Properties

	Name	Description
R	Command (see page 16141)	Specifies the Windows Command ID associated with the menu item.
R	Count (see page 16141)	Indicates the number of subitems of the menu item.
R	Handle (see page 16147)	Indicates the Windows menu handle of the drop-down menu associated with the menu item.
R	Items (see page 16149)	Lists the menu items in the submenu of the menu item.
	MenuIndex (see page 16150)	Indicates the index of the menu item within its parent menu.
R	Parent (see page 16151)	Identifies the parent menu item of this menu item.

Published Properties

	Name	Description
	Action (see page 16133)	Designates the action associated with the menu item.
	AutoCheck (see page 16134)	Indicates whether the menu item's checked state toggles automatically when the item is clicked.
	AutoHotkeys (see page 16134)	Determines whether the accelerator keys for submenu items can be reset automatically.
	AutoLineReduction (see page 16135)	Determines whether redundant separator bars are automatically removed from the submenu.
	Bitmap (see page 16135)	Designates a bitmap that is drawn for the menu item.
	Break (see page 16136)	Determines whether the menu item starts a new column in the menu.
	Caption (see page 16136)	Specifies the text of the menu item.
	Checked (see page 16140)	Specifies whether a check mark should appear beside the Caption (see page 16136).
	Default (see page 16145)	Specifies whether the menu item is invoked when the parent item is double clicked.
	Enabled (see page 16145)	Specifies whether the menu item is enabled.
	GroupIndex (see page 16146)	Identifies the logical group to which the menu item belongs.
	HelpContext (see page 16148)	Specifies the help context ID associated with the menu item.
	Hint (see page 16148)	Specifies the text string that can appear when the user moves the mouse pointer over a menu item.
	ImageIndex (see page 16148)	Indicates which image maintained by the parent menu appears next to the menu item.
	RadioItem (see page 16151)	Specifies whether the menu item is mutually exclusive with other menu items in its group.
	ShortCut (see page 16152)	Specifies the key combination users can type to quickly access the menu item.
	SubMenuImages (see page 16152)	Lists the images that can appear beside individual items in a submenu of this menu item.
	Visible (see page 16153)	Specifies whether the menu item appears in the menu.

95.1.5.5.1 TMenuItem.Action Property

Designates the action associated with the menu item.

Pascal

```
property Action: TBasicAction;
```

C++

```
__property TBasicAction Action;
```

Description

Action designates the action object that is associated with the menu item. Actions can be associated with a menu item by using the action list editor at design-time. Actions are a way of centralizing user responses to commands.

95.1.5.5.2 TMenuItem.ActionLink Property

Pascal

```
property ActionLink: TMenuActionLink;
```

C++

```
__property TMenuActionLink ActionLink;
```

Description

This is ActionLink, a member of class TMenuItem.

95.1.5.5.3 TMenuItem.AutoCheck Property

Indicates whether the menu item's checked state toggles automatically when the item is clicked.

Pascal

```
property AutoCheck: Boolean;
```

C++

```
__property Boolean AutoCheck;
```

Description

When AutoCheck is true, then every time the menu item is clicked, the value of the Checked (see page 16140) property toggles automatically before the OnClick (see page 16154) event occurs. When AutoCheck is false, the application must explicitly set the value of the Checked (see page 16140) property (for example, in an OnClick (see page 16154) event handler).

See Also

Checked (see page 16140)

OnClick (see page 16154)

95.1.5.5.4 TMenuItem.AutoHotkeys Property

Determines whether the accelerator keys for submenu items can be reset automatically.

Pascal

```
property AutoHotkeys: TMenuItemAutoFlag;
```

C++

```
__property TMenuItemAutoFlag AutoHotkeys;
```

Description

Set AutoHotkeys to indicate whether the accelerator keys for the items in the Items (see page 16149) property can be reset if necessary to ensure that every menu item has an accelerator key and no two items have the same accelerator key. This ensures that menu items added dynamically at runtime can have accelerator keys that do not introduce conflicts. TMenuItem (see page 16102) tries to preserve all existing accelerator key mappings when adjusting the accelerator keys, but may be forced to change some in order to ensure that every item has a unique accelerator.

Before the menu is displayed, it checks and adjusts the accelerator key mappings if AutoHotkeys is maAutomatic or if AutoHotkeys is maParent and the parent menu item adjusts accelerator key mappings. Otherwise, the menu does not alter the items listed in the Items (see page 16149) property, but may adjust the accelerator keys for submenus, depending on the AutoHotkeys property of the menu item that is the parent of the submenu.

Note: When AutoHotkeys disallows automatic adjustment of accelerator keys, an application can still adjust the menu items by calling the RethinkHotkeys (see page 16128) method. AutoHotkeys merely controls whether this adjustment occurs automatically.

See Also

AutoHotkeys (see page 16082)

Items (see page 16149)

RethinkHotkeys (see page 16128)

95.1.5.5.5 TMenuItem.AutoLineReduction Property

Determines whether redundant separator bars are automatically removed from the submenu.

Pascal

```
property AutoLineReduction: TMenuItemAutoFlag;
```

C++

```
__property TMenuItemAutoFlag AutoLineReduction;
```

Description

Set AutoLineReduction to indicate whether the menu item should automatically ensure that the submenu defined by its Items (see page 16149) property does not start or end with a separator bar and that two separator bars do not appear next to each other. This ensures that menus built dynamically at runtime do not have separator bars in undesired positions.

Before the menu is displayed, the menu item removes superfluous separator bars if AutoLineReduction is maAutomatic or AutoLineReduction is maParent and the parent menu item removes superfluous separator bars. Otherwise, the menu item does not remove separators from the Items (see page 16149) property, but may remove superfluous separators from submenus, depending on the AutoLineReduction property of the menu item that is the parent of the submenu.

Note: When AutoLineReduction disallows automatic removal of separator bars, an application can still remove superfluous separators by calling the RethinkLines (see page 16129) method. AutoLineReduction merely controls whether this adjustment occurs automatically.

See Also

AutoLineReduction (see page 16082)

Items (see page 16149)

RethinkLines (see page 16129)

95.1.5.5.6 TMenuItem.Bitmap Property

Designates a bitmap that is drawn for the menu item.

Pascal

```
property Bitmap: TBitmap;
```

C++

```
__property TBitmap Bitmap;
```

Description

Use Bitmap to provide a custom image that appears next to the caption in the menu item. On owner-draw menus, Bitmap can be used from an OnDrawItem (see page 16159) event handler to represent the entire menu item or a portion of the menu item.

Note: If the ImageIndex (see page 16148) property is set and the parent menu has a non-nil (Delphi) or NULL (C++) Images property, the image identified by ImageIndex (see page 16148) is used instead of Bitmap.

See Also

ImageIndex (see page 16148)

Images (see page 16083)

Caption (see page 16136)

OwnerDraw (see page 16088)

OnDrawItem (see page 16159)

95.1.5.5.7 TMenuItem.Break Property

Determines whether the menu item starts a new column in the menu.

Pascal

```
property Break: TMenuBreak;
```

C++

```
__property TMenuBreak Break;
```

Description

Set Break to break a long menu into columns at the item described by this menu item. The value of Break indicates whether the menu is broken into columns, and if so, whether a bar appears between the columns of the parent menu.

The default is mbNone (no breaking into columns).

See Also

Caption (see page 16136)

Parent (see page 16151)

95.1.5.5.8 TMenuItem.Caption Property

Specifies the text of the menu item.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Set Caption to the string the user sees for this item in the menu. To underline a character in a string, include an ampersand (&) before the character. This type of character is called an accelerator character. If Caption includes an accelerator character, the user can select the menu item by pressing Alt while typing the underlined character.

Tip: To automatically assign or adjust the accelerator characters in menu item captions, use the RethinkHotkeys (see page 16128) method.

Use the Caption property to identify the menu item as a line that separates the menu into parts. Specify a hyphen character (-) as the value of Caption for the menu item to indicate that the menu item is a separator. To separate the menu into multiple columns, use the Break (see page 16136) property instead.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

C++ Examples:

```
/*
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *NewItem;
  // first create the separator
  NewItem = new TMenuItem(this); // If you change the AOwner (this) to MainMenu1->Items[1] and
then you add the new menu you will get "Menu inserted twice"?  Doesn't happen in Delphi.
  NewItem->Name = "Separator";
  NewItem->Caption = "-";
  // add the new item to the Windows menu
  MainMenu1->Items[1].Add(NewItem);
  // now create and add a menu item for each form
  for  (int I = 0; I < Screen->FormCount; I++)
  {
    NewItem = new TMenuItem(this);
    NewItem->Caption = Screen->Forms[I]->Name + "Item";
    NewItem->Name = Screen->Forms[I]->Name;
    MainMenu1->Items[1].Add(NewItem);
  }
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  // Count down, not up!
  for  (int I = MainMenu1->Items[1].Count - 1; I >= 0; I--)
  {
    delete MainMenu1->Items[1].Items[I];
  }
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

```
void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example assumes that the main form of the application
has a main menu with a menu item. The following code adds a
separator, and the name of all forms to the menu. Do not
access FormCount in the mainform's FormCreate.  The other
forms do not exist yet!
}
procedure TForm1.Button1Click(Sender: TObject);
var
  NewItem: TMenuItem;
  I : integer;
begin
  { first create the separator }
  NewItem := TMenuItem.Create(MainMenu1.Items[1]);
  NewItem.Name:= 'Separator';
  NewItem.Caption := '-';
```

```
    { add the new item to the Windows menu }
    MainMenu1.Items[1].Add(NewItem);
    { now create and add a menu item for each form }
    for  I := 0 to Screen.FormCount-1 do
    begin
      NewItem := TMenuItem.Create(MainMenu1.Items[1]);
      NewItem.Caption := Screen.Forms[I].Name + 'Item';
      NewItem.Name := Screen.Forms[I].Name;
      MainMenu1.Items[1].Add(NewItem);
     end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    I : Integer;
  begin
    // Count down, not up!
    for  I := MainMenu1.Items[1].Count - 1 downto 0 do
    begin
      MainMenu1.Items[1].Items[I].Free;
    end;
  end;
  {
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  }

  type
    TForm1 = class(TForm)

Caption (see page 308)

RethinkHotkeys (see page 16128)

95.1.5.5.9 TMenuItem.Checked Property

Specifies whether a check mark should appear beside the Caption (see page 16136).

Pascal

```
property Checked: Boolean;
```

C++

```
__property Boolean Checked;
```

Description

Use Checked to allow a menu item to work like a check box. If Checked is true, the menu item appears checked. If Checked is

false, the menu item remains unchecked.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

Caption (see page 16136)

RadioItem (see page 16151)

Checked (see page 308)

AutoCheck (see page 16134)

95.1.5.5.10 TMenuItem.Command Property

Specifies the Windows Command ID associated with the menu item.

Pascal

```
property Command: Word;
```

C++

```
__property Word Command;
```

Description

Use Command in an application that directly handles WM_COMMAND messages. When the user selects the menu item, Windows sends a WM_COMMAND to the window associated with the menu. The ItemID of the message contains the value of the Command property of the menu item that was selected.

See Also

OnClick (see page 16154)

DispatchCommand (see page 16074)

WindowHandle (see page 16089)

95.1.5.5.11 TMenuItem.Count Property

Indicates the number of subitems of the menu item.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of subitems listed in the Items (see page 16149) property array. When the user clicks on a menu item that has subitems, a dropdown menu appears which displays those subitems. Each subitem can, in turn, contain additional subitems. The Count property counts only the immediate subitems of the menu item.

C++ Examples:

```
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
```

```
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
```

```
}
```

Delphi Examples:

```
{
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
}
procedure TForm1.DisableSubItemsClick(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to File1.Count - 1 do
    File1.Items[I].Enabled := False;
end;

procedure TForm1.Edit1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Edit command');
end;

procedure TForm1.File1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the File command');
end;

procedure TForm1.FileSub11Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub1 command');
end;

procedure TForm1.FileSub21Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub2 command');
end;

procedure TForm1.FileSub31Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub3 command');
end;

procedure TForm1.Options1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Options command');
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

See Also

Items (see page 16149)

MenuIndex (see page 16150)

95.1.5.5.12 TMenuItem.Default Property

Specifies whether the menu item is invoked when the parent item is double clicked.

Pascal

```
property Default: Boolean;
```

C++

```
__property Boolean Default;
```

Description

Set Default to specify whether a menu item is the default item in a submenu. Default menu items are executed when the parent item is double-clicked, allowing users to avoid navigating the submenus that contain them.

The default item appears in boldface. A submenu can have only one default item. If the Items (see page 16149) list of the parent menu item already contains a default menu item, setting the Default property to true sets the Default property of the previous default item to false.

See Also

Click (see page 16116)

Parent (see page 16151)

95.1.5.5.13 TMenuItem.Enabled Property

Specifies whether the menu item is enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to enable or disable a menu item. If Enabled is true, the Click (see page 16116) method is called when the user selects the item with the mouse. If Enabled is false, the menu item appears dimmed and the user cannot select it. However, calling the Click (see page 16116) method works even when Enabled is false.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

Delphi Examples:

```
{
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
with several menu items added, one of them named File1.
}
procedure TForm1.DisableSubItemsClick(Sender: TObject);
var
  I: Integer;
```

```
begin
  for I := 0 to File1.Count - 1 do
    File1.Items[I].Enabled := False;
end;

procedure TForm1.Edit1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Edit command');
end;

procedure TForm1.File1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the File command');
end;

procedure TForm1.FileSub11Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub1 command');
end;

procedure TForm1.FileSub21Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub2 command');
end;

procedure TForm1.FileSub31Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub3 command');
end;

procedure TForm1.Options1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Options command');
end;
```

Click (see page 16116)

Visible (see page 16153)

Enabled (see page 310)

95.1.5.5.14 TMenuItem.GroupIndex Property

Identifies the logical group to which the menu item belongs.

Pascal

```
property GroupIndex: Byte;
```

C++

```
__property Byte GroupIndex;
```

Description

Use GroupIndex to control how menus are merged. In applications that contain multiple forms, items from the menus of secondary forms can be merged into the application's main menu as those forms become active. MDI applications always merge the menus of child windows with the main menu of the parent window.

By default, all menu items in a menu bar (main menu) have the same GroupIndex value. To use GroupIndex to merge menus, set the GroupIndex value of each successive menu item to a value equal to or greater than that of the previous menu item.

When a menu item in a menu bar that is merged into the application's main menu has the same GroupIndex value as a menu item in the main menu, the menu item in the application's main menu is replaced by the corresponding menu item. If multiple

menu items in the application's main menu have the same GroupIndex value, they can be replaced only by separate menu items from the other form's menu that also have repeated GroupIndex values. Thus, the first main menu item with a given value is replaced by the first item in the second form with that value, the second item in the main form is replaced by the second item in the second form, and so on.

When a menu item in a menu bar that is merged into the application's main menu has a GroupIndex that falls between the GroupIndex values of two adjacent items on the application's main menu, that menu item is inserted between the two adjacent items. If the item's GroupIndex value is greater than all other GroupIndex values in the application's main menu, the item appears at the end of the main menu. If the GroupIndex value is less than all other GroupIndex values in the application's main menu, the menu item appears at the beginning of the main menu bar.

When an object created by an OLE 2.0 server application is activated, the server can try to merge its menus with the menus of the container application. The GroupIndex property is used to replace up to three main menu items with items from the server, in the manner described above. The server application uses the following predefined GroupIndex values to locate menu items to replace:

Group	Index	Description
Edit	1	Server menu items for editing the active OLE object
View	3	Server menu items for modifying the view of the OLE object.
Help	5	Server menu items for accessing the server's online Help.

Note: See the documentation for the OLE server for information about whether it attempts menu merge during in-place activation.

GroupIndex can also be used to define groups of menu items that act like radio buttons. To allow menu items to behave like radio buttons, set the RadioItem (see page 16151) property to all menu items in the group to true, and assign each menu item the same value of GroupIndex. Checking any menu item in the group will then uncheck the others.

See Also

MenuIndex (see page 16150)

RadioItem (see page 16151)

AutoMerge (see page 16065)

Merge (see page 16061)

PopulateOle2Menu (see page 16062)

95.1.5.5.15 TMenuItem.Handle Property

Indicates the Windows menu handle of the drop-down menu associated with the menu item.

Pascal

```
property Handle: HMENU;
```

C++

```
__property HMENU Handle;
```

Description

Use Handle when calling a Windows API function that requires a menu handle. Handle is only valid if the Count (see page 16141) property is greater than 0.

See Also

Count (see page 16141)

Items (see page 16149)

95.1.5.5.16 TMenuItem.HelpContext Property

Specifies the help context ID associated with the menu item.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

Use HelpContext to associate the menu item with a screen in the Help system of the application. Each screen in the Help system should have a unique context ID. When a menu item is selected using the keyboard, pressing F1 displays a Help screen. Which Help screen appears depends on the value of the HelpContext property.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

HelpFile (see page 13711)

HelpContext (see page 5826)

HelpContext (see page 311)

95.1.5.5.17 TMenuItem.Hint Property

Specifies the text string that can appear when the user moves the mouse pointer over a menu item.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Set Hint to a string that provides more information about the meaning of the menu item than the Caption (see page 16136). The hint text appears in the **Status Bar** when the user pauses with the mouse over the menu item if Help Hints are enabled (that is, if the Form's and the Application's Show Hint properties are true). It is also available for the code in the application's On Hint event handler.

The value of Hint can specify both a short value for the Help Hint window and a longer string to be used by the OnHint event handler. To provide both a short and a long hint, set Hint to the short string, followed by a vertical bar (|), followed by the long string.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

95.1.5.5.18 TMenuItem.ImageIndex Property

Indicates which image maintained by the parent menu appears next to the menu item.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

Set ImageIndex to designate an image that should appear next to the caption when the menu item is drawn. On top-level menu items, ImageIndex specifies a zero-offset index into the Images property of the parent menu (TMenu (see page 16067) or TPopupMenu (see page 16169)). On submenu items, ImageIndex is the zero-offset index into the parent item's SubMenuImages (see page 16152) property.

If the parent menu or item does not maintain a list of images, use the Bitmap (see page 16135) property to provide an image for a single menu item. However, any image specified by ImageIndex takes precedence over the Bitmap (see page 16135) property. Bitmap (see page 16135) is only used when ImageIndex has a negative value or the parent's Images or SubMenuImages (see page 16152) property is nil (Delphi) or NULL (C++).

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

Images (see page 16083)

Bitmap (see page 16135)

ImageIndex (see page 313)

SubMenuImages (see page 16152)

95.1.5.5.19 TMenuItem.Items Property

Lists the menu items in the submenu of the menu item.

Pascal

```
property Items [Index: Integer]: TMenuItem;
```

C++

```
__property TMenuItem Items[int Index];
```

Description

Use Items to access to a subitem by its position in the list of subitems. The value of Index is the position of the subitem within the Items array. For example, if an application has a File drop-down menu that contains the menu items New, Open, and Save, in that order, the expression

```
FileMenu.Items[2]
FileMenu->Items[2]
```

refers to the Save command.

Note: In Delphi, Items is the default property for TMenuItem (see page 16102). This means you can leave off the property name. Thus, instead of writing FileMenu.Items[2], you can write FileMenu[2].

Note: In C++, Items can be accessed using the [] operator, to achieve an affect similar to the default property in Delphi.

Delphi Examples:

```
{
The following code disables all the subitems of of the menu
item File1.  This example requires a button, a TMainMenu
```

```
with several menu items added, one of them named File1.
}
procedure TForm1.DisableSubItemsClick(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to File1.Count - 1 do
    File1.Items[I].Enabled := False;
end;

procedure TForm1.Edit1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Edit command');
end;

procedure TForm1.File1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the File command');
end;

procedure TForm1.FileSub11Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub1 command');
end;

procedure TForm1.FileSub21Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub2 command');
end;

procedure TForm1.FileSub31Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the FileSub3 command');
end;

procedure TForm1.Options1Click(Sender: TObject);
begin
  ListBox1.Items.Add('This is the Options command');
end;
```

See Also

Count (see page 16141)

MenuIndex (see page 16150)

Parent (see page 16151)

operator_[]

95.1.5.5.20 TMenuItem.MenuIndex Property

Indicates the index of the menu item within its parent menu.

Pascal

```
property MenuIndex: Integer;
```

C++

```
__property int MenuIndex;
```

Description

Use MenuIndex to locate the menu item in the Items (see page 16149) property of its parent menu item. Changing this value moves the menu item within its menu.

Note: MenuIndex may not correspond to the position of the item in the menu the user sees. The menu can include items that are not visible.

See Also

Count (see page 16141)

GroupIndex (see page 16146)

Items (see page 16149)

Parent (see page 16151)

Visible (see page 16153)

95.1.5.5.21 TMenuItem.Parent Property

Identifies the parent menu item of this menu item.

Pascal

```
property Parent: TMenuItem;
```

C++

```
__property TMenuItem Parent;
```

Description

Read Parent to determine the menu item that represents the dropdown menu that contains this menu item. If the menu item is a top level menu item in a main menu or pop-up menu, Parent is the value of that menu's Items (see page 16149) property.

See Also

Items (see page 16149)

MenuIndex (see page 16150)

Items (see page 16084)

95.1.5.5.22 TMenuItem.RadioItem Property

Specifies whether the menu item is mutually exclusive with other menu items in its group.

Pascal

```
property RadioItem: Boolean;
```

C++

```
__property Boolean RadioItem;
```

Description

Use RadioItem to make the menu item behave like a radio button with a group of other menu items. The group of menu items is the set of all menu items in a pop-up or drop-down menu that have the same value of GroupIndex (see page 16146). When RadioItem is true, only one menu item in the group that contains the menu item can be checked at a time. The single selected menu item in the group is indicated by a round dot next to the Caption (see page 16136).

Note: RadioItem does not automatically select the item when the user clicks it at runtime: you must still explicitly set the Checked (see page 16140) property to true in response to the OnClick (see page 16154) event. RadioItem simply changes the appearance of the Checked (see page 16140) state (from a check mark to a round dot) and automatically unchecks other menu items in the same group when you set the Checked (see page 16140) property to true.

RadioItem does not work for the top-level items in a main menu.

Note: Under Windows NT 3.51, the round dot indicator only appears if the "new shell" has been installed.

See Also

Caption (see page 16136)

Checked (see page 16140)

GroupIndex (see page 16146)

TMainMenu (see page 16056)

OnClick (see page 16154)

95.1.5.5.23 TMenuItem.ShortCut Property

Specifies the key combination users can type to quickly access the menu item.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

Use ShortCut to allow the user to type a key combination instead of selecting the item using the menu. This key combination appears to the right of the menu item in the menu.

When setting menu shortcuts at design time, the Object Inspector provides a long list of key combinations to choose from. To create menu shortcuts at runtime, use the global ShortCut or TextToShortCut (see page 16196) function. For example, the following line creates a shortcut, Ctrl+C and assigns it to a menu item named CloseCommand.

```
CloseCommand.ShortCut := ShortCut(Word('C'), [ssCtrl]);
CloseCommand->ShortCut = ShortCut(Word('C'), TShiftState() << ssCtrl);
```

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

ShortCut (see page 16193)

ShortCutToKey (see page 16194)

ShortCutToText (see page 16195)

TextToShortCut (see page 16196)

IsShortCut (see page 16078)

ShortCut (see page 314)

95.1.5.5.24 TMenuItem.SubMenuImages Property

Lists the images that can appear beside individual items in a submenu of this menu item.

Pascal

```
property SubMenuImages: TCustomImageList;
```

C++

```
__property TCustomImageList SubMenuImages;
```

Description

Use SubMenuImages to supply a set of images that can appear beside items listed in the Items (see page 16149) property. Individual menu items set their ImageIndex (see page 16148) property to indicate which image in the list appears to the left of the menu item caption.

Tip: If the application uses action lists, this property can be the value of the command list's Images property. This way, menu items and buttons that do the same thing can display the same image.

See Also

ImageIndex (see page 16148)

Images (see page 325)

Items (see page 16149)

95.1.5.5.25 TMenuItem.Visible Property

Specifies whether the menu item appears in the menu.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use Visible to prevent the user from seeing an item in the menu. For example, remove menu items that do not apply to the current component of a pop-up menu in an OnPopup event handler.

If Visible is true, the menu item appears. If Visible is false, the menu item is hidden.

Note: This property is not stored with the menu item if it is supplied by a TAction object.

See Also

Enabled (see page 16145)

OnPopup (see page 16184)

PopupComponent (see page 16181)

Visible (see page 314)

95.1.5.6 TMenuItem Events

The events of the TMenuItem class are listed here.

Published Events

	Name	Description
	OnAdvancedDrawItem (see page 16154)	Occurs when an owner-draw menu needs to be drawn.
	OnClick (see page 16154)	Occurs when the user clicks menu item.
	OnDrawItem (see page 16159)	Occurs when an owner-draw menu needs to be drawn.
	OnMeasureItem (see page 16160)	Occurs on owner-draw menu items to determine menu item size before the menu is drawn.

95.1.5.6.1 TMenuItem.OnAdvancedDrawItem Event

Occurs when an owner-draw menu needs to be drawn.

Pascal

```
property OnAdvancedDrawItem: TAdvancedMenuDrawItemEvent;
```

C++

```
__property TAdvancedMenuDrawItemEvent OnAdvancedDrawItem;
```

Description

Write an OnAdvancedDrawItem event handler to render the image of a menu item in an owner-draw menu.

In the event handler, use the Bitmap (see page 16135) property or the ImageIndex (see page 16148) property to access a bitmap that represents the menu item.

Note: OnAdvancedDrawItem will only occur if the parent menu's OwnerDraw property is true or the parent menu's Images property has been set.

See Also

OnMeasureItem (see page 16160)

Bitmap (see page 16135)

ImageIndex (see page 16148)

Images (see page 16083)

OwnerDraw (see page 16088)

OnDrawItem (see page 16159)

95.1.5.6.2 TMenuItem.OnClick Event

Occurs when the user clicks menu item.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Write an OnClick event handler to implement the desired behavior for when the user selects the menu item. An advantage of using the OnClick event handler over directly handling WM_COMMAND messages sent when the user selects the menu item, is that only the OnClick event occurs when the Click (see page 16116) method is called.

Note: This event handler is not stored with the menu item if it is supplied by a TAction object.

C++ Examples:

```
/*
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
```

```
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.
*/
void __fastcall TForm1::MyArrangeIconsClick(TObject *Sender)
{
  Form1->ArrangeIcons();
}
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
```

```
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
```

```
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses several forms. The first form has its
FormStyle property set to MDIForm. The others have their
FormStyle properties set to MDIChild and their Visible
properties set to true. Add a main menu component and name
one of the menu items MyArrangeIcons. This is code for the
MyArrangeIconsClick handler.  When the user chooses the
ArrangeIcons command, minimized child forms are arranged
so that they are evenly spaced and don't overlap.  DO NOT
name the menu items "ArrangeIcons" as that will override
the TForm method.
}
procedure TForm1.MyArrangeIconsClick(Sender: TObject);
begin
  Form1.ArrangeIcons;
end;
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
```

```
    if PopupMenu1.PopupComponent = Edit1 then
      Edit1.CutToClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.CutToClipboard
    else
      Beep;
  end;

  procedure TForm1.Paste1Click(Sender: TObject);
  begin
    if PopupMenu1.PopupComponent = Edit1 then
      Edit1.PasteFromClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.PasteFromClipboard
    else
      Beep;
  end;
  {
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  }

Command (see page 16141)

OnExecute (see page 2716)

95.1.5.6.3 TMenuItem.OnDrawItem Event

Occurs when an owner-draw menu needs to be drawn.

Pascal

```
property OnDrawItem: TMenuDrawItemEvent;
```

C++

```
__property TMenuDrawItemEvent OnDrawItem;
```

Description

Write an OnDrawItem event handler to render the image of a menu item in an owner-draw menu. In the event handler, use the Bitmap (see page 16135) property or the ImageIndex (see page 16148) property to access a bitmap that represents the menu item.

Note: OnDrawItem will only occur if the parent menu's OwnerDraw property is true or the parent menu's Images property has been set.

Tip: For more precise information about the menu item's state, use the OnAdvancedDrawItem (see page 16154) event instead.

See Also

OnMeasureItem (see page 16160)

Bitmap (see page 16135)

ImageIndex (see page 16148)

Images (see page 16083)

OwnerDraw (see page 16088)

OnAdvancedDrawItem (see page 16154)

95.1.5.6.4 TMenuItem.OnMeasureItem Event

Occurs on owner-draw menu items to determine menu item size before the menu is drawn.

Pascal

```
property OnMeasureItem: TMenuMeasureItemEvent;
```

C++

```
__property TMenuMeasureItemEvent OnMeasureItem;
```

Description

Write an OnMeasureItem event handler to indicate the size of owner-draw menu items. If the menu item is using a bitmap image, the event handler can use the Bitmap (see page 16135) property or the ImageIndex (see page 16148) property to access the bitmap to determine its size.

Note: OnMeasureItem will only occur if the parent menu's OwnerDraw property is true or the parent menu's Images property has been set.

95.1.6 TMenuItemEnumerator Class

Class Hierarchy

Menus.TMenuItemEnumerator

Pascal

```
TMenuItemEnumerator = class;
```

C++

```
class TMenuItemEnumerator;
```

File

Menus

Description

This is class Menus.TMenuItemEnumerator.

95.1.6.1 TMenuItemEnumerator Members

The following tables list the members exposed by TMenuItemEnumerator.

Public Methods

	Name	Description
	Create (see page 16161)	This is Create, a member of class TMenuItemEnumerator.
	GetCurrent (see page 16161)	This is GetCurrent, a member of class TMenuItemEnumerator.
	MoveNext (see page 16162)	This is MoveNext, a member of class TMenuItemEnumerator.

Public Properties

	Name	Description
R	Current (see page 16162)	This is Current, a member of class TMenuItemEnumerator.

95.1.6.2 TMenuItemEnumerator.Create Constructor

Pascal

```
constructor Create(AMenuItem: TMenuItem);
```

C++

```
__fastcall TMenuItemEnumerator(TMenuItem AMenuItem);
```

Description

This is Create, a member of class TMenuItemEnumerator.

95.1.6.3 TMenuItemEnumerator Methods

The methods of the TMenuItemEnumerator class are listed here.

Public Methods

	Name	Description
	GetCurrent (see page 16161)	This is GetCurrent, a member of class TMenuItemEnumerator.
	MoveNext (see page 16162)	This is MoveNext, a member of class TMenuItemEnumerator.

95.1.6.3.1 TMenuItemEnumerator.GetCurrent Method

Pascal

```
function GetCurrent: TMenuItem;
```

C++

```
__fastcall TMenuItem GetCurrent();
```

Description

This is GetCurrent, a member of class TMenuItemEnumerator.

95.1.6.3.2 TMenuItemEnumerator.MoveNext Method

Pascal

```
function MoveNext: Boolean;
```

C++

```
__fastcall Boolean MoveNext();
```

Description

This is MoveNext, a member of class TMenuItemEnumerator.

95.1.6.4 TMenuItemEnumerator Properties

The properties of the TMenuItemEnumerator class are listed here.

Public Properties

	Name	Description
	Current (see page 16162)	This is Current, a member of class TMenuItemEnumerator.

95.1.6.4.1 TMenuItemEnumerator.Current Property

Pascal

```
property Current: TMenuItem;
```

C++

```
__property TMenuItem Current;
```

Description

This is Current, a member of class TMenuItemEnumerator.

95.1.7 TMenuItemStack Class

Class Hierarchy

Pascal

```
TMenuItemStack = class(TStack);
```

C++

```
class TMenuItemStack : public TStack;
```

File

Menus

Description

This is class Menus.TMenuItemStack.

95.1.7.1 TMenuItemStack Members

The following tables list the members exposed by TMenuItemStack.

Protected Methods

	Name	Description
V	PeekItem (see page 5697)	Returns a pointer to the next item in the list.
V	PopItem (see page 5697)	Removes and returns a pointer to the next item in the list.
A	PushItem (see page 5698)	Adds an item to the list.
V	PushItem (see page 5703)	Adds an item to the list.

Protected Properties

	Name	Description
R	List (see page 5699)	Identifies the internal list used to store and manage the items in the ordered list.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AtLeast (see page 5696)	Checks the size of the list.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearItem (see page 16164)	This is ClearItem, a member of class TMenuItemStack.
	Count (see page 5696)	Returns the size of the list.
	Create (see page 5695)	Creates a TOrderedList (see page 5693) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 5695)	Destroys the TOrderedList (see page 5693) instance.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Peek (see page 5696)	Returns a pointer to the next item in the list.
	Pop (see page 5697)	Removes and returns the next item in the list.
	Push (see page 5698)	Adds an item to the list.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

95.1.7.2 TMenuItemStack Methods

The methods of the TMenuItemStack class are listed here.

Public Methods

	Name	Description
	ClearItem (see page 16164)	This is ClearItem, a member of class TMenuItemStack.

95.1.7.2.1 TMenuItemStack.ClearItem Method

Pascal

```
procedure ClearItem(AItem: TMenuItem);
```

C++

```
__fastcall ClearItem(TMenuItem AItem);
```

Description

This is ClearItem, a member of class TMenuItemStack.

95.1.8 TPopupList Class

TPopupList manages the window that handles popup menu messages.

Class Hierarchy

Pascal

```
TPopupList = class(TList);
```

C++

```
class TPopupList : public TList;
```

File

Menus

Description

TPopupList is the type of the global PopupList (see page 16207) variable, which provides centralized message handling for all popup menus in an application.

See Also

TPopupMenu (see page 16169)

PopupList (see page 16207)

95.1.8.1 TPopupList Members

The following tables list the members exposed by TPopupList.

Protected Fields

	Name	Description
	FWindow (see page 16166)	This is FWindow, a member of class TPopupList.

Protected Methods

	Name	Description
	Get (see page 2878)	This is Get, a member of class TList.
V	Grow (see page 2879)	This is Grow, a member of class TList.
	MainWndProc (see page 16167)	Wraps the WndProc (see page 16168) method with an exception-handling layer.
V	Notify (see page 2884)	Responds when items are added, removed, or extracted from the list.
	Put (see page 2887)	This is Put, a member of class TList.
	SetCapacity (see page 2891)	This is SetCapacity, a member of class TList.
	SetCount (see page 2892)	This is SetCount, a member of class TList.
V	WndProc (see page 16168)	Provides centralized message handling for all popup menus in the application.

Public Methods

	Name	Description
	Add (see page 16167)	Inserts a new popup menu at the end of the list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2874)	Copies elements of one list to another.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 2874)	Deletes all items from the list.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2874)	Removes the item at the position given by the Index parameter.
V	Destroy (see page 2870)	Destroys an instance of TList (see page 2868).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Error (see page 2875)	This is the overview for the Error method overload.
	Exchange (see page 2876)	Swaps the position of two items in the Items (see page 2898) array.
	Expand (see page 2877)	Increases the Capacity (see page 2895) of the list.
	Extract (see page 2877)	Removes a specified item from the list.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	First (see page 2878)	Returns Items (see page 2898)[0].
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2878)	Returns a TList (see page 2868) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	IndexOf (see page 2879)	Returns the index of the first entry in the Items (see page 2898) array with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2882)	Adds an object to the Items (see page 2898) array at the position specified by Index.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Last (see page 2882)	Returns Items (see page 2898)[Count (see page 2896) - 1].
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	Move (see page 2884)	Changes the position of an item in the Items (see page 2898) array.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Pack (see page 2885)	Deletes all nil (Delphi) or NULL (C++) items from the Items (see page 2898) array.
	Remove (see page 16167)	Removes a popup menu from the list.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Sort (see page 2892)	Performs a QuickSort on the list based on the comparison function Compare.

Public Properties

	Name	Description
	Capacity (see page 2895)	Specifies the allocated size of the array of pointers maintained by the TList (see page 2868) object.
	Count (see page 2896)	Indicates the number of entries in the list that are in use.
	Items (see page 2898)	Lists the object references.
R	List (see page 2900)	Specifies the array of pointers that make up the Items (see page 2898) array.
R	Window (see page 16168)	Provides access to the Window handle of the hidden window that processes popup menu messages.

95.1.8.2 TPopupList Fields

The fields of the TPopupList class are listed here.

Protected Fields

	Name	Description
	FWindow (see page 16166)	This is FWindow, a member of class TPopupList.

95.1.8.2.1 TPopupList.FWindow Field

Pascal

```
FWindow: HWND;
```

C++

```
HWND FWindow;
```

Description

This is FWindow, a member of class TPopupList.

95.1.8.3 TPopupList Methods

The methods of the TPopupList class are listed here.

Protected Methods

	Name	Description
	MainWndProc (see page 16167)	Wraps the WndProc (see page 16168) method with an exception-handling layer.
V	WndProc (see page 16168)	Provides centralized message handling for all popup menus in the application.

Public Methods

	Name	Description
	Add (see page 16167)	Inserts a new popup menu at the end of the list.
	Remove (see page 16167)	Removes a popup menu from the list.

95.1.8.3.1 TPopupList.Add Method

Inserts a new popup menu at the end of the list.

Pascal

```
procedure Add(Popup: TPopupMenu);
```

C++

```
__fastcall Add(TPopupMenu Popup);
```

Description

Do not call the Add method. Popup menus automatically add themselves to the list when they are created.

Add increments Count and, if necessary, allocates memory by increasing the value of Capacity. When the first popup menu is added to the list, Add creates the hidden window whose handle is available as the Window (see page 16168) property.

See Also

Remove (see page 16167)

Window (see page 16168)

95.1.8.3.2 TPopupList.MainWndProc Method

Wraps the WndProc (see page 16168) method with an exception-handling layer.

Pascal

```
procedure MainWndProc(var Message: TMessage);
```

C++

```
__fastcall MainWndProc(TMessage Message);
```

Description

Do not use the protected MainWndProc method. It is used internally when creating the hidden window that responds to popup menu messages. To subclass the window procedure that handles messages sent to popup menus, override the WndProc (see page 16168) method instead.

See Also

WndProc (see page 16168)

95.1.8.3.3 TPopupList.Remove Method

Removes a popup menu from the list.

Pascal

```
procedure Remove(Popup: TPopupMenu);
```

C++

```
__fastcall Remove(TPopupMenu Popup);
```

Description

Do not call the Remove method. It is called automatically by popup menus from their destructors, to remove themselves from the list.

See Also

Add (see page 16167)

95.1.8.3.4 TPopupList.WndProc Method

Provides centralized message handling for all popup menus in the application.

Pascal

```
procedure WndProc(var Message: TMessage); virtual;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

Override WndProc to subclass the window procedure that handles messages directed at the popup menus in an application. WndProc handles messages by dispatching commands, displaying help, painting menu item, and so on.

95.1.8.4 TPopupList Properties

The properties of the TPopupList class are listed here.

Public Properties

	Name	Description
R	Window (see page 16168)	Provides access to the Window handle of the hidden window that processes popup menu messages.

95.1.8.4.1 TPopupList.Window Property

Provides access to the Window handle of the hidden window that processes popup menu messages.

Pascal

```
property Window: HWND;
```

C++

```
__property HWND Window;
```

Description

Use Window for Windows API calls that require a window handle. The hidden window that processes messages for the popup menus in an application is not created until the first popup menu is added to the list. If the list contains no popup menus (that is, if no popup menus are created by the application), Window is 0.

95.1.9 TPopupMenu Class

TPopupMenu encapsulates the properties, methods, and events of a pop-up menu.

Class Hierarchy

Pascal

```
TPopupMenu = class(TMenu);
```

C++

```
class TPopupMenu : public TMenu;
```

File

Menus

Description

Use TPopupMenu to define the pop-up menu that appears when the user clicks on a control with the right mouse button. To make a pop-up menu available, assign the TPopupMenu object to the control's PopupMenu property.

Tip: To create a popup menu that users can configure at runtime, use the TStandardMenuPopup component with an action manager instead.

Note: If the popup menu's ParentBiDiMode (see page 16180) is true, the popup menu's BiDiMode (see page 16178) is set to the BiDiMode (see page 16178) of the control that activates it. If a control cannot be found, the BiDiMode (see page 16178) is set to the value of the Application object's BiDiMode (see page 16178). The popup menu's BiDiMode (see page 16178) affects all of its menu items.

See Also

TMainMenu (see page 16056)

TMenuItem (see page 16102)

NewPopupMenu (see page 16191)

TStandardMenuPopup (see page 20478)

TActionManager (see page 432)

Providing a Pop-up Menu

Setting Up Action Bands

95.1.9.1 TPopupMenu Members

The following tables list the members exposed by TPopupMenu.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AdjustBiDiBehavior (see page 16073)	Applies the BiDiMode (see page 16083) property to the menu when the Windows control is created.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoBiDiModeChanged (see page 16074)	Updates the menu when the BiDiMode (see page 16083) property changes.
V	DoChange (see page 16075)	Generates an OnChange (see page 16090) event.
	DoGetMenuString (see page 16075)	Returns the caption for an item in the menu.
V	DoPopup (see page 16174)	Generates an OnPopup (see page 16184) event.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 16076)	Executes a callback for child menu items.
V	GetHandle (see page 16076)	Returns the value of the Handle (see page 16083) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsOwnerDraw (see page 16077)	Indicates whether menu items can contain more than simple captions.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 16078)	Calls the DoChange (see page 16075) method when the menu is first loaded into memory.
V	MenuChanged (see page 16079)	Responds when the menu changes.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16079)	Responds when components are added or deleted.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 16081)	Ensures that the menu item indexes reflect the order in which they are loaded and saved.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetPopupPoint (see page 16175)	This is SetPopupPoint, a member of class TPopupMenu.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateItems (see page 16081)	Causes all menu items to update themselves.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UseRightToLeftAlignment (see page 16175)	Specifies whether the control's alignment is in a right-to-left mode.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 16173)	Creates an instance of TPopupMenu (see page 16169).
	CreateMenuItem (see page 16073)	This is CreateMenuItem, a member of class TMenu.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 16173)	Destroys an instance of TPopupMenu (see page 16169).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DispatchCommand (see page 16074)	Calls the Click method of the menu item with the specified value as its Command property.
	DispatchPopup (see page 16074)	Dispatches a pop-up menu command.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindItem (see page 16076)	Locates and returns a menu item.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHelpContext (see page 16077)	Returns the help context ID associated with a menu item.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 16077)	Indicates whether menu items read from right to left.
	IsShortCut (see page 16078)	Dispatches a key message if it represents a shortcut key for an item in the menu.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentBiDiModeChanged (see page 16079)	This is the overview for the ParentBiDiModeChanged method overload.
V	Popup (see page 16174)	Displays the pop-up menu onscreen.
	ProcessMenuChar (see page 16080)	Responds to keyboard input for the menu.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Handle (see page 16083)	Provides access to the Windows menu handle for the menu.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	PopupComponent (see page 16181)	Indicates the component that last displayed the popup menu in response to a right mouse click.
R	PopupPoint (see page 16183)	Indicates the location where the pop-up menu appears.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	WindowHandle (see page 16089)	Provides access to the handle of the window that uses the menu.

Published Events

	Name	Description
	OnChange (see page 16184)	Occurs when the menu changes.
	OnPopup (see page 16184)	Occurs just before the pop-up menu appears.

Published Properties

	Name	Description
	Alignment (see page 16176)	Determines where the pop-up menu appears when the user clicks the right mouse button.
	AutoHotkeys (see page 16176)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 16177)	Determines whether redundant separator bars are automatically removed from the menu.
	AutoPopup (see page 16178)	Determines whether the pop-up menu appears automatically when the user clicks the right mouse button.
	BiDiMode (see page 16178)	Determines the layout of the menu in Middle East locales.
	HelpContext (see page 16179)	Specifies a context ID for the entire pop-up menu.
	Images (see page 16179)	Lists the images that can appear beside individual menu items.
R	Items (see page 16084)	Describes the elements of the menu.
	MenuAnimation (see page 16180)	Specifies how the menu appears when it is first displayed.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OwnerDraw (see page 16180)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 16180)	Indicates whether the BiDiMode property is inherited from the control that uses the menu.
	Tag (see page 2808)	Stores an integer value as part of a component.
	TrackButton (see page 16183)	Specifies which mouse button activates the popup menu when it is associated with a toolbar button.

95.1.9.2 TPopupMenu.Create Constructor

Creates an instance of TPopupMenu (see page 16169).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPopupMenu(TComponent * AOwner);
```

Description

Call Create to create to create a pop-up menu at runtime. Pop-up menus placed in forms or data modules at design time are created automatically.

See Also

Create (see page 16072)

95.1.9.3 TPopupMenu.Destroy Destructor

Destroys an instance of TPopupMenu (see page 16169).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPopupMenu();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TPopupMenu (see page 16169) reference is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

95.1.9.4 TPopupMenu Methods

The methods of the TPopupMenu class are listed here.

Protected Methods

	Name	Description
	DoPopup (see page 16174)	Generates an OnPopup (see page 16184) event.
	SetPopupPoint (see page 16175)	This is SetPopupPoint, a member of class TPopupMenu.
	UseRightToLeftAlignment (see page 16175)	Specifies whether the control's alignment is in a right-to-left mode.

Public Methods

	Name	Description
	Popup (see page 16174)	Displays the pop-up menu onscreen.

95.1.9.4.1 TPopupMenu.DoPopup Method

Generates an OnPopup (see page 16184) event.

Pascal

```
procedure DoPopup(Sender: TObject); virtual;
```

C++

```
virtual __fastcall DoPopup(TObject * Sender);
```

Description

DoPopup is called automatically just before the pop-up menu appears to generate an OnPopup (see page 16184) event. Override DoPopup in a descendant class to change the event.

See Also

OnPopup (see page 16184)

Popup (see page 16174)

95.1.9.4.2 TPopupMenu.Popup Method

Displays the pop-up menu onscreen.

Pascal

```
procedure Popup(X: Integer; Y: Integer); virtual;
```

C++

```
virtual __fastcall Popup(int X, int Y);
```

Description

Call Popup to bring up the pop-up menu. The menu appears at the screen coordinates indicated by the values (in pixels) of X and Y.

Delphi Examples:

```
{
This example uses a pop-up menu. When the user presses the
```

```
mouse button, the pop-up menu appears where the user
clicked the mouse:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := False;
end;

procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X, Y: Integer);
begin
  PopupMenu1.Popup(Left + X, Top + Y);
end;
```

See Also

Alignment (see page 16176)

AutoPopup (see page 16178)

OnPopup (see page 16184)

95.1.9.4.3 TPopupMenu.SetPopupPoint Method

Pascal

```
procedure SetPopupPoint(APopupPoint: TPoint);
```

C++

```
__fastcall SetPopupPoint(TPoint APopupPoint);
```

Description

This is SetPopupPoint, a member of class TPopupMenu.

95.1.9.4.4 TPopupMenu.UseRightToLeftAlignment Method

Specifies whether the control's alignment is in a right-to-left mode.

Pascal

```
function UseRightToLeftAlignment: Boolean;
```

C++

```
__fastcall Boolean UseRightToLeftAlignment();
```

Description

Call UseRightToLeftAlignment to determine whether the control's alignment is in a right-to-left mode. This information can be used when painting the control or when responding to mouse events.

UseRightToLeftAlignment returns the setting from the control that activated the popup. If the popup was not activated by a control, UseRightToLeftAlignment returns the setting used in the global Application object.

95.1.9.5 TPopupMenu Properties

The properties of the TPopupMenu class are listed here.

Public Properties

	Name	Description
	PopupComponent (see page 16181)	Indicates the component that last displayed the popup menu in response to a right mouse click.
R	PopupPoint (see page 16183)	Indicates the location where the pop-up menu appears.

Published Properties

	Name	Description
	Alignment (see page 16176)	Determines where the pop-up menu appears when the user clicks the right mouse button.
	AutoHotkeys (see page 16176)	Determines whether the accelerator keys for menu items can be reset automatically.
	AutoLineReduction (see page 16177)	Determines whether redundant separator bars are automatically removed from the menu.
	AutoPopup (see page 16178)	Determines whether the pop-up menu appears automatically when the user clicks the right mouse button.
	BiDiMode (see page 16178)	Determines the layout of the menu in Middle East locales.
	HelpContext (see page 16179)	Specifies a context ID for the entire pop-up menu.
	Images (see page 16179)	Lists the images that can appear beside individual menu items.
	MenuAnimation (see page 16180)	Specifies how the menu appears when it is first displayed.
	OwnerDraw (see page 16180)	Specifies whether the menu items are drawn by the application.
	ParentBiDiMode (see page 16180)	Indicates whether the BiDiMode property is inherited from the control that uses the menu.
	TrackButton (see page 16183)	Specifies which mouse button activates the popup menu when it is associated with a toolbar button.

95.1.9.5.1 TPopupMenu.Alignment Property

Determines where the pop-up menu appears when the user clicks the right mouse button.

Pascal

```
property Alignment: TPopupAlignment;
```

C++

```
__property TPopupAlignment Alignment;
```

Description

Set Alignment to control the placement of the popup menu. Alignment controls whether the menu appears to the left of the mouse, to the right of the mouse, or centered over the mouse.

By default, the menu appears with its top left corner under the mouse (paLeft).

See Also

AutoPopup (see page 16178)

OnPopup (see page 16184)

95.1.9.5.2 TPopupMenu.AutoHotkeys Property

Determines whether the accelerator keys for menu items can be reset automatically.

Pascal

```
property AutoHotkeys: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoHotkeys;
```

Description

Set AutoHotkeys to indicate whether the menu should automatically ensure that accelerator keys for its items are reset if necessary so that every menu item has an accelerator key and no two items have the same accelerator key. This ensures that menu items added dynamically at runtime can have accelerator keys that do not introduce conflicts. TMenu tries to preserve all existing accelerator key mappings when adjusting the accelerator keys, but may be forced to change some in order to ensure that every item has a unique accelerator.

Before the menu is displayed, the menu checks and adjusts the accelerator key mappings if AutoHotkeys is maAutomatic. When AutoHotkeys is maManual, the menu does not alter the top-level menu items, but may adjust the accelerator keys for submenus, depending on the AutoHotkeys property of the menu item that is the parent of the submenu.

When AutoHotkeys is maManual, an application can still adjust the menu items by calling the Items property's RethinkHotkeys method. AutoHotkeys merely controls whether this adjustment occurs automatically.

Note: The AutoHotkeys property of a menu is linked to the AutoHotkeys property of the TMenuItems object that implements its Items property. Setting one sets the other.

See Also

AutoHotkeys (see page 16134)

Items (see page 16084)

RethinkHotkeys (see page 16128)

95.1.9.5.3 TPopupMenu.AutoLineReduction Property

Determines whether redundant separator bars are automatically removed from the menu.

Pascal

```
property AutoLineReduction: TMenuAutoFlag;
```

C++

```
__property TMenuAutoFlag AutoLineReduction;
```

Description

Set AutoLineReduction to indicate whether the menu should automatically ensure that the menu does not start or end with a separator bar and that two separator bars do not appear next to each other. This ensures that menus built dynamically at runtime do not have separator bars in undesired positions.

Before the menu is displayed, it removes superfluous separator bars when AutoLineReduction is maAutomatic. When AutoLineReduction is maManual, the menu does not remove separators from the top-level menu items, but may remove superfluous separators from submenus, depending on the AutoLineReduction property of the menu item that is the parent of the submenu.

When AutoLineReduction is maManual, an application can still remove superfluous separators by calling the Items property's RethinkLines method. AutoLineReduction merely determines whether this adjustment occurs automatically.

Note: The AutoLineReduction property of a menu is linked to the AutoLineReduction property of the TMenuItems object that implements its Items property. Setting one sets the other.

See Also

AutoLineReduction (see page 16135)

Items (see page 16084)

RethinkLines (see page 16129)

95.1.9.5.4 TPopupMenu.AutoPopup Property

Determines whether the pop-up menu appears automatically when the user clicks the right mouse button.

Pascal

```
property AutoPopup: Boolean;
```

C++

```
__property Boolean AutoPopup;
```

Description

Set AutoPopup to true to cause the pop-up menu to appear automatically when the user clicks the right mouse button on a control that has the pop-up menu specified as its PopupMenu property. The application key present on keyboards specifically designed for 32-bit Windows will also show this menu when pressed.

Set AutoPopup to false if the appearance of the pop-up menu should be controlled programmatically. To display a pop-up menu when AutoPopup is false, use the Popup (see page 16174) method.

Delphi Examples:

```
{
This example uses a pop-up menu. When the user presses the
mouse button, the pop-up menu appears where the user
clicked the mouse:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := False;
end;

procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X, Y: Integer);
begin
  PopupMenu1.Popup(Left + X, Top + Y);
end;
```

See Also

Popup (see page 16174)

OnPopup (see page 16184)

PopupMenu (see page 5835)

95.1.9.5.5 TPopupMenu.BiDiMode Property

Determines the layout of the menu in Middle East locales.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Set BiDiMode to control the layout of menu items. BiDiMode controls whether the menu items read from left to right or right to left.

See Also

ParentBiDiMode (see page 16089)

IsRightToLeft (see page 16077)

95.1.9.5.6 TPopupMenu.HelpContext Property

Specifies a context ID for the entire pop-up menu.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

Use HelpContext to associate a help screen with the entire pop-up menu. Each screen in the Help system should have a unique context ID. When a component is selected in the application, pressing F1 displays the Help screen associated with the value of HelpContext.

To associate a help screen with the individual items in the pop-up menu, use the HelpContext property of the associated TMenuItem (see page 16102) objects.

See Also

GetHelpContext (see page 16077)

HelpFile (see page 13711)

HelpContext (see page 16148)

95.1.9.5.7 TPopupMenu.Images Property

Lists the images that can appear beside individual menu items.

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

Use Images to hold the set of images that can appear beside menu items in the menu. Individual menu items set their ImageIndex property to indicate which image in the list appears to the left of the menu item caption.

Images in the list should be 16x16. To accommodate every system on which your application runs, it is recommended that you do not use 256 colors.

Tip: If the application uses action lists, this property should be the value of the action list's Images property. This way, menu items and buttons that do the same thing can display the same image.

See Also

ImageIndex (see page 16148)

Images (see page 325)

Items (see page 16084)

95.1.9.5.8 TPopupMenu.MenuAnimation Property

Specifies how the menu appears when it is first displayed.

Pascal

```
property MenuAnimation: TMenuAnimation;
```

C++

```
__property TMenuAnimation MenuAnimation;
```

Description

Use MenuAnimation to specify how the popup menu appears on the screen. The menu can simply appear as a whole, or can slide into view like a window shade being drawn from any edge.

Note: MenuAnimation only has an effect when running on Windows 98, NT 5.0, or later.

See Also

Popup (see page 16174)

95.1.9.5.9 TPopupMenu.OwnerDraw Property

Specifies whether the menu items are drawn by the application.

Pascal

```
property OwnerDraw: Boolean;
```

C++

```
__property Boolean OwnerDraw;
```

Description

Set OwnerDraw to true to indicate that the application will draw menu items in an OnDrawItem event handler. When OwnerDraw is true, menu items receive an OnMeasureItem and an OnDrawItem event when they need to be rendered on screen.

Set OwnerDraw to false to accept the default drawing. When OwnerDraw is false, menu items display the caption with an optional image to the left (If the Images and ImageIndex properties are set).

Owner-draw menus are useful for displaying the value that appears when selecting a menu item. For example, in a menu that allows users to choose a color, an owner-draw menu could display rectangles drawn in the designated color, rather than color names.

See Also

OnMeasureItem (see page 16160)

OnDrawItem (see page 16159)

Images (see page 16083)

95.1.9.5.10 TPopupMenu.ParentBiDiMode Property

Indicates whether the BiDiMode property is inherited from the control that uses the menu.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

By default, ParentBiDiMode is true, indicating that the layout of menu items follows the BiDiMode setting of the associated form or control. Change ParentBiDiMode to false to override the default BiDiMode setting and control the menu's layout independently.

See Also

BiDiMode (see page 16083)

95.1.9.5.11 TPopupMenu.PopupComponent Property

Indicates the component that last displayed the popup menu in response to a right mouse click.

Pascal

```
property PopupComponent: TComponent;
```

C++

```
__property TComponent * PopupComponent;
```

Description

Read PopupComponent to determine which control is currently using the popup menu. In applications where multiple controls share the same pop-up menu, use PopupComponent to determine which of them displayed the menu.

Set PopupComponent to associate a control with the menu before calling the Popup (see page 16174) method programmatically to bring up the pop-up menu.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
```

```
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;
```

```
procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
```

See Also

AutoPopup (see page 16178)

OnPopup (see page 16184)

Popup (see page 16174)

PopupMenu (see page 5835)

95.1.9.5.12 TPopupMenu.PopupPoint Property

Indicates the location where the pop-up menu appears.

Pascal

```
property PopupPoint: TPoint;
```

C++

```
__property TPoint PopupPoint;
```

Description

This public property is used internally to locate the popup menu. Its value is set by the Popup (see page 16174) method.

See Also

Popup (see page 16174)

95.1.9.5.13 TPopupMenu.TrackButton Property

Specifies which mouse button activates the popup menu when it is associated with a toolbar button.

Pascal

```
property TrackButton: TTrackButton;
```

C++

```
__property TTrackButton TrackButton;
```

Description

Use TrackButton to specify which mouse button activates the popup menu when it is associated with a toolbar button.

95.1.9.6 TPopupMenu Events

The events of the TPopupMenu class are listed here.

Published Events

	Name	Description
	OnChange (see page 16184)	Occurs when the menu changes.
	OnPopup (see page 16184)	Occurs just before the pop-up menu appears.

95.1.9.6.1 TPopupMenu.OnChange Event

Occurs when the menu changes.

Pascal

```
property OnChange: TMenuChangeEvent;
```

C++

```
__property TMenuChangeEvent OnChange;
```

Description

Write an OnChange event handler to respond to changes in the menu's structure. OnChange occurs when the menu is loaded into memory, and in response to property changes that affect the menu's structure.

See Also

Items (see page 16084)

95.1.9.6.2 TPopupMenu.OnPopup Event

Occurs just before the pop-up menu appears.

Pascal

```
property OnPopup: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPopup;
```

Description

Write an OnPopup event handler to take specific action just before the pop-up menu appears. For example, use an OnPopup event handler to set the Checked, Enabled, or Visible property of individual items in the menu so that they are appropriate to the PopupComponent (see page 16181).

Delphi Examples:

```
{
The following code enables the Copy item from the pop-up
menu if the edit control has a nonempty selection.
Note: A portion of the edit control text must be highlighted.
}
procedure TForm1.PopupMenu1Popup(Sender: TObject);
begin
  Copy1.Enabled := Edit1.SelLength > 0;
end;

procedure TForm1.Copy1Click(Sender: TObject);
begin
```

```
    ListBox1.Items.Add('"Copy" menu');
end;

procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X, Y: Integer);
begin
  PopupMenu1.Popup(Left + X, Top + Y);
end;
```

See Also

AutoPopup (see page 16178)

Popup (see page 16174)

PopupComponent (see page 16181)

PopupMenu (see page 5835)

95.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AnsiSameCaption (see page 16186)	Indicates whether two strings are the same based on the current locale, ignoring case information and accelerator characters.
	DrawMenuItem (see page 16187)	This is function Menus.DrawMenuItem.
	GetHotkey (see page 16187)	Returns the last character in a string marked with an ampersand (&).
	IsAltGRPressed (see page 16187)	This is function Menus.IsAltGRPressed.
	NewItem (see page 16188)	Creates and initializes a menu item.
	NewLine (see page 16189)	Creates a menu item for a separator.
	NewMenu (see page 16190)	Creates and initializes a main menu.
	NewPopupMenu (see page 16191)	Creates and initializes a popup menu.
	NewSubMenu (see page 16192)	Creates and initializes a menu item that represents a submenu.
	ShortCut (see page 16193)	Creates a menu shortcut for a specified key combination.
	ShortCutFromMessage (see page 16194)	This is function Menus.ShortCutFromMessage.
	ShortCutToKey (see page 16194)	Returns the key code and shift state of a menu shortcut.
	ShortCutToText (see page 16195)	Converts a menu shortcut into a string that describes the shortcut.
	StripHotkey (see page 16196)	This is function Menus.StripHotkey.
	TextToShortCut (see page 16196)	Creates a menu shortcut from a text string.

95.2.1 Menus.AnsiSameCaption Function

Indicates whether two strings are the same based on the current locale, ignoring case information and accelerator characters.

Pascal

```
function AnsiSameCaption(const Text1: string; const Text2: string): Boolean;
```

C++

```
Boolean AnsiSameCaption(const AnsiString Text1, const AnsiString Text2);
```

File

Menus

Description

AnsiSameCaption compares Text1 to Text2, without case sensitivity and ignoring any ampersands (&) that are included to create accelerator characters. The compare operation is controlled by the current locale. The return value is true if the two strings have the same value, false otherwise.

See Also

StringReplace

IsAccel

AnsiSameText

WideSameCaption

95.2.2 Menus.DrawMenuItem Function

Pascal

```
procedure DrawMenuItem(MenuItem: TMenuItem; ACanvas: TCanvas; ARect: TRect; State:
TOwnerDrawState);
```

C++

```
DrawMenuItem(TMenuItem MenuItem, TCanvas ACanvas, TRect ARect, TOwnerDrawState State);
```

File

Menus

Description

This is function Menus.DrawMenuItem.

95.2.3 Menus.GetHotkey Function

Returns the last character in a string marked with an ampersand (&).

Pascal

```
function GetHotkey(const Text: string): string;
```

C++

```
AnsiString GetHotkey(const AnsiString Text);
```

File

Menus

Description

GetHotKey searches Text, starting at the end, for a character that is identified as an accelerator key by a preceding ampersand (&). If it locates a character marked with an ampersand, GetHotKey returns that character. Otherwise, it returns an empty string.

See Also

AnsiSameCaption (see page 16186)

StripHotKey

IsAccel

95.2.4 Menus.IsAltGRPressed Function

Pascal

```
function IsAltGRPressed: boolean;
```

C++

```
boolean IsAltGRPressed();
```

File

Menus

Description

This is function Menus.IsAltGRPressed.

95.2.5 Menus.NewItem Function

Creates and initializes a menu item.

Pascal

```
function NewItem(const ACaption: string; AShortCut: TShortCut; AChecked: Boolean; AEnabled:
Boolean; AOnClick: TNotifyEvent; hCtx: THelpContext; const AName: string): TMenuItem;
```

C++

```
TMenuItem NewItem(const AnsiString ACaption, TShortCut AShortCut, Boolean AChecked, Boolean
AEnabled, TNotifyEvent AOnClick, THelpContext hCtx, const AnsiString AName);
```

File

Menus

Description

Call NewItem to create and initialize a menu item when constructing a menu programmatically.

The ACaption parameter specifies the string that should appear for the menu item.

The AShortCut parameter specifies any associated shortcut.

The AChecked parameter indicates whether the menu item appears with a check mark.

The AEnabled parameter specifies whether the menu item is enabled or grayed.

The AOnClick parameter specifies an event handler that executes when the user clicks the menu item.

The hCtx parameter specifies the help context ID for the menu item.

The AName parameter specifies the name of the menu item, which can be used to refer to the menu item in code.

The menu item returned by NewItem can be added to a menu using the target parent's Add method. If the entire menu is being created dynamically at runtime, the new menu item can be added to an array that is passed as a parameter to the NewMenu (see page 16190), NewPopupMenu (see page 16191), or NewSubMenu (see page 16192) function.

Warning: The item returned by NewItem does not have an owner. You are responsible for freeing its memory when it is no longer needed. The Delete and Remove methods of TMenuItem (see page 16102) do not free memory.

C++ Examples:

```
/*
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *Item1 = NewItem("New item", TextToShortCut("Ctrl+N"), false, true, MyOnExecute,
0, "Item1");
```

```
  Menu = NewMenu(this, "MyMenu", &Item1, 0);
}

void __fastcall TForm1::MyOnExecute(TObject *Sender)
{
  MessageDlg("Item1 has been executed.", mtInformation, TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Menu := NewMenu(Self, 'MyMenu',
            [NewItem('New item', TextToShortCut('Ctrl+N'),
            False, True, MyOnExecute, 0, 'Item1')]);
end;

procedure TForm1.MyOnExecute(Sender: TObject);
begin
  MessageDlg('Item1 has been executed.', mtInformation, [mbOK], 0);
end;
```

See Also

NewSubMenu (see page 16192)

NewLine (see page 16189)

NewMenu (see page 16190)

NewPopupMenu (see page 16191)

TMenuItem (see page 16102)

TMenuItem (see page 16102)

TMenuItem (see page 16102)

95.2.6 Menus.NewLine Function

Creates a menu item for a separator.

Pascal

```
function NewLine: TMenuItem;
```

C++

```
TMenuItem NewLine();
```

File

Menus

Description

Call NewLine to create a separator that divides the items in a menu into logical groups. Once the menu item for the separator has been created using NewLine, it can be added to a menu using the target parent's Add method. If the entire menu is being created dynamically at runtime, the new menu item can be added to an array that is passed as a parameter to the NewMenu (see page 16190), NewPopupMenu (see page 16191), or NewSubMenu (see page 16192) function.

Warning: The item returned by NewLine does not have an owner. You are responsible for freeing its memory when it is no longer needed. The Delete and Remove methods of TMenuItem (see page 16102) do not free memory.

See Also

NewItem (see page 16188)

NewPopupMenu (see page 16191)

NewSubMenu (see page 16192)

TMenuItem (see page 16102)

TMenuItem (see page 16102)

TMenuItem (see page 16102)

95.2.7 Menus.NewMenu Function

Creates and initializes a main menu.

Pascal

```
function NewMenu(Owner: TComponent; const AName: string; const Items: array of TMenuItem):
TMainMenu;
```

C++

```
TMainMenu NewMenu(TComponent * Owner, const AnsiString AName, const array of TMenuItem Items);
```

File

Menus

Description

Call NewMenu to create and initialize a main menu programmatically. NewMenu returns the TMainMenu (see page 16056) component that represents the menu.

The Owner parameter specifies the component that is responsible for freeing the menu (typically the form).

The AName parameter specifies the name of the menu, which is used to refer to it in code.

The Items parameter is an array of menu items that make up the top level menu items. To create the menu items for the Items parameter, use the NewItem (see page 16188) function.

Note: The Items_Size parameter specifies the index of the last menu item in Items (one less than the number of menu items).

C++ Examples:

```
/*
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *Item1 = NewItem("New item", TextToShortCut("Ctrl+N"), false, true, MyOnExecute,
0, "Item1");
  Menu = NewMenu(this, "MyMenu", &Item1, 0);
}
```

```
void __fastcall TForm1::MyOnExecute(TObject *Sender)
{
  MessageDlg("Item1 has been executed.", mtInformation, TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Menu := NewMenu(Self, 'MyMenu',
            [NewItem('New item', TextToShortCut('Ctrl+N'),
            False, True, MyOnExecute, 0, 'Item1')]);
end;

procedure TForm1.MyOnExecute(Sender: TObject);
begin
  MessageDlg('Item1 has been executed.', mtInformation, [mbOK], 0);
end;
```

See Also

NewPopupMenu (see page 16191)

NewSubMenu (see page 16192)

NewItem (see page 16188)

95.2.8 Menus.NewPopupMenu Function

Creates and initializes a popup menu.

Pascal

```
function NewPopupMenu(Owner: TComponent; const AName: string; Alignment: TPopupAlignment;
AutoPopup: Boolean; const Items: array of TMenuItem): TPopupMenu;
```

C++

```
TPopupMenu NewPopupMenu(TComponent * Owner, const AnsiString AName, TPopupAlignment Alignment,
Boolean AutoPopup, const array of TMenuItem Items);
```

File

Menus

Description

Call NewPopupMenu to create and initialize a popup menu programmatically. NewPopupMenu returns the TPopupMenu (see page 16169) component that represents the popup menu, but does not associate that popup menu with any control.

The Owner parameter specifies the component that is responsible for freeing the menu.

The AName parameter specifies the name of the popup menu, which is used to refer to it in code.

The Alignment parameter determines where the menu appears relative to the mouse when the user right clicks on the control that uses the menu.

The AutoPopup parameter specifies whether the menu should appear automatically when the user right clicks the associated control.

The Items parameter is an array of menu items that make up the top level menu items. To create the menu items for the Items parameter, use the NewItem (see page 16188) function.

Note: The Items_Size parameter specifies the index of the last menu item in Items (one less than the number of menu items).

See Also

NewMenu (see page 16190)

NewSubMenu (see page 16192)

NewItem (see page 16188)

95.2.9 Menus.NewSubMenu Function

Creates and initializes a menu item that represents a submenu.

Pascal

```
function NewSubMenu(const ACaption: string; hCtx: THelpContext; const AName: string; const
Items: array of TMenuItem; AEnabled: Boolean = True): TMenuItem;
```

C++

```
TMenuItem NewSubMenu(const AnsiString ACaption, THelpContext hCtx, const AnsiString AName,
const array of TMenuItem Items, Boolean AEnabled = True);
```

File

Menus

Description

Call NewSubMenu to create a menu item that represents a submenu when constructing a menu programmatically at runtime.

The ACaption parameter indicates the string that appears in the parent menu for the submenu.

The hCtx parameter specifies the help context ID for the menu item.

The AName parameter specifies the name of the menu item, which can be used to refer to the menu item in code.

The Items parameter specifies an array of menu items that make up the submenu and that appear when the user clicks the submenu item in the parent menu.

Note: The Items_Size parameter specifies the index of the last menu item in Items (one less than the number of menu items).

The AEnabled parameter specifies whether the menu item that appears in the parent menu is enabled.

Once a submenu has been created using NewSubMenu, it can be added to a menu using the target parent's Add method. If the entire menu is being created dynamically at runtime, the new menu item can be added to an array that is passed as a parameter to the NewMenu (see page 16190), NewPopupMenu (see page 16191), or NewSubMenu function.

Warning: The item returned by NewSubMenu does not have an owner. You are responsible for freeing its memory when it is no longer needed. The Delete and Remove methods of TMenuItem (see page 16102) do not free memory.

TMenuItem (see page 16102)

95.2.10 Menus.ShortCut Function

Creates a menu shortcut for a specified key combination.

Pascal

```
function ShortCut(Key: Word; Shift: TShiftState): TShortCut;
```

C++

```
TShortCut ShortCut(Word Key, TShiftState Shift);
```

File

Menus

Description

Call ShortCut to create a menu shortcut at runtime.

Specify a Key value using a virtual key code (Menus (see page 16053) version) or Qt key code (QMenus version).

Specify the values for the Shift, Control, and Alt keys by using a set of type TShiftState. For example, to specify the Shift key, use the set [ssShift]. To specify a Shift and Ctrl key combination, use the set [ssShift, ssCtrl].

Assign the value returned by ShortCut as the value of the ShortCut property of a menu item.

Note: TextToShortCut (see page 16196) can also create a shortcut. TextToShortCut (see page 16196) converts a string to a shortcut, so it can be used to let the user specify the shortcut. However, TextToShortCut (see page 16196) executes much more slowly than ShortCut. Use ShortCut whenever possible.

Delphi Examples:

```
{
This line creates a shortcut, Ctrl+O, at run time and
assigns it to the Open command on a File menu.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  OpenCommand.ShortCut := Menus.ShortCut(Word('O'), [ssCtrl]);
end;

procedure TForm1.OpenCommandClick(Sender: TObject);
begin
  MessageDlg('The Open command has been selected.', mtInformation, [mbOk], 0);
end;
```

See Also

ShortCutToKey (see page 16194)

ShortCutToText (see page 16195)

TextToShortCut (see page 16196)

95.2.11 Menus.ShortCutFromMessage Function

Pascal

```
function ShortCutFromMessage(Message: TWMKey): TShortCut;
```

C++

```
TShortCut ShortCutFromMessage(TWMKey Message);
```

File

Menus

Description

This is function Menus.ShortCutFromMessage.

95.2.12 Menus.ShortCutToKey Function

Returns the key code and shift state of a menu shortcut.

Pascal

```
procedure ShortCutToKey(ShortCut: TShortCut; var Key: Word; var Shift: TShiftState);
```

C++

```
ShortCutToKey(TShortCut ShortCut, Word Key, TShiftState Shift);
```

File

Menus

Description

Call ShortCutToKey to parse a menu shortcut into its virtual key code and shift state parts.

ShortCut (see page 16193) is the value of the menu shortcut.

Key returns the virtual key code (Menus (see page 16053) version) or Qt key code (QMenus version) for the key.

Shirt returns the associated combination of Shift, Ctrl, and Alt keys.

Delphi Examples:

```
{
The following code redefines the ShortCut of CloseCommand if
the original short cut used the [ssCtrl] shift state.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  TheKey: Word;
  TheShiftState: TShiftState;
begin
  Menus.ShortCutToKey(CloseCommand.ShortCut, TheKey, TheShiftState);
  if TheShiftState = [ssCtrl] then
   CloseCommand.ShortCut := ShortCut(Word('C'), [ssShift]);
end;
```

```
procedure TForm1.CloseCommandClick(Sender: TObject);
begin
  MessageDlg('The Close command has been selected.', mtInformation, [mbOk], 0);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  CloseCommand.ShortCut := Menus.ShortCut(Word('C'), [ssCtrl]);
end;
```

See Also

ShortCut (see page 16193)

ShortCutToText (see page 16195)

TextToShortCut (see page 16196)

TMenuItem (see page 16102)

95.2.13 Menus.ShortCutToText Function

Converts a menu shortcut into a string that describes the shortcut.

Pascal

```
function ShortCutToText(ShortCut: TShortCut): string;
```

C++

```
AnsiString ShortCutToText(TShortCut ShortCut);
```

File

Menus

Description

Call ShortCutToText to obtain a text description of the shortcut associated with a menu item. Use this function when the application needs to display a description of a shortcut to the user.

Delphi Examples:

```
{
This line creates a shortcut, Ctrl+O, at run time and
assigns it to the Open command on a File menu.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Edit1.Text := Menus.ShortCutToText(OpenCommand.ShortCut);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  OpenCommand.ShortCut := Menus.ShortCut(Word('O'), [ssCtrl]);
end;

procedure TForm1.OpenCommandClick(Sender: TObject);
begin
  MessageDlg('The Open command has been selected.', mtInformation, [mbOk], 0);
end;
```

See Also

ShortCut (see page 16193)

ShortCutToKey (see page 16194)

TextToShortCut (see page 16196)

TMenuItem (see page 16102)

95.2.14 Menus.StripHotkey Function

Pascal

```
function StripHotkey(const Text: string): string;
```

C++

```
AnsiString StripHotkey(const AnsiString Text);
```

File

Menus

Description

This is function Menus.StripHotkey.

95.2.15 Menus.TextToShortCut Function

Creates a menu shortcut from a text string.

Pascal

```
function TextToShortCut(Text: string): TShortCut;
```

C++

```
TShortCut TextToShortCut(AnsiString Text);
```

File

Menus

Description

Call TextToShortCut to create a menu shortcut from a descriptive string. For example, an application can allow users to specify the value of a shortcut in an edit box control, and then call TextToShortCut to create a menu shortcut for the value entered by the user.

Note: TextToShortCut executes slowly. When possible, use the ShortCut (see page 16193) function to create a menu shortcut instead.

C++ Examples:

```
/*
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMenuItem *Item1 = NewItem("New item", TextToShortCut("Ctrl+N"), false, true, MyOnExecute,
```

```
0, "Item1");
  Menu = NewMenu(this, "MyMenu", &Item1, 0);
}

void __fastcall TForm1::MyOnExecute(TObject *Sender)
{
  MessageDlg("Item1 has been executed.", mtInformation, TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This code displays a new menu named MyMenu when the user
clicks the button. MyOnExecute must be included in the
definition of the TForm1 class.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Menu := NewMenu(Self, 'MyMenu',
            [NewItem('New item', TextToShortCut('Ctrl+N'),
            False, True, MyOnExecute, 0, 'Item1')]);
end;

procedure TForm1.MyOnExecute(Sender: TObject);
begin
  MessageDlg('Item1 has been executed.', mtInformation, [mbOK], 0);
end;
```

ShortCut (see page 16193)

ShortCutToText (see page 16195)

TMenuItem (see page 16102)

95.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TFindItemKind (see page 16198)	TFindItemKind indicates the criterion to use when locating menu items.
	TMenuAnimations (see page 16199)	TMenuAnimation (see page 16204) and TMenuAnimations indicate how a popup menu appears on screen.
	TMenuBreak (see page 16199)	TMenuBreak indicates the criterion to use when locating menu items.
	TMenuItemAutoFlag (see page 16200)	TMenuItemAutoFlag and TMenuAutoFlag (see page 16205) Indicate when menu items are automatically maintained.
	TPopupAlignment (see page 16201)	TPopupAlignment represents the position of a popup menu relative to the mouse.
	TTrackButton (see page 16201)	TTrackButton specifies which mouse button activates a tool button menu.

95.3.1 Menus.TFindItemKind Enumeration

TFindItemKind indicates the criterion to use when locating menu items.

Pascal

```
TFindItemKind = (
  fkCommand,
  fkHandle,
  fkShortCut
);
```

C++

```
enum TFindItemKind {
  fkCommand,
  fkHandle,
  fkShortCut
};
```

File

Menus

Description

TFindItemKind values indicate the criterion to use when locating a menu item. The following table gives the possible values:

Value	Meaning
fkID	Identify the item by its Windows command ID (parameter to WM_COMMAND message).
fkHandle	Identify the item by its pop-up menu handle.
fkShortCut	Identify the item by its menu shortcut key code.

95.3.2 Menus.TMenuAnimations Enumeration

TMenuAnimation (see page 16204) and TMenuAnimations indicate how a popup menu appears on screen.

Pascal

```
TMenuAnimations = (
  maLeftToRight,
  maRightToLeft,
  maTopToBottom,
  maBottomToTop,
  maNone
);
```

C++

```
enum TMenuAnimations {
  maLeftToRight,
  maRightToLeft,
  maTopToBottom,
  maBottomToTop,
  maNone
};
```

File

Menus

Description

TMenuAnimations indicates the direction in which a menu can "slide" into view. TMenuAnimation (see page 16204) is a set of TMenuAnimations values, which can be used to specify more than one direction (for a popup menu that slides in at a diagonal). Note that some TMenuAnimations values are mutually exclusive (for example maLeftToRight and maRightToLeft).

Value	Meaning
maLeftToRight	The popup menu appears like a window shade that pulls from left to right.
maRightToLeft	The popup menu appears like a window shade that pulls from right to left.
maTopToBottom	The popup menu appears like a window shade that pulls from top to bottom.
maBottomToTop	The popup menu appears like a window shade that pulls from bottom to top.
maNone	The popup menu appears as a whole with no animation effects.

See Also

TPopupMenu

95.3.3 Menus.TMenuBreak Enumeration

TMenuBreak indicates the criterion to use when locating menu items.

Pascal

```
TMenuBreak = (
  mbNone,
  mbBreak,
  mbBarBreak
```

```
);
```

C++

```
enum TMenuBreak {
  mbNone,
  mbBreak,
  mbBarBreak
};
```

File

Menus

Description

TMenuBreak values indicate the criterion to use when locating a menu item. The following table gives the possible values:

Value	Meaning
mbNone	No menu breaking occurs.
mbBarBreak	The Parent menu breaks into another column with the menu item appearing at the top of the new column. A bar separates the new and the old columns.
mbBreak	The Parent menu breaks into another column with the menu item appearing at the top of the new column. Only space separates the new and the old columns.

95.3.4 Menus.TMenuItemAutoFlag Enumeration

TMenuItemAutoFlag and TMenuAutoFlag (see page 16205) Indicate when menu items are automatically maintained.

Pascal

```
TMenuItemAutoFlag = (
  maAutomatic,
  maManual,
  maParent
);
```

C++

```
enum TMenuItemAutoFlag {
  maAutomatic,
  maManual,
  maParent
};
```

File

Menus

Description

TMenuItemAutoFlag indicates when a submenu is checked for problems and updated. TMenuAutoFlag (see page 16205) provides the same information for top-level menu items. The following table lists the possible values:

Values	Meaning
maAutomatic	The immediate submenu of the menu item or the top-level menu items of the menu are checked for problems and automatically corrected when the menu is displayed at runtime.
maManual	The immediate submenu of the menu item or the top-level menu items of the menu are checked for problems and automatically corrected only when the application specifically calls a method of the menu item to do so.

maParent	Automatic checking and correction of the immediate submenu follows the same rule as the menu item's parent. This value is not applicable to menus, which have no parent menu item.

See Also

AutoHotkeys

AutoLineReduction

95.3.5 Menus.TPopupAlignment Enumeration

TPopupAlignment represents the position of a popup menu relative to the mouse.

Pascal

```
TPopupAlignment = (
  paLeft,
  paRight,
  paCenter
);
```

C++

```
enum TPopupAlignment {
  paLeft,
  paRight,
  paCenter
};
```

File

Menus

Description

These are the possible values:

Value	Meaning
paLeft	The pop-up menu appears with its top left corner under the mouse.
paCenter	The pop-up menu appears with the top center of the menu under the mouse.
paRight	The pop-up menu appears with its top right corner under the mouse.

95.3.6 Menus.TTrackButton Enumeration

TTrackButton specifies which mouse button activates a tool button menu.

Pascal

```
TTrackButton = (
  tbRightButton,
  tbLeftButton
);
```

C++

```
enum TTrackButton {
```

```
    tbRightButton,
    tbLeftButton
  };
```

File

Menus

Description

TTrackButton can have one of the following values:

Value	Meaning
tbRightButton	The right mouse button activates the tool button menu.
tbLeftButton	The left mouse button activates the tool button menu.

95.4 Types

The following table lists types in this documentation.

Types

Name	Description
PMenuItem (see page 16203)	This is type Menus.PMenuItem.
TAdvancedMenuDrawItemEvent (see page 16203)	TAdvancedMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.
TMenuActionLinkClass (see page 16204)	This is type Menus.TMenuActionLinkClass.
TMenuAnimation (see page 16204)	TMenuAnimation and TMenuAnimations (see page 16199) indicate how a popup menu appears on screen.
TMenuAutoFlag (see page 16205)	TMenuItemAutoFlag (see page 16200) and TMenuAutoFlag Indicate when menu items are automatically maintained.
TMenuChangeEvent (see page 16205)	This is type Menus.TMenuChangeEvent.
TMenuDrawItemEvent (see page 16206)	TMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.
TMenuMeasureItemEvent (see page 16206)	TMenuMeasureItemEvent is the type for event handlers that render menu items in owner-Measuren menus.

95.4.1 Menus.PMenuItem Type

Pascal

```
PMenuItem = ^TMenuItem;
```

C++

```
^TMenuItem PMenuItem;
```

File

Menus

Description

This is type Menus.PMenuItem.

95.4.2 Menus.TAdvancedMenuDrawItemEvent Type

TAdvancedMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.

Pascal

```
TAdvancedMenuDrawItemEvent = procedure (Sender: TObject; ACanvas: TCanvas; ARect: TRect;
State: TOwnerDrawState) of object;
```

C++

```
(Sender: TObject; ACanvas: TCanvas; ARect: TRect; State: TOwnerDrawState) (
TAdvancedMenuDrawItemEvent)();
```

File

Menus

Description

Sender is the TMenuItem (see page 16102) instance that represents the menu item to be drawn.

ACanvas provides a drawing surface on which to draw the menu item.

ARect indicates the boundaries (in pixels) of the menu item on ACanvas.

State is a set indicating various aspects of the menu items state such as whether it is selected, checked, grayed, and so on.

95.4.3 Menus.TMenuActionLinkClass Type

Pascal

```
TMenuActionLinkClass = class of TMenuActionLink;
```

C++

```
TMenuActionLink TMenuActionLinkClass;
```

File

Menus

Description

This is type Menus.TMenuActionLinkClass.

95.4.4 Menus.TMenuAnimation Type

TMenuAnimation and TMenuAnimations (see page 16199) indicate how a popup menu appears on screen.

Pascal

```
TMenuAnimation = set of TMenuAnimations;
```

C++

```
TMenuAnimations TMenuAnimation;
```

File

Menus

Description

TMenuAnimations (see page 16199) indicates the direction in which a menu can "slide" into view. TMenuAnimation is a set of TMenuAnimations (see page 16199) values, which can be used to specify more than one direction (for a popup menu that slides in at a diagonal). Note that some TMenuAnimations (see page 16199) values are mutually exclusive (for example maLeftToRight and maRightToLeft).

Value	Meaning
maLeftToRight	The popup menu appears like a window shade that pulls from left to right.
maRightToLeft	The popup menu appears like a window shade that pulls from right to left.

maTopToBottom	The popup menu appears like a window shade that pulls from top to bottom.
maBottomToTop	The popup menu appears like a window shade that pulls from bottom to top.
maNone	The popup menu appears as a whole with no animation effects.

See Also

TPopupMenu

95.4.5 Menus.TMenuAutoFlag Type

TMenuItemAutoFlag (see page 16200) and TMenuAutoFlag Indicate when menu items are automatically maintained.

Pascal

```
TMenuAutoFlag = maAutomatic..maManual;
```

C++

```
maAutomatic..maManual TMenuAutoFlag;
```

File

Menus

Description

TMenuItemAutoFlag (see page 16200) indicates when a submenu is checked for problems and updated. TMenuAutoFlag provides the same information for top-level menu items. The following table lists the possible values:

Values	Meaning
maAutomatic	The immediate submenu of the menu item or the top-level menu items of the menu are checked for problems and automatically corrected when the menu is displayed at runtime.
maManual	The immediate submenu of the menu item or the top-level menu items of the menu are checked for problems and automatically corrected only when the application specifically calls a method of the menu item to do so.
maParent	Automatic checking and correction of the immediate submenu follows the same rule as the menu item's parent. This value is not applicable to menus, which have no parent menu item.

See Also

AutoHotkeys

AutoLineReduction

95.4.6 Menus.TMenuChangeEvent Type

Pascal

```
TMenuChangeEvent = procedure (Sender: TObject; Source: TMenuItem; Rebuild: Boolean) of object;
```

C++

```
(Sender: TObject; Source: TMenuItem; Rebuild: Boolean) ( TMenuChangeEvent)();
```

File

Menus

Description

This is type Menus.TMenuChangeEvent.

95.4.7 Menus.TMenuDrawItemEvent Type

TMenuDrawItemEvent is the type for event handlers that render menu items in owner-drawn menus.

Pascal

```
TMenuDrawItemEvent = procedure (Sender: TObject; ACanvas: TCanvas; ARect: TRect; Selected:
Boolean) of object;
```

C++

```
(Sender: TObject; ACanvas: TCanvas; ARect: TRect; Selected: Boolean) ( TMenuDrawItemEvent)();
```

File

Menus

Description

Sender is the TMenuItem (see page 16102) instance that represents the menu item to be drawn.

ACanvas provides a drawing surface on which to draw the menu item.

ARect indicates the boundaries (in pixels) of the menu item on ACanvas.

Selected indicates whether the menu item is selected (that is, if it will be clicked if the user presses return)

95.4.8 Menus.TMenuMeasureItemEvent Type

TMenuMeasureItemEvent is the type for event handlers that render menu items in owner-Measuren menus.

Pascal

```
TMenuMeasureItemEvent = procedure (Sender: TObject; ACanvas: TCanvas; var Width, Height:
Integer) of object;
```

C++

```
(Sender: TObject; ACanvas: TCanvas; var Width, Height: Integer) ( TMenuMeasureItemEvent)();
```

File

Menus

Description

Sender is the TMenuItem (see page 16102) instance that represents the menu item to be measured.

ACanvas represents the canvas where the menu item will be drawn. Use its methods, if necessary, to determine the size of the menu item.

Width and Height return the dimensions, in pixels, that should be used to draw the menu item.

95.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
PopupList (see page 16207)	This is variable Menus.PopupList.
ShortCutItems (see page 16207)	This is variable Menus.ShortCutItems.
ValidMenuHotkeys (see page 16207)	This is variable Menus.ValidMenuHotkeys.

95.5.1 Menus.PopupList Variable

Pascal

```
PopupList: TPopupList;
```

C++

```
TPopupList PopupList;
```

File

Menus

Description

This is variable Menus.PopupList.

95.5.2 Menus.ShortCutItems Variable

Pascal

```
ShortCutItems: TMenuItemStack;
```

C++

```
TMenuItemStack ShortCutItems;
```

File

Menus

Description

This is variable Menus.ShortCutItems.

95.5.3 Menus.ValidMenuHotkeys Variable

Pascal

```
ValidMenuHotkeys: string = '1234567890ABCDEFGHIJKLMNOPQRSTUVWXYZ';
```

C++

```
AnsiString ValidMenuHotkeys = '1234567890ABCDEFGHIJKLMNOPQRSTUVWXYZ';
```

File

Menus

Description

This is variable Menus.ValidMenuHotkeys.

95.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
cDialogSuffix (see page 16209)	This is constant Menus.cDialogSuffix.
cHotkeyPrefix (see page 16209)	This is constant Menus.cHotkeyPrefix.
cLineCaption (see page 16209)	This is constant Menus.cLineCaption.

95.6.1 Menus.cDialogSuffix Constant

Pascal

```
cDialogSuffix = '...';
```

C++

```
cDialogSuffix = '...';
```

File

Menus

Description

This is constant Menus.cDialogSuffix.

95.6.2 Menus.cHotkeyPrefix Constant

Pascal

```
cHotkeyPrefix = '&';
```

C++

```
cHotkeyPrefix = '&';
```

File

Menus

Description

This is constant Menus.cHotkeyPrefix.

95.6.3 Menus.cLineCaption Constant

Pascal

```
cLineCaption = '-';
```

C++

```
cLineCaption = '-';
```

File

Menus

Description

This is constant Menus.cLineCaption.

96 Messages Namespace

This is namespace Messages.

Topics

CB_SETEDITSEL (see page 16328)	This is constant Messages.CB_SETEDITSEL.
CB_SETEXTENDEDUI (see page 16328)	This is constant Messages.CB_SETEXTENDEDUI.
CB_SETHORIZONTALEXTENT (see page 16328)	This is constant Messages.CB_SETHORIZONTALEXTENT.
CB_SETITEMDATA (see page 16329)	This is constant Messages.CB_SETITEMDATA.
CB_SETITEMHEIGHT (see page 16329)	This is constant Messages.CB_SETITEMHEIGHT.
CB_SETLOCALE (see page 16329)	This is constant Messages.CB_SETLOCALE.
CB_SETTOPINDEX (see page 16330)	This is constant Messages.CB_SETTOPINDEX.
CB_SHOWDROPDOWN (see page 16330)	This is constant Messages.CB_SHOWDROPDOWN.
CBN_CLOSEUP (see page 16330)	This is constant Messages.CBN_CLOSEUP.
CBN_DBLCLK (see page 16331)	This is constant Messages.CBN_DBLCLK.
CBN_DROPDOWN (see page 16331)	This is constant Messages.CBN_DROPDOWN.
CBN_EDITCHANGE (see page 16331)	This is constant Messages.CBN_EDITCHANGE.
CBN_EDITUPDATE (see page 16332)	This is constant Messages.CBN_EDITUPDATE.
CBN_ERRSPACE (see page 16332)	This is constant Messages.CBN_ERRSPACE.
CBN_KILLFOCUS (see page 16332)	This is constant Messages.CBN_KILLFOCUS.
CBN_SELCHANGE (see page 16333)	This is constant Messages.CBN_SELCHANGE.
CBN_SELENDCANCEL (see page 16333)	This is constant Messages.CBN_SELENDCANCEL.
CBN_SELENDOK (see page 16333)	This is constant Messages.CBN_SELENDOK.
CBN_SETFOCUS (see page 16334)	This is constant Messages.CBN_SETFOCUS.
DM_GETDEFID (see page 16334)	This is constant Messages.DM_GETDEFID.
DM_REPOSITION (see page 16334)	This is constant Messages.DM_REPOSITION.
DM_SETDEFID (see page 16335)	This is constant Messages.DM_SETDEFID.
EM_CANUNDO (see page 16335)	This is constant Messages.EM_CANUNDO.
EM_CHARFROMPOS (see page 16335)	This is constant Messages.EM_CHARFROMPOS.
EM_EMPTYUNDOBUFFER (see page 16336)	This is constant Messages.EM_EMPTYUNDOBUFFER.
EM_FMTLINES (see page 16336)	This is constant Messages.EM_FMTLINES.
EM_GETFIRSTVISIBLELINE (see page 16336)	This is constant Messages.EM_GETFIRSTVISIBLELINE.
EM_GETHANDLE (see page 16337)	This is constant Messages.EM_GETHANDLE.
EM_GETIMESTATUS (see page 16337)	This is constant Messages.EM_GETIMESTATUS.
EM_GETLIMITTEXT (see page 16337)	This is constant Messages.EM_GETLIMITTEXT.
EM_GETLINE (see page 16338)	This is constant Messages.EM_GETLINE.
EM_GETLINECOUNT (see page 16338)	This is constant Messages.EM_GETLINECOUNT.
EM_GETMARGINS (see page 16338)	This is constant Messages.EM_GETMARGINS.

EM_GETMODIFY (see page 16339)	This is constant Messages.EM_GETMODIFY.
EM_GETPASSWORDCHAR (see page 16339)	This is constant Messages.EM_GETPASSWORDCHAR.
EM_GETRECT (see page 16339)	This is constant Messages.EM_GETRECT.
EM_GETSEL (see page 16340)	This is constant Messages.EM_GETSEL.
EM_GETTHUMB (see page 16340)	This is constant Messages.EM_GETTHUMB.
EM_GETWORDBREAKPROC (see page 16340)	This is constant Messages.EM_GETWORDBREAKPROC.
EM_LIMITTEXT (see page 16341)	This is constant Messages.EM_LIMITTEXT.
EM_LINEFROMCHAR (see page 16341)	This is constant Messages.EM_LINEFROMCHAR.
EM_LINEINDEX (see page 16341)	This is constant Messages.EM_LINEINDEX.
EM_LINELENGTH (see page 16342)	This is constant Messages.EM_LINELENGTH.
EM_LINESCROLL (see page 16342)	This is constant Messages.EM_LINESCROLL.
EM_POSFROMCHAR (see page 16342)	This is constant Messages.EM_POSFROMCHAR.
EM_REPLACESEL (see page 16343)	This is constant Messages.EM_REPLACESEL.
EM_SCROLL (see page 16343)	This is constant Messages.EM_SCROLL.
EM_SCROLLCARET (see page 16343)	This is constant Messages.EM_SCROLLCARET.
EM_SETHANDLE (see page 16344)	This is constant Messages.EM_SETHANDLE.
EM_SETIMESTATUS (see page 16344)	This is constant Messages.EM_SETIMESTATUS.
EM_SETLIMITTEXT (see page 16344)	This is constant Messages.EM_SETLIMITTEXT.
EM_SETMARGINS (see page 16345)	This is constant Messages.EM_SETMARGINS.
EM_SETMODIFY (see page 16345)	This is constant Messages.EM_SETMODIFY.
EM_SETPASSWORDCHAR (see page 16345)	This is constant Messages.EM_SETPASSWORDCHAR.
EM_SETREADONLY (see page 16346)	This is constant Messages.EM_SETREADONLY.
EM_SETRECT (see page 16346)	This is constant Messages.EM_SETRECT.
EM_SETRECTNP (see page 16346)	This is constant Messages.EM_SETRECTNP.
EM_SETSEL (see page 16347)	This is constant Messages.EM_SETSEL.
EM_SETTABSTOPS (see page 16347)	This is constant Messages.EM_SETTABSTOPS.
EM_SETWORDBREAKPROC (see page 16347)	This is constant Messages.EM_SETWORDBREAKPROC.
EM_UNDO (see page 16348)	This is constant Messages.EM_UNDO.
EN_CHANGE (see page 16348)	This is constant Messages.EN_CHANGE.
EN_ERRSPACE (see page 16348)	This is constant Messages.EN_ERRSPACE.
EN_HSCROLL (see page 16349)	This is constant Messages.EN_HSCROLL.
EN_KILLFOCUS (see page 16349)	This is constant Messages.EN_KILLFOCUS.
EN_MAXTEXT (see page 16349)	This is constant Messages.EN_MAXTEXT.
EN_SETFOCUS (see page 16350)	This is constant Messages.EN_SETFOCUS.
EN_UPDATE (see page 16350)	This is constant Messages.EN_UPDATE.
EN_VSCROLL (see page 16350)	This is constant Messages.EN_VSCROLL.
LB_ADDFILE (see page 16351)	This is constant Messages.LB_ADDFILE.
LB_ADDSTRING (see page 16351)	This is constant Messages.LB_ADDSTRING.
LB_DELETESTRING (see page 16351)	This is constant Messages.LB_DELETESTRING.
LB_DIR (see page 16352)	This is constant Messages.LB_DIR.
LB_FINDSTRING (see page 16352)	This is constant Messages.LB_FINDSTRING.
LB_FINDSTRINGEXACT (see page 16352)	This is constant Messages.LB_FINDSTRINGEXACT.
LB_GETANCHORINDEX (see page 16353)	This is constant Messages.LB_GETANCHORINDEX.
LB_GETCARETINDEX (see page 16353)	This is constant Messages.LB_GETCARETINDEX.
LB_GETCOUNT (see page 16353)	This is constant Messages.LB_GETCOUNT.
LB_GETCURSEL (see page 16354)	This is constant Messages.LB_GETCURSEL.
LB_GETHORIZONTALEXTENT (see page 16354)	This is constant Messages.LB_GETHORIZONTALEXTENT.
LB_GETITEMDATA (see page 16354)	This is constant Messages.LB_GETITEMDATA.
LB_GETITEMHEIGHT (see page 16355)	This is constant Messages.LB_GETITEMHEIGHT.
LB_GETITEMRECT (see page 16355)	This is constant Messages.LB_GETITEMRECT.
LB_GETLOCALE (see page 16355)	This is constant Messages.LB_GETLOCALE.
LB_GETSEL (see page 16356)	This is constant Messages.LB_GETSEL.
LB_GETSELCOUNT (see page 16356)	This is constant Messages.LB_GETSELCOUNT.
LB_GETSELITEMS (see page 16356)	This is constant Messages.LB_GETSELITEMS.

LB_GETTEXT (see page 16357)	This is constant Messages.LB_GETTEXT.
LB_GETTEXTLEN (see page 16357)	This is constant Messages.LB_GETTEXTLEN.
LB_GETTOPINDEX (see page 16357)	This is constant Messages.LB_GETTOPINDEX.
LB_INITSTORAGE (see page 16358)	This is constant Messages.LB_INITSTORAGE.
LB_INSERTSTRING (see page 16358)	This is constant Messages.LB_INSERTSTRING.
LB_ITEMFROMPOINT (see page 16358)	This is constant Messages.LB_ITEMFROMPOINT.
LB_MSGMAX (see page 16359)	This is constant Messages.LB_MSGMAX.
LB_RESETCONTENT (see page 16359)	This is constant Messages.LB_RESETCONTENT.
LB_SELECTSTRING (see page 16359)	This is constant Messages.LB_SELECTSTRING.
LB_SELITEMRANGE (see page 16360)	This is constant Messages.LB_SELITEMRANGE.
LB_SELITEMRANGEEX (see page 16360)	This is constant Messages.LB_SELITEMRANGEEX.
LB_SETANCHORINDEX (see page 16360)	This is constant Messages.LB_SETANCHORINDEX.
LB_SETCARETINDEX (see page 16361)	This is constant Messages.LB_SETCARETINDEX.
LB_SETCOLUMNWIDTH (see page 16361)	This is constant Messages.LB_SETCOLUMNWIDTH.
LB_SETCOUNT (see page 16361)	This is constant Messages.LB_SETCOUNT.
LB_SETCURSEL (see page 16362)	This is constant Messages.LB_SETCURSEL.
LB_SETHORIZONTALEXTENT (see page 16362)	This is constant Messages.LB_SETHORIZONTALEXTENT.
LB_SETITEMDATA (see page 16362)	This is constant Messages.LB_SETITEMDATA.
LB_SETITEMHEIGHT (see page 16363)	This is constant Messages.LB_SETITEMHEIGHT.
LB_SETLOCALE (see page 16363)	This is constant Messages.LB_SETLOCALE.
LB_SETSEL (see page 16363)	This is constant Messages.LB_SETSEL.
LB_SETTABSTOPS (see page 16364)	This is constant Messages.LB_SETTABSTOPS.
LB_SETTOPINDEX (see page 16364)	This is constant Messages.LB_SETTOPINDEX.
LBN_DBLCLK (see page 16364)	This is constant Messages.LBN_DBLCLK.
LBN_ERRSPACE (see page 16365)	This is constant Messages.LBN_ERRSPACE.
LBN_KILLFOCUS (see page 16365)	This is constant Messages.LBN_KILLFOCUS.
LBN_SELCANCEL (see page 16365)	This is constant Messages.LBN_SELCANCEL.
LBN_SELCHANGE (see page 16366)	This is constant Messages.LBN_SELCHANGE.
LBN_SETFOCUS (see page 16366)	This is constant Messages.LBN_SETFOCUS.
PSM_PAGEINFO (see page 16366)	This is constant Messages.PSM_PAGEINFO.
PSM_SHEETINFO (see page 16367)	This is constant Messages.PSM_SHEETINFO.
SBM_ENABLE_ARROWS (see page 16367)	This is constant Messages.SBM_ENABLE_ARROWS.
SBM_GETPOS (see page 16367)	This is constant Messages.SBM_GETPOS.
SBM_GETRANGE (see page 16368)	This is constant Messages.SBM_GETRANGE.
SBM_GETSCROLLINFO (see page 16368)	This is constant Messages.SBM_GETSCROLLINFO.
SBM_SETPOS (see page 16368)	This is constant Messages.SBM_SETPOS.
SBM_SETRANGE (see page 16369)	This is constant Messages.SBM_SETRANGE.
SBM_SETRANGEREDRAW (see page 16369)	This is constant Messages.SBM_SETRANGEREDRAW.
SBM_SETSCROLLINFO (see page 16369)	This is constant Messages.SBM_SETSCROLLINFO.
WM_ACTIVATE (see page 16370)	This is constant Messages.WM_ACTIVATE.
WM_ACTIVATEAPP (see page 16370)	This is constant Messages.WM_ACTIVATEAPP.
WM_APP (see page 16370)	This is constant Messages.WM_APP.
WM_APPCOMMAND (see page 16371)	This is constant Messages.WM_APPCOMMAND.
WM_ASKCBFORMATNAME (see page 16371)	This is constant Messages.WM_ASKCBFORMATNAME.
WM_CANCELJOURNAL (see page 16371)	This is constant Messages.WM_CANCELJOURNAL.
WM_CANCELMODE (see page 16372)	This is constant Messages.WM_CANCELMODE.
WM_CAPTURECHANGED (see page 16372)	This is constant Messages.WM_CAPTURECHANGED.
WM_CHANGECBCHAIN (see page 16372)	This is constant Messages.WM_CHANGECBCHAIN.
WM_CHANGEUISTATE (see page 16373)	This is constant Messages.WM_CHANGEUISTATE.
WM_CHAR (see page 16373)	This is constant Messages.WM_CHAR.
WM_CHARTOITEM (see page 16373)	This is constant Messages.WM_CHARTOITEM.
WM_CHILDACTIVATE (see page 16374)	This is constant Messages.WM_CHILDACTIVATE.
WM_CLEAR (see page 16374)	This is constant Messages.WM_CLEAR.
WM_CLOSE (see page 16374)	This is constant Messages.WM_CLOSE.

WM_COALESCE_FIRST (see page 16375)	This is constant Messages.WM_COALESCE_FIRST.
WM_COALESCE_LAST (see page 16375)	This is constant Messages.WM_COALESCE_LAST.
WM_COMMAND (see page 16375)	This is constant Messages.WM_COMMAND.
WM_COMMNOTIFY (see page 16376)	This is constant Messages.WM_COMMNOTIFY.
WM_COMPACTING (see page 16376)	This is constant Messages.WM_COMPACTING.
WM_COMPAREITEM (see page 16376)	This is constant Messages.WM_COMPAREITEM.
WM_CONTEXTMENU (see page 16377)	This is constant Messages.WM_CONTEXTMENU.
WM_COPY (see page 16377)	This is constant Messages.WM_COPY.
WM_COPYDATA (see page 16377)	This is constant Messages.WM_COPYDATA.
WM_CREATE (see page 16378)	This is constant Messages.WM_CREATE.
WM_CTLCOLOR (see page 16378)	This is constant Messages.WM_CTLCOLOR.
WM_CTLCOLORBTN (see page 16378)	This is constant Messages.WM_CTLCOLORBTN.
WM_CTLCOLORDLG (see page 16379)	This is constant Messages.WM_CTLCOLORDLG.
WM_CTLCOLOREDIT (see page 16379)	This is constant Messages.WM_CTLCOLOREDIT.
WM_CTLCOLORLISTBOX (see page 16379)	This is constant Messages.WM_CTLCOLORLISTBOX.
WM_CTLCOLORMSGBOX (see page 16380)	This is constant Messages.WM_CTLCOLORMSGBOX.
WM_CTLCOLORSCROLLBAR (see page 16380)	This is constant Messages.WM_CTLCOLORSCROLLBAR.
WM_CTLCOLORSTATIC (see page 16380)	This is constant Messages.WM_CTLCOLORSTATIC.
WM_CUT (see page 16381)	This is constant Messages.WM_CUT.
WM_DDE_ACK (see page 16381)	This is constant Messages.WM_DDE_ACK.
WM_DDE_ADVISE (see page 16381)	This is constant Messages.WM_DDE_ADVISE.
WM_DDE_DATA (see page 16382)	This is constant Messages.WM_DDE_DATA.
WM_DDE_EXECUTE (see page 16382)	This is constant Messages.WM_DDE_EXECUTE.
WM_DDE_FIRST (see page 16382)	This is constant Messages.WM_DDE_FIRST.
WM_DDE_INITIATE (see page 16383)	This is constant Messages.WM_DDE_INITIATE.
WM_DDE_LAST (see page 16383)	This is constant Messages.WM_DDE_LAST.
WM_DDE_POKE (see page 16383)	This is constant Messages.WM_DDE_POKE.
WM_DDE_REQUEST (see page 16384)	This is constant Messages.WM_DDE_REQUEST.
WM_DDE_TERMINATE (see page 16384)	This is constant Messages.WM_DDE_TERMINATE.
WM_DDE_UNADVISE (see page 16384)	This is constant Messages.WM_DDE_UNADVISE.
WM_DEADCHAR (see page 16385)	This is constant Messages.WM_DEADCHAR.
WM_DELETEITEM (see page 16385)	This is constant Messages.WM_DELETEITEM.
WM_DESTROY (see page 16385)	This is constant Messages.WM_DESTROY.
WM_DESTROYCLIPBOARD (see page 16386)	This is constant Messages.WM_DESTROYCLIPBOARD.
WM_DEVICECHANGE (see page 16386)	This is constant Messages.WM_DEVICECHANGE.
WM_DEVMODECHANGE (see page 16386)	This is constant Messages.WM_DEVMODECHANGE.
WM_DISPLAYCHANGE (see page 16387)	This is constant Messages.WM_DISPLAYCHANGE.
WM_DRAWCLIPBOARD (see page 16387)	This is constant Messages.WM_DRAWCLIPBOARD.
WM_DRAWITEM (see page 16387)	This is constant Messages.WM_DRAWITEM.
WM_DROPFILES (see page 16388)	This is constant Messages.WM_DROPFILES.
WM_DWMCOLORIZATIONCOLORCHANGED (see page 16388)	This is constant Messages.WM_DWMCOLORIZATIONCOLORCHANGED.
WM_DWMCOMPOSITIONCHANGED (see page 16388)	This is constant Messages.WM_DWMCOMPOSITIONCHANGED.
WM_DWMNCRENDERINGCHANGED (see page 16389)	This is constant Messages.WM_DWMNCRENDERINGCHANGED.
WM_DWMWINDOWMAXIMIZEDCHANGE (see page 16389)	This is constant Messages.WM_DWMWINDOWMAXIMIZEDCHANGE.
WM_ENABLE (see page 16389)	This is constant Messages.WM_ENABLE.
WM_ENDSESSION (see page 16390)	This is constant Messages.WM_ENDSESSION.
WM_ENTERIDLE (see page 16390)	This is constant Messages.WM_ENTERIDLE.
WM_ENTERMENULOOP (see page 16390)	This is constant Messages.WM_ENTERMENULOOP.
WM_ENTERSIZEMOVE (see page 16391)	This is constant Messages.WM_ENTERSIZEMOVE.
WM_ERASEBKGND (see page 16391)	This is constant Messages.WM_ERASEBKGND.
WM_EXITMENULOOP (see page 16391)	This is constant Messages.WM_EXITMENULOOP.
WM_EXITSIZEMOVE (see page 16392)	This is constant Messages.WM_EXITSIZEMOVE.
WM_FONTCHANGE (see page 16392)	This is constant Messages.WM_FONTCHANGE.
WM_GETDLGCODE (see page 16392)	This is constant Messages.WM_GETDLGCODE.

WM_GETFONT (see page 16393)	This is constant Messages.WM_GETFONT.
WM_GETHOTKEY (see page 16393)	This is constant Messages.WM_GETHOTKEY.
WM_GETICON (see page 16393)	This is constant Messages.WM_GETICON.
WM_GETMINMAXINFO (see page 16394)	This is constant Messages.WM_GETMINMAXINFO.
WM_GETOBJECT (see page 16394)	This is constant Messages.WM_GETOBJECT.
WM_GETTEXT (see page 16394)	This is constant Messages.WM_GETTEXT.
WM_GETTEXTLENGTH (see page 16395)	This is constant Messages.WM_GETTEXTLENGTH.
WM_HANDHELDFIRST (see page 16395)	This is constant Messages.WM_HANDHELDFIRST.
WM_HANDHELDLAST (see page 16395)	This is constant Messages.WM_HANDHELDLAST.
WM_HELP (see page 16396)	This is constant Messages.WM_HELP.
WM_HOTKEY (see page 16396)	This is constant Messages.WM_HOTKEY.
WM_HSCROLL (see page 16396)	This is constant Messages.WM_HSCROLL.
WM_HSCROLLCLIPBOARD (see page 16397)	This is constant Messages.WM_HSCROLLCLIPBOARD.
WM_ICONERASEBKGND (see page 16397)	This is constant Messages.WM_ICONERASEBKGND.
WM_IME_CHAR (see page 16397)	This is constant Messages.WM_IME_CHAR.
WM_IME_COMPOSITION (see page 16398)	This is constant Messages.WM_IME_COMPOSITION.
WM_IME_COMPOSITIONFULL (see page 16398)	This is constant Messages.WM_IME_COMPOSITIONFULL.
WM_IME_CONTROL (see page 16398)	This is constant Messages.WM_IME_CONTROL.
WM_IME_ENDCOMPOSITION (see page 16399)	This is constant Messages.WM_IME_ENDCOMPOSITION.
WM_IME_KEYDOWN (see page 16399)	This is constant Messages.WM_IME_KEYDOWN.
WM_IME_KEYLAST (see page 16399)	This is constant Messages.WM_IME_KEYLAST.
WM_IME_KEYUP (see page 16400)	This is constant Messages.WM_IME_KEYUP.
WM_IME_NOTIFY (see page 16400)	This is constant Messages.WM_IME_NOTIFY.
WM_IME_REQUEST (see page 16400)	This is constant Messages.WM_IME_REQUEST.
WM_IME_SELECT (see page 16401)	This is constant Messages.WM_IME_SELECT.
WM_IME_SETCONTEXT (see page 16401)	This is constant Messages.WM_IME_SETCONTEXT.
WM_IME_STARTCOMPOSITION (see page 16401)	This is constant Messages.WM_IME_STARTCOMPOSITION.
WM_INITDIALOG (see page 16402)	This is constant Messages.WM_INITDIALOG.
WM_INITMENU (see page 16402)	This is constant Messages.WM_INITMENU.
WM_INITMENUPOPUP (see page 16402)	This is constant Messages.WM_INITMENUPOPUP.
WM_INPUT (see page 16403)	This is constant Messages.WM_INPUT.
WM_INPUTLANGCHANGE (see page 16403)	This is constant Messages.WM_INPUTLANGCHANGE.
WM_INPUTLANGCHANGEREQUEST (see page 16403)	This is constant Messages.WM_INPUTLANGCHANGEREQUEST.
WM_KEYDOWN (see page 16404)	This is constant Messages.WM_KEYDOWN.
WM_KEYFIRST (see page 16404)	This is constant Messages.WM_KEYFIRST.
WM_KEYLAST (see page 16404)	This is constant Messages.WM_KEYLAST.
WM_KEYUP (see page 16405)	This is constant Messages.WM_KEYUP.
WM_KILLFOCUS (see page 16405)	This is constant Messages.WM_KILLFOCUS.
WM_LBUTTONDBLCLK (see page 16405)	This is constant Messages.WM_LBUTTONDBLCLK.
WM_LBUTTONDOWN (see page 16406)	This is constant Messages.WM_LBUTTONDOWN.
WM_LBUTTONUP (see page 16406)	This is constant Messages.WM_LBUTTONUP.
WM_MBUTTONDBLCLK (see page 16406)	This is constant Messages.WM_MBUTTONDBLCLK.
WM_MBUTTONDOWN (see page 16407)	This is constant Messages.WM_MBUTTONDOWN.
WM_MBUTTONUP (see page 16407)	This is constant Messages.WM_MBUTTONUP.
WM_MDIACTIVATE (see page 16407)	This is constant Messages.WM_MDIACTIVATE.
WM_MDICASCADE (see page 16408)	This is constant Messages.WM_MDICASCADE.
WM_MDICREATE (see page 16408)	This is constant Messages.WM_MDICREATE.
WM_MDIDESTROY (see page 16408)	This is constant Messages.WM_MDIDESTROY.
WM_MDIGETACTIVE (see page 16409)	This is constant Messages.WM_MDIGETACTIVE.
WM_MDIICONARRANGE (see page 16409)	This is constant Messages.WM_MDIICONARRANGE.
WM_MDIMAXIMIZE (see page 16409)	This is constant Messages.WM_MDIMAXIMIZE.
WM_MDINEXT (see page 16410)	This is constant Messages.WM_MDINEXT.
WM_MDIREFRESHMENU (see page 16410)	This is constant Messages.WM_MDIREFRESHMENU.
WM_MDIRESTORE (see page 16410)	This is constant Messages.WM_MDIRESTORE.

WM_MDISETMENU (see page 16411)	This is constant Messages.WM_MDISETMENU.
WM_MDITILE (see page 16411)	This is constant Messages.WM_MDITILE.
WM_MEASUREITEM (see page 16411)	This is constant Messages.WM_MEASUREITEM.
WM_MENUCHAR (see page 16412)	This is constant Messages.WM_MENUCHAR.
WM_MENUCOMMAND (see page 16412)	This is constant Messages.WM_MENUCOMMAND.
WM_MENUDRAG (see page 16412)	This is constant Messages.WM_MENUDRAG.
WM_MENUGETOBJECT (see page 16413)	This is constant Messages.WM_MENUGETOBJECT.
WM_MENURBUTTONUP (see page 16413)	This is constant Messages.WM_MENURBUTTONUP.
WM_MENUSELECT (see page 16413)	This is constant Messages.WM_MENUSELECT.
WM_MOUSEACTIVATE (see page 16414)	This is constant Messages.WM_MOUSEACTIVATE.
WM_MOUSEFIRST (see page 16414)	This is constant Messages.WM_MOUSEFIRST.
WM_MOUSEHOVER (see page 16414)	This is constant Messages.WM_MOUSEHOVER.
WM_MOUSELAST (see page 16415)	This is constant Messages.WM_MOUSELAST.
WM_MOUSELEAVE (see page 16415)	This is constant Messages.WM_MOUSELEAVE.
WM_MOUSEMOVE (see page 16415)	This is constant Messages.WM_MOUSEMOVE.
WM_MOUSEWHEEL (see page 16416)	This is constant Messages.WM_MOUSEWHEEL.
WM_MOVE (see page 16416)	This is constant Messages.WM_MOVE.
WM_MOVING (see page 16416)	This is constant Messages.WM_MOVING.
WM_NCACTIVATE (see page 16417)	This is constant Messages.WM_NCACTIVATE.
WM_NCCALCSIZE (see page 16417)	This is constant Messages.WM_NCCALCSIZE.
WM_NCCREATE (see page 16417)	This is constant Messages.WM_NCCREATE.
WM_NCDESTROY (see page 16418)	This is constant Messages.WM_NCDESTROY.
WM_NCHITTEST (see page 16418)	This is constant Messages.WM_NCHITTEST.
WM_NCLBUTTONDBLCLK (see page 16418)	This is constant Messages.WM_NCLBUTTONDBLCLK.
WM_NCLBUTTONDOWN (see page 16419)	This is constant Messages.WM_NCLBUTTONDOWN.
WM_NCLBUTTONUP (see page 16419)	This is constant Messages.WM_NCLBUTTONUP.
WM_NCMBUTTONDBLCLK (see page 16419)	This is constant Messages.WM_NCMBUTTONDBLCLK.
WM_NCMBUTTONDOWN (see page 16420)	This is constant Messages.WM_NCMBUTTONDOWN.
WM_NCMBUTTONUP (see page 16420)	This is constant Messages.WM_NCMBUTTONUP.
WM_NCMOUSEHOVER (see page 16420)	This is constant Messages.WM_NCMOUSEHOVER.
WM_NCMOUSELEAVE (see page 16421)	This is constant Messages.WM_NCMOUSELEAVE.
WM_NCMOUSEMOVE (see page 16421)	This is constant Messages.WM_NCMOUSEMOVE.
WM_NCPAINT (see page 16421)	This is constant Messages.WM_NCPAINT.
WM_NCRBUTTONDBLCLK (see page 16422)	This is constant Messages.WM_NCRBUTTONDBLCLK.
WM_NCRBUTTONDOWN (see page 16422)	This is constant Messages.WM_NCRBUTTONDOWN.
WM_NCRBUTTONUP (see page 16422)	This is constant Messages.WM_NCRBUTTONUP.
WM_NCXBUTTONDBLCLK (see page 16423)	This is constant Messages.WM_NCXBUTTONDBLCLK.
WM_NCXBUTTONDOWN (see page 16423)	This is constant Messages.WM_NCXBUTTONDOWN.
WM_NCXBUTTONUP (see page 16423)	This is constant Messages.WM_NCXBUTTONUP.
WM_NEXTDLGCTL (see page 16424)	This is constant Messages.WM_NEXTDLGCTL.
WM_NEXTMENU (see page 16424)	This is constant Messages.WM_NEXTMENU.
WM_NOTIFY (see page 16424)	This is constant Messages.WM_NOTIFY.
WM_NOTIFYFORMAT (see page 16425)	This is constant Messages.WM_NOTIFYFORMAT.
WM_NULL (see page 16425)	This is constant Messages.WM_NULL.
WM_PAINT (see page 16425)	This is constant Messages.WM_PAINT.
WM_PAINTCLIPBOARD (see page 16426)	This is constant Messages.WM_PAINTCLIPBOARD.
WM_PAINTICON (see page 16426)	This is constant Messages.WM_PAINTICON.
WM_PALETTECHANGED (see page 16426)	This is constant Messages.WM_PALETTECHANGED.
WM_PALETTEISCHANGING (see page 16427)	This is constant Messages.WM_PALETTEISCHANGING.
WM_PARENTNOTIFY (see page 16427)	This is constant Messages.WM_PARENTNOTIFY.
WM_PASTE (see page 16427)	This is constant Messages.WM_PASTE.
WM_PENWINFIRST (see page 16428)	This is constant Messages.WM_PENWINFIRST.
WM_PENWINLAST (see page 16428)	This is constant Messages.WM_PENWINLAST.
WM_POWER (see page 16428)	This is constant Messages.WM_POWER.

WM_POWERBROADCAST (see page 16429)	This is constant Messages.WM_POWERBROADCAST.
WM_PRINT (see page 16429)	This is constant Messages.WM_PRINT.
WM_PRINTCLIENT (see page 16429)	This is constant Messages.WM_PRINTCLIENT.
WM_QUERYDRAGICON (see page 16430)	This is constant Messages.WM_QUERYDRAGICON.
WM_QUERYENDSESSION (see page 16430)	This is constant Messages.WM_QUERYENDSESSION.
WM_QUERYNEWPALETTE (see page 16430)	This is constant Messages.WM_QUERYNEWPALETTE.
WM_QUERYOPEN (see page 16431)	This is constant Messages.WM_QUERYOPEN.
WM_QUERYUISTATE (see page 16431)	This is constant Messages.WM_QUERYUISTATE.
WM_QUEUESYNC (see page 16431)	This is constant Messages.WM_QUEUESYNC.
WM_QUIT (see page 16432)	This is constant Messages.WM_QUIT.
WM_RBUTTONDBLCLK (see page 16432)	This is constant Messages.WM_RBUTTONDBLCLK.
WM_RBUTTONDOWN (see page 16432)	This is constant Messages.WM_RBUTTONDOWN.
WM_RBUTTONUP (see page 16433)	This is constant Messages.WM_RBUTTONUP.
WM_RENDERALLFORMATS (see page 16433)	This is constant Messages.WM_RENDERALLFORMATS.
WM_RENDERFORMAT (see page 16433)	This is constant Messages.WM_RENDERFORMAT.
WM_SETCURSOR (see page 16434)	This is constant Messages.WM_SETCURSOR.
WM_SETFOCUS (see page 16434)	This is constant Messages.WM_SETFOCUS.
WM_SETFONT (see page 16434)	This is constant Messages.WM_SETFONT.
WM_SETHOTKEY (see page 16435)	This is constant Messages.WM_SETHOTKEY.
WM_SETICON (see page 16435)	This is constant Messages.WM_SETICON.
WM_SETREDRAW (see page 16435)	This is constant Messages.WM_SETREDRAW.
WM_SETTEXT (see page 16436)	This is constant Messages.WM_SETTEXT.
WM_SETTINGCHANGE (see page 16436)	This is constant Messages.WM_SETTINGCHANGE.
WM_SHOWWINDOW (see page 16436)	This is constant Messages.WM_SHOWWINDOW.
WM_SIZE (see page 16437)	This is constant Messages.WM_SIZE.
WM_SIZECLIPBOARD (see page 16437)	This is constant Messages.WM_SIZECLIPBOARD.
WM_SIZING (see page 16437)	This is constant Messages.WM_SIZING.
WM_SPOOLERSTATUS (see page 16438)	This is constant Messages.WM_SPOOLERSTATUS.
WM_STYLECHANGED (see page 16438)	This is constant Messages.WM_STYLECHANGED.
WM_STYLECHANGING (see page 16438)	This is constant Messages.WM_STYLECHANGING.
WM_SYSCHAR (see page 16439)	This is constant Messages.WM_SYSCHAR.
WM_SYSCOLORCHANGE (see page 16439)	This is constant Messages.WM_SYSCOLORCHANGE.
WM_SYSCOMMAND (see page 16439)	This is constant Messages.WM_SYSCOMMAND.
WM_SYSDEADCHAR (see page 16440)	This is constant Messages.WM_SYSDEADCHAR.
WM_SYSKEYDOWN (see page 16440)	This is constant Messages.WM_SYSKEYDOWN.
WM_SYSKEYUP (see page 16440)	This is constant Messages.WM_SYSKEYUP.
WM_SYSTEMERROR (see page 16441)	This is constant Messages.WM_SYSTEMERROR.
WM_TABLET_FIRST (see page 16441)	This is constant Messages.WM_TABLET_FIRST.
WM_TABLET_LAST (see page 16441)	This is constant Messages.WM_TABLET_LAST.
WM_TCARD (see page 16442)	This is constant Messages.WM_TCARD.
WM_THEMECHANGED (see page 16442)	This is constant Messages.WM_THEMECHANGED.
WM_TIMECHANGE (see page 16442)	This is constant Messages.WM_TIMECHANGE.
WM_TIMER (see page 16443)	This is constant Messages.WM_TIMER.
WM_UNDO (see page 16443)	This is constant Messages.WM_UNDO.
WM_UNICHAR (see page 16443)	This is constant Messages.WM_UNICHAR.
WM_UNINITMENUPOPUP (see page 16444)	This is constant Messages.WM_UNINITMENUPOPUP.
WM_UPDATEUISTATE (see page 16444)	This is constant Messages.WM_UPDATEUISTATE.
WM_USER (see page 16444)	This is constant Messages.WM_USER.
WM_USERCHANGED (see page 16445)	This is constant Messages.WM_USERCHANGED.
WM_VKEYTOITEM (see page 16445)	This is constant Messages.WM_VKEYTOITEM.
WM_VSCROLL (see page 16445)	This is constant Messages.WM_VSCROLL.
WM_VSCROLLCLIPBOARD (see page 16446)	This is constant Messages.WM_VSCROLLCLIPBOARD.
WM_WINDOWPOSCHANGED (see page 16446)	This is constant Messages.WM_WINDOWPOSCHANGED.
WM_WINDOWPOSCHANGING (see page 16446)	This is constant Messages.WM_WINDOWPOSCHANGING.

WM_WININICHANGE (see page 16447)	This is constant Messages.WM_WININICHANGE.
WM_WTSSESSION_CHANGE (see page 16447)	This is constant Messages.WM_WTSSESSION_CHANGE.

Structs, Records, Enums

	Name	Description
	TMessage (see page 16225)	TMessage represents a Windows message.
	TMSHMouseWheel (see page 16226)	This is record Messages.TMSHMouseWheel.
	TWMActivate (see page 16226)	This is record Messages.TWMActivate.
	TWMActivateApp (see page 16227)	This is record Messages.TWMActivateApp.
	TWMAskCBFormatName (see page 16227)	This is record Messages.TWMAskCBFormatName.
	TWMChangeCBChain (see page 16228)	This is record Messages.TWMChangeCBChain.
	TWMCharToItem (see page 16228)	This is record Messages.TWMCharToItem.
	TWMChooseFont_GetLogFont (see page 16229)	This is record Messages.TWMChooseFont_GetLogFont.
	TWMCommand (see page 16229)	This is record Messages.TWMCommand.
	TWMCompacting (see page 16230)	This is record Messages.TWMCompacting.
	TWMCompareItem (see page 16230)	This is record Messages.TWMCompareItem.
	TWMContextMenu (see page 16231)	This is record Messages.TWMContextMenu.
	TWMCopyData (see page 16231)	This is record Messages.TWMCopyData.
	TWMCreate (see page 16232)	This is record Messages.TWMCreate.
	TWMCtlColor (see page 16232)	This is record Messages.TWMCtlColor.
	TWMDDE_Ack (see page 16233)	This is record Messages.TWMDDE_Ack.
	TWMDDE_Advise (see page 16233)	This is record Messages.TWMDDE_Advise.
	TWMDDE_Data (see page 16234)	This is record Messages.TWMDDE_Data.
	TWMDDE_Execute (see page 16234)	This is record Messages.TWMDDE_Execute.
	TWMDDE_Initiate (see page 16235)	This is record Messages.TWMDDE_Initiate.
	TWMDDE_Poke (see page 16235)	This is record Messages.TWMDDE_Poke.
	TWMDDE_Request (see page 16236)	This is record Messages.TWMDDE_Request.
	TWMDDE_Terminate (see page 16236)	This is record Messages.TWMDDE_Terminate.
	TWMDDE_Unadvise (see page 16237)	This is record Messages.TWMDDE_Unadvise.
	TWMDeleteItem (see page 16237)	This is record Messages.TWMDeleteItem.
	TWMDevModeChange (see page 16238)	This is record Messages.TWMDevModeChange.
	TWMDisplayChange (see page 16238)	This is record Messages.TWMDisplayChange.
	TWMDrawItem (see page 16239)	This is record Messages.TWMDrawItem.
	TWMDropFiles (see page 16239)	This is record Messages.TWMDropFiles.
	TWMEnable (see page 16240)	This is record Messages.TWMEnable.
	TWMEndSession (see page 16240)	This is record Messages.TWMEndSession.
	TWMEnterIdle (see page 16241)	This is record Messages.TWMEnterIdle.
	TWMEnterMenuLoop (see page 16241)	This is record Messages.TWMEnterMenuLoop.
	TWMEraseBkgnd (see page 16242)	This is record Messages.TWMEraseBkgnd.
	TWMGetIcon (see page 16242)	This is record Messages.TWMGetIcon.
	TWMGetMinMaxInfo (see page 16243)	This is record Messages.TWMGetMinMaxInfo.
	TWMGetText (see page 16243)	This is record Messages.TWMGetText.
	TWMHelp (see page 16244)	This is record Messages.TWMHelp.
	TWMHotKey (see page 16244)	This is record Messages.TWMHotKey.
	TWMHScrollClipboard (see page 16245)	This is record Messages.TWMHScrollClipboard.
	TWMInitDialog (see page 16245)	This is record Messages.TWMInitDialog.
	TWMInitMenu (see page 16246)	This is record Messages.TWMInitMenu.
	TWMInitMenuPopup (see page 16246)	This is record Messages.TWMInitMenuPopup.
	TWMKey (see page 16247)	This is record Messages.TWMKey.
	TWMKillFocus (see page 16247)	This is record Messages.TWMKillFocus.
	TWMMDIActivate (see page 16248)	This is record Messages.TWMMDIActivate.
	TWMMDICascade (see page 16248)	This is record Messages.TWMMDICascade.
	TWMMDICreate (see page 16249)	This is record Messages.TWMMDICreate.
	TWMMDIDestroy (see page 16249)	This is record Messages.TWMMDIDestroy.

	TWMMDIMaximize (see page 16250)	This is record Messages.TWMMDIMaximize.
	TWMMDINext (see page 16250)	This is record Messages.TWMMDINext.
	TWMMDIRestore (see page 16251)	This is record Messages.TWMMDIRestore.
	TWMMDISetMenu (see page 16251)	This is record Messages.TWMMDISetMenu.
	TWMMDITile (see page 16252)	This is record Messages.TWMMDITile.
	TWMMeasureItem (see page 16252)	This is record Messages.TWMMeasureItem.
	TWMMenuChar (see page 16253)	This is record Messages.TWMMenuChar.
	TWMMenuSelect (see page 16253)	This is record Messages.TWMMenuSelect.
	TWMMouse (see page 16254)	This is record Messages.TWMMouse.
	TWMMouseActivate (see page 16254)	This is record Messages.TWMMouseActivate.
	TWMMouseWheel (see page 16255)	This is record Messages.TWMMouseWheel.
	TWMMove (see page 16255)	This is record Messages.TWMMove.
	TWMMoving (see page 16256)	This is record Messages.TWMMoving.
	TWMNCActivate (see page 16256)	This is record Messages.TWMNCActivate.
	TWMNCCalcSize (see page 16257)	This is record Messages.TWMNCCalcSize.
	TWMNCCreate (see page 16257)	This is record Messages.TWMNCCreate.
	TWMNCHitMessage (see page 16258)	This is record Messages.TWMNCHitMessage.
	TWMNCHitTest (see page 16258)	This is record Messages.TWMNCHitTest.
	TWMNCPaint (see page 16259)	This is record Messages.TWMNCPaint.
	TWMNextDlgCtl (see page 16259)	This is record Messages.TWMNextDlgCtl.
	TWMNoParams (see page 16260)	This is record Messages.TWMNoParams.
	TWMNotify (see page 16260)	This is record Messages.TWMNotify.
	TWMNotifyFormat (see page 16261)	This is record Messages.TWMNotifyFormat.
	TWMPaint (see page 16261)	This is record Messages.TWMPaint.
	TWMPaintClipboard (see page 16262)	This is record Messages.TWMPaintClipboard.
	TWMPaletteChanged (see page 16262)	This is record Messages.TWMPaletteChanged.
	TWMPaletteIsChanging (see page 16263)	This is record Messages.TWMPaletteIsChanging.
	TWMParentNotify (see page 16263)	This is record Messages.TWMParentNotify.
	TWMPower (see page 16264)	This is record Messages.TWMPower.
	TWMPrint (see page 16264)	This is record Messages.TWMPrint.
	TWMQueryEndSession (see page 16265)	This is record Messages.TWMQueryEndSession.
	TWMQuit (see page 16265)	This is record Messages.TWMQuit.
	TWMRenderFormat (see page 16266)	This is record Messages.TWMRenderFormat.
	TWMScroll (see page 16266)	This is record Messages.TWMScroll.
	TWMSetCursor (see page 16267)	This is record Messages.TWMSetCursor.
	TWMSetFocus (see page 16267)	This is record Messages.TWMSetFocus.
	TWMSetFont (see page 16268)	This is record Messages.TWMSetFont.
	TWMSetHotKey (see page 16268)	This is record Messages.TWMSetHotKey.
	TWMSetIcon (see page 16269)	This is record Messages.TWMSetIcon.
	TWMSetRedraw (see page 16269)	This is record Messages.TWMSetRedraw.
	TWMSetText (see page 16270)	This is record Messages.TWMSetText.
	TWMSettingChange (see page 16270)	This is record Messages.TWMSettingChange.
	TWMShowWindow (see page 16271)	This is record Messages.TWMShowWindow.
	TWMSize (see page 16271)	This is record Messages.TWMSize.
	TWMSizeClipboard (see page 16272)	This is record Messages.TWMSizeClipboard.
	TWMSpoolerStatus (see page 16272)	This is record Messages.TWMSpoolerStatus.
	TWMStyleChange (see page 16273)	This is record Messages.TWMStyleChange.
	TWMSysCommand (see page 16273)	This is record Messages.TWMSysCommand.
	TWMSysDeadChar (see page 16274)	This is record Messages.TWMSysDeadChar.
	TWMSystemError (see page 16274)	This is record Messages.TWMSystemError.
	TWMTimer (see page 16275)	This is record Messages.TWMTimer.
	TWMUIState (see page 16275)	This is record Messages.TWMUIState.
	TWMVScrollClipboard (see page 16276)	This is record Messages.TWMVScrollClipboard.
	TWMWindowPosMsg (see page 16276)	This is record Messages.TWMWindowPosMsg.

	TWMWinIniChange (see page 16277)	This is record Messages.TWMWinIniChange.

Types

Name	Description
PMessage (see page 16279)	This is type Messages.PMessage.
TWMCancelMode (see page 16280)	This is type Messages.TWMCancelMode.
TWMChangeUIState (see page 16280)	This is type Messages.TWMChangeUIState.
TWMChar (see page 16280)	This is type Messages.TWMChar.
TWMChildActivate (see page 16281)	This is type Messages.TWMChildActivate.
TWMClear (see page 16281)	This is type Messages.TWMClear.
TWMClose (see page 16281)	This is type Messages.TWMClose.
TWMCopy (see page 16282)	This is type Messages.TWMCopy.
TWMCtlColorBtn (see page 16282)	This is type Messages.TWMCtlColorBtn.
TWMCtlColorDlg (see page 16282)	This is type Messages.TWMCtlColorDlg.
TWMCtlColorEdit (see page 16283)	This is type Messages.TWMCtlColorEdit.
TWMCtlColorListbox (see page 16283)	This is type Messages.TWMCtlColorListbox.
TWMCtlColorMsgbox (see page 16283)	This is type Messages.TWMCtlColorMsgbox.
TWMCtlColorScrollbar (see page 16284)	This is type Messages.TWMCtlColorScrollbar.
TWMCtlColorStatic (see page 16284)	This is type Messages.TWMCtlColorStatic.
TWMCut (see page 16284)	This is type Messages.TWMCut.
TWMDeadChar (see page 16285)	This is type Messages.TWMDeadChar.
TWMDestroy (see page 16285)	This is type Messages.TWMDestroy.
TWMDestroyClipboard (see page 16285)	This is type Messages.TWMDestroyClipboard.
TWMDrawClipboard (see page 16286)	This is type Messages.TWMDrawClipboard.
TWMExitMenuLoop (see page 16286)	This is type Messages.TWMExitMenuLoop.
TWMFontChange (see page 16286)	This is type Messages.TWMFontChange.
TWMGetDlgCode (see page 16287)	This is type Messages.TWMGetDlgCode.
TWMGetFont (see page 16287)	This is type Messages.TWMGetFont.
TWMGetHotKey (see page 16287)	This is type Messages.TWMGetHotKey.
TWMGetTextLength (see page 16288)	This is type Messages.TWMGetTextLength.
TWMHScroll (see page 16288)	This is type Messages.TWMHScroll.
TWMIconEraseBkgnd (see page 16288)	This is type Messages.TWMIconEraseBkgnd.
TWMKeyDown (see page 16289)	This is type Messages.TWMKeyDown.
TWMKeyUp (see page 16289)	This is type Messages.TWMKeyUp.
TWMLButtonDblClk (see page 16289)	This is type Messages.TWMLButtonDblClk.
TWMLButtonDown (see page 16290)	TWMLButtonDown represents the Windows message that occurs when the user clicks the left mouse button.
TWMLButtonUp (see page 16290)	This is type Messages.TWMLButtonUp.
TWMMButtonDblClk (see page 16290)	This is type Messages.TWMMButtonDblClk.
TWMMButtonDown (see page 16291)	This is type Messages.TWMMButtonDown.
TWMMButtonUp (see page 16291)	This is type Messages.TWMMButtonUp.
TWMMDIGetActive (see page 16291)	This is type Messages.TWMMDIGetActive.
TWMMDIIconArrange (see page 16292)	This is type Messages.TWMMDIIconArrange.
TWMMDIRefreshMenu (see page 16292)	This is type Messages.TWMMDIRefreshMenu.
TWMMouseMove (see page 16292)	This is type Messages.TWMMouseMove.
TWMNCDestroy (see page 16293)	This is type Messages.TWMNCDestroy.
TWMNCLButtonDblClk (see page 16293)	This is type Messages.TWMNCLButtonDblClk.
TWMNCLButtonDown (see page 16293)	This is type Messages.TWMNCLButtonDown.
TWMNCLButtonUp (see page 16294)	This is type Messages.TWMNCLButtonUp.
TWMNCMButtonDblClk (see page 16294)	This is type Messages.TWMNCMButtonDblClk.
TWMNCMButtonDown (see page 16294)	This is type Messages.TWMNCMButtonDown.
TWMNCMButtonUp (see page 16295)	This is type Messages.TWMNCMButtonUp.
TWMNCMouseMove (see page 16295)	This is type Messages.TWMNCMouseMove.
TWMNCRButtonDblClk (see page 16295)	This is type Messages.TWMNCRButtonDblClk.
TWMNCRButtonDown (see page 16296)	This is type Messages.TWMNCRButtonDown.

TWMNCRButtonUp (see page 16296)	This is type Messages.TWMNCRButtonUp.
TWMPaintIcon (see page 16296)	This is type Messages.TWMPaintIcon.
TWMPaste (see page 16297)	This is type Messages.TWMPaste.
TWMPrintClient (see page 16297)	This is type Messages.TWMPrintClient.
TWMQueryDragIcon (see page 16297)	This is type Messages.TWMQueryDragIcon.
TWMQueryNewPalette (see page 16298)	This is type Messages.TWMQueryNewPalette.
TWMQueryOpen (see page 16298)	This is type Messages.TWMQueryOpen.
TWMQueryUIState (see page 16298)	This is type Messages.TWMQueryUIState.
TWMQueueSync (see page 16299)	This is type Messages.TWMQueueSync.
TWMRButtonDblClk (see page 16299)	This is type Messages.TWMRButtonDblClk.
TWMRButtonDown (see page 16299)	This is type Messages.TWMRButtonDown.
TWMRButtonUp (see page 16300)	This is type Messages.TWMRButtonUp.
TWMRenderAllFormats (see page 16300)	This is type Messages.TWMRenderAllFormats.
TWMStyleChanged (see page 16300)	This is type Messages.TWMStyleChanged.
TWMStyleChanging (see page 16301)	This is type Messages.TWMStyleChanging.
TWMSysChar (see page 16301)	This is type Messages.TWMSysChar.
TWMSysColorChange (see page 16301)	This is type Messages.TWMSysColorChange.
TWMSysKeyDown (see page 16302)	This is type Messages.TWMSysKeyDown.
TWMSysKeyUp (see page 16302)	This is type Messages.TWMSysKeyUp.
TWMTimeChange (see page 16302)	This is type Messages.TWMTimeChange.
TWMUndo (see page 16303)	This is type Messages.TWMUndo.
TWMUpdateUIState (see page 16303)	This is type Messages.TWMUpdateUIState.
TWMVKeyToItem (see page 16303)	This is type Messages.TWMVKeyToItem.
TWMVScroll (see page 16304)	This is type Messages.TWMVScroll.
TWMWindowPosChanged (see page 16304)	This is type Messages.TWMWindowPosChanged.
TWMWindowPosChanging (see page 16304)	This is type Messages.TWMWindowPosChanging.

96.1 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TMessage (see page 16225)	TMessage represents a Windows message.
	TMSHMouseWheel (see page 16226)	This is record Messages.TMSHMouseWheel.
	TWMActivate (see page 16226)	This is record Messages.TWMActivate.
	TWMActivateApp (see page 16227)	This is record Messages.TWMActivateApp.
	TWMAskCBFormatName (see page 16227)	This is record Messages.TWMAskCBFormatName.
	TWMChangeCBChain (see page 16228)	This is record Messages.TWMChangeCBChain.
	TWMCharToItem (see page 16228)	This is record Messages.TWMCharToItem.
	TWMChooseFont_GetLogFont (see page 16229)	This is record Messages.TWMChooseFont_GetLogFont.
	TWMCommand (see page 16229)	This is record Messages.TWMCommand.
	TWMCompacting (see page 16230)	This is record Messages.TWMCompacting.
	TWMCompareItem (see page 16230)	This is record Messages.TWMCompareItem.
	TWMContextMenu (see page 16231)	This is record Messages.TWMContextMenu.
	TWMCopyData (see page 16231)	This is record Messages.TWMCopyData.
	TWMCreate (see page 16232)	This is record Messages.TWMCreate.
	TWMCtlColor (see page 16232)	This is record Messages.TWMCtlColor.
	TWMDDE_Ack (see page 16233)	This is record Messages.TWMDDE_Ack.
	TWMDDE_Advise (see page 16233)	This is record Messages.TWMDDE_Advise.
	TWMDDE_Data (see page 16234)	This is record Messages.TWMDDE_Data.
	TWMDDE_Execute (see page 16234)	This is record Messages.TWMDDE_Execute.
	TWMDDE_Initiate (see page 16235)	This is record Messages.TWMDDE_Initiate.
	TWMDDE_Poke (see page 16235)	This is record Messages.TWMDDE_Poke.
	TWMDDE_Request (see page 16236)	This is record Messages.TWMDDE_Request.
	TWMDDE_Terminate (see page 16236)	This is record Messages.TWMDDE_Terminate.
	TWMDDE_Unadvise (see page 16237)	This is record Messages.TWMDDE_Unadvise.

	TWMSizeClipboard (see page 16272)	This is record Messages.TWMSizeClipboard.
	TWMSpoolerStatus (see page 16272)	This is record Messages.TWMSpoolerStatus.
	TWMStyleChange (see page 16273)	This is record Messages.TWMStyleChange.
	TWMSysCommand (see page 16273)	This is record Messages.TWMSysCommand.
	TWMSysDeadChar (see page 16274)	This is record Messages.TWMSysDeadChar.

	TWMSystemError (see page 16274)	This is record Messages.TWMSystemError.
	TWMTimer (see page 16275)	This is record Messages.TWMTimer.
	TWMUIState (see page 16275)	This is record Messages.TWMUIState.
	TWMVScrollClipboard (see page 16276)	This is record Messages.TWMVScrollClipboard.
	TWMWindowPosMsg (see page 16276)	This is record Messages.TWMWindowPosMsg.
	TWMWinIniChange (see page 16277)	This is record Messages.TWMWinIniChange.

96.1.1 Messages.TMessage Record

TMessage represents a Windows message.

Pascal

```
TMessage = packed record
  Msg: Cardinal;
  case Integer of
    0: (WParam: Longint;
        LParam: Longint;
        Result: Longint;);
    1: (WParamLo: Word;
        WParamHi: Word;
        LParamLo: Word;
        LParamHi: Word;
        ResultLo: Word;
        ResultHi: Word;);
end;
```

C++

```
struct TMessage {
  unsigned Msg;
  Longint WParam;
  Longint LParam;
  Longint Result;
  Word WParamLo;
  Word WParamHi;
  Word LParamLo;
  Word LParamHi;
  Word ResultLo;
  Word ResultHi;
};
```

File

Messages

Description

The TMessage type represents a Windows message in WndProc and other methods.

The Msg field represents the Windows Message code.

The WParam field represents the WParam of the message. To access the low and high words of this field, use the WParamLo and WParamHi fields instead.

The LParam field represents the LParam of the message. To access the low and high words of this field, use the LParamLo and LParamHi fields instead.

The Result field holds the return value. To access the low and high words of this field, use the ResultLo and ResultHi fields instead.

96.1.2 Messages.TMSHMouseWheel Record

Pascal

```
TMSHMouseWheel = packed record
  Msg: Cardinal;
  WheelDelta: Integer;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TMSHMouseWheel {
  unsigned Msg;
  int WheelDelta;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TMSHMouseWheel.

96.1.3 Messages.TWMActivate Record

Pascal

```
TWMActivate = packed record
  Msg: Cardinal;
  Active: Word;
  Minimized: WordBool;
  ActiveWindow: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMActivate {
  unsigned Msg;
  Word Active;
  WordBool Minimized;
  HWND ActiveWindow;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMActivate.

96.1.4 Messages.TWMActivateApp Record

Pascal

```
TWMActivateApp = packed record
  Msg: Cardinal;
  Active: BOOL;
  ThreadId: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMActivateApp {
  unsigned Msg;
  BOOL Active;
  Longint ThreadId;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMActivateApp.

96.1.5 Messages.TWMAskCBFormatName Record

Pascal

```
TWMAskCBFormatName = packed record
  Msg: Cardinal;
  NameLen: Word;
  Unused: Word;
  FormatName: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMAskCBFormatName {
```

```
    unsigned Msg;
    Word NameLen;
    Word Unused;
    const char * FormatName;
    Longint Result;
  };
```

File

Messages

Description

This is record Messages.TWMAskCBFormatName.

96.1.6 Messages.TWMChangeCBChain Record

Pascal

```
  TWMChangeCBChain = packed record
    Msg: Cardinal;
    Remove: HWND;
    Next: HWND;
    Result: Longint;
  end;
```

C++

```
  struct TWMChangeCBChain {
    unsigned Msg;
    HWND Remove;
    HWND Next;
    Longint Result;
  };
```

File

Messages

Description

This is record Messages.TWMChangeCBChain.

96.1.7 Messages.TWMCharToItem Record

Pascal

```
  TWMCharToItem = packed record
    Msg: Cardinal;
    Key: Word;
    CaretPos: Word;
    ListBox: HWND;
    Result: Longint;
  end;
```

C++

```
  struct TWMCharToItem {
    unsigned Msg;
    Word Key;
    Word CaretPos;
    HWND ListBox;
```

```
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCharToItem.

96.1.8 Messages.TWMChooseFont_GetLogFont Record

Pascal

```
TWMChooseFont_GetLogFont = packed record
  Msg: Cardinal;
  Unused: Longint;
  LogFont: PLogFont;
  Result: Longint;
end;
```

C++

```
struct TWMChooseFont_GetLogFont {
  unsigned Msg;
  Longint Unused;
  PLogFont LogFont;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMChooseFont_GetLogFont.

96.1.9 Messages.TWMCommand Record

Pascal

```
TWMCommand = packed record
  Msg: Cardinal;
  ItemID: Word;
  NotifyCode: Word;
  Ctl: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMCommand {
  unsigned Msg;
  Word ItemID;
  Word NotifyCode;
  HWND Ctl;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCommand.

96.1.10 Messages.TWMCompacting Record

Pascal

```
TWMCompacting = packed record
  Msg: Cardinal;
  CompactRatio: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMCompacting {
  unsigned Msg;
  Longint CompactRatio;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCompacting.

96.1.11 Messages.TWMCompareItem Record

Pascal

```
TWMCompareItem = packed record
  Msg: Cardinal;
  Ctl: HWnd;
  CompareItemStruct: PCompareItemStruct;
  Result: Longint;
end;
```

C++

```
struct TWMCompareItem {
  unsigned Msg;
  HWnd Ctl;
  PCompareItemStruct CompareItemStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCompareItem.

96.1.12 Messages.TWMContextMenu Record

Pascal

```
TWMContextMenu = packed record
  Msg: Cardinal;
  hWnd: HWND;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TWMContextMenu {
  unsigned Msg;
  HWND hWnd;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMContextMenu.

96.1.13 Messages.TWMCopyData Record

Pascal

```
TWMCopyData = packed record
  Msg: Cardinal;
  From: HWND;
  CopyDataStruct: PCopyDataStruct;
  Result: Longint;
end;
```

C++

```
struct TWMCopyData {
  unsigned Msg;
  HWND From;
  PCopyDataStruct CopyDataStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCopyData.

96.1.14 Messages.TWMCreate Record

Pascal

```
TWMCreate = packed record
  Msg: Cardinal;
  Unused: Integer;
  CreateStruct: PCreateStruct;
  Result: Longint;
end;
```

C++

```
struct TWMCreate {
  unsigned Msg;
  int Unused;
  PCreateStruct CreateStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCreate.

96.1.15 Messages.TWMCtlColor Record

Pascal

```
TWMCtlColor = packed record
  Msg: Cardinal;
  ChildDC: HDC;
  ChildWnd: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMCtlColor {
  unsigned Msg;
  HDC ChildDC;
  HWND ChildWnd;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMCtlColor.

96.1.16 Messages.TWMDDE_Ack Record

Pascal

```
TWMDDE_Ack = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  case Word of
    WM_DDE_EXECUTE: (PackedVal: Longint;);
    WM_DDE_INITIATE: (App: Word;
                      Topic: Word;
                      Result: Longint;);
end;
```

C++

```
struct TWMDDE_Ack {
  unsigned Msg;
  HWND PostingApp;
  Word App;
  Word Topic;
  Longint Result;
  Longint PackedVal;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Ack.

96.1.17 Messages.TWMDDE_Advise Record

Pascal

```
TWMDDE_Advise = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  PackedVal: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Advise {
  unsigned Msg;
  HWND PostingApp;
  Longint PackedVal;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Advise.

96.1.18 Messages.TWMDDE_Data Record

Pascal

```
TWMDDE_Data = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  PackedVal: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Data {
  unsigned Msg;
  HWND PostingApp;
  Longint PackedVal;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Data.

96.1.19 Messages.TWMDDE_Execute Record

Pascal

```
TWMDDE_Execute = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  Commands: THandle;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Execute {
  unsigned Msg;
  HWND PostingApp;
  THandle Commands;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Execute.

96.1.20 Messages.TWMDDE_Initiate Record

Pascal

```
TWMDDE_Initiate = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  App: Word;
  Topic: Word;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Initiate {
  unsigned Msg;
  HWND PostingApp;
  Word App;
  Word Topic;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Initiate.

96.1.21 Messages.TWMDDE_Poke Record

Pascal

```
TWMDDE_Poke = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  PackedVal: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Poke {
  unsigned Msg;
  HWND PostingApp;
  Longint PackedVal;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Poke.

96.1.22 Messages.TWMDDE_Request Record

Pascal

```
TWMDDE_Request = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  Format: Word;
  Item: Word;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Request {
  unsigned Msg;
  HWND PostingApp;
  Word Format;
  Word Item;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Request.

96.1.23 Messages.TWMDDE_Terminate Record

Pascal

```
TWMDDE_Terminate = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Terminate {
  unsigned Msg;
  HWND PostingApp;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Terminate.

96.1.24 Messages.TWMDDE_Unadvise Record

Pascal

```
TWMDDE_Unadvise = packed record
  Msg: Cardinal;
  PostingApp: HWND;
  Format: Word;
  Item: Word;
  Result: Longint;
end;
```

C++

```
struct TWMDDE_Unadvise {
  unsigned Msg;
  HWND PostingApp;
  Word Format;
  Word Item;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDDE_Unadvise.

96.1.25 Messages.TWMDeleteItem Record

Pascal

```
TWMDeleteItem = packed record
  Msg: Cardinal;
  Ctl: HWND;
  DeleteItemStruct: PDeleteItemStruct;
  Result: Longint;
end;
```

C++

```
struct TWMDeleteItem {
  unsigned Msg;
  HWND Ctl;
  PDeleteItemStruct DeleteItemStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDeleteItem.

96.1.26 Messages.TWMDevModeChange Record

Pascal

```
TWMDevModeChange = packed record
  Msg: Cardinal;
  Unused: Integer;
  Device: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMDevModeChange {
  unsigned Msg;
  int Unused;
  const char * Device;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDevModeChange.

96.1.27 Messages.TWMDisplayChange Record

Pascal

```
TWMDisplayChange = packed record
  Msg: Cardinal;
  BitsPerPixel: Integer;
  Width: Word;
  Height: Word;
  Result: Longint;
end;
```

C++

```
struct TWMDisplayChange {
  unsigned Msg;
  int BitsPerPixel;
  Word Width;
  Word Height;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDisplayChange.

96.1.28 Messages.TWMDrawItem Record

Pascal

```
TWMDrawItem = packed record
  Msg: Cardinal;
  Ctl: HWND;
  DrawItemStruct: PDrawItemStruct;
  Result: Longint;
end;
```

C++

```
struct TWMDrawItem {
  unsigned Msg;
  HWND Ctl;
  PDrawItemStruct DrawItemStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDrawItem.

96.1.29 Messages.TWMDropFiles Record

Pascal

```
TWMDropFiles = packed record
  Msg: Cardinal;
  Drop: THANDLE;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMDropFiles {
  unsigned Msg;
  THANDLE Drop;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMDropFiles.

96.1.30 Messages.TWMEnable Record

Pascal

```
TWMEnable = packed record
  Msg: Cardinal;
  Enabled: LongBool;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMEnable {
  unsigned Msg;
  LongBool Enabled;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEnable.

96.1.31 Messages.TWMEndSession Record

Pascal

```
TWMEndSession = packed record
  Msg: Cardinal;
  EndSession: LongBool;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMEndSession {
  unsigned Msg;
  LongBool EndSession;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEndSession.

96.1.32 Messages.TWMEnterIdle Record

Pascal

```
TWMEnterIdle = packed record
  Msg: Cardinal;
  Source: Longint;
  IdleWnd: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMEnterIdle {
  unsigned Msg;
  Longint Source;
  HWND IdleWnd;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEnterIdle.

96.1.33 Messages.TWMEnterMenuLoop Record

Pascal

```
TWMEnterMenuLoop = packed record
  Msg: Cardinal;
  IsTrackPopupMenu: LongBool;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMEnterMenuLoop {
  unsigned Msg;
  LongBool IsTrackPopupMenu;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEnterMenuLoop.

96.1.34 Messages.TWMEraseBkgnd Record

Pascal

```
TWMEraseBkgnd = packed record
  Msg: Cardinal;
  DC: HDC;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMEraseBkgnd {
  unsigned Msg;
  HDC DC;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMEraseBkgnd.

96.1.35 Messages.TWMGetIcon Record

Pascal

```
TWMGetIcon = packed record
  Msg: Cardinal;
  BigIcon: Longbool;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMGetIcon {
  unsigned Msg;
  Longbool BigIcon;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMGetIcon.

96.1.36 Messages.TWMGetMinMaxInfo Record

Pascal

```
TWMGetMinMaxInfo = packed record
  Msg: Cardinal;
  Unused: Integer;
  MinMaxInfo: PMinMaxInfo;
  Result: Longint;
end;
```

C++

```
struct TWMGetMinMaxInfo {
  unsigned Msg;
  int Unused;
  PMinMaxInfo MinMaxInfo;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMGetMinMaxInfo.

96.1.37 Messages.TWMGetText Record

Pascal

```
TWMGetText = packed record
  Msg: Cardinal;
  TextMax: Integer;
  Text: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMGetText {
  unsigned Msg;
  int TextMax;
  const char * Text;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMGetText.

96.1.38 Messages.TWMHelp Record

Pascal

```
TWMHelp = packed record
  Msg: Cardinal;
  Unused: Integer;
  HelpInfo: PHelpInfo;
  Result: Longint;
end;
```

C++

```
struct TWMHelp {
  unsigned Msg;
  int Unused;
  PHelpInfo HelpInfo;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMHelp.

96.1.39 Messages.TWMHotKey Record

Pascal

```
TWMHotKey = packed record
  Msg: Cardinal;
  HotKey: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMHotKey {
  unsigned Msg;
  Longint HotKey;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMHotKey.

96.1.40 Messages.TWMHScrollClipboard Record

Pascal

```
TWMHScrollClipboard = packed record
  Msg: Cardinal;
  Viewer: HWND;
  ScrollCode: Word;
  Pos: Word;
  Result: Longint;
end;
```

C++

```
struct TWMHScrollClipboard {
  unsigned Msg;
  HWND Viewer;
  Word ScrollCode;
  Word Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMHScrollClipboard.

96.1.41 Messages.TWMInitDialog Record

Pascal

```
TWMInitDialog = packed record
  Msg: Cardinal;
  Focus: HWND;
  InitParam: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMInitDialog {
  unsigned Msg;
  HWND Focus;
  Longint InitParam;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMInitDialog.

96.1.42 Messages.TWMInitMenu Record

Pascal

```
TWMInitMenu = packed record
  Msg: Cardinal;
  Menu: HMENU;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMInitMenu {
  unsigned Msg;
  HMENU Menu;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMInitMenu.

96.1.43 Messages.TWMInitMenuPopup Record

Pascal

```
TWMInitMenuPopup = packed record
  Msg: Cardinal;
  MenuPopup: HMENU;
  Pos: Smallint;
  SystemMenu: WordBool;
  Result: Longint;
end;
```

C++

```
struct TWMInitMenuPopup {
  unsigned Msg;
  HMENU MenuPopup;
  Smallint Pos;
  WordBool SystemMenu;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMInitMenuPopup.

96.1.44 Messages.TWMKey Record

Pascal

```
TWMKey = packed record
  Msg: Cardinal;
  CharCode: Word;
  Unused: Word;
  KeyData: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMKey {
  unsigned Msg;
  Word CharCode;
  Word Unused;
  Longint KeyData;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMKey.

96.1.45 Messages.TWMKillFocus Record

Pascal

```
TWMKillFocus = packed record
  Msg: Cardinal;
  FocusedWnd: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMKillFocus {
  unsigned Msg;
  HWND FocusedWnd;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMKillFocus.

96.1.46 Messages.TWMMDIActivate Record

Pascal

```
TWMMDIActivate = packed record
  Msg: Cardinal;
  case Integer of
    0: (ChildWnd: HWND;);
    1: (DeactiveWnd: HWND;
        ActiveWnd: HWND;
        Result: Longint;);
end;
```

C++

```
struct TWMMDIActivate {
  unsigned Msg;
  HWND ChildWnd;
  HWND DeactiveWnd;
  HWND ActiveWnd;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDIActivate.

96.1.47 Messages.TWMMDICascade Record

Pascal

```
TWMMDICascade = packed record
  Msg: Cardinal;
  Cascade: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDICascade {
  unsigned Msg;
  Longint Cascade;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDICascade.

96.1.48 Messages.TWMMDICreate Record

Pascal

```
TWMMDICreate = packed record
  Msg: Cardinal;
  Unused: Integer;
  MDICreateStruct: PMDICreateStruct;
  Result: Longint;
end;
```

C++

```
struct TWMMDICreate {
  unsigned Msg;
  int Unused;
  PMDICreateStruct MDICreateStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDICreate.

96.1.49 Messages.TWMMDIDestroy Record

Pascal

```
TWMMDIDestroy = packed record
  Msg: Cardinal;
  Child: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDIDestroy {
  unsigned Msg;
  HWND Child;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDIDestroy.

96.1.50 Messages.TWMMDIMaximize Record

Pascal

```
TWMMDIMaximize = packed record
  Msg: Cardinal;
  Maximize: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDIMaximize {
  unsigned Msg;
  HWND Maximize;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDIMaximize.

96.1.51 Messages.TWMMDINext Record

Pascal

```
TWMMDINext = packed record
  Msg: Cardinal;
  Child: HWND;
  Next: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDINext {
  unsigned Msg;
  HWND Child;
  Longint Next;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDINext.

96.1.52 Messages.TWMMDIRestore Record

Pascal

```
TWMMDIRestore = packed record
  Msg: Cardinal;
  IDChild: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDIRestore {
  unsigned Msg;
  HWND IDChild;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDIRestore.

96.1.53 Messages.TWMMDISetMenu Record

Pascal

```
TWMMDISetMenu = packed record
  Msg: Cardinal;
  MenuFrame: HMENU;
  MenuWindow: HMENU;
  Result: Longint;
end;
```

C++

```
struct TWMMDISetMenu {
  unsigned Msg;
  HMENU MenuFrame;
  HMENU MenuWindow;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDISetMenu.

96.1.54 Messages.TWMMDITile Record

Pascal

```
TWMMDITile = packed record
  Msg: Cardinal;
  Tile: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMMDITile {
  unsigned Msg;
  Longint Tile;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMDITile.

96.1.55 Messages.TWMMeasureItem Record

Pascal

```
TWMMeasureItem = packed record
  Msg: Cardinal;
  IDCtl: HWnd;
  MeasureItemStruct: PMeasureItemStruct;
  Result: Longint;
end;
```

C++

```
struct TWMMeasureItem {
  unsigned Msg;
  HWnd IDCtl;
  PMeasureItemStruct MeasureItemStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMeasureItem.

96.1.56 Messages.TWMMenuChar Record

Pascal

```
TWMMenuChar = packed record
  Msg: Cardinal;
  User: Char;
  Unused: Byte;
  MenuFlag: Word;
  Menu: HMENU;
  Result: Longint;
end;
```

C++

```
struct TWMMenuChar {
  unsigned Msg;
  Char User;
  Byte Unused;
  Word MenuFlag;
  HMENU Menu;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMenuChar.

96.1.57 Messages.TWMMenuSelect Record

Pascal

```
TWMMenuSelect = packed record
  Msg: Cardinal;
  IDItem: Word;
  MenuFlag: Word;
  Menu: HMENU;
  Result: Longint;
end;
```

C++

```
struct TWMMenuSelect {
  unsigned Msg;
  Word IDItem;
  Word MenuFlag;
  HMENU Menu;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMenuSelect.

96.1.58 Messages.TWMMouse Record

Pascal

```
TWMMouse = packed record
  Msg: Cardinal;
  Keys: Longint;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TWMMouse {
  unsigned Msg;
  Longint Keys;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMouse.

96.1.59 Messages.TWMMouseActivate Record

Pascal

```
TWMMouseActivate = packed record
  Msg: Cardinal;
  TopLevel: HWND;
  HitTestCode: Word;
  MouseMsg: Word;
  Result: Longint;
end;
```

C++

```
struct TWMMouseActivate {
  unsigned Msg;
  HWND TopLevel;
  Word HitTestCode;
  Word MouseMsg;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMouseActivate.

96.1.60 Messages.TWMMouseWheel Record

Pascal

```
TWMMouseWheel = packed record
  Msg: Cardinal;
  Keys: SmallInt;
  WheelDelta: SmallInt;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TWMMouseWheel {
  unsigned Msg;
  SmallInt Keys;
  SmallInt WheelDelta;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMMouseWheel.

96.1.61 Messages.TWMMove Record

Pascal

```
TWMMove = packed record
  Msg: Cardinal;
  Unused: Integer;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TWMMove {
  unsigned Msg;
  int Unused;
  Smallint XPos;
  Smallint YPos;
```

```
    TSmallPoint Pos;
    Longint Result;
  };
```

File

Messages

Description

This is record Messages.TWMMove.

96.1.62 Messages.TWMMoving Record

Pascal

```
  TWMMoving = packed record
    Msg: Cardinal;
    Edge: Integer;
    DragRect: PRect;
  end;
```

C++

```
  struct TWMMoving {
    unsigned Msg;
    int Edge;
    PRect DragRect;
  };
```

File

Messages

Description

This is record Messages.TWMMoving.

96.1.63 Messages.TWMNCActivate Record

Pascal

```
  TWMNCActivate = packed record
    Msg: Cardinal;
    Active: BOOL;
    Unused: Longint;
    Result: Longint;
  end;
```

C++

```
  struct TWMNCActivate {
    unsigned Msg;
    BOOL Active;
    Longint Unused;
    Longint Result;
  };
```

File

Messages

Description

This is record Messages.TWMNCActivate.

96.1.64 Messages.TWMNCCalcSize Record

Pascal

```
TWMNCCalcSize = packed record
  Msg: Cardinal;
  CalcValidRects: BOOL;
  CalcSize_Params: PNCCalcSizeParams;
  Result: Longint;
end;
```

C++

```
struct TWMNCCalcSize {
  unsigned Msg;
  BOOL CalcValidRects;
  PNCCalcSizeParams CalcSize_Params;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCCalcSize.

96.1.65 Messages.TWMNCCreate Record

Pascal

```
TWMNCCreate = packed record
  Msg: Cardinal;
  Unused: Integer;
  CreateStruct: PCreateStruct;
  Result: Longint;
end;
```

C++

```
struct TWMNCCreate {
  unsigned Msg;
  int Unused;
  PCreateStruct CreateStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCCreate.

96.1.66 Messages.TWMNCHitMessage Record

Pascal

```
TWMNCHitMessage = packed record
  Msg: Cardinal;
  HitTest: Longint;
  XCursor: Smallint;
  YCursor: Smallint;
  Result: Longint;
end;
```

C++

```
struct TWMNCHitMessage {
  unsigned Msg;
  Longint HitTest;
  Smallint XCursor;
  Smallint YCursor;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCHitMessage.

96.1.67 Messages.TWMNCHitTest Record

Pascal

```
TWMNCHitTest = packed record
  Msg: Cardinal;
  Unused: Longint;
  case Integer of
    0: (XPos: Smallint;
        YPos: Smallint;);
    1: (Pos: TSmallPoint;
        Result: Longint;);
end;
```

C++

```
struct TWMNCHitTest {
  unsigned Msg;
  Longint Unused;
  Smallint XPos;
  Smallint YPos;
  TSmallPoint Pos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCHitTest.

96.1.68 Messages.TWMNCPaint Record

Pascal

```
TWMNCPaint = packed record
  Msg: Cardinal;
  RGN: HRGN;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMNCPaint {
  unsigned Msg;
  HRGN RGN;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNCPaint.

96.1.69 Messages.TWMNextDlgCtl Record

Pascal

```
TWMNextDlgCtl = packed record
  Msg: Cardinal;
  CtlFocus: Longint;
  Handle: WordBool;
  Unused: Word;
  Result: Longint;
end;
```

C++

```
struct TWMNextDlgCtl {
  unsigned Msg;
  Longint CtlFocus;
  WordBool Handle;
  Word Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNextDlgCtl.

96.1.70 Messages.TWMNoParams Record

Pascal

```
TWMNoParams = packed record
  Msg: Cardinal;
  Unused: array[0..3] of Word;
  Result: Longint;
end;
```

C++

```
struct TWMNoParams {
  unsigned Msg;
  array[0..3] of Word Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNoParams.

96.1.71 Messages.TWMNotify Record

Pascal

```
TWMNotify = packed record
  Msg: Cardinal;
  IDCtrl: Longint;
  NMHdr: PNMHdr;
  Result: Longint;
end;
```

C++

```
struct TWMNotify {
  unsigned Msg;
  Longint IDCtrl;
  PNMHdr NMHdr;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNotify.

96.1.72 Messages.TWMNotifyFormat Record

Pascal

```
TWMNotifyFormat = packed record
  Msg: Cardinal;
  From: HWND;
  Command: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMNotifyFormat {
  unsigned Msg;
  HWND From;
  Longint Command;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMNotifyFormat.

96.1.73 Messages.TWMPaint Record

Pascal

```
TWMPaint = packed record
  Msg: Cardinal;
  DC: HDC;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMPaint {
  unsigned Msg;
  HDC DC;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMPaint.

96.1.74 Messages.TWMPaintClipboard Record

Pascal

```
TWMPaintClipboard = packed record
  Msg: Cardinal;
  Viewer: HWND;
  PaintStruct: THandle;
  Result: Longint;
end;
```

C++

```
struct TWMPaintClipboard {
  unsigned Msg;
  HWND Viewer;
  THandle PaintStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMPaintClipboard.

96.1.75 Messages.TWMPaletteChanged Record

Pascal

```
TWMPaletteChanged = packed record
  Msg: Cardinal;
  PalChg: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMPaletteChanged {
  unsigned Msg;
  HWND PalChg;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMPaletteChanged.

96.1.76 Messages.TWMPaletteIsChanging Record

Pascal

```
TWMPaletteIsChanging = packed record
  Msg: Cardinal;
  Realize: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMPaletteIsChanging {
  unsigned Msg;
  HWND Realize;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMPaletteIsChanging.

96.1.77 Messages.TWMParentNotify Record

Pascal

```
TWMParentNotify = packed record
  Msg: Cardinal;
  Event: Word;
  case Word of
    0: (Value1: Word;
        Value2: Longint;
        Result: Longint;);
    WM_DESTROY: (ChildID: Word;
                 ChildWnd: HWnd;);
    WM_RBUTTONDOWN: (Value: Word;
                     XPos: Smallint;
                     YPos: Smallint;);
end;
```

C++

```
struct TWMParentNotify {
  unsigned Msg;
  Word Event;
  Word ChildID;
  HWnd ChildWnd;
  Word Value;
  Smallint XPos;
  Smallint YPos;
  Word Value1;
  Longint Value2;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMParentNotify.

96.1.78 Messages.TWMPower Record

Pascal

```
TWMPower = packed record
  Msg: Cardinal;
  PowerEvt: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMPower {
  unsigned Msg;
  Longint PowerEvt;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMPower.

96.1.79 Messages.TWMPrint Record

Pascal

```
TWMPrint = packed record
  Msg: Cardinal;
  DC: HDC;
  Flags: Cardinal;
  Result: Integer;
end;
```

C++

```
struct TWMPrint {
  unsigned Msg;
  HDC DC;
  unsigned Flags;
  int Result;
};
```

File

Messages

Description

This is record Messages.TWMPrint.

96.1.80 Messages.TWMQueryEndSession Record

Pascal

```
TWMQueryEndSession = packed record
  Msg: Cardinal;
  Source: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMQueryEndSession {
  unsigned Msg;
  Longint Source;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMQueryEndSession.

96.1.81 Messages.TWMQuit Record

Pascal

```
TWMQuit = packed record
  Msg: Cardinal;
  ExitCode: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMQuit {
  unsigned Msg;
  Longint ExitCode;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMQuit.

96.1.82 Messages.TWMRenderFormat Record

Pascal

```
TWMRenderFormat = packed record
  Msg: Cardinal;
  Format: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMRenderFormat {
  unsigned Msg;
  Longint Format;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMRenderFormat.

96.1.83 Messages.TWMScroll Record

Pascal

```
TWMScroll = packed record
  Msg: Cardinal;
  ScrollCode: Smallint;
  Pos: Smallint;
  ScrollBar: HWND;
  Result: Longint;
end;
```

C++

```
struct TWMScroll {
  unsigned Msg;
  Smallint ScrollCode;
  Smallint Pos;
  HWND ScrollBar;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMScroll.

96.1.84 Messages.TWMSetCursor Record

Pascal

```
TWMSetCursor = packed record
  Msg: Cardinal;
  CursorWnd: HWND;
  HitTest: Word;
  MouseMsg: Word;
  Result: Longint;
end;
```

C++

```
struct TWMSetCursor {
  unsigned Msg;
  HWND CursorWnd;
  Word HitTest;
  Word MouseMsg;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetCursor.

96.1.85 Messages.TWMSetFocus Record

Pascal

```
TWMSetFocus = packed record
  Msg: Cardinal;
  FocusedWnd: HWND;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSetFocus {
  unsigned Msg;
  HWND FocusedWnd;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetFocus.

96.1.86 Messages.TWMSetFont Record

Pascal

```
TWMSetFont = packed record
  Msg: Cardinal;
  Font: HFONT;
  Redraw: WordBool;
  Unused: Word;
  Result: Longint;
end;
```

C++

```
struct TWMSetFont {
  unsigned Msg;
  HFONT Font;
  WordBool Redraw;
  Word Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetFont.

96.1.87 Messages.TWMSetHotKey Record

Pascal

```
TWMSetHotKey = packed record
  Msg: Cardinal;
  Key: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSetHotKey {
  unsigned Msg;
  Longint Key;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetHotKey.

96.1.88 Messages.TWMSetIcon Record

Pascal

```
TWMSetIcon = packed record
  Msg: Cardinal;
  BigIcon: Longbool;
  Icon: HICON;
  Result: Longint;
end;
```

C++

```
struct TWMSetIcon {
  unsigned Msg;
  Longbool BigIcon;
  HICON Icon;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetIcon.

96.1.89 Messages.TWMSetRedraw Record

Pascal

```
TWMSetRedraw = packed record
  Msg: Cardinal;
  Redraw: Longint;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSetRedraw {
  unsigned Msg;
  Longint Redraw;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetRedraw.

96.1.90 Messages.TWMSetText Record

Pascal

```
TWMSetText = packed record
  Msg: Cardinal;
  Unused: Longint;
  Text: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMSetText {
  unsigned Msg;
  Longint Unused;
  const char * Text;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSetText.

96.1.91 Messages.TWMSettingChange Record

Pascal

```
TWMSettingChange = packed record
  Msg: Cardinal;
  Flag: Integer;
  Section: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMSettingChange {
  unsigned Msg;
  int Flag;
  const char * Section;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSettingChange.

96.1.92 Messages.TWMShowWindow Record

Pascal

```
TWMShowWindow = packed record
  Msg: Cardinal;
  Show: BOOL;
  Status: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMShowWindow {
  unsigned Msg;
  BOOL Show;
  Longint Status;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMShowWindow.

96.1.93 Messages.TWMSize Record

Pascal

```
TWMSize = packed record
  Msg: Cardinal;
  SizeType: Longint;
  Width: Word;
  Height: Word;
  Result: Longint;
end;
```

C++

```
struct TWMSize {
  unsigned Msg;
  Longint SizeType;
  Word Width;
  Word Height;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSize.

96.1.94 Messages.TWMSizeClipboard Record

Pascal

```
TWMSizeClipboard = packed record
  Msg: Cardinal;
  Viewer: HWND;
  RC: THandle;
  Result: Longint;
end;
```

C++

```
struct TWMSizeClipboard {
  unsigned Msg;
  HWND Viewer;
  THandle RC;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSizeClipboard.

96.1.95 Messages.TWMSpoolerStatus Record

Pascal

```
TWMSpoolerStatus = packed record
  Msg: Cardinal;
  JobStatus: Longint;
  JobsLeft: Word;
  Unused: Word;
  Result: Longint;
end;
```

C++

```
struct TWMSpoolerStatus {
  unsigned Msg;
  Longint JobStatus;
  Word JobsLeft;
  Word Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSpoolerStatus.

96.1.96 Messages.TWMStyleChange Record

Pascal

```
TWMStyleChange = packed record
  Msg: Cardinal;
  StyleType: Longint;
  StyleStruct: PStyleStruct;
  Result: Longint;
end;
```

C++

```
struct TWMStyleChange {
  unsigned Msg;
  Longint StyleType;
  PStyleStruct StyleStruct;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMStyleChange.

96.1.97 Messages.TWMSysCommand Record

Pascal

```
TWMSysCommand = packed record
  Msg: Cardinal;
  CmdType: Longint;
  case Longint of
    SC_HOTKEY: (ActivateWnd: HWND;);
    SC_KEYMENU: (Key: Word;);
    SC_VSCROLL: (XPos: Smallint;
                 YPos: Smallint;
                 Result: Longint;);
end;
```

C++

```
struct TWMSysCommand {
  unsigned Msg;
  Longint CmdType;
  HWND ActivateWnd;
  Word Key;
  Smallint XPos;
  Smallint YPos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSysCommand.

96.1.98 Messages.TWMSysDeadChar Record

Pascal

```
TWMSysDeadChar = packed record
  Msg: Cardinal;
  CharCode: Word;
  Unused: Word;
  KeyData: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSysDeadChar {
  unsigned Msg;
  Word CharCode;
  Word Unused;
  Longint KeyData;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSysDeadChar.

96.1.99 Messages.TWMSystemError Record

Pascal

```
TWMSystemError = packed record
  Msg: Cardinal;
  ErrSpec: Word;
  Unused: Longint;
  Result: Longint;
end;
```

C++

```
struct TWMSystemError {
  unsigned Msg;
  Word ErrSpec;
  Longint Unused;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMSystemError.

96.1.100 Messages.TWMTimer Record

Pascal

```
TWMTimer = packed record
  Msg: Cardinal;
  TimerID: Longint;
  TimerProc: TFarProc;
  Result: Longint;
end;
```

C++

```
struct TWMTimer {
  unsigned Msg;
  Longint TimerID;
  TFarProc TimerProc;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMTimer.

96.1.101 Messages.TWMUIState Record

Pascal

```
TWMUIState = packed record
  Msg: Cardinal;
  Action: Word;
  Flags: Word;
  Unused: Longint;
end;
```

C++

```
struct TWMUIState {
  unsigned Msg;
  Word Action;
  Word Flags;
  Longint Unused;
};
```

File

Messages

Description

This is record Messages.TWMUIState.

96.1.102 Messages.TWMVScrollClipboard Record

Pascal

```
TWMVScrollClipboard = packed record
  Msg: Cardinal;
  Viewer: HWND;
  ScollCode: Word;
  ThumbPos: Word;
  Result: Longint;
end;
```

C++

```
struct TWMVScrollClipboard {
  unsigned Msg;
  HWND Viewer;
  Word ScollCode;
  Word ThumbPos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMVScrollClipboard.

96.1.103 Messages.TWMWindowPosMsg Record

Pascal

```
TWMWindowPosMsg = packed record
  Msg: Cardinal;
  Unused: Integer;
  WindowPos: PWindowPos;
  Result: Longint;
end;
```

C++

```
struct TWMWindowPosMsg {
  unsigned Msg;
  int Unused;
  PWindowPos WindowPos;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMWindowPosMsg.

96.1.104 Messages.TWMWinIniChange Record

Pascal

```
TWMWinIniChange = packed record
  Msg: Cardinal;
  Unused: Integer;
  Section: PChar;
  Result: Longint;
end;
```

C++

```
struct TWMWinIniChange {
  unsigned Msg;
  int Unused;
  const char * Section;
  Longint Result;
};
```

File

Messages

Description

This is record Messages.TWMWinIniChange.

96.2 Types

The following table lists types in this documentation.

Types

Name	Description
PMessage (see page 16279)	This is type Messages.PMessage.
TWMCancelMode (see page 16280)	This is type Messages.TWMCancelMode.
TWMChangeUIState (see page 16280)	This is type Messages.TWMChangeUIState.
TWMChar (see page 16280)	This is type Messages.TWMChar.
TWMChildActivate (see page 16281)	This is type Messages.TWMChildActivate.
TWMClear (see page 16281)	This is type Messages.TWMClear.
TWMClose (see page 16281)	This is type Messages.TWMClose.
TWMCopy (see page 16282)	This is type Messages.TWMCopy.
TWMCtlColorBtn (see page 16282)	This is type Messages.TWMCtlColorBtn.
TWMCtlColorDlg (see page 16282)	This is type Messages.TWMCtlColorDlg.
TWMCtlColorEdit (see page 16283)	This is type Messages.TWMCtlColorEdit.
TWMCtlColorListbox (see page 16283)	This is type Messages.TWMCtlColorListbox.
TWMCtlColorMsgbox (see page 16283)	This is type Messages.TWMCtlColorMsgbox.
TWMCtlColorScrollbar (see page 16284)	This is type Messages.TWMCtlColorScrollbar.
TWMCtlColorStatic (see page 16284)	This is type Messages.TWMCtlColorStatic.
TWMCut (see page 16284)	This is type Messages.TWMCut.
TWMDeadChar (see page 16285)	This is type Messages.TWMDeadChar.
TWMDestroy (see page 16285)	This is type Messages.TWMDestroy.
TWMDestroyClipboard (see page 16285)	This is type Messages.TWMDestroyClipboard.
TWMDrawClipboard (see page 16286)	This is type Messages.TWMDrawClipboard.
TWMExitMenuLoop (see page 16286)	This is type Messages.TWMExitMenuLoop.
TWMFontChange (see page 16286)	This is type Messages.TWMFontChange.
TWMGetDlgCode (see page 16287)	This is type Messages.TWMGetDlgCode.
TWMGetFont (see page 16287)	This is type Messages.TWMGetFont.
TWMGetHotKey (see page 16287)	This is type Messages.TWMGetHotKey.
TWMGetTextLength (see page 16288)	This is type Messages.TWMGetTextLength.
TWMHScroll (see page 16288)	This is type Messages.TWMHScroll.
TWMIconEraseBkgnd (see page 16288)	This is type Messages.TWMIconEraseBkgnd.
TWMKeyDown (see page 16289)	This is type Messages.TWMKeyDown.
TWMKeyUp (see page 16289)	This is type Messages.TWMKeyUp.
TWMLButtonDblClk (see page 16289)	This is type Messages.TWMLButtonDblClk.
TWMLButtonDown (see page 16290)	TWMLButtonDown represents the Windows message that occurs when the user clicks the left mouse button.
TWMLButtonUp (see page 16290)	This is type Messages.TWMLButtonUp.
TWMMButtonDblClk (see page 16290)	This is type Messages.TWMMButtonDblClk.
TWMMButtonDown (see page 16291)	This is type Messages.TWMMButtonDown.
TWMMButtonUp (see page 16291)	This is type Messages.TWMMButtonUp.
TWMMDIGetActive (see page 16291)	This is type Messages.TWMMDIGetActive.
TWMMDIIconArrange (see page 16292)	This is type Messages.TWMMDIIconArrange.
TWMMDIRefreshMenu (see page 16292)	This is type Messages.TWMMDIRefreshMenu.
TWMMouseMove (see page 16292)	This is type Messages.TWMMouseMove.
TWMNCDestroy (see page 16293)	This is type Messages.TWMNCDestroy.
TWMNCLButtonDblClk (see page 16293)	This is type Messages.TWMNCLButtonDblClk.
TWMNCLButtonDown (see page 16293)	This is type Messages.TWMNCLButtonDown.
TWMNCLButtonUp (see page 16294)	This is type Messages.TWMNCLButtonUp.

TWMNCMButtonDblClk (see page 16294)	This is type Messages.TWMNCMButtonDblClk.
TWMNCMButtonDown (see page 16294)	This is type Messages.TWMNCMButtonDown.
TWMNCMButtonUp (see page 16295)	This is type Messages.TWMNCMButtonUp.
TWMNCMouseMove (see page 16295)	This is type Messages.TWMNCMouseMove.
TWMNCRButtonDblClk (see page 16295)	This is type Messages.TWMNCRButtonDblClk.
TWMNCRButtonDown (see page 16296)	This is type Messages.TWMNCRButtonDown.
TWMNCRButtonUp (see page 16296)	This is type Messages.TWMNCRButtonUp.
TWMPaintIcon (see page 16296)	This is type Messages.TWMPaintIcon.
TWMPaste (see page 16297)	This is type Messages.TWMPaste.
TWMPrintClient (see page 16297)	This is type Messages.TWMPrintClient.
TWMQueryDragIcon (see page 16297)	This is type Messages.TWMQueryDragIcon.
TWMQueryNewPalette (see page 16298)	This is type Messages.TWMQueryNewPalette.
TWMQueryOpen (see page 16298)	This is type Messages.TWMQueryOpen.
TWMQueryUIState (see page 16298)	This is type Messages.TWMQueryUIState.
TWMQueueSync (see page 16299)	This is type Messages.TWMQueueSync.
TWMRButtonDblClk (see page 16299)	This is type Messages.TWMRButtonDblClk.
TWMRButtonDown (see page 16299)	This is type Messages.TWMRButtonDown.
TWMRButtonUp (see page 16300)	This is type Messages.TWMRButtonUp.
TWMRenderAllFormats (see page 16300)	This is type Messages.TWMRenderAllFormats.
TWMStyleChanged (see page 16300)	This is type Messages.TWMStyleChanged.
TWMStyleChanging (see page 16301)	This is type Messages.TWMStyleChanging.
TWMSysChar (see page 16301)	This is type Messages.TWMSysChar.
TWMSysColorChange (see page 16301)	This is type Messages.TWMSysColorChange.
TWMSysKeyDown (see page 16302)	This is type Messages.TWMSysKeyDown.
TWMSysKeyUp (see page 16302)	This is type Messages.TWMSysKeyUp.
TWMTimeChange (see page 16302)	This is type Messages.TWMTimeChange.
TWMUndo (see page 16303)	This is type Messages.TWMUndo.
TWMUpdateUIState (see page 16303)	This is type Messages.TWMUpdateUIState.
TWMVKeyToItem (see page 16303)	This is type Messages.TWMVKeyToItem.
TWMVScroll (see page 16304)	This is type Messages.TWMVScroll.
TWMWindowPosChanged (see page 16304)	This is type Messages.TWMWindowPosChanged.
TWMWindowPosChanging (see page 16304)	This is type Messages.TWMWindowPosChanging.

96.2.1 Messages.PMessage Type

Pascal

```
PMessage = ^TMessage;
```

C++

```
^TMessage PMessage;
```

File

Messages

Description

This is type Messages.PMessage.

96.2.2 Messages.TWMCancelMode Type

Pascal

```
TWMCancelMode = TWMNoParams;
```

C++

```
TWMNoParams TWMCancelMode;
```

File

Messages

Description

This is type Messages.TWMCancelMode.

96.2.3 Messages.TWMChangeUIState Type

Pascal

```
TWMChangeUIState = TWMUIState;
```

C++

```
TWMUIState TWMChangeUIState;
```

File

Messages

Description

This is type Messages.TWMChangeUIState.

96.2.4 Messages.TWMChar Type

Pascal

```
TWMChar = TWMKey;
```

C++

```
TWMKey TWMChar;
```

File

Messages

Description

This is type Messages.TWMChar.

96.2.5 Messages.TWMChildActivate Type

Pascal

```
TWMChildActivate = TWMNoParams;
```

C++

```
TWMNoParams TWMChildActivate;
```

File

Messages

Description

This is type Messages.TWMChildActivate.

96.2.6 Messages.TWMClear Type

Pascal

```
TWMClear = TWMNoParams;
```

C++

```
TWMNoParams TWMClear;
```

File

Messages

Description

This is type Messages.TWMClear.

96.2.7 Messages.TWMClose Type

Pascal

```
TWMClose = TWMNoParams;
```

C++

```
TWMNoParams TWMClose;
```

File

Messages

Description

This is type Messages.TWMClose.

96.2.8 Messages.TWMCopy Type

Pascal

```
TWMCopy = TWMNoParams;
```

C++

```
TWMNoParams TWMCopy;
```

File

Messages

Description

This is type Messages.TWMCopy.

96.2.9 Messages.TWMCtlColorBtn Type

Pascal

```
TWMCtlColorBtn = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorBtn;
```

File

Messages

Description

This is type Messages.TWMCtlColorBtn.

96.2.10 Messages.TWMCtlColorDlg Type

Pascal

```
TWMCtlColorDlg = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorDlg;
```

File

Messages

Description

This is type Messages.TWMCtlColorDlg.

96.2.11 Messages.TWMCtlColorEdit Type

Pascal

```
TWMCtlColorEdit = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorEdit;
```

File

Messages

Description

This is type Messages.TWMCtlColorEdit.

96.2.12 Messages.TWMCtlColorListbox Type

Pascal

```
TWMCtlColorListbox = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorListbox;
```

File

Messages

Description

This is type Messages.TWMCtlColorListbox.

96.2.13 Messages.TWMCtlColorMsgbox Type

Pascal

```
TWMCtlColorMsgbox = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorMsgbox;
```

File

Messages

Description

This is type Messages.TWMCtlColorMsgbox.

96.2.14 Messages.TWMCtlColorScrollbar Type

Pascal

```
TWMCtlColorScrollbar = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorScrollbar;
```

File

Messages

Description

This is type Messages.TWMCtlColorScrollbar.

96.2.15 Messages.TWMCtlColorStatic Type

Pascal

```
TWMCtlColorStatic = TWMCtlColor;
```

C++

```
TWMCtlColor TWMCtlColorStatic;
```

File

Messages

Description

This is type Messages.TWMCtlColorStatic.

96.2.16 Messages.TWMCut Type

Pascal

```
TWMCut = TWMNoParams;
```

C++

```
TWMNoParams TWMCut;
```

File

Messages

Description

This is type Messages.TWMCut.

96.2.17 Messages.TWMDeadChar Type

Pascal

```
TWMDeadChar = TWMChar;
```

C++

```
TWMChar TWMDeadChar;
```

File

Messages

Description

This is type Messages.TWMDeadChar.

96.2.18 Messages.TWMDestroy Type

Pascal

```
TWMDestroy = TWMNoParams;
```

C++

```
TWMNoParams TWMDestroy;
```

File

Messages

Description

This is type Messages.TWMDestroy.

96.2.19 Messages.TWMDestroyClipboard Type

Pascal

```
TWMDestroyClipboard = TWMNoParams;
```

C++

```
TWMNoParams TWMDestroyClipboard;
```

File

Messages

Description

This is type Messages.TWMDestroyClipboard.

96.2.20 Messages.TWMDrawClipboard Type

Pascal

```
TWMDrawClipboard = TWMNoParams;
```

C++

```
TWMNoParams TWMDrawClipboard;
```

File

Messages

Description

This is type Messages.TWMDrawClipboard.

96.2.21 Messages.TWMExitMenuLoop Type

Pascal

```
TWMExitMenuLoop = TWMEnterMenuLoop;
```

C++

```
TWMEnterMenuLoop TWMExitMenuLoop;
```

File

Messages

Description

This is type Messages.TWMExitMenuLoop.

96.2.22 Messages.TWMFontChange Type

Pascal

```
TWMFontChange = TWMNoParams;
```

C++

```
TWMNoParams TWMFontChange;
```

File

Messages

Description

This is type Messages.TWMFontChange.

96.2.23 Messages.TWMGetDlgCode Type

Pascal

```
TWMGetDlgCode = TWMNoParams;
```

C++

```
TWMNoParams TWMGetDlgCode;
```

File

Messages

Description

This is type Messages.TWMGetDlgCode.

96.2.24 Messages.TWMGetFont Type

Pascal

```
TWMGetFont = TWMNoParams;
```

C++

```
TWMNoParams TWMGetFont;
```

File

Messages

Description

This is type Messages.TWMGetFont.

96.2.25 Messages.TWMGetHotKey Type

Pascal

```
TWMGetHotKey = TWMNoParams;
```

C++

```
TWMNoParams TWMGetHotKey;
```

File

Messages

Description

This is type Messages.TWMGetHotKey.

96.2.26 Messages.TWMGetTextLength Type

Pascal

```
TWMGetTextLength = TWMNoParams;
```

C++

```
TWMNoParams TWMGetTextLength;
```

File

Messages

Description

This is type Messages.TWMGetTextLength.

96.2.27 Messages.TWMHScroll Type

Pascal

```
TWMHScroll = TWMScroll;
```

C++

```
TWMScroll TWMHScroll;
```

File

Messages

Description

This is type Messages.TWMHScroll.

96.2.28 Messages.TWMIconEraseBkgnd Type

Pascal

```
TWMIconEraseBkgnd = TWMEraseBkgnd;
```

C++

```
TWMEraseBkgnd TWMIconEraseBkgnd;
```

File

Messages

Description

This is type Messages.TWMIconEraseBkgnd.

96.2.29 Messages.TWMKeyDown Type

Pascal

```
TWMKeyDown = TWMKey;
```

C++

```
TWMKey TWMKeyDown;
```

File

Messages

Description

This is type Messages.TWMKeyDown.

96.2.30 Messages.TWMKeyUp Type

Pascal

```
TWMKeyUp = TWMKey;
```

C++

```
TWMKey TWMKeyUp;
```

File

Messages

Description

This is type Messages.TWMKeyUp.

96.2.31 Messages.TWMLButtonDblClk Type

Pascal

```
TWMLButtonDblClk = TWMMouse;
```

C++

```
TWMMouse TWMLButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMLButtonDblClk.

96.2.32 Messages.TWMLButtonDown Type

TWMLButtonDown represents the Windows message that occurs when the user clicks the left mouse button.

Pascal

```
TWMLButtonDown = TWMMouse;
```

C++

```
TWMMouse TWMLButtonDown;
```

File

Messages

Description

TWMLButtonDown is the data structure that CLX uses for Windows messages informing an application that the user just clicked the left mouse button. It is the same as all mouse messages.

96.2.33 Messages.TWMLButtonUp Type

Pascal

```
TWMLButtonUp = TWMMouse;
```

C++

```
TWMMouse TWMLButtonUp;
```

File

Messages

Description

This is type Messages.TWMLButtonUp.

96.2.34 Messages.TWMMButtonDblClk Type

Pascal

```
TWMMButtonDblClk = TWMMouse;
```

C++

```
TWMMouse TWMMButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMMButtonDblClk.

96.2.35 Messages.TWMMButtonDown Type

Pascal

```
TWMMButtonDown = TWMMouse;
```

C++

```
TWMMouse TWMMButtonDown;
```

File

Messages

Description

This is type Messages.TWMMButtonDown.

96.2.36 Messages.TWMMButtonUp Type

Pascal

```
TWMMButtonUp = TWMMouse;
```

C++

```
TWMMouse TWMMButtonUp;
```

File

Messages

Description

This is type Messages.TWMMButtonUp.

96.2.37 Messages.TWMMDIGetActive Type

Pascal

```
TWMMDIGetActive = TWMNoParams;
```

C++

```
TWMNoParams TWMMDIGetActive;
```

File

Messages

Description

This is type Messages.TWMMDIGetActive.

96.2.38 Messages.TWMMDIIconArrange Type

Pascal

```
TWMMDIIconArrange = TWMNoParams;
```

C++

```
TWMNoParams TWMMDIIconArrange;
```

File

Messages

Description

This is type Messages.TWMMDIIconArrange.

96.2.39 Messages.TWMMDIRefreshMenu Type

Pascal

```
TWMMDIRefreshMenu = TWMNoParams;
```

C++

```
TWMNoParams TWMMDIRefreshMenu;
```

File

Messages

Description

This is type Messages.TWMMDIRefreshMenu.

96.2.40 Messages.TWMMouseMove Type

Pascal

```
TWMMouseMove = TWMMouse;
```

C++

```
TWMMouse TWMMouseMove;
```

File

Messages

Description

This is type Messages.TWMMouseMove.

96.2.41 Messages.TWMNCDestroy Type

Pascal

```
TWMNCDestroy = TWMNoParams;
```

C++

```
TWMNoParams TWMNCDestroy;
```

File

Messages

Description

This is type Messages.TWMNCDestroy.

96.2.42 Messages.TWMNCLButtonDblClk Type

Pascal

```
TWMNCLButtonDblClk = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCLButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMNCLButtonDblClk.

96.2.43 Messages.TWMNCLButtonDown Type

Pascal

```
TWMNCLButtonDown = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCLButtonDown;
```

File

Messages

Description

This is type Messages.TWMNCLButtonDown.

96.2.44 Messages.TWMNCLButtonUp Type

Pascal

```
TWMNCLButtonUp = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCLButtonUp;
```

File

Messages

Description

This is type Messages.TWMNCLButtonUp.

96.2.45 Messages.TWMNCMButtonDblClk Type

Pascal

```
TWMNCMButtonDblClk = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCMButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMNCMButtonDblClk.

96.2.46 Messages.TWMNCMButtonDown Type

Pascal

```
TWMNCMButtonDown = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCMButtonDown;
```

File

Messages

Description

This is type Messages.TWMNCMButtonDown.

96.2.47 Messages.TWMNCMButtonUp Type

Pascal

```
TWMNCMButtonUp = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCMButtonUp;
```

File

Messages

Description

This is type Messages.TWMNCMButtonUp.

96.2.48 Messages.TWMNCMouseMove Type

Pascal

```
TWMNCMouseMove = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCMouseMove;
```

File

Messages

Description

This is type Messages.TWMNCMouseMove.

96.2.49 Messages.TWMNCRButtonDblClk Type

Pascal

```
TWMNCRButtonDblClk = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCRButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMNCRButtonDblClk.

96.2.50 Messages.TWMNCRButtonDown Type

Pascal

```
TWMNCRButtonDown = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCRButtonDown;
```

File

Messages

Description

This is type Messages.TWMNCRButtonDown.

96.2.51 Messages.TWMNCRButtonUp Type

Pascal

```
TWMNCRButtonUp = TWMNCHitMessage;
```

C++

```
TWMNCHitMessage TWMNCRButtonUp;
```

File

Messages

Description

This is type Messages.TWMNCRButtonUp.

96.2.52 Messages.TWMPaintIcon Type

Pascal

```
TWMPaintIcon = TWMNoParams;
```

C++

```
TWMNoParams TWMPaintIcon;
```

File

Messages

Description

This is type Messages.TWMPaintIcon.

96.2.53 Messages.TWMPaste Type

Pascal

```
TWMPaste = TWMNoParams;
```

C++

```
TWMNoParams TWMPaste;
```

File

Messages

Description

This is type Messages.TWMPaste.

96.2.54 Messages.TWMPrintClient Type

Pascal

```
TWMPrintClient = TWMPrint;
```

C++

```
TWMPrint TWMPrintClient;
```

File

Messages

Description

This is type Messages.TWMPrintClient.

96.2.55 Messages.TWMQueryDragIcon Type

Pascal

```
TWMQueryDragIcon = TWMNoParams;
```

C++

```
TWMNoParams TWMQueryDragIcon;
```

File

Messages

Description

This is type Messages.TWMQueryDragIcon.

96.2.56 Messages.TWMQueryNewPalette Type

Pascal

```
TWMQueryNewPalette = TWMNoParams;
```

C++

```
TWMNoParams TWMQueryNewPalette;
```

File

Messages

Description

This is type Messages.TWMQueryNewPalette.

96.2.57 Messages.TWMQueryOpen Type

Pascal

```
TWMQueryOpen = TWMNoParams;
```

C++

```
TWMNoParams TWMQueryOpen;
```

File

Messages

Description

This is type Messages.TWMQueryOpen.

96.2.58 Messages.TWMQueryUIState Type

Pascal

```
TWMQueryUIState = TWMNoParams;
```

C++

```
TWMNoParams TWMQueryUIState;
```

File

Messages

Description

This is type Messages.TWMQueryUIState.

96.2.59 Messages.TWMQueueSync Type

Pascal

```
TWMQueueSync = TWMNoParams;
```

C++

```
TWMNoParams TWMQueueSync;
```

File

Messages

Description

This is type Messages.TWMQueueSync.

96.2.60 Messages.TWMRButtonDblClk Type

Pascal

```
TWMRButtonDblClk = TWMMouse;
```

C++

```
TWMMouse TWMRButtonDblClk;
```

File

Messages

Description

This is type Messages.TWMRButtonDblClk.

96.2.61 Messages.TWMRButtonDown Type

Pascal

```
TWMRButtonDown = TWMMouse;
```

C++

```
TWMMouse TWMRButtonDown;
```

File

Messages

Description

This is type Messages.TWMRButtonDown.

96.2.62 Messages.TWMRButtonUp Type

Pascal

```
TWMRButtonUp = TWMMouse;
```

C++

```
TWMMouse TWMRButtonUp;
```

File

Messages

Description

This is type Messages.TWMRButtonUp.

96.2.63 Messages.TWMRenderAllFormats Type

Pascal

```
TWMRenderAllFormats = TWMNoParams;
```

C++

```
TWMNoParams TWMRenderAllFormats;
```

File

Messages

Description

This is type Messages.TWMRenderAllFormats.

96.2.64 Messages.TWMStyleChanged Type

Pascal

```
TWMStyleChanged = TWMStyleChange;
```

C++

```
TWMStyleChange TWMStyleChanged;
```

File

Messages

Description

This is type Messages.TWMStyleChanged.

96.2.65 Messages.TWMStyleChanging Type

Pascal

```
TWMStyleChanging = TWMStyleChange;
```

C++

```
TWMStyleChange TWMStyleChanging;
```

File

Messages

Description

This is type Messages.TWMStyleChanging.

96.2.66 Messages.TWMSysChar Type

Pascal

```
TWMSysChar = TWMKey;
```

C++

```
TWMKey TWMSysChar;
```

File

Messages

Description

This is type Messages.TWMSysChar.

96.2.67 Messages.TWMSysColorChange Type

Pascal

```
TWMSysColorChange = TWMNoParams;
```

C++

```
TWMNoParams TWMSysColorChange;
```

File

Messages

Description

This is type Messages.TWMSysColorChange.

96.2.68 Messages.TWMSysKeyDown Type

Pascal

```
TWMSysKeyDown = TWMKey;
```

C++

```
TWMKey TWMSysKeyDown;
```

File

Messages

Description

This is type Messages.TWMSysKeyDown.

96.2.69 Messages.TWMSysKeyUp Type

Pascal

```
TWMSysKeyUp = TWMKey;
```

C++

```
TWMKey TWMSysKeyUp;
```

File

Messages

Description

This is type Messages.TWMSysKeyUp.

96.2.70 Messages.TWMTimeChange Type

Pascal

```
TWMTimeChange = TWMNoParams;
```

C++

```
TWMNoParams TWMTimeChange;
```

File

Messages

Description

This is type Messages.TWMTimeChange.

96.2.71 Messages.TWMUndo Type

Pascal

```
TWMUndo = TWMNoParams;
```

C++

```
TWMNoParams TWMUndo;
```

File

Messages

Description

This is type Messages.TWMUndo.

96.2.72 Messages.TWMUpdateUIState Type

Pascal

```
TWMUpdateUIState = TWMUIState;
```

C++

```
TWMUIState TWMUpdateUIState;
```

File

Messages

Description

This is type Messages.TWMUpdateUIState.

96.2.73 Messages.TWMVKeyToItem Type

Pascal

```
TWMVKeyToItem = TWMCharToItem;
```

C++

```
TWMCharToItem TWMVKeyToItem;
```

File

Messages

Description

This is type Messages.TWMVKeyToItem.

96.2.74 Messages.TWMVScroll Type

Pascal

```
TWMVScroll = TWMScroll;
```

C++

```
TWMScroll TWMVScroll;
```

File

Messages

Description

This is type Messages.TWMVScroll.

96.2.75 Messages.TWMWindowPosChanged Type

Pascal

```
TWMWindowPosChanged = TWMWindowPosMsg;
```

C++

```
TWMWindowPosMsg TWMWindowPosChanged;
```

File

Messages

Description

This is type Messages.TWMWindowPosChanged.

96.2.76 Messages.TWMWindowPosChanging Type

Pascal

```
TWMWindowPosChanging = TWMWindowPosMsg;
```

C++

```
TWMWindowPosMsg TWMWindowPosChanging;
```

File

Messages

Description

This is type Messages.TWMWindowPosChanging.

96.3 Constants

The following table lists constants in this documentation.

Constants

Name	Description
BM_CLICK (see page 16312)	This is constant Messages.BM_CLICK.
BM_GETCHECK (see page 16313)	This is constant Messages.BM_GETCHECK.
BM_GETIMAGE (see page 16313)	This is constant Messages.BM_GETIMAGE.
BM_GETSTATE (see page 16313)	This is constant Messages.BM_GETSTATE.
BM_SETCHECK (see page 16314)	This is constant Messages.BM_SETCHECK.
BM_SETIMAGE (see page 16314)	This is constant Messages.BM_SETIMAGE.
BM_SETSTATE (see page 16314)	This is constant Messages.BM_SETSTATE.
BM_SETSTYLE (see page 16315)	This is constant Messages.BM_SETSTYLE.
BN_CLICKED (see page 16315)	This is constant Messages.BN_CLICKED.
BN_DBLCLK (see page 16315)	This is constant Messages.BN_DBLCLK.
BN_DISABLE (see page 16316)	This is constant Messages.BN_DISABLE.
BN_DOUBLECLICKED (see page 16316)	This is constant Messages.BN_DOUBLECLICKED.
BN_HILITE (see page 16316)	This is constant Messages.BN_HILITE.
BN_KILLFOCUS (see page 16317)	This is constant Messages.BN_KILLFOCUS.
BN_PAINT (see page 16317)	This is constant Messages.BN_PAINT.
BN_PUSHED (see page 16317)	This is constant Messages.BN_PUSHED.
BN_SETFOCUS (see page 16318)	This is constant Messages.BN_SETFOCUS.
BN_UNHILITE (see page 16318)	This is constant Messages.BN_UNHILITE.
BN_UNPUSHED (see page 16318)	This is constant Messages.BN_UNPUSHED.
CB_ADDSTRING (see page 16319)	This is constant Messages.CB_ADDSTRING.
CB_DELETESTRING (see page 16319)	This is constant Messages.CB_DELETESTRING.
CB_DIR (see page 16319)	This is constant Messages.CB_DIR.
CB_FINDSTRING (see page 16320)	This is constant Messages.CB_FINDSTRING.
CB_FINDSTRINGEXACT (see page 16320)	This is constant Messages.CB_FINDSTRINGEXACT.
CB_GETCOUNT (see page 16320)	This is constant Messages.CB_GETCOUNT.
CB_GETCURSEL (see page 16321)	This is constant Messages.CB_GETCURSEL.
CB_GETDROPPEDCONTROLRECT (see page 16321)	This is constant Messages.CB_GETDROPPEDCONTROLRECT.
CB_GETDROPPEDSTATE (see page 16321)	This is constant Messages.CB_GETDROPPEDSTATE.
CB_GETDROPPEDWIDTH (see page 16322)	This is constant Messages.CB_GETDROPPEDWIDTH.
CB_GETEDITSEL (see page 16322)	This is constant Messages.CB_GETEDITSEL.
CB_GETEXTENDEDUI (see page 16322)	This is constant Messages.CB_GETEXTENDEDUI.
CB_GETHORIZONTALEXTENT (see page 16323)	This is constant Messages.CB_GETHORIZONTALEXTENT.
CB_GETITEMDATA (see page 16323)	This is constant Messages.CB_GETITEMDATA.
CB_GETITEMHEIGHT (see page 16323)	This is constant Messages.CB_GETITEMHEIGHT.
CB_GETLBTEXT (see page 16324)	This is constant Messages.CB_GETLBTEXT.
CB_GETLBTEXTLEN (see page 16324)	This is constant Messages.CB_GETLBTEXTLEN.
CB_GETLOCALE (see page 16324)	This is constant Messages.CB_GETLOCALE.
CB_GETTOPINDEX (see page 16325)	This is constant Messages.CB_GETTOPINDEX.
CB_INITSTORAGE (see page 16325)	This is constant Messages.CB_INITSTORAGE.
CB_INSERTSTRING (see page 16325)	This is constant Messages.CB_INSERTSTRING.
CB_LIMITTEXT (see page 16326)	This is constant Messages.CB_LIMITTEXT.
CB_MSGMAX (see page 16326)	This is constant Messages.CB_MSGMAX.
CB_RESETCONTENT (see page 16326)	This is constant Messages.CB_RESETCONTENT.
CB_SELECTSTRING (see page 16327)	This is constant Messages.CB_SELECTSTRING.

CB_SETCURSEL (see page 16327)	This is constant Messages.CB_SETCURSEL.
CB_SETDROPPEDWIDTH (see page 16327)	This is constant Messages.CB_SETDROPPEDWIDTH.
CB_SETEDITSEL (see page 16328)	This is constant Messages.CB_SETEDITSEL.
CB_SETEXTENDEDUI (see page 16328)	This is constant Messages.CB_SETEXTENDEDUI.
CB_SETHORIZONTALEXTENT (see page 16328)	This is constant Messages.CB_SETHORIZONTALEXTENT.
CB_SETITEMDATA (see page 16329)	This is constant Messages.CB_SETITEMDATA.
CB_SETITEMHEIGHT (see page 16329)	This is constant Messages.CB_SETITEMHEIGHT.
CB_SETLOCALE (see page 16329)	This is constant Messages.CB_SETLOCALE.
CB_SETTOPINDEX (see page 16330)	This is constant Messages.CB_SETTOPINDEX.
CB_SHOWDROPDOWN (see page 16330)	This is constant Messages.CB_SHOWDROPDOWN.
CBN_CLOSEUP (see page 16330)	This is constant Messages.CBN_CLOSEUP.
CBN_DBLCLK (see page 16331)	This is constant Messages.CBN_DBLCLK.
CBN_DROPDOWN (see page 16331)	This is constant Messages.CBN_DROPDOWN.
CBN_EDITCHANGE (see page 16331)	This is constant Messages.CBN_EDITCHANGE.
CBN_EDITUPDATE (see page 16332)	This is constant Messages.CBN_EDITUPDATE.
CBN_ERRSPACE (see page 16332)	This is constant Messages.CBN_ERRSPACE.
CBN_KILLFOCUS (see page 16332)	This is constant Messages.CBN_KILLFOCUS.
CBN_SELCHANGE (see page 16333)	This is constant Messages.CBN_SELCHANGE.
CBN_SELENDCANCEL (see page 16333)	This is constant Messages.CBN_SELENDCANCEL.
CBN_SELENDOK (see page 16333)	This is constant Messages.CBN_SELENDOK.
CBN_SETFOCUS (see page 16334)	This is constant Messages.CBN_SETFOCUS.
DM_GETDEFID (see page 16334)	This is constant Messages.DM_GETDEFID.
DM_REPOSITION (see page 16334)	This is constant Messages.DM_REPOSITION.
DM_SETDEFID (see page 16335)	This is constant Messages.DM_SETDEFID.
EM_CANUNDO (see page 16335)	This is constant Messages.EM_CANUNDO.
EM_CHARFROMPOS (see page 16335)	This is constant Messages.EM_CHARFROMPOS.
EM_EMPTYUNDOBUFFER (see page 16336)	This is constant Messages.EM_EMPTYUNDOBUFFER.
EM_FMTLINES (see page 16336)	This is constant Messages.EM_FMTLINES.
EM_GETFIRSTVISIBLELINE (see page 16336)	This is constant Messages.EM_GETFIRSTVISIBLELINE.
EM_GETHANDLE (see page 16337)	This is constant Messages.EM_GETHANDLE.
EM_GETIMESTATUS (see page 16337)	This is constant Messages.EM_GETIMESTATUS.
EM_GETLIMITTEXT (see page 16337)	This is constant Messages.EM_GETLIMITTEXT.
EM_GETLINE (see page 16338)	This is constant Messages.EM_GETLINE.
EM_GETLINECOUNT (see page 16338)	This is constant Messages.EM_GETLINECOUNT.
EM_GETMARGINS (see page 16338)	This is constant Messages.EM_GETMARGINS.
EM_GETMODIFY (see page 16339)	This is constant Messages.EM_GETMODIFY.
EM_GETPASSWORDCHAR (see page 16339)	This is constant Messages.EM_GETPASSWORDCHAR.
EM_GETRECT (see page 16339)	This is constant Messages.EM_GETRECT.
EM_GETSEL (see page 16340)	This is constant Messages.EM_GETSEL.
EM_GETTHUMB (see page 16340)	This is constant Messages.EM_GETTHUMB.
EM_GETWORDBREAKPROC (see page 16340)	This is constant Messages.EM_GETWORDBREAKPROC.
EM_LIMITTEXT (see page 16341)	This is constant Messages.EM_LIMITTEXT.
EM_LINEFROMCHAR (see page 16341)	This is constant Messages.EM_LINEFROMCHAR.
EM_LINEINDEX (see page 16341)	This is constant Messages.EM_LINEINDEX.
EM_LINELENGTH (see page 16342)	This is constant Messages.EM_LINELENGTH.
EM_LINESCROLL (see page 16342)	This is constant Messages.EM_LINESCROLL.
EM_POSFROMCHAR (see page 16342)	This is constant Messages.EM_POSFROMCHAR.
EM_REPLACESEL (see page 16343)	This is constant Messages.EM_REPLACESEL.
EM_SCROLL (see page 16343)	This is constant Messages.EM_SCROLL.
EM_SCROLLCARET (see page 16343)	This is constant Messages.EM_SCROLLCARET.
EM_SETHANDLE (see page 16344)	This is constant Messages.EM_SETHANDLE.
EM_SETIMESTATUS (see page 16344)	This is constant Messages.EM_SETIMESTATUS.
EM_SETLIMITTEXT (see page 16344)	This is constant Messages.EM_SETLIMITTEXT.
EM_SETMARGINS (see page 16345)	This is constant Messages.EM_SETMARGINS.

EM_SETMODIFY (see page 16345)	This is constant Messages.EM_SETMODIFY.
EM_SETPASSWORDCHAR (see page 16345)	This is constant Messages.EM_SETPASSWORDCHAR.
EM_SETREADONLY (see page 16346)	This is constant Messages.EM_SETREADONLY.
EM_SETRECT (see page 16346)	This is constant Messages.EM_SETRECT.
EM_SETRECTNP (see page 16346)	This is constant Messages.EM_SETRECTNP.
EM_SETSEL (see page 16347)	This is constant Messages.EM_SETSEL.
EM_SETTABSTOPS (see page 16347)	This is constant Messages.EM_SETTABSTOPS.
EM_SETWORDBREAKPROC (see page 16347)	This is constant Messages.EM_SETWORDBREAKPROC.
EM_UNDO (see page 16348)	This is constant Messages.EM_UNDO.
EN_CHANGE (see page 16348)	This is constant Messages.EN_CHANGE.
EN_ERRSPACE (see page 16348)	This is constant Messages.EN_ERRSPACE.
EN_HSCROLL (see page 16349)	This is constant Messages.EN_HSCROLL.
EN_KILLFOCUS (see page 16349)	This is constant Messages.EN_KILLFOCUS.
EN_MAXTEXT (see page 16349)	This is constant Messages.EN_MAXTEXT.
EN_SETFOCUS (see page 16350)	This is constant Messages.EN_SETFOCUS.
EN_UPDATE (see page 16350)	This is constant Messages.EN_UPDATE.
EN_VSCROLL (see page 16350)	This is constant Messages.EN_VSCROLL.
LB_ADDFILE (see page 16351)	This is constant Messages.LB_ADDFILE.
LB_ADDSTRING (see page 16351)	This is constant Messages.LB_ADDSTRING.
LB_DELETESTRING (see page 16351)	This is constant Messages.LB_DELETESTRING.
LB_DIR (see page 16352)	This is constant Messages.LB_DIR.
LB_FINDSTRING (see page 16352)	This is constant Messages.LB_FINDSTRING.
LB_FINDSTRINGEXACT (see page 16352)	This is constant Messages.LB_FINDSTRINGEXACT.
LB_GETANCHORINDEX (see page 16353)	This is constant Messages.LB_GETANCHORINDEX.
LB_GETCARETINDEX (see page 16353)	This is constant Messages.LB_GETCARETINDEX.
LB_GETCOUNT (see page 16353)	This is constant Messages.LB_GETCOUNT.
LB_GETCURSEL (see page 16354)	This is constant Messages.LB_GETCURSEL.
LB_GETHORIZONTALEXTENT (see page 16354)	This is constant Messages.LB_GETHORIZONTALEXTENT.
LB_GETITEMDATA (see page 16354)	This is constant Messages.LB_GETITEMDATA.
LB_GETITEMHEIGHT (see page 16355)	This is constant Messages.LB_GETITEMHEIGHT.
LB_GETITEMRECT (see page 16355)	This is constant Messages.LB_GETITEMRECT.
LB_GETLOCALE (see page 16355)	This is constant Messages.LB_GETLOCALE.
LB_GETSEL (see page 16356)	This is constant Messages.LB_GETSEL.
LB_GETSELCOUNT (see page 16356)	This is constant Messages.LB_GETSELCOUNT.
LB_GETSELITEMS (see page 16356)	This is constant Messages.LB_GETSELITEMS.
LB_GETTEXT (see page 16357)	This is constant Messages.LB_GETTEXT.
LB_GETTEXTLEN (see page 16357)	This is constant Messages.LB_GETTEXTLEN.
LB_GETTOPINDEX (see page 16357)	This is constant Messages.LB_GETTOPINDEX.
LB_INITSTORAGE (see page 16358)	This is constant Messages.LB_INITSTORAGE.
LB_INSERTSTRING (see page 16358)	This is constant Messages.LB_INSERTSTRING.
LB_ITEMFROMPOINT (see page 16358)	This is constant Messages.LB_ITEMFROMPOINT.
LB_MSGMAX (see page 16359)	This is constant Messages.LB_MSGMAX.
LB_RESETCONTENT (see page 16359)	This is constant Messages.LB_RESETCONTENT.
LB_SELECTSTRING (see page 16359)	This is constant Messages.LB_SELECTSTRING.
LB_SELITEMRANGE (see page 16360)	This is constant Messages.LB_SELITEMRANGE.
LB_SELITEMRANGEEX (see page 16360)	This is constant Messages.LB_SELITEMRANGEEX.
LB_SETANCHORINDEX (see page 16360)	This is constant Messages.LB_SETANCHORINDEX.
LB_SETCARETINDEX (see page 16361)	This is constant Messages.LB_SETCARETINDEX.
LB_SETCOLUMNWIDTH (see page 16361)	This is constant Messages.LB_SETCOLUMNWIDTH.
LB_SETCOUNT (see page 16361)	This is constant Messages.LB_SETCOUNT.
LB_SETCURSEL (see page 16362)	This is constant Messages.LB_SETCURSEL.
LB_SETHORIZONTALEXTENT (see page 16362)	This is constant Messages.LB_SETHORIZONTALEXTENT.
LB_SETITEMDATA (see page 16362)	This is constant Messages.LB_SETITEMDATA.
LB_SETITEMHEIGHT (see page 16363)	This is constant Messages.LB_SETITEMHEIGHT.

LB_SETLOCALE (see page 16363)	This is constant Messages.LB_SETLOCALE.
LB_SETSEL (see page 16363)	This is constant Messages.LB_SETSEL.
LB_SETTABSTOPS (see page 16364)	This is constant Messages.LB_SETTABSTOPS.
LB_SETTOPINDEX (see page 16364)	This is constant Messages.LB_SETTOPINDEX.
LBN_DBLCLK (see page 16364)	This is constant Messages.LBN_DBLCLK.
LBN_ERRSPACE (see page 16365)	This is constant Messages.LBN_ERRSPACE.
LBN_KILLFOCUS (see page 16365)	This is constant Messages.LBN_KILLFOCUS.
LBN_SELCANCEL (see page 16365)	This is constant Messages.LBN_SELCANCEL.
LBN_SELCHANGE (see page 16366)	This is constant Messages.LBN_SELCHANGE.
LBN_SETFOCUS (see page 16366)	This is constant Messages.LBN_SETFOCUS.
PSM_PAGEINFO (see page 16366)	This is constant Messages.PSM_PAGEINFO.
PSM_SHEETINFO (see page 16367)	This is constant Messages.PSM_SHEETINFO.
SBM_ENABLE_ARROWS (see page 16367)	This is constant Messages.SBM_ENABLE_ARROWS.
SBM_GETPOS (see page 16367)	This is constant Messages.SBM_GETPOS.
SBM_GETRANGE (see page 16368)	This is constant Messages.SBM_GETRANGE.
SBM_GETSCROLLINFO (see page 16368)	This is constant Messages.SBM_GETSCROLLINFO.
SBM_SETPOS (see page 16368)	This is constant Messages.SBM_SETPOS.
SBM_SETRANGE (see page 16369)	This is constant Messages.SBM_SETRANGE.
SBM_SETRANGEREDRAW (see page 16369)	This is constant Messages.SBM_SETRANGEREDRAW.
SBM_SETSCROLLINFO (see page 16369)	This is constant Messages.SBM_SETSCROLLINFO.
WM_ACTIVATE (see page 16370)	This is constant Messages.WM_ACTIVATE.
WM_ACTIVATEAPP (see page 16370)	This is constant Messages.WM_ACTIVATEAPP.
WM_APP (see page 16370)	This is constant Messages.WM_APP.
WM_APPCOMMAND (see page 16371)	This is constant Messages.WM_APPCOMMAND.
WM_ASKCBFORMATNAME (see page 16371)	This is constant Messages.WM_ASKCBFORMATNAME.
WM_CANCELJOURNAL (see page 16371)	This is constant Messages.WM_CANCELJOURNAL.
WM_CANCELMODE (see page 16372)	This is constant Messages.WM_CANCELMODE.
WM_CAPTURECHANGED (see page 16372)	This is constant Messages.WM_CAPTURECHANGED.
WM_CHANGECBCHAIN (see page 16372)	This is constant Messages.WM_CHANGECBCHAIN.
WM_CHANGEUISTATE (see page 16373)	This is constant Messages.WM_CHANGEUISTATE.
WM_CHAR (see page 16373)	This is constant Messages.WM_CHAR.
WM_CHARTOITEM (see page 16373)	This is constant Messages.WM_CHARTOITEM.
WM_CHILDACTIVATE (see page 16374)	This is constant Messages.WM_CHILDACTIVATE.
WM_CLEAR (see page 16374)	This is constant Messages.WM_CLEAR.
WM_CLOSE (see page 16374)	This is constant Messages.WM_CLOSE.
WM_COALESCE_FIRST (see page 16375)	This is constant Messages.WM_COALESCE_FIRST.
WM_COALESCE_LAST (see page 16375)	This is constant Messages.WM_COALESCE_LAST.
WM_COMMAND (see page 16375)	This is constant Messages.WM_COMMAND.
WM_COMMNOTIFY (see page 16376)	This is constant Messages.WM_COMMNOTIFY.
WM_COMPACTING (see page 16376)	This is constant Messages.WM_COMPACTING.
WM_COMPAREITEM (see page 16376)	This is constant Messages.WM_COMPAREITEM.
WM_CONTEXTMENU (see page 16377)	This is constant Messages.WM_CONTEXTMENU.
WM_COPY (see page 16377)	This is constant Messages.WM_COPY.
WM_COPYDATA (see page 16377)	This is constant Messages.WM_COPYDATA.
WM_CREATE (see page 16378)	This is constant Messages.WM_CREATE.
WM_CTLCOLOR (see page 16378)	This is constant Messages.WM_CTLCOLOR.
WM_CTLCOLORBTN (see page 16378)	This is constant Messages.WM_CTLCOLORBTN.
WM_CTLCOLORDLG (see page 16379)	This is constant Messages.WM_CTLCOLORDLG.
WM_CTLCOLOREDIT (see page 16379)	This is constant Messages.WM_CTLCOLOREDIT.
WM_CTLCOLORLISTBOX (see page 16379)	This is constant Messages.WM_CTLCOLORLISTBOX.
WM_CTLCOLORMSGBOX (see page 16380)	This is constant Messages.WM_CTLCOLORMSGBOX.
WM_CTLCOLORSCROLLBAR (see page 16380)	This is constant Messages.WM_CTLCOLORSCROLLBAR.
WM_CTLCOLORSTATIC (see page 16380)	This is constant Messages.WM_CTLCOLORSTATIC.
WM_CUT (see page 16381)	This is constant Messages.WM_CUT.

WM_DDE_ACK (see page 16381)	This is constant Messages.WM_DDE_ACK.
WM_DDE_ADVISE (see page 16381)	This is constant Messages.WM_DDE_ADVISE.
WM_DDE_DATA (see page 16382)	This is constant Messages.WM_DDE_DATA.
WM_DDE_EXECUTE (see page 16382)	This is constant Messages.WM_DDE_EXECUTE.
WM_DDE_FIRST (see page 16382)	This is constant Messages.WM_DDE_FIRST.
WM_DDE_INITIATE (see page 16383)	This is constant Messages.WM_DDE_INITIATE.
WM_DDE_LAST (see page 16383)	This is constant Messages.WM_DDE_LAST.
WM_DDE_POKE (see page 16383)	This is constant Messages.WM_DDE_POKE.
WM_DDE_REQUEST (see page 16384)	This is constant Messages.WM_DDE_REQUEST.
WM_DDE_TERMINATE (see page 16384)	This is constant Messages.WM_DDE_TERMINATE.
WM_DDE_UNADVISE (see page 16384)	This is constant Messages.WM_DDE_UNADVISE.
WM_DEADCHAR (see page 16385)	This is constant Messages.WM_DEADCHAR.
WM_DELETEITEM (see page 16385)	This is constant Messages.WM_DELETEITEM.
WM_DESTROY (see page 16385)	This is constant Messages.WM_DESTROY.
WM_DESTROYCLIPBOARD (see page 16386)	This is constant Messages.WM_DESTROYCLIPBOARD.
WM_DEVICECHANGE (see page 16386)	This is constant Messages.WM_DEVICECHANGE.
WM_DEVMODECHANGE (see page 16386)	This is constant Messages.WM_DEVMODECHANGE.
WM_DISPLAYCHANGE (see page 16387)	This is constant Messages.WM_DISPLAYCHANGE.
WM_DRAWCLIPBOARD (see page 16387)	This is constant Messages.WM_DRAWCLIPBOARD.
WM_DRAWITEM (see page 16387)	This is constant Messages.WM_DRAWITEM.
WM_DROPFILES (see page 16388)	This is constant Messages.WM_DROPFILES.
WM_DWMCOLORIZATIONCOLORCHANGED (see page 16388)	This is constant Messages.WM_DWMCOLORIZATIONCOLORCHANGED.
WM_DWMCOMPOSITIONCHANGED (see page 16388)	This is constant Messages.WM_DWMCOMPOSITIONCHANGED.
WM_DWMNCRENDERINGCHANGED (see page 16389)	This is constant Messages.WM_DWMNCRENDERINGCHANGED.
WM_DWMWINDOWMAXIMIZEDCHANGE (see page 16389)	This is constant Messages.WM_DWMWINDOWMAXIMIZEDCHANGE.
WM_ENABLE (see page 16389)	This is constant Messages.WM_ENABLE.
WM_ENDSESSION (see page 16390)	This is constant Messages.WM_ENDSESSION.
WM_ENTERIDLE (see page 16390)	This is constant Messages.WM_ENTERIDLE.
WM_ENTERMENULOOP (see page 16390)	This is constant Messages.WM_ENTERMENULOOP.
WM_ENTERSIZEMOVE (see page 16391)	This is constant Messages.WM_ENTERSIZEMOVE.
WM_ERASEBKGND (see page 16391)	This is constant Messages.WM_ERASEBKGND.
WM_EXITMENULOOP (see page 16391)	This is constant Messages.WM_EXITMENULOOP.
WM_EXITSIZEMOVE (see page 16392)	This is constant Messages.WM_EXITSIZEMOVE.
WM_FONTCHANGE (see page 16392)	This is constant Messages.WM_FONTCHANGE.
WM_GETDLGCODE (see page 16392)	This is constant Messages.WM_GETDLGCODE.
WM_GETFONT (see page 16393)	This is constant Messages.WM_GETFONT.
WM_GETHOTKEY (see page 16393)	This is constant Messages.WM_GETHOTKEY.
WM_GETICON (see page 16393)	This is constant Messages.WM_GETICON.
WM_GETMINMAXINFO (see page 16394)	This is constant Messages.WM_GETMINMAXINFO.
WM_GETOBJECT (see page 16394)	This is constant Messages.WM_GETOBJECT.
WM_GETTEXT (see page 16394)	This is constant Messages.WM_GETTEXT.
WM_GETTEXTLENGTH (see page 16395)	This is constant Messages.WM_GETTEXTLENGTH.
WM_HANDHELDFIRST (see page 16395)	This is constant Messages.WM_HANDHELDFIRST.
WM_HANDHELDLAST (see page 16395)	This is constant Messages.WM_HANDHELDLAST.
WM_HELP (see page 16396)	This is constant Messages.WM_HELP.
WM_HOTKEY (see page 16396)	This is constant Messages.WM_HOTKEY.
WM_HSCROLL (see page 16396)	This is constant Messages.WM_HSCROLL.
WM_HSCROLLCLIPBOARD (see page 16397)	This is constant Messages.WM_HSCROLLCLIPBOARD.
WM_ICONERASEBKGND (see page 16397)	This is constant Messages.WM_ICONERASEBKGND.
WM_IME_CHAR (see page 16397)	This is constant Messages.WM_IME_CHAR.
WM_IME_COMPOSITION (see page 16398)	This is constant Messages.WM_IME_COMPOSITION.
WM_IME_COMPOSITIONFULL (see page 16398)	This is constant Messages.WM_IME_COMPOSITIONFULL.
WM_IME_CONTROL (see page 16398)	This is constant Messages.WM_IME_CONTROL.
WM_IME_ENDCOMPOSITION (see page 16399)	This is constant Messages.WM_IME_ENDCOMPOSITION.

WM_IME_KEYDOWN (see page 16399)	This is constant Messages.WM_IME_KEYDOWN.
WM_IME_KEYLAST (see page 16399)	This is constant Messages.WM_IME_KEYLAST.
WM_IME_KEYUP (see page 16400)	This is constant Messages.WM_IME_KEYUP.
WM_IME_NOTIFY (see page 16400)	This is constant Messages.WM_IME_NOTIFY.
WM_IME_REQUEST (see page 16400)	This is constant Messages.WM_IME_REQUEST.
WM_IME_SELECT (see page 16401)	This is constant Messages.WM_IME_SELECT.
WM_IME_SETCONTEXT (see page 16401)	This is constant Messages.WM_IME_SETCONTEXT.
WM_IME_STARTCOMPOSITION (see page 16401)	This is constant Messages.WM_IME_STARTCOMPOSITION.
WM_INITDIALOG (see page 16402)	This is constant Messages.WM_INITDIALOG.
WM_INITMENU (see page 16402)	This is constant Messages.WM_INITMENU.
WM_INITMENUPOPUP (see page 16402)	This is constant Messages.WM_INITMENUPOPUP.
WM_INPUT (see page 16403)	This is constant Messages.WM_INPUT.
WM_INPUTLANGCHANGE (see page 16403)	This is constant Messages.WM_INPUTLANGCHANGE.
WM_INPUTLANGCHANGEREQUEST (see page 16403)	This is constant Messages.WM_INPUTLANGCHANGEREQUEST.
WM_KEYDOWN (see page 16404)	This is constant Messages.WM_KEYDOWN.
WM_KEYFIRST (see page 16404)	This is constant Messages.WM_KEYFIRST.
WM_KEYLAST (see page 16404)	This is constant Messages.WM_KEYLAST.
WM_KEYUP (see page 16405)	This is constant Messages.WM_KEYUP.
WM_KILLFOCUS (see page 16405)	This is constant Messages.WM_KILLFOCUS.
WM_LBUTTONDBLCLK (see page 16405)	This is constant Messages.WM_LBUTTONDBLCLK.
WM_LBUTTONDOWN (see page 16406)	This is constant Messages.WM_LBUTTONDOWN.
WM_LBUTTONUP (see page 16406)	This is constant Messages.WM_LBUTTONUP.
WM_MBUTTONDBLCLK (see page 16406)	This is constant Messages.WM_MBUTTONDBLCLK.
WM_MBUTTONDOWN (see page 16407)	This is constant Messages.WM_MBUTTONDOWN.
WM_MBUTTONUP (see page 16407)	This is constant Messages.WM_MBUTTONUP.
WM_MDIACTIVATE (see page 16407)	This is constant Messages.WM_MDIACTIVATE.
WM_MDICASCADE (see page 16408)	This is constant Messages.WM_MDICASCADE.
WM_MDICREATE (see page 16408)	This is constant Messages.WM_MDICREATE.
WM_MDIDESTROY (see page 16408)	This is constant Messages.WM_MDIDESTROY.
WM_MDIGETACTIVE (see page 16409)	This is constant Messages.WM_MDIGETACTIVE.
WM_MDIICONARRANGE (see page 16409)	This is constant Messages.WM_MDIICONARRANGE.
WM_MDIMAXIMIZE (see page 16409)	This is constant Messages.WM_MDIMAXIMIZE.
WM_MDINEXT (see page 16410)	This is constant Messages.WM_MDINEXT.
WM_MDIREFRESHMENU (see page 16410)	This is constant Messages.WM_MDIREFRESHMENU.
WM_MDIRESTORE (see page 16410)	This is constant Messages.WM_MDIRESTORE.
WM_MDISETMENU (see page 16411)	This is constant Messages.WM_MDISETMENU.
WM_MDITILE (see page 16411)	This is constant Messages.WM_MDITILE.
WM_MEASUREITEM (see page 16411)	This is constant Messages.WM_MEASUREITEM.
WM_MENUCHAR (see page 16412)	This is constant Messages.WM_MENUCHAR.
WM_MENUCOMMAND (see page 16412)	This is constant Messages.WM_MENUCOMMAND.
WM_MENUDRAG (see page 16412)	This is constant Messages.WM_MENUDRAG.
WM_MENUGETOBJECT (see page 16413)	This is constant Messages.WM_MENUGETOBJECT.
WM_MENURBUTTONUP (see page 16413)	This is constant Messages.WM_MENURBUTTONUP.
WM_MENUSELECT (see page 16413)	This is constant Messages.WM_MENUSELECT.
WM_MOUSEACTIVATE (see page 16414)	This is constant Messages.WM_MOUSEACTIVATE.
WM_MOUSEFIRST (see page 16414)	This is constant Messages.WM_MOUSEFIRST.
WM_MOUSEHOVER (see page 16414)	This is constant Messages.WM_MOUSEHOVER.
WM_MOUSELAST (see page 16415)	This is constant Messages.WM_MOUSELAST.
WM_MOUSELEAVE (see page 16415)	This is constant Messages.WM_MOUSELEAVE.
WM_MOUSEMOVE (see page 16415)	This is constant Messages.WM_MOUSEMOVE.
WM_MOUSEWHEEL (see page 16416)	This is constant Messages.WM_MOUSEWHEEL.
WM_MOVE (see page 16416)	This is constant Messages.WM_MOVE.
WM_MOVING (see page 16416)	This is constant Messages.WM_MOVING.
WM_NCACTIVATE (see page 16417)	This is constant Messages.WM_NCACTIVATE.

WM_NCCALCSIZE (see page 16417)	This is constant Messages.WM_NCCALCSIZE.
WM_NCCREATE (see page 16417)	This is constant Messages.WM_NCCREATE.
WM_NCDESTROY (see page 16418)	This is constant Messages.WM_NCDESTROY.
WM_NCHITTEST (see page 16418)	This is constant Messages.WM_NCHITTEST.
WM_NCLBUTTONDBLCLK (see page 16418)	This is constant Messages.WM_NCLBUTTONDBLCLK.
WM_NCLBUTTONDOWN (see page 16419)	This is constant Messages.WM_NCLBUTTONDOWN.
WM_NCLBUTTONUP (see page 16419)	This is constant Messages.WM_NCLBUTTONUP.
WM_NCMBUTTONDBLCLK (see page 16419)	This is constant Messages.WM_NCMBUTTONDBLCLK.
WM_NCMBUTTONDOWN (see page 16420)	This is constant Messages.WM_NCMBUTTONDOWN.
WM_NCMBUTTONUP (see page 16420)	This is constant Messages.WM_NCMBUTTONUP.
WM_NCMOUSEHOVER (see page 16420)	This is constant Messages.WM_NCMOUSEHOVER.
WM_NCMOUSELEAVE (see page 16421)	This is constant Messages.WM_NCMOUSELEAVE.
WM_NCMOUSEMOVE (see page 16421)	This is constant Messages.WM_NCMOUSEMOVE.
WM_NCPAINT (see page 16421)	This is constant Messages.WM_NCPAINT.
WM_NCRBUTTONDBLCLK (see page 16422)	This is constant Messages.WM_NCRBUTTONDBLCLK.
WM_NCRBUTTONDOWN (see page 16422)	This is constant Messages.WM_NCRBUTTONDOWN.
WM_NCRBUTTONUP (see page 16422)	This is constant Messages.WM_NCRBUTTONUP.
WM_NCXBUTTONDBLCLK (see page 16423)	This is constant Messages.WM_NCXBUTTONDBLCLK.
WM_NCXBUTTONDOWN (see page 16423)	This is constant Messages.WM_NCXBUTTONDOWN.
WM_NCXBUTTONUP (see page 16423)	This is constant Messages.WM_NCXBUTTONUP.
WM_NEXTDLGCTL (see page 16424)	This is constant Messages.WM_NEXTDLGCTL.
WM_NEXTMENU (see page 16424)	This is constant Messages.WM_NEXTMENU.
WM_NOTIFY (see page 16424)	This is constant Messages.WM_NOTIFY.
WM_NOTIFYFORMAT (see page 16425)	This is constant Messages.WM_NOTIFYFORMAT.
WM_NULL (see page 16425)	This is constant Messages.WM_NULL.
WM_PAINT (see page 16425)	This is constant Messages.WM_PAINT.
WM_PAINTCLIPBOARD (see page 16426)	This is constant Messages.WM_PAINTCLIPBOARD.
WM_PAINTICON (see page 16426)	This is constant Messages.WM_PAINTICON.
WM_PALETTECHANGED (see page 16426)	This is constant Messages.WM_PALETTECHANGED.
WM_PALETTEISCHANGING (see page 16427)	This is constant Messages.WM_PALETTEISCHANGING.
WM_PARENTNOTIFY (see page 16427)	This is constant Messages.WM_PARENTNOTIFY.
WM_PASTE (see page 16427)	This is constant Messages.WM_PASTE.
WM_PENWINFIRST (see page 16428)	This is constant Messages.WM_PENWINFIRST.
WM_PENWINLAST (see page 16428)	This is constant Messages.WM_PENWINLAST.
WM_POWER (see page 16428)	This is constant Messages.WM_POWER.
WM_POWERBROADCAST (see page 16429)	This is constant Messages.WM_POWERBROADCAST.
WM_PRINT (see page 16429)	This is constant Messages.WM_PRINT.
WM_PRINTCLIENT (see page 16429)	This is constant Messages.WM_PRINTCLIENT.
WM_QUERYDRAGICON (see page 16430)	This is constant Messages.WM_QUERYDRAGICON.
WM_QUERYENDSESSION (see page 16430)	This is constant Messages.WM_QUERYENDSESSION.
WM_QUERYNEWPALETTE (see page 16430)	This is constant Messages.WM_QUERYNEWPALETTE.
WM_QUERYOPEN (see page 16431)	This is constant Messages.WM_QUERYOPEN.
WM_QUERYUISTATE (see page 16431)	This is constant Messages.WM_QUERYUISTATE.
WM_QUEUESYNC (see page 16431)	This is constant Messages.WM_QUEUESYNC.
WM_QUIT (see page 16432)	This is constant Messages.WM_QUIT.
WM_RBUTTONDBLCLK (see page 16432)	This is constant Messages.WM_RBUTTONDBLCLK.
WM_RBUTTONDOWN (see page 16432)	This is constant Messages.WM_RBUTTONDOWN.
WM_RBUTTONUP (see page 16433)	This is constant Messages.WM_RBUTTONUP.
WM_RENDERALLFORMATS (see page 16433)	This is constant Messages.WM_RENDERALLFORMATS.
WM_RENDERFORMAT (see page 16433)	This is constant Messages.WM_RENDERFORMAT.
WM_SETCURSOR (see page 16434)	This is constant Messages.WM_SETCURSOR.
WM_SETFOCUS (see page 16434)	This is constant Messages.WM_SETFOCUS.
WM_SETFONT (see page 16434)	This is constant Messages.WM_SETFONT.
WM_SETHOTKEY (see page 16435)	This is constant Messages.WM_SETHOTKEY.

WM_SETICON (see page 16435)	This is constant Messages.WM_SETICON.
WM_SETREDRAW (see page 16435)	This is constant Messages.WM_SETREDRAW.
WM_SETTEXT (see page 16436)	This is constant Messages.WM_SETTEXT.
WM_SETTINGCHANGE (see page 16436)	This is constant Messages.WM_SETTINGCHANGE.
WM_SHOWWINDOW (see page 16436)	This is constant Messages.WM_SHOWWINDOW.
WM_SIZE (see page 16437)	This is constant Messages.WM_SIZE.
WM_SIZECLIPBOARD (see page 16437)	This is constant Messages.WM_SIZECLIPBOARD.
WM_SIZING (see page 16437)	This is constant Messages.WM_SIZING.
WM_SPOOLERSTATUS (see page 16438)	This is constant Messages.WM_SPOOLERSTATUS.
WM_STYLECHANGED (see page 16438)	This is constant Messages.WM_STYLECHANGED.
WM_STYLECHANGING (see page 16438)	This is constant Messages.WM_STYLECHANGING.
WM_SYSCHAR (see page 16439)	This is constant Messages.WM_SYSCHAR.
WM_SYSCOLORCHANGE (see page 16439)	This is constant Messages.WM_SYSCOLORCHANGE.
WM_SYSCOMMAND (see page 16439)	This is constant Messages.WM_SYSCOMMAND.
WM_SYSDEADCHAR (see page 16440)	This is constant Messages.WM_SYSDEADCHAR.
WM_SYSKEYDOWN (see page 16440)	This is constant Messages.WM_SYSKEYDOWN.
WM_SYSKEYUP (see page 16440)	This is constant Messages.WM_SYSKEYUP.
WM_SYSTEMERROR (see page 16441)	This is constant Messages.WM_SYSTEMERROR.
WM_TABLET_FIRST (see page 16441)	This is constant Messages.WM_TABLET_FIRST.
WM_TABLET_LAST (see page 16441)	This is constant Messages.WM_TABLET_LAST.
WM_TCARD (see page 16442)	This is constant Messages.WM_TCARD.
WM_THEMECHANGED (see page 16442)	This is constant Messages.WM_THEMECHANGED.
WM_TIMECHANGE (see page 16442)	This is constant Messages.WM_TIMECHANGE.
WM_TIMER (see page 16443)	This is constant Messages.WM_TIMER.
WM_UNDO (see page 16443)	This is constant Messages.WM_UNDO.
WM_UNICHAR (see page 16443)	This is constant Messages.WM_UNICHAR.
WM_UNINITMENUPOPUP (see page 16444)	This is constant Messages.WM_UNINITMENUPOPUP.
WM_UPDATEUISTATE (see page 16444)	This is constant Messages.WM_UPDATEUISTATE.
WM_USER (see page 16444)	This is constant Messages.WM_USER.
WM_USERCHANGED (see page 16445)	This is constant Messages.WM_USERCHANGED.
WM_VKEYTOITEM (see page 16445)	This is constant Messages.WM_VKEYTOITEM.
WM_VSCROLL (see page 16445)	This is constant Messages.WM_VSCROLL.
WM_VSCROLLCLIPBOARD (see page 16446)	This is constant Messages.WM_VSCROLLCLIPBOARD.
WM_WINDOWPOSCHANGED (see page 16446)	This is constant Messages.WM_WINDOWPOSCHANGED.
WM_WINDOWPOSCHANGING (see page 16446)	This is constant Messages.WM_WINDOWPOSCHANGING.
WM_WININICHANGE (see page 16447)	This is constant Messages.WM_WININICHANGE.
WM_WTSSESSION_CHANGE (see page 16447)	This is constant Messages.WM_WTSSESSION_CHANGE.

96.3.1 Messages.BM_CLICK Constant

Pascal

```
BM_CLICK = $00F5;
```

C++

```
BM_CLICK = 0x00F5;
```

File

Messages

Description

This is constant Messages.BM_CLICK.

96.3.2 Messages.BM_GETCHECK Constant

Pascal

```
BM_GETCHECK = $00F0;
```

C++

```
BM_GETCHECK = 0x00F0;
```

File

Messages

Description

This is constant Messages.BM_GETCHECK.

96.3.3 Messages.BM_GETIMAGE Constant

Pascal

```
BM_GETIMAGE = $00F6;
```

C++

```
BM_GETIMAGE = 0x00F6;
```

File

Messages

Description

This is constant Messages.BM_GETIMAGE.

96.3.4 Messages.BM_GETSTATE Constant

Pascal

```
BM_GETSTATE = $00F2;
```

C++

```
BM_GETSTATE = 0x00F2;
```

File

Messages

Description

This is constant Messages.BM_GETSTATE.

96.3.5 Messages.BM_SETCHECK Constant

Pascal

```
BM_SETCHECK = $00F1;
```

C++

```
BM_SETCHECK = 0x00F1;
```

File

Messages

Description

This is constant Messages.BM_SETCHECK.

96.3.6 Messages.BM_SETIMAGE Constant

Pascal

```
BM_SETIMAGE = $00F7;
```

C++

```
BM_SETIMAGE = 0x00F7;
```

File

Messages

Description

This is constant Messages.BM_SETIMAGE.

96.3.7 Messages.BM_SETSTATE Constant

Pascal

```
BM_SETSTATE = $00F3;
```

C++

```
BM_SETSTATE = 0x00F3;
```

File

Messages

Description

This is constant Messages.BM_SETSTATE.

96.3.8 Messages.BM_SETSTYLE Constant

Pascal

```
BM_SETSTYLE = $00F4;
```

C++

```
BM_SETSTYLE = 0x00F4;
```

File

Messages

Description

This is constant Messages.BM_SETSTYLE.

96.3.9 Messages.BN_CLICKED Constant

Pascal

```
BN_CLICKED = 0;
```

C++

```
BN_CLICKED = 0;
```

File

Messages

Description

This is constant Messages.BN_CLICKED.

96.3.10 Messages.BN_DBLCLK Constant

Pascal

```
BN_DBLCLK = BN_DOUBLECLICKED;
```

C++

```
BN_DBLCLK = BN_DOUBLECLICKED;
```

File

Messages

Description

This is constant Messages.BN_DBLCLK.

96.3.11 Messages.BN_DISABLE Constant

Pascal

```
BN_DISABLE = 4;
```

C++

```
BN_DISABLE = 4;
```

File

Messages

Description

This is constant Messages.BN_DISABLE.

96.3.12 Messages.BN_DOUBLECLICKED Constant

Pascal

```
BN_DOUBLECLICKED = 5;
```

C++

```
BN_DOUBLECLICKED = 5;
```

File

Messages

Description

This is constant Messages.BN_DOUBLECLICKED.

96.3.13 Messages.BN_HILITE Constant

Pascal

```
BN_HILITE = 2;
```

C++

```
BN_HILITE = 2;
```

File

Messages

Description

This is constant Messages.BN_HILITE.

96.3.14 Messages.BN_KILLFOCUS Constant

Pascal

```
BN_KILLFOCUS = 7;
```

C++

```
BN_KILLFOCUS = 7;
```

File

Messages

Description

This is constant Messages.BN_KILLFOCUS.

96.3.15 Messages.BN_PAINT Constant

Pascal

```
BN_PAINT = 1;
```

C++

```
BN_PAINT = 1;
```

File

Messages

Description

This is constant Messages.BN_PAINT.

96.3.16 Messages.BN_PUSHED Constant

Pascal

```
BN_PUSHED = BN_HILITE;
```

C++

```
BN_PUSHED = BN_HILITE;
```

File

Messages

Description

This is constant Messages.BN_PUSHED.

96.3.17 Messages.BN_SETFOCUS Constant

Pascal

```
BN_SETFOCUS = 6;
```

C++

```
BN_SETFOCUS = 6;
```

File

Messages

Description

This is constant Messages.BN_SETFOCUS.

96.3.18 Messages.BN_UNHILITE Constant

Pascal

```
BN_UNHILITE = 3;
```

C++

```
BN_UNHILITE = 3;
```

File

Messages

Description

This is constant Messages.BN_UNHILITE.

96.3.19 Messages.BN_UNPUSHED Constant

Pascal

```
BN_UNPUSHED = BN_UNHILITE;
```

C++

```
BN_UNPUSHED = BN_UNHILITE;
```

File

Messages

Description

This is constant Messages.BN_UNPUSHED.

96.3.20 Messages.CB_ADDSTRING Constant

Pascal

```
CB_ADDSTRING = $0143;
```

C++

```
CB_ADDSTRING = 0x0143;
```

File

Messages

Description

This is constant Messages.CB_ADDSTRING.

96.3.21 Messages.CB_DELETESTRING Constant

Pascal

```
CB_DELETESTRING = $0144;
```

C++

```
CB_DELETESTRING = 0x0144;
```

File

Messages

Description

This is constant Messages.CB_DELETESTRING.

96.3.22 Messages.CB_DIR Constant

Pascal

```
CB_DIR = $0145;
```

C++

```
CB_DIR = 0x0145;
```

File

Messages

Description

This is constant Messages.CB_DIR.

96.3.23 Messages.CB_FINDSTRING Constant

Pascal

```
CB_FINDSTRING = $014C;
```

C++

```
CB_FINDSTRING = 0x014C;
```

File

Messages

Description

This is constant Messages.CB_FINDSTRING.

96.3.24 Messages.CB_FINDSTRINGEXACT Constant

Pascal

```
CB_FINDSTRINGEXACT = $0158;
```

C++

```
CB_FINDSTRINGEXACT = 0x0158;
```

File

Messages

Description

This is constant Messages.CB_FINDSTRINGEXACT.

96.3.25 Messages.CB_GETCOUNT Constant

Pascal

```
CB_GETCOUNT = $0146;
```

C++

```
CB_GETCOUNT = 0x0146;
```

File

Messages

Description

This is constant Messages.CB_GETCOUNT.

96.3.26 Messages.CB_GETCURSEL Constant

Pascal

```
CB_GETCURSEL = $0147;
```

C++

```
CB_GETCURSEL = 0x0147;
```

File

Messages

Description

This is constant Messages.CB_GETCURSEL.

96.3.27 Messages.CB_GETDROPPEDCONTROLRECT Constant

Pascal

```
CB_GETDROPPEDCONTROLRECT = $0152;
```

C++

```
CB_GETDROPPEDCONTROLRECT = 0x0152;
```

File

Messages

Description

This is constant Messages.CB_GETDROPPEDCONTROLRECT.

96.3.28 Messages.CB_GETDROPPEDSTATE Constant

Pascal

```
CB_GETDROPPEDSTATE = $0157;
```

C++

```
CB_GETDROPPEDSTATE = 0x0157;
```

File

Messages

Description

This is constant Messages.CB_GETDROPPEDSTATE.

96.3.29 Messages.CB_GETDROPPEDWIDTH Constant

Pascal

```
CB_GETDROPPEDWIDTH = 351;
```

C++

```
CB_GETDROPPEDWIDTH = 351;
```

File

Messages

Description

This is constant Messages.CB_GETDROPPEDWIDTH.

96.3.30 Messages.CB_GETEDITSEL Constant

Pascal

```
CB_GETEDITSEL = $0140;
```

C++

```
CB_GETEDITSEL = 0x0140;
```

File

Messages

Description

This is constant Messages.CB_GETEDITSEL.

96.3.31 Messages.CB_GETEXTENDEDUI Constant

Pascal

```
CB_GETEXTENDEDUI = $0156;
```

C++

```
CB_GETEXTENDEDUI = 0x0156;
```

File

Messages

Description

This is constant Messages.CB_GETEXTENDEDUI.

96.3.32 Messages.CB_GETHORIZONTALEXTENT Constant

Pascal

```
CB_GETHORIZONTALEXTENT = 349;
```

C++

```
CB_GETHORIZONTALEXTENT = 349;
```

File

Messages

Description

This is constant Messages.CB_GETHORIZONTALEXTENT.

96.3.33 Messages.CB_GETITEMDATA Constant

Pascal

```
CB_GETITEMDATA = $0150;
```

C++

```
CB_GETITEMDATA = 0x0150;
```

File

Messages

Description

This is constant Messages.CB_GETITEMDATA.

96.3.34 Messages.CB_GETITEMHEIGHT Constant

Pascal

```
CB_GETITEMHEIGHT = $0154;
```

C++

```
CB_GETITEMHEIGHT = 0x0154;
```

File

Messages

Description

This is constant Messages.CB_GETITEMHEIGHT.

96.3.35 Messages.CB_GETLBTEXT Constant

Pascal

```
CB_GETLBTEXT = $0148;
```

C++

```
CB_GETLBTEXT = 0x0148;
```

File

Messages

Description

This is constant Messages.CB_GETLBTEXT.

96.3.36 Messages.CB_GETLBTEXTLEN Constant

Pascal

```
CB_GETLBTEXTLEN = $0149;
```

C++

```
CB_GETLBTEXTLEN = 0x0149;
```

File

Messages

Description

This is constant Messages.CB_GETLBTEXTLEN.

96.3.37 Messages.CB_GETLOCALE Constant

Pascal

```
CB_GETLOCALE = 346;
```

C++

```
CB_GETLOCALE = 346;
```

File

Messages

Description

This is constant Messages.CB_GETLOCALE.

96.3.38 Messages.CB_GETTOPINDEX Constant

Pascal

```
CB_GETTOPINDEX = 347;
```

C++

```
CB_GETTOPINDEX = 347;
```

File

Messages

Description

This is constant Messages.CB_GETTOPINDEX.

96.3.39 Messages.CB_INITSTORAGE Constant

Pascal

```
CB_INITSTORAGE = 353;
```

C++

```
CB_INITSTORAGE = 353;
```

File

Messages

Description

This is constant Messages.CB_INITSTORAGE.

96.3.40 Messages.CB_INSERTSTRING Constant

Pascal

```
CB_INSERTSTRING = $014A;
```

C++

```
CB_INSERTSTRING = 0x014A;
```

File

Messages

Description

This is constant Messages.CB_INSERTSTRING.

96.3.41 Messages.CB_LIMITTEXT Constant

Pascal

```
CB_LIMITTEXT = $0141;
```

C++

```
CB_LIMITTEXT = 0x0141;
```

File

Messages

Description

This is constant Messages.CB_LIMITTEXT.

96.3.42 Messages.CB_MSGMAX Constant

Pascal

```
CB_MSGMAX = 354;
```

C++

```
CB_MSGMAX = 354;
```

File

Messages

Description

This is constant Messages.CB_MSGMAX.

96.3.43 Messages.CB_RESETCONTENT Constant

Pascal

```
CB_RESETCONTENT = $014B;
```

C++

```
CB_RESETCONTENT = 0x014B;
```

File

Messages

Description

This is constant Messages.CB_RESETCONTENT.

96.3.44 Messages.CB_SELECTSTRING Constant

Pascal

```
CB_SELECTSTRING = $014D;
```

C++

```
CB_SELECTSTRING = 0x014D;
```

File

Messages

Description

This is constant Messages.CB_SELECTSTRING.

96.3.45 Messages.CB_SETCURSEL Constant

Pascal

```
CB_SETCURSEL = $014E;
```

C++

```
CB_SETCURSEL = 0x014E;
```

File

Messages

Description

This is constant Messages.CB_SETCURSEL.

96.3.46 Messages.CB_SETDROPPEDWIDTH Constant

Pascal

```
CB_SETDROPPEDWIDTH = 352;
```

C++

```
CB_SETDROPPEDWIDTH = 352;
```

File

Messages

Description

This is constant Messages.CB_SETDROPPEDWIDTH.

96.3.47 Messages.CB_SETEDITSEL Constant

Pascal

```
CB_SETEDITSEL = $0142;
```

C++

```
CB_SETEDITSEL = 0x0142;
```

File

Messages

Description

This is constant Messages.CB_SETEDITSEL.

96.3.48 Messages.CB_SETEXTENDEDUI Constant

Pascal

```
CB_SETEXTENDEDUI = $0155;
```

C++

```
CB_SETEXTENDEDUI = 0x0155;
```

File

Messages

Description

This is constant Messages.CB_SETEXTENDEDUI.

96.3.49 Messages.CB_SETHORIZONTALEXTENT Constant

Pascal

```
CB_SETHORIZONTALEXTENT = 350;
```

C++

```
CB_SETHORIZONTALEXTENT = 350;
```

File

Messages

Description

This is constant Messages.CB_SETHORIZONTALEXTENT.

96.3.50 Messages.CB_SETITEMDATA Constant

Pascal

```
CB_SETITEMDATA = $0151;
```

C++

```
CB_SETITEMDATA = 0x0151;
```

File

Messages

Description

This is constant Messages.CB_SETITEMDATA.

96.3.51 Messages.CB_SETITEMHEIGHT Constant

Pascal

```
CB_SETITEMHEIGHT = $0153;
```

C++

```
CB_SETITEMHEIGHT = 0x0153;
```

File

Messages

Description

This is constant Messages.CB_SETITEMHEIGHT.

96.3.52 Messages.CB_SETLOCALE Constant

Pascal

```
CB_SETLOCALE = 345;
```

C++

```
CB_SETLOCALE = 345;
```

File

Messages

Description

This is constant Messages.CB_SETLOCALE.

96.3.53 Messages.CB_SETTOPINDEX Constant

Pascal

```
CB_SETTOPINDEX = 348;
```

C++

```
CB_SETTOPINDEX = 348;
```

File

Messages

Description

This is constant Messages.CB_SETTOPINDEX.

96.3.54 Messages.CB_SHOWDROPDOWN Constant

Pascal

```
CB_SHOWDROPDOWN = $014F;
```

C++

```
CB_SHOWDROPDOWN = 0x014F;
```

File

Messages

Description

This is constant Messages.CB_SHOWDROPDOWN.

96.3.55 Messages.CBN_CLOSEUP Constant

Pascal

```
CBN_CLOSEUP = 8;
```

C++

```
CBN_CLOSEUP = 8;
```

File

Messages

Description

This is constant Messages.CBN_CLOSEUP.

96.3.56 Messages.CBN_DBLCLK Constant

Pascal

```
CBN_DBLCLK = 2;
```

C++

```
CBN_DBLCLK = 2;
```

File

Messages

Description

This is constant Messages.CBN_DBLCLK.

96.3.57 Messages.CBN_DROPDOWN Constant

Pascal

```
CBN_DROPDOWN = 7;
```

C++

```
CBN_DROPDOWN = 7;
```

File

Messages

Description

This is constant Messages.CBN_DROPDOWN.

96.3.58 Messages.CBN_EDITCHANGE Constant

Pascal

```
CBN_EDITCHANGE = 5;
```

C++

```
CBN_EDITCHANGE = 5;
```

File

Messages

Description

This is constant Messages.CBN_EDITCHANGE.

96.3.59 Messages.CBN_EDITUPDATE Constant

Pascal

```
CBN_EDITUPDATE = 6;
```

C++

```
CBN_EDITUPDATE = 6;
```

File

Messages

Description

This is constant Messages.CBN_EDITUPDATE.

96.3.60 Messages.CBN_ERRSPACE Constant

Pascal

```
CBN_ERRSPACE = (-1);
```

C++

```
CBN_ERRSPACE = (-1);
```

File

Messages

Description

This is constant Messages.CBN_ERRSPACE.

96.3.61 Messages.CBN_KILLFOCUS Constant

Pascal

```
CBN_KILLFOCUS = 4;
```

C++

```
CBN_KILLFOCUS = 4;
```

File

Messages

Description

This is constant Messages.CBN_KILLFOCUS.

96.3.62 Messages.CBN_SELCHANGE Constant

Pascal

```
CBN_SELCHANGE = 1;
```

C++

```
CBN_SELCHANGE = 1;
```

File

Messages

Description

This is constant Messages.CBN_SELCHANGE.

96.3.63 Messages.CBN_SELENDCANCEL Constant

Pascal

```
CBN_SELENDCANCEL = 10;
```

C++

```
CBN_SELENDCANCEL = 10;
```

File

Messages

Description

This is constant Messages.CBN_SELENDCANCEL.

96.3.64 Messages.CBN_SELENDOK Constant

Pascal

```
CBN_SELENDOK = 9;
```

C++

```
CBN_SELENDOK = 9;
```

File

Messages

Description

This is constant Messages.CBN_SELENDOK.

96.3.65 Messages.CBN_SETFOCUS Constant

Pascal

```
CBN_SETFOCUS = 3;
```

C++

```
CBN_SETFOCUS = 3;
```

File

Messages

Description

This is constant Messages.CBN_SETFOCUS.

96.3.66 Messages.DM_GETDEFID Constant

Pascal

```
DM_GETDEFID = (WM_USER+0);
```

C++

```
DM_GETDEFID = (WM_USER+0);
```

File

Messages

Description

This is constant Messages.DM_GETDEFID.

96.3.67 Messages.DM_REPOSITION Constant

Pascal

```
DM_REPOSITION = (WM_USER+2);
```

C++

```
DM_REPOSITION = (WM_USER+2);
```

File

Messages

Description

This is constant Messages.DM_REPOSITION.

96.3.68 Messages.DM_SETDEFID Constant

Pascal

```
DM_SETDEFID = (WM_USER+1);
```

C++

```
DM_SETDEFID = (WM_USER+1);
```

File

Messages

Description

This is constant Messages.DM_SETDEFID.

96.3.69 Messages.EM_CANUNDO Constant

Pascal

```
EM_CANUNDO = $00C6;
```

C++

```
EM_CANUNDO = 0x00C6;
```

File

Messages

Description

This is constant Messages.EM_CANUNDO.

96.3.70 Messages.EM_CHARFROMPOS Constant

Pascal

```
EM_CHARFROMPOS = 215;
```

C++

```
EM_CHARFROMPOS = 215;
```

File

Messages

Description

This is constant Messages.EM_CHARFROMPOS.

96.3.71 Messages.EM_EMPTYUNDOBUFFER Constant

Pascal

```
EM_EMPTYUNDOBUFFER = $00CD;
```

C++

```
EM_EMPTYUNDOBUFFER = 0x00CD;
```

File

Messages

Description

This is constant Messages.EM_EMPTYUNDOBUFFER.

96.3.72 Messages.EM_FMTLINES Constant

Pascal

```
EM_FMTLINES = $00C8;
```

C++

```
EM_FMTLINES = 0x00C8;
```

File

Messages

Description

This is constant Messages.EM_FMTLINES.

96.3.73 Messages.EM_GETFIRSTVISIBLELINE Constant

Pascal

```
EM_GETFIRSTVISIBLELINE = $00CE;
```

C++

```
EM_GETFIRSTVISIBLELINE = 0x00CE;
```

File

Messages

Description

This is constant Messages.EM_GETFIRSTVISIBLELINE.

96.3.74 Messages.EM_GETHANDLE Constant

Pascal

```
EM_GETHANDLE = $00BD;
```

C++

```
EM_GETHANDLE = 0x00BD;
```

File

Messages

Description

This is constant Messages.EM_GETHANDLE.

96.3.75 Messages.EM_GETIMESTATUS Constant

Pascal

```
EM_GETIMESTATUS = 217;
```

C++

```
EM_GETIMESTATUS = 217;
```

File

Messages

Description

This is constant Messages.EM_GETIMESTATUS.

96.3.76 Messages.EM_GETLIMITTEXT Constant

Pascal

```
EM_GETLIMITTEXT = 213;
```

C++

```
EM_GETLIMITTEXT = 213;
```

File

Messages

Description

This is constant Messages.EM_GETLIMITTEXT.

96.3.77 Messages.EM_GETLINE Constant

Pascal

```
EM_GETLINE = $00C4;
```

C++

```
EM_GETLINE = 0x00C4;
```

File

Messages

Description

This is constant Messages.EM_GETLINE.

96.3.78 Messages.EM_GETLINECOUNT Constant

Pascal

```
EM_GETLINECOUNT = $00BA;
```

C++

```
EM_GETLINECOUNT = 0x00BA;
```

File

Messages

Description

This is constant Messages.EM_GETLINECOUNT.

96.3.79 Messages.EM_GETMARGINS Constant

Pascal

```
EM_GETMARGINS = 212;
```

C++

```
EM_GETMARGINS = 212;
```

File

Messages

Description

This is constant Messages.EM_GETMARGINS.

96.3.80 Messages.EM_GETMODIFY Constant

Pascal

```
EM_GETMODIFY = $00B8;
```

C++

```
EM_GETMODIFY = 0x00B8;
```

File

Messages

Description

This is constant Messages.EM_GETMODIFY.

96.3.81 Messages.EM_GETPASSWORDCHAR Constant

Pascal

```
EM_GETPASSWORDCHAR = $00D2;
```

C++

```
EM_GETPASSWORDCHAR = 0x00D2;
```

File

Messages

Description

This is constant Messages.EM_GETPASSWORDCHAR.

96.3.82 Messages.EM_GETRECT Constant

Pascal

```
EM_GETRECT = $00B2;
```

C++

```
EM_GETRECT = 0x00B2;
```

File

Messages

Description

This is constant Messages.EM_GETRECT.

96.3.83 Messages.EM_GETSEL Constant

Pascal

```
EM_GETSEL = $00B0;
```

C++

```
EM_GETSEL = 0x00B0;
```

File

Messages

Description

This is constant Messages.EM_GETSEL.

96.3.84 Messages.EM_GETTHUMB Constant

Pascal

```
EM_GETTHUMB = $00BE;
```

C++

```
EM_GETTHUMB = 0x00BE;
```

File

Messages

Description

This is constant Messages.EM_GETTHUMB.

96.3.85 Messages.EM_GETWORDBREAKPROC Constant

Pascal

```
EM_GETWORDBREAKPROC = $00D1;
```

C++

```
EM_GETWORDBREAKPROC = 0x00D1;
```

File

Messages

Description

This is constant Messages.EM_GETWORDBREAKPROC.

96.3.86 Messages.EM_LIMITTEXT Constant

Pascal

```
EM_LIMITTEXT = $00C5;
```

C++

```
EM_LIMITTEXT = 0x00C5;
```

File

Messages

Description

This is constant Messages.EM_LIMITTEXT.

96.3.87 Messages.EM_LINEFROMCHAR Constant

Pascal

```
EM_LINEFROMCHAR = $00C9;
```

C++

```
EM_LINEFROMCHAR = 0x00C9;
```

File

Messages

Description

This is constant Messages.EM_LINEFROMCHAR.

96.3.88 Messages.EM_LINEINDEX Constant

Pascal

```
EM_LINEINDEX = $00BB;
```

C++

```
EM_LINEINDEX = 0x00BB;
```

File

Messages

Description

This is constant Messages.EM_LINEINDEX.

96.3.89 Messages.EM_LINELENGTH Constant

Pascal

```
EM_LINELENGTH = $00C1;
```

C++

```
EM_LINELENGTH = 0x00C1;
```

File

Messages

Description

This is constant Messages.EM_LINELENGTH.

96.3.90 Messages.EM_LINESCROLL Constant

Pascal

```
EM_LINESCROLL = $00B6;
```

C++

```
EM_LINESCROLL = 0x00B6;
```

File

Messages

Description

This is constant Messages.EM_LINESCROLL.

96.3.91 Messages.EM_POSFROMCHAR Constant

Pascal

```
EM_POSFROMCHAR = 214;
```

C++

```
EM_POSFROMCHAR = 214;
```

File

Messages

Description

This is constant Messages.EM_POSFROMCHAR.

96.3.92 Messages.EM_REPLACESEL Constant

Pascal

```
EM_REPLACESEL = $00C2;
```

C++

```
EM_REPLACESEL = 0x00C2;
```

File

Messages

Description

This is constant Messages.EM_REPLACESEL.

96.3.93 Messages.EM_SCROLL Constant

Pascal

```
EM_SCROLL = $00B5;
```

C++

```
EM_SCROLL = 0x00B5;
```

File

Messages

Description

This is constant Messages.EM_SCROLL.

96.3.94 Messages.EM_SCROLLCARET Constant

Pascal

```
EM_SCROLLCARET = $00B7;
```

C++

```
EM_SCROLLCARET = 0x00B7;
```

File

Messages

Description

This is constant Messages.EM_SCROLLCARET.

96.3.95 Messages.EM_SETHANDLE Constant

Pascal

```
EM_SETHANDLE = $00BC;
```

C++

```
EM_SETHANDLE = 0x00BC;
```

File

Messages

Description

This is constant Messages.EM_SETHANDLE.

96.3.96 Messages.EM_SETIMESTATUS Constant

Pascal

```
EM_SETIMESTATUS = 216;
```

C++

```
EM_SETIMESTATUS = 216;
```

File

Messages

Description

This is constant Messages.EM_SETIMESTATUS.

96.3.97 Messages.EM_SETLIMITTEXT Constant

Pascal

```
EM_SETLIMITTEXT = EM_LIMITTEXT;
```

C++

```
EM_SETLIMITTEXT = EM_LIMITTEXT;
```

File

Messages

Description

This is constant Messages.EM_SETLIMITTEXT.

96.3.98 Messages.EM_SETMARGINS Constant

Pascal

```
EM_SETMARGINS = 211;
```

C++

```
EM_SETMARGINS = 211;
```

File

Messages

Description

This is constant Messages.EM_SETMARGINS.

96.3.99 Messages.EM_SETMODIFY Constant

Pascal

```
EM_SETMODIFY = $00B9;
```

C++

```
EM_SETMODIFY = 0x00B9;
```

File

Messages

Description

This is constant Messages.EM_SETMODIFY.

96.3.100 Messages.EM_SETPASSWORDCHAR Constant

Pascal

```
EM_SETPASSWORDCHAR = $00CC;
```

C++

```
EM_SETPASSWORDCHAR = 0x00CC;
```

File

Messages

Description

This is constant Messages.EM_SETPASSWORDCHAR.

96.3.101 Messages.EM_SETREADONLY Constant

Pascal

```
EM_SETREADONLY = $00CF;
```

C++

```
EM_SETREADONLY = 0x00CF;
```

File

Messages

Description

This is constant Messages.EM_SETREADONLY.

96.3.102 Messages.EM_SETRECT Constant

Pascal

```
EM_SETRECT = $00B3;
```

C++

```
EM_SETRECT = 0x00B3;
```

File

Messages

Description

This is constant Messages.EM_SETRECT.

96.3.103 Messages.EM_SETRECTNP Constant

Pascal

```
EM_SETRECTNP = $00B4;
```

C++

```
EM_SETRECTNP = 0x00B4;
```

File

Messages

Description

This is constant Messages.EM_SETRECTNP.

96.3.104 Messages.EM_SETSEL Constant

Pascal

```
EM_SETSEL = $00B1;
```

C++

```
EM_SETSEL = 0x00B1;
```

File

Messages

Description

This is constant Messages.EM_SETSEL.

96.3.105 Messages.EM_SETTABSTOPS Constant

Pascal

```
EM_SETTABSTOPS = $00CB;
```

C++

```
EM_SETTABSTOPS = 0x00CB;
```

File

Messages

Description

This is constant Messages.EM_SETTABSTOPS.

96.3.106 Messages.EM_SETWORDBREAKPROC Constant

Pascal

```
EM_SETWORDBREAKPROC = $00D0;
```

C++

```
EM_SETWORDBREAKPROC = 0x00D0;
```

File

Messages

Description

This is constant Messages.EM_SETWORDBREAKPROC.

96.3.107 Messages.EM_UNDO Constant

Pascal

```
EM_UNDO = $00C7;
```

C++

```
EM_UNDO = 0x00C7;
```

File

Messages

Description

This is constant Messages.EM_UNDO.

96.3.108 Messages.EN_CHANGE Constant

Pascal

```
EN_CHANGE = $0300;
```

C++

```
EN_CHANGE = 0x0300;
```

File

Messages

Description

This is constant Messages.EN_CHANGE.

96.3.109 Messages.EN_ERRSPACE Constant

Pascal

```
EN_ERRSPACE = $0500;
```

C++

```
EN_ERRSPACE = 0x0500;
```

File

Messages

Description

This is constant Messages.EN_ERRSPACE.

96.3.110 Messages.EN_HSCROLL Constant

Pascal

```
EN_HSCROLL = $0601;
```

C++

```
EN_HSCROLL = 0x0601;
```

File

Messages

Description

This is constant Messages.EN_HSCROLL.

96.3.111 Messages.EN_KILLFOCUS Constant

Pascal

```
EN_KILLFOCUS = $0200;
```

C++

```
EN_KILLFOCUS = 0x0200;
```

File

Messages

Description

This is constant Messages.EN_KILLFOCUS.

96.3.112 Messages.EN_MAXTEXT Constant

Pascal

```
EN_MAXTEXT = $0501;
```

C++

```
EN_MAXTEXT = 0x0501;
```

File

Messages

Description

This is constant Messages.EN_MAXTEXT.

96.3.113 Messages.EN_SETFOCUS Constant

Pascal

```
EN_SETFOCUS = $0100;
```

C++

```
EN_SETFOCUS = 0x0100;
```

File

Messages

Description

This is constant Messages.EN_SETFOCUS.

96.3.114 Messages.EN_UPDATE Constant

Pascal

```
EN_UPDATE = $0400;
```

C++

```
EN_UPDATE = 0x0400;
```

File

Messages

Description

This is constant Messages.EN_UPDATE.

96.3.115 Messages.EN_VSCROLL Constant

Pascal

```
EN_VSCROLL = $0602;
```

C++

```
EN_VSCROLL = 0x0602;
```

File

Messages

Description

This is constant Messages.EN_VSCROLL.

96.3.116 Messages.LB_ADDFILE Constant

Pascal

```
LB_ADDFILE = $0196;
```

C++

```
LB_ADDFILE = 0x0196;
```

File

Messages

Description

This is constant Messages.LB_ADDFILE.

96.3.117 Messages.LB_ADDSTRING Constant

Pascal

```
LB_ADDSTRING = $0180;
```

C++

```
LB_ADDSTRING = 0x0180;
```

File

Messages

Description

This is constant Messages.LB_ADDSTRING.

96.3.118 Messages.LB_DELETESTRING Constant

Pascal

```
LB_DELETESTRING = $0182;
```

C++

```
LB_DELETESTRING = 0x0182;
```

File

Messages

Description

This is constant Messages.LB_DELETESTRING.

96.3.119 Messages.LB_DIR Constant

Pascal

```
LB_DIR = $018D;
```

C++

```
LB_DIR = 0x018D;
```

File

Messages

Description

This is constant Messages.LB_DIR.

96.3.120 Messages.LB_FINDSTRING Constant

Pascal

```
LB_FINDSTRING = $018F;
```

C++

```
LB_FINDSTRING = 0x018F;
```

File

Messages

Description

This is constant Messages.LB_FINDSTRING.

96.3.121 Messages.LB_FINDSTRINGEXACT Constant

Pascal

```
LB_FINDSTRINGEXACT = $01A2;
```

C++

```
LB_FINDSTRINGEXACT = 0x01A2;
```

File

Messages

Description

This is constant Messages.LB_FINDSTRINGEXACT.

96.3.122 Messages.LB_GETANCHORINDEX Constant

Pascal

```
LB_GETANCHORINDEX = $019D;
```

C++

```
LB_GETANCHORINDEX = 0x019D;
```

File

Messages

Description

This is constant Messages.LB_GETANCHORINDEX.

96.3.123 Messages.LB_GETCARETINDEX Constant

Pascal

```
LB_GETCARETINDEX = $019F;
```

C++

```
LB_GETCARETINDEX = 0x019F;
```

File

Messages

Description

This is constant Messages.LB_GETCARETINDEX.

96.3.124 Messages.LB_GETCOUNT Constant

Pascal

```
LB_GETCOUNT = $018B;
```

C++

```
LB_GETCOUNT = 0x018B;
```

File

Messages

Description

This is constant Messages.LB_GETCOUNT.

96.3.125 Messages.LB_GETCURSEL Constant

Pascal

```
LB_GETCURSEL = $0188;
```

C++

```
LB_GETCURSEL = 0x0188;
```

File

Messages

Description

This is constant Messages.LB_GETCURSEL.

96.3.126 Messages.LB_GETHORIZONTALEXTENT Constant

Pascal

```
LB_GETHORIZONTALEXTENT = $0193;
```

C++

```
LB_GETHORIZONTALEXTENT = 0x0193;
```

File

Messages

Description

This is constant Messages.LB_GETHORIZONTALEXTENT.

96.3.127 Messages.LB_GETITEMDATA Constant

Pascal

```
LB_GETITEMDATA = $0199;
```

C++

```
LB_GETITEMDATA = 0x0199;
```

File

Messages

Description

This is constant Messages.LB_GETITEMDATA.

96.3.128 Messages.LB_GETITEMHEIGHT Constant

Pascal

```
LB_GETITEMHEIGHT = $01A1;
```

C++

```
LB_GETITEMHEIGHT = 0x01A1;
```

File

Messages

Description

This is constant Messages.LB_GETITEMHEIGHT.

96.3.129 Messages.LB_GETITEMRECT Constant

Pascal

```
LB_GETITEMRECT = $0198;
```

C++

```
LB_GETITEMRECT = 0x0198;
```

File

Messages

Description

This is constant Messages.LB_GETITEMRECT.

96.3.130 Messages.LB_GETLOCALE Constant

Pascal

```
LB_GETLOCALE = $01A6;
```

C++

```
LB_GETLOCALE = 0x01A6;
```

File

Messages

Description

This is constant Messages.LB_GETLOCALE.

96.3.131 Messages.LB_GETSEL Constant

Pascal

```
LB_GETSEL = $0187;
```

C++

```
LB_GETSEL = 0x0187;
```

File

Messages

Description

This is constant Messages.LB_GETSEL.

96.3.132 Messages.LB_GETSELCOUNT Constant

Pascal

```
LB_GETSELCOUNT = $0190;
```

C++

```
LB_GETSELCOUNT = 0x0190;
```

File

Messages

Description

This is constant Messages.LB_GETSELCOUNT.

96.3.133 Messages.LB_GETSELITEMS Constant

Pascal

```
LB_GETSELITEMS = $0191;
```

C++

```
LB_GETSELITEMS = 0x0191;
```

File

Messages

Description

This is constant Messages.LB_GETSELITEMS.

96.3.134 Messages.LB_GETTEXT Constant

Pascal

```
LB_GETTEXT = $0189;
```

C++

```
LB_GETTEXT = 0x0189;
```

File

Messages

Description

This is constant Messages.LB_GETTEXT.

96.3.135 Messages.LB_GETTEXTLEN Constant

Pascal

```
LB_GETTEXTLEN = $018A;
```

C++

```
LB_GETTEXTLEN = 0x018A;
```

File

Messages

Description

This is constant Messages.LB_GETTEXTLEN.

96.3.136 Messages.LB_GETTOPINDEX Constant

Pascal

```
LB_GETTOPINDEX = $018E;
```

C++

```
LB_GETTOPINDEX = 0x018E;
```

File

Messages

Description

This is constant Messages.LB_GETTOPINDEX.

96.3.137 Messages.LB_INITSTORAGE Constant

Pascal

```
LB_INITSTORAGE = $01A8;
```

C++

```
LB_INITSTORAGE = 0x01A8;
```

File

Messages

Description

This is constant Messages.LB_INITSTORAGE.

96.3.138 Messages.LB_INSERTSTRING Constant

Pascal

```
LB_INSERTSTRING = $0181;
```

C++

```
LB_INSERTSTRING = 0x0181;
```

File

Messages

Description

This is constant Messages.LB_INSERTSTRING.

96.3.139 Messages.LB_ITEMFROMPOINT Constant

Pascal

```
LB_ITEMFROMPOINT = $01A9;
```

C++

```
LB_ITEMFROMPOINT = 0x01A9;
```

File

Messages

Description

This is constant Messages.LB_ITEMFROMPOINT.

96.3.140 Messages.LB_MSGMAX Constant

Pascal

```
LB_MSGMAX = 432;
```

C++

```
LB_MSGMAX = 432;
```

File

Messages

Description

This is constant Messages.LB_MSGMAX.

96.3.141 Messages.LB_RESETCONTENT Constant

Pascal

```
LB_RESETCONTENT = $0184;
```

C++

```
LB_RESETCONTENT = 0x0184;
```

File

Messages

Description

This is constant Messages.LB_RESETCONTENT.

96.3.142 Messages.LB_SELECTSTRING Constant

Pascal

```
LB_SELECTSTRING = $018C;
```

C++

```
LB_SELECTSTRING = 0x018C;
```

File

Messages

Description

This is constant Messages.LB_SELECTSTRING.

96.3.143 Messages.LB_SELITEMRANGE Constant

Pascal

```
LB_SELITEMRANGE = $019B;
```

C++

```
LB_SELITEMRANGE = 0x019B;
```

File

Messages

Description

This is constant Messages.LB_SELITEMRANGE.

96.3.144 Messages.LB_SELITEMRANGEEX Constant

Pascal

```
LB_SELITEMRANGEEX = $0183;
```

C++

```
LB_SELITEMRANGEEX = 0x0183;
```

File

Messages

Description

This is constant Messages.LB_SELITEMRANGEEX.

96.3.145 Messages.LB_SETANCHORINDEX Constant

Pascal

```
LB_SETANCHORINDEX = $019C;
```

C++

```
LB_SETANCHORINDEX = 0x019C;
```

File

Messages

Description

This is constant Messages.LB_SETANCHORINDEX.

96.3.146 Messages.LB_SETCARETINDEX Constant

Pascal

```
LB_SETCARETINDEX = $019E;
```

C++

```
LB_SETCARETINDEX = 0x019E;
```

File

Messages

Description

This is constant Messages.LB_SETCARETINDEX.

96.3.147 Messages.LB_SETCOLUMNWIDTH Constant

Pascal

```
LB_SETCOLUMNWIDTH = $0195;
```

C++

```
LB_SETCOLUMNWIDTH = 0x0195;
```

File

Messages

Description

This is constant Messages.LB_SETCOLUMNWIDTH.

96.3.148 Messages.LB_SETCOUNT Constant

Pascal

```
LB_SETCOUNT = $01A7;
```

C++

```
LB_SETCOUNT = 0x01A7;
```

File

Messages

Description

This is constant Messages.LB_SETCOUNT.

96.3.149 Messages.LB_SETCURSEL Constant

Pascal

```
LB_SETCURSEL = $0186;
```

C++

```
LB_SETCURSEL = 0x0186;
```

File

Messages

Description

This is constant Messages.LB_SETCURSEL.

96.3.150 Messages.LB_SETHORIZONTALEXTENT Constant

Pascal

```
LB_SETHORIZONTALEXTENT = $0194;
```

C++

```
LB_SETHORIZONTALEXTENT = 0x0194;
```

File

Messages

Description

This is constant Messages.LB_SETHORIZONTALEXTENT.

96.3.151 Messages.LB_SETITEMDATA Constant

Pascal

```
LB_SETITEMDATA = $019A;
```

C++

```
LB_SETITEMDATA = 0x019A;
```

File

Messages

Description

This is constant Messages.LB_SETITEMDATA.

96.3.152 Messages.LB_SETITEMHEIGHT Constant

Pascal

```
LB_SETITEMHEIGHT = $01A0;
```

C++

```
LB_SETITEMHEIGHT = 0x01A0;
```

File

Messages

Description

This is constant Messages.LB_SETITEMHEIGHT.

96.3.153 Messages.LB_SETLOCALE Constant

Pascal

```
LB_SETLOCALE = $01A5;
```

C++

```
LB_SETLOCALE = 0x01A5;
```

File

Messages

Description

This is constant Messages.LB_SETLOCALE.

96.3.154 Messages.LB_SETSEL Constant

Pascal

```
LB_SETSEL = $0185;
```

C++

```
LB_SETSEL = 0x0185;
```

File

Messages

Description

This is constant Messages.LB_SETSEL.

96.3.155 Messages.LB_SETTABSTOPS Constant

Pascal

```
LB_SETTABSTOPS = $0192;
```

C++

```
LB_SETTABSTOPS = 0x0192;
```

File

Messages

Description

This is constant Messages.LB_SETTABSTOPS.

96.3.156 Messages.LB_SETTOPINDEX Constant

Pascal

```
LB_SETTOPINDEX = $0197;
```

C++

```
LB_SETTOPINDEX = 0x0197;
```

File

Messages

Description

This is constant Messages.LB_SETTOPINDEX.

96.3.157 Messages.LBN_DBLCLK Constant

Pascal

```
LBN_DBLCLK = 2;
```

C++

```
LBN_DBLCLK = 2;
```

File

Messages

Description

This is constant Messages.LBN_DBLCLK.

96.3.158 Messages.LBN_ERRSPACE Constant

Pascal

```
LBN_ERRSPACE = (-2);
```

C++

```
LBN_ERRSPACE = (-2);
```

File

Messages

Description

This is constant Messages.LBN_ERRSPACE.

96.3.159 Messages.LBN_KILLFOCUS Constant

Pascal

```
LBN_KILLFOCUS = 5;
```

C++

```
LBN_KILLFOCUS = 5;
```

File

Messages

Description

This is constant Messages.LBN_KILLFOCUS.

96.3.160 Messages.LBN_SELCANCEL Constant

Pascal

```
LBN_SELCANCEL = 3;
```

C++

```
LBN_SELCANCEL = 3;
```

File

Messages

Description

This is constant Messages.LBN_SELCANCEL.

96.3.161 Messages.LBN_SELCHANGE Constant

Pascal

```
LBN_SELCHANGE = 1;
```

C++

```
LBN_SELCHANGE = 1;
```

File

Messages

Description

This is constant Messages.LBN_SELCHANGE.

96.3.162 Messages.LBN_SETFOCUS Constant

Pascal

```
LBN_SETFOCUS = 4;
```

C++

```
LBN_SETFOCUS = 4;
```

File

Messages

Description

This is constant Messages.LBN_SETFOCUS.

96.3.163 Messages.PSM_PAGEINFO Constant

Pascal

```
PSM_PAGEINFO = (WM_USER+100);
```

C++

```
PSM_PAGEINFO = (WM_USER+100);
```

File

Messages

Description

This is constant Messages.PSM_PAGEINFO.

96.3.164 Messages.PSM_SHEETINFO Constant

Pascal

```
PSM_SHEETINFO = (WM_USER+101);
```

C++

```
PSM_SHEETINFO = (WM_USER+101);
```

File

Messages

Description

This is constant Messages.PSM_SHEETINFO.

96.3.165 Messages.SBM_ENABLE_ARROWS Constant

Pascal

```
SBM_ENABLE_ARROWS = 228;
```

C++

```
SBM_ENABLE_ARROWS = 228;
```

File

Messages

Description

This is constant Messages.SBM_ENABLE_ARROWS.

96.3.166 Messages.SBM_GETPOS Constant

Pascal

```
SBM_GETPOS = 225;
```

C++

```
SBM_GETPOS = 225;
```

File

Messages

Description

This is constant Messages.SBM_GETPOS.

96.3.167 Messages.SBM_GETRANGE Constant

Pascal

```
SBM_GETRANGE = 227;
```

C++

```
SBM_GETRANGE = 227;
```

File

Messages

Description

This is constant Messages.SBM_GETRANGE.

96.3.168 Messages.SBM_GETSCROLLINFO Constant

Pascal

```
SBM_GETSCROLLINFO = 234;
```

C++

```
SBM_GETSCROLLINFO = 234;
```

File

Messages

Description

This is constant Messages.SBM_GETSCROLLINFO.

96.3.169 Messages.SBM_SETPOS Constant

Pascal

```
SBM_SETPOS = 224;
```

C++

```
SBM_SETPOS = 224;
```

File

Messages

Description

This is constant Messages.SBM_SETPOS.

96.3.170 Messages.SBM_SETRANGE Constant

Pascal

```
SBM_SETRANGE = 226;
```

C++

```
SBM_SETRANGE = 226;
```

File

Messages

Description

This is constant Messages.SBM_SETRANGE.

96.3.171 Messages.SBM_SETRANGEREDRAW Constant

Pascal

```
SBM_SETRANGEREDRAW = 230;
```

C++

```
SBM_SETRANGEREDRAW = 230;
```

File

Messages

Description

This is constant Messages.SBM_SETRANGEREDRAW.

96.3.172 Messages.SBM_SETSCROLLINFO Constant

Pascal

```
SBM_SETSCROLLINFO = 233;
```

C++

```
SBM_SETSCROLLINFO = 233;
```

File

Messages

Description

This is constant Messages.SBM_SETSCROLLINFO.

96.3.173 Messages.WM_ACTIVATE Constant

Pascal

```
WM_ACTIVATE = $0006;
```

C++

```
WM_ACTIVATE = 0x0006;
```

File

Messages

Description

This is constant Messages.WM_ACTIVATE.

96.3.174 Messages.WM_ACTIVATEAPP Constant

Pascal

```
WM_ACTIVATEAPP = $001C;
```

C++

```
WM_ACTIVATEAPP = 0x001C;
```

File

Messages

Description

This is constant Messages.WM_ACTIVATEAPP.

96.3.175 Messages.WM_APP Constant

Pascal

```
WM_APP = $8000;
```

C++

```
WM_APP = 0x8000;
```

File

Messages

Description

This is constant Messages.WM_APP.

96.3.176 Messages.WM_APPCOMMAND Constant

Pascal

```
WM_APPCOMMAND = $0319;
```

C++

```
WM_APPCOMMAND = 0x0319;
```

File

Messages

Description

This is constant Messages.WM_APPCOMMAND.

96.3.177 Messages.WM_ASKCBFORMATNAME Constant

Pascal

```
WM_ASKCBFORMATNAME = $030C;
```

C++

```
WM_ASKCBFORMATNAME = 0x030C;
```

File

Messages

Description

This is constant Messages.WM_ASKCBFORMATNAME.

96.3.178 Messages.WM_CANCELJOURNAL Constant

Pascal

```
WM_CANCELJOURNAL = $004B;
```

C++

```
WM_CANCELJOURNAL = 0x004B;
```

File

Messages

Description

This is constant Messages.WM_CANCELJOURNAL.

96.3.179 Messages.WM_CANCELMODE Constant

Pascal

```
WM_CANCELMODE = $001F;
```

C++

```
WM_CANCELMODE = 0x001F;
```

File

Messages

Description

This is constant Messages.WM_CANCELMODE.

96.3.180 Messages.WM_CAPTURECHANGED Constant

Pascal

```
WM_CAPTURECHANGED = 533;
```

C++

```
WM_CAPTURECHANGED = 533;
```

File

Messages

Description

This is constant Messages.WM_CAPTURECHANGED.

96.3.181 Messages.WM_CHANGECBCHAIN Constant

Pascal

```
WM_CHANGECBCHAIN = $030D;
```

C++

```
WM_CHANGECBCHAIN = 0x030D;
```

File

Messages

Description

This is constant Messages.WM_CHANGECBCHAIN.

96.3.182 Messages.WM_CHANGEUISTATE Constant

Pascal

```
WM_CHANGEUISTATE = $0127;
```

C++

```
WM_CHANGEUISTATE = 0x0127;
```

File

Messages

Description

This is constant Messages.WM_CHANGEUISTATE.

96.3.183 Messages.WM_CHAR Constant

Pascal

```
WM_CHAR = $0102;
```

C++

```
WM_CHAR = 0x0102;
```

File

Messages

Description

This is constant Messages.WM_CHAR.

96.3.184 Messages.WM_CHARTOITEM Constant

Pascal

```
WM_CHARTOITEM = $002F;
```

C++

```
WM_CHARTOITEM = 0x002F;
```

File

Messages

Description

This is constant Messages.WM_CHARTOITEM.

96.3.185 Messages.WM_CHILDACTIVATE Constant

Pascal

```
WM_CHILDACTIVATE = $0022;
```

C++

```
WM_CHILDACTIVATE = 0x0022;
```

File

Messages

Description

This is constant Messages.WM_CHILDACTIVATE.

96.3.186 Messages.WM_CLEAR Constant

Pascal

```
WM_CLEAR = $0303;
```

C++

```
WM_CLEAR = 0x0303;
```

File

Messages

Description

This is constant Messages.WM_CLEAR.

96.3.187 Messages.WM_CLOSE Constant

Pascal

```
WM_CLOSE = $0010;
```

C++

```
WM_CLOSE = 0x0010;
```

File

Messages

Description

This is constant Messages.WM_CLOSE.

96.3.188 Messages.WM_COALESCE_FIRST Constant

Pascal

```
WM_COALESCE_FIRST = $0390;
```

C++

```
WM_COALESCE_FIRST = 0x0390;
```

File

Messages

Description

This is constant Messages.WM_COALESCE_FIRST.

96.3.189 Messages.WM_COALESCE_LAST Constant

Pascal

```
WM_COALESCE_LAST = $039F;
```

C++

```
WM_COALESCE_LAST = 0x039F;
```

File

Messages

Description

This is constant Messages.WM_COALESCE_LAST.

96.3.190 Messages.WM_COMMAND Constant

Pascal

```
WM_COMMAND = $0111;
```

C++

```
WM_COMMAND = 0x0111;
```

File

Messages

Description

This is constant Messages.WM_COMMAND.

96.3.191 Messages.WM_COMMNOTIFY Constant

Pascal

```
WM_COMMNOTIFY = $0044;
```

C++

```
WM_COMMNOTIFY = 0x0044;
```

File

Messages

Description

This is constant Messages.WM_COMMNOTIFY.

96.3.192 Messages.WM_COMPACTING Constant

Pascal

```
WM_COMPACTING = $0041;
```

C++

```
WM_COMPACTING = 0x0041;
```

File

Messages

Description

This is constant Messages.WM_COMPACTING.

96.3.193 Messages.WM_COMPAREITEM Constant

Pascal

```
WM_COMPAREITEM = $0039;
```

C++

```
WM_COMPAREITEM = 0x0039;
```

File

Messages

Description

This is constant Messages.WM_COMPAREITEM.

96.3.194 Messages.WM_CONTEXTMENU Constant

Pascal

```
WM_CONTEXTMENU = $007B;
```

C++

```
WM_CONTEXTMENU = 0x007B;
```

File

Messages

Description

This is constant Messages.WM_CONTEXTMENU.

96.3.195 Messages.WM_COPY Constant

Pascal

```
WM_COPY = $0301;
```

C++

```
WM_COPY = 0x0301;
```

File

Messages

Description

This is constant Messages.WM_COPY.

96.3.196 Messages.WM_COPYDATA Constant

Pascal

```
WM_COPYDATA = $004A;
```

C++

```
WM_COPYDATA = 0x004A;
```

File

Messages

Description

This is constant Messages.WM_COPYDATA.

96.3.197 Messages.WM_CREATE Constant

Pascal

```
WM_CREATE = $0001;
```

C++

```
WM_CREATE = 0x0001;
```

File

Messages

Description

This is constant Messages.WM_CREATE.

96.3.198 Messages.WM_CTLCOLOR Constant

Pascal

```
WM_CTLCOLOR = $0019;
```

C++

```
WM_CTLCOLOR = 0x0019;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLOR.

96.3.199 Messages.WM_CTLCOLORBTN Constant

Pascal

```
WM_CTLCOLORBTN = $0135;
```

C++

```
WM_CTLCOLORBTN = 0x0135;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLORBTN.

96.3.200 Messages.WM_CTLCOLORDLG Constant

Pascal

```
WM_CTLCOLORDLG = $0136;
```

C++

```
WM_CTLCOLORDLG = 0x0136;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLORDLG.

96.3.201 Messages.WM_CTLCOLOREDIT Constant

Pascal

```
WM_CTLCOLOREDIT = $0133;
```

C++

```
WM_CTLCOLOREDIT = 0x0133;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLOREDIT.

96.3.202 Messages.WM_CTLCOLORLISTBOX Constant

Pascal

```
WM_CTLCOLORLISTBOX = $0134;
```

C++

```
WM_CTLCOLORLISTBOX = 0x0134;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLORLISTBOX.

96.3.203 Messages.WM_CTLCOLORMSGBOX Constant

Pascal

```
WM_CTLCOLORMSGBOX = $0132;
```

C++

```
WM_CTLCOLORMSGBOX = 0x0132;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLORMSGBOX.

96.3.204 Messages.WM_CTLCOLORSCROLLBAR Constant

Pascal

```
WM_CTLCOLORSCROLLBAR = $0137;
```

C++

```
WM_CTLCOLORSCROLLBAR = 0x0137;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLORSCROLLBAR.

96.3.205 Messages.WM_CTLCOLORSTATIC Constant

Pascal

```
WM_CTLCOLORSTATIC = $0138;
```

C++

```
WM_CTLCOLORSTATIC = 0x0138;
```

File

Messages

Description

This is constant Messages.WM_CTLCOLORSTATIC.

96.3.206 Messages.WM_CUT Constant

Pascal

```
WM_CUT = $0300;
```

C++

```
WM_CUT = 0x0300;
```

File

Messages

Description

This is constant Messages.WM_CUT.

96.3.207 Messages.WM_DDE_ACK Constant

Pascal

```
WM_DDE_ACK = WM_DDE_FIRST + 4;
```

C++

```
WM_DDE_ACK = WM_DDE_FIRST + 4;
```

File

Messages

Description

This is constant Messages.WM_DDE_ACK.

96.3.208 Messages.WM_DDE_ADVISE Constant

Pascal

```
WM_DDE_ADVISE = WM_DDE_FIRST + 2;
```

C++

```
WM_DDE_ADVISE = WM_DDE_FIRST + 2;
```

File

Messages

Description

This is constant Messages.WM_DDE_ADVISE.

96.3.209 Messages.WM_DDE_DATA Constant

Pascal

```
WM_DDE_DATA = WM_DDE_FIRST + 5;
```

C++

```
WM_DDE_DATA = WM_DDE_FIRST + 5;
```

File

Messages

Description

This is constant Messages.WM_DDE_DATA.

96.3.210 Messages.WM_DDE_EXECUTE Constant

Pascal

```
WM_DDE_EXECUTE = WM_DDE_FIRST + 8;
```

C++

```
WM_DDE_EXECUTE = WM_DDE_FIRST + 8;
```

File

Messages

Description

This is constant Messages.WM_DDE_EXECUTE.

96.3.211 Messages.WM_DDE_FIRST Constant

Pascal

```
WM_DDE_FIRST = $03E0;
```

C++

```
WM_DDE_FIRST = 0x03E0;
```

File

Messages

Description

This is constant Messages.WM_DDE_FIRST.

96.3.212 Messages.WM_DDE_INITIATE Constant

Pascal

```
WM_DDE_INITIATE = WM_DDE_FIRST + 0;
```

C++

```
WM_DDE_INITIATE = WM_DDE_FIRST + 0;
```

File

Messages

Description

This is constant Messages.WM_DDE_INITIATE.

96.3.213 Messages.WM_DDE_LAST Constant

Pascal

```
WM_DDE_LAST = WM_DDE_FIRST + 8;
```

C++

```
WM_DDE_LAST = WM_DDE_FIRST + 8;
```

File

Messages

Description

This is constant Messages.WM_DDE_LAST.

96.3.214 Messages.WM_DDE_POKE Constant

Pascal

```
WM_DDE_POKE = WM_DDE_FIRST + 7;
```

C++

```
WM_DDE_POKE = WM_DDE_FIRST + 7;
```

File

Messages

Description

This is constant Messages.WM_DDE_POKE.

96.3.215 Messages.WM_DDE_REQUEST Constant

Pascal

```
WM_DDE_REQUEST = WM_DDE_FIRST + 6;
```

C++

```
WM_DDE_REQUEST = WM_DDE_FIRST + 6;
```

File

Messages

Description

This is constant Messages.WM_DDE_REQUEST.

96.3.216 Messages.WM_DDE_TERMINATE Constant

Pascal

```
WM_DDE_TERMINATE = WM_DDE_FIRST + 1;
```

C++

```
WM_DDE_TERMINATE = WM_DDE_FIRST + 1;
```

File

Messages

Description

This is constant Messages.WM_DDE_TERMINATE.

96.3.217 Messages.WM_DDE_UNADVISE Constant

Pascal

```
WM_DDE_UNADVISE = WM_DDE_FIRST + 3;
```

C++

```
WM_DDE_UNADVISE = WM_DDE_FIRST + 3;
```

File

Messages

Description

This is constant Messages.WM_DDE_UNADVISE.

96.3.218 Messages.WM_DEADCHAR Constant

Pascal

```
WM_DEADCHAR = $0103;
```

C++

```
WM_DEADCHAR = 0x0103;
```

File

Messages

Description

This is constant Messages.WM_DEADCHAR.

96.3.219 Messages.WM_DELETEITEM Constant

Pascal

```
WM_DELETEITEM = $002D;
```

C++

```
WM_DELETEITEM = 0x002D;
```

File

Messages

Description

This is constant Messages.WM_DELETEITEM.

96.3.220 Messages.WM_DESTROY Constant

Pascal

```
WM_DESTROY = $0002;
```

C++

```
WM_DESTROY = 0x0002;
```

File

Messages

Description

This is constant Messages.WM_DESTROY.

96.3.221 Messages.WM_DESTROYCLIPBOARD Constant

Pascal

```
WM_DESTROYCLIPBOARD = $0307;
```

C++

```
WM_DESTROYCLIPBOARD = 0x0307;
```

File

Messages

Description

This is constant Messages.WM_DESTROYCLIPBOARD.

96.3.222 Messages.WM_DEVICECHANGE Constant

Pascal

```
WM_DEVICECHANGE = 537;
```

C++

```
WM_DEVICECHANGE = 537;
```

File

Messages

Description

This is constant Messages.WM_DEVICECHANGE.

96.3.223 Messages.WM_DEVMODECHANGE Constant

Pascal

```
WM_DEVMODECHANGE = $001B;
```

C++

```
WM_DEVMODECHANGE = 0x001B;
```

File

Messages

Description

This is constant Messages.WM_DEVMODECHANGE.

96.3.224 Messages.WM_DISPLAYCHANGE Constant

Pascal

```
WM_DISPLAYCHANGE = $007E;
```

C++

```
WM_DISPLAYCHANGE = 0x007E;
```

File

Messages

Description

This is constant Messages.WM_DISPLAYCHANGE.

96.3.225 Messages.WM_DRAWCLIPBOARD Constant

Pascal

```
WM_DRAWCLIPBOARD = $0308;
```

C++

```
WM_DRAWCLIPBOARD = 0x0308;
```

File

Messages

Description

This is constant Messages.WM_DRAWCLIPBOARD.

96.3.226 Messages.WM_DRAWITEM Constant

Pascal

```
WM_DRAWITEM = $002B;
```

C++

```
WM_DRAWITEM = 0x002B;
```

File

Messages

Description

This is constant Messages.WM_DRAWITEM.

96.3.227 Messages.WM_DROPFILES Constant

Pascal

```
WM_DROPFILES = $0233;
```

C++

```
WM_DROPFILES = 0x0233;
```

File

Messages

Description

This is constant Messages.WM_DROPFILES.

96.3.228 Messages.WM_DWMCOLORIZATIONCOLORCHANGED Constant

Pascal

```
WM_DWMCOLORIZATIONCOLORCHANGED = $0320;
```

C++

```
WM_DWMCOLORIZATIONCOLORCHANGED = 0x0320;
```

File

Messages

Description

This is constant Messages.WM_DWMCOLORIZATIONCOLORCHANGED.

96.3.229 Messages.WM_DWMCOMPOSITIONCHANGED Constant

Pascal

```
WM_DWMCOMPOSITIONCHANGED = $031E;
```

C++

```
WM_DWMCOMPOSITIONCHANGED = 0x031E;
```

File

Messages

Description

This is constant Messages.WM_DWMCOMPOSITIONCHANGED.

96.3.230 Messages.WM_DWMNCRENDERINGCHANGED Constant

Pascal

```
WM_DWMNCRENDERINGCHANGED = $031F;
```

C++

```
WM_DWMNCRENDERINGCHANGED = 0x031F;
```

File

Messages

Description

This is constant Messages.WM_DWMNCRENDERINGCHANGED.

96.3.231 Messages.WM_DWMWINDOWMAXIMIZEDCHANGE Constant

Pascal

```
WM_DWMWINDOWMAXIMIZEDCHANGE = $0321;
```

C++

```
WM_DWMWINDOWMAXIMIZEDCHANGE = 0x0321;
```

File

Messages

Description

This is constant Messages.WM_DWMWINDOWMAXIMIZEDCHANGE.

96.3.232 Messages.WM_ENABLE Constant

Pascal

```
WM_ENABLE = $000A;
```

C++

```
WM_ENABLE = 0x000A;
```

File

Messages

Description

This is constant Messages.WM_ENABLE.

96.3.233 Messages.WM_ENDSESSION Constant

Pascal

```
WM_ENDSESSION = $0016;
```

C++

```
WM_ENDSESSION = 0x0016;
```

File

Messages

Description

This is constant Messages.WM_ENDSESSION.

96.3.234 Messages.WM_ENTERIDLE Constant

Pascal

```
WM_ENTERIDLE = $0121;
```

C++

```
WM_ENTERIDLE = 0x0121;
```

File

Messages

Description

This is constant Messages.WM_ENTERIDLE.

96.3.235 Messages.WM_ENTERMENULOOP Constant

Pascal

```
WM_ENTERMENULOOP = $0211;
```

C++

```
WM_ENTERMENULOOP = 0x0211;
```

File

Messages

Description

This is constant Messages.WM_ENTERMENULOOP.

96.3.236 Messages.WM_ENTERSIZEMOVE Constant

Pascal

```
WM_ENTERSIZEMOVE = $0231;
```

C++

```
WM_ENTERSIZEMOVE = 0x0231;
```

File

Messages

Description

This is constant Messages.WM_ENTERSIZEMOVE.

96.3.237 Messages.WM_ERASEBKGND Constant

Pascal

```
WM_ERASEBKGND = $0014;
```

C++

```
WM_ERASEBKGND = 0x0014;
```

File

Messages

Description

This is constant Messages.WM_ERASEBKGND.

96.3.238 Messages.WM_EXITMENULOOP Constant

Pascal

```
WM_EXITMENULOOP = $0212;
```

C++

```
WM_EXITMENULOOP = 0x0212;
```

File

Messages

Description

This is constant Messages.WM_EXITMENULOOP.

96.3.239 Messages.WM_EXITSIZEMOVE Constant

Pascal

```
WM_EXITSIZEMOVE = $0232;
```

C++

```
WM_EXITSIZEMOVE = 0x0232;
```

File

Messages

Description

This is constant Messages.WM_EXITSIZEMOVE.

96.3.240 Messages.WM_FONTCHANGE Constant

Pascal

```
WM_FONTCHANGE = $001D;
```

C++

```
WM_FONTCHANGE = 0x001D;
```

File

Messages

Description

This is constant Messages.WM_FONTCHANGE.

96.3.241 Messages.WM_GETDLGCODE Constant

Pascal

```
WM_GETDLGCODE = $0087;
```

C++

```
WM_GETDLGCODE = 0x0087;
```

File

Messages

Description

This is constant Messages.WM_GETDLGCODE.

96.3.242 Messages.WM_GETFONT Constant

Pascal

```
WM_GETFONT = $0031;
```

C++

```
WM_GETFONT = 0x0031;
```

File

Messages

Description

This is constant Messages.WM_GETFONT.

96.3.243 Messages.WM_GETHOTKEY Constant

Pascal

```
WM_GETHOTKEY = $0033;
```

C++

```
WM_GETHOTKEY = 0x0033;
```

File

Messages

Description

This is constant Messages.WM_GETHOTKEY.

96.3.244 Messages.WM_GETICON Constant

Pascal

```
WM_GETICON = $007F;
```

C++

```
WM_GETICON = 0x007F;
```

File

Messages

Description

This is constant Messages.WM_GETICON.

96.3.245 Messages.WM_GETMINMAXINFO Constant

Pascal

```
WM_GETMINMAXINFO = $0024;
```

C++

```
WM_GETMINMAXINFO = 0x0024;
```

File

Messages

Description

This is constant Messages.WM_GETMINMAXINFO.

96.3.246 Messages.WM_GETOBJECT Constant

Pascal

```
WM_GETOBJECT = $003D;
```

C++

```
WM_GETOBJECT = 0x003D;
```

File

Messages

Description

This is constant Messages.WM_GETOBJECT.

96.3.247 Messages.WM_GETTEXT Constant

Pascal

```
WM_GETTEXT = $000D;
```

C++

```
WM_GETTEXT = 0x000D;
```

File

Messages

Description

This is constant Messages.WM_GETTEXT.

96.3.248 Messages.WM_GETTEXTLENGTH Constant

Pascal

```
WM_GETTEXTLENGTH = $000E;
```

C++

```
WM_GETTEXTLENGTH = 0x000E;
```

File

Messages

Description

This is constant Messages.WM_GETTEXTLENGTH.

96.3.249 Messages.WM_HANDHELDFIRST Constant

Pascal

```
WM_HANDHELDFIRST = 856;
```

C++

```
WM_HANDHELDFIRST = 856;
```

File

Messages

Description

This is constant Messages.WM_HANDHELDFIRST.

96.3.250 Messages.WM_HANDHELDLAST Constant

Pascal

```
WM_HANDHELDLAST = 863;
```

C++

```
WM_HANDHELDLAST = 863;
```

File

Messages

Description

This is constant Messages.WM_HANDHELDLAST.

96.3.251 Messages.WM_HELP Constant

Pascal

```
WM_HELP = $0053;
```

C++

```
WM_HELP = 0x0053;
```

File

Messages

Description

This is constant Messages.WM_HELP.

96.3.252 Messages.WM_HOTKEY Constant

Pascal

```
WM_HOTKEY = $0312;
```

C++

```
WM_HOTKEY = 0x0312;
```

File

Messages

Description

This is constant Messages.WM_HOTKEY.

96.3.253 Messages.WM_HSCROLL Constant

Pascal

```
WM_HSCROLL = $0114;
```

C++

```
WM_HSCROLL = 0x0114;
```

File

Messages

Description

This is constant Messages.WM_HSCROLL.

96.3.254 Messages.WM_HSCROLLCLIPBOARD Constant

Pascal

```
WM_HSCROLLCLIPBOARD = $030E;
```

C++

```
WM_HSCROLLCLIPBOARD = 0x030E;
```

File

Messages

Description

This is constant Messages.WM_HSCROLLCLIPBOARD.

96.3.255 Messages.WM_ICONERASEBKGND Constant

Pascal

```
WM_ICONERASEBKGND = $0027;
```

C++

```
WM_ICONERASEBKGND = 0x0027;
```

File

Messages

Description

This is constant Messages.WM_ICONERASEBKGND.

96.3.256 Messages.WM_IME_CHAR Constant

Pascal

```
WM_IME_CHAR = $0286;
```

C++

```
WM_IME_CHAR = 0x0286;
```

File

Messages

Description

This is constant Messages.WM_IME_CHAR.

96.3.257 Messages.WM_IME_COMPOSITION Constant

Pascal

```
WM_IME_COMPOSITION = $010F;
```

C++

```
WM_IME_COMPOSITION = 0x010F;
```

File

Messages

Description

This is constant Messages.WM_IME_COMPOSITION.

96.3.258 Messages.WM_IME_COMPOSITIONFULL Constant

Pascal

```
WM_IME_COMPOSITIONFULL = $0284;
```

C++

```
WM_IME_COMPOSITIONFULL = 0x0284;
```

File

Messages

Description

This is constant Messages.WM_IME_COMPOSITIONFULL.

96.3.259 Messages.WM_IME_CONTROL Constant

Pascal

```
WM_IME_CONTROL = $0283;
```

C++

```
WM_IME_CONTROL = 0x0283;
```

File

Messages

Description

This is constant Messages.WM_IME_CONTROL.

96.3.260 Messages.WM_IME_ENDCOMPOSITION Constant

Pascal

```
WM_IME_ENDCOMPOSITION = $010E;
```

C++

```
WM_IME_ENDCOMPOSITION = 0x010E;
```

File

Messages

Description

This is constant Messages.WM_IME_ENDCOMPOSITION.

96.3.261 Messages.WM_IME_KEYDOWN Constant

Pascal

```
WM_IME_KEYDOWN = $0290;
```

C++

```
WM_IME_KEYDOWN = 0x0290;
```

File

Messages

Description

This is constant Messages.WM_IME_KEYDOWN.

96.3.262 Messages.WM_IME_KEYLAST Constant

Pascal

```
WM_IME_KEYLAST = $010F;
```

C++

```
WM_IME_KEYLAST = 0x010F;
```

File

Messages

Description

This is constant Messages.WM_IME_KEYLAST.

96.3.263 Messages.WM_IME_KEYUP Constant

Pascal

```
WM_IME_KEYUP = $0291;
```

C++

```
WM_IME_KEYUP = 0x0291;
```

File

Messages

Description

This is constant Messages.WM_IME_KEYUP.

96.3.264 Messages.WM_IME_NOTIFY Constant

Pascal

```
WM_IME_NOTIFY = $0282;
```

C++

```
WM_IME_NOTIFY = 0x0282;
```

File

Messages

Description

This is constant Messages.WM_IME_NOTIFY.

96.3.265 Messages.WM_IME_REQUEST Constant

Pascal

```
WM_IME_REQUEST = $0288;
```

C++

```
WM_IME_REQUEST = 0x0288;
```

File

Messages

Description

This is constant Messages.WM_IME_REQUEST.

96.3.266 Messages.WM_IME_SELECT Constant

Pascal

```
WM_IME_SELECT = $0285;
```

C++

```
WM_IME_SELECT = 0x0285;
```

File

Messages

Description

This is constant Messages.WM_IME_SELECT.

96.3.267 Messages.WM_IME_SETCONTEXT Constant

Pascal

```
WM_IME_SETCONTEXT = $0281;
```

C++

```
WM_IME_SETCONTEXT = 0x0281;
```

File

Messages

Description

This is constant Messages.WM_IME_SETCONTEXT.

96.3.268 Messages.WM_IME_STARTCOMPOSITION Constant

Pascal

```
WM_IME_STARTCOMPOSITION = $010D;
```

C++

```
WM_IME_STARTCOMPOSITION = 0x010D;
```

File

Messages

Description

This is constant Messages.WM_IME_STARTCOMPOSITION.

96.3.269 Messages.WM_INITDIALOG Constant

Pascal

```
WM_INITDIALOG = $0110;
```

C++

```
WM_INITDIALOG = 0x0110;
```

File

Messages

Description

This is constant Messages.WM_INITDIALOG.

96.3.270 Messages.WM_INITMENU Constant

Pascal

```
WM_INITMENU = $0116;
```

C++

```
WM_INITMENU = 0x0116;
```

File

Messages

Description

This is constant Messages.WM_INITMENU.

96.3.271 Messages.WM_INITMENUPOPUP Constant

Pascal

```
WM_INITMENUPOPUP = $0117;
```

C++

```
WM_INITMENUPOPUP = 0x0117;
```

File

Messages

Description

This is constant Messages.WM_INITMENUPOPUP.

96.3.272 Messages.WM_INPUT Constant

Pascal

```
WM_INPUT = $00FF;
```

C++

```
WM_INPUT = 0x00FF;
```

File

Messages

Description

This is constant Messages.WM_INPUT.

96.3.273 Messages.WM_INPUTLANGCHANGE Constant

Pascal

```
WM_INPUTLANGCHANGE = $0051;
```

C++

```
WM_INPUTLANGCHANGE = 0x0051;
```

File

Messages

Description

This is constant Messages.WM_INPUTLANGCHANGE.

96.3.274 Messages.WM_INPUTLANGCHANGEREQUEST Constant

Pascal

```
WM_INPUTLANGCHANGEREQUEST = $0050;
```

C++

```
WM_INPUTLANGCHANGEREQUEST = 0x0050;
```

File

Messages

Description

This is constant Messages.WM_INPUTLANGCHANGEREQUEST.

96.3.275 Messages.WM_KEYDOWN Constant

Pascal

```
WM_KEYDOWN = $0100;
```

C++

```
WM_KEYDOWN = 0x0100;
```

File

Messages

Description

This is constant Messages.WM_KEYDOWN.

96.3.276 Messages.WM_KEYFIRST Constant

Pascal

```
WM_KEYFIRST = $0100;
```

C++

```
WM_KEYFIRST = 0x0100;
```

File

Messages

Description

This is constant Messages.WM_KEYFIRST.

96.3.277 Messages.WM_KEYLAST Constant

Pascal

```
WM_KEYLAST = $0109;
```

C++

```
WM_KEYLAST = 0x0109;
```

File

Messages

Description

This is constant Messages.WM_KEYLAST.

96.3.278 Messages.WM_KEYUP Constant

Pascal

```
WM_KEYUP = $0101;
```

C++

```
WM_KEYUP = 0x0101;
```

File

Messages

Description

This is constant Messages.WM_KEYUP.

96.3.279 Messages.WM_KILLFOCUS Constant

Pascal

```
WM_KILLFOCUS = $0008;
```

C++

```
WM_KILLFOCUS = 0x0008;
```

File

Messages

Description

This is constant Messages.WM_KILLFOCUS.

96.3.280 Messages.WM_LBUTTONDBLCLK Constant

Pascal

```
WM_LBUTTONDBLCLK = $0203;
```

C++

```
WM_LBUTTONDBLCLK = 0x0203;
```

File

Messages

Description

This is constant Messages.WM_LBUTTONDBLCLK.

96.3.281 Messages.WM_LBUTTONDOWN Constant

Pascal

```
WM_LBUTTONDOWN = $0201;
```

C++

```
WM_LBUTTONDOWN = 0x0201;
```

File

Messages

Description

This is constant Messages.WM_LBUTTONDOWN.

96.3.282 Messages.WM_LBUTTONUP Constant

Pascal

```
WM_LBUTTONUP = $0202;
```

C++

```
WM_LBUTTONUP = 0x0202;
```

File

Messages

Description

This is constant Messages.WM_LBUTTONUP.

96.3.283 Messages.WM_MBUTTONDBLCLK Constant

Pascal

```
WM_MBUTTONDBLCLK = $0209;
```

C++

```
WM_MBUTTONDBLCLK = 0x0209;
```

File

Messages

Description

This is constant Messages.WM_MBUTTONDBLCLK.

96.3.284 Messages.WM_MBUTTONDOWN Constant

Pascal

```
WM_MBUTTONDOWN = $0207;
```

C++

```
WM_MBUTTONDOWN = 0x0207;
```

File

Messages

Description

This is constant Messages.WM_MBUTTONDOWN.

96.3.285 Messages.WM_MBUTTONUP Constant

Pascal

```
WM_MBUTTONUP = $0208;
```

C++

```
WM_MBUTTONUP = 0x0208;
```

File

Messages

Description

This is constant Messages.WM_MBUTTONUP.

96.3.286 Messages.WM_MDIACTIVATE Constant

Pascal

```
WM_MDIACTIVATE = $0222;
```

C++

```
WM_MDIACTIVATE = 0x0222;
```

File

Messages

Description

This is constant Messages.WM_MDIACTIVATE.

96.3.287 Messages.WM_MDICASCADE Constant

Pascal

```
WM_MDICASCADE = $0227;
```

C++

```
WM_MDICASCADE = 0x0227;
```

File

Messages

Description

This is constant Messages.WM_MDICASCADE.

96.3.288 Messages.WM_MDICREATE Constant

Pascal

```
WM_MDICREATE = $0220;
```

C++

```
WM_MDICREATE = 0x0220;
```

File

Messages

Description

This is constant Messages.WM_MDICREATE.

96.3.289 Messages.WM_MDIDESTROY Constant

Pascal

```
WM_MDIDESTROY = $0221;
```

C++

```
WM_MDIDESTROY = 0x0221;
```

File

Messages

Description

This is constant Messages.WM_MDIDESTROY.

96.3.290 Messages.WM_MDIGETACTIVE Constant

Pascal

```
WM_MDIGETACTIVE = $0229;
```

C++

```
WM_MDIGETACTIVE = 0x0229;
```

File

Messages

Description

This is constant Messages.WM_MDIGETACTIVE.

96.3.291 Messages.WM_MDIICONARRANGE Constant

Pascal

```
WM_MDIICONARRANGE = $0228;
```

C++

```
WM_MDIICONARRANGE = 0x0228;
```

File

Messages

Description

This is constant Messages.WM_MDIICONARRANGE.

96.3.292 Messages.WM_MDIMAXIMIZE Constant

Pascal

```
WM_MDIMAXIMIZE = $0225;
```

C++

```
WM_MDIMAXIMIZE = 0x0225;
```

File

Messages

Description

This is constant Messages.WM_MDIMAXIMIZE.

96.3.293 Messages.WM_MDINEXT Constant

Pascal

```
WM_MDINEXT = $0224;
```

C++

```
WM_MDINEXT = 0x0224;
```

File

Messages

Description

This is constant Messages.WM_MDINEXT.

96.3.294 Messages.WM_MDIREFRESHMENU Constant

Pascal

```
WM_MDIREFRESHMENU = $0234;
```

C++

```
WM_MDIREFRESHMENU = 0x0234;
```

File

Messages

Description

This is constant Messages.WM_MDIREFRESHMENU.

96.3.295 Messages.WM_MDIRESTORE Constant

Pascal

```
WM_MDIRESTORE = $0223;
```

C++

```
WM_MDIRESTORE = 0x0223;
```

File

Messages

Description

This is constant Messages.WM_MDIRESTORE.

96.3.296 Messages.WM_MDISETMENU Constant

Pascal

```
WM_MDISETMENU = $0230;
```

C++

```
WM_MDISETMENU = 0x0230;
```

File

Messages

Description

This is constant Messages.WM_MDISETMENU.

96.3.297 Messages.WM_MDITILE Constant

Pascal

```
WM_MDITILE = $0226;
```

C++

```
WM_MDITILE = 0x0226;
```

File

Messages

Description

This is constant Messages.WM_MDITILE.

96.3.298 Messages.WM_MEASUREITEM Constant

Pascal

```
WM_MEASUREITEM = $002C;
```

C++

```
WM_MEASUREITEM = 0x002C;
```

File

Messages

Description

This is constant Messages.WM_MEASUREITEM.

96.3.299 Messages.WM_MENUCHAR Constant

Pascal

```
WM_MENUCHAR = $0120;
```

C++

```
WM_MENUCHAR = 0x0120;
```

File

Messages

Description

This is constant Messages.WM_MENUCHAR.

96.3.300 Messages.WM_MENUCOMMAND Constant

Pascal

```
WM_MENUCOMMAND = $0126;
```

C++

```
WM_MENUCOMMAND = 0x0126;
```

File

Messages

Description

This is constant Messages.WM_MENUCOMMAND.

96.3.301 Messages.WM_MENUDRAG Constant

Pascal

```
WM_MENUDRAG = $0123;
```

C++

```
WM_MENUDRAG = 0x0123;
```

File

Messages

Description

This is constant Messages.WM_MENUDRAG.

96.3.302 Messages.WM_MENUGETOBJECT Constant

Pascal

```
WM_MENUGETOBJECT = $0124;
```

C++

```
WM_MENUGETOBJECT = 0x0124;
```

File

Messages

Description

This is constant Messages.WM_MENUGETOBJECT.

96.3.303 Messages.WM_MENURBUTTONUP Constant

Pascal

```
WM_MENURBUTTONUP = $0122;
```

C++

```
WM_MENURBUTTONUP = 0x0122;
```

File

Messages

Description

This is constant Messages.WM_MENURBUTTONUP.

96.3.304 Messages.WM_MENUSELECT Constant

Pascal

```
WM_MENUSELECT = $011F;
```

C++

```
WM_MENUSELECT = 0x011F;
```

File

Messages

Description

This is constant Messages.WM_MENUSELECT.

96.3.305 Messages.WM_MOUSEACTIVATE Constant

Pascal

```
WM_MOUSEACTIVATE = $0021;
```

C++

```
WM_MOUSEACTIVATE = 0x0021;
```

File

Messages

Description

This is constant Messages.WM_MOUSEACTIVATE.

96.3.306 Messages.WM_MOUSEFIRST Constant

Pascal

```
WM_MOUSEFIRST = $0200;
```

C++

```
WM_MOUSEFIRST = 0x0200;
```

File

Messages

Description

This is constant Messages.WM_MOUSEFIRST.

96.3.307 Messages.WM_MOUSEHOVER Constant

Pascal

```
WM_MOUSEHOVER = $02A1;
```

C++

```
WM_MOUSEHOVER = 0x02A1;
```

File

Messages

Description

This is constant Messages.WM_MOUSEHOVER.

96.3.308 Messages.WM_MOUSELAST Constant

Pascal

```
WM_MOUSELAST = $020A;
```

C++

```
WM_MOUSELAST = 0x020A;
```

File

Messages

Description

This is constant Messages.WM_MOUSELAST.

96.3.309 Messages.WM_MOUSELEAVE Constant

Pascal

```
WM_MOUSELEAVE = $02A3;
```

C++

```
WM_MOUSELEAVE = 0x02A3;
```

File

Messages

Description

This is constant Messages.WM_MOUSELEAVE.

96.3.310 Messages.WM_MOUSEMOVE Constant

Pascal

```
WM_MOUSEMOVE = $0200;
```

C++

```
WM_MOUSEMOVE = 0x0200;
```

File

Messages

Description

This is constant Messages.WM_MOUSEMOVE.

96.3.311 Messages.WM_MOUSEWHEEL Constant

Pascal

```
WM_MOUSEWHEEL = $020A;
```

C++

```
WM_MOUSEWHEEL = 0x020A;
```

File

Messages

Description

This is constant Messages.WM_MOUSEWHEEL.

96.3.312 Messages.WM_MOVE Constant

Pascal

```
WM_MOVE = $0003;
```

C++

```
WM_MOVE = 0x0003;
```

File

Messages

Description

This is constant Messages.WM_MOVE.

96.3.313 Messages.WM_MOVING Constant

Pascal

```
WM_MOVING = 534;
```

C++

```
WM_MOVING = 534;
```

File

Messages

Description

This is constant Messages.WM_MOVING.

96.3.314 Messages.WM_NCACTIVATE Constant

Pascal

```
WM_NCACTIVATE = $0086;
```

C++

```
WM_NCACTIVATE = 0x0086;
```

File

Messages

Description

This is constant Messages.WM_NCACTIVATE.

96.3.315 Messages.WM_NCCALCSIZE Constant

Pascal

```
WM_NCCALCSIZE = $0083;
```

C++

```
WM_NCCALCSIZE = 0x0083;
```

File

Messages

Description

This is constant Messages.WM_NCCALCSIZE.

96.3.316 Messages.WM_NCCREATE Constant

Pascal

```
WM_NCCREATE = $0081;
```

C++

```
WM_NCCREATE = 0x0081;
```

File

Messages

Description

This is constant Messages.WM_NCCREATE.

96.3.317 Messages.WM_NCDESTROY Constant

Pascal

```
WM_NCDESTROY = $0082;
```

C++

```
WM_NCDESTROY = 0x0082;
```

File

Messages

Description

This is constant Messages.WM_NCDESTROY.

96.3.318 Messages.WM_NCHITTEST Constant

Pascal

```
WM_NCHITTEST = $0084;
```

C++

```
WM_NCHITTEST = 0x0084;
```

File

Messages

Description

This is constant Messages.WM_NCHITTEST.

96.3.319 Messages.WM_NCLBUTTONDBLCLK Constant

Pascal

```
WM_NCLBUTTONDBLCLK = $00A3;
```

C++

```
WM_NCLBUTTONDBLCLK = 0x00A3;
```

File

Messages

Description

This is constant Messages.WM_NCLBUTTONDBLCLK.

96.3.320 Messages.WM_NCLBUTTONDOWN Constant

Pascal

```
WM_NCLBUTTONDOWN = $00A1;
```

C++

```
WM_NCLBUTTONDOWN = 0x00A1;
```

File

Messages

Description

This is constant Messages.WM_NCLBUTTONDOWN.

96.3.321 Messages.WM_NCLBUTTONUP Constant

Pascal

```
WM_NCLBUTTONUP = $00A2;
```

C++

```
WM_NCLBUTTONUP = 0x00A2;
```

File

Messages

Description

This is constant Messages.WM_NCLBUTTONUP.

96.3.322 Messages.WM_NCMBUTTONDBLCLK Constant

Pascal

```
WM_NCMBUTTONDBLCLK = $00A9;
```

C++

```
WM_NCMBUTTONDBLCLK = 0x00A9;
```

File

Messages

Description

This is constant Messages.WM_NCMBUTTONDBLCLK.

96.3.323 Messages.WM_NCMBUTTONDOWN Constant

Pascal

```
WM_NCMBUTTONDOWN = $00A7;
```

C++

```
WM_NCMBUTTONDOWN = 0x00A7;
```

File

Messages

Description

This is constant Messages.WM_NCMBUTTONDOWN.

96.3.324 Messages.WM_NCMBUTTONUP Constant

Pascal

```
WM_NCMBUTTONUP = $00A8;
```

C++

```
WM_NCMBUTTONUP = 0x00A8;
```

File

Messages

Description

This is constant Messages.WM_NCMBUTTONUP.

96.3.325 Messages.WM_NCMOUSEHOVER Constant

Pascal

```
WM_NCMOUSEHOVER = $02A0;
```

C++

```
WM_NCMOUSEHOVER = 0x02A0;
```

File

Messages

Description

This is constant Messages.WM_NCMOUSEHOVER.

96.3.326 Messages.WM_NCMOUSELEAVE Constant

Pascal

```
WM_NCMOUSELEAVE = $02A2;
```

C++

```
WM_NCMOUSELEAVE = 0x02A2;
```

File

Messages

Description

This is constant Messages.WM_NCMOUSELEAVE.

96.3.327 Messages.WM_NCMOUSEMOVE Constant

Pascal

```
WM_NCMOUSEMOVE = $00A0;
```

C++

```
WM_NCMOUSEMOVE = 0x00A0;
```

File

Messages

Description

This is constant Messages.WM_NCMOUSEMOVE.

96.3.328 Messages.WM_NCPAINT Constant

Pascal

```
WM_NCPAINT = $0085;
```

C++

```
WM_NCPAINT = 0x0085;
```

File

Messages

Description

This is constant Messages.WM_NCPAINT.

96.3.329 Messages.WM_NCRBUTTONDBLCLK Constant

Pascal

```
WM_NCRBUTTONDBLCLK = $00A6;
```

C++

```
WM_NCRBUTTONDBLCLK = 0x00A6;
```

File

Messages

Description

This is constant Messages.WM_NCRBUTTONDBLCLK.

96.3.330 Messages.WM_NCRBUTTONDOWN Constant

Pascal

```
WM_NCRBUTTONDOWN = $00A4;
```

C++

```
WM_NCRBUTTONDOWN = 0x00A4;
```

File

Messages

Description

This is constant Messages.WM_NCRBUTTONDOWN.

96.3.331 Messages.WM_NCRBUTTONUP Constant

Pascal

```
WM_NCRBUTTONUP = $00A5;
```

C++

```
WM_NCRBUTTONUP = 0x00A5;
```

File

Messages

Description

This is constant Messages.WM_NCRBUTTONUP.

96.3.332 Messages.WM_NCXBUTTONDBLCLK Constant

Pascal

```
WM_NCXBUTTONDBLCLK = $00AD;
```

C++

```
WM_NCXBUTTONDBLCLK = 0x00AD;
```

File

Messages

Description

This is constant Messages.WM_NCXBUTTONDBLCLK.

96.3.333 Messages.WM_NCXBUTTONDOWN Constant

Pascal

```
WM_NCXBUTTONDOWN = $00AB;
```

C++

```
WM_NCXBUTTONDOWN = 0x00AB;
```

File

Messages

Description

This is constant Messages.WM_NCXBUTTONDOWN.

96.3.334 Messages.WM_NCXBUTTONUP Constant

Pascal

```
WM_NCXBUTTONUP = $00AC;
```

C++

```
WM_NCXBUTTONUP = 0x00AC;
```

File

Messages

Description

This is constant Messages.WM_NCXBUTTONUP.

96.3.335 Messages.WM_NEXTDLGCTL Constant

Pascal

```
WM_NEXTDLGCTL = $0028;
```

C++

```
WM_NEXTDLGCTL = 0x0028;
```

File

Messages

Description

This is constant Messages.WM_NEXTDLGCTL.

96.3.336 Messages.WM_NEXTMENU Constant

Pascal

```
WM_NEXTMENU = $0213;
```

C++

```
WM_NEXTMENU = 0x0213;
```

File

Messages

Description

This is constant Messages.WM_NEXTMENU.

96.3.337 Messages.WM_NOTIFY Constant

Pascal

```
WM_NOTIFY = $004E;
```

C++

```
WM_NOTIFY = 0x004E;
```

File

Messages

Description

This is constant Messages.WM_NOTIFY.

96.3.338 Messages.WM_NOTIFYFORMAT Constant

Pascal

```
WM_NOTIFYFORMAT = $0055;
```

C++

```
WM_NOTIFYFORMAT = 0x0055;
```

File

Messages

Description

This is constant Messages.WM_NOTIFYFORMAT.

96.3.339 Messages.WM_NULL Constant

Pascal

```
WM_NULL = $0000;
```

C++

```
WM_NULL = 0x0000;
```

File

Messages

Description

This is constant Messages.WM_NULL.

96.3.340 Messages.WM_PAINT Constant

Pascal

```
WM_PAINT = $000F;
```

C++

```
WM_PAINT = 0x000F;
```

File

Messages

Description

This is constant Messages.WM_PAINT.

96.3.341 Messages.WM_PAINTCLIPBOARD Constant

Pascal

```
WM_PAINTCLIPBOARD = $0309;
```

C++

```
WM_PAINTCLIPBOARD = 0x0309;
```

File

Messages

Description

This is constant Messages.WM_PAINTCLIPBOARD.

96.3.342 Messages.WM_PAINTICON Constant

Pascal

```
WM_PAINTICON = $0026;
```

C++

```
WM_PAINTICON = 0x0026;
```

File

Messages

Description

This is constant Messages.WM_PAINTICON.

96.3.343 Messages.WM_PALETTECHANGED Constant

Pascal

```
WM_PALETTECHANGED = $0311;
```

C++

```
WM_PALETTECHANGED = 0x0311;
```

File

Messages

Description

This is constant Messages.WM_PALETTECHANGED.

96.3.344 Messages.WM_PALETTEISCHANGING Constant

Pascal

```
WM_PALETTEISCHANGING = $0310;
```

C++

```
WM_PALETTEISCHANGING = 0x0310;
```

File

Messages

Description

This is constant Messages.WM_PALETTEISCHANGING.

96.3.345 Messages.WM_PARENTNOTIFY Constant

Pascal

```
WM_PARENTNOTIFY = $0210;
```

C++

```
WM_PARENTNOTIFY = 0x0210;
```

File

Messages

Description

This is constant Messages.WM_PARENTNOTIFY.

96.3.346 Messages.WM_PASTE Constant

Pascal

```
WM_PASTE = $0302;
```

C++

```
WM_PASTE = 0x0302;
```

File

Messages

Description

This is constant Messages.WM_PASTE.

96.3.347 Messages.WM_PENWINFIRST Constant

Pascal

```
WM_PENWINFIRST = $0380;
```

C++

```
WM_PENWINFIRST = 0x0380;
```

File

Messages

Description

This is constant Messages.WM_PENWINFIRST.

96.3.348 Messages.WM_PENWINLAST Constant

Pascal

```
WM_PENWINLAST = $038F;
```

C++

```
WM_PENWINLAST = 0x038F;
```

File

Messages

Description

This is constant Messages.WM_PENWINLAST.

96.3.349 Messages.WM_POWER Constant

Pascal

```
WM_POWER = $0048;
```

C++

```
WM_POWER = 0x0048;
```

File

Messages

Description

This is constant Messages.WM_POWER.

96.3.350 Messages.WM_POWERBROADCAST Constant

Pascal

```
WM_POWERBROADCAST = 536;
```

C++

```
WM_POWERBROADCAST = 536;
```

File

Messages

Description

This is constant Messages.WM_POWERBROADCAST.

96.3.351 Messages.WM_PRINT Constant

Pascal

```
WM_PRINT = 791;
```

C++

```
WM_PRINT = 791;
```

File

Messages

Description

This is constant Messages.WM_PRINT.

96.3.352 Messages.WM_PRINTCLIENT Constant

Pascal

```
WM_PRINTCLIENT = 792;
```

C++

```
WM_PRINTCLIENT = 792;
```

File

Messages

Description

This is constant Messages.WM_PRINTCLIENT.

96.3.353 Messages.WM_QUERYDRAGICON Constant

Pascal

```
WM_QUERYDRAGICON = $0037;
```

C++

```
WM_QUERYDRAGICON = 0x0037;
```

File

Messages

Description

This is constant Messages.WM_QUERYDRAGICON.

96.3.354 Messages.WM_QUERYENDSESSION Constant

Pascal

```
WM_QUERYENDSESSION = $0011;
```

C++

```
WM_QUERYENDSESSION = 0x0011;
```

File

Messages

Description

This is constant Messages.WM_QUERYENDSESSION.

96.3.355 Messages.WM_QUERYNEWPALETTE Constant

Pascal

```
WM_QUERYNEWPALETTE = $030F;
```

C++

```
WM_QUERYNEWPALETTE = 0x030F;
```

File

Messages

Description

This is constant Messages.WM_QUERYNEWPALETTE.

96.3.356 Messages.WM_QUERYOPEN Constant

Pascal

```
WM_QUERYOPEN = $0013;
```

C++

```
WM_QUERYOPEN = 0x0013;
```

File

Messages

Description

This is constant Messages.WM_QUERYOPEN.

96.3.357 Messages.WM_QUERYUISTATE Constant

Pascal

```
WM_QUERYUISTATE = $0129;
```

C++

```
WM_QUERYUISTATE = 0x0129;
```

File

Messages

Description

This is constant Messages.WM_QUERYUISTATE.

96.3.358 Messages.WM_QUEUESYNC Constant

Pascal

```
WM_QUEUESYNC = $0023;
```

C++

```
WM_QUEUESYNC = 0x0023;
```

File

Messages

Description

This is constant Messages.WM_QUEUESYNC.

96.3.359 Messages.WM_QUIT Constant

Pascal

```
WM_QUIT = $0012;
```

C++

```
WM_QUIT = 0x0012;
```

File

Messages

Description

This is constant Messages.WM_QUIT.

96.3.360 Messages.WM_RBUTTONDBLCLK Constant

Pascal

```
WM_RBUTTONDBLCLK = $0206;
```

C++

```
WM_RBUTTONDBLCLK = 0x0206;
```

File

Messages

Description

This is constant Messages.WM_RBUTTONDBLCLK.

96.3.361 Messages.WM_RBUTTONDOWN Constant

Pascal

```
WM_RBUTTONDOWN = $0204;
```

C++

```
WM_RBUTTONDOWN = 0x0204;
```

File

Messages

Description

This is constant Messages.WM_RBUTTONDOWN.

96.3.362 Messages.WM_RBUTTONUP Constant

Pascal

```
WM_RBUTTONUP = $0205;
```

C++

```
WM_RBUTTONUP = 0x0205;
```

File

Messages

Description

This is constant Messages.WM_RBUTTONUP.

96.3.363 Messages.WM_RENDERALLFORMATS Constant

Pascal

```
WM_RENDERALLFORMATS = $0306;
```

C++

```
WM_RENDERALLFORMATS = 0x0306;
```

File

Messages

Description

This is constant Messages.WM_RENDERALLFORMATS.

96.3.364 Messages.WM_RENDERFORMAT Constant

Pascal

```
WM_RENDERFORMAT = $0305;
```

C++

```
WM_RENDERFORMAT = 0x0305;
```

File

Messages

Description

This is constant Messages.WM_RENDERFORMAT.

96.3.365 Messages.WM_SETCURSOR Constant

Pascal

```
WM_SETCURSOR = $0020;
```

C++

```
WM_SETCURSOR = 0x0020;
```

File

Messages

Description

This is constant Messages.WM_SETCURSOR.

96.3.366 Messages.WM_SETFOCUS Constant

Pascal

```
WM_SETFOCUS = $0007;
```

C++

```
WM_SETFOCUS = 0x0007;
```

File

Messages

Description

This is constant Messages.WM_SETFOCUS.

96.3.367 Messages.WM_SETFONT Constant

Pascal

```
WM_SETFONT = $0030;
```

C++

```
WM_SETFONT = 0x0030;
```

File

Messages

Description

This is constant Messages.WM_SETFONT.

96.3.368 Messages.WM_SETHOTKEY Constant

Pascal

```
WM_SETHOTKEY = $0032;
```

C++

```
WM_SETHOTKEY = 0x0032;
```

File

Messages

Description

This is constant Messages.WM_SETHOTKEY.

96.3.369 Messages.WM_SETICON Constant

Pascal

```
WM_SETICON = $0080;
```

C++

```
WM_SETICON = 0x0080;
```

File

Messages

Description

This is constant Messages.WM_SETICON.

96.3.370 Messages.WM_SETREDRAW Constant

Pascal

```
WM_SETREDRAW = $000B;
```

C++

```
WM_SETREDRAW = 0x000B;
```

File

Messages

Description

This is constant Messages.WM_SETREDRAW.

96.3.371 Messages.WM_SETTEXT Constant

Pascal

```
WM_SETTEXT = $000C;
```

C++

```
WM_SETTEXT = 0x000C;
```

File

Messages

Description

This is constant Messages.WM_SETTEXT.

96.3.372 Messages.WM_SETTINGCHANGE Constant

Pascal

```
WM_SETTINGCHANGE = WM_WININICHANGE;
```

C++

```
WM_SETTINGCHANGE = WM_WININICHANGE;
```

File

Messages

Description

This is constant Messages.WM_SETTINGCHANGE.

96.3.373 Messages.WM_SHOWWINDOW Constant

Pascal

```
WM_SHOWWINDOW = $0018;
```

C++

```
WM_SHOWWINDOW = 0x0018;
```

File

Messages

Description

This is constant Messages.WM_SHOWWINDOW.

96.3.374 Messages.WM_SIZE Constant

Pascal

```
WM_SIZE = $0005;
```

C++

```
WM_SIZE = 0x0005;
```

File

Messages

Description

This is constant Messages.WM_SIZE.

96.3.375 Messages.WM_SIZECLIPBOARD Constant

Pascal

```
WM_SIZECLIPBOARD = $030B;
```

C++

```
WM_SIZECLIPBOARD = 0x030B;
```

File

Messages

Description

This is constant Messages.WM_SIZECLIPBOARD.

96.3.376 Messages.WM_SIZING Constant

Pascal

```
WM_SIZING = 532;
```

C++

```
WM_SIZING = 532;
```

File

Messages

Description

This is constant Messages.WM_SIZING.

96.3.377 Messages.WM_SPOOLERSTATUS Constant

Pascal

```
WM_SPOOLERSTATUS = $002A;
```

C++

```
WM_SPOOLERSTATUS = 0x002A;
```

File

Messages

Description

This is constant Messages.WM_SPOOLERSTATUS.

96.3.378 Messages.WM_STYLECHANGED Constant

Pascal

```
WM_STYLECHANGED = $007D;
```

C++

```
WM_STYLECHANGED = 0x007D;
```

File

Messages

Description

This is constant Messages.WM_STYLECHANGED.

96.3.379 Messages.WM_STYLECHANGING Constant

Pascal

```
WM_STYLECHANGING = $007C;
```

C++

```
WM_STYLECHANGING = 0x007C;
```

File

Messages

Description

This is constant Messages.WM_STYLECHANGING.

96.3.380 Messages.WM_SYSCHAR Constant

Pascal

```
WM_SYSCHAR = $0106;
```

C++

```
WM_SYSCHAR = 0x0106;
```

File

Messages

Description

This is constant Messages.WM_SYSCHAR.

96.3.381 Messages.WM_SYSCOLORCHANGE Constant

Pascal

```
WM_SYSCOLORCHANGE = $0015;
```

C++

```
WM_SYSCOLORCHANGE = 0x0015;
```

File

Messages

Description

This is constant Messages.WM_SYSCOLORCHANGE.

96.3.382 Messages.WM_SYSCOMMAND Constant

Pascal

```
WM_SYSCOMMAND = $0112;
```

C++

```
WM_SYSCOMMAND = 0x0112;
```

File

Messages

Description

This is constant Messages.WM_SYSCOMMAND.

96.3.383 Messages.WM_SYSDEADCHAR Constant

Pascal

```
WM_SYSDEADCHAR = $0107;
```

C++

```
WM_SYSDEADCHAR = 0x0107;
```

File

Messages

Description

This is constant Messages.WM_SYSDEADCHAR.

96.3.384 Messages.WM_SYSKEYDOWN Constant

Pascal

```
WM_SYSKEYDOWN = $0104;
```

C++

```
WM_SYSKEYDOWN = 0x0104;
```

File

Messages

Description

This is constant Messages.WM_SYSKEYDOWN.

96.3.385 Messages.WM_SYSKEYUP Constant

Pascal

```

97.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAppServer (see page 16450)	IAppServer is the interface that client datasets use to communicate with a dataset provider.
	IAppServerDisp (see page 16457)	This is class Midas.IAppServerDisp.

97.1.1 IAppServer Interface

IAppServer is the interface that client datasets use to communicate with a dataset provider.

Class Hierarchy

Pascal

```
IAppServer = interface(IDispatch);
```

C++

```
__interface IAppServer : public IDispatch;
```

File

Midas

Description

Client datasets use an IAppServer interface to implement many of their properties and methods. This interface provides the basis of communication between the client dataset and a provider component from which it receives data and to which it applies updates.

If the provider is in the same application as the client dataset, the IAppServer interface is implemented by a hidden object that is created to manage the communication between the client dataset and the provider. In multi-tiered applications, client datasets obtain an IAppServer instance from a connection component that resides in the client application.

When client datasets use IAppServer to talk to a provider component, they pass the name of the desired provider to all method calls. By default, the interface is stateless, meaning that each method call functions independently, with no reliance on previous method calls. Because of this, IAppServer has no properties, which would represent persistent state information. However, there are cases where the client dataset relies on state information, such as the current database cursor position when performing incremental fetching using the AS_GetRecords (see page 16455) method. This state information is preserved only if multiple clients do not share an application server that implements IAppServer.

Note: Component Method declarations that use IAppServer use the _di_IAppServer type instead. This type is a DelphiInterface wrapper around the IAppServer interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IAppServer >  _di_IAppServer;
```

Communicating with Providers Using Custom Events

Communicating with the Client Dataset

97.1.1.1 IAppServer Members

The following tables list the members exposed by IAppServer.

Public Methods

	Name	Description
	AS_ApplyUpdates (see page 16451)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 16452)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 16453)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 16454)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 16454)	Returns a list of all the available providers on a remote data module.
	AS_GetRecords (see page 16455)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 16456)	Returns information from a specified record of the provider's dataset.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.

97.1.1.2 IAppServer Methods

The methods of the IAppServer class are listed here.

Public Methods

	Name	Description
	AS_ApplyUpdates (see page 16451)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 16452)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 16453)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 16454)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 16454)	Returns a list of all the available providers on a remote data module.
	AS_GetRecords (see page 16455)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 16456)	Returns information from a specified record of the provider's dataset.

97.1.1.2.1 IAppServer.AS_ApplyUpdates Method

Applies updates received from a client dataset using a specified provider.

Pascal

```
function AS_ApplyUpdates(const ProviderName: WideString; Delta: OleVariant; MaxErrors:
Integer; out ErrorCount: Integer; var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_ApplyUpdates(const BSTR ProviderName, OleVariant Delta, int
```

```
MaxErrors, int ErrorCount, OleVariant OwnerData);
```

Description

AS_AS_ApplyUpdates writes client updates to a dataset or database server.

ProviderName specifies the name of the provider component that manages the update operation.

Delta is a Variant containing the updated, inserted, and deleted records to write to the database.

MaxErrors indicates the maximum number of errors to permit before stopping the update operation.

ErrorCount returns the actual number of errors encountered during the update operation.

OwnerData is information supplied by the client application in a BeforeAS_ApplyUpdates event handler and returned to the client application in an AfterAS_ApplyUpdates event handler.

AS_AS_ApplyUpdates (Delphi) or AS_ApplyUpdates_result parameter (C++) returns a Variant that is a data packet containing all records that could not be applied to the database.

See Also

ApplyUpdates (see page 8394)

applyupdates (see page 18459)

BeforeApplyUpdates (see page 18479)

AfterApplyUpdates (see page 18475)

BeforeApplyUpdates (see page 8511)

AfterApplyUpdates (see page 8497)

AS_ApplyUpdates (see page 6590)

as_applyupdates (see page 19892)

Communicating with the Client Dataset

97.1.1.2.2 IAppServer.AS_DataRequest Method

Generates an OnAS_DataRequest event on the specified provider component.

Pascal

```
function AS_DataRequest(const ProviderName: WideString; Data: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_DataRequest(const BSTR ProviderName, OleVariant Data);
```

Description

Use AS_AS_DataRequest to invoke an OnAS_DataRequest event handler of the provider named by ProviderName. This method is provided to allow application developers to customize the communication between a client application and a provider component. There is no predefined meaning for the Data parameter or the return value (Delphi) or the AS_DataRequest_result parameter (C++), which is returned to the caller.

See Also

OnDataRequest (see page 18482)

DataRequest (see page 8404)

Communicating with the Client Dataset

97.1.1.2.3 IAppServer.AS_Execute Method

AS_Executes the query or stored procedure bound to a specified provider.

Pascal

```
procedure AS_Execute(const ProviderName: WideString; const CommandText: WideString; var
Params: OleVariant; var OwnerData: OleVariant); safecall;
```

C++

```
__fastcall AS_Execute(const BSTR ProviderName, const BSTR CommandText, OleVariant Params,
OleVariant OwnerData);
```

Description

Use AS_AS_Execute to pass an execute command to a remote provider, using a specified set of parameters. AS_AS_Execute calls the AS_Execute method of the specified provider after assigning any parameters. Output parameters that result from executing a query or stored procedure are returned in the Params parameter.

The provider's AS_Execute method generates a BeforeAS_Execute event, passes the command on to its associated dataset, and generates an AfterAS_Execute event. The dataset must represent a query or stored procedure that does not return a cursor.

The ProviderName parameter specifies the name of the provider component associated with the query or stored procedure.

CommandText specifies an optional SQL statement that replaces the SQL of the query, or the name of a stored procedure that replaces the dataset's stored procedure. This parameter is ignored if the provider's Options property does not include poAllowCommandText.

The Params parameter encodes any parameters expected by the query or stored procedure and returns any output parameters. To create a properly encoded value for Params from a TParams object, use the PackageParams routine. To decode Params into a TParams object, use the Unpackparams routine.

The OwnerData parameter contains custom information that appears as an argument to the provider's BeforeAS_Execute and AfterAS_Execute event handlers. This information originates in a client dataset's BeforeAS_Execute event handler. The value returned in OwnerData is passed to the client dataset's AfterAS_Execute event handler.

BeforeExecute (see page 8514)

AfterExecute (see page 8504)

Options (see page 18440)

PackageParams (see page 8534)

UnpackParams (see page 8534)

Communicating with the Client Dataset

97.1.1.2.4 IAppServer.AS_GetParams Method

Fetches current parameter values from the dataset bound to a specified provider.

Pascal

```
function AS_GetParams(const ProviderName: WideString; var OwnerData: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_GetParams(const BSTR ProviderName, OleVariant OwnerData);
```

Description

Use AS_AS_GetParams to retrieve the current parameter values from the dataset associated with a provider.

The ProviderName parameter specifies the name of the provider component whose dataset has the parameters.

The OwnerData represents custom information that originates in a client dataset's BeforeAS_GetParams event handler and returns information that is passed to the client dataset's AfterAS_GetParams event handler.

AS_GetParams_result (C++) or AS_AS_GetParams (Delphi) returns the parameters, encoded as a Variant array, where each element is a 2-element Variant array containing a parameter name and a parameter value. These parameters can be converted to a TParams object using the UnpackParams procedure. If the dataset has no parameters, or if the provider does not support parameter fetching, AS_GetParams_result (C++) or AS_AS_GetParams (Delphi) returns a Null Variant.

Note: AS_AS_GetParams should not be used to retrieve output parameters from stateless application servers, because parameter values may be changed by other applications. When writing a stateless application server, retrieve parameter values using the AS_Execute (see page 16453) method instead.

AS_Execute (see page 16453)

UnpackParams (see page 8534)

Communicating with the Client Dataset

97.1.1.2.5 IAppServer.AS_GetProviderNames Method

Returns a list of all the available providers on a remote data module.

Pascal

```
function AS_GetProviderNames: OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetProviderNames();
```

Description

Call AS_AS_GetProviderNames for a list of all providers available from a remote data module. These values indicate the

possible values for the ProviderName property of a client dataset that uses the IAppServer (see page 16450) interface of an application server. When calling any other IAppServer (see page 16450) method, pass one of these names to indicate the provider that is the target of the method call.

AS_AS_GetProviderNames returns the names of the providers in a Variant array. Client datasets are associated with a provider by setting their ProviderName property to one of these names.

See Also

providers (see page 6599)

ProviderName (see page 8492)

Providers (see page 19908)

Communicating with the Client Dataset

97.1.1.2.6 IAppServer.AS_GetRecords Method

Returns a data packet that contains the specified data.

Pascal

```
function AS_GetRecords(const ProviderName: WideString; Count: Integer; out RecsOut: Integer;
Options: Integer; const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetRecords(const BSTR ProviderName, int Count, int RecsOut, int
Options, const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

Call AS_AS_GetRecords to retrieve a specified number of records. AS_GetRecords returns the requested records, starting with the current record of the provider's dataset. When working with a stateless remote data module, you may need to reposition the cursor or re-execute a query or stored procedure in the provider's BeforeAS_GetRecords event handler.

ProviderName gives the name of the provider component that provides the records.

Count indicates the number or type of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only Count records are retrieved.

RecsOut returns the actual number of records retrieved.

Options indicates what information should be added to the data packet in addition to data. It is a combination of the GetRecordOption constants. For example, the following value requests metadata along with a data packet encoded in XML:

```
MetaDataOption + XMLOption
MetaDataOption || XMLOption
```

CommandText specifies an optional SQL statement that replaces the SQL of a query, or the name of a table or stored procedure that replaces the provider's table or stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

Params is a Variant containing any parameters that should be passed to the provider's dataset before it executes to generate the requested data. It returns any output parameters. You can convert between the Variant format for parameters used by this argument and a TParams object using the global PackageParams and UnpackParams routines.

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_GetRecords event handler. This information is passed to the provider's BeforeAS_GetRecords event handler. OwnerData returns information supplied by the provider's AfterAS_GetRecords event handler.

Records are returned as a data packet in a Variantparameter, AS_GetRecords_result (C++).

UnpackParams (see page 8534)

Communicating with the Client Dataset

97.1.1.2.7 IAppServer.AS_RowRequest Method

Returns information from a specified record of the provider's dataset.

Pascal

```
function AS_RowRequest(const ProviderName: WideString; Row: OleVariant; RequestType: Integer;
var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_RowRequest(const BSTR ProviderName, OleVariant Row, int RequestType,
OleVariant OwnerData);
```

Description

Client datasets call AS_AS_RowRequest automatically to implement their FetchBlobs, FetchDetails , or RefreshRecord method.

The ProviderName parameter indicates the provider associated with the dataset from which information should be fetched.

The Row parameter is an OleVariant that describes the current record on the client dataset.

The RequestType parameter indicates the type of information required. It is an integer version of the TFetchOptions type. (An integer because the value may be marshaled to a remote application server). To create a value for RequestType, take the corresponding TFetchOptions value, cast it to a Byte, and cast the result to an Integer:

```
Integer(Byte([foBlobs, foDetails]));
(int) (Byte) (TFetchOptions() << foBlobs << foDetails);
```

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_RowRequest event handler. This information is passed to the provider's BeforeAS_RowRequest event handler. OwnerData returns custom information supplied by the provider's AfterAS_RowRequest event handler.

The requested data is returned as a delta packet in AS_RowRequest_result (C++).

Communicating with the Client Dataset

97.1.2 IAppServerDisp Interface

Class Hierarchy

Midas.IAppServerDisp

Pascal

```
IAppServerDisp = dispinterface;
```

C++

```
class IAppServerDisp;
```

File

Midas

Description

This is class Midas.IAppServerDisp.

97.1.2.1 IAppServerDisp Members

The following tables list the members exposed by IAppServerDisp.

Public Methods

	Name	Description
	AS_ApplyUpdates (see page 16458)	This is AS_ApplyUpdates, a member of class IAppServerDisp.
	AS_DataRequest (see page 16458)	This is AS_DataRequest, a member of class IAppServerDisp.
	AS_Execute (see page 16458)	This is AS_Execute, a member of class IAppServerDisp.
	AS_GetParams (see page 16458)	This is AS_GetParams, a member of class IAppServerDisp.
	AS_GetProviderNames (see page 16459)	This is AS_GetProviderNames, a member of class IAppServerDisp.
	AS_GetRecords (see page 16459)	This is AS_GetRecords, a member of class IAppServerDisp.
	AS_RowRequest (see page 16459)	This is AS_RowRequest, a member of class IAppServerDisp.

97.1.2.2 IAppServerDisp Methods

The methods of the IAppServerDisp class are listed here.

Public Methods

	Name	Description
	AS_ApplyUpdates (see page 16458)	This is AS_ApplyUpdates, a member of class IAppServerDisp.
	AS_DataRequest (see page 16458)	This is AS_DataRequest, a member of class IAppServerDisp.
	AS_Execute (see page 16458)	This is AS_Execute, a member of class IAppServerDisp.
	AS_GetParams (see page 16458)	This is AS_GetParams, a member of class IAppServerDisp.
	AS_GetProviderNames (see page 16459)	This is AS_GetProviderNames, a member of class IAppServerDisp.

	AS_GetRecords (see page 16459)	This is AS_GetRecords, a member of class IAppServerDisp.
	AS_RowRequest (see page 16459)	This is AS_RowRequest, a member of class IAppServerDisp.

97.1.2.2.1 IAppServerDisp.AS_ApplyUpdates Method

Pascal

```
function AS_ApplyUpdates(const ProviderName: WideString; Delta: OleVariant; MaxErrors:
Integer; out ErrorCount: Integer; var OwnerData: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant AS_ApplyUpdates(const BSTR ProviderName, OleVariant Delta, int
MaxErrors, int ErrorCount, OleVariant OwnerData);
```

Description

This is AS_ApplyUpdates, a member of class IAppServerDisp.

97.1.2.2.2 IAppServerDisp.AS_DataRequest Method

Pascal

```
function AS_DataRequest(const ProviderName: WideString; Data: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant AS_DataRequest(const BSTR ProviderName, OleVariant Data);
```

Description

This is AS_DataRequest, a member of class IAppServerDisp.

97.1.2.2.3 IAppServerDisp.AS_Execute Method

Pascal

```
procedure AS_Execute(const ProviderName: WideString; const CommandText: WideString; var
Params: OleVariant; var OwnerData: OleVariant);
```

C++

```
__fastcall AS_Execute(const BSTR ProviderName, const BSTR CommandText, OleVariant Params,
OleVariant OwnerData);
```

Description

This is AS_Execute, a member of class IAppServerDisp.

97.1.2.2.4 IAppServerDisp.AS_GetParams Method

Pascal

```
function AS_GetParams(const ProviderName: WideString; var OwnerData: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant AS_GetParams(const BSTR ProviderName, OleVariant OwnerData);
```

Description

This is AS_GetParams, a member of class IAppServerDisp.

97.1.2.2.5 IAppServerDisp.AS_GetProviderNames Method

Pascal

```
function AS_GetProviderNames: OleVariant;
```

C++

```
__fastcall OleVariant AS_GetProviderNames();
```

Description

This is AS_GetProviderNames, a member of class IAppServerDisp.

97.1.2.2.6 IAppServerDisp.AS_GetRecords Method

Pascal

```
function AS_GetRecords(const ProviderName: WideString; Count: Integer; out RecsOut: Integer;
Options: Integer; const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant AS_GetRecords(const BSTR ProviderName, int Count, int RecsOut, int
Options, const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

This is AS_GetRecords, a member of class IAppServerDisp.

97.1.2.2.7 IAppServerDisp.AS_RowRequest Method

Pascal

```
function AS_RowRequest(const ProviderName: WideString; Row: OleVariant; RequestType: Integer;
var OwnerData: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant AS_RowRequest(const BSTR ProviderName, OleVariant Row, int RequestType,
OleVariant OwnerData);
```

Description

This is AS_RowRequest, a member of class IAppServerDisp.

97.2 Constants

The following table lists constants in this documentation.

Constants

Name	Description
IID_IAppServer (see page 16460)	This is constant Midas.IID_IAppServer.
LIBID_Midas (see page 16460)	This is constant Midas.LIBID_Midas.

97.2.1 Midas.IID_IAppServer Constant

Pascal

```
IID_IAppServer: TGUID = '{1AEFCC20-7A24-11D2-98B0-C69BEB4B5B6D}';
```

C++

```
TGUID IID_IAppServer = '{1AEFCC20-7A24-11D2-98B0-C69BEB4B5B6D}';
```

File

Midas

Description

This is constant Midas.IID_IAppServer.

97.2.2 Midas.LIBID_Midas Constant

Pascal

```
LIBID_Midas: TGUID = '{83F57D68-CA9A-11D2-9088-00C04FA35CFA}';
```

C++

```
TGUID LIBID_Midas = '{83F57D68-CA9A-11D2-9088-00C04FA35CFA}';
```

File

Midas

Description

This is constant Midas.LIBID_Midas.

98 MidasCon Namespace

This is namespace MidasCon.

Topics

Name	Description
Classes (see page 16462)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 16472)	The following table lists structs, records, enums in this documentation.

Classes

	Name	Description
	TMidasConnection (see page 16462)	TMidasConnection handles a server connection for the client of a multi-tiered application.
	TRemoteServer (see page 16470)	TRemoteServer handles a DCOM connection to a remote server in a client application that is part of a multi-tiered application.

Structs, Records, Enums

	Name	Description
	TConnectType (see page 16472)	This is record MidasCon.TConnectType.

98.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TMidasConnection (see page 16462)	TMidasConnection handles a server connection for the client of a multi-tiered application.
	TRemoteServer (see page 16470)	TRemoteServer handles a DCOM connection to a remote server in a client application that is part of a multi-tiered application.

98.1.1 TMidasConnection Class

TMidasConnection handles a server connection for the client of a multi-tiered application.

Class Hierarchy

Pascal

```
TMidasConnection = class(TDCOMConnection);
```

C++

```
class TMidasConnection : public TDCOMConnection;
```

File

MidasCon

Description

TMidasConnection is provided for backward compatibility. When writing client applications that connect to application servers using DCOM, use TDCOMConnection instead. When writing client applications that connect to application servers using sockets, use TSocketConnection instead. When writing client applications that connect to application servers using HTTP, use TWebConnection instead.

See Also

TClientDataSet (see page 8289)

TDCOMConnection (see page 16008)

TSocketConnection (see page 18928)

TWebConnection (see page 18968)

98.1.1.1 TMidasConnection Members

The following tables list the members exposed by TMidasConnection.

Protected Events

	Name	Description
	OnGetUsername (see page 8533)	This is OnGetUsername, a member of class TCustomRemoteServer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 16467)	Connects to an application server.
V	DoDisconnect (see page 16468)	Drops a connection to an application server.
V	GetAppServer (see page 8530)	Returns the value of the AppServer (see page 8532) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetConnected (see page 6865)	Returns the value of the Connected (see page 6868) property.
V	GetConnected (see page 16023)	Returns the value of the Connected (see page 16026) property.
V	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
V	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetServerCLSID (see page 16024)	Returns the GUID for the application server.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 6866)	Initializes the connection component after all objects in the form or data module have been loaded.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16025)	Responds when other objects are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	RegisterClient (see page 6866)	Registers an object that uses the connection component.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAppServer (see page 8531)	Sets the AppServer (see page 8532) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetConnected (see page 6867)	Changes the value of the Connected (see page 6868) property.
V	SetConnected (see page 16001)	Sets the Connected (see page 16026) property.

	SetConnected (see page 16025)	Sets the Connected (see page 16026) property.
	SetConnectType (see page 16468)	This is SetConnectType, a member of class TMidasConnection.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetUseBroker (see page 16468)	This is SetUseBroker, a member of class TMidasConnection.
	UnRegisterClient (see page 6868)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ObjectBroker (see page 16028)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.

Public Events

	Name	Description
	AfterConnect (see page 6874)	Occurs after a connection is established.
	AfterDisconnect (see page 6875)	Occurs after the connection closes.
	BeforeConnect (see page 6875)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 6875)	Occurs immediately before the connection closes.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.
	Create (see page 16466)	Creates and initializes an instance of TMidasConnection (see page 16462).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.

	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 6863)	Destroys the instance of a connection component.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProviderNames (see page 8530)	Executes a callback for all provider objects on the application server.
	GetServer (see page 8530)	Returns the IAppServer interface of the application server.
	GetServer (see page 16023)	Returns the IAppServer interface of the application server.
	GetServerList (see page 8531)	Returns a list of application servers (remote data modules) to which the component can connect.
	GetServerList (see page 16024)	Returns a list of remote data modules to which the component can connect.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AppServer (see page 8532)	Contains the interface for communicating with the application server.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Connected (see page 6868)	Determines whether a connection has been established to the remote source of data.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 6870)	Lists the datasets currently using this connection component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	LoginPrompt (see page 6872)	Specifies whether a login dialog appears immediately before opening a new connection.
	OnLogin (see page 6873)	Occurs when a communication channel opens to the server.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterConnect (see page 16031)	Occurs after a connection is established.
	AfterDisconnect (see page 16031)	Occurs after the connection closes.
	BeforeConnect (see page 16032)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 16032)	Occurs immediately before the connection closes.
	OnGetUsername (see page 16033)	This is OnGetUsername, a member of class TDispatchConnection.

Published Properties

	Name	Description
	ComputerName (see page 16014)	This is ComputerName, a member of class TDCOMConnection.
	Connected (see page 16026)	Indicates whether the TDispatchConnection (see page 16017) object is connected to an application server.
	ConnectType (see page 16469)	Specifies the protocol to use to establish the connection to the application server.
	LoginPrompt (see page 16027)	Specifies whether a login dialog appears immediately before opening a new connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ObjectBroker (see page 16014)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	OnLogin (see page 16028)	Occurs when a communication channel opens to the server.
	ServerGUID (see page 16030)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 16030)	Specifies the name of the application server with which to connect.
	ServerPort (see page 16469)	Specifies the port used by the listening socket on the server machine.
	Tag (see page 2808)	Stores an integer value as part of a component.
	UseBroker (see page 16470)	Indicates whether an OLEnterprise connection should use the OLEnterprise Business Object Broker.

98.1.1.2 TMidasConnection.Create Constructor

Creates and initializes an instance of TMidasConnection (see page 16462).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMidasConnection(TComponent * AOwner);
```

Description

Call Create to instantiate a TMidasConnection (see page 16462) component at runtime. TMidasConnection (see page 16462) components placed in forms or data modules at design time are created automatically.

Create initializes the value of the ServerPort (see page 16469) property to 211. This is also the default port number for ScktSrvr.exe and ScktSrvc.exe.

See Also

ServerPort (see page 16469)

Create (see page 16022)

Port (see page 18751)

98.1.1.3 TMidasConnection Methods

The methods of the TMidasConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 16467)	Connects to an application server.
	DoDisconnect (see page 16468)	Drops a connection to an application server.
	SetConnectType (see page 16468)	This is SetConnectType, a member of class TMidasConnection.
	SetUseBroker (see page 16468)	This is SetUseBroker, a member of class TMidasConnection.

98.1.1.3.1 TMidasConnection.DoConnect Method

Connects to an application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called when the Connected property is set to true. DoConnect establishes a dual interface with the remote data module on the application server. This interface is used to locate providers on the application server.

To locate the server system, DoConnect uses the ComputerName property. If the ObjectBroker property is set, DoConnect gets this value from the object broker. Otherwise, the application must assign this property a value directly.

See Also

AfterConnect (see page 6874)

BeforeConnect (see page 6875)

Connected

AppServer (see page 8532)

computername (see page 16014)

ObjectBroker (see page 16028)

98.1.1.3.2 TMidasConnection.DoDisconnect Method

Drops a connection to an application server.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

DoDisconnect is called internally when the Connected property is set to false. It drops the connection and changes the AppServer property to a NULL Variant.

See Also

AfterDisconnect (see page 6875)

BeforeDisconnect (see page 6875)

Connected (see page 16026)

AppServer (see page 8532)

98.1.1.3.3 TMidasConnection.SetConnectType Method

Pascal

```
procedure SetConnectType(Value: TConnectType); virtual;
```

C++

```
virtual __fastcall SetConnectType(TConnectType Value);
```

Description

This is SetConnectType, a member of class TMidasConnection.

98.1.1.3.4 TMidasConnection.SetUseBroker Method

Pascal

```
procedure SetUseBroker(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetUseBroker(Boolean Value);
```

Description

This is SetUseBroker, a member of class TMidasConnection.

98.1.1.4 TMidasConnection Properties

The properties of the TMidasConnection class are listed here.

Published Properties

	Name	Description
	ConnectType (see page 16469)	Specifies the protocol to use to establish the connection to the application server.
	ServerPort (see page 16469)	Specifies the port used by the listening socket on the server machine.
	UseBroker (see page 16470)	Indicates whether an OLEnterprise connection should use the OLEnterprise Business Object Broker.

98.1.1.4.1 TMidasConnection.ConnectType Property

Specifies the protocol to use to establish the connection to the application server.

Pascal

```
property ConnectType: TConnectType;
```

C++

```
__property TConnectType ConnectType;
```

Description

Use ConnectType to specify the desired protocol for connecting with the application server.

See Also

ServerPort (see page 16469)

computername (see page 16014)

UseBroker (see page 16470)

ServerName (see page 16030)

98.1.1.4.2 TMidasConnection.ServerPort Property

Specifies the port used by the listening socket on the server machine.

Pascal

```
property ServerPort: Integer;
```

C++

```
__property int ServerPort;
```

Description

When establishing connections to the application server using TCP/IP sockets, the application server must have a socket dispatcher listening on a predefined port for requests from client applications. If the value of ConnectType (see page 16469) is ctSockets, set ServerPort to the port number used by Scktsrvr.exe or ScktSrvc.exe on the server system. TMidasConnection (see page 16462) attempts to connect to the application server by sending a message to the system specified by the ComputerName property at the port specified by ServerPort.

Note: ServerPort has no effect if ConnectType (see page 16469) is not ctSockets.

See Also

ConnectType (see page 16469)

computername (see page 16014)

Port (see page 18751)

98.1.1.4.3 TMidasConnection.UseBroker Property

Indicates whether an OLEnterprise connection should use the OLEnterprise Business Object Broker.

Pascal

```
property UseBroker: Boolean;
```

C++

```
__property Boolean UseBroker;
```

Description

When establishing connections to the application server using OLEnterprise, UseBroker specifies whether the connection should use the Business Object Broker. If UseBroker is true, TMidasConnection (see page 16462) uses the Business Object Broker, and the ComputerName property specifies the name of the Business Object Broker. If UseBroker is false, TMidasConnection (see page 16462) uses OLEnterprise, but does not go through the Business Object Broker. When UseBroker is false, ComputerName specifies the name of the OLEnterprise server.

For more information about using OLEnterprise, see the OLEnterprise documentation.

Note: The value of UseBroker has no effect unless ConnectType (see page 16469) is ctOLEnterprise.

See Also

ConnectType (see page 16469)

computername (see page 16014)

98.1.2 TRemoteServer Class

TRemoteServer handles a DCOM connection to a remote server in a client application that is part of a multi-tiered application.

Class Hierarchy

Pascal

```
TRemoteServer = class(TDCOMConnection);
```

C++

```
class TRemoteServer : public TDCOMConnection;
```

File

MidasCon

Description

TRemoteServer is provided for backward compatibility. When writing client applications that connect to application servers using DCOM, use TDCOMConnection instead.

See Also

TClientDataSet (see page 8289)

TDCOMConnection (see page 16008)

TSocketConnection (see page 18928)

TWebConnection (see page 18968)

TDatasetprovider

98.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TConnectType (see page 16472)	This is record MidasCon.TConnectType.

98.2.1 MidasCon.TConnectType Enumeration

Pascal

```
TConnectType = (
  ctDCOM,
  ctSockets,
  ctOLEnterprise
);
```

C++

```
enum TConnectType {
  ctDCOM,
  ctSockets,
  ctOLEnterprise
};
```

File

MidasCon

Description

This is record MidasCon.TConnectType.

99 MidItems Namespace

This is namespace MidItems.

Topics

Classes (see page 16478)	The following table lists classes in this documentation.
Interfaces (see page 17053)	The following table lists interfaces in this documentation.
Functions (see page 17085)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 17090)	The following table lists structs, records, enums in this documentation.
Types (see page 17093)	The following table lists types in this documentation.
Constants (see page 17095)	The following table lists constants in this documentation.

Classes

	Name	Description
	TApplyUpdatesButton (see page 16480)	TApplyUpdatesButton generates an HTML control that sends an Update message to the XML broker on an InternetExpress application.
	TCaptionAttributes (see page 16489)	TCaptionAttributes customizes the appearance of the label that identifies a display control in a WebSnap or InternetExpress application.
	TCustomDataForm (see page 16493)	TCustomDataForm is the base class for components that generate an HTML form in an InternetExpress application.
	TCustomDataGrid (see page 16499)	TCustomDataGrid is the base class for Web items that generate an HTML table to display a dataset in an XML data packet.
	TCustomDataNavigator (see page 16511)	TCustomDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 16576) and TXMLButton (see page 16989) descendants.
	TCustomFieldGroup (see page 16519)	TCustomFieldGroup is the base class for Web items that arrange information on an HTML form as a set of labeled fields.
	TCustomLayoutGroup (see page 16528)	TCustomLayoutGroup is the base class for Web items that arrange content produced by arbitrary Web items.
	TCustomQueryButtons (see page 16537)	TCustomQueryButtons assembles the HTML generated by a set of TQueryButton (see page 16718) descendants.
	TCustomQueryForm (see page 16545)	TCustomQueryForm is the base class for Web items that generate HTML forms for letting users enter application-defined values.
	TDataForm (see page 16554)	TDataForm generates an HTML form that displays database information and lets users apply updates.
	TDataGrid (see page 16560)	TDataGrid generates an HTML table to display a dataset in an XML data packet.
	TDataNavigator (see page 16569)	TDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 16576) and TXMLButton (see page 16989) descendants.
	TDataSetButton (see page 16576)	TDataSetButton is the base class for Web items that create HTML buttons for navigating or editing data.

	TDeleteButton (see page 16586)	TDeleteButton generates an HTML control that deletes a record from an XML data packet.
	TFieldGroup (see page 16591)	TFieldGroup arranges database information on an HTML form as a set of labeled fields.
	TFieldRadioGroup (see page 16599)	TFieldRadioGroup creates an HTML radio group control to represent a field in an XML data packet.
	TFieldSelectOptions (see page 16612)	TFieldSelectOptions creates an HTML list control to represent a field in an XML data packet.
	TFieldStatus (see page 16624)	TFieldStatus generates an HTML control that indicates whether a record in an XML data packet has been modified by the end user.
	TFieldText (see page 16631)	TFieldText creates a single-line HTML input control to represent a field in an XML data packet.
	TFieldTextArea (see page 16640)	TFieldTextArea creates a multi-line HTML input control to represent a field in an XML data packet.
	TFirstButton (see page 16651)	TFirstButton generates an HTML control that moves to the first record in an XML data packet.
	TFormLayout (see page 16656)	TFormLayout lets child Web items adhere to layout rules imposed by their parent.
	TGridAttributes (see page 16664)	TGridAttributes describes the options the TDataGrid (see page 16560) component adds to an HTML <TABLE> tag.
	TGridRowAttributes (see page 16671)	TGridRowAttributes describes the options the TDataGrid (see page 16560) component adds to its HTML row tags (<TR>).
	TInsertButton (see page 16677)	TInsertButton generates an HTML control that inserts a new record in an XML data packet.
	TLastButton (see page 16682)	TLastButton generates an HTML control that moves to the last record in an XML data packet.
	TLayoutGroup (see page 16687)	TLayoutGroup generates the HTML to arrange content produced by other Web items.
	TNextButton (see page 16694)	TNextButton generates an HTML control that moves to the next record in an XML data packet.
	TNextPageButton (see page 16699)	TNextPageButton generates an HTML control that moves to the next set of records in an XML data packet.
	TPostButton (see page 16704)	TPostButton generates an HTML control that posts changes to an XML delta packet.
	TPriorButton (see page 16709)	TPriorButton generates an HTML control that moves to the previous record in an XML data packet.
	TPriorPageButton (see page 16713)	TPriorPageButton generates an HTML control that moves to the previous set of records in an XML data packet.
	TQueryButton (see page 16718)	TQueryButton is the base class for Web items that create HTML buttons that manage application-defined values.
	TQueryButtons (see page 16730)	TQueryButtons assembles the HTML generated by a set of TQueryButton (see page 16718) descendants.
	TQueryFieldGroup (see page 16736)	TQueryFieldGroup arranges information on an HTML form as a set of labeled fields.
	TQueryForm (see page 16745)	TQueryForm generates HTML forms for letting users enter application-defined values.
	TQueryRadioGroup (see page 16753)	TQueryRadioGroup creates an HTML radio group control to represent named parameter.
	TQuerySelectOptions (see page 16768)	TQuerySelectOptions creates an HTML list control to represent a named parameter.
	TQueryText (see page 16783)	TQueryText creates a single-line HTML input control to represent a named parameter.
	TQueryTextArea (see page 16795)	TQueryTextArea creates a multi-line HTML input control to represent named parameter.
	TResetQueryButton (see page 16809)	TResetQueryButton generates an HTML control that backs out changes to the values on a query form.
	TSelectOptionsColumn (see page 16814)	TSelectOptionsColumn creates an HTML list control to represent a field value in a data grid.
	TStatusColumn (see page 16826)	TStatusColumn generates an HTML control that indicates whether a record in a data grid has been modified by the end user.
	TSubmitQueryButton (see page 16833)	TSubmitQueryButton generates an HTML control that backs out changes to the values on a query form.
	TTextAreaColumn (see page 16838)	TTextAreaColumn creates a multi-line HTML input control to represent a field value in a data grid.

	TTextColumn (see page 16849)	TTextColumn creates a single-line HTML input control to represent a field value in a data grid.
	TUndoButton (see page 16858)	TUndoButton generates an HTML control that backs out changes to the current record.
	TWebButton (see page 16863)	TWebButton is the base class for Web items that create HTML button controls.
	TWebControlGroup (see page 16872)	TWebControlGroup is the base class for Web items that arrange HTML controls.
	TWebDataDisplay (see page 16884)	TWebDataDisplay is the base class for Web items that create HTML display controls.
	TWebDataInput (see page 16900)	TWebDataInput is the base class for Web items that create HTML display controls for entering information.
	TWebDisplay (see page 16911)	This is class MidItems.TWebDisplay.
	TWebDisplayReferenceGroup (see page 16915)	TWebDisplayReferenceGroup is the base class for Web items that arrange a set of controls that influence a control that displays data.
	TWebForm (see page 16922)	TWebForm is the base class for Web items that create HTML forms in InternetExpress applications.
	TWebListInput (see page 16935)	TWebListInput is the base class for Web items that create HTML display controls which present a fixed set of possible values.
	TWebRadioGroupInput (see page 16947)	TWebRadioGroupInput is the base class for Web items that create HTML radio group controls.
	TWebSelectOptionsInput (see page 16956)	TWebSelectOptionsInput is the base class for Web items that create HTML list controls.
	TWebStatus (see page 16963)	TWebStatus is the base class for Web items that indicate the status of records in an XML data packet.
	TWebTextAreaInput (see page 16971)	TWebTextAreaInput is the base class for Web items that create HTML multi-line text controls.
	TWebTextInput (see page 16980)	TWebTextInput is the base class for Web items that create HTML single-line text controls.
	TXMLButton (see page 16989)	TXMLButton is the base class for Web items that create HTML buttons that perform some action with the XML data packet.
	TXMLData (see page 16998)	TXMLData manages the relationship between an XML broker and a Web item that represents a dataset in that XML broker's data packet.
	TXMLDataParent (see page 17003)	This is class MidItems.TXMLDataParent.
	TXMLDataSet (see page 17006)	TXMLDataSet manages the relationship between a Web item and the XML dataset to which it is bound.
	TXMLDataSetParent (see page 17014)	This is class MidItems.TXMLDataSetParent.
	TXMLDisplayGroup (see page 17019)	TXMLDisplayGroup is the base class for Web items that arrange a set of special-purpose controls in an HTML form.
	TXMLDisplayParent (see page 17034)	This is class MidItems.TXMLDisplayParent.
	TXMLDisplayReferenceButton (see page 17037)	TXMLDisplayReferenceButton is the base class for Web items that generate HTML buttons for influencing controls that display data.
	TXMLDisplayReferenceGroup (see page 17046)	TXMLDisplayReferenceGroup is the base class for Web items that arrange a set of button controls that influence a control that displays data.

Constants

Name	Description
FormMethodNames (see page 17095)	This is constant MidItems.FormMethodNames.
HTMLAlignValues (see page 17096)	This is constant MidItems.HTMLAlignValues.
HTMLVAlignValues (see page 17096)	This is constant MidItems.HTMLVAlignValues.
sActionAttr (see page 17096)	This is constant MidItems.sActionAttr.
sAlignAttr (see page 17097)	This is constant MidItems.sAlignAttr.
sBgColorAttr (see page 17097)	This is constant MidItems.sBgColorAttr.
sBorderAttr (see page 17097)	This is constant MidItems.sBorderAttr.
sCellPaddingAttr (see page 17098)	This is constant MidItems.sCellPaddingAttr.
sCellSpacingAttr (see page 17098)	This is constant MidItems.sCellSpacingAttr.
sCheckedAttr (see page 17098)	This is constant MidItems.sCheckedAttr.
sClassAttr (see page 17099)	This is constant MidItems.sClassAttr.
sColsAttr (see page 17099)	This is constant MidItems.sColsAttr.
sColSpanAttr (see page 17099)	This is constant MidItems.sColSpanAttr.
sEncTypeAttr (see page 17100)	This is constant MidItems.sEncTypeAttr.
sImageHeightAttr (see page 17100)	This is constant MidItems.sImageHeightAttr.

sImageWidthAttr (see page 17100)	This is constant MidItems.sImageWidthAttr.
sMaxLengthAttr (see page 17101)	This is constant MidItems.sMaxLengthAttr.
sMethodAttr (see page 17101)	This is constant MidItems.sMethodAttr.
sMultipleAttr (see page 17101)	This is constant MidItems.sMultipleAttr.
sNameAttr (see page 17102)	This is constant MidItems.sNameAttr.
sOnClickAttr (see page 17102)	This is constant MidItems.sOnClickAttr.
sReadOnlyAttr (see page 17102)	This is constant MidItems.sReadOnlyAttr.
sRowsAttr (see page 17103)	This is constant MidItems.sRowsAttr.
sSelectedAttr (see page 17103)	This is constant MidItems.sSelectedAttr.
sSizeAttr (see page 17103)	This is constant MidItems.sSizeAttr.
sStyleAttr (see page 17104)	This is constant MidItems.sStyleAttr.
sTabIndexAttr (see page 17104)	This is constant MidItems.sTabIndexAttr.
sTypeAttr (see page 17104)	This is constant MidItems.sTypeAttr.
sVAlignAttr (see page 17105)	This is constant MidItems.sVAlignAttr.
sValueAttr (see page 17105)	This is constant MidItems.sValueAttr.
sWidthAttr (see page 17105)	This is constant MidItems.sWidthAttr.
sWrapAttr (see page 17106)	This is constant MidItems.sWrapAttr.
TextAreaWrap (see page 17106)	This is constant MidItems.TextAreaWrap.

Functions

	Name	Description
	AddBoolAttrib (see page 17085)	This is function MidItems.AddBoolAttrib.
	AddCustomAttrib (see page 17085)	This is function MidItems.AddCustomAttrib.
	AddIntAttrib (see page 17086)	This is function MidItems.AddIntAttrib.
	AddQuotedAttrib (see page 17086)	This is function MidItems.AddQuotedAttrib.
	AddStringAttrib (see page 17086)	This is function MidItems.AddStringAttrib.
	CanAddClassHelper (see page 17087)	This is function MidItems.CanAddClassHelper.
	CreateDefaultButtonClasses (see page 17087)	This is function MidItems.CreateDefaultButtonClasses.
	DeclareSubmitForm (see page 17087)	This is function MidItems.DeclareSubmitForm.
	FindDispatcher (see page 17088)	This is function MidItems.FindDispatcher.
	FindProducer (see page 17088)	This is function MidItems.FindProducer.
	FormatColumnData (see page 17088)	This is function MidItems.FormatColumnData.
	FormatColumnHeading (see page 17089)	This is function MidItems.FormatColumnHeading.
	GetItemValuesFromDataSet (see page 17089)	This is function MidItems.GetItemValuesFromDataSet.

Interfaces

	Name	Description
	IDataSetComponent (see page 17053)	IDataSetComponent defines the methods that bind a Web item to an XML broker.
	IDataSetField (see page 17057)	This is class MidItems.IDataSetField.
	IDataSetFields (see page 17059)	This is class MidItems.IDataSetFields.
	IFormatColumn (see page 17061)	This is class MidItems.IFormatColumn.
	IHTMLField (see page 17062)	IHTMLField is an interface that must be implemented by Web items that generate <INPUT> elements.
	IHTMLForm (see page 17064)	IHTMLForm is an interface that must be implemented by Web items that generate forms.
	IInetXWebDataSet (see page 17066)	IInetXWebDataSet lets a Web item interact with information about a dataset in an XML broker's data packet.
	IQueryField (see page 17070)	This is class MidItems.IQueryField.
	IQueryFields (see page 17073)	This is class MidItems.IQueryFields.
	IQueryForm (see page 17074)	This is class MidItems.IQueryForm.
	IRestoreDefaults (see page 17074)	This is class MidItems.IRestoreDefaults.
	IStatusField (see page 17075)	This is class MidItems.IStatusField.
	IValidateField (see page 17076)	This is class MidItems.IValidateField.
	IValidateFields (see page 17077)	This is class MidItems.IValidateFields.
	IWebDisplay (see page 17079)	

	IWebDisplayReference (see page 17080)	
	IXMLDisplay (see page 17082)	This is class MidItems.IXMLDisplay.

Structs, Records, Enums

	Name	Description
	TCaptionPosition (see page 17090)	TCaptionPosition indicates the relative position of a label to the HTML control it labels.
	TFormMethod (see page 17091)	TFormMethod represents the method attribute on the <form> tag of an HTML form.
	TLayoutState (see page 17091)	This is record MidItems.TLayoutState.
	TTextAreaWrap (see page 17092)	TTextAreaWrap indicates how an HTML display control should treat items that are too wide for the physical width of the control.

Types

Name	Description
IMidasWebDataSet (see page 17093)	This is type MidItems.IMidasWebDataSet.
TWebButtonClass (see page 17093)	This is type MidItems.TWebButtonClass.
TWebDataDisplayClass (see page 17094)	This is type MidItems.TWebDataDisplayClass.
TWebDataInputClass (see page 17094)	This is type MidItems.TWebDataInputClass.
TWebStatusClass (see page 17094)	This is type MidItems.TWebStatusClass.

99.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TApplyUpdatesButton (see page 16480)	TApplyUpdatesButton generates an HTML control that sends an Update message to the XML broker on an InternetExpress application.
	TCaptionAttributes (see page 16489)	TCaptionAttributes customizes the appearance of the label that identifies a display control in a WebSnap or InternetExpress application.
	TCustomDataForm (see page 16493)	TCustomDataForm is the base class for components that generate an HTML form in an InternetExpress application.
	TCustomDataGrid (see page 16499)	TCustomDataGrid is the base class for Web items that generate an HTML table to display a dataset in an XML data packet.
	TCustomDataNavigator (see page 16511)	TCustomDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 16576) and TXMLButton (see page 16989) descendants.
	TCustomFieldGroup (see page 16519)	TCustomFieldGroup is the base class for Web items that arrange information on an HTML form as a set of labeled fields.
	TCustomLayoutGroup (see page 16528)	TCustomLayoutGroup is the base class for Web items that arrange content produced by arbitrary Web items.
	TCustomQueryButtons (see page 16537)	TCustomQueryButtons assembles the HTML generated by a set of TQueryButton (see page 16718) descendants.
	TCustomQueryForm (see page 16545)	TCustomQueryForm is the base class for Web items that generate HTML forms for letting users enter application-defined values.
	TDataForm (see page 16554)	TDataForm generates an HTML form that displays database information and lets users apply updates.
	TDataGrid (see page 16560)	TDataGrid generates an HTML table to display a dataset in an XML data packet.
	TDataNavigator (see page 16569)	TDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 16576) and TXMLButton (see page 16989) descendants.
	TDataSetButton (see page 16576)	TDataSetButton is the base class for Web items that create HTML buttons for navigating or editing data.
	TDeleteButton (see page 16586)	TDeleteButton generates an HTML control that deletes a record from an XML data packet.
	TFieldGroup (see page 16591)	TFieldGroup arranges database information on an HTML form as a set of labeled fields.
	TFieldRadioGroup (see page 16599)	TFieldRadioGroup creates an HTML radio group control to represent a field in an XML data packet.
	TFieldSelectOptions (see page 16612)	TFieldSelectOptions creates an HTML list control to represent a field in an XML data packet.
	TFieldStatus (see page 16624)	TFieldStatus generates an HTML control that indicates whether a record in an XML data packet has been modified by the end user.
	TFieldText (see page 16631)	TFieldText creates a single-line HTML input control to represent a field in an XML data packet.
	TFieldTextArea (see page 16640)	TFieldTextArea creates a multi-line HTML input control to represent a field in an XML data packet.
	TFirstButton (see page 16651)	TFirstButton generates an HTML control that moves to the first record in an XML data packet.
	TFormLayout (see page 16656)	TFormLayout lets child Web items adhere to layout rules imposed by their parent.
	TGridAttributes (see page 16664)	TGridAttributes describes the options the TDataGrid (see page 16560) component adds to an HTML <TABLE> tag.
	TGridRowAttributes (see page 16671)	TGridRowAttributes describes the options the TDataGrid (see page 16560) component adds to its HTML row tags (<TR>).
	TInsertButton (see page 16677)	TInsertButton generates an HTML control that inserts a new record in an XML data packet.
	TLastButton (see page 16682)	TLastButton generates an HTML control that moves to the last record in an XML data packet.

	TLayoutGroup (see page 16687)	TLayoutGroup generates the HTML to arrange content produced by other Web items.
	TNextButton (see page 16694)	TNextButton generates an HTML control that moves to the next record in an XML data packet.
	TNextPageButton (see page 16699)	TNextPageButton generates an HTML control that moves to the next set of records in an XML data packet.
	TPostButton (see page 16704)	TPostButton generates an HTML control that posts changes to an XML delta packet.
	TPriorButton (see page 16709)	TPriorButton generates an HTML control that moves to the previous record in an XML data packet.
	TPriorPageButton (see page 16713)	TPriorPageButton generates an HTML control that moves to the previous set of records in an XML data packet.
	TQueryButton (see page 16718)	TQueryButton is the base class for Web items that create HTML buttons that manage application-defined values.
	TQueryButtons (see page 16730)	TQueryButtons assembles the HTML generated by a set of TQueryButton (see page 16718) descendants.
	TQueryFieldGroup (see page 16736)	TQueryFieldGroup arranges information on an HTML form as a set of labeled fields.
	TQueryForm (see page 16745)	TQueryForm generates HTML forms for letting users enter application-defined values.
	TQueryRadioGroup (see page 16753)	TQueryRadioGroup creates an HTML radio group control to represent named parameter.
	TQuerySelectOptions (see page 16768)	TQuerySelectOptions creates an HTML list control to represent a named parameter.
	TQueryText (see page 16783)	TQueryText creates a single-line HTML input control to represent a named parameter.
	TQueryTextArea (see page 16795)	TQueryTextArea creates a multi-line HTML input control to represent named parameter.
	TResetQueryButton (see page 16809)	TResetQueryButton generates an HTML control that backs out changes to the values on a query form.
	TSelectOptionsColumn (see page 16814)	TSelectOptionsColumn creates an HTML list control to represent a field value in a data grid.
	TStatusColumn (see page 16826)	TStatusColumn generates an HTML control that indicates whether a record in a data grid has been modified by the end user.
	TSubmitQueryButton (see page 16833)	TSubmitQueryButton generates an HTML control that backs out changes to the values on a query form.
	TTextAreaColumn (see page 16838)	TTextAreaColumn creates a multi-line HTML input control to represent a field value in a data grid.
	TTextColumn (see page 16849)	TTextColumn creates a single-line HTML input control to represent a field value in a data grid.
	TUndoButton (see page 16858)	TUndoButton generates an HTML control that backs out changes to the current record.
	TWebButton (see page 16863)	TWebButton is the base class for Web items that create HTML button controls.
	TWebControlGroup (see page 16872)	TWebControlGroup is the base class for Web items that arrange HTML controls.
	TWebDataDisplay (see page 16884)	TWebDataDisplay is the base class for Web items that create HTML display controls.
	TWebDataInput (see page 16900)	TWebDataInput is the base class for Web items that create HTML display controls for entering information.
	TWebDisplay (see page 16911)	This is class MidItems.TWebDisplay.
	TWebDisplayReferenceGroup (see page 16915)	TWebDisplayReferenceGroup is the base class for Web items that arrange a set of controls that influence a control that displays data.
	TWebForm (see page 16922)	TWebForm is the base class for Web items that create HTML forms in InternetExpress applications.
	TWebListInput (see page 16935)	TWebListInput is the base class for Web items that create HTML display controls which present a fixed set of possible values.
	TWebRadioGroupInput (see page 16947)	TWebRadioGroupInput is the base class for Web items that create HTML radio group controls.
	TWebSelectOptionsInput (see page 16956)	TWebSelectOptionsInput is the base class for Web items that create HTML list controls.
	TWebStatus (see page 16963)	TWebStatus is the base class for Web items that indicate the status of records in an XML data packet.
	TWebTextAreaInput (see page 16971)	TWebTextAreaInput is the base class for Web items that create HTML multi-line text controls.

	TWebTextInput (see page 16980)	TWebTextInput is the base class for Web items that create HTML single-line text controls.
	TXMLButton (see page 16989)	TXMLButton is the base class for Web items that create HTML buttons that perform some action with the XML data packet.
	TXMLData (see page 16998)	TXMLData manages the relationship between an XML broker and a Web item that represents a dataset in that XML broker's data packet.
	TXMLDataParent (see page 17003)	This is class MidItems.TXMLDataParent.
	TXMLDataSet (see page 17006)	TXMLDataSet manages the relationship between a Web item and the XML dataset to which it is bound.
	TXMLDataSetParent (see page 17014)	This is class MidItems.TXMLDataSetParent.
	TXMLDisplayGroup (see page 17019)	TXMLDisplayGroup is the base class for Web items that arrange a set of special-purpose controls in an HTML form.
	TXMLDisplayParent (see page 17034)	This is class MidItems.TXMLDisplayParent.
	TXMLDisplayReferenceButton (see page 17037)	TXMLDisplayReferenceButton is the base class for Web items that generate HTML buttons for influencing controls that display data.
	TXMLDisplayReferenceGroup (see page 17046)	TXMLDisplayReferenceGroup is the base class for Web items that arrange a set of button controls that influence a control that displays data.

99.1.1 TApplyUpdatesButton Class

TApplyUpdatesButton generates an HTML control that sends an Update message to the XML broker on an InternetExpress application.

Class Hierarchy

Pascal

```
TApplyUpdatesButton = class(TXMLButton, IScriptComponent);
```

C++

```
class TApplyUpdatesButton : public TXMLButton, public IScriptComponent;
```

File

MidItems

Description

Add TApplyUpdatesButton as the child of a TDataNavigator (see page 16569) component (or a layout group that is a child of a TDataNavigator (see page 16569) component) to enable the generated HTML form to submit changes made by end users. The resulting HTML button's action generates an HTTP message that forwards all changes to a specific XML data packet back to the XML broker on the InternetExpress application.

Use the properties of TApplyUpdatesButton to customize the appearance of the button and associate it with an XML broker. The associated XML broker adds the XML data packet to the HTML document and responds to update messages generated by the apply updates button on the HTML form.

See Also

TXMLBroker (see page 26049)

TDataNavigator (see page 16569)

TLayoutGroup (see page 16687)

Using the Web Page Editor

99.1.1.1 TApplyUpdatesButton Members

The following tables list the members exposed by TApplyUpdatesButton.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16485)	This is AddElements, a member of class TApplyUpdatesButton.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
V	GetCaption (see page 16994)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16485)	This is GetSubComponents, a member of class TApplyUpdatesButton.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXMLBroker (see page 16995)	This is GetXMLBroker, a member of class TXMLButton.
	GetXMLUseParent (see page 16995)	This is GetXMLUseParent, a member of class TXMLButton.
V	ImplAddElements (see page 16485)	This is ImplAddElements, a member of class TApplyUpdatesButton.
V	ImplContent (see page 16485)	Provides the underlying implementation for the Content method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.

V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16995)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	SetXMLBroker (see page 16996)	This is SetXMLBroker, a member of class TXMLButton.
	SetXMLUseParent (see page 16996)	This is SetXMLUseParent, a member of class TXMLButton.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultCaption (see page 16996)	This is DefaultCaption, a member of class TXMLButton.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.
R	XMLData (see page 16997)	This is XMLData, a member of class TXMLButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16484)	Creates and initializes an instance of TApplyUpdatesButton (see page 16480).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16994)	Frees an instance of TXMLButton (see page 16989).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16486)	Specifies the caption that appears on the button.
	Custom (see page 16486)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16487)	Adds style attributes to the generated button control.
	StyleRule (see page 16487)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLBroker (see page 16488)	Associates the XML button with an XML broker.
	XMLUseParent (see page 16488)	Specifies whether the XML button is associated with its parent's XML broker.

99.1.1.2 TApplyUpdatesButton.Create Constructor

Creates and initializes an instance of TApplyUpdatesButton (see page 16480).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TApplyUpdatesButton(TComponent * AOwner);
```

Description

Call Create to instantiate TApplyUpdatesButton (see page 16480) at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.1.3 TApplyUpdatesButton Methods

The methods of the TApplyUpdatesButton class are listed here.

Protected Methods

	Name	Description
	AddElements (see page 16485)	This is AddElements, a member of class TApplyUpdatesButton.
	GetSubComponents (see page 16485)	This is GetSubComponents, a member of class TApplyUpdatesButton.
V	ImplAddElements (see page 16485)	This is ImplAddElements, a member of class TApplyUpdatesButton.
V	ImplContent (see page 16485)	Provides the underlying implementation for the Content method.

99.1.1.3.1 TApplyUpdatesButton.AddElements Method

Pascal

```
procedure AddElements(AddIntf: IAddScriptElements);
```

C++

```
__fastcall AddElements(IAddScriptElements AddIntf);
```

Description

This is AddElements, a member of class TApplyUpdatesButton.

99.1.1.3.2 TApplyUpdatesButton.GetSubComponents Method

Pascal

```
function GetSubComponents: TObject;
```

C++

```
__fastcall TObject * GetSubComponents();
```

Description

This is GetSubComponents, a member of class TApplyUpdatesButton.

99.1.1.3.3 TApplyUpdatesButton.ImplAddElements Method

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); virtual;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

This is ImplAddElements, a member of class TApplyUpdatesButton.

99.1.1.3.4 TApplyUpdatesButton.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the button control. TWebButton introduces

ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

See Also

Content (see page 16868)

ILayoutWebContent (see page 24774)

99.1.1.4 TApplyUpdatesButton Properties

The properties of the TApplyUpdatesButton class are listed here.

Published Properties

	Name	Description
	Caption (see page 16486)	Specifies the caption that appears on the button.
	Custom (see page 16486)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 16487)	Adds style attributes to the generated button control.
	StyleRule (see page 16487)	Applies a style in the page producer's style sheet to the button.
	XMLBroker (see page 16488)	Associates the XML button with an XML broker.
	XMLUseParent (see page 16488)	Specifies whether the XML button is associated with its parent's XML broker.

99.1.1.4.1 TApplyUpdatesButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom (see page 16871)

GetCaption (see page 16869)

SetCaption (see page 16870)

99.1.1.4.2 TApplyUpdatesButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption (see page 16870)

Style (see page 16871)

99.1.1.4.3 TApplyUpdatesButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 16871)

StyleRule (see page 16872)

99.1.1.4.4 TApplyUpdatesButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style property.

See Also

Style (see page 16871)

Styles (see page 17127)

StylesFile (see page 17128)

Styles (see page 19830)

StylesFile (see page 19831)

99.1.1.4.5 TApplyUpdatesButton.XMLBroker Property

Associates the XML button with an XML broker.

Pascal

```
property XMLBroker: TXMLBroker;
```

C++

```
__property TXMLBroker XMLBroker;
```

Description

Set XMLBroker to specify the XML broker whose data packets the XML button manipulates.

When XML buttons are used by TDataNavigator, the data navigator already establishes a connection (indirectly) to an XML broker. If the XML button uses this same XML broker, you do not need to set the XMLBroker property. Instead, setting the XMLUseParent property to true (the default) automatically associates the XML button with the same broker as the one associated with the navigator.

See Also

XMLUseParent (see page 16997)

99.1.1.4.6 TApplyUpdatesButton.XMLUseParent Property

Specifies whether the XML button is associated with its parent's XML broker.

Pascal

```
property XMLUseParent: Boolean;
```

C++

```
__property Boolean XMLUseParent;
```

Description

Use XMLUseParent to indicate how the XML button determines the XML broker whose data packets it manipulates. When XMLUseParent is false, the XMLBroker property must be set to indicate the XML broker. When XMLUseParent is true, the XML broker associated with the XML button's parent determines the associated XML broker.

The XML button's parent is the Web item (typically TDataNavigator) that uses the XML button to assemble its own HTML content. The parent's associated broker may be defined through an indirect association. For example, the data navigator acts on another component, such as a field group, which has an associated broker.

If the parent does not have an associated XML broker, setting XMLUseParent to true sets the XMLBroker property to nil (Delphi) or NULL (C++).

See Also

XMLBroker (see page 16996)

99.1.2 TCaptionAttributes Class

TCaptionAttributes customizes the appearance of the label that identifies a display control in a WebSnap or InternetExpress application.

Class Hierarchy

Pascal

```
TCaptionAttributes = class(TPersistent);
```

C++

```
class TCaptionAttributes : public TPersistent;
```

File

MidItems

Description

TCaptionAttributes is the type of the CaptionAttributes property of Web items that generate display controls. It defines several properties that customize the appearance of the label generated by the Web item.

See Also

CaptionAttributes

99.1.2.1 TCaptionAttributes Members

The following tables list the members exposed by TCaptionAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 16490)	Creates an instance of TCaptionAttributes (see page 16489).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.

	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Parent (see page 16492)	Indicates the Web item that uses TCaptionAttributes (see page 16489) to customize the appearance of its generated caption.

Published Properties

	Name	Description
	Align (see page 16491)	Represents the Align option of an HTML tag.
	Custom (see page 16491)	Represents a tag option and its value.
	Style (see page 16492)	Adds style attributes to the generated caption.
	StyleRule (see page 16492)	Applies a style in the page producer's style sheet to the generated caption.
	VAlign (see page 16493)	Represents the VAlign option of an HTML tag.

99.1.2.2 TCaptionAttributes.Create Constructor

Creates an instance of TCaptionAttributes (see page 16489).

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TCaptionAttributes(TComponent * AParent);
```

Description

Do not create instances of TCaptionAttributes (see page 16489). This object is instantiated by the Web item that uses it to implement its CaptionAttributes property.

The AParent parameter specifies the Web item that creates a TCaptionAttributes (see page 16489) instance for its CaptionAttributes property. This becomes the value of the Parent (see page 16492) property.

See Also

CaptionAttributes (see page 16897)

Parent (see page 16492)

99.1.2.3 TCaptionAttributes Properties

The properties of the TCaptionAttributes class are listed here.

Public Properties

	Name	Description
R	Parent (see page 16492)	Indicates the Web item that uses TCaptionAttributes (see page 16489) to customize the appearance of its generated caption.

Published Properties

	Name	Description
	Align (see page 16491)	Represents the Align option of an HTML tag.
	Custom (see page 16491)	Represents a tag option and its value.
	Style (see page 16492)	Adds style attributes to the generated caption.
	StyleRule (see page 16492)	Applies a style in the page producer's style sheet to the generated caption.
	VAlign (see page 16493)	Represents the VAlign option of an HTML tag.

99.1.2.3.1 TCaptionAttributes.Align Property

Represents the Align option of an HTML tag.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Use Align to add an Align option to the tag that surrounds the caption. The Align option influences the horizontal alignment of the caption text.

The Web item that generates the caption inserts the specified Align option into the HTML tag when it generates its content.

See Also

VAlign (see page 16493)

99.1.2.3.2 TCaptionAttributes.Custom Property

Represents a tag option and its value.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to add one or more options to the tag that surrounds the caption. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces.

The Web item that generates the caption inserts the Custom string into the HTML tag when it generates its content.

See Also

Style (see page 16492)

StyleRule (see page 16492)

99.1.2.3.3 TCaptionAttributes.Parent Property

Indicates the Web item that uses TCaptionAttributes (see page 16489) to customize the appearance of its generated caption.

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

Use Parent to access the Web item that uses the TCaptionAttributes (see page 16489) object.

See Also

Create (see page 16490)

99.1.2.3.4 TCaptionAttributes.Style Property

Adds style attributes to the generated caption.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated caption. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the HTML tag that generates the caption as the value of a STYLE option.

See Also

Custom (see page 16491)

StyleRule (see page 16492)

99.1.2.3.5 TCaptionAttributes.StyleRule Property

Applies a style in the page producer's style sheet to the generated caption.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated caption. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style (see page 16492) property instead.

See Also

Style (see page 16492)

Styles (see page 17127)

Styles (see page 19830)

StylesFile (see page 17128)

StylesFile (see page 19831)

99.1.2.3.6 TCaptionAttributes.VAlign Property

Represents the VAlign option of an HTML tag.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

Use VAlign to add an VAlign option to the tag that surrounds the caption. The VAlign option influences the vertical alignment of the caption text.

The Web item that generates the caption inserts the specified VAlign option into the HTML tag when it generates its content.

See Also

Align (see page 16491)

99.1.3 TCustomDataForm Class

TCustomDataForm is the base class for components that generate an HTML form in an InternetExpress application.

Class Hierarchy

Pascal

```
TCustomDataForm = class(TWebForm);
```

C++

```
class TCustomDataForm : public TWebForm;
```

File

MidItems

Description

TCustomDataForm is the base class for components that generate HTML forms to display database information that users can view and edit. Such forms can be added to the items of an InternetExpress page producer (InetXPageProducer).

TCustomDataForm implements the ability to generate an HTML form that contains controls for displaying information from an XML data packet. Buttons (see page 2289) on the form manipulate that data, and submit updates back to the XML broker that supplies the XML data packet.

TCustomDataForm generates the HTML FORM tag and assembles the HTML generated by its Web items. It restricts the Web items that generate the contents of the form to components that generate data displays (TDataGrid (see page 16560) or TFieldGroup (see page 16591)), components that contain buttons which operate on those displays (TDataNavigator (see page 16569)), and components that manage the layout of HTML controls (TLayoutGroup (see page 16687)). At design time, you can add these Web items to the form using the Web page editor.

IWebContent (see page 24792)

TInetXPageProducer (see page 17145)

99.1.3.1 TCustomDataForm Members

The following tables list the members exposed by TCustomDataForm.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16927)	Used internally to generate any javascript declarations needed by the form.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16928)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 16934) property list.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16928)	Returns the HTML that defines the HTML form.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.

	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDefaultWebComponents (see page 16929)	Returns nil (Delphi) or NULL (C++).
	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetHTMLFormName (see page 16929)	Returns the name of the generated HTML form.
	GetHTMLFormTag (see page 16498)	This is GetHTMLFormTag, a member of class TCustomDataForm.
	GetHTMLFormVarName (see page 16929)	Returns the name of the javascript variable that refers to the generated form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLayoutAttributes (see page 16930)	Returns the object that specifies how the generated form should look.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16930)	Returns the value of the WebComponents (see page 16934) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 16930)	Returns the value of the VisibleFields (see page 16934) property.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	ImplAddElements (see page 16931)	Provides the underlying implementation for the AddElements (see page 16927) method.
	ImplCanAddClass (see page 16498)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 16499)	Provides the underlying implementation for the Content method.
	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 16932)	Prevents an application from trying to assign a default set of Web items on the form.
	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	VisibleFields (see page 16934)	Lists the Web items whose generated content appears in the HTML form.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16926)	Creates and initializes an instance of TWebForm (see page 16922).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16926)	Frees an instance of TWebForm (see page 16922).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHTMLFormName (see page 17065)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 17065)	Returns the name of the javascript variable that refers to the generated form.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.

R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16933)	Represents a tag option and its value in the generated FORM tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLFormName (see page 17066)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 17066)	Indicates the name of the javascript variable that represents the HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16933)	Adds style attributes to the generated form.
	StyleRule (see page 16934)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebComponents (see page 16934)	Maintains a list of components that generate HTML content for the TWebForm (see page 16922) descendant.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.3.2 TCustomDataForm Methods

The methods of the TCustomDataForm class are listed here.

Protected Methods

	Name	Description
V	GetHTMLFormTag (see page 16498)	This is GetHTMLFormTag, a member of class TCustomDataForm.
V	ImplCanAddClass (see page 16498)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 16499)	Provides the underlying implementation for the Content method.

99.1.3.2.1 TCustomDataForm.GetHTMLFormTag Method

Pascal

```
function GetHTMLFormTag(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall AnsiString GetHTMLFormTag(TWebContentOptions Options);
```

Description

This is GetHTMLFormTag, a member of class TCustomDataForm.

99.1.3.2.2 TCustomDataForm.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebForm descendant can add a component of

type AClass to its WebComponents property list. AParent is the TWebForm instance to which the component will be added.

In TWebForm, ImplCanAddClass is abstract or, in C++ terminology, pure virtual. TWebForm descendants must override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML forms.

See Also

CanAddClass (see page 16928)

WebComponents (see page 16934)

99.1.3.2.3 TCustomDataForm.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML form. ImplContent is anabstract or, in C++ terminology, pure virtual method in TWebForm. TWebForm descendants override it to generate the HTML form.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebForm should format the HTML control it generates. Typically, this parameter is nil (Delphi) or NULL (C++) for forms.

ImplContent returns an HTML form definition.

Content (see page 16928)

AddElements (see page 16927)

99.1.4 TCustomDataGrid Class

TCustomDataGrid is the base class for Web items that generate an HTML table to display a dataset in an XML data packet.

Class Hierarchy

Pascal

```
TCustomDataGrid = class(TXMLDisplayGroup, IDataSetComponent);
```

C++

```
class TCustomDataGrid : public TXMLDisplayGroup, public IDataSetComponent;
```

File

MidItems

Description

Use TCustomDataGrid as a base class for Web items that generate an HTML table to display multiple records from a dataset as a set of rows and columns. Each TCustomDataGrid object maintains a list of Web items that generate the individual fields (columns) of the table. These Web items can be from the following classes: TTextColumn (see page 16849), TSelectOptionColumn, TTextAreaColumn (see page 16838), and TStatusColumn (see page 16826).

You can bind the data grid to an XML data packet or dataset field within an XML data packet. The column Web items can then use that binding to determine the source of the data they display.

TCustomDataGrid introduces a number of properties that affect the appearance of the generated table.

In order to let other Web items use the HTML table that the data grid generates, TCustomDataGrid inherits the IWebContent interface from TWebControlGroup (see page 16872).

Do not create instances of TCustomDataGrid. Instead, use a descendant of TCustomDataGrid such as TDataGrid (see page 16560).

99.1.4.1 TCustomDataGrid Members

The following tables list the members exposed by TCustomDataGrid.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 17025)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindField (see page 17026)	This is FindField, a member of class TXMLDisplayGroup.
	FormatTable (see page 16506)	This is FormatTable, a member of class TCustomDataGrid.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 17026)	Returns the value of the DataSet property.
	GetDataSetField (see page 17026)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetEnableValidateFields (see page 17026)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 17027)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsMultipleRecordView (see page 17027)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 17027)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	GetXMLBroker (see page 17027)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 17028)	Returns the value of the XMLDataSet property.

	GetXMLDisplayName (see page 17028)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 17028)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 17028)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 16506)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 16507)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 16507)	Provides the underlying implementation for the Content method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
V	ImplGetSubComponents (see page 17029)	Provides the underlying implementation for the GetSubComponents method.
V	ImplIsMultipleRecordView (see page 16508)	This is ImplIsMultipleRecordView, a member of class TCustomDataGrid.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsFieldInUse (see page 17030)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17030)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDataSetField (see page 17030)	This is SetDataSetField, a member of class TXMLDisplayGroup.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEnableValidateFields (see page 17031)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetHeadingAttributes (see page 16508)	This is SetHeadingAttributes, a member of class TCustomDataGrid.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetRowAttributes (see page 16508)	This is SetRowAttributes, a member of class TCustomDataGrid.
	SetTableAttributes (see page 16508)	This is SetTableAttributes, a member of class TCustomDataGrid.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	SetXMLBroker (see page 17031)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateDataSet (see page 17031)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 17031)	This is ValidateFields, a member of class TXMLDisplayGroup.

	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
V	XMLDataChange (see page 17031)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
	EnableValidateFields (see page 17032)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.
R	XMLDataSet (see page 17033)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16505)	Creates and initializes an instance of TCustomDataGrid (see page 16499).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 16506)	Frees an instance of TCustomDataGrid (see page 16499).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.

	GetDataSet (see page 17054)	Returns the value of the DataSet (see page 17055) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnableValidateFields (see page 17078)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 17060)	This is GetFieldsList, a member of class IDataSetFields.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsMultipleRecordView (see page 17079)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 17082)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVisibleFields (see page 17060)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 17054)	Returns the value of the XMLBroker (see page 17056) property.
	GetXMLDataSet (see page 17055)	Returns the value of the XMLDataSet (see page 17056) property.
	GetXMLDisplayName (see page 17083)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 17083)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	HasStatusField (see page 17060)	This is HasStatusField, a member of class IDataSetFields.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsFieldInUse (see page 17060)	This is IsFieldInUse, a member of class IDataSetFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEnableValidateFields (see page 17078)	This is SetEnableValidateFields, a member of class IValidateFields.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateDataSet (see page 17060)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateFields (see page 17078)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.

R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 17055)	Provides access to an interface for working with the associated dataset.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayRows (see page 16509)	Limits the number of rows in the HTML table.
	EnableValidateFields (see page 17078)	This is EnableValidateFields, a member of class IValidateFields.
	HeadingAttributes (see page 16509)	Determines the display characteristics of the table's header.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsMultipleRecordView (see page 17080)	
R	IsMultipleRecordView (see page 17083)	
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RowAttributes (see page 16510)	Determines the display characteristics of the table's body.
	TableAttributes (see page 16510)	Determines the basic display characteristics of the table.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleFields (see page 17061)	This is VisibleFields, a member of class IDataSetFields.
R	VisibleFields (see page 17032)	Indicates the controls displayed by the HTML that the XML display group generates.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.
R	XMLBroker (see page 17056)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
R	XMLDataSet (see page 17056)	Indicates the TXMLDataSet (see page 17006) object that represents the dataset to which the Web item is bound.
R	XMLDisplayName (see page 17084)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 17084)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLBroker (see page 17033)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSetField (see page 17033)	Binds the XML display group to a nested dataset from the XML data packet.

99.1.4.2 TCustomDataGrid.Create Constructor

Creates and initializes an instance of TCustomDataGrid (see page 16499).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomDataGrid(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomDataGrid (see page 16499) at runtime. TCustomDataGrid (see page 16499) components added at design time using the Web Page editor are instantiated automatically.

99.1.4.3 TCustomDataGrid.Destroy Destructor

Frees an instance of TCustomDataGrid (see page 16499).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomDataGrid();
```

Description

Do not call Destroy directly. Instead, call Free, which checks whether the object reference is nil before calling Destroy.

See Also

Free (see page 22300)

99.1.4.4 TCustomDataGrid Methods

The methods of the TCustomDataGrid class are listed here.

Protected Methods

	Name	Description
	FormatTable (see page 16506)	This is FormatTable, a member of class TCustomDataGrid.
V	ImplAddElements (see page 16506)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 16507)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 16507)	Provides the underlying implementation for the Content method.
V	ImplIsMultipleRecordView (see page 16508)	This is ImplIsMultipleRecordView, a member of class TCustomDataGrid.
	SetHeadingAttributes (see page 16508)	This is SetHeadingAttributes, a member of class TCustomDataGrid.
	SetRowAttributes (see page 16508)	This is SetRowAttributes, a member of class TCustomDataGrid.
	SetTableAttributes (see page 16508)	This is SetTableAttributes, a member of class TCustomDataGrid.

99.1.4.4.1 TCustomDataGrid.FormatTable Method

Pascal

```
function FormatTable(Layout: TLayoutWebContent; Options: TWebContentOptions): string;
```

C++

```
__fastcall AnsiString FormatTable(TLayoutWebContent Layout, TWebContentOptions Options);
```

Description

This is FormatTable, a member of class TCustomDataGrid.

99.1.4.4.2 TCustomDataGrid.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup, ImplAddElements does nothing. TWebControlGroup descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 16878)

99.1.4.4.3 TCustomDataGrid.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 16878)

WebFieldControls (see page 16884)

99.1.4.4.4 TCustomDataGrid.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 16879)

AddElements (see page 16878)

ILayoutWebContent (see page 24774)

99.1.4.4.5 TCustomDataGrid.ImplIsMultipleRecordView Method

Pascal

```
function ImplIsMultipleRecordView: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsMultipleRecordView();
```

Description

This is ImplIsMultipleRecordView, a member of class TCustomDataGrid.

99.1.4.4.6 TCustomDataGrid.SetHeadingAttributes Method

Pascal

```
procedure SetHeadingAttributes(const Value: TGridRowAttributes);
```

C++

```
__fastcall SetHeadingAttributes(const TGridRowAttributes Value);
```

Description

This is SetHeadingAttributes, a member of class TCustomDataGrid.

99.1.4.4.7 TCustomDataGrid.SetRowAttributes Method

Pascal

```
procedure SetRowAttributes(const Value: TGridRowAttributes);
```

C++

```
__fastcall SetRowAttributes(const TGridRowAttributes Value);
```

Description

This is SetRowAttributes, a member of class TCustomDataGrid.

99.1.4.4.8 TCustomDataGrid.SetTableAttributes Method

Pascal

```
procedure SetTableAttributes(const Value: TGridAttributes);
```

C++

```
__fastcall SetTableAttributes(const TGridAttributes Value);
```

Description

This is SetTableAttributes, a member of class TCustomDataGrid.

99.1.4.5 TCustomDataGrid Properties

The properties of the TCustomDataGrid class are listed here.

Public Properties

	Name	Description
	DisplayRows (see page 16509)	Limits the number of rows in the HTML table.
	HeadingAttributes (see page 16509)	Determines the display characteristics of the table's header.
	RowAttributes (see page 16510)	Determines the display characteristics of the table's body.
	TableAttributes (see page 16510)	Determines the basic display characteristics of the table.

99.1.4.5.1 TCustomDataGrid.DisplayRows Property

Limits the number of rows in the HTML table.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify the number of rows that appear in the generated HTML table.

Note that the number of rows in the HTML table does not limit the number of records that end users can view and edit. When DisplayRows is less than the number of records in the data packet, the control generated by TNextPageButton (see page 16699) or TPriorPageButton (see page 16713) lets end users scroll through the records in the data packet.

See Also

MaxRecords (see page 26072)

TNextPageButton (see page 16699)

TPriorPageButton (see page 16713)

99.1.4.5.2 TCustomDataGrid.HeadingAttributes Property

Determines the display characteristics of the table's header.

Pascal

```
property HeadingAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes HeadingAttributes;
```

Description

Use HeadingAttributes to specify any display attributes that apply only to the heading of the generated HTML table. HeadingAttributes determines the options that are added to the <TR> tag that defines the header of the grid. These include the color of the header, the alignment of the caption for each column, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the rows of the grid, use the TableAttributes (see page 16510) or RowAttributes (see page 16510) property instead.

See Also

TableAttributes (see page 16510)

RowAttributes (see page 16510)

99.1.4.5.3 TCustomDataGrid.RowAttributes Property

Determines the display characteristics of the table's body.

Pascal

```
property RowAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes RowAttributes;
```

Description

Use RowAttributes to specify any display attributes that apply only to the rows of the generated HTML table. RowAttributes determines the options that are added to the <TR> tag for each row in the body of the grid. These include the color of the rows, the alignment of data within each cell, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the header of the grid, use the TableAttributes (see page 16510) or HeadingAttributes (see page 16509) property instead.

See Also

TableAttributes (see page 16510)

HeadingAttributes (see page 16509)

99.1.4.5.4 TCustomDataGrid.TableAttributes Property

Determines the basic display characteristics of the table.

Pascal

```
property TableAttributes: TGridAttributes;
```

C++

```
__property TGridAttributes TableAttributes;
```

Description

Use TableAttributes to specify values for the most common options on the HTML <TABLE> tag. TableAttributes lets you specify the alignment of the table in its HTML document, its color and border size, the offset of data within each table cell, as well as any custom options or style rules.

Note: To influence the display attributes of only the header of the grid, or only the rows in its body, use the TableAttributes or HeadingAttributes (see page 16509) property instead.

See Also

RowAttributes (see page 16510)

DisplayRows (see page 16509)

HeadingAttributes (see page 16509)

99.1.5 TCustomDataNavigator Class

TCustomDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 16576) and TXMLButton (see page 16989) descendants.

Class Hierarchy

Pascal

```
TCustomDataNavigator = class(TXMLDisplayReferenceGroup);
```

C++

```
class TCustomDataNavigator : public TXMLDisplayReferenceGroup;
```

File

MidItems

Description

Use TCustomDataNavigator as a base class for Web items that generate the HTML to arrange a collection of button controls in a data form. Each TCustomDataNavigator object has an associated Web item that generates display controls in the form. The buttons arranged by the data navigator component manipulate the information these display controls show.

TCustomDataNavigator introduces properties that customize the appearance of the buttons it arranges.

Do not create instances of TCustomDataNavigator. TCustomDataNavigator is intended to act as a base class. Instead, instantiate a descendant class such as TDataNavigator (see page 16569).

See Also

TDataForm (see page 16554)

TFieldGroup (see page 16591)

TDataGrid (see page 16560)

IWebContent (see page 24792)

99.1.5.1 TCustomDataNavigator Members

The following tables list the members exposed by TCustomDataNavigator.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultButtons (see page 16516)	This is GetDefaultButtons, a member of class TCustomDataNavigator.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	GetWebDisplayComponent (see page 16920)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplAddElements (see page 17051)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 16516)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 16516)	Provides the underlying implementation for the Content method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16517)	Provides the underlying implementation for the GetSubComponents method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.

V	Notification (see page 16920)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
V	SetWebDisplayComponent (see page 16921)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleButtons (see page 16517)	This is VisibleButtons, a member of class TCustomDataNavigator.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebDisplay (see page 16921)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 16921)	
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
V	Create (see page 16919)	Creates an instance of TWebDisplayReferenceGroup (see page 16915).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).
V	Destroy (see page 16919)	Frees an instance of TWebDisplayReferenceGroup (see page 16915).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetWebDisplayComponent (see page 17081)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16518)	Represents a tag option and its value in the generated TABLE tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16518)	Adds style attributes to the generated HTML table.
	StyleRule (see page 16519)	Applies a style in the page producer's style sheet to the group of buttons.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebDisplayComponent (see page 17081)	
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.
	XMLComponent (see page 17051)	Associates the group with a component that generates HTML display controls.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.5.2 TCustomDataNavigator Methods

The methods of the TCustomDataNavigator class are listed here.

Protected Methods

	Name	Description
	GetDefaultButtons (see page 16516)	This is GetDefaultButtons, a member of class TCustomDataNavigator.
	ImplCanAddClass (see page 16516)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 16516)	Provides the underlying implementation for the Content method.
	ImplGetSubComponents (see page 16517)	Provides the underlying implementation for the GetSubComponents method.
	VisibleButtons (see page 16517)	This is VisibleButtons, a member of class TCustomDataNavigator.

99.1.5.2.1 TCustomDataNavigator.GetDefaultButtons Method

Pascal

```
procedure GetDefaultButtons; virtual;
```

C++

```
virtual __fastcall GetDefaultButtons();
```

Description

This is GetDefaultButtons, a member of class TCustomDataNavigator.

99.1.5.2.2 TCustomDataNavigator.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 16878)

WebFieldControls (see page 16884)

99.1.5.2.3 TCustomDataNavigator.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 16879)

AddElements (see page 16878)

ILayoutWebContent (see page 24774)

99.1.5.2.4 TCustomDataNavigator.ImplGetSubComponents Method

Provides the underlying implementation for the GetSubComponents method.

Pascal

```
function ImplGetSubComponents: TObject; override;
```

C++

```
virtual __fastcall TObject * ImplGetSubComponents();
```

Description

The GetSubComponents method calls ImplGetSubComponents to retrieve the value of WebFieldControls as a TObject. TWebControlGroup descendants override this method if the list is not simply the value of WebFieldControls. For example, some TWebControlGroup descendants supply a default value (DefaultWebComponents) when the WebFieldControls property list is empty.

ImplGetSubComponents returns the TWebComponentList object that contains all subitems of the Web control group.

See Also

GetSubComponents (see page 16880)

DefaultWebComponents (see page 16883)

WebFieldControls (see page 16884)

99.1.5.2.5 TCustomDataNavigator.VisibleButtons Method

Pascal

```
function VisibleButtons: TWebComponentList;
```

C++

```
__fastcall TWebComponentList VisibleButtons();
```

Description

This is VisibleButtons, a member of class TCustomDataNavigator.

99.1.5.3 TCustomDataNavigator Properties

The properties of the TCustomDataNavigator class are listed here.

Public Properties

	Name	Description
	Custom (see page 16518)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 16518)	Adds style attributes to the generated HTML table.
	StyleRule (see page 16519)	Applies a style in the page producer's style sheet to the group of buttons.

99.1.5.3.1 TCustomDataNavigator.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TCustomDataNavigator (see page 16511) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 16884) property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the buttons and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 16518)

StyleRule (see page 16519)

WebFieldControls (see page 16884)

99.1.5.3.2 TCustomDataNavigator.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

TCustomDataNavigator (see page 16511) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 16884) property. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 16518)

StyleRule (see page 16519)

WebFieldControls (see page 16884)

99.1.5.3.3 TCustomDataNavigator.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

TCustomDataNavigator (see page 16511) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 16884) property. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 16518) property.

See Also

Style (see page 16518)

Styles (see page 17127)

StylesFile (see page 17128)

WebFieldControls (see page 16884)

99.1.6 TCustomFieldGroup Class

TCustomFieldGroup is the base class for Web items that arrange information on an HTML form as a set of labeled fields.

Class Hierarchy

Pascal

```
TCustomFieldGroup = class(TXMLDisplayGroup);
```

C++

```
class TCustomFieldGroup : public TXMLDisplayGroup;
```

File

MidItems

Description

Use TCustomFieldGroup as a base class for Web items that display information in labeled fields on an HTML form. Each TCustomFieldGroup object maintains a list of Web items that generate the individual display fields. These Web items are restricted to classes that are appropriate for the specific TCustomFieldGroup descendant.

If the controls generated for TCustomFieldGroup by its Web items represent database information, you can bind the field group to an XML data packet or dataset field within an XML data packet. The Web items can use that binding to determine the source of the data they display.

TCustomFieldGroup introduces a number of properties that affect the appearance of the generated set of fields.

In order to let other Web items use the HTML that the TCustomFieldGroup object generates, TCustomFieldGroup inherits the IWebContent interface from TWebControlGroup (see page 16872).

Do not create instances of TCustomFieldGroup. Instead, use a descendant of TCustomFieldGroup such as TFieldGroup (see page 16591) or TQueryFieldGroup (see page 16736).

See Also

TFieldGroup (see page 16591)

IWebContent (see page 24792)

TQueryFieldGroup (see page 16736)

99.1.6.1 TCustomFieldGroup Members

The following tables list the members exposed by TCustomFieldGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 17025)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindField (see page 17026)	This is FindField, a member of class TXMLDisplayGroup.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 17026)	Returns the value of the DataSet property.
	GetDataSetField (see page 17026)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetEnableValidateFields (see page 17026)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 17027)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsMultipleRecordView (see page 17027)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 16526)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 17027)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	GetXMLBroker (see page 17027)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 17028)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 17028)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 17028)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 17028)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplAddElements (see page 17029)	Provides the underlying implementation for the AddElements method.

	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
	ImplContent (see page 16526)	Provides the underlying implementation for the Content method.
	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	ImplGetSubComponents (see page 17029)	Provides the underlying implementation for the GetSubComponents method.
	ImplIsMultipleRecordView (see page 17029)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsFieldInUse (see page 17030)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 17030)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDataSetField (see page 17030)	This is SetDataSetField, a member of class TXMLDisplayGroup.
	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEnableValidateFields (see page 17031)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	SetXMLBroker (see page 17031)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateDataSet (see page 17031)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 17031)	This is ValidateFields, a member of class TXMLDisplayGroup.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
	XMLDataChange (see page 17031)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
	EnableValidateFields (see page 17032)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.
R	XMLDataSet (see page 17033)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16525)	Creates and initializes an instance of TCustomFieldGroup (see page 16519).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 16525)	Frees an instance of TCustomFieldGroup (see page 16519).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDataSet (see page 17054)	Returns the value of the DataSet (see page 17055) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnableValidateFields (see page 17078)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 17060)	This is GetFieldsList, a member of class IDataSetFields.

	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsMultipleRecordView (see page 17079)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 17082)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVisibleFields (see page 17060)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 17054)	Returns the value of the XMLBroker (see page 17056) property.
	GetXMLDataSet (see page 17055)	Returns the value of the XMLDataSet (see page 17056) property.
	GetXMLDisplayName (see page 17083)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 17083)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	HasStatusField (see page 17060)	This is HasStatusField, a member of class IDataSetFields.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsFieldInUse (see page 17060)	This is IsFieldInUse, a member of class IDataSetFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEnableValidateFields (see page 17078)	This is SetEnableValidateFields, a member of class IValidateFields.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateDataSet (see page 17060)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateFields (see page 17078)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16527)	Represents a tag option and its value in the generated TABLE tag.
R	DataSet (see page 17055)	Provides access to an interface for working with the associated dataset.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EnableValidateFields (see page 17078)	This is EnableValidateFields, a member of class IValidateFields.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsMultipleRecordView (see page 17080)	
R	IsMultipleRecordView (see page 17083)	
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16527)	Adds style attributes to the generated set of fields.
	StyleRule (see page 16528)	Applies a style in the page producer's style sheet to the table.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleFields (see page 17061)	This is VisibleFields, a member of class IDataSetFields.
R	VisibleFields (see page 17032)	Indicates the controls displayed by the HTML that the XML display group generates.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.
R	XMLBroker (see page 17056)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
R	XMLDataSet (see page 17056)	Indicates the TXMLDataSet (see page 17006) object that represents the dataset to which the Web item is bound.
R	XMLDisplayName (see page 17084)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 17084)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLBroker (see page 17033)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSetField (see page 17033)	Binds the XML display group to a nested dataset from the XML data packet.

99.1.6.2 TCustomFieldGroup.Create Constructor

Creates and initializes an instance of TCustomFieldGroup (see page 16519).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomFieldGroup(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomFieldGroup (see page 16519) at runtime. TCustomFieldGroup (see page 16519) components added at design time using the Web Page editor are instantiated automatically.

99.1.6.3 TCustomFieldGroup.Destroy Destructor

Frees an instance of TCustomFieldGroup (see page 16519).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomFieldGroup();
```

Description

Do not call Destroy directly. Instead, call Free, which checks whether the object reference is not nil before calling Destroy.

See Also

Free (see page 22300)

99.1.6.4 TCustomFieldGroup Methods

The methods of the TCustomFieldGroup class are listed here.

Protected Methods

	Name	Description
	GetLayoutAttributes (see page 16526)	Returns an object that specifies how the generated group of controls should look.
	ImplContent (see page 16526)	Provides the underlying implementation for the Content method.

99.1.6.4.1 TCustomFieldGroup.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

As implemented by TWebControlGroup, GetLayoutAttributes returns nil (Delphi) or NULL (C++), because TWebControlGroup descendants not make use of layout attributes.

See Also

Content (see page 16879)

99.1.6.4.2 TCustomFieldGroup.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup,

ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 16879)

AddElements (see page 16878)

ILayoutWebContent (see page 24774)

99.1.6.5 TCustomFieldGroup Properties

The properties of the TCustomFieldGroup class are listed here.

Public Properties

	Name	Description
	Custom (see page 16527)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 16527)	Adds style attributes to the generated set of fields.
	StyleRule (see page 16528)	Applies a style in the page producer's style sheet to the table.

99.1.6.5.1 TCustomFieldGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TCustomFieldGroup (see page 16519) generates an HTML table to manage the layout of the HTML controls that its Web items generate. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to surround the set of fields with a border and give them a blue background, set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 16527)

StyleRule (see page 16528)

99.1.6.5.2 TCustomFieldGroup.Style Property

Adds style attributes to the generated set of fields.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

TCustomFieldGroup (see page 16519) generates an HTML table to lay out the fields that its Web items generate. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 16527)

StyleRule (see page 16528)

99.1.6.5.3 TCustomFieldGroup.StyleRule Property

Applies a style in the page producer's style sheet to the table.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated set of fields. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 16527) property.

See Also

Style (see page 16527)

99.1.7 TCustomLayoutGroup Class

TCustomLayoutGroup is the base class for Web items that arrange content produced by arbitrary Web items.

Class Hierarchy

Pascal

```
TCustomLayoutGroup = class(TWebControlGroup);
```

C++

```
class TCustomLayoutGroup : public TWebControlGroup;
```

File

MidItems

Description

Use TCustomLayoutGroup as a base class for Web items that are used purely for layout. There are few restrictions on what Web items can use a layout group because it has no special content that it displays. It merely imposes a layout on content generated by other Web items.

TCustomLayoutGroup maintains a list of Web items that display information in the final HTML document, but imposes no restrictions of its own on the possible types of Web items. Instead, it restricts those Web items to the classes that its parent allows. In order to let the parent component use the HTML that TCustomLayoutGroup generates, TCustomLayoutGroup inherits the IWebContent interface from TWebControlGroup (see page 16872).

Do not create instances of TCustomLayoutGroup. Instead, use a descendant of TCustomLayoutGroup such as TLayoutGroup (see page 16687).

See Also

TLayoutGroup (see page 16687)

IWebContent (see page 24792)

99.1.7.1 TCustomLayoutGroup Members

The following tables list the members exposed by TCustomLayoutGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLayoutAttributes (see page 16534)	Returns an object that specifies how the generated group of controls should look.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
	ImplCanAddClass (see page 16534)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 16535)	Provides the underlying implementation for the Content method.
	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16533)	Creates and initializes an instance of TCustomLayoutGroup (see page 16528).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 16533)	Frees an instance of TCustomLayoutGroup (see page 16528).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16535)	Represents a tag option and its value in the generated TABLE tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayColumns (see page 16536)	Specifies the number of columns the layout group uses to lay out its child controls.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16536)	Adds style attributes to the generated HTML table.
	StyleRule (see page 16537)	Applies a style in the page producer's style sheet to the group of buttons.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.7.2 TCustomLayoutGroup.Create Constructor

Creates and initializes an instance of TCustomLayoutGroup (see page 16528).

Pascal

```
constructor Create(AComponent: TComponent); override;
```

C++

```
virtual __fastcall TCustomLayoutGroup(TComponent * AComponent);
```

Description

Call Create to instantiate TCustomLayoutGroup (see page 16528) at runtime. TCustomLayoutGroup (see page 16528) components added at design time using the Web Page editor are instantiated automatically.

99.1.7.3 TCustomLayoutGroup.Destroy Destructor

Frees an instance of TCustomLayoutGroup (see page 16528).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomLayoutGroup();
```

Description

Do not call Destroy directly. Instead, call Free, which checks whether the layout group is nil before calling Destroy.

See Also

Free (see page 22300)

99.1.7.4 TCustomLayoutGroup Methods

The methods of the TCustomLayoutGroup class are listed here.

Protected Methods

	Name	Description
	GetLayoutAttributes (see page 16534)	Returns an object that specifies how the generated group of controls should look.
	ImplCanAddClass (see page 16534)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 16535)	Provides the underlying implementation for the Content method.

99.1.7.4.1 TCustomLayoutGroup.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

As implemented by TWebControlGroup, GetLayoutAttributes returns nil (Delphi) or NULL (C++), because TWebControlGroup descendants not make use of layout attributes.

See Also

Content (see page 16879)

99.1.7.4.2 TCustomLayoutGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 16878)

WebFieldControls (see page 16884)

99.1.7.4.3 TCustomLayoutGroup.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 16879)

AddElements (see page 16878)

ILayoutWebContent (see page 24774)

99.1.7.5 TCustomLayoutGroup Properties

The properties of the TCustomLayoutGroup class are listed here.

Public Properties

	Name	Description
	Custom (see page 16535)	Represents a tag option and its value in the generated TABLE tag.
	DisplayColumns (see page 16536)	Specifies the number of columns the layout group uses to lay out its child controls.
	Style (see page 16536)	Adds style attributes to the generated HTML table.
	StyleRule (see page 16537)	Applies a style in the page producer's style sheet to the group of buttons.

99.1.7.5.1 TCustomLayoutGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TCustomLayoutGroup (see page 16528) generates an HTML table to lay out the controls generated by the Web items in its WebFieldControls (see page 16884) property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the group of controls and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 16536)

StyleRule (see page 16537)

WebFieldControls (see page 16884)

DisplayColumns (see page 16536)

99.1.7.5.2 TCustomLayoutGroup.DisplayColumns Property

Specifies the number of columns the layout group uses to lay out its child controls.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

TCustomLayoutGroup (see page 16528) generates an HTML table to lay out the controls generated by the Web items in its WebFieldControls (see page 16884) property. It adds the HTML generated by each Web item listed in WebFieldControls (see page 16884) to a cell of the table, filling the cells out row by row until it displays all the Web items. DisplayColumns determines the number of cells in each row.

See Also

WebFieldControls (see page 16884)

99.1.7.5.3 TCustomLayoutGroup.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

TCustomLayoutGroup (see page 16528) generates an HTML table to lay out the controls generated by the Web items in WebFieldControls (see page 16884). Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 16535)

StyleRule (see page 16537)

WebFieldControls (see page 16884)

99.1.7.5.4 TCustomLayoutGroup.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

TCustomLayoutGroup (see page 16528) generates an HTML table to lay out the controls generated by its Web items. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 16536) property.

See Also

Style (see page 16536)

Styles (see page 19830)

StylesFile (see page 19831)

WebFieldControls (see page 16884)

99.1.8 TCustomQueryButtons Class

TCustomQueryButtons assembles the HTML generated by a set of TQueryButton (see page 16718) descendants.

Class Hierarchy

Pascal

```
TCustomQueryButtons = class(TWebControlGroup);
```

C++

```
class TCustomQueryButtons : public TWebControlGroup;
```

File

MidItems

Description

Use TCustomQueryButtons as a base class for Web items that generate the HTML to arrange a collection of button controls in a query form. The buttons arranged by the query buttons component manipulate information shown by display controls in the parent Query form.

TCustomQueryButtons introduces properties that customize the appearance of the buttons it arranges.

Do not create instances of TCustomQueryButtons. TCustomQueryButtons is intended to act as a base class. Instead, instantiate a descendant class such as TQueryButtons (see page 16730).

See Also

TQueryForm (see page 16745)

TQueryFieldGroup (see page 16736)

IWebContent (see page 24792)

99.1.8.1 TCustomQueryButtons Members

The following tables list the members exposed by TCustomQueryButtons.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultButtons (see page 16542)	This is GetDefaultButtons, a member of class TCustomQueryButtons.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.

	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	ImplAddElements (see page 16542)	Provides the underlying implementation for the AddElements method.
	ImplCanAddClass (see page 16543)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 16543)	Provides the underlying implementation for the Content method.
	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleButtons (see page 16543)	This is VisibleButtons, a member of class TCustomQueryButtons.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.

R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16544)	Represents a tag option and its value in the generated TABLE tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16544)	Adds style attributes to the generated HTML table.
	StyleRule (see page 16545)	Applies a style in the page producer's style sheet to the group of buttons.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.8.2 TCustomQueryButtons Methods

The methods of the TCustomQueryButtons class are listed here.

Protected Methods

	Name	Description
	GetDefaultButtons (see page 16542)	This is GetDefaultButtons, a member of class TCustomQueryButtons.
	ImplAddElements (see page 16542)	Provides the underlying implementation for the AddElements method.
	ImplCanAddClass (see page 16543)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 16543)	Provides the underlying implementation for the Content method.
	VisibleButtons (see page 16543)	This is VisibleButtons, a member of class TCustomQueryButtons.

99.1.8.2.1 TCustomQueryButtons.GetDefaultButtons Method

Pascal

```
procedure GetDefaultButtons; virtual;
```

C++

```
virtual __fastcall GetDefaultButtons();
```

Description

This is GetDefaultButtons, a member of class TCustomQueryButtons.

99.1.8.2.2 TCustomQueryButtons.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup, ImplAddElements does nothing. TWebControlGroup descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 16878)

99.1.8.2.3 TCustomQueryButtons.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 16878)

WebFieldControls (see page 16884)

99.1.8.2.4 TCustomQueryButtons.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 16879)

AddElements (see page 16878)

ILayoutWebContent (see page 24774)

99.1.8.2.5 TCustomQueryButtons.VisibleButtons Method

Pascal

```
function VisibleButtons: TWebComponentList;
```

C++

```
__fastcall TWebComponentList VisibleButtons();
```

Description

This is VisibleButtons, a member of class TCustomQueryButtons.

99.1.8.3 TCustomQueryButtons Properties

The properties of the TCustomQueryButtons class are listed here.

Public Properties

	Name	Description
	Custom (see page 16544)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 16544)	Adds style attributes to the generated HTML table.
	StyleRule (see page 16545)	Applies a style in the page producer's style sheet to the group of buttons.

99.1.8.3.1 TCustomQueryButtons.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TCustomQueryButtons (see page 16537) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 16884) property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the query buttons and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 16544)

StyleRule (see page 16545)

WebFieldControls (see page 16884)

99.1.8.3.2 TCustomQueryButtons.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

TCustomQueryButtons (see page 16537) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 16884) property. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 16544)

StyleRule (see page 16545)

WebFieldControls (see page 16884)

99.1.8.3.3 TCustomQueryButtons.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

TCustomQueryButtons (see page 16537) generates an HTML table to lay out the buttons listed in the WebFieldControls (see page 16884) property. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 16544) property.

See Also

Style (see page 16544)

Styles (see page 17127)

StylesFile (see page 17128)

WebFieldControls (see page 16884)

99.1.9 TCustomQueryForm Class

TCustomQueryForm is the base class for Web items that generate HTML forms for letting users enter application-defined values.

Class Hierarchy

Pascal

```
TCustomQueryForm = class(TWebForm, IQueryForm);
```

C++

```
class TCustomQueryForm : public TWebForm, public IQueryForm;
```

File

MidItems

Description

Use TCustomQueryForm as a base class for components that generate an HTML form that displays application-defined values and submits them to an InternetExpress application. TCustomQueryForm introduces properties for specifying the method and target URL of messages submitted by the form.

When building an HTML form, TCustomQueryForm makes use of content generated by the components listed in its WebComponents (see page 16934) property. These components can include Web items that display application-defined values (TQueryFieldGroup (see page 16736)) or that generate buttons to operate on those values (TQueryButtons (see page 16730)). They can also include components that manage the layout of other HTML controls (TLayoutGroup (see page 16687)).

In order to let an InternetExpress page producer use the generated HTML query form, TCustomQueryForm inherits support for the IWebContent interface from TWebForm (see page 16922).

Do not create instances of TCustomQueryForm. Instead, create descendants of TCustomQueryForm, such as TQueryForm (see page 16745).

See Also

TQueryForm (see page 16745)

IWebContent (see page 24792)

TInetXPageProducer (see page 17145)

99.1.9.1 TCustomQueryForm Members

The following tables list the members exposed by TCustomQueryForm.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16927)	Used internally to generate any javascript declarations needed by the form.
	AssignStringsCallback (see page 16551)	This is AssignStringsCallback, a member of class TCustomQueryForm.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16928)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 16934) property list.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16928)	Returns the HTML that defines the HTML form.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultWebComponents (see page 16929)	Returns nil (Delphi) or NULL (C++).
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetHTMLFormName (see page 16929)	Returns the name of the generated HTML form.
V	GetHTMLFormTag (see page 16551)	This is GetHTMLFormTag, a member of class TCustomQueryForm.
	GetHTMLFormVarName (see page 16929)	Returns the name of the javascript variable that refers to the generated form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16930)	Returns the object that specifies how the generated form should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16930)	Returns the value of the WebComponents (see page 16934) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 16930)	Returns the value of the VisibleFields (see page 16934) property.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
V	ImplAddElements (see page 16552)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 16552)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 16552)	Provides the underlying implementation for the Content method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	MethodString (see page 16553)	This is MethodString, a member of class TCustomQueryForm.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.

V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16932)	Prevents an application from trying to assign a default set of Web items on the form.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	VisibleFields (see page 16934)	Lists the Web items whose generated content appears in the HTML form.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
	AssignStrings (see page 16551)	This is AssignStrings, a member of class TCustomQueryForm.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16550)	Creates and initializes an instance of TCustomQueryForm (see page 16545).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16926)	Frees an instance of TWebForm (see page 16922).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHTMLFormName (see page 17065)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 17065)	Returns the name of the javascript variable that refers to the generated form.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.

	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Action (see page 16553)	Specifies the path info portion of the URL to which the query submits request messages.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16933)	Represents a tag option and its value in the generated FORM tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLFormName (see page 17066)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 17066)	Indicates the name of the javascript variable that represents the HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
	Method (see page 16554)	This is Method, a member of class TCustomQueryForm.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16933)	Adds style attributes to the generated form.
	StyleRule (see page 16934)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebComponents (see page 16934)	Maintains a list of components that generate HTML content for the TWebForm (see page 16922) descendant.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.9.2 TCustomQueryForm.Create Constructor

Creates and initializes an instance of TCustomQueryForm (see page 16545).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomQueryForm(TComponent * AOwner);
```

Description

Call Create to instantiate a query form at runtime. Query forms added at design time using the Web Page editor are instantiated automatically.

99.1.9.3 TCustomQueryForm Methods

The methods of the TCustomQueryForm class are listed here.

Protected Methods

	Name	Description
	AssignStringsCallback (see page 16551)	This is AssignStringsCallback, a member of class TCustomQueryForm.
V	GetHTMLFormTag (see page 16551)	This is GetHTMLFormTag, a member of class TCustomQueryForm.
V	ImplAddElements (see page 16552)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 16552)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 16552)	Provides the underlying implementation for the Content method.
	MethodString (see page 16553)	This is MethodString, a member of class TCustomQueryForm.

Public Methods

	Name	Description
	AssignStrings (see page 16551)	This is AssignStrings, a member of class TCustomQueryForm.

99.1.9.3.1 TCustomQueryForm.AssignStrings Method

Pascal

```
procedure AssignStrings(Value: TStrings);
```

C++

```
__fastcall AssignStrings(TStrings Value);
```

Description

This is AssignStrings, a member of class TCustomQueryForm.

99.1.9.3.2 TCustomQueryForm.AssignStringsCallback Method

Pascal

```
procedure AssignStringsCallback(AComponent: TComponent);
```

C++

```
__fastcall AssignStringsCallback(TComponent * AComponent);
```

Description

This is AssignStringsCallback, a member of class TCustomQueryForm.

99.1.9.3.3 TCustomQueryForm.GetHTMLFormTag Method

Pascal

```
function GetHTMLFormTag(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall AnsiString GetHTMLFormTag(TWebContentOptions Options);
```

Description

This is GetHTMLFormTag, a member of class TCustomQueryForm.

99.1.9.3.4 TCustomQueryForm.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any javascript declarations by calling the AddIntf interface. These declarations allow the generated display control to call javascript methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebForm, ImplAddElements does nothing. TWebForm descendants can override ImplAddElements to add any required declarations.

See Also

AddElements (see page 16927)

99.1.9.3.5 TCustomQueryForm.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebForm descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebForm instance to which the component will be added.

In TWebForm, ImplCanAddClass is abstract or, in C++ terminology, pure virtual. TWebForm descendants must override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML forms.

See Also

CanAddClass (see page 16928)

WebComponents (see page 16934)

99.1.9.3.6 TCustomQueryForm.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML form. ImplContent is anabstract or, in C++ terminology, pure virtual method in TWebForm. TWebForm descendants override it to generate the HTML form.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebForm should format the HTML control it generates. Typically, this parameter is nil (Delphi) or NULL (C++) for forms.

ImplContent returns an HTML form definition.

See Also

Content (see page 16928)

AddElements (see page 16927)

99.1.9.3.7 TCustomQueryForm.MethodString Method

Pascal

```
function MethodString: string;
```

C++

```
__fastcall AnsiString MethodString();
```

Description

This is MethodString, a member of class TCustomQueryForm.

99.1.9.4 TCustomQueryForm Properties

The properties of the TCustomQueryForm class are listed here.

Public Properties

	Name	Description
	Action (see page 16553)	Specifies the path info portion of the URL to which the query submits request messages.
	Method (see page 16554)	This is Method, a member of class TCustomQueryForm.

99.1.9.4.1 TCustomQueryForm.Action Property

Specifies the path info portion of the URL to which the query submits request messages.

Pascal

```
property Action: string;
```

C++

```
__property AnsiString Action;
```

Description

Use Action to specify the target URL for messages that the query form submits. Action supplies the PathInfo property of Web request messages from the query form. This value is matched to the PathInfo property of a Web action item when determining what object responds to those messages.

See Also

TCustomQueryForm (see page 16545)

PathInfo (see page 15185)

PathInfo (see page 15138)

99.1.9.4.2 TCustomQueryForm.Method Property

Pascal

```
property Method: TFormMethod;
```

C++

```
__property TFormMethod Method;
```

Description

This is Method, a member of class TCustomQueryForm.

99.1.10 TDataForm Class

TDataForm generates an HTML form that displays database information and lets users apply updates.

Class Hierarchy

Pascal

```
TDataForm = class(TCustomDataForm);
```

C++

```
class TDataForm : public TCustomDataForm;
```

File

MidItems

Description

Add TDataForm to the Web items of an Internet Express page producer (TInetXPageProducer) to add an HTML form that displays database information that users can view and edit.

Data forms generate an HTML form that contains controls which display information from an XML data packet. Buttons (see page 2289) on the form manipulate that data, and submit updates back to the XML broker that supplies the XML data packet.

TDataForm generates the HTML FORM tag and assembles the HTML generated by its Web items. It restricts the Web items that

generate the contents of the form to components that generate data displays (TDataGrid (see page 16560) or TFieldGroup (see page 16591)), components that contain buttons which operate on those displays (TDataNavigator (see page 16569)), and components that manage the layout of HTML controls (TLayoutGroup (see page 16687)). At design time, you can add these Web items to the form using the Web page editor.

See Also

TDataGrid (see page 16560)

TBasePageItemsProducer (see page 18376)

TInetXPageProducer (see page 17145)

TFieldGroup (see page 16591)

TlayoutGroup

TDataNavigator (see page 16569)

TApplyUpdatesButton (see page 16480)

Using the Web Page Editor

99.1.10.1 TDataForm Members

The following tables list the members exposed by TDataForm.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16927)	Used internally to generate any javascript declarations needed by the form.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16928)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 16934) property list.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16928)	Returns the HTML that defines the HTML form.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultWebComponents (see page 16929)	Returns nil (Delphi) or NULL (C++).
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetHTMLFormName (see page 16929)	Returns the name of the generated HTML form.
V	GetHTMLFormTag (see page 16498)	This is GetHTMLFormTag, a member of class TCustomDataForm.
	GetHTMLFormVarName (see page 16929)	Returns the name of the javascript variable that refers to the generated form.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16930)	Returns the object that specifies how the generated form should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16930)	Returns the value of the WebComponents (see page 16934) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 16930)	Returns the value of the VisibleFields (see page 16934) property.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
V	ImplAddElements (see page 16931)	Provides the underlying implementation for the AddElements (see page 16927) method.
V	ImplCanAddClass (see page 16498)	Provides the underlying implementation for the CanAddClass method.
A	ImplCanAddClass (see page 16931)	Provides the underlying implementation for the CanAddClass (see page 16928) method.
V	ImplContent (see page 16499)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 16932)	Provides the underlying implementation for the Content (see page 16928) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16932)	Prevents an application from trying to assign a default set of Web items on the form.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.

	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	VisibleFields (see page 16934)	Lists the Web items whose generated content appears in the HTML form.
	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 16926)	Creates and initializes an instance of TWebForm (see page 16922).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16926)	Frees an instance of TWebForm (see page 16922).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.

	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHTMLFormName (see page 17065)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 17065)	Returns the name of the javascript variable that refers to the generated form.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLFormName (see page 17066)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 17066)	Indicates the name of the javascript variable that represents the HTML form.

	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebComponents (see page 16934)	Maintains a list of components that generate HTML content for the TWebForm (see page 16922) descendant.

Published Properties

	Name	Description
	Custom (see page 16559)	Represents a tag option and its value in the generated FORM tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16559)	Adds style attributes to the generated form.
	StyleRule (see page 16560)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.10.2 TDataForm Properties

The properties of the TDataForm class are listed here.

Published Properties

	Name	Description
	Custom (see page 16559)	Represents a tag option and its value in the generated FORM tag.
	Style (see page 16559)	Adds style attributes to the generated form.
	StyleRule (see page 16560)	Applies a style in the page producer's style sheet to the button.

99.1.10.2.1 TDataForm.Custom Property

Represents a tag option and its value in the generated FORM tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options that qualify the FORM tag generated by the TWebForm descendant. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to specify that the form includes files with the text it submits and indicate that the page returned after submitting the form goes into a separate window, use a Custom value such as the following:

```
ENCTYPE="multipart/form-data" TARGET="ResultFrame"
```

See Also

Style (see page 16933)

99.1.10.2.2 TDataForm.Style Property

Adds style attributes to the generated form.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to add a STYLE option that qualifies the FORM tag generated by the TWebForm descendant. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated FORM tag as the value of a STYLE option.

See Also

Custom (see page 16933)

StyleRule (see page 16934)

99.1.10.2.3 TDataForm.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated form. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

Style (see page 16933)

Styles (see page 17127)

StylesFile (see page 17128)

99.1.11 TDataGrid Class

TDataGrid generates an HTML table to display a dataset in an XML data packet.

Class Hierarchy

Pascal

```
TDataGrid = class(TCustomDataGrid);
```

C++

```
class TDataGrid : public TCustomDataGrid;
```

File

MidItems

Description

Add TDataGrid to the Web items of a TDataForm (see page 16554) component (or a layout group that is a child of a TDataForm (see page 16554) component.) TDataGrid generates an HTML table that displays multiple records from a dataset as a set of rows and columns.

Each TDataGrid object maintains a list of Web items that generate the individual fields (columns) of the table. These Web items can be from the following classes: TTextColumn (see page 16849), TSelectOptionColumn, TTextAreaColumn (see page 16838), and TStatusColumn (see page 16826). You can bind the data grid to an XML data packet or dataset field within an XML data packet. The column Web items can then use that binding to determine the source of the data they display.

You can also use the properties of TDataGrid to affect the appearance of the generated table.

See Also

TSelectOptionsColumn (see page 16814)

TStatusColumn (see page 16826)

TTextAreaColumn (see page 16838)

TTextColumn (see page 16849)

TDataForm (see page 16554)

TLayoutGroup (see page 16687)

TWebDataDisplay (see page 16884)

Using the Web Page Editor

99.1.11.1 TDataGrid Members

The following tables list the members exposed by TDataGrid.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 17025)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindField (see page 17026)	This is FindField, a member of class TXMLDisplayGroup.
	FormatTable (see page 16506)	This is FormatTable, a member of class TCustomDataGrid.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 17026)	Returns the value of the DataSet property.
	GetDataSetField (see page 17026)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetEnableValidateFields (see page 17026)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 17027)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsMultipleRecordView (see page 17027)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 17027)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	GetXMLBroker (see page 17027)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 17028)	Returns the value of the XMLDataSet property.

	GetXMLDisplayName (see page 17028)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 17028)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 17028)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 16506)	Provides the underlying implementation for the AddElements method.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplAddElements (see page 17029)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 16507)	Provides the underlying implementation for the CanAddClass method.
V	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
V	ImplContent (see page 16507)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
V	ImplGetSubComponents (see page 17029)	Provides the underlying implementation for the GetSubComponents method.
V	ImplIsMultipleRecordView (see page 16508)	This is ImplIsMultipleRecordView, a member of class TCustomDataGrid.
V	ImplIsMultipleRecordView (see page 17029)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsFieldInUse (see page 17030)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17030)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDataSetField (see page 17030)	This is SetDataSetField, a member of class TXMLDisplayGroup.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEnableValidateFields (see page 17031)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetHeadingAttributes (see page 16508)	This is SetHeadingAttributes, a member of class TCustomDataGrid.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetRowAttributes (see page 16508)	This is SetRowAttributes, a member of class TCustomDataGrid.
	SetTableAttributes (see page 16508)	This is SetTableAttributes, a member of class TCustomDataGrid.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	SetXMLBroker (see page 17031)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateDataSet (see page 17031)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 17031)	This is ValidateFields, a member of class TXMLDisplayGroup.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
	XMLDataChange (see page 17031)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
	EnableValidateFields (see page 17032)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.
	XMLDataSet (see page 17033)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 16505)	Creates and initializes an instance of TCustomDataGrid (see page 16499).
	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
	Create (see page 17024)	Creates and initializes an instance of TXMLDisplayGroup (see page 17019).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16506)	Frees an instance of TCustomDataGrid (see page 16499).
	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).

V	Destroy (see page 17024)	Frees an instance of TXMLDisplayGroup (see page 17019).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDataSet (see page 17054)	Returns the value of the DataSet (see page 17055) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnableValidateFields (see page 17078)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 17060)	This is GetFieldsList, a member of class IDataSetFields.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsMultipleRecordView (see page 17079)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 17082)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVisibleFields (see page 17060)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 17054)	Returns the value of the XMLBroker (see page 17056) property.
	GetXMLDataSet (see page 17055)	Returns the value of the XMLDataSet (see page 17056) property.
	GetXMLDisplayName (see page 17083)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 17083)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	HasStatusField (see page 17060)	This is HasStatusField, a member of class IDataSetFields.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsFieldInUse (see page 17060)	This is IsFieldInUse, a member of class IDataSetFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEnableValidateFields (see page 17078)	This is SetEnableValidateFields, a member of class IValidateFields.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateDataSet (see page 17060)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateFields (see page 17078)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 17055)	Provides access to an interface for working with the associated dataset.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EnableValidateFields (see page 17078)	This is EnableValidateFields, a member of class IValidateFields.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsMultipleRecordView (see page 17080)	
R	IsMultipleRecordView (see page 17083)	
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleFields (see page 17061)	This is VisibleFields, a member of class IDataSetFields.
R	VisibleFields (see page 17032)	Indicates the controls displayed by the HTML that the XML display group generates.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.
R	XMLBroker (see page 17056)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
R	XMLDataSet (see page 17056)	Indicates the TXMLDataSet (see page 17006) object that represents the dataset to which the Web item is bound.
R	XMLDisplayName (see page 17084)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 17084)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	DisplayRows (see page 16567)	Limits the number of rows in the HTML table.
	HeadingAttributes (see page 16567)	Determines the display characteristics of the table's header.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RowAttributes (see page 16568)	Determines the display characteristics of the table's body.
	TableAttributes (see page 16568)	Determines the basic display characteristics of the table.

	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLBroker (see page 17033)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSetField (see page 17033)	Binds the XML display group to a nested dataset from the XML data packet.

99.1.11.2 TDataGrid Properties

The properties of the TDataGrid class are listed here.

Published Properties

	Name	Description
	DisplayRows (see page 16567)	Limits the number of rows in the HTML table.
	HeadingAttributes (see page 16567)	Determines the display characteristics of the table's header.
	RowAttributes (see page 16568)	Determines the display characteristics of the table's body.
	TableAttributes (see page 16568)	Determines the basic display characteristics of the table.

99.1.11.2.1 TDataGrid.DisplayRows Property

Limits the number of rows in the HTML table.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify the number of rows that appear in the generated HTML table.

Note that the number of rows in the HTML table does not limit the number of records that end users can view and edit. When DisplayRows is less than the number of records in the data packet, the control generated by TNextPageButton or TPriorPageButton lets end users scroll through the records in the data packet.

See Also

MaxRecords (see page 26072)

TNextPageButton (see page 16699)

TPriorPageButton (see page 16713)

99.1.11.2.2 TDataGrid.HeadingAttributes Property

Determines the display characteristics of the table's header.

Pascal

```
property HeadingAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes HeadingAttributes;
```

Description

Use HeadingAttributes to specify any display attributes that apply only to the heading of the generated HTML table. HeadingAttributes determines the options that are added to the <TR> tag that defines the header of the grid. These include the color of the header, the alignment of the caption for each column, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the rows of the grid, use the TableAttributes or RowAttributes property instead.

See Also

TableAttributes (see page 16510)

RowAttributes (see page 16510)

99.1.11.2.3 TDataGrid.RowAttributes Property

Determines the display characteristics of the table's body.

Pascal

```
property RowAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes RowAttributes;
```

Description

Use RowAttributes to specify any display attributes that apply only to the rows of the generated HTML table. RowAttributes determines the options that are added to the <TR> tag for each row in the body of the grid. These include the color of the rows, the alignment of data within each cell, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the header of the grid, use the TableAttributes or HeadingAttributes property instead.

See Also

TableAttributes (see page 16510)

HeadingAttributes (see page 16509)

99.1.11.2.4 TDataGrid.TableAttributes Property

Determines the basic display characteristics of the table.

Pascal

```
property TableAttributes: TGridAttributes;
```

C++

```
__property TGridAttributes TableAttributes;
```

Description

Use TableAttributes to specify values for the most common options on the HTML <TABLE> tag. TableAttributes lets you specify the alignment of the table in its HTML document, its color and border size, the offset of data within each table cell, as well as any custom options or style rules.

Note: To influence the display attributes of only the header of the grid, or only the rows in its body, use the TableAttributes or HeadingAttributes property instead.

See Also

RowAttributes (see page 16510)

DisplayRows (see page 16509)

HeadingAttributes (see page 16509)

99.1.12 TDataNavigator Class

TDataNavigator assembles the HTML generated by a set of TDataSetButton (see page 16576) and TXMLButton (see page 16989) descendants.

Class Hierarchy

Pascal

```
TDataNavigator = class(TCustomDataNavigator);
```

C++

```
class TDataNavigator : public TCustomDataNavigator;
```

File

MidItems

Description

Add TDataNavigator as the child of a TDataForm (see page 16554) component (or a layout group that is a child of a TDataForm (see page 16554) component) to enable the generated HTML form to navigate the displayed data and apply updates that end users make to the data. TDataNavigator can be associated with the Web item that displays the data, such as TDataGrid (see page 16560) or TFieldGroup (see page 16591).

TDataNavigator generates HTML containing the controls generated by its children. These children must be descendants of TDataSetButton (see page 16576) or TXMLButton (see page 16989), such as TInsertButton (see page 16677) and TApplyUpdatesButton (see page 16480).

Use the properties of TDataNavigator to customize the appearance of the group of buttons.

See Also

TDataForm (see page 16554)

TFieldGroup (see page 16591)

TDataGrid (see page 16560)

Using the Web Page Editor

99.1.12.1 TDataNavigator Members

The following tables list the members exposed by TDataNavigator.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultButtons (see page 16516)	This is GetDefaultButtons, a member of class TCustomDataNavigator.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	GetWebDisplayComponent (see page 16920)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplAddElements (see page 17051)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 16516)	Provides the underlying implementation for the CanAddClass method.
V	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
V	ImplContent (see page 16516)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16517)	Provides the underlying implementation for the GetSubComponents method.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16920)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
V	SetWebDisplayComponent (see page 16921)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleButtons (see page 16517)	This is VisibleButtons, a member of class TCustomDataNavigator.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebDisplay (see page 16921)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 16921)	
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
V	Create (see page 16919)	Creates an instance of TWebDisplayReferenceGroup (see page 16915).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).
V	Destroy (see page 16919)	Frees an instance of TWebDisplayReferenceGroup (see page 16915).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.

	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetWebDisplayComponent (see page 17081)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebDisplayComponent (see page 17081)	
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Custom (see page 16574)	Represents a tag option and its value in the generated TABLE tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	Style (see page 16574)	Adds style attributes to the generated HTML table.
	StyleRule (see page 16575)	Applies a style in the page producer's style sheet to the group of buttons.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16575)	Associates the group with a component that generates HTML display controls.

99.1.12.2 TDataNavigator Properties

The properties of the TDataNavigator class are listed here.

Published Properties

	Name	Description
	Custom (see page 16574)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 16574)	Adds style attributes to the generated HTML table.
	StyleRule (see page 16575)	Applies a style in the page producer's style sheet to the group of buttons.
	XMLComponent (see page 16575)	Associates the group with a component that generates HTML display controls.

99.1.12.2.1 TDataNavigator.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TCustomDataNavigator generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the buttons and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 16518)

StyleRule (see page 16519)

WebFieldControls (see page 16884)

99.1.12.2.2 TDataNavigator.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

TCustomDataNavigator generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use Style to add

a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 16518)

StyleRule (see page 16519)

WebFieldControls (see page 16884)

99.1.12.2.3 TDataNavigator.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

TCustomDataNavigator generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

See Also

Style (see page 16518)

Styles (see page 17127)

StylesFile (see page 17128)

WebFieldControls (see page 16884)

99.1.12.2.4 TDataNavigator.XMLComponent Property

Associates the group with a component that generates HTML display controls.

Pascal

```
property XMLComponent: TComponent;
```

C++

```
__property TComponent * XMLComponent;
```

Description

Use XMLComponent to associate the group of buttons with a Web item that generates the display controls those buttons influence. Typical values of XMLComponent are TFieldGroup or TDataGrid.

If all the buttons arranged by the TXMLDisplayReferenceGroup object operate on the same set of display controls, it is most efficient to specify the Web item generating these controls as the value of XMLComponent. Then, each button uses this value to determine its associated display controls when its XMLUseParent property is true. Any buttons that do not operate on the display controls generated by XMLComponent can set their own XMLComponent property to another Web item.

See Also

XMLComponent (see page 17045)

XMLUseParent (see page 17045)

TFieldGroup (see page 16591)

TDataGrid (see page 16560)

TQueryFieldGroup (see page 16736)

99.1.13 TDataSetButton Class

TDataSetButton is the base class for Web items that create HTML buttons for navigating or editing data.

Class Hierarchy

Pascal

```
TDataSetButton = class(TXMLDisplayReferenceButton, IScriptComponent);
```

C++

```
class TDataSetButton : public TXMLDisplayReferenceButton, public IScriptComponent;
```

File

MidItems

Description

Use TDataSetButton as a base class for components that generate the HTML statements defining a specialized button control for working with the data displayed by another Web item. TDataSetButton objects are used by TDataNavigator (see page 16569), which organizes the generated buttons.

TDataSetButton defines properties and methods for

Generating the HTML code to define the button control.

Associating the button with another Web item that generates HTML for displaying the data that the button manipulates.

Specifying tag attributes of the HTML button control, including those defined by a style sheet.

Fitting the component into a hierarchy of Web items, each of which generates part of a larger HTML document.

In order to allow other Web items to use the HTML generated by the button control, TDataSetButton inherits support for the IWebContent interface from TWebButton (see page 16863).

Do not create instances of TDataSetButton. TDataSetButton relies on anabstract or, in C++ terminology, pure virtual method to generate the HTML statements defining a button control. Instead, create descendants of TDataSetButton, such as TNextButton

(see page 16694), TPostButton (see page 16704), TInsertButton (see page 16677), and so on.

See Also

TFirstButton (see page 16651)

TNextButton (see page 16694)

TPriorButton (see page 16709)

TLastButton (see page 16682)

TNextPageButton (see page 16699)

TPriorPageButton (see page 16713)

TInsertButton (see page 16677)

TDeleteButton (see page 16586)

TUndoButton (see page 16858)

TPostButton (see page 16704)

IWebContent (see page 24792)

TDataNavigator (see page 16569)

99.1.13.1 TDataSetButton Members

The following tables list the members exposed by TDataSetButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16581)	This is DefaultCaption, a member of class TDataSetButton.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	XMLMethodName (see page 16581)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16582)	This is AddElements, a member of class TDataSetButton.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16582)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDisplayComponent (see page 17043)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 17043)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 16582)	This is GetMethodName, a member of class TDataSetButton.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16582)	This is GetSubComponents, a member of class TDataSetButton.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 17043)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 16583)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 16583)	Provides the underlying implementation for the Content method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17044)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayComponent (see page 17044)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 17044)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.

R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.
R	XMLDisplay (see page 17045)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16868)	Creates and initializes an instance of TWebButton (see page 16863).
V	Create (see page 17042)	Creates and initializes an instance of TXMLDisplayReferenceButton (see page 17037).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 17042)	Frees an instance of TXMLDisplayReferenceButton (see page 17037).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.

	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16584)	Specifies the caption that appears on the button.
	Custom (see page 16584)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16584)	Adds style attributes to the generated button control.
	StyleRule (see page 16585)	Applies a style in the page producer's style sheet to the button.

	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16585)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 16586)	Specifies whether the button is associated with its parent's display object.

99.1.13.2 TDataSetButton Fields

The fields of the TDataSetButton class are listed here.

Protected Fields

	Name	Description
	DefaultCaption (see page 16581)	This is DefaultCaption, a member of class TDataSetButton.
	XMLMethodName (see page 16581)	This is XMLMethodName, a member of class TDataSetButton.

99.1.13.2.1 TDataSetButton.DefaultCaption Field

Pascal

```
DefaultCaption: string;
```

C++

```
AnsiString DefaultCaption;
```

Description

This is DefaultCaption, a member of class TDataSetButton.

99.1.13.2.2 TDataSetButton.XMLMethodName Field

Pascal

```
XMLMethodName: string;
```

C++

```
AnsiString XMLMethodName;
```

Description

This is XMLMethodName, a member of class TDataSetButton.

99.1.13.3 TDataSetButton Methods

The methods of the TDataSetButton class are listed here.

Protected Methods

	Name	Description
	AddElements (see page 16582)	This is AddElements, a member of class TDataSetButton.
V	GetCaption (see page 16582)	Returns the value of the Caption property.
V	GetMethodName (see page 16582)	This is GetMethodName, a member of class TDataSetButton.
	GetSubComponents (see page 16582)	This is GetSubComponents, a member of class TDataSetButton.
V	ImplAddElements (see page 16583)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 16583)	Provides the underlying implementation for the Content method.

99.1.13.3.1 TDataSetButton.AddElements Method

Pascal

```
procedure AddElements(AddIntf: IAddScriptElements);
```

C++

```
__fastcall AddElements(IAddScriptElements AddIntf);
```

Description

This is AddElements, a member of class TDataSetButton.

99.1.13.3.2 TDataSetButton.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall AnsiString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 16870)

SetCaption (see page 16870)

99.1.13.3.3 TDataSetButton.GetMethodName Method

Pascal

```
function GetMethodName: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetMethodName();
```

Description

This is GetMethodName, a member of class TDataSetButton.

99.1.13.3.4 TDataSetButton.GetSubComponents Method

Pascal

```
function GetSubComponents: TObject;
```

C++

```
__fastcall TObject * GetSubComponents();
```

Description

This is GetSubComponents, a member of class TDataSetButton.

99.1.13.3.5 TDataSetButton.ImplAddElements Method

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); virtual;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

This is ImplAddElements, a member of class TDataSetButton.

99.1.13.3.6 TDataSetButton.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the button control. TWebButton introduces ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

See Also

Content (see page 16868)

ILayoutWebContent (see page 24774)

99.1.13.4 TDataSetButton Properties

The properties of the TDataSetButton class are listed here.

Published Properties

	Name	Description
	Caption (see page 16584)	Specifies the caption that appears on the button.
	Custom (see page 16584)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 16584)	Adds style attributes to the generated button control.
	StyleRule (see page 16585)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 16585)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 16586)	Specifies whether the button is associated with its parent's display object.

99.1.13.4.1 TDataSetButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom (see page 16871)

99.1.13.4.2 TDataSetButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption (see page 16870)

Style (see page 16871)

99.1.13.4.3 TDataSetButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or

more attribute descriptions such as

`font-family: arial; font-weight: bold; font-size: 10px`

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 16871)

StyleRule (see page 16872)

99.1.13.4.4 TDataSetButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style property.

See Also

Style (see page 16871)

Styles (see page 17127)

StylesFile (see page 17128)

Styles (see page 19830)

StylesFile (see page 19831)

99.1.13.4.5 TDataSetButton.XMLComponent Property

Associates the button with the component that generates the display control it influences.

Pascal

```
property XMLComponent: TComponent;
```

C++

```
__property TComponent * XMLComponent;
```

Description

Set XMLComponent to specify the Web item that generates a display control that the button influences.

Note: Typically, descendants of TXMLDisplayReferenceButton are used by a descendant of TXMLDisplayReferenceGroup, which has its own XMLComponent property. If the button influences this same component, you need not set the XMLComponent property. Instead, setting the XMLUseParent property to true (the default) sets XMLComponent to the value of the parent's XMLComponent property.

See Also

XMLUseParent (see page 17045)

99.1.13.4.6 TDataSetButton.XMLUseParent Property

Specifies whether the button is associated with its parent's display object.

Pascal

```
property XMLUseParent: Boolean;
```

C++

```
__property Boolean XMLUseParent;
```

Description

Use XMLUseParent to indicate how the dataset button determines the component that it influences. When XMLUseParent is false, the XMLComponent property must be set to indicate the display component. When XMLUseParent is true, the button influences the component specified by its parent's XMLComponent property.

The button's parent is the Web item that uses the button to assemble its own HTML content (typically a TDataNavigator or TQueryButtons object). If the parent does not have an associated display component, setting XMLUseParent to true sets the XMLComponent property to nil (Delphi) or NULL (C++).

See Also

XMLComponent (see page 17045)

XMLComponent (see page 17051)

99.1.14 TDeleteButton Class

TDeleteButton generates an HTML control that deletes a record from an XML data packet.

Class Hierarchy

Pascal

```
TDeleteButton = class(TDataSetButton);
```

C++

```
class TDeleteButton : public TDataSetButton;
```

File

MidItems

Description

Add TDeleteButton as the child of a TDataNavigator (see page 16569) component (or a layout group that is a child of a TDataNavigator (see page 16569) component) to enable the generated HTML form to delete records. The resulting HTML button's action adds the record deletion to the emerging delta packet, which can then be submitted using an apply updates

button.

Use the properties of TDeleteButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the delete button can delete.

See Also

TXMLBroker (see page 26049)

TDataNavigator (see page 16569)

TLayoutGroup (see page 16687)

TApplyUpdatesButton (see page 16480)

99.1.14.1 TDeleteButton Members

The following tables list the members exposed by TDeleteButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16581)	This is DefaultCaption, a member of class TDataSetButton.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	XMLMethodName (see page 16581)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16582)	This is AddElements, a member of class TDataSetButton.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16582)	Returns the value of the Caption property.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDisplayComponent (see page 17043)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 17043)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 16582)	This is GetMethodName, a member of class TDataSetButton.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16582)	This is GetSubComponents, a member of class TDataSetButton.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 17043)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 16583)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 16583)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17044)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayComponent (see page 17044)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 17044)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.
R	XMLDisplay (see page 17045)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.

	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16591)	Creates and initializes an instance of TDeleteButton (see page 16586).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 17042)	Frees an instance of TXMLDisplayReferenceButton (see page 17037).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLComponent (see page 17045)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 17045)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 16584)	Specifies the caption that appears on the button.
	Custom (see page 16584)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16584)	Adds style attributes to the generated button control.
	StyleRule (see page 16585)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16585)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 16586)	Specifies whether the button is associated with its parent's display object.

99.1.14.2 TDeleteButton.Create Constructor

Creates and initializes an instance of TDeleteButton (see page 16586).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDeleteButton(TComponent * AOwner);
```

Description

Call Create to instantiate TDeleteButton (see page 16586) at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.15 TFieldGroup Class

TFieldGroup arranges database information on an HTML form as a set of labeled fields.

Class Hierarchy

Pascal

```
TFieldGroup = class(TCustomFieldGroup);
```

C++

```
class TFieldGroup : public TCustomFieldGroup;
```

File

MidItems

Description

Add TFieldGroup to a data form component (TDataForm (see page 16554)) or a layout group (TLayoutGroup (see page 16687)) that is a child for a data form. TFieldGroup generates the HTML to display information from an XML data packet in labeled fields.

TFieldGroup maintains a list of Web items that generate the individual display fields. These Web items are restricted to the

following classes: TFieldText (see page 16631), TFieldTextArea (see page 16640), TFieldSelectOptions (see page 16612), TFieldRadioGroup (see page 16599), and TFieldStatus (see page 16624). You can bind the field group to an XML data packet or dataset field within an XML data packet. The Web items can then use that binding to determine the source of the data they display.

You can also use the properties of TFieldGroup to affect the overall appearance of the set of fields.

See Also

TDataForm (see page 16554)

TLayoutGroup (see page 16687)

TFieldRadioGroup (see page 16599)

TFieldStatus (see page 16624)

TFieldSelectOptions (see page 16612)

TFieldText (see page 16631)

TFieldTextArea (see page 16640)

Using the Web Page Editor

99.1.15.1 TFieldGroup Members

The following tables list the members exposed by TFieldGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 17025)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindField (see page 17026)	This is FindField, a member of class TXMLDisplayGroup.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.

	GetDataSet (see page 17026)	Returns the value of the DataSet property.
	GetDataSetField (see page 17026)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetEnableValidateFields (see page 17026)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 17027)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsMultipleRecordView (see page 17027)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 16526)	Returns an object that specifies how the generated group of controls should look.
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 17027)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	GetXMLBroker (see page 17027)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 17028)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 17028)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 17028)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 17028)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 16597)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 16597)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 16526)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
V	ImplGetSubComponents (see page 17029)	Provides the underlying implementation for the GetSubComponents method.
V	ImplIsMultipleRecordView (see page 17029)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsFieldInUse (see page 17030)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17030)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDataSetField (see page 17030)	This is SetDataSetField, a member of class TXMLDisplayGroup.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEnableValidateFields (see page 17031)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	SetXMLBroker (see page 17031)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateDataSet (see page 17031)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 17031)	This is ValidateFields, a member of class TXMLDisplayGroup.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
V	XMLDataChange (see page 17031)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
	EnableValidateFields (see page 17032)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.
R	XMLDataSet (see page 17033)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.

	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 16525)	Creates and initializes an instance of TCustomFieldGroup (see page 16519).
	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
	Create (see page 17024)	Creates and initializes an instance of TXMLDisplayGroup (see page 17019).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16525)	Frees an instance of TCustomFieldGroup (see page 16519).
	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).
	Destroy (see page 17024)	Frees an instance of TXMLDisplayGroup (see page 17019).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDataSet (see page 17054)	Returns the value of the DataSet (see page 17055) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnableValidateFields (see page 17078)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 17060)	This is GetFieldsList, a member of class IDataSetFields.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsMultipleRecordView (see page 17079)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 17082)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVisibleFields (see page 17060)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 17054)	Returns the value of the XMLBroker (see page 17056) property.
	GetXMLDataSet (see page 17055)	Returns the value of the XMLDataSet (see page 17056) property.
	GetXMLDisplayName (see page 17083)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 17083)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.

	HasStatusField (see page 17060)	This is HasStatusField, a member of class IDataSetFields.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsFieldInUse (see page 17060)	This is IsFieldInUse, a member of class IDataSetFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEnableValidateFields (see page 17078)	This is SetEnableValidateFields, a member of class IValidateFields.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateDataSet (see page 17060)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateFields (see page 17078)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 17055)	Provides access to an interface for working with the associated dataset.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EnableValidateFields (see page 17078)	This is EnableValidateFields, a member of class IValidateFields.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsMultipleRecordView (see page 17080)	
R	IsMultipleRecordView (see page 17083)	
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleFields (see page 17061)	This is VisibleFields, a member of class IDataSetFields.
R	VisibleFields (see page 17032)	Indicates the controls displayed by the HTML that the XML display group generates.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.
R	XMLBroker (see page 17056)	Indicates the XML broker that fetches the data packets to which the Web item is bound.

R	XMLDataSet (see page 17056)	Indicates the TXMLDataSet (see page 17006) object that represents the dataset to which the Web item is bound.
R	XMLDisplayName (see page 17084)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 17084)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	Custom (see page 16598)	Represents a tag option and its value in the generated TABLE tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16598)	Adds style attributes to the generated set of fields.
	StyleRule (see page 16599)	Applies a style in the page producer's style sheet to the table.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLBroker (see page 17033)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSetField (see page 17033)	Binds the XML display group to a nested dataset from the XML data packet.

99.1.15.2 TFieldGroup Methods

The methods of the TFieldGroup class are listed here.

Protected Methods

	Name	Description
V	ImplAddElements (see page 16597)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 16597)	Provides the underlying implementation for the CanAddClass method.

99.1.15.2.1 TFieldGroup.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup, ImplAddElements does nothing. TWebControlGroup descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 16878)

99.1.15.2.2 TFieldGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 16878)

WebFieldControls (see page 16884)

99.1.15.3 TFieldGroup Properties

The properties of the TFieldGroup class are listed here.

Published Properties

	Name	Description
	Custom (see page 16598)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 16598)	Adds style attributes to the generated set of fields.
	StyleRule (see page 16599)	Applies a style in the page producer's style sheet to the table.

99.1.15.3.1 TFieldGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TCustomFieldGroup generates an HTML table to manage the layout of the HTML controls that its Web items generate. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to surround the set of fields with a border and give them a blue background, set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 16527)

StyleRule (see page 16528)

99.1.15.3.2 TFieldGroup.Style Property

Adds style attributes to the generated set of fields.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

TCustomFieldGroup generates an HTML table to lay out the fields that its Web items generate. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 16527)

StyleRule (see page 16528)

99.1.15.3.3 TFieldGroup.StyleRule Property

Applies a style in the page producer's style sheet to the table.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated set of fields. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

See Also

Style (see page 16527)

Styles (see page 17127)

StylesFile (see page 17128)

99.1.16 TFieldRadioGroup Class

TFieldRadioGroup creates an HTML radio group control to represent a field in an XML data packet.

Class Hierarchy

Pascal

```
TFieldRadioGroup = class(TWebRadioGroupInput);
```

C++

```
class TFieldRadioGroup : public TWebRadioGroupInput;
```

File

MidItems

Description

Add TFieldRadioGroup as the child of a TFieldGroup (see page 16591) component to add a radio group control that represents a field from the field group's associated dataset.

Use the properties and methods of TFieldRadioGroup to

Specify the field whose value the radio group displays.

Specify the possible values for the field from which the user can choose.

Specify a caption that describes the field.

Customize the appearance of the radio group.

Fit the radio group into the tab order of the generated HTML form.

See Also

TFieldGroup (see page 16591)

TXMLDisplayGroup (see page 17019)

TXMLDisplayGroup (see page 17019)

99.1.16.1 TFieldRadioGroup Members

The following tables list the members exposed by TFieldRadioGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16953)	This is AddAttributes, a member of class TWebRadioGroupInput.
	AddElements (see page 16941)	This is AddElements, a member of class TWebListInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16942)	This is ControlContent, a member of class TWebListInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	EventContent (see page 16953)	This is EventContent, a member of class TWebRadioGroupInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
A	FormatInputs (see page 16942)	This is FormatInputs, a member of class TWebListInput.
V	FormatInputs (see page 16953)	This is FormatInputs, a member of class TWebRadioGroupInput.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
V	GetCheckIndex (see page 16954)	This is GetCheckIndex, a member of class TWebRadioGroupInput.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetSubComponents (see page 16942)	This is GetSubComponents, a member of class TWebListInput.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplAddElements (see page 16942)	This is ImplAddElements, a member of class TWebListInput.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.

V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplGetRowSetFieldAttributes (see page 16954)	This is ImplGetRowSetFieldAttributes, a member of class TWebRadioGroupInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16943)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16954)	This is RestoreFieldDefaults, a member of class TWebRadioGroupInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 16943)	This is SetDataSet, a member of class TWebListInput.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItems (see page 16943)	This is SetItems, a member of class TWebListInput.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetValues (see page 16944)	This is SetValues, a member of class TWebListInput.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.

	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
V	Create (see page 16940)	Creates and initializes an instance of TWebListInput (see page 16935).
V	Create (see page 16952)	Creates and initializes an instance of TWebRadioGroupInput (see page 16947).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 16941)	Frees an instance of TWebListInput (see page 16935).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.

	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.

R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16606)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16606)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16606)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16607)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 16607)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayColumns (see page 16608)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 16608)	Specifies the width of the radio group, in characters.
	FieldName (see page 16608)	Specifies the name of the field whose value the generated control represents.
	Items (see page 16609)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 16609)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ReadOnly (see page 16610)	Indicates whether end users can use the generated control to set values.
	Style (see page 16610)	Adds style attributes to the generated display control.
	StyleRule (see page 16611)	This is StyleRule, a member of class TFieldRadioGroup.
	TabIndex (see page 16611)	Determines the position of the generated control in the HTML form's tab order.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Values (see page 16611)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 16612)	Indicates which field in DataSet supplies the possible values for the generated control.

99.1.16.2 TFieldRadioGroup Properties

The properties of the TFieldRadioGroup class are listed here.

Published Properties

	Name	Description
	Caption (see page 16606)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16606)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16606)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16607)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 16607)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayColumns (see page 16608)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 16608)	Specifies the width of the radio group, in characters.
	FieldName (see page 16608)	Specifies the name of the field whose value the generated control represents.
	Items (see page 16609)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 16609)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ReadOnly (see page 16610)	Indicates whether end users can use the generated control to set values.
	Style (see page 16610)	Adds style attributes to the generated display control.
	StyleRule (see page 16611)	This is StyleRule, a member of class TFieldRadioGroup.
	TabIndex (see page 16611)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 16611)	Lists the possible values that can be assigned to the control.

	ValuesField (see page 16612)	Indicates which field in DataSet supplies the possible values for the generated control.

99.1.16.2.1 TFieldRadioGroup.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.16.2.2 TFieldRadioGroup.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.16.2.3 TFieldRadioGroup.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 16897)

Caption (see page 16897)

99.1.16.2.4 TFieldRadioGroup.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.16.2.5 TFieldRadioGroup.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 16945)

ValuesField (see page 16946)

Items (see page 16945)

Values (see page 16946)

99.1.16.2.6 TFieldRadioGroup.DisplayColumns Property

Specifies the number of radio buttons that appear in each row of the control.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to specify how many radio buttons can appear in a single line of the radio group. If DisplayColumns is less than the number of items, the radio group displays its buttons in multiple rows.

See Also

ItemsField (see page 16945)

Items (see page 16945)

DisplayWidth (see page 16955)

99.1.16.2.7 TFieldRadioGroup.DisplayWidth Property

Specifies the width of the radio group, in characters.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to limit the width of the generated control. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. DisplayWidth is added as a WIDTH option.

See Also

DisplayColumns (see page 16954)

Custom (see page 16898)

99.1.16.2.8 TFieldRadioGroup.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

xmlbroker (see page 17033)

XMLDataSetField (see page 17033)

ParamName (see page 16910)

Setting Web Item Properties

99.1.16.2.9 TFieldRadioGroup.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.16.2.10 TFieldRadioGroup.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property AnsiString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is

assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.16.2.11 TFieldRadioGroup.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the radio group. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. ReadOnly is added as a READONLY option.

See Also

DisplayWidth (see page 16955)

Custom (see page 16898)

99.1.16.2.12 TFieldRadioGroup.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.16.2.13 TFieldRadioGroup.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TFieldRadioGroup.

99.1.16.2.14 TFieldRadioGroup.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

99.1.16.2.15 TFieldRadioGroup.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 16945)

ItemsField (see page 16945)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.16.2.16 TFieldRadioGroup.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property AnsiString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ItemsField (see page 16945)

99.1.17 TFieldSelectOptions Class

TFieldSelectOptions creates an HTML list control to represent a field in an XML data packet.

Class Hierarchy

Pascal

```
TFieldSelectOptions = class(TWebSelectOptionsInput);
```

C++

```
class TFieldSelectOptions : public TWebSelectOptionsInput;
```

File

MidItems

Description

Add TFieldSelectOptions as the child of a TFieldGroup (see page 16591) component to add a list control that represents a field from the field group's associated dataset.

Use the properties and methods of TFieldSelectOptions to

Specify the field whose value the list box displays.

Specify the possible values for the field from which the user can choose.

Specify a caption that describes the field.

Customize the appearance of the list box.

Fit the list box into the tab order of the generated HTML form.

See Also

TFieldGroup (see page 16591)

TXMLDisplayGroup (see page 17019)

TXMLDisplayGroup (see page 17019)

99.1.17.1 TFieldSelectOptions Members

The following tables list the members exposed by TFieldSelectOptions.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16962)	This is AddAttributes, a member of class TWebSelectOptionsInput.
	AddElements (see page 16941)	This is AddElements, a member of class TWebListInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16942)	This is ControlContent, a member of class TWebListInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	EventContent (see page 16962)	This is EventContent, a member of class TWebSelectOptionsInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
A	FormatInputs (see page 16942)	This is FormatInputs, a member of class TWebListInput.
V	FormatInputs (see page 16962)	This is FormatInputs, a member of class TWebSelectOptionsInput.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.

	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
V	GetSelectIndex (see page 16962)	This is GetSelectIndex, a member of class TWebSelectOptionsInput.
	GetSubComponents (see page 16942)	This is GetSubComponents, a member of class TWebListInput.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplAddElements (see page 16942)	This is ImplAddElements, a member of class TWebListInput.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16943)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 16943)	This is SetDataSet, a member of class TWebListInput.

	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItems (see page 16943)	This is SetItems, a member of class TWebListInput.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetValues (see page 16944)	This is SetValues, a member of class TWebListInput.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
V	Create (see page 16940)	Creates and initializes an instance of TWebListInput (see page 16935).

	Create (see page 16961)	Creates and initializes an instance of TWebSelectOptionsInput (see page 16956).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
	Destroy (see page 16941)	Frees an instance of TWebListInput (see page 16935).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16618)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16618)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16619)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16619)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 16620)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 16620)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 16621)	Specifies the name of the field whose value the generated control represents.
	Items (see page 16621)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 16621)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16622)	Adds style attributes to the generated display control.
	StyleRule (see page 16622)	This is StyleRule, a member of class TFieldSelectOptions.
	TabIndex (see page 16623)	Determines the position of the generated control in the HTML form's tab order.
	Tag (see page 2808)	Stores an integer value as part of a component.

	Values (see page 16623)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 16623)	Indicates which field in DataSet supplies the possible values for the generated control.

99.1.17.2 TFieldSelectOptions Properties

The properties of the TFieldSelectOptions class are listed here.

Published Properties

	Name	Description
	Caption (see page 16618)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16618)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16619)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16619)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 16620)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 16620)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 16621)	Specifies the name of the field whose value the generated control represents.
	Items (see page 16621)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 16621)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Style (see page 16622)	Adds style attributes to the generated display control.
	StyleRule (see page 16622)	This is StyleRule, a member of class TFieldSelectOptions.
	TabIndex (see page 16623)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 16623)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 16623)	Indicates which field in DataSet supplies the possible values for the generated control.

99.1.17.2.1 TFieldSelectOptions.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.17.2.2 TFieldSelectOptions.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.17.2.3 TFieldSelectOptions.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 16897)

Caption (see page 16897)

99.1.17.2.4 TFieldSelectOptions.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.17.2.5 TFieldSelectOptions.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 16945)

ValuesField (see page 16946)

Items (see page 16945)

Values (see page 16946)

99.1.17.2.6 TFieldSelectOptions.DisplayRows Property

Specifies the number of rows that appear in the generated list box.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify how many rows appear in the generated list control. If DisplayRows is less than the number of items, the generated list displays only DisplayRows options at one time, but can scroll to display the hidden items. If DisplayRows is 1, the generated control becomes a drop-down list box.

See Also

ItemsField (see page 16945)

Items (see page 16945)

99.1.17.2.7 TFieldSelectOptions.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 17033)

XMLDataSetField (see page 17033)

ParamName (see page 16910)

Setting Web Item Properties

99.1.17.2.8 TFieldSelectOptions.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.17.2.9 TFieldSelectOptions.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property AnsiString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.17.2.10 TFieldSelectOptions.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.17.2.11 TFieldSelectOptions.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TFieldSelectOptions.

99.1.17.2.12 TFieldSelectOptions.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

99.1.17.2.13 TFieldSelectOptions.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 16945)

ItemsField (see page 16945)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.17.2.14 TFieldSelectOptions.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property AnsiString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ItemsField (see page 16945)

99.1.18 TFieldStatus Class

TFieldStatus generates an HTML control that indicates whether a record in an XML data packet has been modified by the end user.

Class Hierarchy

Pascal

```
TFieldStatus = class(TWebStatus);
```

C++

```
class TFieldStatus : public TWebStatus;
```

File

MidItems

Description

Add TFieldStatus as the child of a TFieldGroup (see page 16591) component to provide feedback about whether the current record has been modified. The generated control displays an M if the user has edited the record, an I if the user has inserted the record, and blank if the user has made no changes to the record.

Use the properties and methods of TFieldStatus to

Specify a caption that labels the status control.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

TFieldGroup (see page 16591)

TXMLDisplayGroup (see page 17019)

TXMLDisplayGroup (see page 17019)

99.1.18.1 TFieldStatus Members

The following tables list the members exposed by TFieldStatus.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16969)	This is ControlContent, a member of class TWebStatus.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16969)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.

V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 16969)	Returns the name that other components can use to refer to the generated display control.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
V	Create (see page 16968)	Creates and initializes an instance of TWebStatus (see page 16963).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	Identifier (see page 16969)	Returns the name under which record status information is stored in the XML data packet.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayWidth (see page 16971)	Specifies the width, in characters, of the generated HTML control.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16629)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16629)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16630)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16630)	Represents a tag option and its value in the tag for the display control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16630)	Adds style attributes to the generated display control.
	StyleRule (see page 16631)	This is StyleRule, a member of class TFieldStatus.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.18.2 TFieldStatus Properties

The properties of the TFieldStatus class are listed here.

Published Properties

	Name	Description
	Caption (see page 16629)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16629)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16630)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16630)	Represents a tag option and its value in the tag for the display control.
	Style (see page 16630)	Adds style attributes to the generated display control.
	StyleRule (see page 16631)	This is StyleRule, a member of class TFieldStatus.

99.1.18.2.1 TFieldStatus.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.18.2.2 TFieldStatus.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.18.2.3 TFieldStatus.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 16897)

Caption (see page 16897)

99.1.18.2.4 TFieldStatus.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.18.2.5 TFieldStatus.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.18.2.6 TFieldStatus.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TFieldStatus.

99.1.19 TFieldText Class

TFieldText creates a single-line HTML input control to represent a field in an XML data packet.

Class Hierarchy

Pascal

```
TFieldText = class(TWebTextInput);
```

C++

```
class TFieldText : public TWebTextInput;
```

File

MidItems

Description

Add TFieldText as the child of a TFieldGroup (see page 16591) component to add a single-line edit control that represents a field from the field group's associated dataset.

Use the properties and methods of TFieldText to

Specify the field whose value the control displays.

Specify a caption that describes the field.

Customize the appearance of the edit control.

Fit the control into the tab order of the generated HTML form.

See Also

TFieldGroup (see page 16591)

TXMLDisplayGroup (see page 17019)

TXMLDisplayGroup (see page 17019)

99.1.19.1 TFieldText Members

The following tables list the members exposed by TFieldText.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16986)	This is AddAttributes, a member of class TWebTextInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16987)	This is ControlContent, a member of class TWebTextInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.

	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplGetRowSetFieldAttributes (see page 16987)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16987)	This is RestoreFieldDefaults, a member of class TWebTextInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
V	Create (see page 16986)	Creates and initializes an instance of TWebTextInput (see page 16980).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.

	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16637)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16637)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16637)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16638)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 16638)	Specifies the horizontal size of the generated control.
	FieldName (see page 16639)	Specifies the name of the field whose value the generated control represents.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ReadOnly (see page 16639)	Indicates whether end users can use the generated control to set values.
	Style (see page 16639)	Adds style attributes to the generated display control.
	StyleRule (see page 16640)	This is StyleRule, a member of class TFieldText.
	TabIndex (see page 16640)	Determines the position of the generated control in the HTML form's tab order.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.19.2 TFieldText Properties

The properties of the TFieldText class are listed here.

Published Properties

	Name	Description
	Caption (see page 16637)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16637)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16637)	Specifies where the label appears relative to the generated display control.

	Custom (see page 16638)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 16638)	Specifies the horizontal size of the generated control.
	FieldName (see page 16639)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 16639)	Indicates whether end users can use the generated control to set values.
	Style (see page 16639)	Adds style attributes to the generated display control.
	StyleRule (see page 16640)	This is StyleRule, a member of class TFieldText.
	TabIndex (see page 16640)	Determines the position of the generated control in the HTML form's tab order.

99.1.19.2.1 TFieldText.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.19.2.2 TFieldText.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.19.2.3 TFieldText.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 16897)

Caption (see page 16897)

99.1.19.2.4 TFieldText.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.19.2.5 TFieldText.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in the control.

Note: DisplayWidth controls the size of the generated control, not the size of the text that users can enter. If the user enters a string longer than DisplayWidth characters, the text scrolls in the control.

99.1.19.2.6 TFieldText.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 17033)

XMLDataSetField (see page 17033)

ParamName (see page 16910)

Setting Web Item Properties

99.1.19.2.7 TFieldText.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control.

99.1.19.2.8 TFieldText.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute

descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.19.2.9 TFieldText.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TFieldText.

99.1.19.2.10 TFieldText.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

99.1.20 TFieldTextArea Class

TFieldTextArea creates a multi-line HTML input control to represent a field in an XML data packet.

Class Hierarchy

Pascal

```
TFieldTextArea = class(TWebTextAreaInput);
```

C++

```
class TFieldTextArea : public TWebTextAreaInput;
```

File

MidItems

Description

Add TFieldTextArea as the child of a TFieldGroup (see page 16591) component to add a multi-line edit control that represents a field from the field group's associated dataset.

Use the properties and methods of TFieldTextArea to

Specify the field whose value the control displays.

Specify a caption that describes the field.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

IWebContent (see page 24792)

TDataGrid (see page 16560)

TFieldGroup (see page 16591)

TQueryFieldGroup (see page 16736)

TQueryTextArea (see page 16795)

TTextAreaColumn (see page 16838)

99.1.20.1 TFieldTextArea Members

The following tables list the members exposed by TFieldTextArea.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16977)	This is AddAttributes, a member of class TWebTextAreaInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16978)	This is ControlContent, a member of class TWebTextAreaInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	EventContent (see page 16978)	This is EventContent, a member of class TWebTextAreaInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.

V	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplGetRowSetFieldAttributes (see page 16978)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16978)	This is RestoreFieldDefaults, a member of class TWebTextAreaInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
V	Create (see page 16977)	Creates and initializes an instance of TWebTextAreaInput (see page 16971).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.

V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16646)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16647)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16647)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16647)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 16648)	Specifies the height of the generated control.
	DisplayWidth (see page 16648)	Specifies the horizontal size of the generated control.
	FieldName (see page 16649)	Specifies the name of the field whose value the generated control represents.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ReadOnly (see page 16649)	Indicates whether end users can use the generated control to set values.
	Style (see page 16649)	Adds style attributes to the generated display control.
	StyleRule (see page 16650)	This is StyleRule, a member of class TFieldTextArea.
	TabIndex (see page 16650)	Determines the position of the generated control in the HTML form's tab order.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Wrap (see page 16650)	Specifies how the generated control treats lines that are longer than the display width.

99.1.20.2 TFieldTextArea Properties

The properties of the TFieldTextArea class are listed here.

Published Properties

	Name	Description
	Caption (see page 16646)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16647)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16647)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16647)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 16648)	Specifies the height of the generated control.
	DisplayWidth (see page 16648)	Specifies the horizontal size of the generated control.
	FieldName (see page 16649)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 16649)	Indicates whether end users can use the generated control to set values.
	Style (see page 16649)	Adds style attributes to the generated display control.
	StyleRule (see page 16650)	This is StyleRule, a member of class TFieldTextArea.
	TabIndex (see page 16650)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 16650)	Specifies how the generated control treats lines that are longer than the display width.

99.1.20.2.1 TFieldTextArea.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.20.2.2 TFieldTextArea.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.20.2.3 TFieldTextArea.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 16897)

Caption (see page 16897)

99.1.20.2.4 TFieldTextArea.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.20.2.5 TFieldTextArea.DisplayRows Property

Specifies the height of the generated control.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to indicate the desired height of the generated HTML control. DisplayRows specifies the number of lines of text that can be displayed in the control. This value is assigned to the ROWS option of the generated TEXTAREA tag.

See Also

DisplayWidth (see page 16979)

99.1.20.2.6 TFieldTextArea.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in one line of the control. This value is assigned to the COLS option of the generated TEXTAREA tag.

See Also

DisplayRows (see page 16979)

99.1.20.2.7 TFieldTextArea.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 17033)

XMLDataSetField (see page 17033)

ParamName (see page 16910)

Setting Web Item Properties

99.1.20.2.8 TFieldTextArea.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control. This value determines whether there is a READONLY option added to the generated TEXTAREA tag.

99.1.20.2.9 TFieldTextArea.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.20.2.10 TFieldTextArea.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TFieldTextArea.

99.1.20.2.11 TFieldTextArea.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

99.1.20.2.12 TFieldTextArea.Wrap Property

Specifies how the generated control treats lines that are longer than the display width.

Pascal

```
property Wrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap Wrap;
```

Description

Use Wrap to specify how the generated control formats lines that are longer than the number of characters specified by DisplayWidth. TWebTextAreaInput uses Wrap to add a WRAP option to the generated TEXTAREA tag.

Wrap can have any of the following values:

Value	WRAP option value	Meaning
wrOff	OFF	The control does not wrap long lines. Only newline characters that are part of the text string cause the lines in the control to wrap.
wrPhysical	PHYSICAL	The control formats its text value by wrapping long lines so that no text is hidden. The control inserts carriage returns into the text string.
wrVirtual	VIRTUAL	The control formats its text value by wrapping long lines so that no text is hidden but does not change the actual value of the text string.

See Also

DisplayWidth (see page 16979)

99.1.21 TFirstButton Class

TFirstButton generates an HTML control that moves to the first record in an XML data packet.

Class Hierarchy

Pascal

```
TFirstButton = class(TDataSetButton);
```

C++

```
class TFirstButton : public TDataSetButton;
```

File

MidItems

Description

Add TFirstButton as the child of a TDataNavigator (see page 16569) component (or a layout group that is a child of a TDataNavigator (see page 16569) component) to enable the generated HTML form to move quickly to the first record in a dataset. The resulting HTML button's action changes the associated display control so that it shows the first record as current.

Use the properties of TFirstButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the first button navigates.

See Also

TXMLBroker (see page 26049)

TDataNavigator (see page 16569)

TLayoutGroup (see page 16687)

99.1.21.1 TFirstButton Members

The following tables list the members exposed by TFirstButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16581)	This is DefaultCaption, a member of class TDataSetButton.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	XMLMethodName (see page 16581)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16582)	This is AddElements, a member of class TDataSetButton.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16582)	Returns the value of the Caption property.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDisplayComponent (see page 17043)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 17043)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 16582)	This is GetMethodName, a member of class TDataSetButton.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16582)	This is GetSubComponents, a member of class TDataSetButton.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 17043)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 16583)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 16583)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17044)	Forwards notification messages to all owned components.

	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayComponent (see page 17044)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 17044)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.
R	XMLDisplay (see page 17045)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16655)	Creates and initializes an instance of TFirstButton (see page 16651).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 17042)	Frees an instance of TXMLDisplayReferenceButton (see page 17037).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.

	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLComponent (see page 17045)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 17045)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 16584)	Specifies the caption that appears on the button.
	Custom (see page 16584)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16584)	Adds style attributes to the generated button control.
	StyleRule (see page 16585)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16585)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 16586)	Specifies whether the button is associated with its parent's display object.

99.1.21.2 TFirstButton.Create Constructor

Creates and initializes an instance of TFirstButton (see page 16651).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TFirstButton(TComponent * AOwner);
```

Description

Call Create to instantiate TFirstButton (see page 16651) at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.22 TFormLayout Class

TFormLayout lets child Web items adhere to layout rules imposed by their parent.

Class Hierarchy

Pascal

```
TFormLayout = class(TLayoutWebContent);
```

C++

```
class TFormLayout : public TLayoutWebContent;
```

File

MidItems

Description

TFormLayout is the default implementation of the ILayoutWebContent interface for InternetExpress applications. The Web items that belong to an InetXPageProducer object pass a TFormLayout instance to their child Web items as the ParentLayout parameter of their Content method. This object provides helper functions that the child items use to fit their generated content into the parent object's HTML structure.

Use the TFormLayout properties to configure how the ILayoutWebContent methods convert HTML that child Web items generate into a final form.

See Also

TLayout

IWebContent (see page 24792)

ILayoutWebContent (see page 24774)

TInetXPageProducer (see page 17145)

99.1.22.1 TFormLayout Members

The following tables list the members exposed by TFormLayout.

Protected Methods

	Name	Description
	_AddRef (see page 24700)	Responds when the caller acquires a reference to this object's interface.
	_Release (see page 24701)	Responds when the caller releases a reference to this object's interface.
	EndButtons (see page 16659)	This is EndButtons, a member of class TFormLayout.
	EndFields (see page 16659)	This is EndFields, a member of class TFormLayout.
	EndRow (see page 16659)	This is EndRow, a member of class TFormLayout.
	EndTable (see page 16660)	This is EndTable, a member of class TFormLayout.
V	ImplLayoutButton (see page 16660)	Provides the underlying implementation for the LayoutButton method.
V	ImplLayoutField (see page 16660)	Provides the underlying implementation for the LayoutField method.
V	ImplLayoutLabelAndField (see page 16661)	Provides the underlying implementation for the LayoutLabelAndField method.
V	ImplLayoutTable (see page 16661)	Provides the underlying implementation for the LayoutTable method.

	LayoutButton (see page 24703)	Converts the HTML declaring a button into a form the associated Web item can use.
	LayoutField (see page 24704)	Converts the HTML declaring a field into a form the associated Web item can use.
	LayoutLabelAndField (see page 24704)	Converts the HTML declaring a labeled field into a form the associated Web item can use.
	LayoutTable (see page 24705)	This is LayoutTable, a member of class TLayoutWebContent.
	NextColumn (see page 16662)	This is NextColumn, a member of class TFormLayout.
V	QueryInterface (see page 24705)	Returns a reference to a specified interface if the object supports that interface.
	StartButtons (see page 16662)	This is StartButtons, a member of class TFormLayout.
	StartFields (see page 16662)	This is StartFields, a member of class TFormLayout.
	StartRow (see page 16662)	This is StartRow, a member of class TFormLayout.
	StartTable (see page 16663)	This is StartTable, a member of class TFormLayout.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 16658)	Creates a new TFormLayout (see page 16656) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndLayout (see page 16659)	Returns the string of HTML to insert after laying out all child items.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	LayoutButton (see page 24775)	This is LayoutButton, a member of class ILayoutWebContent.
	LayoutField (see page 24775)	This is LayoutField, a member of class ILayoutWebContent.
	LayoutLabelAndField (see page 24775)	Converts the HTML declaring a labeled field into a form the Web item's parent can use.
	LayoutTable (see page 24776)	This is LayoutTable, a member of class ILayoutWebContent.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	BreakButtons (see page 16663)	Indicates whether the associated Web item uses a grid to lay out buttons that child Web items generate.

	ColumnCount (see page 16663)	Indicates the number of child elements appear in a single row when the associated Web item uses a grid to lay them out.
R	ParentLayout (see page 24706)	Provides access to the layout object of the Web item that is the parent of the Web item to which this object belongs.
	TableHeader (see page 16664)	Specifies the HTML to generate at the beginning of a table that lays out child elements.

99.1.22.2 TFormLayout.Create Constructor

Creates a new TFormLayout (see page 16656) object.

Pascal

```
constructor Create(AParentLayout: TLayout);
```

C++

```
__fastcall TFormLayout(TLayout AParentLayout);
```

Description

Call Create to instantiate a TFormLayout (see page 16656) object to use when fetching the content produced by child Web items.

AParentLayout is the layout object of the parent Web item (the grandparent of the child Web items that call this object's methods). AParentLayout becomes the value of the ParentLayout property.

See Also

ParentLayout (see page 24706)

99.1.22.3 TFormLayout Methods

The methods of the TFormLayout class are listed here.

Protected Methods

	Name	Description
	EndButtons (see page 16659)	This is EndButtons, a member of class TFormLayout.
	EndFields (see page 16659)	This is EndFields, a member of class TFormLayout.
	EndRow (see page 16659)	This is EndRow, a member of class TFormLayout.
	EndTable (see page 16660)	This is EndTable, a member of class TFormLayout.
V	ImplLayoutButton (see page 16660)	Provides the underlying implementation for the LayoutButton method.
V	ImplLayoutField (see page 16660)	Provides the underlying implementation for the LayoutField method.
V	ImplLayoutLabelAndField (see page 16661)	Provides the underlying implementation for the LayoutLabelAndField method.
V	ImplLayoutTable (see page 16661)	Provides the underlying implementation for the LayoutTable method.
	NextColumn (see page 16662)	This is NextColumn, a member of class TFormLayout.
	StartButtons (see page 16662)	This is StartButtons, a member of class TFormLayout.
	StartFields (see page 16662)	This is StartFields, a member of class TFormLayout.
	StartRow (see page 16662)	This is StartRow, a member of class TFormLayout.
	StartTable (see page 16663)	This is StartTable, a member of class TFormLayout.

Public Methods

	Name	Description
	EndLayout (see page 16659)	Returns the string of HTML to insert after laying out all child items.

99.1.22.3.1 TFormLayout.EndButtons Method

Pascal

```
function EndButtons: string;
```

C++

```
__fastcall AnsiString EndButtons();
```

Description

This is EndButtons, a member of class TFormLayout.

99.1.22.3.2 TFormLayout.EndFields Method

Pascal

```
function EndFields: string;
```

C++

```
__fastcall AnsiString EndFields();
```

Description

This is EndFields, a member of class TFormLayout.

99.1.22.3.3 TFormLayout.EndLayout Method

Returns the string of HTML to insert after laying out all child items.

Pascal

```
function EndLayout: string;
```

C++

```
__fastcall AnsiString EndLayout();
```

Description

EndLayout generates the tags that must be inserted after all the content that child Web items generate. TFormLayout (see page 16656) keeps track of the ILayoutWebContent method calls that are made so that it can know what tags need to be closed.

See Also

ILayoutWebContent (see page 24774)

99.1.22.3.4 TFormLayout.EndRow Method

Pascal

```
function EndRow: string;
```

C++

```
__fastcall AnsiString EndRow();
```

Description

This is EndRow, a member of class TFormLayout.

99.1.22.3.5 TFormLayout.EndTable Method

Pascal

```
function EndTable: string;
```

C++

```
__fastcall AnsiString EndTable();
```

Description

This is EndTable, a member of class TFormLayout.

99.1.22.3.6 TFormLayout.ImplLayoutButton Method

Provides the underlying implementation for the LayoutButton method.

Pascal

```
function ImplLayoutButton(const HTMLButton: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall AnsiString ImplLayoutButton(const AnsiString HTMLButton, TLayoutAttributes
Attributes);
```

Description

The LayoutButton method calls ImplLayoutButton to convert the HTML that declares a button (typically an <INPUT> tag) into the form that the associated Web item requires.

HTMLButton is the HTML that declares a button. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the button.

LayoutButton returns the HTML for the button in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutButton is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutButton method.

See Also

LayoutButton (see page 24703)

99.1.22.3.7 TFormLayout.ImplLayoutField Method

Provides the underlying implementation for the LayoutField method.

Pascal

```
function ImplLayoutField(const HTMLField: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall AnsiString ImplLayoutField(const AnsiString HTMLField, TLayoutAttributes
Attributes);
```

Description

The LayoutField method calls ImplLayoutField to convert the HTML that declares a field (an input control that represents a data field or a named value) into the form that the associated Web item requires.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field.

LayoutField returns the HTML for the field in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutField method.

See Also

LayoutField (see page 24704)

99.1.22.3.8 TFormLayout.ImplLayoutLabelAndField Method

Provides the underlying implementation for the LayoutLabelAndField method.

Pascal

```
function ImplLayoutLabelAndField(const HTMLLabel: string; const HTMLField: string; Attributes:
TLayoutAttributes): string; override;
```

C++

```
virtual __fastcall AnsiString ImplLayoutLabelAndField(const AnsiString HTMLLabel, const
AnsiString HTMLField, TLayoutAttributes Attributes);
```

Description

The LayoutLabelAndField method calls ImplLayoutLabelAndField to convert the HTML that declares a labeled field (an input control that represents a data field or a named value along with its label) into the form that the associated Web item requires.

HTMLLabel is the HTML that declares the label. This is produced by the child Web item.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field and its label.

LayoutLabelAndField returns the HTML for the field and label in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutLabelAndField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutLabelAndField method.

See Also

LayoutLabelAndField (see page 24704)

99.1.22.3.9 TFormLayout.ImplLayoutTable Method

Provides the underlying implementation for the LayoutTable method.

Pascal

```
function ImplLayoutTable(const HTMLTable: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall AnsiString ImplLayoutTable(const AnsiString HTMLTable, TLayoutAttributes
Attributes);
```

Description

The LayoutTable method calls ImplLayoutTable to convert the HTML that declares a table (typically a structure used to layout the content produced by the child Web item's children) into the form that the associated Web item requires.

HTMLTable is the HTML that declares the table. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the table.

LayoutTable returns the HTML for the table in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutTable is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutTable method.

See Also

layouttable (see page 24705)

99.1.22.3.10 TFormLayout.NextColumn Method

Pascal

```
function NextColumn(SubItemCount: Integer): string;
```

C++

```
__fastcall AnsiString NextColumn(int SubItemCount);
```

Description

This is NextColumn, a member of class TFormLayout.

99.1.22.3.11 TFormLayout.StartButtons Method

Pascal

```
function StartButtons: string;
```

C++

```
__fastcall AnsiString StartButtons();
```

Description

This is StartButtons, a member of class TFormLayout.

99.1.22.3.12 TFormLayout.StartFields Method

Pascal

```
function StartFields(ColCount: Integer): string;
```

C++

```
__fastcall AnsiString StartFields(int ColCount);
```

Description

This is StartFields, a member of class TFormLayout.

99.1.22.3.13 TFormLayout.StartRow Method

Pascal

```
function StartRow: string;
```

C++

```
__fastcall AnsiString StartRow();
```

Description

This is StartRow, a member of class TFormLayout.

99.1.22.3.14 TFormLayout.StartTable Method

Pascal

```
function StartTable: string;
```

C++

```
__fastcall AnsiString StartTable();
```

Description

This is StartTable, a member of class TFormLayout.

99.1.22.4 TFormLayout Properties

The properties of the TFormLayout class are listed here.

Public Properties

	Name	Description
	BreakButtons (see page 16663)	Indicates whether the associated Web item uses a grid to lay out buttons that child Web items generate.
	ColumnCount (see page 16663)	Indicates the number of child elements appear in a single row when the associated Web item uses a grid to lay them out.
	TableHeader (see page 16664)	Specifies the HTML to generate at the beginning of a table that lays out child elements.

99.1.22.4.1 TFormLayout.BreakButtons Property

Indicates whether the associated Web item uses a grid to lay out buttons that child Web items generate.

Pascal

```
property BreakButtons: Boolean;
```

C++

```
__property Boolean BreakButtons;
```

Description

Set BreakButtons to true if the Web item that supplies this object to its child Web items uses an HTML table to position HTML buttons that those child Web items generate. Set BreakButtons to false if the Web item does not use an HTML table to position child buttons.

BreakButtons affects the whether the LayoutButton method on this object's ILayoutWebContent interface adds <TD> tags to the HTML that child Web items generate for HTML buttons.

See Also

layoutbutton (see page 24775)

99.1.22.4.2 TFormLayout.ColumnCount Property

Indicates the number of child elements appear in a single row when the associated Web item uses a grid to lay them out.

Pascal

```
property ColumnCount: Integer;
```

C++

```
__property int ColumnCount;
```

Description

Set ColumnCount to the number of child elements that appear in a single row when laying out child controls by rows.

ColumnCount affects where the LayoutField or LayoutButton method on this object's ILayoutWebContent interface adds <TR> and </TR> tags to the HTML that child Web items generate.

Note: ColumnCount only affects the LayoutButton method if the value of the BreakButtons (see page 16663) property is true.

See Also

layoutbutton (see page 24775)

layoutfield (see page 24775)

BreakButtons (see page 16663)

99.1.22.4.3 TFormLayout.TableHeader Property

Specifies the HTML to generate at the beginning of a table that lays out child elements.

Pascal

```
property TableHeader: string;
```

C++

```
__property AnsiString TableHeader;
```

Description

Set TableHeader to the HTML tag that appears at the beginning of the HTML table used to control the layout of child elements. TableHeader is a string that includes the <table> tag, along with any attributes (such as alignment) that affect the layout of child items.

See Also

layoutbutton (see page 24775)

layoutfield (see page 24775)

BreakButtons (see page 16663)

99.1.23 TGridAttributes Class

TGridAttributes describes the options the TDataGrid (see page 16560) component adds to an HTML <TABLE> tag.

Class Hierarchy

Pascal

```
TGridAttributes = class(TPersistent);
```

C++

```
class TGridAttributes : public TPersistent;
```

File

MidItems

Description

TGridAttributes implements the TableAttributes property of a TDataGrid (see page 16560) or TAdapterGrid component. It describes display attributes that apply to an HTML table generated by TDataGrid (see page 16560) or TAdapterGrid. The properties of TGridAttributes specify the options added to the generated HTML <TABLE> tag, as well as any styles that should be applied.

See Also

TCustomDataGrid (see page 16499)

TCustomAdapterGrid (see page 25286)

99.1.23.1 TGridAttributes Members

The following tables list the members exposed by TGridAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 16667)	Copies the properties of an object to a destination object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 16666)	Creates an instance of TGridAttributes (see page 16664).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Parent (see page 16670)	Indicates the TDataGrid (see page 16560) object that uses this TGridAttributes (see page 16664) to describe its attributes.

Published Properties

	Name	Description
	Align (see page 16668)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 16668)	Specifies the background color of the HTML table.
	Border (see page 16669)	Specifies the thickness of the border drawn around the HTML table.
	CellPadding (see page 16669)	This is CellPadding, a member of class TGridAttributes.
	CellSpacing (see page 16669)	Specifies the amount of space to leave between cells in the HTML table.
	Custom (see page 16670)	Represents a tag option and its value in an HTML tag.
	Style (see page 16670)	Adds style attributes to the generated table.
	StyleRule (see page 16671)	This is StyleRule, a member of class TGridAttributes.

99.1.23.2 TGridAttributes.Create Constructor

Creates an instance of TGridAttributes (see page 16664).

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TGridAttributes(TComponent * AParent);
```

Description

Most applications have no need to instantiate TGridAttributes (see page 16664). TGridAttributes (see page 16664) is instantiated by the TDataGrid (see page 16560) component that uses it.

The AParent parameter is the TDataGrid (see page 16560) or TAdapterGrid component that uses the TGridAttributes (see page 16664) instance. This parameter becomes the value of the Parent (see page 16670) property.

See Also

Parent (see page 16670)

TDataGrid (see page 16560)

TAdapterGrid (see page 25175)

99.1.23.3 TGridAttributes Methods

The methods of the TGridAttributes class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 16667)	Copies the properties of an object to a destination object.

99.1.23.3.1 TGridAttributes.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign (see page 2930)

EConvertError (see page 22724)

99.1.23.4 TGridAttributes Properties

The properties of the TGridAttributes class are listed here.

Public Properties

	Name	Description
	Parent (see page 16670)	Indicates the TDataGrid (see page 16560) object that uses this TGridAttributes (see page 16664) to describe its attributes.

Published Properties

	Name	Description
	Align (see page 16668)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 16668)	Specifies the background color of the HTML table.
	Border (see page 16669)	Specifies the thickness of the border drawn around the HTML table.
	CellPadding (see page 16669)	This is CellPadding, a member of class TGridAttributes.

	CellSpacing (see page 16669)	Specifies the amount of space to leave between cells in the HTML table.
	Custom (see page 16670)	Represents a tag option and its value in an HTML tag.
	Style (see page 16670)	Adds style attributes to the generated table.
	StyleRule (see page 16671)	This is StyleRule, a member of class TGridAttributes.

99.1.23.4.1 TGridAttributes.Align Property

Specifies the alignment of the table within the HTML document.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Set Align to indicate the desired alignment of the table within the HTML document, or within the cell of a surrounding HTML table in a layout group. Align indicates the desired value of the Align option of the HTML table tag.

The default value of Align is haDefault, which means the web browser that reads the HTML document positions the HTML table where it wants.

See Also

cellpadding (see page 16669)

Border (see page 16669)

99.1.23.4.2 TGridAttributes.BgColor Property

Specifies the background color of the HTML table.

Pascal

```
property BgColor: THTMLBgColor;
```

C++

```
__property THTMLBgColor BgColor;
```

Description

Use BgColor to indicate the desired background color of the HTML table. The value of BgColor is the name of color. This can be one of the following strings:

Aqua	Black	Blue	Fuchsia
Gray	Green	Lime	Maroon
Navy	Olive	Purple	Red
Silver	Teal	White	Yellow

Note: The row or heading attributes can override this background color for a portion of the HTML table.

See Also

BgColor (see page 16675)

99.1.23.4.3 TGridAttributes.Border Property

Specifies the thickness of the border drawn around the HTML table.

Pascal

```
property Border: Integer;
```

C++

```
__property int Border;
```

Description

Set Border to specify whether a border should be drawn around the table, and if so, how thick it should be. The thickness specified by any particular value of border depends on the web browser that views the HTML table. For any browser, however, larger numbers indicate thicker borders. A value of -1 indicates that no border should be drawn around the table.

See Also

CellSpacing (see page 16669)

99.1.23.4.4 TGridAttributes.CellPadding Property

Pascal

```
property CellPadding: Integer;
```

C++

```
__property int CellPadding;
```

Description

This is CellPadding, a member of class TGridAttributes.

99.1.23.4.5 TGridAttributes.CellSpacing Property

Specifies the amount of space to leave between cells in the HTML table.

Pascal

```
property CellSpacing: Integer;
```

C++

```
__property int CellSpacing;
```

Description

Set CellSpacing to specify how many pixels of whitespace should appear between the cells in the table. A value of -1 indicates that the web browser should decide how to separate the cells of the HTML table.

Note: CellSpacing refers to the whitespace between cells in an HTML table, not the thickness of the lines drawn to separate rows and columns.

See Also

Border (see page 16669)

cellpadding (see page 16669)

99.1.23.4.6 TGridAttributes.Custom Property

Represents a tag option and its value in an HTML tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options to be added to the HTML <TABLE> tag. Each option and its value should have the form

`OPTIONNAME=Value`

The options specified by Custom should be separated by spaces. For example, to hide the side borders and add row dividers, you can set Custom to

`FRAME=HSIDES RULES=ROWS`

See Also

Style (see page 16670)

stylerule (see page 16671)

99.1.23.4.7 TGridAttributes.Parent Property

Indicates the TDataGrid (see page 16560) object that uses this TGridAttributes (see page 16664) to describe its attributes.

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

Read Parent to access the TDataGrid (see page 16560) that uses this TGridAttributes (see page 16664) object. The value of Parent is assigned by the constructor.

See Also

TDataGrid (see page 16560)

Create (see page 16666)

TAdapterGrid (see page 25175)

99.1.23.4.8 TGridAttributes.Style Property

Adds style attributes to the generated table.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the entire table. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the <TABLE> tag as the value of a STYLE option.

See Also

Custom (see page 16670)

stylerule (see page 16671)

99.1.23.4.9 TGridAttributes.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TGridAttributes.

99.1.24 TGridRowAttributes Class

TGridRowAttributes describes the options the TDataGrid (see page 16560) component adds to its HTML row tags (<TR>).

Class Hierarchy

Pascal

```
TGridRowAttributes = class(TPersistent);
```

C++

```
class TGridRowAttributes : public TPersistent;
```

File

MidItems

Description

TGridRowAttributes implements the RowAttributes and HeadingAttributes properties of a TDataGrid (see page 16560) or TAdapterGrid component. It describes display attributes that apply to the generated HTML table's rows. The properties of TGridRowAttributes specify the options added to the generated HTML <TR> tag, as well as any styles that should be applied to the header or body of the table.

See Also

TCustomDataGrid (see page 16499)

TCustomDataGrid (see page 16499)

TCustomAdapterGrid (see page 25286)

TCustomAdapterGrid (see page 25286)

99.1.24.1 TGridRowAttributes Members

The following tables list the members exposed by TGridRowAttributes.

Protected Methods

	Name	Description
	AssignTo (see page 16673)	Copies the properties of an object to a destination object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 16673)	Creates an instance of TGridRowAttributes (see page 16671).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Parent (see page 16676)	Indicates the TDataGrid (see page 16560) or TAdapterGrid object that uses this TGridRowAttributes (see page 16671) to describe its header or row attributes.

Published Properties

	Name	Description
	Align (see page 16674)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 16675)	Specifies the background color of the rows or header of an HTML table.
	Custom (see page 16675)	Represents a tag option and its value in an HTML tag.
	Style (see page 16676)	Adds style attributes to the generated table body or header.
	StyleRule (see page 16676)	Applies a style in the page producer's style sheet to the generated table body or header.
	VAlign (see page 16677)	Specifies the vertical alignment within the cells of the HTML table body or header.

99.1.24.2 TGridRowAttributes.Create Constructor

Creates an instance of TGridRowAttributes (see page 16671).

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TGridRowAttributes(TComponent * AParent);
```

Description

Most applications have no need to instantiate TGridRowAttributes (see page 16671). TGridRowAttributes (see page 16671) is instantiated by the TDataGrid (see page 16560) or TAdapterGrid component that uses it.

The AParent parameter is the TDataGrid (see page 16560) or TAdapterGrid component that uses the TGridRowAttributes (see page 16671) instance. This parameter becomes the value of the Parent (see page 16676) property.

See Also

Parent (see page 16676)

TDataGrid (see page 16560)

TAdapterGrid (see page 25175)

99.1.24.3 TGridRowAttributes Methods

The methods of the TGridRowAttributes class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 16673)	Copies the properties of an object to a destination object.

99.1.24.3.1 TGridRowAttributes.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign (see page 2930)

EConvertError (see page 22724)

99.1.24.4 TGridRowAttributes Properties

The properties of the TGridRowAttributes class are listed here.

Public Properties

	Name	Description
R	Parent (see page 16676)	Indicates the TDataGrid (see page 16560) or TAdapterGrid object that uses this TGridRowAttributes (see page 16671) to describe its header or row attributes.

Published Properties

	Name	Description
	Align (see page 16674)	Specifies the alignment of the table within the HTML document.
	BgColor (see page 16675)	Specifies the background color of the rows or header of an HTML table.
	Custom (see page 16675)	Represents a tag option and its value in an HTML tag.
	Style (see page 16676)	Adds style attributes to the generated table body or header.
	StyleRule (see page 16676)	Applies a style in the page producer's style sheet to the generated table body or header.
	VAlign (see page 16677)	Specifies the vertical alignment within the cells of the HTML table body or header.

99.1.24.4.1 TGridRowAttributes.Align Property

Specifies the alignment of the table within the HTML document.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Set Align to indicate the desired alignment of the contents of each cell in the table row or header. Align indicates the desired value of the Align option of the <TR> tag.

The default value of Align is haDefault, which means the web browser that reads the HTML document positions the cell contents wherever it wants horizontally.

See Also

VAlign (see page 16677)

99.1.24.4.2 TGridRowAttributes.BgColor Property

Specifies the background color of the rows or header of an HTML table.

Pascal

```
property BgColor: THTMLBgColor;
```

C++

```
__property THTMLBgColor BgColor;
```

Description

Use BgColor to indicate the desired background color of the rows or heading of an HTML table. The value of BgColor is the name of color. This can be one of the following strings:

Aqua	Black	Blue	Fuchsia
Gray	Green	Lime	Maroon
Navy	Olive	Purple	Red
Silver	Teal	White	Yellow

Note: This property overrides the background color option of the HTML table itself.

See Also

BgColor (see page 16668)

99.1.24.4.3 TGridRowAttributes.Custom Property

Represents a tag option and its value in an HTML tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options to be added to the HTML <TR> tag. Each option and its value should have the form

```
OPTIONNAME=Value
```

To specify multiple options, separate the Name/value pairs with spaces.

See Also

Style (see page 16676)

StyleRule (see page 16676)

99.1.24.4.4 TGridRowAttributes.Parent Property

Indicates the TDataGrid (see page 16560) or TAdapterGrid object that uses this TGridRowAttributes (see page 16671) to describe its header or row attributes.

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

Read Parent to access the TDataGrid (see page 16560) or TAdapterGrid that uses this TGridRowAttributes (see page 16671) object. The value of Parent is assigned by the constructor.

See Also

TDataGrid (see page 16560)

TAdapterGrid (see page 25175)

Create (see page 16673)

99.1.24.4.5 TGridRowAttributes.Style Property

Adds style attributes to the generated table body or header.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the rows or header of the HTML table. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the <TR> tag as the value of a STYLE option.

See Also

Custom (see page 16675)

StyleRule (see page 16676)

99.1.24.4.6 TGridRowAttributes.StyleRule Property

Applies a style in the page producer's style sheet to the generated table body or header.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table body or header. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style (see page 16676) property instead.

See Also

Style (see page 16676)

Styles (see page 17127)

StylesFile (see page 17128)

Styles (see page 19830)

StylesFile (see page 19831)

99.1.24.4.7 TGridRowAttributes.VAlign Property

Specifies the vertical alignment within the cells of the HTML table body or header.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

Set VAlign to indicate the desired vertical alignment of the contents of each cell. VAlign indicates the desired value of the VAlign option of the <TR> tag for the table rows or header.

The default value of VAlign is haVDefault, which means the web browser that reads the HTML document positions the contents of cells in the table element wherever it wishes vertically.

See Also

Align (see page 16674)

99.1.25 TInsertButton Class

TInsertButton generates an HTML control that inserts a new record in an XML data packet.

Class Hierarchy

Pascal

```
TInsertButton = class(TDataSetButton);
```

C++

```
class TInsertButton : public TDataSetButton;
```

File

MidItems

Description

Add TInsertButton as the child of a TDataNavigator (see page 16569) component (or a layout group that is a child of a TDataNavigator (see page 16569) component) to enable the generated HTML form to add records to an XML data packet. The resulting HTML button's action adds a new blank record to the emerging XML delta packet and causes the associated display control to display that new record.

Use the properties of TInsertButton to customize the appearance of the button and associate it with a Web item. The associated Web item generates the HTML control that displays the newly inserted record.

See Also

TXMLBroker (see page 26049)

TDataNavigator (see page 16569)

TLayoutGroup (see page 16687)

TApplyUpdatesButton (see page 16480)

99.1.25.1 TInsertButton Members

The following tables list the members exposed by TInsertButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16581)	This is DefaultCaption, a member of class TDataSetButton.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	XMLMethodName (see page 16581)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16582)	This is AddElements, a member of class TDataSetButton.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetCaption (see page 16582)	Returns the value of the Caption property.
	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDisplayComponent (see page 17043)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 17043)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
	GetMethodName (see page 16582)	This is GetMethodName, a member of class TDataSetButton.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16582)	This is GetSubComponents, a member of class TDataSetButton.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 17043)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
	ImplAddElements (see page 16583)	This is ImplAddElements, a member of class TDataSetButton.
	ImplContent (see page 16583)	Provides the underlying implementation for the Content method.
	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 17044)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayComponent (see page 17044)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 17044)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.

	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.
	XMLDisplay (see page 17045)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
	Create (see page 16682)	Creates and initializes an instance of TInsertButton (see page 16677).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 17042)	Frees an instance of TXMLDisplayReferenceButton (see page 17037).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.

	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLComponent (see page 17045)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 17045)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 16584)	Specifies the caption that appears on the button.
	Custom (see page 16584)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16584)	Adds style attributes to the generated button control.
	StyleRule (see page 16585)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16585)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 16586)	Specifies whether the button is associated with its parent's display object.

99.1.25.2 TInsertButton.Create Constructor

Creates and initializes an instance of TInsertButton (see page 16677).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TInsertButton(TComponent * AOwner);
```

Description

Call Create to instantiate TInsertButton (see page 16677) at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.26 TLastButton Class

TLastButton generates an HTML control that moves to the last record in an XML data packet.

Class Hierarchy

Pascal

```
TLastButton = class(TDataSetButton);
```

C++

```
class TLastButton : public TDataSetButton;
```

File

MidItems

Description

Add TLastButton as the child of a TDataNavigator (see page 16569) component (or a layout group that is a child of a TDataNavigator (see page 16569) component) to enable the generated HTML form to move quickly to the last record in a dataset. The resulting HTML button's action changes the associated display control so that it shows the last record as current.

Use the properties of TLastButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the last button navigates.

TXMLBroker (see page 26049)

TDataNavigator (see page 16569)

TLayoutGroup (see page 16687)

99.1.26.1 TLastButton Members

The following tables list the members exposed by TLastButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16581)	This is DefaultCaption, a member of class TDataSetButton.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	XMLMethodName (see page 16581)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16582)	This is AddElements, a member of class TDataSetButton.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.

	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16582)	Returns the value of the Caption property.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDisplayComponent (see page 17043)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 17043)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 16582)	This is GetMethodName, a member of class TDataSetButton.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16582)	This is GetSubComponents, a member of class TDataSetButton.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 17043)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 16583)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 16583)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17044)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayComponent (see page 17044)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 17044)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.
R	XMLDisplay (see page 17045)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16687)	Creates and initializes an instance of TLastButton (see page 16682).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 17042)	Frees an instance of TXMLDisplayReferenceButton (see page 17037).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.

	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLComponent (see page 17045)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 17045)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 16584)	Specifies the caption that appears on the button.
	Custom (see page 16584)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16584)	Adds style attributes to the generated button control.
	StyleRule (see page 16585)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16585)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 16586)	Specifies whether the button is associated with its parent's display object.

99.1.26.2 TLastButton.Create Constructor

Creates and initializes an instance of TLastButton (see page 16682).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TLastButton(TComponent * AOwner);
```

Description

Call Create to instantiate TLastButton (see page 16682) at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.27 TLayoutGroup Class

TLayoutGroup generates the HTML to arrange content produced by other Web items.

Class Hierarchy

Pascal

```
TLayoutGroup = class(TCustomLayoutGroup);
```

C++

```
class TLayoutGroup : public TCustomLayoutGroup;
```

File

MidItems

Description

Use TLayoutGroup to adjust the layout of items in an HTML document. There are few restrictions on what Web items can use a layout group because it has no special content that it displays. It merely imposes a layout on content generated by other Web items.

TLayoutGroup maintains a list of Web items that display information in the final HTML document, but imposes no restrictions of its own on the possible types of Web items. Instead, it restricts those Web items to the classes that its parent allows. In order to let the parent component use the HTML that TLayoutGroup generates, TLayoutGroup inherits the IWebContent interface from TWebControlGroup (see page 16872).

See Also

IWebContent (see page 24792)

Using the Web Page Editor

99.1.27.1 TLayoutGroup Members

The following tables list the members exposed by TLayoutGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.

	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLayoutAttributes (see page 16534)	Returns an object that specifies how the generated group of controls should look.
	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
	ImplCanAddClass (see page 16534)	Provides the underlying implementation for the CanAddClass method.
	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
	ImplContent (see page 16535)	Provides the underlying implementation for the Content method.
	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16533)	Creates and initializes an instance of TCustomLayoutGroup (see page 16528).
V	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.

	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16533)	Frees an instance of TCustomLayoutGroup (see page 16528).
	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.

	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Custom (see page 16692)	Represents a tag option and its value in the generated TABLE tag.
	DisplayColumns (see page 16693)	Specifies the number of columns the layout group uses to lay out its child controls.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16693)	Adds style attributes to the generated HTML table.
	StyleRule (see page 16694)	Applies a style in the page producer's style sheet to the group of buttons.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.27.2 TLayoutGroup Properties

The properties of the TLayoutGroup class are listed here.

Published Properties

	Name	Description
	Custom (see page 16692)	Represents a tag option and its value in the generated TABLE tag.
	DisplayColumns (see page 16693)	Specifies the number of columns the layout group uses to lay out its child controls.
	Style (see page 16693)	Adds style attributes to the generated HTML table.
	StyleRule (see page 16694)	Applies a style in the page producer's style sheet to the group of buttons.

99.1.27.2.1 TLayoutGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TCustomLayoutGroup generates an HTML table to lay out the controls generated by the Web items in its WebFieldControls property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the group of controls and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 16536)

StyleRule (see page 16537)

WebFieldControls (see page 16884)

DisplayColumns (see page 16536)

99.1.27.2.2 TLayoutGroup.DisplayColumns Property

Specifies the number of columns the layout group uses to lay out its child controls.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

TCustomLayoutGroup generates an HTML table to lay out the controls generated by the Web items in its WebFieldControls property. It adds the HTML generated by each Web item listed in WebFieldControls to a cell of the table, filling the cells out row by row until it displays all the Web items. DisplayColumns determines the number of cells in each row.

See Also

WebFieldControls (see page 16884)

99.1.27.2.3 TLayoutGroup.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

TCustomLayoutGroup generates an HTML table to lay out the controls generated by the Web items in WebFieldControls. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 16535)

StyleRule (see page 16537)

WebFieldControls (see page 16884)

99.1.27.2.4 TLayoutGroup.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

TCustomLayoutGroup generates an HTML table to lay out the controls generated by its Web items. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

StylesFile (see page 19831)

WebFieldControls (see page 16884)

99.1.28 TNextButton Class

TNextButton generates an HTML control that moves to the next record in an XML data packet.

Class Hierarchy

Pascal

```
TNextButton = class(TDataSetButton);
```

C++

```
class TNextButton : public TDataSetButton;
```

File

MidItems

Description

Add TNextButton as the child of a TDataNavigator (see page 16569) component (or a layout group that is a child of a TDataNavigator (see page 16569) component) to enable an associated control to move to the next record in a dataset. The resulting HTML button's action changes the current record displayed by the associated control.

Use the properties of TNextButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the next button navigates.

See Also

TXMLBroker (see page 26049)

TDataNavigator (see page 16569)

TLayoutGroup (see page 16687)

99.1.28.1 TNextButton Members

The following tables list the members exposed by TNextButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16581)	This is DefaultCaption, a member of class TDataSetButton.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	XMLMethodName (see page 16581)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16582)	This is AddElements, a member of class TDataSetButton.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16582)	Returns the value of the Caption property.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDisplayComponent (see page 17043)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 17043)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.

V	GetMethodName (see page 16582)	This is GetMethodName, a member of class TDataSetButton.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16582)	This is GetSubComponents, a member of class TDataSetButton.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 17043)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 16583)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 16583)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17044)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayComponent (see page 17044)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 17044)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

R	XMLDisplay (see page 17045)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16699)	Creates and initializes an instance of TNextButton (see page 16694).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 17042)	Frees an instance of TXMLDisplayReferenceButton (see page 17037).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLComponent (see page 17045)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 17045)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 16584)	Specifies the caption that appears on the button.
	Custom (see page 16584)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16584)	Adds style attributes to the generated button control.
	StyleRule (see page 16585)	Applies a style in the page producer's style sheet to the button.

	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16585)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 16586)	Specifies whether the button is associated with its parent's display object.

99.1.28.2 TNextButton.Create Constructor

Creates and initializes an instance of TNextButton (see page 16694).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TNextButton(TComponent * AOwner);
```

Description

Call Create to instantiate TNextButton (see page 16694) at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.29 TNextPageButton Class

TNextPageButton generates an HTML control that moves to the next set of records in an XML data packet.

Class Hierarchy

Pascal

```
TNextPageButton = class(TDataSetButton);
```

C++

```
class TNextPageButton : public TDataSetButton;
```

File

MidItems

Description

Add TNextPageButton as the child of a TDataNavigator (see page 16569) component (or a layout group that is a child of a TDataNavigator (see page 16569) component) to enable the generated HTML form to display the next group of records in a dataset. If the button is associated with a grid (TDataGrid (see page 16560)), the grid scrolls by the number of rows in the grid. If the button is associated with a collection of fields (TFieldGroup (see page 16591)), the current record changes to the next record in the data packet.

Use the properties of TNextPageButton to customize the appearance of the button and associate it with a display component.

99.1.29.1 TNextPageButton Members

The following tables list the members exposed by TNextPageButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16581)	This is DefaultCaption, a member of class TDataSetButton.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	XMLMethodName (see page 16581)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16582)	This is AddElements, a member of class TDataSetButton.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16582)	Returns the value of the Caption property.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDisplayComponent (see page 17043)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 17043)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 16582)	This is GetMethodName, a member of class TDataSetButton.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16582)	This is GetSubComponents, a member of class TDataSetButton.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 17043)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.

V	ImplAddElements (see page 16583)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 16583)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17044)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayComponent (see page 17044)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 17044)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.
R	XMLDisplay (see page 17045)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.

	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
	Create (see page 16703)	Creates and initializes an instance of TNextPageButton (see page 16699).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 17042)	Frees an instance of TXMLDisplayReferenceButton (see page 17037).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLComponent (see page 17045)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 17045)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 16584)	Specifies the caption that appears on the button.
	Custom (see page 16584)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16584)	Adds style attributes to the generated button control.
	StyleRule (see page 16585)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16585)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 16586)	Specifies whether the button is associated with its parent's display object.

99.1.29.2 TNextPageButton.Create Constructor

Creates and initializes an instance of TNextPageButton (see page 16699).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TNextPageButton(TComponent * AOwner);
```

Description

Call Create to instantiate TNextPageButton (see page 16699) at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.30 TPostButton Class

TPostButton generates an HTML control that posts changes to an XML delta packet.

Class Hierarchy

Pascal

```
TPostButton = class(TDataSetButton);
```

C++

```
class TPostButton : public TDataSetButton;
```

File

MidItems

Description

Add TPostButton as the child of a TDataNavigator (see page 16569) component (or a layout group that is a child of a TDataNavigator (see page 16569) component) to enable the generated HTML form to commit the edits on the current record of an associated display control. The resulting HTML button's action posts all edits to the current record to the emerging delta packet, which can then be submitted using an apply updates button.

Use the properties of TPostButton to customize the appearance of the button and associate it with a Web item that generates the display control.

See Also

TXMLBroker (see page 26049)

TDataNavigator (see page 16569)

TLayoutGroup (see page 16687)

TApplyUpdatesButton (see page 16480)

99.1.30.1 TPostButton Members

The following tables list the members exposed by TPostButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16581)	This is DefaultCaption, a member of class TDataSetButton.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	XMLMethodName (see page 16581)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16582)	This is AddElements, a member of class TDataSetButton.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16582)	Returns the value of the Caption property.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDisplayComponent (see page 17043)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 17043)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 16582)	This is GetMethodName, a member of class TDataSetButton.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16582)	This is GetSubComponents, a member of class TDataSetButton.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 17043)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 16583)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 16583)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17044)	Forwards notification messages to all owned components.

	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayComponent (see page 17044)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 17044)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.
R	XMLDisplay (see page 17045)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16708)	Creates and initializes an instance of TPostButton (see page 16704).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 17042)	Frees an instance of TXMLDisplayReferenceButton (see page 17037).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.

	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLComponent (see page 17045)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 17045)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 16584)	Specifies the caption that appears on the button.
	Custom (see page 16584)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16584)	Adds style attributes to the generated button control.
	StyleRule (see page 16585)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16585)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 16586)	Specifies whether the button is associated with its parent's display object.

99.1.30.2 TPostButton.Create Constructor

Creates and initializes an instance of TPostButton (see page 16704).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPostButton(TComponent * AOwner);
```

Description

Call Create to instantiate TPostButton (see page 16704) at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.31 TPriorButton Class

TPriorButton generates an HTML control that moves to the previous record in an XML data packet.

Class Hierarchy

Pascal

```
TPriorButton = class(TDataSetButton);
```

C++

```
class TPriorButton : public TDataSetButton;
```

File

MidItems

Description

Add TPriorButton as the child of a TDataNavigator (see page 16569) component (or a layout group that is a child of a TDataNavigator (see page 16569) component) to enable an associated control to move to the previous record in a dataset. The resulting HTML button's action changes the current record displayed by the associated control.

Use the properties of TPriorButton to customize the appearance of the button and associate it with a Web item. The associated Web item displays the records that the prior button navigates.

See Also

TXMLBroker (see page 26049)

TDataNavigator (see page 16569)

TLayoutGroup (see page 16687)

99.1.31.1 TPriorButton Members

The following tables list the members exposed by TPriorButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16581)	This is DefaultCaption, a member of class TDataSetButton.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	XMLMethodName (see page 16581)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16582)	This is AddElements, a member of class TDataSetButton.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16582)	Returns the value of the Caption property.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDisplayComponent (see page 17043)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 17043)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 16582)	This is GetMethodName, a member of class TDataSetButton.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16582)	This is GetSubComponents, a member of class TDataSetButton.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 17043)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 16583)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 16583)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17044)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDisplayComponent (see page 17044)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 17044)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.
R	XMLDisplay (see page 17045)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16713)	Creates and initializes an instance of TPriorButton (see page 16709).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 17042)	Frees an instance of TXMLDisplayReferenceButton (see page 17037).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.

V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.

W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLComponent (see page 17045)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 17045)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 16584)	Specifies the caption that appears on the button.
	Custom (see page 16584)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16584)	Adds style attributes to the generated button control.
	StyleRule (see page 16585)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16585)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 16586)	Specifies whether the button is associated with its parent's display object.

99.1.31.2 TPriorButton.Create Constructor

Creates and initializes an instance of TPriorButton (see page 16709).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPriorButton(TComponent * AOwner);
```

Description

Call Create to instantiate TPriorButton (see page 16709) at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.32 TPriorPageButton Class

TPriorPageButton generates an HTML control that moves to the previous set of records in an XML data packet.

Class Hierarchy

Pascal

```
TPriorPageButton = class(TDataSetButton);
```

C++

```
class TPriorPageButton : public TDataSetButton;
```

File

MidItems

Description

Add TPriorPageButton as the child of a TDataNavigator (see page 16569) component (or a layout group that is a child of a TDataNavigator (see page 16569) component) to enable the generated HTML form to display the previous group of records in a dataset. If the button is associated with a grid (TDataGrid (see page 16560)), the grid scrolls by the number of rows in the grid. If the button is associated with a collection of fields (TFieldGroup (see page 16591)), the current record changes to the previous record in the data packet.

Use the properties of TNextPageButton (see page 16699) to customize the appearance of the button and associate it with a display component.

99.1.32.1 TPriorPageButton Members

The following tables list the members exposed by TPriorPageButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16581)	This is DefaultCaption, a member of class TDataSetButton.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	XMLMethodName (see page 16581)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.

	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16582)	This is AddElements, a member of class TDataSetButton.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16582)	Returns the value of the Caption property.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDisplayComponent (see page 17043)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 17043)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 16582)	This is GetMethodName, a member of class TDataSetButton.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16582)	This is GetSubComponents, a member of class TDataSetButton.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 17043)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 16583)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 16583)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17044)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayComponent (see page 17044)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 17044)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property

V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.
R	XMLDisplay (see page 17045)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16718)	Creates and initializes an instance of TPriorPageButton (see page 16713).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 17042)	Frees an instance of TXMLDisplayReferenceButton (see page 17037).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.

	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLComponent (see page 17045)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 17045)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 16584)	Specifies the caption that appears on the button.
	Custom (see page 16584)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16584)	Adds style attributes to the generated button control.
	StyleRule (see page 16585)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16585)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 16586)	Specifies whether the button is associated with its parent's display object.

99.1.32.2 TPriorPageButton.Create Constructor

Creates and initializes an instance of TPriorPageButton (see page 16713).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPriorPageButton(TComponent * AOwner);
```

Description

Call Create to instantiate TPriorPageButton (see page 16713) at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.33 TQueryButton Class

TQueryButton is the base class for Web items that create HTML buttons that manage application-defined values.

Class Hierarchy

Pascal

```
TQueryButton = class(TWebButton);
```

C++

```
class TQueryButton : public TWebButton;
```

File

MidItems

Description

Use TQueryButton as a base class in an InternetExpress application for components that generate the HTML statements defining a specialized button control for managing the application-defined input controls. TQueryButton objects are used by TQueryForm (see page 16745), which organizes the generated buttons and the input controls they manipulate.

TQueryButton defines properties and methods for

Generating the HTML code to define the button control.

Specifying tag attributes of the HTML button control, including those defined by a style sheet.

Associating the button with a Query form whose controls it influences.

Fitting the component into a hierarchy of Web items, each of which generates part of a larger HTML document.

In order to allow other Web items to use the HTML generated by the button control, TQueryButton inherits support for the IWebContent interface from TWebButton (see page 16863).

Do not create instances of TQueryButton. TQueryButton relies on anabstract or, in C++ terminology, pure virtual method to generate the HTML statements defining a button control. Instead, create descendants of TQueryButton, such as TResetQueryButton (see page 16809) or TSubmitQueryButton (see page 16833).

See Also

TResetQueryButton (see page 16809)

TSubmitQueryButton (see page 16833)

IWebContent (see page 24792)

TQueryForm (see page 16745)

99.1.33.1 TQueryButton Members

The following tables list the members exposed by TQueryButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16723)	This is DefaultCaption, a member of class TQueryButton.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	InputType (see page 16723)	This is InputType, a member of class TQueryButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.

	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16724)	This is EventContent, a member of class TQueryButton.
V	GetCaption (see page 16724)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetHTMLControlName (see page 16725)	This is GetHTMLControlName, a member of class TQueryButton.
	GetHTMLForm (see page 16725)	This is GetHTMLForm, a member of class TQueryButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetInputType (see page 16725)	This is GetInputType, a member of class TQueryButton.
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXMLComponent (see page 16725)	This is GetXMLComponent, a member of class TQueryButton.
V	ImplContent (see page 16725)	Provides the underlying implementation for the Content method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 16726)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	ParentXMLComponent (see page 16726)	This is ParentXMLComponent, a member of class TQueryButton.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	SetXMLComponent (see page 16727)	This is SetXMLComponent, a member of class TQueryButton.
	SetXMLUseParent (see page 16727)	This is SetXMLUseParent, a member of class TQueryButton.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16723)	Creates and initializes an instance of TQueryButton (see page 16718).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16727)	Specifies the caption that appears on the button.
	Custom (see page 16728)	Represents a tag option and its value in the generated INPUT tag.

	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16728)	Adds style attributes to the generated button control.
	StyleRule (see page 16729)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16729)	Associates the button with the query form whose display controls it influences.
	XMLUseParent (see page 16729)	Specifies whether the button is associated with its parent's query form.

99.1.33.2 TQueryButton.Create Constructor

Creates and initializes an instance of TQueryButton (see page 16718).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TQueryButton(TComponent * AOwner);
```

Description

Call Create to instantiate a dataset button at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

AOwner is the component that is responsible for freeing the query button. Typically, this is the Web module that contains the InterenetExpress page producer that uses the query button's generated HTML.

99.1.33.3 TQueryButton Fields

The fields of the TQueryButton class are listed here.

Protected Fields

	Name	Description
	DefaultCaption (see page 16723)	This is DefaultCaption, a member of class TQueryButton.
	InputType (see page 16723)	This is InputType, a member of class TQueryButton.

99.1.33.3.1 TQueryButton.DefaultCaption Field

Pascal

```
DefaultCaption: string;
```

C++

```
AnsiString DefaultCaption;
```

Description

This is DefaultCaption, a member of class TQueryButton.

99.1.33.3.2 TQueryButton.InputType Field

Pascal

```
InputType: string;
```

C++

```
AnsiString InputType;
```

Description

This is InputType, a member of class TQueryButton.

99.1.33.4 TQueryButton Methods

The methods of the TQueryButton class are listed here.

Protected Methods

	Name	Description
	EventContent (see page 16724)	This is EventContent, a member of class TQueryButton.
	GetCaption (see page 16724)	Returns the value of the Caption property.
	GetHTMLControlName (see page 16725)	This is GetHTMLControlName, a member of class TQueryButton.
	GetHTMLForm (see page 16725)	This is GetHTMLForm, a member of class TQueryButton.
	GetInputType (see page 16725)	This is GetInputType, a member of class TQueryButton.
	GetXMLComponent (see page 16725)	This is GetXMLComponent, a member of class TQueryButton.
	ImplContent (see page 16725)	Provides the underlying implementation for the Content method.
	Notification (see page 16726)	Forwards notification messages to all owned components.
	ParentXMLComponent (see page 16726)	This is ParentXMLComponent, a member of class TQueryButton.
	SetXMLComponent (see page 16727)	This is SetXMLComponent, a member of class TQueryButton.
	SetXMLUseParent (see page 16727)	This is SetXMLUseParent, a member of class TQueryButton.

99.1.33.4.1 TQueryButton.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall AnsiString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TQueryButton.

99.1.33.4.2 TQueryButton.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall AnsiString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 16870)

SetCaption (see page 16870)

99.1.33.4.3 TQueryButton.GetHTMLControlName Method

Pascal

```
function GetHTMLControlName: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetHTMLControlName();
```

Description

This is GetHTMLControlName, a member of class TQueryButton.

99.1.33.4.4 TQueryButton.GetHTMLForm Method

Pascal

```
function GetHTMLForm: IHTMLForm;
```

C++

```
__fastcall IHTMLForm GetHTMLForm();
```

Description

This is GetHTMLForm, a member of class TQueryButton.

99.1.33.4.5 TQueryButton.GetInputType Method

Pascal

```
function GetInputType: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetInputType();
```

Description

This is GetInputType, a member of class TQueryButton.

99.1.33.4.6 TQueryButton.GetXMLComponent Method

Pascal

```
function GetXMLComponent: TComponent;
```

C++

```
__fastcall TComponent * GetXMLComponent();
```

Description

This is GetXMLComponent, a member of class TQueryButton.

99.1.33.4.7 TQueryButton.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the button control. TWebButton introduces ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

See Also

Content (see page 16868)

ILayoutWebContent (see page 24774)

99.1.33.4.8 TQueryButton.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

99.1.33.4.9 TQueryButton.ParentXMLComponent Method

Pascal

```
function ParentXMLComponent: TComponent;
```

C++

```
__fastcall TComponent * ParentXMLComponent();
```

Description

This is ParentXMLComponent, a member of class TQueryButton.

99.1.33.4.10 TQueryButton.SetXMLComponent Method

Pascal

```
procedure SetXMLComponent(const Value: TComponent);
```

C++

```
__fastcall SetXMLComponent(const TComponent * Value);
```

Description

This is SetXMLComponent, a member of class TQueryButton.

99.1.33.4.11 TQueryButton.SetXMLUseParent Method

Pascal

```
procedure SetXMLUseParent(const Value: Boolean);
```

C++

```
__fastcall SetXMLUseParent(const Boolean Value);
```

Description

This is SetXMLUseParent, a member of class TQueryButton.

99.1.33.5 TQueryButton Properties

The properties of the TQueryButton class are listed here.

Published Properties

	Name	Description
	Caption (see page 16727)	Specifies the caption that appears on the button.
	Custom (see page 16728)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 16728)	Adds style attributes to the generated button control.
	StyleRule (see page 16729)	Applies a style in the page producer's style sheet to the button.
	XMLComponent (see page 16729)	Associates the button with the query form whose display controls it influences.
	XMLUseParent (see page 16729)	Specifies whether the button is associated with its parent's query form.

99.1.33.5.1 TQueryButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom (see page 16871)

99.1.33.5.2 TQueryButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption (see page 16870)

Style (see page 16871)

99.1.33.5.3 TQueryButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 16871)

StyleRule (see page 16872)

99.1.33.5.4 TQueryButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style property.

See Also

Style (see page 16871)

Styles (see page 17127)

StylesFile (see page 17128)

Styles (see page 19830)

StylesFile (see page 19831)

99.1.33.5.5 TQueryButton.XMLComponent Property

Associates the button with the query form whose display controls it influences.

Pascal

```
property XMLComponent: TComponent;
```

C++

```
__property TComponent * XMLComponent;
```

Description

Set XMLComponent to specify the Web item that generates the form whose controls the query button influences. If this query form contains the TQueryButtons (see page 16730) object that formats the query button with its siblings, you need not set the XMLComponent property. Instead, setting the XMLUseParent (see page 16729) property to true (the default) sets XMLComponent to the Query form that contains the parent TQueryButtons (see page 16730) object.

See Also

XMLUseParent (see page 16729)

TQueryForm (see page 16745)

99.1.33.5.6 TQueryButton.XMLUseParent Property

Specifies whether the button is associated with its parent's query form.

Pascal

```
property XMLUseParent: Boolean;
```

C++

```
__property Boolean XMLUseParent;
```

Description

Use XMLUseParent to indicate how the query button determines the form whose controls it influences. When XMLUseParent is false, the XMLComponent (see page 16729) property must be set to indicate the query form. When XMLUseParent is true, the button influences controls on the query form that contains its parent TQueryButtons (see page 16730) component.

See Also

XMLComponent (see page 16729)

TQueryForm (see page 16745)

TQueryButtons (see page 16730)

99.1.34 TQueryButtons Class

TQueryButtons assembles the HTML generated by a set of TQueryButton (see page 16718) descendants.

Class Hierarchy

Pascal

```
TQueryButtons = class(TCustomQueryButtons);
```

C++

```
class TQueryButtons : public TCustomQueryButtons;
```

File

MidItems

Description

Add TQueryButtons as the child of a TQueryForm (see page 16745) component (or a layout group that is a child of a TQueryForm (see page 16745) component) to enable the generated HTML form to undo or submit changes made by end users. TQueryButtons generates HTML containing the controls generated by its children. These children must be descendants of TQueryButton (see page 16718), such as TSubmitQueryButton (see page 16833) and TResetQueryButton (see page 16809).

In order to let other Web items to use the HTML that defines the organized collection of controls, TQueryButtons inherits the IWebContent interface from TWebControlGroup (see page 16872).

Use the properties of TQueryButtons to customize the appearance of the group of buttons.

See Also

TQueryForm (see page 16745)

TResetQueryButton (see page 16809)

TSubmitQueryButton (see page 16833)

IWebContent (see page 24792)

TQueryFieldGroup (see page 16736)

Using the Web Page Editor

99.1.34.1 TQueryButtons Members

The following tables list the members exposed by TQueryButtons.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultButtons (see page 16542)	This is GetDefaultButtons, a member of class TCustomQueryButtons.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
V	ImplAddElements (see page 16542)	Provides the underlying implementation for the AddElements method.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplCanAddClass (see page 16543)	Provides the underlying implementation for the CanAddClass method.
V	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
V	ImplContent (see page 16543)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleButtons (see page 16543)	This is VisibleButtons, a member of class TCustomQueryButtons.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.

	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Custom (see page 16735)	Represents a tag option and its value in the generated TABLE tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16735)	Adds style attributes to the generated HTML table.
	StyleRule (see page 16736)	Applies a style in the page producer's style sheet to the group of buttons.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.34.2 TQueryButtons Properties

The properties of the TQueryButtons class are listed here.

Published Properties

	Name	Description
	Custom (see page 16735)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 16735)	Adds style attributes to the generated HTML table.
	StyleRule (see page 16736)	Applies a style in the page producer's style sheet to the group of buttons.

99.1.34.2.1 TQueryButtons.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TCustomQueryButtons generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add a border around the query buttons and color the background blue, you can set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 16544)

StyleRule (see page 16545)

WebFieldControls (see page 16884)

99.1.34.2.2 TQueryButtons.Style Property

Adds style attributes to the generated HTML table.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

TCustomQueryButtons generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 16544)

StyleRule (see page 16545)

WebFieldControls (see page 16884)

99.1.34.2.3 TQueryButtons.StyleRule Property

Applies a style in the page producer's style sheet to the group of buttons.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

TCustomQueryButtons generates an HTML table to lay out the buttons listed in the WebFieldControls property. Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated table. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

99.1.35 TQueryFieldGroup Class

TQueryFieldGroup arranges information on an HTML form as a set of labeled fields.

Class Hierarchy

Pascal

```
TQueryFieldGroup = class(TCustomFieldGroup, IQueryFields);
```

C++

```
class TQueryFieldGroup : public TCustomFieldGroup, public IQueryFields;
```

File

MidItems

Description

Add TQueryFieldGroup to a query form component (TQueryForm (see page 16745)) or a layout group (TLayoutGroup (see page 16687)) that is a child for a query form. TQueryFieldGroup generates the HTML to display information in labeled fields. By default, TQueryFieldGroup displays information about the parameters for an XML broker, but it can be used to display any application-defined named values.

TQueryFieldGroup maintains a list of Web items that generate the individual display fields. These Web items are restricted to the following classes: TQueryText (see page 16783), TQueryTextArea (see page 16795), TQuerySelectOptions (see page 16768), and TQueryRadioGroup (see page 16753). If the query field group displays parameter values, you can bind the query field group to an XML data packet or dataset field within an XML data packet. The Web items can then use that binding to determine the source of the parameters they display.

You can also use the properties of TQueryFieldGroup to affect the overall appearance of the set of fields.

Using the Web Page Editor

99.1.35.1 TQueryFieldGroup Members

The following tables list the members exposed by TQueryFieldGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	CreateDefaultFields (see page 17025)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindField (see page 17026)	This is FindField, a member of class TXMLDisplayGroup.
	FindParam (see page 16743)	This is FindParam, a member of class TQueryFieldGroup.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 17026)	Returns the value of the DataSet property.
	GetDataSetField (see page 17026)	This is GetDataSetField, a member of class TXMLDisplayGroup.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetEnableValidateFields (see page 17026)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
V	GetFieldsList (see page 17027)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsMultipleRecordView (see page 17027)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
V	GetLayoutAttributes (see page 16526)	Returns an object that specifies how the generated group of controls should look.
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetParamsList (see page 16743)	This is GetParamsList, a member of class TQueryFieldGroup.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 17027)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	GetXMLBroker (see page 17027)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 17028)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 17028)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 17028)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 17028)	This is HasStatusField, a member of class TXMLDisplayGroup.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplAddElements (see page 17029)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 16743)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 16526)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
V	ImplGetSubComponents (see page 17029)	Provides the underlying implementation for the GetSubComponents method.
V	ImplIsMultipleRecordView (see page 17029)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsFieldInUse (see page 17030)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
	IsParamInUse (see page 16744)	This is IsParamInUse, a member of class TQueryFieldGroup.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17030)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDataSetField (see page 17030)	This is SetDataSetField, a member of class TXMLDisplayGroup.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEnableValidateFields (see page 17031)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	SetXMLBroker (see page 17031)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateDataSet (see page 17031)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 17031)	This is ValidateFields, a member of class TXMLDisplayGroup.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
V	XMLDataChange (see page 17031)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
	EnableValidateFields (see page 17032)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.
R	XMLDataSet (see page 17033)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16525)	Creates and initializes an instance of TCustomFieldGroup (see page 16519).
V	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
V	Create (see page 17024)	Creates and initializes an instance of TXMLDisplayGroup (see page 17019).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16525)	Frees an instance of TCustomFieldGroup (see page 16519).
V	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).

V	Destroy (see page 17024)	Frees an instance of TXMLDisplayGroup (see page 17019).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDataSet (see page 17054)	Returns the value of the DataSet (see page 17055) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnableValidateFields (see page 17078)	This is GetEnableValidateFields, a member of class IValidateFields.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 17060)	This is GetFieldsList, a member of class IDataSetFields.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsMultipleRecordView (see page 17079)	This is GetIsMultipleRecordView, a member of class IWebDisplay.
	GetIsMultipleRecordView (see page 17082)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVisibleFields (see page 17060)	This is GetVisibleFields, a member of class IDataSetFields.
	GetXMLBroker (see page 17054)	Returns the value of the XMLBroker (see page 17056) property.
	GetXMLDataSet (see page 17055)	Returns the value of the XMLDataSet (see page 17056) property.
	GetXMLDisplayName (see page 17083)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 17083)	This is GetXMLRowSetName, a member of class IXMLDisplay.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	HasStatusField (see page 17060)	This is HasStatusField, a member of class IDataSetFields.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsFieldInUse (see page 17060)	This is IsFieldInUse, a member of class IDataSetFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEnableValidateFields (see page 17078)	This is SetEnableValidateFields, a member of class IValidateFields.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateDataSet (see page 17060)	This is ValidateDataSet, a member of class IDataSetFields.
	ValidateDataSet (see page 17074)	This is ValidateDataSet, a member of class IQueryFields.
	ValidateFields (see page 17078)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 17055)	Provides access to an interface for working with the associated dataset.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EnableValidateFields (see page 17078)	This is EnableValidateFields, a member of class IValidateFields.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsMultipleRecordView (see page 17080)	
R	IsMultipleRecordView (see page 17083)	
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleFields (see page 17061)	This is VisibleFields, a member of class IDataSetFields.
R	VisibleFields (see page 17032)	Indicates the controls displayed by the HTML that the XML display group generates.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.
R	XMLBroker (see page 17056)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
R	XMLDataSet (see page 17056)	Indicates the TXMLDataSet (see page 17006) object that represents the dataset to which the Web item is bound.
R	XMLDisplayName (see page 17084)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 17084)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	Custom (see page 16744)	Represents a tag option and its value in the generated TABLE tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16745)	Adds style attributes to the generated set of fields.
	StyleRule (see page 16745)	Applies a style in the page producer's style sheet to the table.

	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLBroker (see page 17033)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSetField (see page 17033)	Binds the XML display group to a nested dataset from the XML data packet.

99.1.35.2 TQueryFieldGroup Methods

The methods of the TQueryFieldGroup class are listed here.

Protected Methods

	Name	Description
	FindParam (see page 16743)	This is FindParam, a member of class TQueryFieldGroup.
	GetParamsList (see page 16743)	This is GetParamsList, a member of class TQueryFieldGroup.
V	ImplCanAddClass (see page 16743)	Provides the underlying implementation for the CanAddClass method.
	IsParamInUse (see page 16744)	This is IsParamInUse, a member of class TQueryFieldGroup.

99.1.35.2.1 TQueryFieldGroup.FindParam Method

Pascal

```
function FindParam(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindParam(const AnsiString AName);
```

Description

This is FindParam, a member of class TQueryFieldGroup.

99.1.35.2.2 TQueryFieldGroup.GetParamsList Method

Pascal

```
procedure GetParamsList(List: TStrings);
```

C++

```
__fastcall GetParamsList(TStrings List);
```

Description

This is GetParamsList, a member of class TQueryFieldGroup.

99.1.35.2.3 TQueryFieldGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 16878)

WebFieldControls (see page 16884)

99.1.35.2.4 TQueryFieldGroup.IsParamInUse Method

Pascal

```
function IsParamInUse(AName: string): Boolean;
```

C++

```
__fastcall Boolean IsParamInUse(AnsiString AName);
```

Description

This is IsParamInUse, a member of class TQueryFieldGroup.

99.1.35.3 TQueryFieldGroup Properties

The properties of the TQueryFieldGroup class are listed here.

Published Properties

	Name	Description
	Custom (see page 16744)	Represents a tag option and its value in the generated TABLE tag.
	Style (see page 16745)	Adds style attributes to the generated set of fields.
	StyleRule (see page 16745)	Applies a style in the page producer's style sheet to the table.

99.1.35.3.1 TQueryFieldGroup.Custom Property

Represents a tag option and its value in the generated TABLE tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TCustomFieldGroup generates an HTML table to manage the layout of the HTML controls that its Web items generate. Use Custom to add options that qualify the TABLE tag. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to surround the set of fields with a border and give them a blue background, set Custom to

```
BORDER=2 BGCOLOR=BLUE
```

See Also

Style (see page 16527)

StyleRule (see page 16528)

99.1.35.3.2 TQueryFieldGroup.Style Property

Adds style attributes to the generated set of fields.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

TCustomFieldGroup generates an HTML table to lay out the fields that its Web items generate. Use Style to add a STYLE option that qualifies the TABLE tag. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated TABLE tag as the value of a STYLE option.

See Also

Custom (see page 16527)

StyleRule (see page 16528)

99.1.35.3.3 TQueryFieldGroup.StyleRule Property

Applies a style in the page producer's style sheet to the table.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated set of fields. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

See Also

Style (see page 16527)

Styles (see page 17127)

StylesFile (see page 17128)

99.1.36 TQueryForm Class

TQueryForm generates HTML forms for letting users enter application-defined values.

Class Hierarchy

Pascal

```
TQueryForm = class(TCustomQueryForm);
```

C++

```
class TQueryForm : public TCustomQueryForm;
```

File

MidItems

Description

Add TQueryForm to the Web items of an InternetExpress page producer to add an HTML form that displays application-defined values that users can view and edit. Query forms submit these values to the InternetExpress application using a specified URL and method type.

TQueryForm generates the HTML FORM tag and assembles the HTML generated by its Web items. It restricts the Web items that generate the contents of the form to components that display application-defined values (TQueryFieldGroup (see page 16736)), components that contain buttons to operate on those displays (TQueryButtons (see page 16730)), and components that manage the layout of HTML controls (TLayoutGroup (see page 16687)). At design time, you can add these Web items to the form using the Web page editor.

See Also

TQueryButtons (see page 16730)

TBasePageItemsProducer (see page 18376)

TInetXPageProducer (see page 17145)

TQueryFieldGroup (see page 16736)

TLayoutGroup (see page 16687)

Using the Web Page Editor

99.1.36.1 TQueryForm Members

The following tables list the members exposed by TQueryForm.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16927)	Used internally to generate any javascript declarations needed by the form.
	AssignStringsCallback (see page 16551)	This is AssignStringsCallback, a member of class TCustomQueryForm.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16928)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 16934) property list.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16928)	Returns the HTML that defines the HTML form.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultWebComponents (see page 16929)	Returns nil (Delphi) or NULL (C++).
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetHTMLFormName (see page 16929)	Returns the name of the generated HTML form.
V	GetHTMLFormTag (see page 16551)	This is GetHTMLFormTag, a member of class TCustomQueryForm.
	GetHTMLFormVarName (see page 16929)	Returns the name of the javascript variable that refers to the generated form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16930)	Returns the object that specifies how the generated form should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16930)	Returns the value of the WebComponents (see page 16934) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 16930)	Returns the value of the VisibleFields (see page 16934) property.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
V	ImplAddElements (see page 16552)	Provides the underlying implementation for the AddElements method.
V	ImplAddElements (see page 16931)	Provides the underlying implementation for the AddElements (see page 16927) method.
V	ImplCanAddClass (see page 16552)	Provides the underlying implementation for the CanAddClass method.
A	ImplCanAddClass (see page 16931)	Provides the underlying implementation for the CanAddClass (see page 16928) method.
V	ImplContent (see page 16552)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 16932)	Provides the underlying implementation for the Content (see page 16928) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	MethodString (see page 16553)	This is MethodString, a member of class TCustomQueryForm.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16932)	Prevents an application from trying to assign a default set of Web items on the form.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	VisibleFields (see page 16934)	Lists the Web items whose generated content appears in the HTML form.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
	AssignStrings (see page 16551)	This is AssignStrings, a member of class TCustomQueryForm.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16550)	Creates and initializes an instance of TCustomQueryForm (see page 16545).
V	Create (see page 16926)	Creates and initializes an instance of TWebForm (see page 16922).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16926)	Frees an instance of TWebForm (see page 16922).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHTMLFormName (see page 17065)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 17065)	Returns the name of the javascript variable that refers to the generated form.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLFormName (see page 17066)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 17066)	Indicates the name of the javascript variable that represents the HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebComponents (see page 16934)	Maintains a list of components that generate HTML content for the TWebForm (see page 16922) descendant.

Published Properties

	Name	Description
	Action (see page 16751)	Specifies the path info portion of the URL to which the query submits request messages.
	Custom (see page 16751)	Represents a tag option and its value in the generated FORM tag.
	Method (see page 16752)	This is Method, a member of class TQueryForm.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16752)	Adds style attributes to the generated form.
	StyleRule (see page 16752)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.36.2 TQueryForm Properties

The properties of the TQueryForm class are listed here.

Published Properties

	Name	Description
	Action (see page 16751)	Specifies the path info portion of the URL to which the query submits request messages.
	Custom (see page 16751)	Represents a tag option and its value in the generated FORM tag.
	Method (see page 16752)	This is Method, a member of class TQueryForm.
	Style (see page 16752)	Adds style attributes to the generated form.
	StyleRule (see page 16752)	Applies a style in the page producer's style sheet to the button.

99.1.36.2.1 TQueryForm.Action Property

Specifies the path info portion of the URL to which the query submits request messages.

Pascal

```
property Action: string;
```

C++

```
__property AnsiString Action;
```

Description

Use Action to specify the target URL for messages that the query form submits. Action supplies the PathInfo property of Web request messages from the query form. This value is matched to the PathInfo property of a Web action item when determining what object responds to those messages.

See Also

TCustomQueryForm (see page 16545)

PathInfo (see page 15185)

PathInfo (see page 15138)

99.1.36.2.2 TQueryForm.Custom Property

Represents a tag option and its value in the generated FORM tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options that qualify the FORM tag generated by the TWebForm descendant. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to specify that the form includes files with the text it submits and indicate that the page returned after submitting the form goes into a separate window, use a Custom value such as the following:

```
ENCTYPE="multipart/form-data" TARGET="ResultFrame"
```

See Also

Style (see page 16933)

99.1.36.2.3 TQueryForm.Method Property

Pascal

```
property Method: TFormMethod;
```

C++

```
__property TFormMethod Method;
```

Description

This is Method, a member of class TQueryForm.

99.1.36.2.4 TQueryForm.Style Property

Adds style attributes to the generated form.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to add a STYLE option that qualifies the FORM tag generated by the TWebForm descendant. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated FORM tag as the value of a STYLE option.

See Also

Custom (see page 16933)

StyleRule (see page 16934)

99.1.36.2.5 TQueryForm.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated form. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style property.

Style (see page 16933)

Styles (see page 17127)

StylesFile (see page 17128)

99.1.37 TQueryRadioGroup Class

TQueryRadioGroup creates an HTML radio group control to represent named parameter.

Class Hierarchy

Pascal

```
TQueryRadioGroup = class(TWebRadioGroupInput, IQueryField);
```

C++

```
class TQueryRadioGroup : public TWebRadioGroupInput, public IQueryField;
```

File

MidItems

Description

Add TQueryRadioGroup as the child of a TQueryFieldGroup (see page 16736) component to add a radio group control that represents a parameter value. By default, the children of TQueryFieldGroup (see page 16736) represent the parameters of an XML broker. However, TQueryRadioGroup can represent any named value that the InternetExpress application uses.

Use the properties and methods of TQueryRadioGroup to

Specify the field or parameter whose value the radio group displays.

Specify the possible values from which the user can choose.

Initialize the value of the radio group.

Specify a caption that describes the value of the radio group.

Customize the appearance of the radio group.

Fit the radio group into the tab order of the generated HTML form.

See Also

TQueryFieldGroup (see page 16736)

TXMLDisplayGroup (see page 17019)

TXMLDisplayGroup (see page 17019)

TXMLBroker (see page 26049)

99.1.37.1 TQueryRadioGroup Members

The following tables list the members exposed by TQueryRadioGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16759)	This is AddAttributes, a member of class TQueryRadioGroup.
	AddElements (see page 16941)	This is AddElements, a member of class TWebListInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16942)	This is ControlContent, a member of class TWebListInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	EventContent (see page 16953)	This is EventContent, a member of class TWebRadioGroupInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
A	FormatInputs (see page 16942)	This is FormatInputs, a member of class TWebListInput.
V	FormatInputs (see page 16953)	This is FormatInputs, a member of class TWebRadioGroupInput.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
V	GetCheckIndex (see page 16759)	This is GetCheckIndex, a member of class TQueryRadioGroup.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.

	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetSubComponents (see page 16942)	This is GetSubComponents, a member of class TWebListInput.
	GetText (see page 16759)	This is GetText, a member of class TQueryRadioGroup.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplAddElements (see page 16942)	This is ImplAddElements, a member of class TWebListInput.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplGetRowSetFieldAttributes (see page 16954)	This is ImplGetRowSetFieldAttributes, a member of class TWebRadioGroupInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16943)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16954)	This is RestoreFieldDefaults, a member of class TWebRadioGroupInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 16943)	This is SetDataSet, a member of class TWebListInput.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItems (see page 16943)	This is SetItems, a member of class TWebListInput.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetText (see page 16760)	This is SetText, a member of class TQueryRadioGroup.
	SetValues (see page 16944)	This is SetValues, a member of class TWebListInput.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
V	Create (see page 16940)	Creates and initializes an instance of TWebListInput (see page 16935).
V	Create (see page 16952)	Creates and initializes an instance of TWebRadioGroupInput (see page 16947).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).

	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
	Destroy (see page 16941)	Frees an instance of TWebListInput (see page 16935).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParamName (see page 17071)	This is GetParamName, a member of class IQueryField.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsQueryField (see page 16760)	Indicates whether the component generates a control that can appear in a query form.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.

	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetParamName (see page 17071)	This is SetParamName, a member of class IQueryField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16761)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16761)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16761)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16762)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 16762)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayColumns (see page 16763)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 16763)	Specifies the width of the radio group, in characters.
	FieldName (see page 16764)	Specifies the name of the field whose value the generated control represents.
	Items (see page 16764)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 16765)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParamName (see page 16765)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 16766)	Indicates whether end users can use the generated control to set values.
	Style (see page 16766)	Adds style attributes to the generated display control.
	StyleRule (see page 16766)	This is StyleRule, a member of class TQueryRadioGroup.

	TabIndex (see page 16767)	Determines the position of the generated control in the HTML form's tab order.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Text (see page 16767)	Specifies the initial value of the radio group.
	Values (see page 16767)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 16768)	Indicates which field in DataSet supplies the possible values for the generated control.

99.1.37.2 TQueryRadioGroup Methods

The methods of the TQueryRadioGroup class are listed here.

Protected Methods

	Name	Description
V	AddAttributes (see page 16759)	This is AddAttributes, a member of class TQueryRadioGroup.
V	GetCheckIndex (see page 16759)	This is GetCheckIndex, a member of class TQueryRadioGroup.
	GetText (see page 16759)	This is GetText, a member of class TQueryRadioGroup.
	SetText (see page 16760)	This is SetText, a member of class TQueryRadioGroup.

Public Methods

	Name	Description
V	IsQueryField (see page 16760)	Indicates whether the component generates a control that can appear in a query form.

99.1.37.2.1 TQueryRadioGroup.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); override;
```

C++

```
virtual __fastcall AddAttributes(AnsiString Attrs);
```

Description

This is AddAttributes, a member of class TQueryRadioGroup.

99.1.37.2.2 TQueryRadioGroup.GetCheckIndex Method

Pascal

```
function GetCheckIndex(ItemsStrings: TStrings; ValuesStrings: TStrings): Integer; override;
```

C++

```
virtual __fastcall int GetCheckIndex(TStrings ItemsStrings, TStrings ValuesStrings);
```

Description

This is GetCheckIndex, a member of class TQueryRadioGroup.

99.1.37.2.3 TQueryRadioGroup.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall AnsiString GetText();
```

Description

This is GetText, a member of class TQueryRadioGroup.

99.1.37.2.4 TQueryRadioGroup.IsQueryField Method

Indicates whether the component generates a control that can appear in a query form.

Pascal

```
class function IsQueryField: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

Call IsQueryField to determine whether a Web display component generates a control that represents a named value in a query form (TQueryForm (see page 16745)). IsQueryField returns true, because TQueryRadioGroup (see page 16753) is designed specifically for use by TQueryFieldGroup (see page 16736).

See Also

IsColumn (see page 16895)

TQueryFieldGroup (see page 16736)

TQueryForm (see page 16745)

99.1.37.2.5 TQueryRadioGroup.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const AnsiString Value);
```

Description

This is SetText, a member of class TQueryRadioGroup.

99.1.37.3 TQueryRadioGroup Properties

The properties of the TQueryRadioGroup class are listed here.

Published Properties

	Name	Description
	Caption (see page 16761)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16761)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16761)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16762)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 16762)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayColumns (see page 16763)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 16763)	Specifies the width of the radio group, in characters.
	FieldName (see page 16764)	Specifies the name of the field whose value the generated control represents.
	Items (see page 16764)	Lists the possible selections that appear in the generated control.

	ItemsField (see page 16765)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ParamName (see page 16765)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 16766)	Indicates whether end users can use the generated control to set values.
	Style (see page 16766)	Adds style attributes to the generated display control.
	StyleRule (see page 16766)	This is StyleRule, a member of class TQueryRadioGroup.
	TabIndex (see page 16767)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 16767)	Specifies the initial value of the radio group.
	Values (see page 16767)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 16768)	Indicates which field in DataSet supplies the possible values for the generated control.

99.1.37.3.1 TQueryRadioGroup.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.37.3.2 TQueryRadioGroup.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.37.3.3 TQueryRadioGroup.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 16897)

Caption (see page 16897)

99.1.37.3.4 TQueryRadioGroup.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.37.3.5 TQueryRadioGroup.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 16945)

ValuesField (see page 16946)

Items (see page 16945)

Values (see page 16946)

99.1.37.3.6 TQueryRadioGroup.DisplayColumns Property

Specifies the number of radio buttons that appear in each row of the control.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to specify how many radio buttons can appear in a single line of the radio group. If DisplayColumns is less than the number of items, the radio group displays its buttons in multiple rows.

See Also

ItemsField (see page 16945)

Items (see page 16945)

DisplayWidth (see page 16955)

99.1.37.3.7 TQueryRadioGroup.DisplayWidth Property

Specifies the width of the radio group, in characters.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to limit the width of the generated control. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. DisplayWidth is added as a WIDTH option.

See Also

DisplayColumns (see page 16954)

Custom (see page 16898)

99.1.37.3.8 TQueryRadioGroup.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 17033)

XMLDataSetField (see page 17033)

ParamName (see page 16910)

Setting Web Item Properties

99.1.37.3.9 TQueryRadioGroup.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.37.3.10 TQueryRadioGroup.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property AnsiString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.37.3.11 TQueryRadioGroup.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property AnsiString ParamName;__property AnsiString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

See Also

FieldName (see page 16909)

IsQueryField (see page 16895)

Params (see page 26073)

xmlbroker (see page 17033)

Setting Web Item Properties

99.1.37.3.12 TQueryRadioGroup.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the radio group. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. ReadOnly is added as a READONLY option.

See Also

DisplayWidth (see page 16955)

Custom (see page 16898)

99.1.37.3.13 TQueryRadioGroup.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.37.3.14 TQueryRadioGroup.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TQueryRadioGroup.

99.1.37.3.15 TQueryRadioGroup.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

99.1.37.3.16 TQueryRadioGroup.Text Property

Specifies the initial value of the radio group.

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

Use Text to initialize the value that appears in the generated radio group. This should be one of the values listed in the Items (see page 16764) property or in the field referenced by the ItemsField (see page 16765) property.

See Also

Items (see page 16945)

ItemsField (see page 16945)

99.1.37.3.17 TQueryRadioGroup.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 16945)

ItemsField (see page 16945)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.37.3.18 TQueryRadioGroup.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property AnsiString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ItemsField (see page 16945)

99.1.38 TQuerySelectOptions Class

TQuerySelectOptions creates an HTML list control to represent a named parameter.

Class Hierarchy

Pascal

```
TQuerySelectOptions = class(TWebSelectOptionsInput, IQueryField);
```

C++

```
class TQuerySelectOptions : public TWebSelectOptionsInput, public IQueryField;
```

File

MidItems

Description

Add TQuerySelectOptions as the child of a TQueryFieldGroup (see page 16736) component to add a list control that represents a parameter value. By default, the children of TQueryFieldGroup (see page 16736) represent the parameters of an XML broker. However, TQuerySelectOptions can represent any named value that the InternetExpress application uses.

Use the properties and methods of TQuerySelectOptions to

Specify the field or parameter whose value the list box displays.

Specify the possible values from which the user can choose.

Assign an initial value to the list box.

Specify a caption that describes the value of the list box.

Customize the appearance of the list box.

Fit the list box into the tab order of the generated HTML form.

See Also

TQueryFieldGroup (see page 16736)

TXMLDisplayGroup (see page 17019)

TXMLDisplayGroup (see page 17019)

TXMLBroker (see page 26049)

99.1.38.1 TQuerySelectOptions Members

The following tables list the members exposed by TQuerySelectOptions.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16962)	This is AddAttributes, a member of class TWebSelectOptionsInput.
	AddElements (see page 16941)	This is AddElements, a member of class TWebListInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16942)	This is ControlContent, a member of class TWebListInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	EventContent (see page 16962)	This is EventContent, a member of class TWebSelectOptionsInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
A	FormatInputs (see page 16942)	This is FormatInputs, a member of class TWebListInput.
V	FormatInputs (see page 16962)	This is FormatInputs, a member of class TWebSelectOptionsInput.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
V	GetSelectIndex (see page 16775)	This is GetSelectIndex, a member of class TQuerySelectOptions.
	GetSubComponents (see page 16942)	This is GetSubComponents, a member of class TWebListInput.
	GetText (see page 16775)	This is GetText, a member of class TQuerySelectOptions.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplAddElements (see page 16942)	This is ImplAddElements, a member of class TWebListInput.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16943)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 16943)	This is SetDataSet, a member of class TWebListInput.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItems (see page 16943)	This is SetItems, a member of class TWebListInput.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetText (see page 16776)	This is SetText, a member of class TQuerySelectOptions.
	SetValues (see page 16944)	This is SetValues, a member of class TWebListInput.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
V	Create (see page 16940)	Creates and initializes an instance of TWebListInput (see page 16935).
V	Create (see page 16961)	Creates and initializes an instance of TWebSelectOptionsInput (see page 16956).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 16941)	Frees an instance of TWebListInput (see page 16935).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParamName (see page 17071)	This is GetParamName, a member of class IQueryField.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsQueryField (see page 16775)	Indicates whether the component generates a control that can appear in a query form.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetParamName (see page 17071)	This is SetParamName, a member of class IQueryField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16776)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16777)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16777)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16777)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 16778)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 16778)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 16779)	Specifies the name of the field whose value the generated control represents.
	Items (see page 16779)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 16780)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParamName (see page 16780)	Specifies the name of the parameter whose value the generated control represents.
	Style (see page 16781)	Adds style attributes to the generated display control.
	StyleRule (see page 16781)	This is StyleRule, a member of class TQuerySelectOptions.
	TabIndex (see page 16781)	Determines the position of the generated control in the HTML form's tab order.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Text (see page 16782)	Specifies the initial value selected in the list box.
	Values (see page 16782)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 16782)	Indicates which field in DataSet supplies the possible values for the generated control.

99.1.38.2 TQuerySelectOptions Methods

The methods of the TQuerySelectOptions class are listed here.

Protected Methods

	Name	Description
V	GetSelectIndex (see page 16775)	This is GetSelectIndex, a member of class TQuerySelectOptions.
	GetText (see page 16775)	This is GetText, a member of class TQuerySelectOptions.
	SetText (see page 16776)	This is SetText, a member of class TQuerySelectOptions.

Public Methods

	Name	Description
	IsQueryField (see page 16775)	Indicates whether the component generates a control that can appear in a query form.

99.1.38.2.1 TQuerySelectOptions.GetSelectIndex Method

Pascal

```
function GetSelectIndex(ItemsStrings: TStrings; ValuesStrings: TStrings): Integer; override;
```

C++

```
virtual __fastcall int GetSelectIndex(TStrings ItemsStrings, TStrings ValuesStrings);
```

Description

This is GetSelectIndex, a member of class TQuerySelectOptions.

99.1.38.2.2 TQuerySelectOptions.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall AnsiString GetText();
```

Description

This is GetText, a member of class TQuerySelectOptions.

99.1.38.2.3 TQuerySelectOptions.IsQueryField Method

Indicates whether the component generates a control that can appear in a query form.

Pascal

```
class function IsQueryField: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

Call IsQueryField to determine whether a Web display component generates a control that represents a named value in a query form (TQueryForm (see page 16745)). IsQueryField returns true, because TQuerySelectOptions (see page 16768) is designed specifically for use by TQueryFieldGroup (see page 16736).

See Also

IsColumn (see page 16895)

TQueryFieldGroup (see page 16736)

TQueryForm (see page 16745)

99.1.38.2.4 TQuerySelectOptions.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const AnsiString Value);
```

Description

This is SetText, a member of class TQuerySelectOptions.

99.1.38.3 TQuerySelectOptions Properties

The properties of the TQuerySelectOptions class are listed here.

Published Properties

	Name	Description
	Caption (see page 16776)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16777)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16777)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16777)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 16778)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 16778)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 16779)	Specifies the name of the field whose value the generated control represents.
	Items (see page 16779)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 16780)	Indicates which field in DataSet supplies the possible selections for the generated control.
	ParamName (see page 16780)	Specifies the name of the parameter whose value the generated control represents.
	Style (see page 16781)	Adds style attributes to the generated display control.
	StyleRule (see page 16781)	This is StyleRule, a member of class TQuerySelectOptions.
	TabIndex (see page 16781)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 16782)	Specifies the initial value selected in the list box.
	Values (see page 16782)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 16782)	Indicates which field in DataSet supplies the possible values for the generated control.

99.1.38.3.1 TQuerySelectOptions.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.38.3.2 TQuerySelectOptions.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.38.3.3 TQuerySelectOptions.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 16897)

Caption (see page 16897)

99.1.38.3.4 TQuerySelectOptions.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to

add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.38.3.5 TQuerySelectOptions.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 16945)

ValuesField (see page 16946)

Items (see page 16945)

Values (see page 16946)

99.1.38.3.6 TQuerySelectOptions.DisplayRows Property

Specifies the number of rows that appear in the generated list box.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify how many rows appear in the generated list control. If DisplayRows is less than the number of

items, the generated list displays only DisplayRows options at one time, but can scroll to display the hidden items. If DisplayRows is 1, the generated control becomes a drop-down list box.

See Also

ItemsField (see page 16945)

Items (see page 16945)

99.1.38.3.7 TQuerySelectOptions.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 17033)

XMLDataSetField (see page 17033)

ParamName (see page 16910)

Setting Web Item Properties

99.1.38.3.8 TQuerySelectOptions.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.38.3.9 TQuerySelectOptions.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property AnsiString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.38.3.10 TQuerySelectOptions.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property AnsiString ParamName;__property AnsiString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

See Also

FieldName (see page 16909)

IsQueryField (see page 16895)

Params (see page 26073)

xmlbroker (see page 17033)

Setting Web Item Properties

99.1.38.3.11 TQuerySelectOptions.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.38.3.12 TQuerySelectOptions.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TQuerySelectOptions.

99.1.38.3.13 TQuerySelectOptions.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

99.1.38.3.14 TQuerySelectOptions.Text Property

Specifies the initial value selected in the list box.

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

Use Text to initialize the value of the generated list control. Text should specify one of the values listed in the Items (see page 16779) property or referenced by the ItemsField (see page 16780) property.

See Also

Items (see page 16945)

ItemsField (see page 16945)

99.1.38.3.15 TQuerySelectOptions.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 16945)

ItemsField (see page 16945)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.38.3.16 TQuerySelectOptions.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property AnsiString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ItemsField (see page 16945)

99.1.39 TQueryText Class

TQueryText creates a single-line HTML input control to represent a named parameter.

Class Hierarchy

Pascal

```
TQueryText = class(TWebTextInput, IQueryField);
```

C++

```
class TQueryText : public TWebTextInput, public IQueryField;
```

File

MidItems

Description

Add TQueryText as the child of a TQueryFieldGroup (see page 16736) component to add an edit control that represents a parameter value. By default, the children of TQueryFieldGroup (see page 16736) represent the parameters of an XML broker. However, TQueryText can represent any named value that the InternetExpress application uses.

Use the properties and methods of TQueryText to

Specify the field or parameter whose value the control displays.

Assign an initial value to the control.

Specify a caption that describes the value of the control.

Customize the appearance of the input control.

Fit the control into the tab order of the generated HTML form.

See Also

TQueryFieldGroup (see page 16736)

TXMLDisplayGroup (see page 17019)

TXMLDisplayGroup (see page 17019)

TXMLBroker (see page 26049)

99.1.39.1 TQueryText Members

The following tables list the members exposed by TQueryText.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16789)	This is AddAttributes, a member of class TQueryText.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16987)	This is ControlContent, a member of class TWebTextInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.

	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetText (see page 16789)	This is GetText, a member of class TQueryText.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetRowSetFieldAttributes (see page 16987)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.
	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 16987)	This is RestoreFieldDefaults, a member of class TWebTextInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetText (see page 16790)	This is SetText, a member of class TQueryText.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
	Create (see page 16788)	Creates and initializes an instance of TQueryText (see page 16783).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParamName (see page 17071)	This is GetParamName, a member of class IQueryField.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16789)	Indicates whether the component generates a control that can appear in a query form.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetParamName (see page 17071)	This is SetParamName, a member of class IQueryField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16790)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16791)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16791)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16791)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 16792)	Specifies the horizontal size of the generated control.
	FieldName (see page 16792)	Specifies the name of the field whose value the generated control represents.
	MaxWidth (see page 16793)	Limits the length of text users can type into the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParamName (see page 16793)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 16793)	Indicates whether end users can use the generated control to set values.
	Style (see page 16794)	Adds style attributes to the generated display control.
	StyleRule (see page 16794)	This is StyleRule, a member of class TQueryText.
	TabIndex (see page 16794)	Determines the position of the generated control in the HTML form's tab order.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Text (see page 16795)	Specifies the initial value of the generated control.

99.1.39.2 TQueryText.Create Constructor

Creates and initializes an instance of TQueryText (see page 16783).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TQueryText(TComponent * AOwner);
```

Description

Call Create to instantiate TQueryText (see page 16783) at runtime. TQueryText (see page 16783) components added at design time using the Web Page editor are instantiated automatically.

99.1.39.3 TQueryText Methods

The methods of the TQueryText class are listed here.

Protected Methods

	Name	Description
	AddAttributes (see page 16789)	This is AddAttributes, a member of class TQueryText.
	GetText (see page 16789)	This is GetText, a member of class TQueryText.
	SetText (see page 16790)	This is SetText, a member of class TQueryText.

Public Methods

	Name	Description
	IsQueryField (see page 16789)	Indicates whether the component generates a control that can appear in a query form.

99.1.39.3.1 TQueryText.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); override;
```

C++

```
virtual __fastcall AddAttributes(AnsiString Attrs);
```

Description

This is AddAttributes, a member of class TQueryText.

99.1.39.3.2 TQueryText.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall AnsiString GetText();
```

Description

This is GetText, a member of class TQueryText.

99.1.39.3.3 TQueryText.IsQueryField Method

Indicates whether the component generates a control that can appear in a query form.

Pascal

```
class function IsQueryField: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

Call IsQueryField to determine whether a Web display component generates a control that represents a named value in a query form (TQueryForm (see page 16745)). IsQueryField returns true, because TQueryText (see page 16783) is designed specifically for TQueryFieldGroup (see page 16736) to use.

See Also

IsColumn (see page 16895)

TQueryFieldGroup (see page 16736)

TQueryForm (see page 16745)

99.1.39.3.4 TQueryText.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const AnsiString Value);
```

Description

This is SetText, a member of class TQueryText.

99.1.39.4 TQueryText Properties

The properties of the TQueryText class are listed here.

Published Properties

	Name	Description
	Caption (see page 16790)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16791)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16791)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16791)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 16792)	Specifies the horizontal size of the generated control.
	FieldName (see page 16792)	Specifies the name of the field whose value the generated control represents.
	MaxWidth (see page 16793)	Limits the length of text users can type into the control.
	ParamName (see page 16793)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 16793)	Indicates whether end users can use the generated control to set values.
	Style (see page 16794)	Adds style attributes to the generated display control.
	StyleRule (see page 16794)	This is StyleRule, a member of class TQueryText.
	TabIndex (see page 16794)	Determines the position of the generated control in the HTML form's tab order.
	Text (see page 16795)	Specifies the initial value of the generated control.

99.1.39.4.1 TQueryText.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.39.4.2 TQueryText.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.39.4.3 TQueryText.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 16897)

Caption (see page 16897)

99.1.39.4.4 TQueryText.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.39.4.5 TQueryText.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in the control.

Note: DisplayWidth controls the size of the generated control, not the size of the text that users can enter. If the user enters a string longer than DisplayWidth characters, the text scrolls in the control.

99.1.39.4.6 TQueryText.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 17033)

XMLDataSetField (see page 17033)

ParamName (see page 16910)

Setting Web Item Properties

99.1.39.4.7 TQueryText.MaxWidth Property

Limits the length of text users can type into the control.

Pascal

```
property MaxWidth: Integer;
```

C++

```
__property int MaxWidth;
```

Description

Use MaxWidth to limit the length of strings (in characters) that users can type into the generated control.

Note: MaxWidth has no effect on the size of the generated control. To limit the size of the control, use the DisplayWidth (see page 16792) property.

See Also

DisplayWidth (see page 16988)

99.1.39.4.8 TQueryText.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property AnsiString ParamName;__property AnsiString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

See Also

FieldName (see page 16909)

IsQueryField (see page 16895)

Params (see page 26073)

xmlbroker (see page 17033)

Setting Web Item Properties

99.1.39.4.9 TQueryText.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control.

99.1.39.4.10 TQueryText.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.39.4.11 TQueryText.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TQueryText.

99.1.39.4.12 TQueryText.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

99.1.39.4.13 TQueryText.Text Property

Specifies the initial value of the generated control.

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

Use Text to initialize the value that appears in the generated display control.

See Also

FieldName (see page 16909)

ParamName (see page 16910)

99.1.40 TQueryTextArea Class

TQueryTextArea creates a multi-line HTML input control to represent named parameter.

Class Hierarchy

Pascal

```
TQueryTextArea = class(TWebTextAreaInput, IQueryField);
```

C++

```
class TQueryTextArea : public TWebTextAreaInput, public IQueryField;
```

File

MidItems

Description

Add TQueryTextArea as the child of a TQueryFieldGroup (see page 16736) component to add a multi-line edit control that

represents a parameter value. By default, the children of TQueryFieldGroup (see page 16736) represent the parameters of an XML broker. However, TQueryTextArea can represent any named value that the InternetExpress application uses.

Use the properties and methods of TQueryTextArea to

Specify the field or parameter whose value the control displays.

Assign an initial value to the control.

Specify a caption that describes the value of the control.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

TQueryFieldGroup (see page 16736)

TXMLDisplayGroup (see page 17019)

TXMLDisplayGroup (see page 17019)

TXMLBroker (see page 26049)

99.1.40.1 TQueryTextArea Members

The following tables list the members exposed by TQueryTextArea.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16801)	This is AddAttributes, a member of class TQueryTextArea.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
V	ControlContent (see page 16801)	This is ControlContent, a member of class TQueryTextArea.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	EventContent (see page 16978)	This is EventContent, a member of class TWebTextAreaInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.

	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetText (see page 16802)	This is GetText, a member of class TQueryTextArea.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplGetRowSetFieldAttributes (see page 16978)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.
	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 16978)	This is RestoreFieldDefaults, a member of class TWebTextAreaInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetLines (see page 16802)	This is SetLines, a member of class TQueryTextArea.

V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetText (see page 16803)	This is SetText, a member of class TQueryTextArea.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16800)	Creates and initializes an instance of TQueryTextArea (see page 16795).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 16801)	Frees an instance of TQueryTextArea (see page 16795).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParamName (see page 17071)	This is GetParamName, a member of class IQueryField.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsQueryField (see page 16802)	Indicates whether the component generates a control that can appear in a query form.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetParamName (see page 17071)	This is SetParamName, a member of class IQueryField.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Text (see page 17072)	This is Text, a member of class IQueryField.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16803)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16804)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16804)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16804)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 16805)	Specifies the height of the generated control.
	DisplayWidth (see page 16805)	Specifies the horizontal size of the generated control.
	FieldName (see page 16805)	Specifies the name of the field whose value the generated control represents.
	Lines (see page 16806)	Specifies the initial value that appears in the multi-line edit control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParamName (see page 16806)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 16807)	Indicates whether end users can use the generated control to set values.
	Style (see page 16807)	Adds style attributes to the generated display control.
	StyleRule (see page 16808)	This is StyleRule, a member of class TQueryTextArea.
	TabIndex (see page 16808)	Determines the position of the generated control in the HTML form's tab order.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Wrap (see page 16808)	Specifies how the generated control treats lines that are longer than the display width.

99.1.40.2 TQueryTextArea.Create Constructor

Creates and initializes an instance of TQueryTextArea (see page 16795).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TQueryTextArea(TComponent * AOwner);
```

Description

Call Create to instantiate TQueryTextArea (see page 16795) at runtime. TQueryTextArea (see page 16795) components

added at design time using the Web Page editor are instantiated automatically.

99.1.40.3 TQueryTextArea.Destroy Destructor

Frees an instance of TQueryTextArea (see page 16795).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TQueryTextArea();
```

Description

Do not call Destroy directly in an application. Instead, use the Free method, which checks that the component reference is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

99.1.40.4 TQueryTextArea Methods

The methods of the TQueryTextArea class are listed here.

Protected Methods

	Name	Description
	AddAttributes (see page 16801)	This is AddAttributes, a member of class TQueryTextArea.
	ControlContent (see page 16801)	This is ControlContent, a member of class TQueryTextArea.
	GetText (see page 16802)	This is GetText, a member of class TQueryTextArea.
	SetLines (see page 16802)	This is SetLines, a member of class TQueryTextArea.
	SetText (see page 16803)	This is SetText, a member of class TQueryTextArea.

Public Methods

	Name	Description
	IsQueryField (see page 16802)	Indicates whether the component generates a control that can appear in a query form.

99.1.40.4.1 TQueryTextArea.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); override;
```

C++

```
virtual __fastcall AddAttributes(AnsiString Attrs);
```

Description

This is AddAttributes, a member of class TQueryTextArea.

99.1.40.4.2 TQueryTextArea.ControlContent Method

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString ControlContent(TWebContentOptions Options);
```

Description

This is ControlContent, a member of class TQueryTextArea.

99.1.40.4.3 TQueryTextArea.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall AnsiString GetText();
```

Description

This is GetText, a member of class TQueryTextArea.

99.1.40.4.4 TQueryTextArea.IsQueryField Method

Indicates whether the component generates a control that can appear in a query form.

Pascal

```
class function IsQueryField: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

Call IsQueryField to determine whether a Web display component generates a control that represents a named value in a query form (TQueryForm (see page 16745)). IsQueryField returns true, because TQueryTextArea (see page 16795) is designed specifically for TQueryFieldGroup (see page 16736) to use.

See Also

IsColumn (see page 16895)

TQueryFieldGroup (see page 16736)

TQueryForm (see page 16745)

99.1.40.4.5 TQueryTextArea.SetLines Method

Pascal

```
procedure SetLines(const Value: TStrings);
```

C++

```
__fastcall SetLines(const TStrings Value);
```

Description

This is SetLines, a member of class TQueryTextArea.

99.1.40.4.6 TQueryTextArea.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const AnsiString Value);
```

Description

This is SetText, a member of class TQueryTextArea.

99.1.40.5 TQueryTextArea Properties

The properties of the TQueryTextArea class are listed here.

Published Properties

	Name	Description
	Caption (see page 16803)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16804)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16804)	Specifies where the label appears relative to the generated display control.
	Custom (see page 16804)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 16805)	Specifies the height of the generated control.
	DisplayWidth (see page 16805)	Specifies the horizontal size of the generated control.
	FieldName (see page 16805)	Specifies the name of the field whose value the generated control represents.
	Lines (see page 16806)	Specifies the initial value that appears in the multi-line edit control.
	ParamName (see page 16806)	Specifies the name of the parameter whose value the generated control represents.
	ReadOnly (see page 16807)	Indicates whether end users can use the generated control to set values.
	Style (see page 16807)	Adds style attributes to the generated display control.
	StyleRule (see page 16808)	This is StyleRule, a member of class TQueryTextArea.
	TabIndex (see page 16808)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 16808)	Specifies how the generated control treats lines that are longer than the display width.

99.1.40.5.1 TQueryTextArea.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.40.5.2 TQueryTextArea.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.40.5.3 TQueryTextArea.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 16897)

Caption (see page 16897)

99.1.40.5.4 TQueryTextArea.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.40.5.5 TQueryTextArea.DisplayRows Property

Specifies the height of the generated control.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to indicate the desired height of the generated HTML control. DisplayRows specifies the number of lines of text that can be displayed in the control. This value is assigned to the ROWS option of the generated TEXTAREA tag.

See Also

DisplayWidth (see page 16979)

99.1.40.5.6 TQueryTextArea.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in one line of the control. This value is assigned to the COLS option of the generated TEXTAREA tag.

See Also

DisplayRows (see page 16979)

99.1.40.5.7 TQueryTextArea.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 17033)

XMLDataSetField (see page 17033)

ParamName (see page 16910)

Setting Web Item Properties

99.1.40.5.8 TQueryTextArea.Lines Property

Specifies the initial value that appears in the multi-line edit control.

Pascal

```
property Lines: TStrings;
```

C++

```
__property TStrings Lines;
```

Description

Use Lines to initialize the value that appears in the generated display control.

Each string in the TStrings object designates a line in the text value. This may affect the formatting, depending on the value of Wrap (see page 16808).

See Also

FieldName (see page 16909)

ParamName (see page 16910)

Wrap (see page 16980)

99.1.40.5.9 TQueryTextArea.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property AnsiString ParamName;__property AnsiString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

See Also

FieldName (see page 16909)

IsQueryField (see page 16895)

Params (see page 26073)

xmlbroker (see page 17033)

Setting Web Item Properties

99.1.40.5.10 TQueryTextArea.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control. This value determines whether there is a READONLY option added to the generated TEXTAREA tag.

99.1.40.5.11 TQueryTextArea.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.40.5.12 TQueryTextArea.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TQueryTextArea.

99.1.40.5.13 TQueryTextArea.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

99.1.40.5.14 TQueryTextArea.Wrap Property

Specifies how the generated control treats lines that are longer than the display width.

Pascal

```
property Wrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap Wrap;
```

Description

Use Wrap to specify how the generated control formats lines that are longer than the number of characters specified by DisplayWidth. TWebTextAreaInput uses Wrap to add a WRAP option to the generated TEXTAREA tag.

Wrap can have any of the following values:

Value	WRAP option value	Meaning
wrOff	OFF	The control does not wrap long lines. Only newline characters that are part of the text string cause the lines in the control to wrap.
wrPhysical	PHYSICAL	The control formats its text value by wrapping long lines so that no text is hidden. The control inserts carriage returns into the text string.

wrVirtual	VIRTUAL	The control formats its text value by wrapping long lines so that no text is hidden but does not change the actual value of the text string.

See Also

DisplayWidth (see page 16979)

99.1.41 TResetQueryButton Class

TResetQueryButton generates an HTML control that backs out changes to the values on a query form.

Class Hierarchy

Pascal

```
TResetQueryButton = class(TQueryButton);
```

C++

```
class TResetQueryButton : public TQueryButton;
```

File

MidItems

Description

Add TResetQueryButton as the child of a TQueryButtons (see page 16730) component (or a layout group that is a child of a TQueryButtons (see page 16730) component) to enable the generated HTML form to undo edits made in the query form's display fields. The resulting HTML button's action backs out all edits to the values displayed on the query form.

Use the properties of TResetQueryButton to customize the appearance of the button.

See Also

TXMLBroker (see page 26049)

TQueryForm (see page 16745)

TQueryButtons (see page 16730)

TLayoutGroup (see page 16687)

99.1.41.1 TResetQueryButton Members

The following tables list the members exposed by TResetQueryButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16723)	This is DefaultCaption, a member of class TQueryButton.

	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	InputType (see page 16723)	This is InputType, a member of class TQueryButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16813)	This is EventContent, a member of class TResetQueryButton.
V	GetCaption (see page 16724)	Returns the value of the Caption property.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetHTMLControlName (see page 16725)	This is GetHTMLControlName, a member of class TQueryButton.
	GetHTMLForm (see page 16725)	This is GetHTMLForm, a member of class TQueryButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetInputType (see page 16725)	This is GetInputType, a member of class TQueryButton.
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXMLComponent (see page 16725)	This is GetXMLComponent, a member of class TQueryButton.
V	ImplContent (see page 16725)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16726)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	ParentXMLComponent (see page 16726)	This is ParentXMLComponent, a member of class TQueryButton.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	SetXMLComponent (see page 16727)	This is SetXMLComponent, a member of class TQueryButton.
	SetXMLUseParent (see page 16727)	This is SetXMLUseParent, a member of class TQueryButton.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16813)	Creates and initializes an instance of TResetQueryButton (see page 16809).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16727)	Specifies the caption that appears on the button.
	Custom (see page 16728)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16728)	Adds style attributes to the generated button control.
	StyleRule (see page 16729)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16729)	Associates the button with the query form whose display controls it influences.
	XMLUseParent (see page 16729)	Specifies whether the button is associated with its parent's query form.

99.1.41.2 TResetQueryButton.Create Constructor

Creates and initializes an instance of TResetQueryButton (see page 16809).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TResetQueryButton(TComponent * AOwner);
```

Description

Call Create to instantiate TResetQueryButton (see page 16809) at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.41.3 TResetQueryButton Methods

The methods of the TResetQueryButton class are listed here.

Protected Methods

	Name	Description
V	EventContent (see page 16813)	This is EventContent, a member of class TResetQueryButton.

99.1.41.3.1 TResetQueryButton.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TResetQueryButton.

99.1.42 TSelectOptionsColumn Class

TSelectOptionsColumn creates an HTML list control to represent a field value in a data grid.

Class Hierarchy

Pascal

```
TSelectOptionsColumn = class(TWebSelectOptionsInput);
```

C++

```
class TSelectOptionsColumn : public TWebSelectOptionsInput;
```

File

MidItems

Description

Add TSelectOptionsColumn as the child of a TDataGrid (see page 16560) component to add a list control as the display control for a column. TSelectOptionsColumn represents the value of a field in the TDataGrid (see page 16560)'s associated dataset.

Use the properties and methods of TSelectOptionsColumn to

Specify the field whose value the list box displays.

Specify the possible values for the field from which the user can choose.

Specify the caption that appears at the top of the column.

Customize the appearance of the list box.

Fit the list box into the tab order of the generated HTML form.

See Also

TDataGrid (see page 16560)

TXMLDisplayGroup (see page 17019)

TXMLDisplayGroup (see page 17019)

99.1.42.1 TSelectOptionsColumn Members

The following tables list the members exposed by TSelectOptionsColumn.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16962)	This is AddAttributes, a member of class TWebSelectOptionsInput.
	AddElements (see page 16941)	This is AddElements, a member of class TWebListInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16942)	This is ControlContent, a member of class TWebListInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	EventContent (see page 16962)	This is EventContent, a member of class TWebSelectOptionsInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
A	FormatInputs (see page 16942)	This is FormatInputs, a member of class TWebListInput.
V	FormatInputs (see page 16962)	This is FormatInputs, a member of class TWebSelectOptionsInput.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
V	GetSelectIndex (see page 16962)	This is GetSelectIndex, a member of class TWebSelectOptionsInput.
	GetSubComponents (see page 16942)	This is GetSubComponents, a member of class TWebListInput.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplAddElements (see page 16942)	This is ImplAddElements, a member of class TWebListInput.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16943)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 16943)	This is SetDataSet, a member of class TWebListInput.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItems (see page 16943)	This is SetItems, a member of class TWebListInput.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetValues (see page 16944)	This is SetValues, a member of class TWebListInput.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.

	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
V	Create (see page 16940)	Creates and initializes an instance of TWebListInput (see page 16935).
V	Create (see page 16961)	Creates and initializes an instance of TWebSelectOptionsInput (see page 16956).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 16941)	Frees an instance of TWebListInput (see page 16935).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16819)	Indicates whether the component generates a control that can appear in the column of a data grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16820)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16821)	Customizes the appearance of the generated control's label.
	Custom (see page 16821)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 16822)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 16822)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 16822)	Specifies the name of the field whose value the generated control represents.
	Items (see page 16823)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 16823)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16824)	Adds style attributes to the generated display control.
	StyleRule (see page 16824)	This is StyleRule, a member of class TSelectOptionsColumn.
	TabIndex (see page 16825)	Determines the position of the generated control in the HTML form's tab order.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Values (see page 16825)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 16825)	Indicates which field in DataSet supplies the possible values for the generated control.

99.1.42.2 TSelectOptionsColumn Methods

The methods of the TSelectOptionsColumn class are listed here.

Public Methods

	Name	Description
V	IsColumn (see page 16819)	Indicates whether the component generates a control that can appear in the column of a data grid.

99.1.42.2.1 TSelectOptionsColumn.IsColumn Method

Indicates whether the component generates a control that can appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a Web display component generates a control that represents a column in a data grid (TDataGrid (see page 16560)). IsColumn returns true, because TSelectOptionsColumn (see page 16814) is designed specifically for TDataGrid (see page 16560) to use.

See Also

IsColumn (see page 16895)

TDataGrid (see page 16560)

99.1.42.3 TSelectOptionsColumn Properties

The properties of the TSelectOptionsColumn class are listed here.

Published Properties

	Name	Description
	Caption (see page 16820)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16821)	Customizes the appearance of the generated control's label.
	Custom (see page 16821)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 16822)	Specifies a dataset that supplies the possible values listed in the generated control.
	DisplayRows (see page 16822)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 16822)	Specifies the name of the field whose value the generated control represents.
	Items (see page 16823)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 16823)	Indicates which field in DataSet supplies the possible selections for the generated control.
	Style (see page 16824)	Adds style attributes to the generated display control.
	StyleRule (see page 16824)	This is StyleRule, a member of class TSelectOptionsColumn.
	TabIndex (see page 16825)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 16825)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 16825)	Indicates which field in DataSet supplies the possible values for the generated control.

99.1.42.3.1 TSelectOptionsColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.42.3.2 TSelectOptionsColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.42.3.3 TSelectOptionsColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.42.3.4 TSelectOptionsColumn.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 16945)

ValuesField (see page 16946)

Items (see page 16945)

Values (see page 16946)

99.1.42.3.5 TSelectOptionsColumn.DisplayRows Property

Specifies the number of rows that appear in the generated list box.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify how many rows appear in the generated list control. If DisplayRows is less than the number of items, the generated list displays only DisplayRows options at one time, but can scroll to display the hidden items. If DisplayRows is 1, the generated control becomes a drop-down list box.

See Also

ItemsField (see page 16945)

Items (see page 16945)

99.1.42.3.6 TSelectOptionsColumn.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 17033)

XMLDataSetField (see page 17033)

ParamName (see page 16910)

Setting Web Item Properties

99.1.42.3.7 TSelectOptionsColumn.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

ItemsField (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.42.3.8 TSelectOptionsColumn.ItemsField Property

Indicates which field in DataSet supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property AnsiString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField property.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.42.3.9 TSelectOptionsColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.42.3.10 TSelectOptionsColumn.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TSelectOptionsColumn.

99.1.42.3.11 TSelectOptionsColumn.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

99.1.42.3.12 TSelectOptionsColumn.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values properties, use the DataSet, ItemsField, and ValuesField properties.

See Also

Items (see page 16945)

ItemsField (see page 16945)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.42.3.13 TSelectOptionsColumn.ValuesField Property

Indicates which field in DataSet supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property AnsiString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items and Values properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ItemsField (see page 16945)

99.1.43 TStatusColumn Class

TStatusColumn generates an HTML control that indicates whether a record in a data grid has been modified by the end user.

Class Hierarchy

Pascal

```
TStatusColumn = class(TWebStatus);
```

C++

```
class TStatusColumn : public TWebStatus;
```

File

MidItems

Description

Add TStatusColumn as the child of a TDataGrid (see page 16560) component to provide feedback about whether records in the grid have been modified. The generated control displays an M if the user has edited a record, an I if the user has inserted the record, and blank if the user has made no changes to the record.

Use the properties and methods of TStatusColumn to

Specify the caption that appears at the top of the column.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

TDataGrid (see page 16560)

TXMLDisplayGroup (see page 17019)

TXMLDisplayGroup (see page 17019)

99.1.43.1 TStatusColumn Members

The following tables list the members exposed by TStatusColumn.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16969)	This is ControlContent, a member of class TWebStatus.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16969)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 16969)	Returns the name that other components can use to refer to the generated display control.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.

V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
V	Create (see page 16968)	Creates and initializes an instance of TWebStatus (see page 16963).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	Identifier (see page 16969)	Returns the name under which record status information is stored in the XML data packet.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16831)	Indicates whether the component generates a control that can appear in the column of a data grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	CaptionPosition (see page 16971)	Specifies where the label appears relative to the generated display control.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayWidth (see page 16971)	Specifies the width, in characters, of the generated HTML control.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16831)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16832)	Customizes the appearance of the generated control's label.
	Custom (see page 16832)	Represents a tag option and its value in the tag for the display control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16832)	Adds style attributes to the generated display control.
	StyleRule (see page 16833)	This is StyleRule, a member of class TStatusColumn.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.43.2 TStatusColumn Methods

The methods of the TStatusColumn class are listed here.

Public Methods

	Name	Description
	IsColumn (see page 16831)	Indicates whether the component generates a control that can appear in the column of a data grid.

99.1.43.2.1 TStatusColumn.IsColumn Method

Indicates whether the component generates a control that can appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a Web item generates a control that represents a column in a data grid (TDataGrid (see page 16560)). IsColumn returns true, because TStatusColumn (see page 16826) is designed specifically for TDataGrid (see page 16560) to use.

See Also

IsColumn (see page 16895)

TDataGrid (see page 16560)

99.1.43.3 TStatusColumn Properties

The properties of the TStatusColumn class are listed here.

Published Properties

	Name	Description
	Caption (see page 16831)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16832)	Customizes the appearance of the generated control's label.
	Custom (see page 16832)	Represents a tag option and its value in the tag for the display control.
	Style (see page 16832)	Adds style attributes to the generated display control.
	StyleRule (see page 16833)	This is StyleRule, a member of class TStatusColumn.

99.1.43.3.1 TStatusColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.43.3.2 TStatusColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.43.3.3 TStatusColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.43.3.4 TStatusColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.43.3.5 TStatusColumn.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TStatusColumn.

99.1.44 TSubmitQueryButton Class

TSubmitQueryButton generates an HTML control that backs out changes to the values on a query form.

Class Hierarchy

Pascal

```
TSubmitQueryButton = class(TQueryButton);
```

C++

```
class TSubmitQueryButton : public TQueryButton;
```

File

MidItems

Description

Add TSubmitQueryButton as the child of a TQueryButtons (see page 16730) component (or a layout group that is a child of a TQueryButtons (see page 16730) component) to enable the generated HTML form to send the values entered in the query form back to the Web application. When the user presses the generated button, the values in the query form are sent to the Web application, using the path info specified by the query form's Action property.

Use the properties of TSubmitQueryButton to customize the appearance of the button.

TXMLBroker (see page 26049)

TQueryForm (see page 16745)

TQueryButtons (see page 16730)

TLayoutGroup (see page 16687)

TCustomQueryForm (see page 16545)

99.1.44.1 TSubmitQueryButton Members

The following tables list the members exposed by TSubmitQueryButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16723)	This is DefaultCaption, a member of class TQueryButton.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	InputType (see page 16723)	This is InputType, a member of class TQueryButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16838)	This is EventContent, a member of class TSubmitQueryButton.
V	GetCaption (see page 16724)	Returns the value of the Caption property.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetHTMLControlName (see page 16725)	This is GetHTMLControlName, a member of class TQueryButton.
	GetHTMLForm (see page 16725)	This is GetHTMLForm, a member of class TQueryButton.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetInputType (see page 16725)	This is GetInputType, a member of class TQueryButton.
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXMLComponent (see page 16725)	This is GetXMLComponent, a member of class TQueryButton.
V	ImplContent (see page 16725)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16726)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	ParentXMLComponent (see page 16726)	This is ParentXMLComponent, a member of class TQueryButton.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	SetXMLComponent (see page 16727)	This is SetXMLComponent, a member of class TQueryButton.
	SetXMLUseParent (see page 16727)	This is SetXMLUseParent, a member of class TQueryButton.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.

R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16838)	Creates and initializes an instance of TSubmitQueryButton (see page 16833).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16727)	Specifies the caption that appears on the button.
	Custom (see page 16728)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16728)	Adds style attributes to the generated button control.
	StyleRule (see page 16729)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16729)	Associates the button with the query form whose display controls it influences.
	XMLUseParent (see page 16729)	Specifies whether the button is associated with its parent's query form.

99.1.44.2 TSubmitQueryButton.Create Constructor

Creates and initializes an instance of TSubmitQueryButton (see page 16833).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSubmitQueryButton(TComponent * AOwner);
```

Description

Call Create to instantiate TSubmitQueryButton (see page 16833) at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.44.3 TSubmitQueryButton Methods

The methods of the TSubmitQueryButton class are listed here.

Protected Methods

	Name	Description
	EventContent (see page 16838)	This is EventContent, a member of class TSubmitQueryButton.

99.1.44.3.1 TSubmitQueryButton.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TSubmitQueryButton.

99.1.45 TTextAreaColumn Class

TTextAreaColumn creates a multi-line HTML input control to represent a field value in a data grid.

Class Hierarchy

Pascal

```
TTextAreaColumn = class(TWebTextAreaInput);
```

C++

```
class TTextAreaColumn : public TWebTextAreaInput;
```

File

MidItems

Description

Add TTextAreaColumn as the child of a TDataGrid (see page 16560) component to add a multi-line edit control as the display control for a column. TTextAreaColumn represents the value of a field in the TDataGrid (see page 16560)'s associated dataset.

Use the properties and methods of TTextAreaColumn to

Specify the field whose value the control displays.

Specify the caption that appears at the top of the column.

Customize the appearance of the control.

Fit the control into the tab order of the generated HTML form.

See Also

IWebContent (see page 24792)

TDataGrid (see page 16560)

TFieldGroup (see page 16591)

TQueryFieldGroup (see page 16736)

TQueryTextArea (see page 16795)

99.1.45.1 TTextAreaColumn Members

The following tables list the members exposed by TTextAreaColumn.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16977)	This is AddAttributes, a member of class TWebTextAreaInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16978)	This is ControlContent, a member of class TWebTextAreaInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	EventContent (see page 16978)	This is EventContent, a member of class TWebTextAreaInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplGetRowSetFieldAttributes (see page 16978)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16978)	This is RestoreFieldDefaults, a member of class TWebTextAreaInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
V	Create (see page 16977)	Creates and initializes an instance of TWebTextAreaInput (see page 16971).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.

V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16844)	Indicates whether the component generates a control that can appear in the column of a data grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16845)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16845)	Customizes the appearance of the generated control's label.
	Custom (see page 16846)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 16846)	Specifies the height of the generated control.
	DisplayWidth (see page 16846)	Specifies the horizontal size of the generated control.
	FieldName (see page 16847)	Specifies the name of the field whose value the generated control represents.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ReadOnly (see page 16847)	Indicates whether end users can use the generated control to set values.
	Style (see page 16847)	Adds style attributes to the generated display control.
	StyleRule (see page 16848)	This is StyleRule, a member of class TTextAreaColumn.
	TabIndex (see page 16848)	Determines the position of the generated control in the HTML form's tab order.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Wrap (see page 16848)	Specifies how the generated control treats lines that are longer than the display width.

99.1.45.2 TTextAreaColumn Methods

The methods of the TTextAreaColumn class are listed here.

Public Methods

	Name	Description
	IsColumn (see page 16844)	Indicates whether the component generates a control that can appear in the column of a data grid.

99.1.45.2.1 TTextAreaColumn.IsColumn Method

Indicates whether the component generates a control that can appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a Web display component generates a control that represents a column in a data grid (TDataGrid (see page 16560)). IsColumn returns true, because TTextAreaColumn (see page 16838) is designed specifically for TDataGrid (see page 16560) to use.

See Also

IsColumn (see page 16895)

TDataGrid (see page 16560)

99.1.45.3 TTextAreaColumn Properties

The properties of the TTextAreaColumn class are listed here.

Published Properties

	Name	Description
	Caption (see page 16845)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16845)	Customizes the appearance of the generated control's label.
	Custom (see page 16846)	Represents a tag option and its value in the tag for the display control.
	DisplayRows (see page 16846)	Specifies the height of the generated control.
	DisplayWidth (see page 16846)	Specifies the horizontal size of the generated control.
	FieldName (see page 16847)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 16847)	Indicates whether end users can use the generated control to set values.
	Style (see page 16847)	Adds style attributes to the generated display control.
	StyleRule (see page 16848)	This is StyleRule, a member of class TTextAreaColumn.
	TabIndex (see page 16848)	Determines the position of the generated control in the HTML form's tab order.
	Wrap (see page 16848)	Specifies how the generated control treats lines that are longer than the display width.

99.1.45.3.1 TTextAreaColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.45.3.2 TTextAreaColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.45.3.3 TTextAreaColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.45.3.4 TTextAreaColumn.DisplayRows Property

Specifies the height of the generated control.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to indicate the desired height of the generated HTML control. DisplayRows specifies the number of lines of text that can be displayed in the control. This value is assigned to the ROWS option of the generated TEXTAREA tag.

See Also

DisplayWidth (see page 16979)

99.1.45.3.5 TTextAreaColumn.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in one line of the control. This value is assigned to the COLS option of the generated TEXTAREA tag.

See Also

DisplayRows (see page 16979)

99.1.45.3.6 TTextAreaColumn.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 17033)

XMLDataSetField (see page 17033)

ParamName (see page 16910)

Setting Web Item Properties

99.1.45.3.7 TTextAreaColumn.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control. This value determines whether there is a READONLY option added to the generated TEXTAREA tag.

99.1.45.3.8 TTextAreaColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.45.3.9 TTextAreaColumn.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TTextAreaColumn.

99.1.45.3.10 TTextAreaColumn.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

99.1.45.3.11 TTextAreaColumn.Wrap Property

Specifies how the generated control treats lines that are longer than the display width.

Pascal

```
property Wrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap Wrap;
```

Description

Use Wrap to specify how the generated control formats lines that are longer than the number of characters specified by DisplayWidth. TWebTextAreaInput uses Wrap to add a WRAP option to the generated TEXTAREA tag.

Wrap can have any of the following values:

Value	WRAP option value	Meaning
wrOff	OFF	The control does not wrap long lines. Only newline characters that are part of the text string cause the lines in the control to wrap.
wrPhysical	PHYSICAL	The control formats its text value by wrapping long lines so that no text is hidden. The control inserts carriage returns into the text string.
wrVirtual	VIRTUAL	The control formats its text value by wrapping long lines so that no text is hidden but does not change the actual value of the text string.

DisplayWidth (see page 16979)

99.1.46 TTextColumn Class

TTextColumn creates a single-line HTML input control to represent a field value in a data grid.

Class Hierarchy

Pascal

```
TTextColumn = class(TWebTextInput);
```

C++

```
class TTextColumn : public TWebTextInput;
```

File

MidItems

Description

Add TTextColumn as the child of a TDataGrid (see page 16560) component to add an edit control as the display control for a

column. TTextColumn represents the value of a field in the TDataGrid (see page 16560)'s associated dataset.

Use the properties and methods of TTextColumn to

Specify the field whose value the control displays.

Specify the caption that appears at the top of the column.

Customize the appearance of the edit control.

Fit the control into the tab order of the generated HTML form.

See Also

TDataGrid (see page 16560)

TXMLDisplayGroup (see page 17019)

TXMLDisplayGroup (see page 17019)

99.1.46.1 TTextColumn Members

The following tables list the members exposed by TTextColumn.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16986)	This is AddAttributes, a member of class TWebTextInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16987)	This is ControlContent, a member of class TWebTextInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.

	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplGetRowSetFieldAttributes (see page 16987)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16987)	This is RestoreFieldDefaults, a member of class TWebTextInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
V	Create (see page 16986)	Creates and initializes an instance of TWebTextInput (see page 16980).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsColumn (see page 16854)	Indicates whether the component generates a control that can appear in the column of a data grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Caption (see page 16855)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16855)	Customizes the appearance of the generated control's label.
	Custom (see page 16856)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 16856)	Specifies the horizontal size of the generated control.
	FieldName (see page 16857)	Specifies the name of the field whose value the generated control represents.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ReadOnly (see page 16857)	Indicates whether end users can use the generated control to set values.
	Style (see page 16857)	Adds style attributes to the generated display control.
	StyleRule (see page 16858)	This is StyleRule, a member of class TTextColumn.
	TabIndex (see page 16858)	Determines the position of the generated control in the HTML form's tab order.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.46.2 TTextColumn Methods

The methods of the TTextColumn class are listed here.

Public Methods

	Name	Description
V	IsColumn (see page 16854)	Indicates whether the component generates a control that can appear in the column of a data grid.

99.1.46.2.1 TTextColumn.IsColumn Method

Indicates whether the component generates a control that can appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a Web display component generates a control that represents a column in a data grid (TDataGrid (see page 16560)). IsColumn returns true, because TTextColumn (see page 16849) is designed specifically for TDataGrid (see page 16560) to use.

See Also

IsColumn (see page 16895)

TDataGrid (see page 16560)

99.1.46.3 TTextColumn Properties

The properties of the TTextColumn class are listed here.

Published Properties

	Name	Description
	Caption (see page 16855)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16855)	Customizes the appearance of the generated control's label.
	Custom (see page 16856)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 16856)	Specifies the horizontal size of the generated control.
	FieldName (see page 16857)	Specifies the name of the field whose value the generated control represents.
	ReadOnly (see page 16857)	Indicates whether end users can use the generated control to set values.
	Style (see page 16857)	Adds style attributes to the generated display control.
	StyleRule (see page 16858)	This is StyleRule, a member of class TTextColumn.
	TabIndex (see page 16858)	Determines the position of the generated control in the HTML form's tab order.

99.1.46.3.1 TTextColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.46.3.2 TTextColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.46.3.3 TTextColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.46.3.4 TTextColumn.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in the control.

Note: DisplayWidth controls the size of the generated control, not the size of the text that users can enter. If the user enters a string longer than DisplayWidth characters, the text scrolls in the control.

99.1.46.3.5 TTextColumn.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 17033)

XMLDataSetField (see page 17033)

ParamName (see page 16910)

Setting Web Item Properties

99.1.46.3.6 TTextColumn.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control.

99.1.46.3.7 TTextColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.46.3.8 TTextColumn.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TTextColumn.

99.1.46.3.9 TTextColumn.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

99.1.47 TUndoButton Class

TUndoButton generates an HTML control that backs out changes to the current record.

Class Hierarchy

Pascal

```
TUndoButton = class(TDataSetButton);
```

C++

```
class TUndoButton : public TDataSetButton;
```

File

MidItems

Description

Add TUndoButton as the child of a TDataNavigator (see page 16569) component (or a layout group that is a child of a TDataNavigator (see page 16569) component) to enable the generated HTML form to undo edits made in an associated display control or controls. The resulting HTML button's action backs out all edits to the current record.

Use the properties of TUndoButton to customize the appearance of the button and associate it with a Web item that generates the display controls.

TLayoutGroup (see page 16687)

99.1.47.1 TUndoButton Members

The following tables list the members exposed by TUndoButton.

Protected Fields

	Name	Description
	DefaultCaption (see page 16581)	This is DefaultCaption, a member of class TDataSetButton.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	XMLMethodName (see page 16581)	This is XMLMethodName, a member of class TDataSetButton.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16582)	This is AddElements, a member of class TDataSetButton.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.

	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16582)	Returns the value of the Caption property.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDisplayComponent (see page 17043)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 17043)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetMethodName (see page 16582)	This is GetMethodName, a member of class TDataSetButton.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16582)	This is GetSubComponents, a member of class TDataSetButton.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 17043)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	ImplAddElements (see page 16583)	This is ImplAddElements, a member of class TDataSetButton.
V	ImplContent (see page 16583)	Provides the underlying implementation for the Content method.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17044)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayComponent (see page 17044)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 17044)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.
R	XMLDisplay (see page 17045)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16863)	Creates and initializes an instance of TUndoButton (see page 16858).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 17042)	Frees an instance of TXMLDisplayReferenceButton (see page 17037).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.

	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLComponent (see page 17045)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 17045)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Caption (see page 16584)	Specifies the caption that appears on the button.
	Custom (see page 16584)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 16584)	Adds style attributes to the generated button control.
	StyleRule (see page 16585)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLComponent (see page 16585)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 16586)	Specifies whether the button is associated with its parent's display object.

99.1.47.2 TUndoButton.Create Constructor

Creates and initializes an instance of TUndoButton (see page 16858).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TUndoButton(TComponent * AOwner);
```

Description

Call Create to instantiate TUndoButton (see page 16858) at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.48 TWebButton Class

TWebButton is the base class for Web items that create HTML button controls.

Class Hierarchy

Pascal

```
TWebButton = class(TWebContainedComponent, IWebContent);
```

C++

```
class TWebButton : public TWebContainedComponent, public IWebContent;
```

File

MidItems

Description

Use TWebButton as a base class for components that generate the HTML statements defining a specialized button control in a WebSnap or InternetExpress application. TWebButton introduces the properties and methods for

Generating the HTML code to define the button control.

Defining a button caption.

Specifying tag attributes of the HTML button control, including those defined by a style sheet.

In order to allow other Web items to use the HTML generated by the button control, TWebButton implements the IWebContent interface.

Do not create instances of TWebButton. TWebButton relies on an abstract or, in C++ terminology, pure virtual method to generate the HTML statements defining a button control. Instead, create descendants of TWebButton that represent buttons with specific purposes.

IWebContent (see page 24792)

99.1.48.1 TWebButton Members

The following tables list the members exposed by TWebButton.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 16868)	Creates and initializes an instance of TWebButton (see page 16863).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.48.2 TWebButton.Create Constructor

Creates and initializes an instance of TWebButton (see page 16863).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebButton(TComponent * AOwner);
```

Description

Call Create to instantiate a Web button at runtime. Web buttons added at design time using the Web Page editor are instantiated automatically.

99.1.48.3 TWebButton Methods

The methods of the TWebButton class are listed here.

Protected Methods

	Name	Description
	Content (see page 16868)	Returns the HTML that defines the button control.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.

99.1.48.3.1 TWebButton.Content Method

Returns the HTML that defines the button control.

Pascal

```
function Content(Options: TWebContentOptions; Layout: TLayout): string;
```

C++

```
__fastcall AnsiString Content(TWebContentOptions Options, TLayout Layout);
```

Description

Content implements the IWebContent method of the same name. This method allows the Web button's parent to extract the HTML defining the button.

Content calls the virtual ImplContent (see page 16869) method to provide the content it returns. Each TWebButton (see page 16863) descendant overrides ImplContent (see page 16869) to generate the definition of its particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

Content returns a string of HTML defining the button control.

See Also

ImplContent (see page 16869)

IWebContent (see page 24792)

ILayoutWebContent (see page 24774)

99.1.48.3.2 TWebButton.GetCaption Method

Returns the value of the Caption (see page 16870) property.

Pascal

```
function GetCaption: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption (see page 16870) property.

See Also

Caption (see page 16870)

SetCaption (see page 16870)

99.1.48.3.3 TWebButton.GetLayoutAttributes Method

Returns the layout object that specifies how the generated control should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; virtual;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 16868) method) to take into account layout properties of the child component.

As implemented by TWebButton (see page 16863), GetLayoutAttributes returns nil (Delphi) or NULL (C++), because the layout of buttons does not make use of layout attributes.

See Also

Content (see page 16868)

99.1.48.3.4 TWebButton.ImplContent Method

Provides the underlying implementation for the Content (see page 16868) method.

Pascal

```
function ImplContent(Options: TWebContentOptions; Layout: TLayout): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout Layout) = 0;
```

Description

The Content (see page 16868) method calls ImplContent to generate the HTML that defines the button control. TWebButton (see page 16863) introduces ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton (see page 16863) descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

See Also

Content (see page 16868)

ILayoutWebContent (see page 24774)

99.1.48.3.5 TWebButton.SetCaption Method

Sets the value of the Caption (see page 16870) property.

Pascal

```
procedure SetCaption(const AValue: string); virtual;
```

C++

```
virtual __fastcall SetCaption(const AnsiString AValue);
```

Description

SetCaption is the protected write implementation for the Caption (see page 16870) property.

See Also

Caption (see page 16870)

GetCaption (see page 16869)

99.1.48.4 TWebButton Properties

The properties of the TWebButton class are listed here.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.

99.1.48.4.1 TWebButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom (see page 16871)

GetCaption (see page 16869)

SetCaption (see page 16870)

99.1.48.4.2 TWebButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption (see page 16870)

Style (see page 16871)

99.1.48.4.3 TWebButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 16871)

StyleRule (see page 16872)

99.1.48.4.4 TWebButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style (see page 16871) property.

See Also

Style (see page 16871)

Styles (see page 17127)

StylesFile (see page 17128)

Styles (see page 19830)

StylesFile (see page 19831)

99.1.49 TWebControlGroup Class

TWebControlGroup is the base class for Web items that arrange HTML controls.

Class Hierarchy

Pascal

```
TWebControlGroup = class(TWebContainedContainerComponent, IWebComponentEditor,
```

```
IScriptComponent, IWebContent);
```

C++

```
class TWebControlGroup : public TWebContainedContainerComponent, public IWebComponentEditor,
public IScriptComponent, public IWebContent;
```

File

MidItems

Description

Use TWebControlGroup as a base class for components that generate organized portions of the HTML document containing one or more related HTML controls. TWebControlGroup introduces the properties and methods for managing a collection of Web items that generate the HTML controls that make up the group.

In order to let other Web items to use the HTML that defines the organized collection of controls, TWebControlGroup implements the IWebContent interface.

Do not create instances of TWebControlGroup. TWebControlGroup manages the Web items that generate HTML defining controls, but does not combine the generated content into any content of its own. Instead, use a descendant of TWebControlGroup for a set of specialized controls. These descendants are listed in the See also list.

See Also

TDataNavigator (see page 16569)

TQueryButtons (see page 16730)

TDataGrid (see page 16560)

TFieldGroup (see page 16591)

TQueryFieldGroup (see page 16736)

IWebContent (see page 24792)

TAdapterForm (see page 25159)

99.1.49.1 TWebControlGroup Members

The following tables list the members exposed by TWebControlGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.

	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.

V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.

	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.49.2 TWebControlGroup.Create Constructor

Creates and initializes an instance of TWebControlGroup (see page 16872).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebControlGroup(TComponent * AOwner);
```

Description

Call Create to instantiate TWebControlGroup (see page 16872) at runtime. TWebControlGroup (see page 16872) descendants added at design time are instantiated automatically.

99.1.49.3 TWebControlGroup.Destroy Destructor

Frees an instance of TWebControlGroup (see page 16872).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebControlGroup();
```

Description

Destroy removes the Web control group from its parent's list of components that generate HTML before freeing its own resources.

99.1.49.4 TWebControlGroup Methods

The methods of the TWebControlGroup class are listed here.

Protected Methods

	Name	Description
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.

	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.

99.1.49.4.1 TWebControlGroup.AddElements Method

Used internally to generate any script declarations needed by the group of controls.

Pascal

```
procedure AddElements(AddIntf: IAddScriptElements);
```

C++

```
__fastcall AddElements(IAddScriptElements AddIntf);
```

Description

The page producer calls AddElements when it generates the block of declarations for the script language it uses. This method allows the generated group of controls to use classes and methods in the scripting language of the page producer.

AddElements calls on the virtual ImplAddElements (see page 16881) method, which uses the provided interface to return its declarations. Each TWebControlGroup (see page 16872) descendant overrides ImplAddElements (see page 16881) to add any declarations it needs.

See Also

ImplAddElements (see page 16881)

TAdapterPageProducer (see page 19802)

TInetXPageProducer (see page 17145)

99.1.49.4.2 TWebControlGroup.CanAddClass Method

Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

The Web page editor calls CanAddClass to determine what Web items can be added to supply content for the TWebControlGroup (see page 16872) descendant. CanAddClass calls the virtual ImplCanAddClass (see page 16881) method to determine whether a class of Web item is valid.

AParent is the TWebControlGroup (see page 16872) descendant to whose WebFieldControls (see page 16884) property the Web item will be added.

AClass is the class of the proposed child Web item.

CanAddClass returns true if the TWebControlGroup (see page 16872) descendant can use content generated by a component of type AClass, false otherwise.

See Also

ImplCanAddClass (see page 16881)

WebFieldControls (see page 16884)

99.1.49.4.3 TWebControlGroup.ChangeFieldControls Method

Responds when the group of HTML controls changes.

Pascal

```
procedure ChangeFieldControls(Sender: TObject);
```

C++

```
__fastcall ChangeFieldControls(TObject * Sender);
```

Description

ChangeFieldControls is called automatically when the list of Web items that generate HTML controls in this group changes. (It is assigned as the OnChange event handler to the TWebComponentList object that implements the WebFieldControls (see page 16884) property.)

ChangeFieldControls sets the DefaultWebComponents (see page 16883) property to nil (Delphi) or NULL (C++) when an application explicitly assigns child items to the WebFieldControls (see page 16884) property.

See Also

OnChange (see page 24719)

WebFieldControls (see page 16884)

DefaultWebComponents (see page 16883)

DefaultWebComponents (see page 16883)

99.1.49.4.4 TWebControlGroup.Content Method

Returns the HTML that defines the group of HTML controls.

Pascal

```
function Content(Options: TWebContentOptions; ParentLayout: TLayout): string;
```

C++

```
__fastcall AnsiString Content(TWebContentOptions Options, TLayout ParentLayout);
```

Description

Content implements the IWebContent method of the same name. This method allows the TWebControlGroup (see page 16872) object's parent to extract the HTML that defines and lays out a set of controls.

Content calls the virtual ImplContent (see page 16882) method to provide the HTML it returns. Each TWebControlGroup (see page 16872) descendant overrides ImplContent (see page 16882) to generate its particular group of controls. The generated HTML can make use of any script declarations supplied by the AddElements (see page 16878) method.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the component should format the HTML it generates. It implements the ILayoutWebContent interface.

Content returns a string of HTML defining the group of controls.

See Also

ImplContent (see page 16882)

IWebContent (see page 24792)

AddElements (see page 16878)

ILayoutWebContent (see page 24774)

99.1.49.4.5 TWebControlGroup.GetDefaultWebComponents Method

Returns the value of the DefaultWebComponents (see page 16883) property.

Pascal

```
function GetDefaultWebComponents: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents returns the value of DefaultWebComponents (see page 16883). When no Web items have explicitly been added to the control group, this is a list of controls that appear by default. Once an application explicitly assigns controls to the WebFieldControls (see page 16884) property, GetDefaultWebComponents returns nil (Delphi) or NULL (C++).

See Also

WebFieldControls (see page 16884)

DefaultWebComponents (see page 16883)

SetDefaultWebComponents (see page 16883)

99.1.49.4.6 TWebControlGroup.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; virtual;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 16879) method) to take into account layout properties of the child component.

As implemented by TWebControlGroup (see page 16872), GetLayoutAttributes returns nil (Delphi) or NULL (C++), because TWebControlGroup (see page 16872) descendants not make use of layout attributes.

See Also

Content (see page 16879)

99.1.49.4.7 TWebControlGroup.GetSubComponents Method

Returns the value of the WebFieldControls (see page 16884) property.

Pascal

```
function GetSubComponents: TObject;
```

C++

```
__fastcall TObject * GetSubComponents();
```

Description

GetSubComponents returns the TWebControlGroup (see page 16872)'s list of Web items that it uses to generate HTML content. This method is part of the mechanism that fits TWebControlGroup (see page 16872) into a hierarchy of Web items, each of which generates part of a larger HTML document.

See Also

WebFieldControls (see page 16884)

ImplGetSubComponents (see page 16882)

99.1.49.4.8 TWebControlGroup.ImplAddElements Method

Provides the underlying implementation for the AddElements (see page 16878) method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); virtual;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements (see page 16878) method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup (see page 16872), ImplAddElements does nothing. TWebControlGroup (see page 16872) descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 16878)

99.1.49.4.9 TWebControlGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass (see page 16878) method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass (see page 16878) method calls ImpleCanAddClass to determine whether the TWebControlGroup (see page 16872) descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup (see page 16872) instance to which the component will be added.

In TWebControlGroup (see page 16872), ImplCanAddClass always returns true. TWebControlGroup (see page 16872) descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 16878)

WebFieldControls (see page 16884)

99.1.49.4.10 TWebControlGroup.ImplContent Method

Provides the underlying implementation for the Content (see page 16879) method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content (see page 16879) method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup (see page 16872), ImplContent returns an empty string. TWebControlGroup (see page 16872) descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup (see page 16872) should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 16879)

AddElements (see page 16878)

ILayoutWebContent (see page 24774)

99.1.49.4.11 TWebControlGroup.ImplGetSubComponents Method

Provides the underlying implementation for the GetSubComponents (see page 16880) method.

Pascal

```
function ImplGetSubComponents: TObject; virtual;
```

C++

```
virtual __fastcall TObject * ImplGetSubComponents();
```

Description

The GetSubComponents (see page 16880) method calls ImplGetSubComponents to retrieve the value of WebFieldControls (see page 16884) as a TObject. TWebControlGroup (see page 16872) descendants override this method if the list is not simply the value of WebFieldControls (see page 16884). For example, some TWebControlGroup (see page 16872) descendants supply a default value (DefaultWebComponents (see page 16883)) when the WebFieldControls (see page 16884) property list is empty.

ImplGetSubComponents returns the TWebComponentList object that contains all subitems of the Web control group.

See Also

GetSubComponents (see page 16880)

DefaultWebComponents (see page 16883)

WebFieldControls (see page 16884)

99.1.49.4.12 TWebControlGroup.SetDefaultWebComponents Method

Sets the value of the DefaultWebComponents (see page 16883) property.

Pascal

```
procedure SetDefaultWebComponents(Value: TWebComponentList); override;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList Value);
```

Description

SetDefaultWebComponents assigns a list of Web items as the value of the DefaultWebComponents (see page 16883) property. This list specifies the controls that appear in the control group if the application does not explicitly assign any controls to the WebFieldControls (see page 16884) property.

See Also

DefaultWebComponents (see page 16883)

GetDefaultWebComponents (see page 16880)

WebFieldControls (see page 16884)

99.1.49.5 TWebControlGroup Properties

The properties of the TWebControlGroup class are listed here.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.

Public Properties

	Name	Description
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

99.1.49.5.1 TWebControlGroup.DefaultWebComponents Property

Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.

Pascal

```
property DefaultWebComponents: TWebComponentList;
```

C++

```
__property TWebComponentList DefaultWebComponents;
```

Description

Most TWebControlGroup (see page 16872) descendants have a default set of values for the WebFieldControls (see page 16884) property.

Note: For example, on Windows, TDataNavigator (see page 16569) has a default set of buttons and TFieldGroup (see page 16591) defaults to a control for each field in the associated data packet.

TWebControlGroup (see page 16872) descendants that supply default sets of Web items store these default sets as the value of the protected DefaultWebComponents property. Then, if the value of WebFieldControls (see page 16884) is not set, the TWebControlGroup (see page 16872) descendant uses DefaultWebComponents instead.

See Also

WebFieldControls (see page 16884)

99.1.49.5.2 TWebControlGroup.WebFieldControls Property

Lists the components that generate HTML controls for the Web control group.

Pascal

```
property WebFieldControls: TWebComponentList;
```

C++

```
__property TWebComponentList WebFieldControls;
```

Description

WebFieldControls lists the components that generate the related HTML controls that the Web control group assembles into a single unit. Each of these components supports the IWebContent interface, and some can contain their own list of Web items that help them generate their content.

The type of items that can be added to the WebFieldControls list are restricted by the CanAddClass (see page 16878) method. TWebControlGroup (see page 16872) does not restrict the items in the list at all, but descendant classes add restrictions to limit the list to related types of controls.

Note: For example, on Windows, TDataNavigator (see page 16569) limits the list to button generators that are descendants of TDataSetButton (see page 16576) or TXMLButton (see page 16989).

At design time, add components to the WebFieldControls property by bringing up the Web page editor for the containing page producer. Select the Web control group in the editor, and use the editor to add child controls.

TInetXPageProducer (see page 17145)

TAdapterPageProducer (see page 19802)

IWebContent (see page 24792)

CanAddClass (see page 16878)

99.1.50 TWebDataDisplay Class

TWebDataDisplay is the base class for Web items that create HTML display controls.

Class Hierarchy

Pascal

```
TWebDataDisplay = class(TWebContainedComponent, IWebContent, IHTMLField);
```

C++

```
class TWebDataDisplay : public TWebContainedComponent, public IWebContent, public IHTMLField;
```

File

MidItems

Description

Use TWebDataDisplay as a base class for components that generate HTML controls which display information in a WebSnap or InternetExpress application. TWebDataDisplay descendants generate the individual controls that are organized by TAdapterGrid or TAdapterFieldGroup.

Note: On Windows, additional descendants, TDataGrid (see page 16560), TFieldGroup (see page 16591), or TQueryFieldGroup (see page 16736), can be used to generate the individual controls.

TWebDataDisplay introduces the properties and methods for

Generating a caption that describes the information displayed.

Customizing the appearance of the control that displays information.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebDataDisplay implements the IWebContent interface.

Do not create instances of TWebDataDisplay. TWebDataDisplay relies on an abstract (pure virtual) method for generating the display control. Instead, use a descendant of TWebDataDisplay that generates an HTML control of the desired type.

See Also

IWebContent (see page 24792)

TAdapterGrid (see page 25175)

TAdapterFieldGroup (see page 25150)

TDataGrid (see page 16560)

TFieldGroup (see page 16591)

TQueryFieldGroup (see page 16736)

99.1.50.1 TWebDataDisplay Members

The following tables list the members exposed by TWebDataDisplay.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.

	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16897)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16897)	Customizes the appearance of the generated control's label.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.

	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16898)	Represents a tag option and its value in the tag for the display control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16899)	Adds style attributes to the generated display control.
	StyleRule (see page 16899)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.50.2 TWebDataDisplay.Create Constructor

Creates and initializes an instance of TWebDataDisplay (see page 16884).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebDataDisplay(TComponent * AOwner);
```

Description

Call Create to instantiate TWebDataDisplay (see page 16884) at runtime. TWebDataDisplay (see page 16884) descendants added at design time are instantiated automatically.

99.1.50.3 TWebDataDisplay.Destroy Destructor

Frees an instance of TWebDataDisplay (see page 16884).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebDataDisplay();
```

Description

Do not call Destroy directly in an application. Instead, use the Free method, which checks that the component is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

99.1.50.4 TWebDataDisplay Methods

The methods of the TWebDataDisplay class are listed here.

Protected Methods

	Name	Description
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.

Public Methods

	Name	Description
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

99.1.50.4.1 TWebDataDisplay.Content Method

Returns the HTML that defines the display control.

Pascal

```
function Content(Options: TWebContentOptions; ParentLayout: TLayout): string;
```

C++

```
__fastcall AnsiString Content(TWebContentOptions Options, TLayout ParentLayout);
```

Description

Content implements the IWebContent method of the same name. This method allows the TWebDataDisplay (see page 16884) component's parent to extract the HTML defining the display control.

Content calls the virtual ImplContent (see page 16894) method to provide the HTML content that it returns. Each TWebDataDisplay (see page 16884) descendant overrides ImplContent (see page 16894) to generate the definition of its particular control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the component should format the HTML control it generates. It supports the ILayoutWebContent interface.

Content returns a string of HTML defining the display control.

See Also

ImplContent (see page 16894)

IWebContent (see page 24792)

ILayoutWebContent (see page 24774)

99.1.50.4.2 TWebDataDisplay.ControlContent Method

Pascal

```
function ControlContent(Options: TWebContentOptions): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString ControlContent(TWebContentOptions Options) = 0;
```

Description

This is ControlContent, a member of class TWebDataDisplay.

99.1.50.4.3 TWebDataDisplay.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall AnsiString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TWebDataDisplay.

99.1.50.4.4 TWebDataDisplay.FormatCaption Method

Pascal

```
function FormatCaption: string; virtual;
```

C++

```
virtual __fastcall AnsiString FormatCaption();
```

Description

This is FormatCaption, a member of class TWebDataDisplay.

99.1.50.4.5 TWebDataDisplay.GetCaption Method

Returns the value of the Caption (see page 16897) property.

Pascal

```
function GetCaption: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption (see page 16897) property.

See Also

Caption (see page 16897)

99.1.50.4.6 TWebDataDisplay.GetHTMLControlName Method

Returns the name that other components can use to refer to the generated display control.

Pascal

```
function GetHTMLControlName: string;
```

C++

```
__fastcall AnsiString GetHTMLControlName();
```

Description

GetHTMLControlName returns the name of the generated control. This value is assigned to a NAME option on the generated HTML tag.

GetHTMLControlName returns the value supplied by the ImplGetHTMLControlName (see page 16894) method. Unlike GetHTMLControlName, ImplGetHTMLControlName (see page 16894) is a virtual method that descendants can override to supply a name in class-specific ways.

See Also

ImplGetHTMLControlName (see page 16894)

99.1.50.4.7 TWebDataDisplay.GetHTMLForm Method

Used internally to retrieve information about the form in which the display control is defined.

Pascal

```
function GetHTMLForm: IHTMLForm;
```

C++

```
__fastcall IHTMLForm GetHTMLForm();
```

Description

TWebDataDisplay (see page 16884) and its descendants use GetHTMLForm to obtain information about the form in which the generated display control appears. This information is used to generate code for calling form methods in response to user events.

GetHTMLForm walks up the hierarchy of Web items (using the GetParentComponent method) until it finds a component that can supply an interface for the HTML form.

See Also

GetParentComponent

99.1.50.4.8 TWebDataDisplay.GetLayoutAttributes Method

Returns the value of the LayoutAttributes (see page 16898) property.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; virtual;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 16890) method) to take into account layout properties of the child component.

GetLayoutAttributes returns the value of the LayoutAttributes (see page 16898) property.

See Also

Content (see page 16890)

LayoutAttributes (see page 16898)

99.1.50.4.9 TWebDataDisplay.GetXmlDisplayName Method

Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.

Pascal

```
function GetXmlDisplayName: string;
```

C++

```
__fastcall AnsiString GetXmlDisplayName();
```

Description

GetXmlDisplayName is not available for cross-platform programming. It is introduced in TWebDataDisplay (see page 16884) for descendant classes that are only accessible on Windows.

On Windows, GetXmlDisplayName returns the name of the javascript object that groups the set of display controls which includes this TWebDataDisplay (see page 16884) descendant's generated control. The javascript object is generated by a TDataGrid (see page 16560) or TFieldGroup (see page 16591) component, and provides the display component's link to its XML data packet. Typically, the TDataGrid (see page 16560) or TFieldGroup (see page 16591) component is the parent of the TWebDataDisplay (see page 16884) component, but it may be higher in the parent hierarchy if the application uses layout groups.

See Also

TDataGrid (see page 16560)

TFieldGroup (see page 16591)

TQueryFieldGroup (see page 16736)

xmlbroker (see page 17033)

99.1.50.4.10 TWebDataDisplay.GetXmlRowSetName Method

Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.

Pascal

```
function GetXmlRowSetName: string;
```

C++

```
__fastcall AnsiString GetXmlRowSetName();
```

Description

GetXmlRowSetName is not available for cross-platform programming. It is introduced in TWebDataDisplay (see page 16884) for descendant classes that are only accessible on Windows.

On Windows, GetXmlRowSetName is used when generating HTML that accesses data from the XML data packet. It returns the name of the rowset that represents the data in the Web data display.

As implemented in TWebDataDisplay (see page 16884), GetXmlRowSetName walks up the parent hierarchy until it finds a Web item associated with a rowset, and then returns the name of that rowset.

See Also

GetXmlDisplayName (see page 16893)

99.1.50.4.11 TWebDataDisplay.ImplContent Method

Provides the underlying implementation for the Content (see page 16890) method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content (see page 16890) method calls ImplContent to generate the HTML that defines the display control and its label. ImplContent formats the caption and combines this HTML with the results of the ControlContent (see page 16891) method. ControlContent (see page 16891) is an abstract (pure virtual) method in TWebDataDisplay (see page 16884). TWebDataDisplay (see page 16884) descendants override it to generate the definition of their particular display control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebDataDisplay (see page 16884) should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the display control.

See Also

Content (see page 16890)

Caption (see page 16897)

ILayoutWebContent (see page 24774)

99.1.50.4.12 TWebDataDisplay.ImplGetHTMLControlName Method

Returns the name that other components can use to refer to the generated display control.

Pascal

```
function ImplGetHTMLControlName: string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetHTMLControlName();
```

Description

ImplGetHTMLControlName returns the name of the generated control. This value is assigned to a NAME option on the generated HTML tag.

ImplGetHTMLControlName returns the value of the Name property. TWebDataDisplay (see page 16884) descendants can override this method to return a more meaningful value such as the name of the field or parameter displayed in the control.

See Also

Name (see page 2805)

99.1.50.4.13 TWebDataDisplay.IsColumn Method

Indicates whether the component generates the controls that appear in the column of a grid.

Pascal

```
class function IsColumn: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a TWebDataDisplay (see page 16884) descendant generates the controls that appear in a single column of an adapter grid (TAdapterGrid) or data grid (TDataGrid (see page 16560)). As implemented in TWebDataDisplay (see page 16884), IsColumn returns false. Descendant classes that generate controls for the columns of a grid override this method to return true.

See Also

IsQueryField (see page 16895)

TDataGrid (see page 16560)

TAdapterGrid (see page 25175)

99.1.50.4.14 TWebDataDisplay.IsQueryField Method

Indicates whether the component generates the controls that appear in a query form. Not used on Linux.

Pascal

```
class function IsQueryField: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsQueryField();
```

Description

IsQueryField is not available for cross-platform programming. It is introduced in TWebDataDisplay (see page 16884) for descendant classes that are only used on Windows.

On Windows, Call IsQueryField to determine whether a TWebDataDisplay (see page 16884) descendant generates the controls that represent a named value in a query form (TQueryForm (see page 16745)). As implemented in TWebDataDisplay (see page 16884), IsQueryField returns false. Descendant classes that generate controls for a TQueryFieldGroup (see page 16736) component override this method to return true.

See Also

IsColumn (see page 16895)

TQueryFieldGroup (see page 16736)

TQueryForm (see page 16745)

99.1.50.4.15 TWebDataDisplay.LabelContent Method

Pascal

```
function LabelContent: string; virtual;
```

C++

```
virtual __fastcall AnsiString LabelContent();
```

Description

This is LabelContent, a member of class TWebDataDisplay.

99.1.50.4.16 TWebDataDisplay.SetCaption Method

Sets the value of the Caption (see page 16897) property.

Pascal

```
procedure SetCaption(Value: string); virtual;
```

C++

```
virtual __fastcall SetCaption(AnsiString Value);
```

Description

SetCaption is the protected write implementation for the Caption (see page 16897) property.

See Also

Caption (see page 16897)

99.1.50.4.17 TWebDataDisplay.SetCaptionAttributes Method

Sets the value of the CaptionAttributes (see page 16897) property.

Pascal

```
procedure SetCaptionAttributes(const Value: TCaptionAttributes);
```

C++

```
__fastcall SetCaptionAttributes(const TCaptionAttributes Value);
```

Description

SetCaptionAttributes is the protected write implementation for the CaptionAttributes (see page 16897) property.

See Also

CaptionAttributes (see page 16897)

99.1.50.5 TWebDataDisplay Properties

The properties of the TWebDataDisplay class are listed here.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.

Public Properties

	Name	Description
	Caption (see page 16897)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16897)	Customizes the appearance of the generated control's label.

	Custom (see page 16898)	Represents a tag option and its value in the tag for the display control.
	Style (see page 16899)	Adds style attributes to the generated display control.
	StyleRule (see page 16899)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.

99.1.50.5.1 TWebDataDisplay.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.50.5.2 TWebDataDisplay.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption (see page 16897) property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.50.5.3 TWebDataDisplay.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 16897)

Caption (see page 16897)

99.1.50.5.4 TWebDataDisplay.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay (see page 16884) descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes (see page 16897) property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.50.5.5 TWebDataDisplay.LayoutAttributes Property

Encodes attributes that describe how the generated control should look.

Pascal

```
property LayoutAttributes: TLayoutAttributes;
```

C++

```
__property TLayoutAttributes LayoutAttributes;
```

Description

LayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 16890) method) to take into account layout properties of the child component.

LayoutAttributes encodes the information in the CaptionPosition (see page 16897) and CaptionAttributes (see page 16897) properties. Some descendant classes add information from the Style (see page 16899) and StyleRule (see page 16899) properties as well.

See Also

GetLayoutAttributes (see page 16892)

CaptionPosition (see page 16897)

Content (see page 16890)

Style (see page 16899)

CaptionAttributes (see page 16897)

stylerule (see page 16899)

99.1.50.5.6 TWebDataDisplay.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes (see page 16897) property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

99.1.50.5.7 TWebDataDisplay.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TWebDataDisplay.

99.1.50.5.8 TWebDataDisplay.TabIndex Property

Determines the position of the generated control in the HTML form's tab order.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

Use TabIndex to control the order that focus moves between controls when the end-user presses the Tab key. TabIndex specifies the position of the control in the tab order. If TabIndex is less than 0, the HTML tag's TABINDEX option is not set.

99.1.51 TWebDataInput Class

TWebDataInput is the base class for Web items that create HTML display controls for entering information.

Class Hierarchy

Pascal

```
TWebDataInput = class(TWebDataDisplay, IRestoreDefaults, IDataSetField, IValidateField);
```

C++

```
class TWebDataInput : public TWebDataDisplay, public IRestoreDefaults, public IDataSetField,
public IValidateField;
```

File

MidItems

Description

Use TWebDataInput as a base class for components that generate HTML controls which display information in an InternetExpress application and into which users can enter values. TWebDataInput descendants generate controls that are organized by TDataGrid (see page 16560), TFieldGroup (see page 16591), or TQueryFieldGroup (see page 16736).

TWebDataInput defines or inherits properties and methods for

Generating a caption that describes the information displayed.

Customizing the appearance of the control that displays information.

Specifying a field or parameter whose value the control displays.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebDataInput inherits the IWebContent interface from TWebDataDisplay (see page 16884).

Do not create instances of TWebDataInput. TWebDataInput relies on an abstract (pure virtual) method for generating the display control. Instead, use a descendant of TWebDataInput that generates an HTML control of the desired type.

See Also

IWebContent (see page 24792)

TDataGrid (see page 16560)

TFieldGroup (see page 16591)

TQueryFieldGroup (see page 16736)

99.1.51.1 TWebDataInput Members

The following tables list the members exposed by TWebDataInput.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.

	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.

	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16897)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16897)	Customizes the appearance of the generated control's label.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16898)	Represents a tag option and its value in the tag for the display control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.

	FieldName (see page 16909)	Specifies the name of the field whose value the generated control represents.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16899)	Adds style attributes to the generated display control.
	StyleRule (see page 16899)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.51.2 TWebDataInput Methods

The methods of the TWebDataInput class are listed here.

Protected Methods

	Name	Description
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.

99.1.51.2.1 TWebDataInput.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TWebDataInput.

99.1.51.2.2 TWebDataInput.FindAssociatedField Method

Pascal

```
function FindAssociatedField(DataSet: IInetXWebDataSet): TField; virtual;
```

C++

```
virtual __fastcall TField FindAssociatedField(IInetXWebDataSet DataSet);
```

Description

This is FindAssociatedField, a member of class TWebDataInput.

99.1.51.2.3 TWebDataInput.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall AnsiString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 16897)

99.1.51.2.4 TWebDataInput.GetFieldName Method

Pascal

```
function GetFieldName: string;
```

C++

```
__fastcall AnsiString GetFieldName();
```

Description

This is GetFieldName, a member of class TWebDataInput.

99.1.51.2.5 TWebDataInput.GetParamName Method

Pascal

```
function GetParamName: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetParamName();
```

Description

This is GetParamName, a member of class TWebDataInput.

99.1.51.2.6 TWebDataInput.GetRowSetFieldAttributes Method

Pascal

```
function GetRowSetFieldAttributes(const FieldVarName: string): string;
```

C++

```
__fastcall AnsiString GetRowSetFieldAttributes(const AnsiString FieldVarName);
```

Description

This is GetRowSetFieldAttributes, a member of class TWebDataInput.

99.1.51.2.7 TWebDataInput.ImplGetFieldName Method

Pascal

```
function ImplGetFieldName: string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetFieldName();
```

Description

This is ImplGetFieldName, a member of class TWebDataInput.

99.1.51.2.8 TWebDataInput.ImplGetHTMLControlName Method

Returns the name that other components can use to refer to the generated display control.

Pascal

```
function ImplGetHTMLControlName: string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetHTMLControlName();
```

Description

ImplGetHTMLControlName returns the name of the generated control. This value is assigned to a NAME option on the generated HTML tag.

ImplGetHTMLControlName returns the value of the Name property. TWebDataDisplay descendants can override this method to return a more meaningful value such as the name of the field or parameter displayed in the control.

See Also

Name (see page 2805)

99.1.51.2.9 TWebDataInput.ImplGetRowSetFieldAttributes Method

Pascal

```
function ImplGetRowSetFieldAttributes(const FieldVarName: string): string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetRowSetFieldAttributes(const AnsiString FieldVarName);
```

Description

This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.

99.1.51.2.10 TWebDataInput.ImplRestoreDefaults Method

Pascal

```
procedure ImplRestoreDefaults; virtual;
```

C++

```
virtual __fastcall ImplRestoreDefaults();
```

Description

This is ImplRestoreDefaults, a member of class TWebDataInput.

99.1.51.2.11 TWebDataInput.RestoreDefaults Method

Pascal

```
procedure RestoreDefaults;
```

C++

```
__fastcall RestoreDefaults();
```

Description

This is RestoreDefaults, a member of class TWebDataInput.

99.1.51.2.12 TWebDataInput.RestoreFieldDefaults Method

Pascal

```
procedure RestoreFieldDefaults(AField: TField); virtual;
```

C++

```
virtual __fastcall RestoreFieldDefaults(TField AField);
```

Description

This is RestoreFieldDefaults, a member of class TWebDataInput.

99.1.51.2.13 TWebDataInput.SetCaption Method

Sets the value of the Caption property.

Pascal

```
procedure SetCaption(Value: string); override;
```

C++

```
virtual __fastcall SetCaption(AnsiString Value);
```

Description

SetCaption is the protected write implementation for the Caption property.

See Also

Caption (see page 16897)

99.1.51.2.14 TWebDataInput.SetFieldName Method

Pascal

```
procedure SetFieldName(Value: string);
```

C++

```
__fastcall SetFieldName(AnsiString Value);
```

Description

This is SetFieldName, a member of class TWebDataInput.

99.1.51.2.15 TWebDataInput.SetParamName Method

Pascal

```
procedure SetParamName(Value: string);
```

C++

```
__fastcall SetParamName(AnsiString Value);
```

Description

This is SetParamName, a member of class TWebDataInput.

99.1.51.2.16 TWebDataInput.ValidateField Method

Pascal

```
function ValidateField(DataSet: IInetXWebDataSet; AddIntf: IAddScriptElements): Boolean;
```

C++

```
__fastcall Boolean ValidateField(IInetXWebDataSet DataSet, IAddScriptElements AddIntf);
```

Description

This is ValidateField, a member of class TWebDataInput.

99.1.51.3 TWebDataInput Properties

The properties of the TWebDataInput class are listed here.

Protected Properties

	Name	Description
	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.

Public Properties

	Name	Description
	FieldName (see page 16909)	Specifies the name of the field whose value the generated control represents.

99.1.51.3.1 TWebDataInput.FieldName Property

Specifies the name of the field whose value the generated control represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;
```

Description

Use FieldName to bind the Web data input component to a field in the XML data packet. When the display control represents a field value, this is the field whose value is displayed and edited using the control. When the display control represents a parameter value, this is a field that is used to filter records that appear in data packets.

The dataset that contains the field is identified by the XMLBroker and XMLDataSetField properties of the Web item that acts as a parent to the Web data input component.

See Also

xmlbroker (see page 17033)

XMLDataSetField (see page 17033)

ParamName (see page 16910)

Setting Web Item Properties

99.1.51.3.2 TWebDataInput.ParamName Property

Specifies the name of the parameter whose value the generated control represents.

Pascal

```
property ParamName: string;
```

C++

```
__property AnsiString ParamName;
```

Description

Use ParamName to bind the Web data input component to a parameter in the XML data packet or supply an application-specific name to the value for this control. ParamName is only used when the IsQueryField (see page 16895) method returns true. By default, the controls in a query form represent parameter values. However, they can be used to represent any named value.

If ParamName identifies one of the parameters of an XML broker, the XML broker property of the parent Web item identifies the broker that uses the parameter.

Setting Web Item Properties

99.1.52 TWebDisplay Class

Class Hierarchy

System::TObject → MidItems.TWebDisplay

Pascal

```
TWebDisplay = class(TObject);
```

C++

```
class TWebDisplay : public TObject;
```

File

MidItems

Description

This is class MidItems.TWebDisplay.

99.1.52.1 TWebDisplay Members

The following tables list the members exposed by TWebDisplay.

Protected Methods

	Name	Description
	Changed (see page 16912)	This is Changed, a member of class TWebDisplay.
	ChangedDisplayComponent (see page 16913)	This is ChangedDisplayComponent, a member of class TWebDisplay.
	GetDisplayComponent (see page 16913)	This is GetDisplayComponent, a member of class TWebDisplay.
	SetDisplayComponent (see page 16913)	This is SetDisplayComponent, a member of class TWebDisplay.

Public Events

	Name	Description
	OnChange (see page 16914)	This is OnChange, a member of class TWebDisplay.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 16912)	This is Create, a member of class TWebDisplay.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Notification (see page 16913)	This is Notification, a member of class TWebDisplay.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	DisplayComponent (see page 16914)	This is DisplayComponent, a member of class TWebDisplay.
R	Parent (see page 16914)	This is Parent, a member of class TWebDisplay.

99.1.52.2 TWebDisplay.Create Constructor

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TWebDisplay(TComponent * AParent);
```

Description

This is Create, a member of class TWebDisplay.

99.1.52.3 TWebDisplay Methods

The methods of the TWebDisplay class are listed here.

Protected Methods

	Name	Description
	Changed (see page 16912)	This is Changed, a member of class TWebDisplay.
	ChangedDisplayComponent (see page 16913)	This is ChangedDisplayComponent, a member of class TWebDisplay.
	GetDisplayComponent (see page 16913)	This is GetDisplayComponent, a member of class TWebDisplay.
	SetDisplayComponent (see page 16913)	This is SetDisplayComponent, a member of class TWebDisplay.

Public Methods

	Name	Description
	Notification (see page 16913)	This is Notification, a member of class TWebDisplay.

99.1.52.3.1 TWebDisplay.Changed Method

Pascal

```
procedure Changed;
```

C++

```
__fastcall Changed();
```

Description

This is Changed, a member of class TWebDisplay.

99.1.52.3.2 TWebDisplay.ChangedDisplayComponent Method

Pascal

```
procedure ChangedDisplayComponent; virtual;
```

C++

```
virtual __fastcall ChangedDisplayComponent();
```

Description

This is ChangedDisplayComponent, a member of class TWebDisplay.

99.1.52.3.3 TWebDisplay.GetDisplayComponent Method

Pascal

```
function GetDisplayComponent: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * GetDisplayComponent();
```

Description

This is GetDisplayComponent, a member of class TWebDisplay.

99.1.52.3.4 TWebDisplay.Notification Method

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); virtual;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

This is Notification, a member of class TWebDisplay.

99.1.52.3.5 TWebDisplay.SetDisplayComponent Method

Pascal

```
procedure SetDisplayComponent(const Value: TComponent);
```

C++

```
__fastcall SetDisplayComponent(const TComponent * Value);
```

Description

This is SetDisplayComponent, a member of class TWebDisplay.

99.1.52.4 TWebDisplay Properties

The properties of the TWebDisplay class are listed here.

Public Properties

	Name	Description
	DisplayComponent (see page 16914)	This is DisplayComponent, a member of class TWebDisplay.
R	Parent (see page 16914)	This is Parent, a member of class TWebDisplay.

99.1.52.4.1 TWebDisplay.DisplayComponent Property

Pascal

```
property DisplayComponent: TComponent;
```

C++

```
__property TComponent * DisplayComponent;
```

Description

This is DisplayComponent, a member of class TWebDisplay.

99.1.52.4.2 TWebDisplay.Parent Property

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

This is Parent, a member of class TWebDisplay.

99.1.52.5 TWebDisplay Events

The events of the TWebDisplay class are listed here.

Public Events

	Name	Description
	OnChange (see page 16914)	This is OnChange, a member of class TWebDisplay.

99.1.52.5.1 TWebDisplay.OnChange Event

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

This is OnChange, a member of class TWebDisplay.

99.1.53 TWebDisplayReferenceGroup Class

TWebDisplayReferenceGroup is the base class for Web items that arrange a set of controls that influence a control that displays data.

Class Hierarchy

Pascal

```
TWebDisplayReferenceGroup = class(TWebControlGroup, IWebDisplayReference);
```

C++

```
class TWebDisplayReferenceGroup : public TWebControlGroup, public IWebDisplayReference;
```

File

MidItems

Description

Use TWebDisplayReferenceGroup as a base class for Web items that generate the HTML to arrange a collection of button controls. Each TWebDisplayReferenceGroup object has an associated Web item that generates controls that display data in the final HTML document. The controls arranged by TWebDisplayReferenceGroup manipulate the information the display controls show.

In order to let other Web items use the HTML that the TWebDisplayReferenceGroup object generates, TWebDisplayReferenceGroup inherits the IWebContent interface from TWebControlGroup (see page 16872).

Do not create instances of TWebDisplayReferenceGroup. TWebDisplayReferenceGroup manages the Web items that generate buttons and the association to a display generator, but does not produce any content. Instead, use a descendant of TWebDisplayReferenceGroup such as TDataNavigator (see page 16569) (in InternetExpress applications) or TAdapterCommandGroup (in WebSnap applications).

See Also

TDataNavigator (see page 16569)

IWebContent (see page 24792)

TAdapterCommandGroup (see page 25062)

99.1.53.1 TWebDisplayReferenceGroup Members

The following tables list the members exposed by TWebDisplayReferenceGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	GetWebDisplayComponent (see page 16920)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 16920)	Forwards notification messages to all owned components.

	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
V	SetWebDisplayComponent (see page 16921)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebDisplay (see page 16921)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 16921)	
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16919)	Creates an instance of TWebDisplayReferenceGroup (see page 16915).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 16919)	Frees an instance of TWebDisplayReferenceGroup (see page 16915).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.53.2 TWebDisplayReferenceGroup.Create Constructor

Creates an instance of TWebDisplayReferenceGroup (see page 16915).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebDisplayReferenceGroup(TComponent * AOwner);
```

Description

Call TWebDisplayReferenceGroup (see page 16915) to instantiate TWebDisplayReferenceGroup (see page 16915) at runtime. TWebDisplayReferenceGroup (see page 16915) components added at design time are instantiated automatically.

99.1.53.3 TWebDisplayReferenceGroup.Destroy Destructor

Frees an instance of TWebDisplayReferenceGroup (see page 16915).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebDisplayReferenceGroup();
```

Description

Do not call Destroy directly. Instead, call Free, which checks whether the object is not nil before calling Destroy.

See Also

Free (see page 22300)

99.1.53.4 TWebDisplayReferenceGroup Methods

The methods of the TWebDisplayReferenceGroup class are listed here.

Protected Methods

	Name	Description
	GetWebDisplayComponent (see page 16920)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	Notification (see page 16920)	Forwards notification messages to all owned components.
V	SetWebDisplayComponent (see page 16921)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.

99.1.53.4.1 TWebDisplayReferenceGroup.GetWebDisplayComponent Method

Pascal

```
function GetWebDisplayComponent: TComponent;
```

C++

```
__fastcall TComponent * GetWebDisplayComponent();
```

Description

This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.

99.1.53.4.2 TWebDisplayReferenceGroup.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

99.1.53.4.3 TWebDisplayReferenceGroup.SetWebDisplayComponent Method

Pascal

```
procedure SetWebDisplayComponent(const Value: TComponent); virtual;
```

C++

```
virtual __fastcall SetWebDisplayComponent(const TComponent * Value);
```

Description

This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.

99.1.53.5 TWebDisplayReferenceGroup Properties

The properties of the TWebDisplayReferenceGroup class are listed here.

Protected Properties

	Name	Description
R	WebDisplay (see page 16921)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 16921)	

99.1.53.5.1 TWebDisplayReferenceGroup.WebDisplay Property

Pascal

```
property WebDisplay: TWebDisplay;
```

C++

```
__property TWebDisplay WebDisplay;
```

Description

This is WebDisplay, a member of class TWebDisplayReferenceGroup.

99.1.53.5.2 TWebDisplayReferenceGroup.WebDisplayComponent Property

Pascal

```
property WebDisplayComponent: TComponent;
```

C++

```
__property TComponent * WebDisplayComponent;
```

See Also

GetWebDisplayComponent (see page 17081)

99.1.54 TWebForm Class

TWebForm is the base class for Web items that create HTML forms in InternetExpress applications.

Class Hierarchy

Pascal

```
TWebForm = class(TWebContainedContainerComponent, IWebContent, IWebComponentEditor,
IScriptComponent, IHTMLForm);
```

C++

```
class TWebForm : public TWebContainedContainerComponent, public IWebContent, public
IWebComponentEditor, public IScriptComponent, public IHTMLForm;
```

File

MidItems

Description

Use TWebForm as a base class for components that generate the HTML statements defining a form that is contained in an HTML document. The list of Web items that generate content for an InternetExpress page producer can only contain descendants of TWebForm.

In order to allow the InternetExpress page producer to use the HTML generated by the TWebForm descendant, TWebForm implements the IWebContent interface. In order to allow other Web items to generate javascript that refers to form elements, TWebForm implements the IHTMLForm (see page 17064) interface.

Do not create instances of TWebForm. TWebForm relies on an abstract or, in C++ terminology, pure virtual method to generate the HTML form. Instead, create descendants of TWebForm such a TDataForm (see page 16554) or TQueryForm (see page 16745).

See Also

TQueryForm (see page 16745)

TDataForm (see page 16554)

TBasePageItemsProducer (see page 18376)

TInetXPageProducer (see page 17145)

IWebContent (see page 24792)

IHTMLForm (see page 17064)

99.1.54.1 TWebForm Members

The following tables list the members exposed by TWebForm.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16927)	Used internally to generate any javascript declarations needed by the form.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16928)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 16934) property list.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16928)	Returns the HTML that defines the HTML form.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultWebComponents (see page 16929)	Returns nil (Delphi) or NULL (C++).
	GetHTMLFormName (see page 16929)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 16929)	Returns the name of the javascript variable that refers to the generated form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16930)	Returns the object that specifies how the generated form should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16930)	Returns the value of the WebComponents (see page 16934) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 16930)	Returns the value of the VisibleFields (see page 16934) property.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
V	ImplAddElements (see page 16931)	Provides the underlying implementation for the AddElements (see page 16927) method.
A	ImplCanAddClass (see page 16931)	Provides the underlying implementation for the CanAddClass (see page 16928) method.
A	ImplContent (see page 16932)	Provides the underlying implementation for the Content (see page 16928) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.

V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16932)	Prevents an application from trying to assign a default set of Web items on the form.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	VisibleFields (see page 16934)	Lists the Web items whose generated content appears in the HTML form.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 16926)	Creates and initializes an instance of TWebForm (see page 16922).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 16926)	Frees an instance of TWebForm (see page 16922).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.

	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16933)	Represents a tag option and its value in the generated FORM tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLFormName (see page 17066)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 17066)	Indicates the name of the javascript variable that represents the HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16933)	Adds style attributes to the generated form.
	StyleRule (see page 16934)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebComponents (see page 16934)	Maintains a list of components that generate HTML content for the TWebForm (see page 16922) descendant.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.54.2 TWebForm.Create Constructor

Creates and initializes an instance of TWebForm (see page 16922).

Pascal

```
constructor Create(AComponent: TComponent); override;
```

C++

```
virtual __fastcall TWebForm(TComponent * AComponent);
```

Description

Call Create to instantiate a TWebForm (see page 16922) descendant at runtime. TWebForm (see page 16922) descendants added at design time using the Web Page editor are instantiated automatically.

99.1.54.3 TWebForm.Destroy Destructor

Frees an instance of TWebForm (see page 16922).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebForm();
```

Description

Destroy removes the form generator from its parent's list of components that generate HTML before freeing the TWebForm (see page 16922) instance.

99.1.54.4 TWebForm Methods

The methods of the TWebForm class are listed here.

Protected Methods

	Name	Description
	AddElements (see page 16927)	Used internally to generate any javascript declarations needed by the form.
	CanAddClass (see page 16928)	Specifies whether a Web item of a specified type can be added to the WebComponents (see page 16934) property list.
	Content (see page 16928)	Returns the HTML that defines the HTML form.
V	GetDefaultWebComponents (see page 16929)	Returns nil (Delphi) or NULL (C++).
	GetHTMLFormName (see page 16929)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 16929)	Returns the name of the javascript variable that refers to the generated form.
V	GetLayoutAttributes (see page 16930)	Returns the object that specifies how the generated form should look.
	GetSubComponents (see page 16930)	Returns the value of the WebComponents (see page 16934) property.
	GetVisibleFields (see page 16930)	Returns the value of the VisibleFields (see page 16934) property.
V	ImplAddElements (see page 16931)	Provides the underlying implementation for the AddElements (see page 16927) method.
A	ImplCanAddClass (see page 16931)	Provides the underlying implementation for the CanAddClass (see page 16928) method.
A	ImplContent (see page 16932)	Provides the underlying implementation for the Content (see page 16928) method.
V	SetDefaultWebComponents (see page 16932)	Prevents an application from trying to assign a default set of Web items on the form.

99.1.54.4.1 TWebForm.AddElements Method

Used internally to generate any javascript declarations needed by the form.

Pascal

```
procedure AddElements(AddIntf: IAddScriptElements);
```

C++

```
__fastcall AddElements(IAddScriptElements AddIntf);
```

Description

The InternetExpress page producer calls AddElements when it generates the block of javascript declarations in its HTML document. This method allows the generated form to use javascript classes and methods.

AddElements calls on the virtual ImplAddElements (see page 16931) method, which uses the provided interface to return javascript declarations. Each TWebForm (see page 16922) descendant overrides ImplAddElements (see page 16931) to add any declarations it needs.

See Also

ImplAddElements (see page 16931)

TInetXPageProducer (see page 17145)

99.1.54.4.2 TWebForm.CanAddClass Method

Specifies whether a Web item of a specified type can be added to the WebComponents (see page 16934) property list.

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

The Web page editor calls CanAddClass to determine what Web items can be added to supply content for the TWebForm (see page 16922) descendant. CanAddClass calls the virtual ImplCanAddClass (see page 16931) method to determine whether a class of Web item is valid.

AParent is the TWebForm (see page 16922) descendant to whose WebComponents (see page 16934) property the Web item will be added.

AClass is the class of the proposed child Web item.

CanAddClass returns true if the Web form can use content generated by a component of type AClass, false otherwise.

See Also

ImplCanAddClass (see page 16931)

WebComponents (see page 16934)

99.1.54.4.3 TWebForm.Content Method

Returns the HTML that defines the HTML form.

Pascal

```
function Content(Options: TWebContentOptions; Layout: TLayout): string;
```

C++

```
__fastcall AnsiString Content(TWebContentOptions Options, TLayout Layout);
```

Description

Content implements the IWebContent method of the same name. This method allows the page producer to extract the HTML defining the form.

Content calls the virtual ImplContent (see page 16932) method to provide the HTML form it returns. Each TWebForm (see page 16922) descendant overrides ImplContent (see page 16932) to generate its particular HTML form. The generated HTML can make use of any javascript declarations supplied by the AddElements (see page 16927) method.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the component should format the HTML form it generates. Typically, this parameter is nil (Delphi) or NULL (C++) for forms.

Content returns a string of HTML defining the form.

See Also

ImplContent (see page 16932)

IWebContent (see page 24792)

AddElements (see page 16927)

99.1.54.4.4 TWebForm.GetDefaultWebComponents Method

Returns nil (Delphi) or NULL (C++).

Pascal

```
function GetDefaultWebComponents: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents is implemented by all Web items that use sub Web items when generating HTML. (TWebForm (see page 16922) uses the subitems in the WebComponents (see page 16934) property). This method returns a list of Web items that are used by default when an application does not explicitly assign child Web items.

In TWebForm (see page 16922), GetDefaultWebComponents returns nil (Delphi) or NULL (C++) because Web forms do not any set of items that appear by default.

See Also

WebComponents (see page 16934)

GetDefaultWebComponents (see page 24744)

99.1.54.4.5 TWebForm.GetHTMLFormName Method

Returns the name of the generated HTML form.

Pascal

```
function GetHTMLFormName: string;
```

C++

```
__fastcall AnsiString GetHTMLFormName();
```

Description

TWebForm (see page 16922) uses GetHTMLFormName internally to specify the NAME option of the generated form and to declare a javascript variable that references the form.

GetHTMLFormName returns the value of the Name property.

See Also

GetHTMLFormVarName (see page 16929)

Name (see page 2805)

99.1.54.4.6 TWebForm.GetHTMLFormVarName Method

Returns the name of the javascript variable that refers to the generated form.

Pascal

```
function GetHTMLFormVarName: string;
```

C++

```
__fastcall AnsiString GetHTMLFormVarName();
```

Description

TWebForm (see page 16922) uses GetHTMLFormVarName internally to declare a javascript variable that references the form. GetHTMLFormVarName returns the value of the Name property.

See Also

GetHTMLFormName (see page 16929)

Name (see page 2805)

99.1.54.4.7 TWebForm.GetLayoutAttributes Method

Returns the object that specifies how the generated form should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; virtual;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content (see page 16928) method) to take into account layout properties of the child component.

As implemented by TWebForm (see page 16922), GetLayoutAttributes returns nil (Delphi) or NULL (C++), because the layout at the form level does not make use of layout attributes.

See Also

Content (see page 16928)

99.1.54.4.8 TWebForm.GetSubComponents Method

Returns the value of the WebComponents (see page 16934) property.

Pascal

```
function GetSubComponents: TObject;
```

C++

```
__fastcall TObject * GetSubComponents();
```

Description

GetSubComponents returns the TWebForm (see page 16922)'s list of Web items that it uses to generate HTML content. This method is part of the mechanism that fits TWebForm (see page 16922) into a hierarchy of Web items, each of which generates part of a larger HTML document.

See Also

WebComponents (see page 16934)

99.1.54.4.9 TWebForm.GetVisibleFields Method

Returns the value of the VisibleFields (see page 16934) property.

Pascal

```
function GetVisibleFields: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleFields();
```

Description

GetVisibleFields is the protected read implementation of the VisibleFields (see page 16934) property.

See Also

VisibleFields (see page 16934)

99.1.54.4.10 TWebForm.ImplAddElements Method

Provides the underlying implementation for the AddElements (see page 16927) method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); virtual;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements (see page 16927) method calls ImplAddElements to add any javascript declarations by calling the AddIntf interface. These declarations allow the generated display control to call javascript methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebForm (see page 16922), ImplAddElements does nothing. TWebForm (see page 16922) descendants can override ImplAddElements to add any required declarations.

See Also

AddElements (see page 16927)

99.1.54.4.11 TWebForm.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass (see page 16928) method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass) = 0;
```

Description

The CanAddClass (see page 16928) method calls ImpleCanAddClass to determine whether the TWebForm (see page 16922) descendant can add a component of type AClass to its WebComponents (see page 16934) property list. AParent is the TWebForm (see page 16922) instance to which the component will be added.

In TWebForm (see page 16922), ImplCanAddClass is abstract or, in C++ terminology, pure virtual. TWebForm (see page 16922) descendants must override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML forms.

See Also

CanAddClass (see page 16928)

WebComponents (see page 16934)

99.1.54.4.12 TWebForm.ImplContent Method

Provides the underlying implementation for the Content (see page 16928) method.

Pascal

```
function ImplContent(Options: TWebContentOptions; Layout: TLayout): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout Layout) = 0;
```

Description

The Content (see page 16928) method calls ImplContent to generate the HTML form. ImplContent is anabstract or, in C++ terminology, pure virtual method in TWebForm (see page 16922). TWebForm (see page 16922) descendants override it to generate the HTML form.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebForm (see page 16922) should format the HTML control it generates. Typically, this parameter is nil (Delphi) or NULL (C++) for forms.

ImplContent returns an HTML form definition.

See Also

Content (see page 16928)

AddElements (see page 16927)

99.1.54.4.13 TWebForm.SetDefaultWebComponents Method

Prevents an application from trying to assign a default set of Web items on the form.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList); override;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

SetDefaultWebComponents is implemented by all Web items that use sub Web items when generating HTML. (TWebForm (see page 16922) uses the subitems in the WebComponents (see page 16934) property). This method assigns a list of Web items that are used by default when an application does not explicitly assign child Web items.

In TWebForm (see page 16922), SetDefaultWebComponents does nothing with the list supplied as the AList parameter. This is because web forms do not have default items.

See Also

WebComponents (see page 16934)

SetDefaultWebComponents (see page 24748)

99.1.54.5 TWebForm Properties

The properties of the TWebForm class are listed here.

Protected Properties

	Name	Description
R	VisibleFields (see page 16934)	Lists the Web items whose generated content appears in the HTML form.

Public Properties

	Name	Description
	Custom (see page 16933)	Represents a tag option and its value in the generated FORM tag.
	Style (see page 16933)	Adds style attributes to the generated form.
	StyleRule (see page 16934)	Applies a style in the page producer's style sheet to the button.
R	WebComponents (see page 16934)	Maintains a list of components that generate HTML content for the TWebForm (see page 16922) descendant.

99.1.54.5.1 TWebForm.Custom Property

Represents a tag option and its value in the generated FORM tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options that qualify the FORM tag generated by the TWebForm (see page 16922) descendant. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to specify that the form includes files with the text it submits and indicate that the page returned after submitting the form goes into a separate window, use a Custom value such as the following:

```
ENCTYPE="multipart/form-data" TARGET="ResultFrame"
```

See Also

Style (see page 16933)

99.1.54.5.2 TWebForm.Style Property

Adds style attributes to the generated form.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to add a STYLE option that qualifies the FORM tag generated by the TWebForm (see page 16922) descendant. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated FORM tag as the value of a STYLE option.

See Also

Custom (see page 16933)

StyleRule (see page 16934)

99.1.54.5.3 TWebForm.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated form. The value of StyleRule specifies one of the user-defined style names defined in the InternetExpress page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the Style (see page 16933) property.

See Also

Style (see page 16933)

Styles (see page 17127)

StylesFile (see page 17128)

99.1.54.5.4 TWebForm.VisibleFields Property

Lists the Web items whose generated content appears in the HTML form.

Pascal

```
property VisibleFields: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleFields;
```

Description

VisibleFields is used internally when assembling the HTML form from the HTML generated by the form's Web items. For TWebForm (see page 16922), the value of VisibleFields is always the same as WebComponents (see page 16934).

Override GetVisibleFields (see page 16930) in a descendant class to provide a default set of that appear when the WebComponents (see page 16934) property is not set.

See Also

WebComponents (see page 16934)

99.1.54.5.5 TWebForm.WebComponents Property

Maintains a list of components that generate HTML content for the TWebForm (see page 16922) descendant.

Pascal

```
property WebComponents: TWebComponentList;
```

C++

```
__property TWebComponentList WebComponents;
```

Description

WebComponents lists the components that generate content for the Web form. Each of these components supports the IWebContent interface, and some can contain their own list of Web items that help them generate their content.

The type of items that can be added to the WebComponents list are restricted by the protected CanAddClass (see page 16928) method. Descendant classes override this method to indicate what types of items can be added to the list. For example, TQueryForm (see page 16745) limits the list to components that display or manipulate named values (TQueryButtons (see page 16730), TQueryFields) or layout groups that manage the layout of those items (TLayoutGroup (see page 16687)).

At design time, add components to the WebComponents property by bringing up the Web page editor for the containing TInetXPageProducer component. Select the TWebForm (see page 16922) descendant in the editor, and use the editor to add child controls.

See Also

IWebContent (see page 24792)

TInetXPageProducer (see page 17145)

CanAddClass (see page 16928)

99.1.55 TWebListInput Class

TWebListInput is the base class for Web items that create HTML display controls which present a fixed set of possible values.

Class Hierarchy

Pascal

```
TWebListInput = class(TWebDataInput, IScriptComponent);
```

C++

```
class TWebListInput : public TWebDataInput, public IScriptComponent;
```

File

MidItems

Description

Use TWebListInput as a base class for components that generate HTML controls for displaying a fixed set of possible values from which a user can choose. TWebListInput descendants generate controls that are organized by TDataGrid (see page 16560), TFieldGroup (see page 16591), or TQueryFieldGroup (see page 16736).

TWebListInput defines or inherits properties and methods for

Specifying a field or parameter whose value the control displays.

Specifying the possible values from which the user can choose.

Generating a caption that describes the information displayed.

Customizing the appearance of the control that displays information.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebListInput inherits the IWebContent interface from TWebDataDisplay (see page 16884).

Do not create instances of TWebListInput. Instead, use a descendant of TWebListInput such as TFieldRadioGroup (see page 16599), TQueryRadioGroup (see page 16753), TFieldSelectOptions (see page 16612), TQuerySelectOptions (see page 16768), or TSelectOptionsColumn (see page 16814).

See Also

IWebContent (see page 24792)

TDataGrid (see page 16560)

TFieldGroup (see page 16591)

TQueryFieldGroup (see page 16736)

TFieldRadioGroup (see page 16599)

TQUeryRadioGroup

TFieldSelectOptions (see page 16612)

TQuerySelectOptions (see page 16768)

TSelectOptionsColumn (see page 16814)

99.1.55.1 TWebListInput Members

The following tables list the members exposed by TWebListInput.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16941)	This is AddElements, a member of class TWebListInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
V	ControlContent (see page 16942)	This is ControlContent, a member of class TWebListInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
	FormatInputs (see page 16942)	This is FormatInputs, a member of class TWebListInput.
	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
	GetCaption (see page 16906)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetSubComponents (see page 16942)	This is GetSubComponents, a member of class TWebListInput.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplAddElements (see page 16942)	This is ImplAddElements, a member of class TWebListInput.
	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 16943)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.

V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 16943)	This is SetDataSet, a member of class TWebListInput.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItems (see page 16943)	This is SetItems, a member of class TWebListInput.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetValues (see page 16944)	This is SetValues, a member of class TWebListInput.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16940)	Creates and initializes an instance of TWebListInput (see page 16935).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 16941)	Frees an instance of TWebListInput (see page 16935).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)

	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	Caption (see page 16897)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16897)	Customizes the appearance of the generated control's label.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16898)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 16944)	Specifies a dataset that supplies the possible values listed in the generated control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	FieldName (see page 17058)	This is FieldName, a member of class IDataSetField.
	FieldName (see page 16909)	Specifies the name of the field whose value the generated control represents.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
	Items (see page 16945)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 16945)	Indicates which field in DataSet (see page 16944) supplies the possible selections for the generated control.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16899)	Adds style attributes to the generated display control.
	StyleRule (see page 16899)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 16946)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 16946)	Indicates which field in DataSet (see page 16944) supplies the possible values for the generated control.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.55.2 TWebListInput.Create Constructor

Creates and initializes an instance of TWebListInput (see page 16935).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebListInput(TComponent * AOwner);
```

Description

Call Create to instantiate TWebListInput (see page 16935) at runtime. TWebListInput (see page 16935) descendants added at design time using the Web Page editor are instantiated automatically.

99.1.55.3 TWebListInput.Destroy Destructor

Frees an instance of TWebListInput (see page 16935).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebListInput();
```

Description

Do not call Destroy directly in an application. Instead, use the Free method, which checks that the component is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

99.1.55.4 TWebListInput Methods

The methods of the TWebListInput class are listed here.

Protected Methods

	Name	Description
	AddElements (see page 16941)	This is AddElements, a member of class TWebListInput.
V	ControlContent (see page 16942)	This is ControlContent, a member of class TWebListInput.
A	FormatInputs (see page 16942)	This is FormatInputs, a member of class TWebListInput.
	GetSubComponents (see page 16942)	This is GetSubComponents, a member of class TWebListInput.
V	ImplAddElements (see page 16942)	This is ImplAddElements, a member of class TWebListInput.
V	Notification (see page 16943)	Forwards notification messages to all owned components.
	SetDataSet (see page 16943)	This is SetDataSet, a member of class TWebListInput.
	SetItems (see page 16943)	This is SetItems, a member of class TWebListInput.
	SetValues (see page 16944)	This is SetValues, a member of class TWebListInput.

99.1.55.4.1 TWebListInput.AddElements Method

Pascal

```
procedure AddElements(AddIntf: IAddScriptElements);
```

C++

```
__fastcall AddElements(IAddScriptElements AddIntf);
```

Description

This is AddElements, a member of class TWebListInput.

99.1.55.4.2 TWebListInput.ControlContent Method

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString ControlContent(TWebContentOptions Options);
```

Description

This is ControlContent, a member of class TWebListInput.

99.1.55.4.3 TWebListInput.FormatInputs Method

Pascal

```
function FormatInputs(ItemsStrings: TStrings; ValuesStrings: TStrings; Options:
TWebContentOptions): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString FormatInputs(TStrings ItemsStrings, TStrings ValuesStrings,
TWebContentOptions Options) = 0;
```

Description

This is FormatInputs, a member of class TWebListInput.

99.1.55.4.4 TWebListInput.GetSubComponents Method

Pascal

```
function GetSubComponents: TObject;
```

C++

```
__fastcall TObject * GetSubComponents();
```

Description

This is GetSubComponents, a member of class TWebListInput.

99.1.55.4.5 TWebListInput.ImplAddElements Method

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); virtual;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

This is ImplAddElements, a member of class TWebListInput.

99.1.55.4.6 TWebListInput.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

99.1.55.4.7 TWebListInput.SetDataSet Method

Pascal

```
procedure SetDataSet(const Value: TDataSet);
```

C++

```
__fastcall SetDataSet(const TDataSet Value);
```

Description

This is SetDataSet, a member of class TWebListInput.

99.1.55.4.8 TWebListInput.SetItems Method

Pascal

```
procedure SetItems(const Value: TStrings);
```

C++

```
__fastcall SetItems(const TStrings Value);
```

Description

This is SetItems, a member of class TWebListInput.

99.1.55.4.9 TWebListInput.SetValues Method

Pascal

```
procedure SetValues(const Value: TStrings);
```

C++

```
__fastcall SetValues(const TStrings Value);
```

Description

This is SetValues, a member of class TWebListInput.

99.1.55.5 TWebListInput Properties

The properties of the TWebListInput class are listed here.

Public Properties

	Name	Description
	DataSet (see page 16944)	Specifies a dataset that supplies the possible values listed in the generated control.
	Items (see page 16945)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 16945)	Indicates which field in DataSet (see page 16944) supplies the possible selections for the generated control.
	Values (see page 16946)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 16946)	Indicates which field in DataSet (see page 16944) supplies the possible values for the generated control.

99.1.55.5.1 TWebListInput.DataSet Property

Specifies a dataset that supplies the possible values listed in the generated control.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Use DataSet to specify a dataset from which the component can extract the selections that appear to the user and the underlying values they represent. The ItemsField (see page 16945) property specifies the field in this dataset that lists the selections that appear in the generated control. The ValuesField (see page 16946) property specifies the field in this dataset that lists the corresponding values that are assigned to the control.

Note: If the list of possible values is not available in a dataset, use the Items (see page 16945) and Values (see page 16946) properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

ItemsField (see page 16945)

ValuesField (see page 16946)

Items (see page 16945)

Values (see page 16946)

99.1.55.5.2 TWebListInput.Items Property

Lists the possible selections that appear in the generated control.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to supply a list of possible selections to the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the corresponding entry in the Values (see page 16946) property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items and Values (see page 16946) properties, use the DataSet (see page 16944), ItemsField (see page 16945), and ValuesField (see page 16946) properties.

See Also

ItemsField (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.55.5.3 TWebListInput.ItemsField Property

Indicates which field in DataSet (see page 16944) supplies the possible selections for the generated control.

Pascal

```
property ItemsField: string;
```

C++

```
__property AnsiString ItemsField;
```

Description

Use ItemsField to specify which field in the dataset specified by the DataSet (see page 16944) property contains selections that appear in the generated control. The end-user can choose from these selections to assign a value to the generated control. The value that is assigned comes from the field specified by the ValuesField (see page 16946) property.

Note: If the list of possible values is not available in a dataset, use the Items (see page 16945) and Values (see page 16946) properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.55.5.4 TWebListInput.Values Property

Lists the possible values that can be assigned to the control.

Pascal

```
property Values: TStrings;
```

C++

```
__property TStrings Values;
```

Description

Use Values to supply a list of possible values for the generated control. When the end-user chooses one of the selections listed by the Items (see page 16945) property, the control is assigned the corresponding value in the Values property.

Note: To use a dataset to supply items and values, rather than explicitly listing them in the Items (see page 16945) and Values properties, use the DataSet (see page 16944), ItemsField (see page 16945), and ValuesField (see page 16946) properties.

See Also

Items (see page 16945)

ItemsField (see page 16945)

DataSet (see page 16944)

ValuesField (see page 16946)

99.1.55.5.5 TWebListInput.ValuesField Property

Indicates which field in DataSet (see page 16944) supplies the possible values for the generated control.

Pascal

```
property ValuesField: string;
```

C++

```
__property AnsiString ValuesField;
```

Description

Use ValuesField to specify which field in the dataset specified by the DataSet (see page 16944) property contains values that can be assigned to the generated control. When the end-user selects the corresponding value form the ItemsField (see page 16945) field, the control gets the value in the ValuesField field.

Note: If the list of possible values is not available in a dataset, use the Items (see page 16945) and Values (see page 16946) properties instead to list the selections that appear to the user and the underlying values they represent.

See Also

Items (see page 16945)

Values (see page 16946)

DataSet (see page 16944)

ItemsField (see page 16945)

99.1.56 TWebRadioGroupInput Class

TWebRadioGroupInput is the base class for Web items that create HTML radio group controls.

Class Hierarchy

Pascal

```
TWebRadioGroupInput = class(TWebListInput);
```

C++

```
class TWebRadioGroupInput : public TWebListInput;
```

File

MidItems

Description

Use TWebRadioGroupInput as a base class for components that generate HTML radio groups that represent field or parameter values. TWebRadioGroupInput descendants generate controls that are organized by TFieldGroup (see page 16591) or TQueryFieldGroup (see page 16736).

TWebRadioGroupInput defines or inherits properties and methods for

Specifying a field or parameter whose value the radio group displays.

Specifying the possible values from which the user can choose.

Generating a caption that describes the information displayed.

Customizing the appearance of the radio group.

Fitting the radio group into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebRadioGroupInput inherits the IWebContent interface from TWebDataDisplay (see page 16884).

Do not create instances of TWebRadioGroupInput. Instead, use a descendant of TWebRadioGroupInput such as TFieldRadioGroup (see page 16599) or TQueryRadioGroup (see page 16753).

See Also

IWebContent (see page 24792)

TFieldGroup (see page 16591)

TQueryFieldGroup (see page 16736)

TFieldRadioGroup (see page 16599)

TQUeryRadioGroup

99.1.56.1 TWebRadioGroupInput Members

The following tables list the members exposed by TWebRadioGroupInput.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16953)	This is AddAttributes, a member of class TWebRadioGroupInput.
	AddElements (see page 16941)	This is AddElements, a member of class TWebListInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16942)	This is ControlContent, a member of class TWebListInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16953)	This is EventContent, a member of class TWebRadioGroupInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	FormatInputs (see page 16953)	This is FormatInputs, a member of class TWebRadioGroupInput.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
V	GetCheckIndex (see page 16954)	This is GetCheckIndex, a member of class TWebRadioGroupInput.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetSubComponents (see page 16942)	This is GetSubComponents, a member of class TWebListInput.

	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplAddElements (see page 16942)	This is ImplAddElements, a member of class TWebListInput.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 16954)	This is ImplGetRowSetFieldAttributes, a member of class TWebRadioGroupInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16943)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16954)	This is RestoreFieldDefaults, a member of class TWebRadioGroupInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 16943)	This is SetDataSet, a member of class TWebListInput.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItems (see page 16943)	This is SetItems, a member of class TWebListInput.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetValues (see page 16944)	This is SetValues, a member of class TWebListInput.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16952)	Creates and initializes an instance of TWebRadioGroupInput (see page 16947).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 16941)	Frees an instance of TWebListInput (see page 16935).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	Caption (see page 16897)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16897)	Customizes the appearance of the generated control's label.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16898)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 16944)	Specifies a dataset that supplies the possible values listed in the generated control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayColumns (see page 16954)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 16955)	Specifies the width of the radio group, in characters.
	FieldName (see page 17058)	This is FieldName, a member of class IDataSetField.
	FieldName (see page 16909)	Specifies the name of the field whose value the generated control represents.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
	Items (see page 16945)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 16945)	Indicates which field in DataSet (see page 16944) supplies the possible selections for the generated control.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 16955)	Indicates whether end users can use the generated control to set values.
	Style (see page 16899)	Adds style attributes to the generated display control.
	StyleRule (see page 16899)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 16946)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 16946)	Indicates which field in DataSet (see page 16944) supplies the possible values for the generated control.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.56.2 TWebRadioGroupInput.Create Constructor

Creates and initializes an instance of TWebRadioGroupInput (see page 16947).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebRadioGroupInput(TComponent * AOwner);
```

Description

Call Create to instantiate TWebRadioGroupInput (see page 16947) at runtime. TWebRadioGroupInput (see page 16947) descendants added at design time using the Web Page editor are instantiated automatically.

99.1.56.3 TWebRadioGroupInput Methods

The methods of the TWebRadioGroupInput class are listed here.

Protected Methods

	Name	Description
	AddAttributes (see page 16953)	This is AddAttributes, a member of class TWebRadioGroupInput.
	EventContent (see page 16953)	This is EventContent, a member of class TWebRadioGroupInput.
	FormatInputs (see page 16953)	This is FormatInputs, a member of class TWebRadioGroupInput.
	GetCheckIndex (see page 16954)	This is GetCheckIndex, a member of class TWebRadioGroupInput.
	ImplGetRowSetFieldAttributes (see page 16954)	This is ImplGetRowSetFieldAttributes, a member of class TWebRadioGroupInput.
	RestoreFieldDefaults (see page 16954)	This is RestoreFieldDefaults, a member of class TWebRadioGroupInput.

99.1.56.3.1 TWebRadioGroupInput.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); virtual;
```

C++

```
virtual __fastcall AddAttributes(AnsiString Attrs);
```

Description

This is AddAttributes, a member of class TWebRadioGroupInput.

99.1.56.3.2 TWebRadioGroupInput.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TWebRadioGroupInput.

99.1.56.3.3 TWebRadioGroupInput.FormatInputs Method

Pascal

```
function FormatInputs(ItemsStrings: TStrings; ValuesStrings: TStrings; Options:
TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString FormatInputs(TStrings ItemsStrings, TStrings ValuesStrings,
TWebContentOptions Options);
```

Description

This is FormatInputs, a member of class TWebRadioGroupInput.

99.1.56.3.4 TWebRadioGroupInput.GetCheckIndex Method

Pascal

```
function GetCheckIndex(ItemsStrings: TStrings; ValuesStrings: TStrings): Integer; virtual;
```

C++

```
virtual __fastcall int GetCheckIndex(TStrings ItemsStrings, TStrings ValuesStrings);
```

Description

This is GetCheckIndex, a member of class TWebRadioGroupInput.

99.1.56.3.5 TWebRadioGroupInput.ImplGetRowSetFieldAttributes Method

Pascal

```
function ImplGetRowSetFieldAttributes(const FieldVarName: string): string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetRowSetFieldAttributes(const AnsiString FieldVarName);
```

Description

This is ImplGetRowSetFieldAttributes, a member of class TWebRadioGroupInput.

99.1.56.3.6 TWebRadioGroupInput.RestoreFieldDefaults Method

Pascal

```
procedure RestoreFieldDefaults(AField: TField); override;
```

C++

```
virtual __fastcall RestoreFieldDefaults(TField AField);
```

Description

This is RestoreFieldDefaults, a member of class TWebRadioGroupInput.

99.1.56.4 TWebRadioGroupInput Properties

The properties of the TWebRadioGroupInput class are listed here.

Public Properties

	Name	Description
	DisplayColumns (see page 16954)	Specifies the number of radio buttons that appear in each row of the control.
	DisplayWidth (see page 16955)	Specifies the width of the radio group, in characters.
	ReadOnly (see page 16955)	Indicates whether end users can use the generated control to set values.

99.1.56.4.1 TWebRadioGroupInput.DisplayColumns Property

Specifies the number of radio buttons that appear in each row of the control.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to specify how many radio buttons can appear in a single line of the radio group. If DisplayColumns is less than the number of items, the radio group displays its buttons in multiple rows.

See Also

ItemsField (see page 16945)

Items (see page 16945)

DisplayWidth (see page 16955)

99.1.56.4.2 TWebRadioGroupInput.DisplayWidth Property

Specifies the width of the radio group, in characters.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to limit the width of the generated control. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. DisplayWidth is added as a WIDTH option.

See Also

DisplayColumns (see page 16954)

Custom (see page 16898)

99.1.56.4.3 TWebRadioGroupInput.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the radio group. TWebRadioGroup generates an INPUT tag of type RADIO to implement the radio group. ReadOnly is added as a READONLY option.

See Also

DisplayWidth (see page 16955)

Custom (see page 16898)

99.1.57 TWebSelectOptionsInput Class

TWebSelectOptionsInput is the base class for Web items that create HTML list controls.

Class Hierarchy

Pascal

```
TWebSelectOptionsInput = class(TWebListInput);
```

C++

```
class TWebSelectOptionsInput : public TWebListInput;
```

File

MidItems

Description

Use TWebSelectOptionsInput as a base class for components that generate HTML list controls that represent field or parameter values. TWebSelectOptionsInput descendants generate controls that are organized by TDataGrid (see page 16560), TFieldGroup (see page 16591), or TQueryFieldGroup (see page 16736).

TWebSelectOptionsInput defines or inherits properties and methods for

Specifying a field or parameter whose value the list box displays.

Specifying the possible values from which the user can choose.

Generating a caption that describes the information displayed.

Customizing the appearance of the list box.

Fitting the list box into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebSelectOptionsInput inherits the IWebContent interface from TWebDataDisplay (see page 16884).

Do not create instances of TWebSelectOptionsInput. Instead, use a descendant of TWebSelectOptionsInput such as TFieldSelectOptions (see page 16612), TQuerySelectOptions (see page 16768), or TSelectOptionsColumn (see page 16814).

See Also

IWebContent (see page 24792)

TFieldGroup (see page 16591)

TQueryFieldGroup (see page 16736)

TFieldSelectOptions (see page 16612)

TQUerySelectOptions

TDataGrid (see page 16560)

TSelectOptionsColumn (see page 16814)

99.1.57.1 TWebSelectOptionsInput Members

The following tables list the members exposed by TWebSelectOptionsInput.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16962)	This is AddAttributes, a member of class TWebSelectOptionsInput.
	AddElements (see page 16941)	This is AddElements, a member of class TWebListInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 16942)	This is ControlContent, a member of class TWebListInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16962)	This is EventContent, a member of class TWebSelectOptionsInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	FormatInputs (see page 16962)	This is FormatInputs, a member of class TWebSelectOptionsInput.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.

	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetSelectIndex (see page 16962)	This is GetSelectIndex, a member of class TWebSelectOptionsInput.
	GetSubComponents (see page 16942)	This is GetSubComponents, a member of class TWebListInput.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplAddElements (see page 16942)	This is ImplAddElements, a member of class TWebListInput.
	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.
	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
	ImplGetRowSetFieldAttributes (see page 16907)	This is ImplGetRowSetFieldAttributes, a member of class TWebDataInput.
	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 16943)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
	RestoreFieldDefaults (see page 16908)	This is RestoreFieldDefaults, a member of class TWebDataInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDataSet (see page 16943)	This is SetDataSet, a member of class TWebListInput.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItems (see page 16943)	This is SetItems, a member of class TWebListInput.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetValues (see page 16944)	This is SetValues, a member of class TWebListInput.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16961)	Creates and initializes an instance of TWebSelectOptionsInput (see page 16956).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 16941)	Frees an instance of TWebListInput (see page 16935).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	Caption (see page 16897)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16897)	Customizes the appearance of the generated control's label.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16898)	Represents a tag option and its value in the tag for the display control.
	DataSet (see page 16944)	Specifies a dataset that supplies the possible values listed in the generated control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayRows (see page 16963)	Specifies the number of rows that appear in the generated list box.
	FieldName (see page 17058)	This is FieldName, a member of class IDataSetField.
	FieldName (see page 16909)	Specifies the name of the field whose value the generated control represents.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
	Items (see page 16945)	Lists the possible selections that appear in the generated control.
	ItemsField (see page 16945)	Indicates which field in DataSet (see page 16944) supplies the possible selections for the generated control.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16899)	Adds style attributes to the generated display control.
	StyleRule (see page 16899)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	Values (see page 16946)	Lists the possible values that can be assigned to the control.
	ValuesField (see page 16946)	Indicates which field in DataSet (see page 16944) supplies the possible values for the generated control.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.57.2 TWebSelectOptionsInput.Create Constructor

Creates and initializes an instance of TWebSelectOptionsInput (see page 16956).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebSelectOptionsInput(TComponent * AOwner);
```

Description

Call Create to instantiate TWebSelectOptionsInput (see page 16956) at runtime. TWebSelectOptionsInput (see page 16956) descendants added at design time using the Web Page editor are instantiated automatically.

99.1.57.3 TWebSelectOptionsInput Methods

The methods of the TWebSelectOptionsInput class are listed here.

Protected Methods

	Name	Description
	AddAttributes (see page 16962)	This is AddAttributes, a member of class TWebSelectOptionsInput.
	EventContent (see page 16962)	This is EventContent, a member of class TWebSelectOptionsInput.
	FormatInputs (see page 16962)	This is FormatInputs, a member of class TWebSelectOptionsInput.
	GetSelectIndex (see page 16962)	This is GetSelectIndex, a member of class TWebSelectOptionsInput.

99.1.57.3.1 TWebSelectOptionsInput.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); virtual;
```

C++

```
virtual __fastcall AddAttributes(AnsiString Attrs);
```

Description

This is AddAttributes, a member of class TWebSelectOptionsInput.

99.1.57.3.2 TWebSelectOptionsInput.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TWebSelectOptionsInput.

99.1.57.3.3 TWebSelectOptionsInput.FormatInputs Method

Pascal

```
function FormatInputs(ItemsStrings: TStrings; ValuesStrings: TStrings; Options:
TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString FormatInputs(TStrings ItemsStrings, TStrings ValuesStrings,
TWebContentOptions Options);
```

Description

This is FormatInputs, a member of class TWebSelectOptionsInput.

99.1.57.3.4 TWebSelectOptionsInput.GetSelectIndex Method

Pascal

```
function GetSelectIndex(ItemsStrings: TStrings; ValuesStrings: TStrings): Integer; virtual;
```

C++

```
virtual __fastcall int GetSelectIndex(TStrings ItemsStrings, TStrings ValuesStrings);
```

Description

This is GetSelectIndex, a member of class TWebSelectOptionsInput.

99.1.57.4 TWebSelectOptionsInput Properties

The properties of the TWebSelectOptionsInput class are listed here.

Public Properties

	Name	Description
	DisplayRows (see page 16963)	Specifies the number of rows that appear in the generated list box.

99.1.57.4.1 TWebSelectOptionsInput.DisplayRows Property

Specifies the number of rows that appear in the generated list box.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to specify how many rows appear in the generated list control. If DisplayRows is less than the number of items, the generated list displays only DisplayRows options at one time, but can scroll to display the hidden items. If DisplayRows is 1, the generated control becomes a drop-down list box.

Items (see page 16945)

99.1.58 TWebStatus Class

TWebStatus is the base class for Web items that indicate the status of records in an XML data packet.

Class Hierarchy

Pascal

```
TWebStatus = class(TWebDataDisplay, IStatusField);
```

C++

```
class TWebStatus : public TWebDataDisplay, public IStatusField;
```

File

MidItems

Description

Use TWebStatus as a base class for components that generate HTML controls which indicate whether records have been inserted or modified by the user. TWebStatus descendants generate controls that are added to TDataGrid (see page 16560) or TFieldGroup (see page 16591) to provide feedback about modifications to the underlying XML data packet.

TWebStatus defines or inherits properties and methods for

Generating a caption that describes the information displayed.

Customizing the appearance of the control.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebStatus inherits the IWebContent interface from TWebDataDisplay (see page 16884).

Do not create instances of TWebStatus. Instead, use a descendant of TWebStatus such as TFieldStatus (see page 16624) or TStatusColumn (see page 16826).

See Also

IWebContent (see page 24792)

TDataGrid (see page 16560)

TFieldGroup (see page 16591)

TFieldStatus (see page 16624)

TStatusColumn (see page 16826)

99.1.58.1 TWebStatus Members

The following tables list the members exposed by TWebStatus.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.

	ControlContent (see page 16969)	This is ControlContent, a member of class TWebStatus.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
	GetCaption (see page 16969)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
	ImplGetHTMLControlName (see page 16969)	Returns the name that other components can use to refer to the generated display control.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.

	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16968)	Creates and initializes an instance of TWebStatus (see page 16963).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	Identifier (see page 16969)	Returns the name under which record status information is stored in the XML data packet.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16970)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16970)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16971)	Specifies where the label appears relative to the generated display control.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16898)	Represents a tag option and its value in the tag for the display control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayWidth (see page 16971)	Specifies the width, in characters, of the generated HTML control.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16899)	Adds style attributes to the generated display control.
	StyleRule (see page 16899)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.58.2 TWebStatus.Create Constructor

Creates and initializes an instance of TWebStatus (see page 16963).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebStatus(TComponent * AOwner);
```

Description

Call Create to instantiate TWebStatus (see page 16963) at runtime. TWebStatus (see page 16963) descendants added at design time using the Web Page editor are instantiated automatically.

99.1.58.3 TWebStatus Methods

The methods of the TWebStatus class are listed here.

Protected Methods

	Name	Description
V	ControlContent (see page 16969)	This is ControlContent, a member of class TWebStatus.
V	GetCaption (see page 16969)	Returns the value of the Caption property.
V	ImplGetHTMLControlName (see page 16969)	Returns the name that other components can use to refer to the generated display control.

Public Methods

	Name	Description
	Identifier (see page 16969)	Returns the name under which record status information is stored in the XML data packet.

99.1.58.3.1 TWebStatus.ControlContent Method

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString ControlContent(TWebContentOptions Options);
```

Description

This is ControlContent, a member of class TWebStatus.

99.1.58.3.2 TWebStatus.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall AnsiString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 16897)

99.1.58.3.3 TWebStatus.Identifier Method

Returns the name under which record status information is stored in the XML data packet.

Pascal

```
class function Identifier: string;
```

C++

```
__fastcall AnsiString Identifier();
```

Description

Call Identifier to determine the name of the pseudo-field in the XML data packet that stores the status information displayed by the generated control.

99.1.58.3.4 TWebStatus.ImplGetHTMLControlName Method

Returns the name that other components can use to refer to the generated display control.

Pascal

```
function ImplGetHTMLControlName: string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetHTMLControlName();
```

Description

ImplGetHTMLControlName returns the name of the generated control. This value is assigned to a NAME option on the generated HTML tag.

ImplGetHTMLControlName returns the value of the Name property. TWebDataDisplay descendants can override this method to return a more meaningful value such as the name of the field or parameter displayed in the control.

See Also

Name (see page 2805)

99.1.58.4 TWebStatus Properties

The properties of the TWebStatus class are listed here.

Public Properties

	Name	Description
	Caption (see page 16970)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16970)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 16971)	Specifies where the label appears relative to the generated display control.
	DisplayWidth (see page 16971)	Specifies the width, in characters, of the generated HTML control.

99.1.58.4.1 TWebStatus.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

99.1.58.4.2 TWebStatus.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

99.1.58.4.3 TWebStatus.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 16897)

Caption (see page 16897)

99.1.58.4.4 TWebStatus.DisplayWidth Property

Specifies the width, in characters, of the generated HTML control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to control the width of the HTML control that displays record status information. By default, DisplayWidth is 1 because the TWebStatus (see page 16963) control values are one character (M for modified or I for inserted).

99.1.59 TWebTextAreaInput Class

TWebTextAreaInput is the base class for Web items that create HTML multi-line text controls.

Class Hierarchy

Pascal

```
TWebTextAreaInput = class(TWebDataInput);
```

C++

```
class TWebTextAreaInput : public TWebDataInput;
```

File

MidItems

Description

Use TWebTextAreaInput as a base class for components that generate HTML controls for displaying a field or parameter value in a multi-line text control. TWebTextAreaInput descendants generate controls that are organized by TDataGrid (see page 16560), TFieldGroup (see page 16591), or TQueryFieldGroup (see page 16736).

TWebTextAreaInput defines or inherits properties and methods for

Specifying a field or parameter whose value the control displays.

Generating a caption that describes the information displayed.

Customizing the appearance of the control that displays information.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebTextAreaInput inherits the IWebContent interface from TWebDataDisplay (see page 16884).

Do not create instances of TWebTextAreaInput. Instead, use a descendant of TWebTextAreaInput such as TFieldTextArea (see page 16640), TQueryTextArea (see page 16795), or TTextAreaColumn (see page 16838).

See Also

IWebContent (see page 24792)

TDataGrid (see page 16560)

TFieldGroup (see page 16591)

TQueryFieldGroup (see page 16736)

TFieldTextArea (see page 16640)

TQueryTextArea (see page 16795)

TTextAreaColumn (see page 16838)

99.1.59.1 TWebTextAreaInput Members

The following tables list the members exposed by TWebTextAreaInput.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16977)	This is AddAttributes, a member of class TWebTextAreaInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
V	ControlContent (see page 16978)	This is ControlContent, a member of class TWebTextAreaInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16978)	This is EventContent, a member of class TWebTextAreaInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.

V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 16978)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16978)	This is RestoreFieldDefaults, a member of class TWebTextAreaInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.

R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16977)	Creates and initializes an instance of TWebTextAreaInput (see page 16971).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	Caption (see page 16897)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16897)	Customizes the appearance of the generated control's label.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16898)	Represents a tag option and its value in the tag for the display control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayRows (see page 16979)	Specifies the height of the generated control.
	DisplayWidth (see page 16979)	Specifies the horizontal size of the generated control.
	FieldName (see page 17058)	This is FieldName, a member of class IDataSetField.
	FieldName (see page 16909)	Specifies the name of the field whose value the generated control represents.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.

R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 16979)	Indicates whether end users can use the generated control to set values.
	Style (see page 16899)	Adds style attributes to the generated display control.
	StyleRule (see page 16899)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Wrap (see page 16980)	Specifies how the generated control treats lines that are longer than the display width.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.59.2 TWebTextAreaInput.Create Constructor

Creates and initializes an instance of TWebTextAreaInput (see page 16971).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebTextAreaInput(TComponent * AOwner);
```

Description

Call Create to instantiate TWebTextAreaInput (see page 16971) at runtime. TWebTextAreaInput (see page 16971) descendants added at design time using the Web Page editor are instantiated automatically.

99.1.59.3 TWebTextAreaInput Methods

The methods of the TWebTextAreaInput class are listed here.

Protected Methods

	Name	Description
V	AddAttributes (see page 16977)	This is AddAttributes, a member of class TWebTextAreaInput.
V	ControlContent (see page 16978)	This is ControlContent, a member of class TWebTextAreaInput.
V	EventContent (see page 16978)	This is EventContent, a member of class TWebTextAreaInput.
V	ImplGetRowSetFieldAttributes (see page 16978)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.
V	RestoreFieldDefaults (see page 16978)	This is RestoreFieldDefaults, a member of class TWebTextAreaInput.

99.1.59.3.1 TWebTextAreaInput.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); virtual;
```

C++

```
virtual __fastcall AddAttributes(AnsiString Attrs);
```

Description

This is AddAttributes, a member of class TWebTextAreaInput.

99.1.59.3.2 TWebTextAreaInput.ControlContent Method

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString ControlContent(TWebContentOptions Options);
```

Description

This is ControlContent, a member of class TWebTextAreaInput.

99.1.59.3.3 TWebTextAreaInput.EventContent Method

Pascal

```
function EventContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString EventContent(TWebContentOptions Options);
```

Description

This is EventContent, a member of class TWebTextAreaInput.

99.1.59.3.4 TWebTextAreaInput.ImplGetRowSetFieldAttributes Method

Pascal

```
function ImplGetRowSetFieldAttributes(const FieldVarName: string): string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetRowSetFieldAttributes(const AnsiString FieldVarName);
```

Description

This is ImplGetRowSetFieldAttributes, a member of class TWebTextAreaInput.

99.1.59.3.5 TWebTextAreaInput.RestoreFieldDefaults Method

Pascal

```
procedure RestoreFieldDefaults(AField: TField); override;
```

C++

```
virtual __fastcall RestoreFieldDefaults(TField AField);
```

Description

This is RestoreFieldDefaults, a member of class TWebTextAreaInput.

99.1.59.4 TWebTextAreaInput Properties

The properties of the TWebTextAreaInput class are listed here.

Public Properties

	Name	Description
	DisplayRows (see page 16979)	Specifies the height of the generated control.
	DisplayWidth (see page 16979)	Specifies the horizontal size of the generated control.
	ReadOnly (see page 16979)	Indicates whether end users can use the generated control to set values.
	Wrap (see page 16980)	Specifies how the generated control treats lines that are longer than the display width.

99.1.59.4.1 TWebTextAreaInput.DisplayRows Property

Specifies the height of the generated control.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayRows to indicate the desired height of the generated HTML control. DisplayRows specifies the number of lines of text that can be displayed in the control. This value is assigned to the ROWS option of the generated TEXTAREA tag.

See Also

DisplayWidth (see page 16979)

99.1.59.4.2 TWebTextAreaInput.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in one line of the control. This value is assigned to the COLS option of the generated TEXTAREA tag.

See Also

DisplayRows (see page 16979)

99.1.59.4.3 TWebTextAreaInput.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control. This value determines

whether there is a READONLY option added to the generated TEXTAREA tag.

99.1.59.4.4 TWebTextAreaInput.Wrap Property

Specifies how the generated control treats lines that are longer than the display width.

Pascal

```
property Wrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap Wrap;
```

Description

Use Wrap to specify how the generated control formats lines that are longer than the number of characters specified by DisplayWidth (see page 16979). TWebTextAreaInput (see page 16971) uses Wrap to add a WRAP option to the generated TEXTAREA tag.

Wrap can have any of the following values:

Value	WRAP option value	Meaning
wrOff	OFF	The control does not wrap long lines. Only newline characters that are part of the text string cause the lines in the control to wrap.
wrPhysical	PHYSICAL	The control formats its text value by wrapping long lines so that no text is hidden. The control inserts carriage returns into the text string.
wrVirtual	VIRTUAL	The control formats its text value by wrapping long lines so that no text is hidden but does not change the actual value of the text string.

See Also

DisplayWidth (see page 16979)

99.1.60 TWebTextInput Class

TWebTextInput is the base class for Web items that create HTML single-line text controls.

Class Hierarchy

Pascal

```
TWebTextInput = class(TWebDataInput);
```

C++

```
class TWebTextInput : public TWebDataInput;
```

File

MidItems

Description

Use TWebTextInput as a base class for components that generate HTML controls for displaying a field or parameter value as a single-line text string. TWebTextInput descendants generate controls that are organized by TDataGrid (see page 16560), TFieldGroup (see page 16591), or TQueryFieldGroup (see page 16736).

TWebTextInput defines or inherits properties and methods for

Specifying a field or parameter whose value the control displays.

Generating a caption that describes the information displayed.

Customizing the appearance of the control that displays information.

Fitting the control into the tab order of the generated HTML form.

Fitting the component into a hierarchy of Web items that collectively generate the content of an HTML document.

In order to let other Web items to use the HTML control it generates, TWebTextInput inherits the IWebContent interface from TWebDataDisplay (see page 16884).

Do not create instances of TWebTextInput. Instead, use a descendant of TWebTextInput such as TFieldText (see page 16631), TQueryText (see page 16783), or TTextColumn (see page 16849).

See Also

IWebContent (see page 24792)

TDataGrid (see page 16560)

TFieldGroup (see page 16591)

TQueryFieldGroup (see page 16736)

TFieldText (see page 16631)

TQueryText (see page 16783)

TTextColumn (see page 16849)

99.1.60.1 TWebTextInput Members

The following tables list the members exposed by TWebTextInput.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddAttributes (see page 16986)	This is AddAttributes, a member of class TWebTextInput.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
V	ControlContent (see page 16987)	This is ControlContent, a member of class TWebTextInput.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	EventContent (see page 16905)	This is EventContent, a member of class TWebDataInput.
V	FindAssociatedField (see page 16906)	This is FindAssociatedField, a member of class TWebDataInput.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 16906)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetFieldName (see page 16906)	This is GetFieldName, a member of class TWebDataInput.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetParamName (see page 16906)	This is GetParamName, a member of class TWebDataInput.
	GetRowSetFieldAttributes (see page 16907)	This is GetRowSetFieldAttributes, a member of class TWebDataInput.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplGetFieldName (see page 16907)	This is ImplGetFieldName, a member of class TWebDataInput.

V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetHTMLControlName (see page 16907)	Returns the name that other components can use to refer to the generated display control.
V	ImplGetRowSetFieldAttributes (see page 16987)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.
V	ImplRestoreDefaults (see page 16908)	This is ImplRestoreDefaults, a member of class TWebDataInput.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 16908)	This is RestoreDefaults, a member of class TWebDataInput.
V	RestoreFieldDefaults (see page 16987)	This is RestoreFieldDefaults, a member of class TWebTextInput.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 16908)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 16909)	This is SetFieldName, a member of class TWebDataInput.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParamName (see page 16909)	This is SetParamName, a member of class TWebDataInput.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateField (see page 16909)	This is ValidateField, a member of class TWebDataInput.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	ParamName (see page 16910)	Specifies the name of the parameter whose value the generated control represents.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.

R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16986)	Creates and initializes an instance of TWebTextInput (see page 16980).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

Public Properties

	Name	Description
	Caption (see page 16897)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16897)	Customizes the appearance of the generated control's label.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16987)	Represents a tag option and its value in the tag for the display control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayWidth (see page 16988)	Specifies the horizontal size of the generated control.
	FieldName (see page 17058)	This is FieldName, a member of class IDataSetField.
	FieldName (see page 16909)	Specifies the name of the field whose value the generated control represents.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.

R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 16988)	Indicates whether end users can use the generated control to set values.
	Style (see page 16989)	Adds style attributes to the generated display control.
	StyleRule (see page 16989)	This is StyleRule, a member of class TWebTextInput.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.60.2 TWebTextInput.Create Constructor

Creates and initializes an instance of TWebTextInput (see page 16980).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebTextInput(TComponent * AOwner);
```

Description

Call Create to instantiate a TWebTextInput (see page 16980) descendant at runtime. TWebTextInput (see page 16980) descendants added at design time using the Web Page editor are instantiated automatically.

99.1.60.3 TWebTextInput Methods

The methods of the TWebTextInput class are listed here.

Protected Methods

	Name	Description
V	AddAttributes (see page 16986)	This is AddAttributes, a member of class TWebTextInput.
V	ControlContent (see page 16987)	This is ControlContent, a member of class TWebTextInput.
V	ImplGetRowSetFieldAttributes (see page 16987)	This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.
V	RestoreFieldDefaults (see page 16987)	This is RestoreFieldDefaults, a member of class TWebTextInput.

99.1.60.3.1 TWebTextInput.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string); virtual;
```

C++

```
virtual __fastcall AddAttributes(AnsiString Attrs);
```

Description

This is AddAttributes, a member of class TWebTextInput.

99.1.60.3.2 TWebTextInput.ControlContent Method

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString ControlContent(TWebContentOptions Options);
```

Description

This is ControlContent, a member of class TWebTextInput.

99.1.60.3.3 TWebTextInput.ImplGetRowSetFieldAttributes Method

Pascal

```
function ImplGetRowSetFieldAttributes(const FieldVarName: string): string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetRowSetFieldAttributes(const AnsiString FieldVarName);
```

Description

This is ImplGetRowSetFieldAttributes, a member of class TWebTextInput.

99.1.60.3.4 TWebTextInput.RestoreFieldDefaults Method

Pascal

```
procedure RestoreFieldDefaults(AField: TField); override;
```

C++

```
virtual __fastcall RestoreFieldDefaults(TField AField);
```

Description

This is RestoreFieldDefaults, a member of class TWebTextInput.

99.1.60.4 TWebTextInput Properties

The properties of the TWebTextInput class are listed here.

Public Properties

	Name	Description
	Custom (see page 16987)	Represents a tag option and its value in the tag for the display control.
	DisplayWidth (see page 16988)	Specifies the horizontal size of the generated control.
	ReadOnly (see page 16988)	Indicates whether end users can use the generated control to set values.
	Style (see page 16989)	Adds style attributes to the generated display control.
	StyleRule (see page 16989)	This is StyleRule, a member of class TWebTextInput.

99.1.60.4.1 TWebTextInput.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

99.1.60.4.2 TWebTextInput.DisplayWidth Property

Specifies the horizontal size of the generated control.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to indicate the desired width of the generated HTML control. DisplayWidth specifies the number of characters that can be displayed in the control.

Note: DisplayWidth controls the size of the generated control, not the size of the text that users can enter. If the user enters a string longer than DisplayWidth characters, the text scrolls in the control.

99.1.60.4.3 TWebTextInput.ReadOnly Property

Indicates whether end users can use the generated control to set values.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use ReadOnly to indicate whether users can change the value displayed by the generated control.

99.1.60.4.4 TWebTextInput.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

Setting Web Item Properties

99.1.60.4.5 TWebTextInput.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TWebTextInput.

99.1.61 TXMLButton Class

TXMLButton is the base class for Web items that create HTML buttons that perform some action with the XML data packet.

Class Hierarchy

Pascal

```
TXMLButton = class(TWebButton);
```

C++

```
class TXMLButton : public TWebButton;
```

File

MidItems

Description

Use TXMLButton as a base class for components that generate the HTML statements defining a specialized button control for manipulating an XML data packet. TXMLButton defines properties and methods for
