Generating the HTML code to define the button control.

Associating the button with an XML broker that fetches the XML data packet and responds to update messages.

Specifying tag attributes of the HTML button control, including those defined by a style sheet.

Fitting the component into a hierarchy of Web items, each of which generates part of a larger HTML document.

In order to allow other Web items to use the HTML generated by the button control, TXMLButton inherits support for the IWebContent interface from TWebButton (see page 16863).

Do not create instances of TXMLButton. TXMLButton relies on anabstract or, in C++ terminology, pure virtual method to generate the HTML statements defining a button control. Instead, create descendants of TXMLButton, such as TApplyUpdatesButton (see page 16480).

TApplyUpdatesButton (see page 16480)

IWebContent (see page 24792)

99.1.61.1 TXMLButton Members

The following tables list the members exposed by TXMLButton.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16994)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.

	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXMLBroker (see page 16995)	This is GetXMLBroker, a member of class TXMLButton.
	GetXMLUseParent (see page 16995)	This is GetXMLUseParent, a member of class TXMLButton.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 16995)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	SetXMLBroker (see page 16996)	This is SetXMLBroker, a member of class TXMLButton.
	SetXMLUseParent (see page 16996)	This is SetXMLUseParent, a member of class TXMLButton.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultCaption (see page 16996)	This is DefaultCaption, a member of class TXMLButton.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.

R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.
R	XMLData (see page 16997)	This is XMLData, a member of class TXMLButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 16993)	Creates and initializes an instance of TXMLButton (see page 16989).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 16994)	Frees an instance of TXMLButton (see page 16989).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLBroker (see page 16996)	Associates the XML button with an XML broker.
	XMLUseParent (see page 16997)	Specifies whether the XML button is associated with its parent's XML broker.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.61.2 TXMLButton.Create Constructor

Creates and initializes an instance of TXMLButton (see page 16989).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TXMLButton(TComponent * AOwner);
```

Description

Call Create to instantiate an XML button at runtime. Web buttons added at design time using the Web Page editor are instantiated automatically.

99.1.61.3 TXMLButton.Destroy Destructor

Frees an instance of TXMLButton (see page 16989).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLButton();
```

Description

Destroy removes the XML button from its parent's list of components that generate HTML before freeing the button instance.

99.1.61.4 TXMLButton Methods

The methods of the TXMLButton class are listed here.

Protected Methods

	Name	Description
	GetCaption (see page 16994)	Returns the value of the Caption property.
	GetXMLBroker (see page 16995)	This is GetXMLBroker, a member of class TXMLButton.
	GetXMLUseParent (see page 16995)	This is GetXMLUseParent, a member of class TXMLButton.
	Notification (see page 16995)	Forwards notification messages to all owned components.
	SetXMLBroker (see page 16996)	This is SetXMLBroker, a member of class TXMLButton.
	SetXMLUseParent (see page 16996)	This is SetXMLUseParent, a member of class TXMLButton.

99.1.61.4.1 TXMLButton.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall AnsiString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 16870)

SetCaption (see page 16870)

99.1.61.4.2 TXMLButton.GetXMLBroker Method

Pascal

```
function GetXMLBroker: TXMLBroker;
```

C++

```
__fastcall TXMLBroker GetXMLBroker();
```

Description

This is GetXMLBroker, a member of class TXMLButton.

99.1.61.4.3 TXMLButton.GetXMLUseParent Method

Pascal

```
function GetXMLUseParent: Boolean;
```

C++

```
__fastcall Boolean GetXMLUseParent();
```

Description

This is GetXMLUseParent, a member of class TXMLButton.

99.1.61.4.4 TXMLButton.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

99.1.61.4.5 TXMLButton.SetXMLBroker Method

Pascal

```
procedure SetXMLBroker(const Value: TXMLBroker);
```

C++

```
__fastcall SetXMLBroker(const TXMLBroker Value);
```

Description

This is SetXMLBroker, a member of class TXMLButton.

99.1.61.4.6 TXMLButton.SetXMLUseParent Method

Pascal

```
procedure SetXMLUseParent(const Value: Boolean);
```

C++

```
__fastcall SetXMLUseParent(const Boolean Value);
```

Description

This is SetXMLUseParent, a member of class TXMLButton.

99.1.61.5 TXMLButton Properties

The properties of the TXMLButton class are listed here.

Protected Properties

	Name	Description
	DefaultCaption (see page 16996)	This is DefaultCaption, a member of class TXMLButton.
R	XMLData (see page 16997)	This is XMLData, a member of class TXMLButton.

Public Properties

	Name	Description
	XMLBroker (see page 16996)	Associates the XML button with an XML broker.
	XMLUseParent (see page 16997)	Specifies whether the XML button is associated with its parent's XML broker.

99.1.61.5.1 TXMLButton.DefaultCaption Property

Pascal

```
property DefaultCaption: string;
```

C++

```
__property AnsiString DefaultCaption;
```

Description

This is DefaultCaption, a member of class TXMLButton.

99.1.61.5.2 TXMLButton.XMLBroker Property

Associates the XML button with an XML broker.

Pascal

```
property XMLBroker: TXMLBroker;
```

C++

```
__property TXMLBroker XMLBroker;
```

Description

Set XMLBroker to specify the XML broker whose data packets the XML button manipulates.

When XML buttons are used by TDataNavigator (see page 16569), the data navigator already establishes a connection (indirectly) to an XML broker. If the XML button uses this same XML broker, you do not need to set the XMLBroker property. Instead, setting the XMLUseParent (see page 16997) property to true (the default) automatically associates the XML button with the same broker as the one associated with the navigator.

See Also

XMLUseParent (see page 16997)

99.1.61.5.3 TXMLButton.XMLData Property

Pascal

```
property XMLData: TXMLDataParent;
```

C++

```
__property TXMLDataParent XMLData;
```

Description

This is XMLData, a member of class TXMLButton.

99.1.61.5.4 TXMLButton.XMLUseParent Property

Specifies whether the XML button is associated with its parent's XML broker.

Pascal

```
property XMLUseParent: Boolean;
```

C++

```
__property Boolean XMLUseParent;
```

Description

Use XMLUseParent to indicate how the XML button determines the XML broker whose data packets it manipulates. When XMLUseParent is false, the XMLBroker (see page 16996) property must be set to indicate the XML broker. When XMLUseParent is true, the XML broker associated with the XML button's parent determines the associated XML broker.

The XML button's parent is the Web item (typically TDataNavigator (see page 16569)) that uses the XML button to assemble its own HTML content. The parent's associated broker may be defined through an indirect association. For example, the data navigator acts on another component, such as a field group, which has an associated broker.

If the parent does not have an associated XML broker, setting XMLUseParent to true sets the XMLBroker (see page 16996) property to nil (Delphi) or NULL (C++).

See Also

XMLBroker (see page 16996)

99.1.62 TXMLData Class

TXMLData manages the relationship between an XML broker and a Web item that represents a dataset in that XML broker's data packet.

Class Hierarchy

Pascal

```
TXMLData = class(TObject);
```

C++

```
class TXMLData : public TObject;
```

File

MidItems

Description

TXMLData represents the link to an XML broker for a Web item that is bound to a dataset in the XML broker's data packet. It is the base class for TXMLDataSet (see page 17006), which allows the Web item to bind to a dataset field nested in the XML broker's top-level dataset.

TXMLData does not support the ability to bind to a nested dataset field. Rather, it introduces the underlying support needed to keep track of the XML broker for components that supply this ability.

See Also

TXMLBroker (see page 26049)

IDataSetComponent (see page 17053)

TXMLDataSet (see page 17006)

99.1.62.1 TXMLData Members

The following tables list the members exposed by TXMLData.

Protected Methods

	Name	Description
	Changed (see page 17000)	This is Changed, a member of class TXMLData.
	ChangedXMLBroker (see page 17000)	This is ChangedXMLBroker, a member of class TXMLData.
	GetXMLBroker (see page 17000)	This is GetXMLBroker, a member of class TXMLData.
	SetXMLBroker (see page 17001)	This is SetXMLBroker, a member of class TXMLData.

Public Events

	Name	Description
	OnChange (see page 17002)	Occurs when the XMLBroker (see page 17002) property changes.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 16999)	Creates a new TXMLData (see page 16998) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Notification (see page 17001)	Responds to notifications when objects are created or destroyed.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Parent (see page 17001)	Indicates the Web item that uses this object to represent its link to an XML broker.
	XMLBroker (see page 17002)	Specifies the XML broker that generates the dataset to which the associated Web item is bound.

99.1.62.2 TXMLData.Create Constructor

Creates a new TXMLData (see page 16998) object.

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TXMLData(TComponent * AParent);
```

Description

Most applications do not need to call the TXMLData (see page 16998) constructor. The Web item that uses the TXMLData (see page 16998) object to represent its link to a dataset instantiates this object.

The AParent parameter specifies the Web item that uses the TXMLData (see page 16998) object to link to an XML broker. This becomes the value of the Parent (see page 17001) property.

See Also

Parent (see page 17001)

99.1.62.3 TXMLData Methods

The methods of the TXMLData class are listed here.

Protected Methods

	Name	Description
	Changed (see page 17000)	This is Changed, a member of class TXMLData.
V	ChangedXMLBroker (see page 17000)	This is ChangedXMLBroker, a member of class TXMLData.
V	GetXMLBroker (see page 17000)	This is GetXMLBroker, a member of class TXMLData.
V	SetXMLBroker (see page 17001)	This is SetXMLBroker, a member of class TXMLData.

Public Methods

	Name	Description
V	Notification (see page 17001)	Responds to notifications when objects are created or destroyed.

99.1.62.3.1 TXMLData.Changed Method

Pascal

```
procedure Changed;
```

C++

```
__fastcall Changed();
```

Description

This is Changed, a member of class TXMLData.

99.1.62.3.2 TXMLData.ChangedXMLBroker Method

Pascal

```
procedure ChangedXMLBroker; virtual;
```

C++

```
virtual __fastcall ChangedXMLBroker();
```

Description

This is ChangedXMLBroker, a member of class TXMLData.

99.1.62.3.3 TXMLData.GetXMLBroker Method

Pascal

```
function GetXMLBroker: TXMLBroker; virtual;
```

C++

```
virtual __fastcall TXMLBroker GetXMLBroker();
```

Description

This is GetXMLBroker, a member of class TXMLData.

99.1.62.3.4 TXMLData.Notification Method

Responds to notifications when objects are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); virtual;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method. It is called automatically when objects are created or destroyed. TXMLData (see page 16998) responds to notifications by setting the XMLBroker (see page 17002) property to nil (Delphi) or NULL (C++) if it is notified that this component is about to be destroyed.

See Also

XMLBroker (see page 17002)

99.1.62.3.5 TXMLData.SetXMLBroker Method

Pascal

```
procedure SetXMLBroker(const Value: TXMLBroker); virtual;
```

C++

```
virtual __fastcall SetXMLBroker(const TXMLBroker Value);
```

Description

This is SetXMLBroker, a member of class TXMLData.

99.1.62.4 TXMLData Properties

The properties of the TXMLData class are listed here.

Public Properties

	Name	Description
R	Parent (see page 17001)	Indicates the Web item that uses this object to represent its link to an XML broker.
	XMLBroker (see page 17002)	Specifies the XML broker that generates the dataset to which the associated Web item is bound.

99.1.62.4.1 TXMLData.Parent Property

Indicates the Web item that uses this object to represent its link to an XML broker.

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

Read Parent to determine the Web item that uses this object to bind to a dataset from an XML broker. The value of Parent is set by the constructor.

See Also

XMLBroker (see page 17002)

Create (see page 16999)

99.1.62.4.2 TXMLData.XMLBroker Property

Specifies the XML broker that generates the dataset to which the associated Web item is bound.

Pascal

```
property XMLBroker: TXMLBroker;
```

C++

```
__property TXMLBroker XMLBroker;
```

Description

The Web item specified by the Parent (see page 17001) property sets XMLBroker to bind to an XML broker.

When the value of XMLBroker changes, the TXMLData (see page 16998) object generates an OnChange (see page 17002) event.

See Also

Parent (see page 17001)

OnChange (see page 17002)

99.1.62.5 TXMLData Events

The events of the TXMLData class are listed here.

Public Events

	Name	Description
	OnChange (see page 17002)	Occurs when the XMLBroker (see page 17002) property changes.

99.1.62.5.1 TXMLData.OnChange Event

Occurs when the XMLBroker (see page 17002) property changes.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to respond immediately after the Web item specified by Parent (see page 17001) becomes bound to a different XML broker. This occurs when Parent (see page 17001) changes the XMLBroker (see page 17002) property explicitly in response to a change in its own properties, or when the XML broker object to which it is bound is destroyed.

See Also

XMLBroker (see page 17002)

Parent (see page 17001)

99.1.63 TXMLDataParent Class

Class Hierarchy

System::TObject → MidItems.TXMLData → MidItems.TXMLDataParent

Pascal

```
TXMLDataParent = class(TXMLData);
```

C++

```
class TXMLDataParent : public TXMLData;
```

File

MidItems

Description

This is class MidItems.TXMLDataParent.

99.1.63.1 TXMLDataParent Members

The following tables list the members exposed by TXMLDataParent.

Protected Methods

	Name	Description
	Changed (see page 17000)	This is Changed, a member of class TXMLData.
V	ChangedUseParent (see page 17004)	This is ChangedUseParent, a member of class TXMLDataParent.
V	ChangedXMLBroker (see page 17005)	This is ChangedXMLBroker, a member of class TXMLDataParent.
V	GetXMLBroker (see page 17005)	This is GetXMLBroker, a member of class TXMLDataParent.
	ParentXMLBroker (see page 17005)	This is ParentXMLBroker, a member of class TXMLDataParent.
	SetUseParent (see page 17005)	This is SetUseParent, a member of class TXMLDataParent.
V	SetXMLBroker (see page 17001)	This is SetXMLBroker, a member of class TXMLData.

Public Events

	Name	Description
	OnChange (see page 17002)	Occurs when the XMLBroker (see page 17002) property changes.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 16999)	Creates a new TXMLData (see page 16998) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Notification (see page 17001)	Responds to notifications when objects are created or destroyed.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Parent (see page 17001)	Indicates the Web item that uses this object to represent its link to an XML broker.
	XMLBroker (see page 17002)	Specifies the XML broker that generates the dataset to which the associated Web item is bound.

Published Properties

	Name	Description
	UseParent (see page 17006)	This is UseParent, a member of class TXMLDataParent.

99.1.63.2 TXMLDataParent Methods

The methods of the TXMLDataParent class are listed here.

Protected Methods

	Name	Description
V	ChangedUseParent (see page 17004)	This is ChangedUseParent, a member of class TXMLDataParent.
V	ChangedXMLBroker (see page 17005)	This is ChangedXMLBroker, a member of class TXMLDataParent.
V	GetXMLBroker (see page 17005)	This is GetXMLBroker, a member of class TXMLDataParent.
	ParentXMLBroker (see page 17005)	This is ParentXMLBroker, a member of class TXMLDataParent.
	SetUseParent (see page 17005)	This is SetUseParent, a member of class TXMLDataParent.

99.1.63.2.1 TXMLDataParent.ChangedUseParent Method

Pascal

```
procedure ChangedUseParent; virtual;
```

C++

```
virtual __fastcall ChangedUseParent();
```

Description

This is ChangedUseParent, a member of class TXMLDataParent.

99.1.63.2.2 TXMLDataParent.ChangedXMLBroker Method

Pascal

```
procedure ChangedXMLBroker; override;
```

C++

```
virtual __fastcall ChangedXMLBroker();
```

Description

This is ChangedXMLBroker, a member of class TXMLDataParent.

99.1.63.2.3 TXMLDataParent.GetXMLBroker Method

Pascal

```
function GetXMLBroker: TXMLBroker; override;
```

C++

```
virtual __fastcall TXMLBroker GetXMLBroker();
```

Description

This is GetXMLBroker, a member of class TXMLDataParent.

99.1.63.2.4 TXMLDataParent.ParentXMLBroker Method

Pascal

```
function ParentXMLBroker: TXMLBroker;
```

C++

```
__fastcall TXMLBroker ParentXMLBroker();
```

Description

This is ParentXMLBroker, a member of class TXMLDataParent.

99.1.63.2.5 TXMLDataParent.SetUseParent Method

Pascal

```
procedure SetUseParent(const Value: Boolean);
```

C++

```
__fastcall SetUseParent(const Boolean Value);
```

Description

This is SetUseParent, a member of class TXMLDataParent.

99.1.63.3 TXMLDataParent Properties

The properties of the TXMLDataParent class are listed here.

Published Properties

	Name	Description
	UseParent (see page 17006)	This is UseParent, a member of class TXMLDataParent.

99.1.63.3.1 TXMLDataParent.UseParent Property

Pascal

```
property UseParent: Boolean;
```

C++

```
__property Boolean UseParent;
```

Description

This is UseParent, a member of class TXMLDataParent.

99.1.64 TXMLDataSet Class

TXMLDataSet manages the relationship between a Web item and the XML dataset to which it is bound.

Class Hierarchy

Pascal

```
TXMLDataSet = class(TXMLData, INotifyConnectionChange);
```

C++

```
class TXMLDataSet : public TXMLData, public INotifyConnectionChange;
```

File

MidItems

Description

TXMLDataSet represents a Web item's link to an XML dataset. The Web item can be bound to an XML broker's data packet, or to a dataset field nested in an XML broker's data packet.

See Also

TXMLBroker (see page 26049)

IDataSetComponent (see page 17053)

TXMLDisplayGroup (see page 17019)

99.1.64.1 TXMLDataSet Members

The following tables list the members exposed by TXMLDataSet.

Protected Methods

	Name	Description
	_AddRef (see page 17009)	This is _AddRef, a member of class TXMLDataSet.

	_Release (see page 17009)	This is _Release, a member of class TXMLDataSet.
	Changed (see page 17000)	This is Changed, a member of class TXMLData.
V	ChangedDataSetField (see page 17009)	This is ChangedDataSetField, a member of class TXMLDataSet.
V	ChangedXMLBroker (see page 17010)	This is ChangedXMLBroker, a member of class TXMLDataSet.
	CompareXMLData (see page 17010)	This is CompareXMLData, a member of class TXMLDataSet.
	ConnectionChange (see page 17010)	This is ConnectionChange, a member of class TXMLDataSet.
	CreateDataSet (see page 17010)	This is CreateDataSet, a member of class TXMLDataSet.
	FindDataSet (see page 17010)	This is FindDataSet, a member of class TXMLDataSet.
	GetDataSet (see page 17011)	This is GetDataSet, a member of class TXMLDataSet.
V	GetDataSetField (see page 17011)	This is GetDataSetField, a member of class TXMLDataSet.
	GetDataSetPath (see page 17011)	This is GetDataSetPath, a member of class TXMLDataSet.
V	GetXMLBroker (see page 17000)	This is GetXMLBroker, a member of class TXMLData.
V	QueryInterface (see page 17011)	This is QueryInterface, a member of class TXMLDataSet.
	SetDataSetField (see page 17012)	This is SetDataSetField, a member of class TXMLDataSet.
V	SetXMLBroker (see page 17012)	This is SetXMLBroker, a member of class TXMLDataSet.
	WrapperDataChange (see page 17012)	This is WrapperDataChange, a member of class TXMLDataSet.

Protected Properties

	Name	Description
R	Parent (see page 17014)	Indicates the Web item that uses this object to represent its link to an XML broker.

Public Events

	Name	Description
	OnChange (see page 17002)	Occurs when the XMLBroker (see page 17002) property changes.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 17008)	Creates a new TXMLDataSet (see page 17006) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 17008)	TXMLDataSetFrees the memory associated with the TXMLDataSet (see page 17006) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Notification (see page 17001)	Responds to notifications when objects are created or destroyed.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	DataSet (see page 17012)	Provides access to an interface for working with the associated dataset.
	DataSetField (see page 17013)	Identifies a nested dataset in the associated XML broker's data packet.
R	DataSetPath (see page 17013)	Represents the parsed value of the DataSetField (see page 17013) property.
	XMLBroker (see page 17002)	Specifies the XML broker that generates the dataset to which the associated Web item is bound.

99.1.64.2 TXMLDataSet.Create Constructor

Creates a new TXMLDataSet (see page 17006) object.

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TXMLDataSet(TComponent * AParent);
```

Description

Most applications do not need to call the TXMLDataSet (see page 17006) constructor. The Web item that uses the TXMLDataSet (see page 17006) object to represent its link to a dataset instantiates this object.

The AParent parameter specifies the Web item that uses the TXMLDataSet (see page 17006) object to link to an XML dataset. This becomes the value of the Parent (see page 17014) property.

See Also

Parent (see page 17001)

99.1.64.3 TXMLDataSet.Destroy Destructor

TXMLDataSetFrees the memory associated with the TXMLDataSet (see page 17006) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLDataSet();
```

Description

Typically, applications do not free instances of TXMLDataSet (see page 17006). Instead, this object is freed by the Web item that uses it.

99.1.64.4 TXMLDataSet Methods

The methods of the TXMLDataSet class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 17009)	This is _AddRef, a member of class TXMLDataSet.
	_Release (see page 17009)	This is _Release, a member of class TXMLDataSet.
V	ChangedDataSetField (see page 17009)	This is ChangedDataSetField, a member of class TXMLDataSet.
V	ChangedXMLBroker (see page 17010)	This is ChangedXMLBroker, a member of class TXMLDataSet.
	CompareXMLData (see page 17010)	This is CompareXMLData, a member of class TXMLDataSet.
	ConnectionChange (see page 17010)	This is ConnectionChange, a member of class TXMLDataSet.
	CreateDataSet (see page 17010)	This is CreateDataSet, a member of class TXMLDataSet.
	FindDataSet (see page 17010)	This is FindDataSet, a member of class TXMLDataSet.
	GetDataSet (see page 17011)	This is GetDataSet, a member of class TXMLDataSet.
V	GetDataSetField (see page 17011)	This is GetDataSetField, a member of class TXMLDataSet.
	GetDataSetPath (see page 17011)	This is GetDataSetPath, a member of class TXMLDataSet.
V	QueryInterface (see page 17011)	This is QueryInterface, a member of class TXMLDataSet.
	SetDataSetField (see page 17012)	This is SetDataSetField, a member of class TXMLDataSet.
V	SetXMLBroker (see page 17012)	This is SetXMLBroker, a member of class TXMLDataSet.
	WrapperDataChange (see page 17012)	This is WrapperDataChange, a member of class TXMLDataSet.

99.1.64.4.1 TXMLDataSet._AddRef Method

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

This is _AddRef, a member of class TXMLDataSet.

99.1.64.4.2 TXMLDataSet._Release Method

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

This is _Release, a member of class TXMLDataSet.

99.1.64.4.3 TXMLDataSet.ChangedDataSetField Method

Pascal

```
procedure ChangedDataSetField; virtual;
```

C++

```
virtual __fastcall ChangedDataSetField();
```

Description

This is ChangedDataSetField, a member of class TXMLDataSet.

99.1.64.4.4 TXMLDataSet.ChangedXMLBroker Method

Pascal

```
procedure ChangedXMLBroker; override;
```

C++

```
virtual __fastcall ChangedXMLBroker();
```

Description

This is ChangedXMLBroker, a member of class TXMLDataSet.

99.1.64.4.5 TXMLDataSet.CompareXMLData Method

Pascal

```
function CompareXMLData(XMLDataSet: TXMLDataSet): Boolean;
```

C++

```
__fastcall Boolean CompareXMLData(TXMLDataSet XMLDataSet);
```

Description

This is CompareXMLData, a member of class TXMLDataSet.

99.1.64.4.6 TXMLDataSet.ConnectionChange Method

Pascal

```
procedure ConnectionChange(Sender: TComponent; Connecting: Boolean);
```

C++

```
__fastcall ConnectionChange(TComponent * Sender, Boolean Connecting);
```

Description

This is ConnectionChange, a member of class TXMLDataSet.

99.1.64.4.7 TXMLDataSet.CreateDataSet Method

Pascal

```
function CreateDataSet: IInetXWebDataSet;
```

C++

```
__fastcall IInetXWebDataSet CreateDataSet();
```

Description

This is CreateDataSet, a member of class TXMLDataSet.

99.1.64.4.8 TXMLDataSet.FindDataSet Method

Pascal

```
function FindDataSet: IInetXWebDataSet;
```

C++

```
__fastcall IInetXWebDataSet FindDataSet();
```

Description

This is FindDataSet, a member of class TXMLDataSet.

99.1.64.4.9 TXMLDataSet.GetDataSet Method

Pascal

```
function GetDataSet: IInetXWebDataSet;
```

C++

```
__fastcall IInetXWebDataSet GetDataSet();
```

Description

This is GetDataSet, a member of class TXMLDataSet.

99.1.64.4.10 TXMLDataSet.GetDataSetField Method

Pascal

```
function GetDataSetField: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetDataSetField();
```

Description

This is GetDataSetField, a member of class TXMLDataSet.

99.1.64.4.11 TXMLDataSet.GetDataSetPath Method

Pascal

```
function GetDataSetPath: TStrings;
```

C++

```
__fastcall TStrings GetDataSetPath();
```

Description

This is GetDataSetPath, a member of class TXMLDataSet.

99.1.64.4.12 TXMLDataSet.QueryInterface Method

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

This is QueryInterface, a member of class TXMLDataSet.

99.1.64.4.13 TXMLDataSet.SetDataSetField Method

Pascal

```
procedure SetDataSetField(const Value: string);
```

C++

```
__fastcall SetDataSetField(const AnsiString Value);
```

Description

This is SetDataSetField, a member of class TXMLDataSet.

99.1.64.4.14 TXMLDataSet.SetXMLBroker Method

Pascal

```
procedure SetXMLBroker(const Value: TXMLBroker); override;
```

C++

```
virtual __fastcall SetXMLBroker(const TXMLBroker Value);
```

Description

This is SetXMLBroker, a member of class TXMLDataSet.

99.1.64.4.15 TXMLDataSet.WrapperDataChange Method

Pascal

```
procedure WrapperDataChange(Sender: TObject);
```

C++

```
__fastcall WrapperDataChange(TObject * Sender);
```

Description

This is WrapperDataChange, a member of class TXMLDataSet.

99.1.64.5 TXMLDataSet Properties

The properties of the TXMLDataSet class are listed here.

Protected Properties

	Name	Description
R	Parent (see page 17014)	Indicates the Web item that uses this object to represent its link to an XML broker.

Public Properties

	Name	Description
R	DataSet (see page 17012)	Provides access to an interface for working with the associated dataset.
	DataSetField (see page 17013)	Identifies a nested dataset in the associated XML broker's data packet.
R	DataSetPath (see page 17013)	Represents the parsed value of the DataSetField (see page 17013) property.

99.1.64.5.1 TXMLDataSet.DataSet Property

Provides access to an interface for working with the associated dataset.

Pascal

```
property DataSet: IInetXWebDataSet;
```

C++

```
__property IInetXWebDataSet DataSet;
```

Description

Use DataSet to manipulate the associated dataset. DataSet is an interface that provides information about the available fields and parameters of the dataset and lets you respond when this information changes.

An advantage of using the DataSet property is that it handles the task of identifying the correct dataset within the associated XML broker's data packet. This lets you treat nested datasets in the same way that you interact with the XML broker's main dataset.

See Also

XMLBroker

DataSetField (see page 17013)

99.1.64.5.2 TXMLDataSet.DataSetField Property

Identifies a nested dataset in the associated XML broker's data packet.

Pascal

```
property DataSetField: string;
```

C++

```
__property AnsiString DataSetField;
```

Description

Use DataSetField, in conjunction with the XMLBroker (see page 17002) property, to identify the XML dataset that the TXMLDataSet (see page 17006) object represents. If the dataset is the dataset represented directly by the XML broker's data packet, DataSetField is an empty string and the XMLBroker (see page 17002) property fully describes the dataset. If the dataset is a nested detail set, DataSetField indicates what detail dataset to use from the data packet associated with XMLBroker (see page 17002).

Specify the name of the dataset field as the value of DataSetField. If the dataset is the detail set of a detail set, you can use periods to qualify dataset field names. Thus, for example, if XMLBroker (see page 17002) represents a customer dataset with a nested Orders dataset field that has its own nested LineItems field, you can specify the LineItems dataset by setting DataSetField to

```
Orders.LineItems
```

See Also

XMLBroker

DataSet (see page 17012)

DataSetPath (see page 17013)

99.1.64.5.3 TXMLDataSet.DataSetPath Property

Represents the parsed value of the DataSetField (see page 17013) property.

Pascal

```
property DataSetPath: TStrings;
```

C++

```
__property TStrings DataSetPath;
```

Description

DataSetPath is a parsed version of the DataSetField (see page 17013) property, where each dataset field is a separate string in the TStrings object. The order of the strings indicates the level of nesting, where the first string names a dataset field in the XML broker's data packet, the second string names a dataset field in that nested dataset, and so on.

XMLBroker

DataSetField (see page 17013)

99.1.64.5.4 TXMLDataSet.Parent Property

Indicates the Web item that uses this object to represent its link to an XML broker.

Pascal

```
property Parent: TComponent;
```

C++

```
__property TComponent * Parent;
```

Description

Read Parent to determine the Web item that uses this object to bind to a dataset from an XML broker. The value of Parent is set by the constructor.

Create (see page 16999)

99.1.65 TXMLDataSetParent Class

Class Hierarchy

Pascal

```
TXMLDataSetParent = class(TXMLDataSet);
```

C++

```
class TXMLDataSetParent : public TXMLDataSet;
```

File

MidItems

Description

This is class MidItems.TXMLDataSetParent.

99.1.65.1 TXMLDataSetParent Members

The following tables list the members exposed by TXMLDataSetParent.

Protected Methods

	Name	Description
	_AddRef (see page 17009)	This is _AddRef, a member of class TXMLDataSet.
	_Release (see page 17009)	This is _Release, a member of class TXMLDataSet.
	Changed (see page 17000)	This is Changed, a member of class TXMLData.
V	ChangedDataSetField (see page 17017)	This is ChangedDataSetField, a member of class TXMLDataSetParent.
V	ChangedUseParent (see page 17017)	This is ChangedUseParent, a member of class TXMLDataSetParent.
V	ChangedXMLBroker (see page 17017)	This is ChangedXMLBroker, a member of class TXMLDataSetParent.
	CompareXMLData (see page 17010)	This is CompareXMLData, a member of class TXMLDataSet.
	ConnectionChange (see page 17010)	This is ConnectionChange, a member of class TXMLDataSet.
	CreateDataSet (see page 17010)	This is CreateDataSet, a member of class TXMLDataSet.
	FindDataSet (see page 17010)	This is FindDataSet, a member of class TXMLDataSet.
	GetDataSet (see page 17011)	This is GetDataSet, a member of class TXMLDataSet.
V	GetDataSetField (see page 17017)	This is GetDataSetField, a member of class TXMLDataSetParent.
	GetDataSetPath (see page 17011)	This is GetDataSetPath, a member of class TXMLDataSet.
V	GetXMLBroker (see page 17017)	This is GetXMLBroker, a member of class TXMLDataSetParent.
	ParentDataSetField (see page 17018)	This is ParentDataSetField, a member of class TXMLDataSetParent.
	ParentXMLBroker (see page 17018)	This is ParentXMLBroker, a member of class TXMLDataSetParent.
	ParentXMLDataSet (see page 17018)	This is ParentXMLDataSet, a member of class TXMLDataSetParent.
V	QueryInterface (see page 17011)	This is QueryInterface, a member of class TXMLDataSet.
	SetDataSetField (see page 17012)	This is SetDataSetField, a member of class TXMLDataSet.
	SetUseParent (see page 17018)	This is SetUseParent, a member of class TXMLDataSetParent.
V	SetXMLBroker (see page 17001)	This is SetXMLBroker, a member of class TXMLData.
V	SetXMLBroker (see page 17012)	This is SetXMLBroker, a member of class TXMLDataSet.
	WrapperDataChange (see page 17012)	This is WrapperDataChange, a member of class TXMLDataSet.

Protected Properties

	Name	Description
R	Parent (see page 17014)	Indicates the Web item that uses this object to represent its link to an XML broker.
	UseParent (see page 17019)	This is UseParent, a member of class TXMLDataSetParent.

Public Events

	Name	Description
	OnChange (see page 17002)	Occurs when the XMLBroker (see page 17002) property changes.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ConnectionChange (see page 26087)	This is ConnectionChange, a member of class INotifyConnectionChange.
	Create (see page 16999)	Creates a new TXMLData (see page 16998) object.
	Create (see page 17008)	Creates a new TXMLDataSet (see page 17006) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 17008)	TXMLDataSetFrees the memory associated with the TXMLDataSet (see page 17006) object.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Notification (see page 17001)	Responds to notifications when objects are created or destroyed.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	DataSet (see page 17012)	Provides access to an interface for working with the associated dataset.
	DataSetField (see page 17013)	Identifies a nested dataset in the associated XML broker's data packet.
R	DataSetPath (see page 17013)	Represents the parsed value of the DataSetField (see page 17013) property.
R	Parent (see page 17001)	Indicates the Web item that uses this object to represent its link to an XML broker.
	XMLBroker (see page 17002)	Specifies the XML broker that generates the dataset to which the associated Web item is bound.

99.1.65.2 TXMLDataSetParent Methods

The methods of the TXMLDataSetParent class are listed here.

Protected Methods

	Name	Description
V	ChangedDataSetField (see page 17017)	This is ChangedDataSetField, a member of class TXMLDataSetParent.
V	ChangedUseParent (see page 17017)	This is ChangedUseParent, a member of class TXMLDataSetParent.
V	ChangedXMLBroker (see page 17017)	This is ChangedXMLBroker, a member of class TXMLDataSetParent.
V	GetDataSetField (see page 17017)	This is GetDataSetField, a member of class TXMLDataSetParent.
V	GetXMLBroker (see page 17017)	This is GetXMLBroker, a member of class TXMLDataSetParent.
	ParentDataSetField (see page 17018)	This is ParentDataSetField, a member of class TXMLDataSetParent.
	ParentXMLBroker (see page 17018)	This is ParentXMLBroker, a member of class TXMLDataSetParent.
	ParentXMLDataSet (see page 17018)	This is ParentXMLDataSet, a member of class TXMLDataSetParent.
	SetUseParent (see page 17018)	This is SetUseParent, a member of class TXMLDataSetParent.

99.1.65.2.1 TXMLDataSetParent.ChangedDataSetField Method

Pascal

```
procedure ChangedDataSetField; override;
```

C++

```
virtual __fastcall ChangedDataSetField();
```

Description

This is ChangedDataSetField, a member of class TXMLDataSetParent.

99.1.65.2.2 TXMLDataSetParent.ChangedUseParent Method

Pascal

```
procedure ChangedUseParent; virtual;
```

C++

```
virtual __fastcall ChangedUseParent();
```

Description

This is ChangedUseParent, a member of class TXMLDataSetParent.

99.1.65.2.3 TXMLDataSetParent.ChangedXMLBroker Method

Pascal

```
procedure ChangedXMLBroker; override;
```

C++

```
virtual __fastcall ChangedXMLBroker();
```

Description

This is ChangedXMLBroker, a member of class TXMLDataSetParent.

99.1.65.2.4 TXMLDataSetParent.GetDataSetField Method

Pascal

```
function GetDataSetField: string; override;
```

C++

```
virtual __fastcall AnsiString GetDataSetField();
```

Description

This is GetDataSetField, a member of class TXMLDataSetParent.

99.1.65.2.5 TXMLDataSetParent.GetXMLBroker Method

Pascal

```
function GetXMLBroker: TXMLBroker; override;
```

C++

```
virtual __fastcall TXMLBroker GetXMLBroker();
```

Description

This is GetXMLBroker, a member of class TXMLDataSetParent.

99.1.65.2.6 TXMLDataSetParent.ParentDataSetField Method

Pascal

```
function ParentDataSetField: string;
```

C++

```
__fastcall AnsiString ParentDataSetField();
```

Description

This is ParentDataSetField, a member of class TXMLDataSetParent.

99.1.65.2.7 TXMLDataSetParent.ParentXMLBroker Method

Pascal

```
function ParentXMLBroker: TXMLBroker;
```

C++

```
__fastcall TXMLBroker ParentXMLBroker();
```

Description

This is ParentXMLBroker, a member of class TXMLDataSetParent.

99.1.65.2.8 TXMLDataSetParent.ParentXMLDataSet Method

Pascal

```
function ParentXMLDataSet: TXMLDataSet;
```

C++

```
__fastcall TXMLDataSet ParentXMLDataSet();
```

Description

This is ParentXMLDataSet, a member of class TXMLDataSetParent.

99.1.65.2.9 TXMLDataSetParent.SetUseParent Method

Pascal

```
procedure SetUseParent(const Value: Boolean);
```

C++

```
__fastcall SetUseParent(const Boolean Value);
```

Description

This is SetUseParent, a member of class TXMLDataSetParent.

99.1.65.3 TXMLDataSetParent Properties

The properties of the TXMLDataSetParent class are listed here.

Protected Properties

	Name	Description
	UseParent (see page 17019)	This is UseParent, a member of class TXMLDataSetParent.

99.1.65.3.1 TXMLDataSetParent.UseParent Property

Pascal

```
property UseParent: Boolean;
```

C++

```
__property Boolean UseParent;
```

Description

This is UseParent, a member of class TXMLDataSetParent.

99.1.66 TXMLDisplayGroup Class

TXMLDisplayGroup is the base class for Web items that arrange a set of special-purpose controls in an HTML form.

Class Hierarchy

Pascal

```
TXMLDisplayGroup = class(TWebControlGroup, IDataSetComponent, IDataSetFields, IXMLDisplay,
IValidateFields);
```

C++

```
class TXMLDisplayGroup : public TWebControlGroup, public IDataSetComponent, public
IDataSetFields, public IXMLDisplay, public IValidateFields;
```

File

MidItems

Description

Use TXMLDisplayGroup as a base class for Web items that generate the HTML to arrange a collection of HTML controls. Each TXMLDisplayGroup object maintains a list of Web items that display information in the final HTML document. The XML display group arranges the controls that these items generate.

If the controls generated for TXMLDisplayGroup by its Web items represent database information, you can bind the XML display group to an XML data packet or dataset field within an XML data packet. The Web items can use that binding to determine the source of the data they display.

In order to let other Web items use the HTML that the TXMLDisplayGroup object generates, TXMLDisplayGroup inherits the IWebContent interface from TWebControlGroup (see page 16872).

Do not create instances of TXMLDisplayGroup. TXMLDisplayGroup manages the Web items that generate display controls, but does not produce any content. Instead, use a descendant of TXMLDisplayGroup that generates the HTML for its set of specialized controls such as TDataGrid (see page 16560), TFieldGroup (see page 16591) or TQueryFieldGroup (see page 16736).

See Also

TDataGrid (see page 16560)

TFieldGroup (see page 16591)

TQueryFieldGroup (see page 16736)

IWebContent (see page 24792)

99.1.66.1 TXMLDisplayGroup Members

The following tables list the members exposed by TXMLDisplayGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
	CreateDefaultFields (see page 17025)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindField (see page 17026)	This is FindField, a member of class TXMLDisplayGroup.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDataSet (see page 17026)	Returns the value of the DataSet property.
	GetDataSetField (see page 17026)	This is GetDataSetField, a member of class TXMLDisplayGroup.

	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetEnableValidateFields (see page 17026)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
	GetFieldsList (see page 17027)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIsMultipleRecordView (see page 17027)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 17027)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	GetXMLBroker (see page 17027)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 17028)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 17028)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 17028)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 17028)	This is HasStatusField, a member of class TXMLDisplayGroup.
	ImplAddElements (see page 17029)	Provides the underlying implementation for the AddElements method.
	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	ImplGetSubComponents (see page 17029)	Provides the underlying implementation for the GetSubComponents method.
	ImplIsMultipleRecordView (see page 17029)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsFieldInUse (see page 17030)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 17030)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDataSetField (see page 17030)	This is SetDataSetField, a member of class TXMLDisplayGroup.
	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEnableValidateFields (see page 17031)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.

V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	SetXMLBroker (see page 17031)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateDataSet (see page 17031)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 17031)	This is ValidateFields, a member of class TXMLDisplayGroup.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
V	XMLDataChange (see page 17031)	This is XMLDataChange, a member of class TXMLDisplayGroup.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
	EnableValidateFields (see page 17032)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.
R	XMLDataSet (see page 17033)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 17024)	Creates and initializes an instance of TXMLDisplayGroup (see page 17019).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 17024)	Frees an instance of TXMLDisplayGroup (see page 17019).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
R	DataSet (see page 17055)	Provides access to an interface for working with the associated dataset.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsMultipleRecordView (see page 17080)	
R	IsMultipleRecordView (see page 17083)	
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleFields (see page 17032)	Indicates the controls displayed by the HTML that the XML display group generates.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.
R	XMLDisplayName (see page 17084)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 17084)	This is XMLRowSetName, a member of class IXMLDisplay.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XMLBroker (see page 17033)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSetField (see page 17033)	Binds the XML display group to a nested dataset from the XML data packet.

99.1.66.2 TXMLDisplayGroup.Create Constructor

Creates and initializes an instance of TXMLDisplayGroup (see page 17019).

Pascal

```
constructor Create(AComponent: TComponent); override;
```

C++

```
virtual __fastcall TXMLDisplayGroup(TComponent * AComponent);
```

Description

Call Create to instantiate TXMLDisplayGroup (see page 17019) at runtime. TXMLDisplayGroup (see page 17019) components added at design time using the Web Page editor are instantiated automatically.

99.1.66.3 TXMLDisplayGroup.Destroy Destructor

Frees an instance of TXMLDisplayGroup (see page 17019).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLDisplayGroup();
```

Description

Do not call Destroy directly. Instead, call Free, which checks that the object is not nil before calling Destroy.

See Also

Free (see page 22300)

99.1.66.4 TXMLDisplayGroup Methods

The methods of the TXMLDisplayGroup class are listed here.

Protected Methods

	Name	Description
	CreateDefaultFields (see page 17025)	This is CreateDefaultFields, a member of class TXMLDisplayGroup.
	FindField (see page 17026)	This is FindField, a member of class TXMLDisplayGroup.
	GetDataSet (see page 17026)	Returns the value of the DataSet property.
	GetDataSetField (see page 17026)	This is GetDataSetField, a member of class TXMLDisplayGroup.
	GetEnableValidateFields (see page 17026)	This is GetEnableValidateFields, a member of class TXMLDisplayGroup.
	GetFieldsList (see page 17027)	This is GetFieldsList, a member of class TXMLDisplayGroup.
	GetIsMultipleRecordView (see page 17027)	This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.
	GetVisibleFields (see page 17027)	This is GetVisibleFields, a member of class TXMLDisplayGroup.
	GetXMLBroker (see page 17027)	Returns the value of the XMLBroker property.
	GetXMLDataSet (see page 17028)	Returns the value of the XMLDataSet property.
	GetXMLDisplayName (see page 17028)	This is GetXMLDisplayName, a member of class TXMLDisplayGroup.
	GetXMLRowSetName (see page 17028)	This is GetXMLRowSetName, a member of class TXMLDisplayGroup.
	HasStatusField (see page 17028)	This is HasStatusField, a member of class TXMLDisplayGroup.
	ImplAddElements (see page 17029)	Provides the underlying implementation for the AddElements method.
	ImplGetSubComponents (see page 17029)	Provides the underlying implementation for the GetSubComponents method.
	ImplIsMultipleRecordView (see page 17029)	This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.
	IsFieldInUse (see page 17030)	This is IsFieldInUse, a member of class TXMLDisplayGroup.
	Notification (see page 17030)	Forwards notification messages to all owned components.
	SetDataSetField (see page 17030)	This is SetDataSetField, a member of class TXMLDisplayGroup.
	SetEnableValidateFields (see page 17031)	This is SetEnableValidateFields, a member of class TXMLDisplayGroup.
	SetXMLBroker (see page 17031)	This is SetXMLBroker, a member of class TXMLDisplayGroup.
	ValidateDataSet (see page 17031)	This is ValidateDataSet, a member of class TXMLDisplayGroup.
	ValidateFields (see page 17031)	This is ValidateFields, a member of class TXMLDisplayGroup.
	XMLDataChange (see page 17031)	This is XMLDataChange, a member of class TXMLDisplayGroup.

99.1.66.4.1 TXMLDisplayGroup.CreateDefaultFields Method

Pascal

```
procedure CreateDefaultFields; virtual;
```

C++

```
virtual __fastcall CreateDefaultFields();
```

Description

This is CreateDefaultFields, a member of class TXMLDisplayGroup.

99.1.66.4.2 TXMLDisplayGroup.FindField Method

Pascal

```
function FindField(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindField(const AnsiString AName);
```

Description

This is FindField, a member of class TXMLDisplayGroup.

99.1.66.4.3 TXMLDisplayGroup.GetDataSet Method

Returns the value of the DataSet property.

Pascal

```
function GetDataSet: IInetXWebDataSet;
```

C++

```
__fastcall IInetXWebDataSet GetDataSet();
```

Description

GetDataSet is the read access method for the DataSet property.

See Also

DataSet (see page 17055)

99.1.66.4.4 TXMLDisplayGroup.GetDataSetField Method

Pascal

```
function GetDataSetField: string;
```

C++

```
__fastcall AnsiString GetDataSetField();
```

Description

This is GetDataSetField, a member of class TXMLDisplayGroup.

99.1.66.4.5 TXMLDisplayGroup.GetEnableValidateFields Method

Pascal

```
function GetEnableValidateFields: Boolean;
```

C++

```
__fastcall Boolean GetEnableValidateFields();
```

Description

This is GetEnableValidateFields, a member of class TXMLDisplayGroup.

99.1.66.4.6 TXMLDisplayGroup.GetFieldsList Method

Pascal

```
procedure GetFieldsList(List: TStrings); virtual;
```

C++

```
virtual __fastcall GetFieldsList(TStrings List);
```

Description

This is GetFieldsList, a member of class TXMLDisplayGroup.

99.1.66.4.7 TXMLDisplayGroup.GetIsMultipleRecordView Method

Pascal

```
function GetIsMultipleRecordView: Boolean;
```

C++

```
__fastcall Boolean GetIsMultipleRecordView();
```

Description

This is GetIsMultipleRecordView, a member of class TXMLDisplayGroup.

99.1.66.4.8 TXMLDisplayGroup.GetVisibleFields Method

Pascal

```
function GetVisibleFields: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleFields();
```

Description

This is GetVisibleFields, a member of class TXMLDisplayGroup.

99.1.66.4.9 TXMLDisplayGroup.GetXMLBroker Method

Returns the value of the XMLBroker property.

Pascal

```
function GetXMLBroker: TXMLBroker;
```

C++

```
__fastcall TXMLBroker GetXMLBroker();
```

Description

GetXMLBroker is the read access method for the XMLBroker property.

See Also

XMLBroker (see page 17056)

99.1.66.4.10 TXMLDisplayGroup.GetXMLDataSet Method

Returns the value of the XMLDataSet property.

Pascal

```
function GetXMLDataSet: TXMLDataSet;
```

C++

```
__fastcall TXMLDataSet GetXMLDataSet();
```

Description

GetXMLDataSet is the read access method for the XMLDataSet property.

See Also

XMLDataSet (see page 17056)

99.1.66.4.11 TXMLDisplayGroup.GetXMLDisplayName Method

Pascal

```
function GetXMLDisplayName: string;
```

C++

```
__fastcall AnsiString GetXMLDisplayName();
```

Description

This is GetXMLDisplayName, a member of class TXMLDisplayGroup.

99.1.66.4.12 TXMLDisplayGroup.GetXMLRowSetName Method

Pascal

```
function GetXMLRowSetName: string;
```

C++

```
__fastcall AnsiString GetXMLRowSetName();
```

Description

This is GetXMLRowSetName, a member of class TXMLDisplayGroup.

99.1.66.4.13 TXMLDisplayGroup.HasStatusField Method

Pascal

```
function HasStatusField: Boolean;
```

C++

```
__fastcall Boolean HasStatusField();
```

Description

This is HasStatusField, a member of class TXMLDisplayGroup.

99.1.66.4.14 TXMLDisplayGroup.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup, ImplAddElements does nothing. TWebControlGroup descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 16878)

99.1.66.4.15 TXMLDisplayGroup.ImplGetSubComponents Method

Provides the underlying implementation for the GetSubComponents method.

Pascal

```
function ImplGetSubComponents: TObject; override;
```

C++

```
virtual __fastcall TObject * ImplGetSubComponents();
```

Description

The GetSubComponents method calls ImplGetSubComponents to retrieve the value of WebFieldControls as a TObject. TWebControlGroup descendants override this method if the list is not simply the value of WebFieldControls. For example, some TWebControlGroup descendants supply a default value (DefaultWebComponents) when the WebFieldControls property list is empty.

ImplGetSubComponents returns the TWebComponentList object that contains all subitems of the Web control group.

See Also

GetSubComponents (see page 16880)

DefaultWebComponents (see page 16883)

WebFieldControls (see page 16884)

99.1.66.4.16 TXMLDisplayGroup.ImplIsMultipleRecordView Method

Pascal

```
function ImplIsMultipleRecordView: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplIsMultipleRecordView();
```

Description

This is ImplIsMultipleRecordView, a member of class TXMLDisplayGroup.

99.1.66.4.17 TXMLDisplayGroup.IsFieldInUse Method

Pascal

```
function IsFieldInUse(AName: string): Boolean;
```

C++

```
__fastcall Boolean IsFieldInUse(AnsiString AName);
```

Description

This is IsFieldInUse, a member of class TXMLDisplayGroup.

99.1.66.4.18 TXMLDisplayGroup.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

99.1.66.4.19 TXMLDisplayGroup.SetDataSetField Method

Pascal

```
procedure SetDataSetField(const Value: string);
```

C++

```
__fastcall SetDataSetField(const AnsiString Value);
```

Description

This is SetDataSetField, a member of class TXMLDisplayGroup.

99.1.66.4.20 TXMLDisplayGroup.SetEnableValidateFields Method

Pascal

```
procedure SetEnableValidateFields(Value: Boolean);
```

C++

```
__fastcall SetEnableValidateFields(Boolean Value);
```

Description

This is SetEnableValidateFields, a member of class TXMLDisplayGroup.

99.1.66.4.21 TXMLDisplayGroup.SetXMLBroker Method

Pascal

```
procedure SetXMLBroker(const Value: TXMLBroker);
```

C++

```
__fastcall SetXMLBroker(const TXMLBroker Value);
```

Description

This is SetXMLBroker, a member of class TXMLDisplayGroup.

99.1.66.4.22 TXMLDisplayGroup.ValidateDataSet Method

Pascal

```
procedure ValidateDataSet;
```

C++

```
__fastcall ValidateDataSet();
```

Description

This is ValidateDataSet, a member of class TXMLDisplayGroup.

99.1.66.4.23 TXMLDisplayGroup.ValidateFields Method

Pascal

```
function ValidateFields(AddIntf: IAddScriptElements): Boolean;
```

C++

```
__fastcall Boolean ValidateFields(IAddScriptElements AddIntf);
```

Description

This is ValidateFields, a member of class TXMLDisplayGroup.

99.1.66.4.24 TXMLDisplayGroup.XMLDataChange Method

Pascal

```
procedure XMLDataChange(Sender: TObject); virtual;
```

C++

```
virtual __fastcall XMLDataChange(TObject * Sender);
```

Description

This is XMLDataChange, a member of class TXMLDisplayGroup.

99.1.66.5 TXMLDisplayGroup Properties

The properties of the TXMLDisplayGroup class are listed here.

Protected Properties

	Name	Description
	EnableValidateFields (see page 17032)	This is EnableValidateFields, a member of class TXMLDisplayGroup.
R	XMLDataSet (see page 17033)	Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Public Properties

	Name	Description
R	VisibleFields (see page 17032)	Indicates the controls displayed by the HTML that the XML display group generates.

Published Properties

	Name	Description
	XMLBroker (see page 17033)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
	XMLDataSetField (see page 17033)	Binds the XML display group to a nested dataset from the XML data packet.

99.1.66.5.1 TXMLDisplayGroup.EnableValidateFields Property

Pascal

```
property EnableValidateFields: Boolean;
```

C++

```
__property Boolean EnableValidateFields;
```

Description

This is EnableValidateFields, a member of class TXMLDisplayGroup.

99.1.66.5.2 TXMLDisplayGroup.VisibleFields Property

Indicates the controls displayed by the HTML that the XML display group generates.

Pascal

```
property VisibleFields: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleFields;
```

Description

Use VisibleFields to access the components that generate HTML controls for the XML display group. If a set of Web items is explicitly assigned to the WebFieldControls (see page 16884) property, VisibleFields has the same value as WebFieldControls (see page 16884). Otherwise, VisibleFields represents a set of default Web items that generate display controls for all the fields or parameters of the associated dataset or dataset field.

When no Web items are assigned to WebFieldControls (see page 16884), the default Web items in the VisibleFields list are specific to the TXMLDisplayGroup (see page 17019) descendant.

See Also

WebFieldControls (see page 16884)

xmlbroker (see page 17033)

XMLDataSetField (see page 17033)

99.1.66.5.3 TXMLDisplayGroup.XMLBroker Property

Indicates the XML broker that fetches the data packets to which the Web item is bound.

Pascal

```
property XMLBroker: TXMLBroker;
```

C++

```
__property TXMLBroker XMLBroker;
```

Description

Use XMLBroker to access the TXMLBroker object that fetches XML data packets from the application server. The XML broker can be used to obtain information about the source of the dataset, the form that contains the XML data packet, the javascript variables that represent this data packet, and so on.

Note: The dataset represented by the Web item may not correspond directly to the XML broker's dataset. It may be a nested dataset contained by that dataset. The XMLDataSet property indicates whether the dataset is nested, and if so, describes the field that represents it.

See Also

XMLDataSet (see page 17056)

DataSet (see page 17055)

99.1.66.5.4 TXMLDisplayGroup.XMLDataSet Property

Indicates the TXMLDataSet object that represents the dataset to which the Web item is bound.

Pascal

```
property XMLDataSet: TXMLDataSet;
```

C++

```
__property TXMLDataSet XMLDataSet;
```

Description

XMLDataSet describes how to locate the appropriate dataset, given the XML broker that provides its XML data packet. This dataset may be the main dataset of the XML broker, or it may be a nested dataset that is represented by a dataset field within that dataset (or a dataset field nested in a dataset field, and so on).

See Also

DataSet (see page 17055)

XMLBroker (see page 17056)

99.1.66.5.5 TXMLDisplayGroup.XMLDataSetField Property

Binds the XML display group to a nested dataset from the XML data packet.

Pascal

```
property XMLDataSetField: string;
```

C++

```
__property AnsiString XMLDataSetField;
```

Description

Most XML display groups contain controls that represent database information. TDataGrid (see page 16560) and TFieldGroup (see page 16591) represent the fields from a dataset. By default, TQueryFieldGroup (see page 16736) represents the parameter values for a query or stored procedure or field values that filter a table. If the database information comes from the dataset represented by an XML broker's data packet, XMLDataSetField is an empty string and the XMLBroker (see page 17033) property fully describes the dataset. However, if the database information comes from a nested detail set, XMLDataSetField indicates what detail dataset to use from the data packet associated with XMLBroker (see page 17033).

Specify the name of the dataset field as the value of XMLDataSetField. If the XML display group is bound to the detail set of a detail set, you can use periods to qualify dataset field names. Thus, for example, if XMLBroker (see page 17033) represents a customer dataset with a nested Orders dataset field that has its own nested LineItems field, you can bind the XML display group to the LineItems dataset by setting XMLDataSetField to

```
Orders.LineItems
```

See Also

xmlbroker (see page 17033)

VisibleFields (see page 17032)

Setting Web Item Properties

99.1.67 TXMLDisplayParent Class

Class Hierarchy

Pascal

```
TXMLDisplayParent = class(TWebDisplay);
```

C++

```
class TXMLDisplayParent : public TWebDisplay;
```

File

MidItems

Description

This is class MidItems.TXMLDisplayParent.

99.1.67.1 TXMLDisplayParent Members

The following tables list the members exposed by TXMLDisplayParent.

Protected Methods

	Name	Description
	Changed (see page 16912)	This is Changed, a member of class TWebDisplay.
V	ChangedDisplayComponent (see page 17036)	This is ChangedDisplayComponent, a member of class TXMLDisplayParent.
V	ChangedUseParent (see page 17036)	This is ChangedUseParent, a member of class TXMLDisplayParent.
V	GetDisplayComponent (see page 17037)	This is GetDisplayComponent, a member of class TXMLDisplayParent.
	SetDisplayComponent (see page 16913)	This is SetDisplayComponent, a member of class TWebDisplay.
	SetUseParent (see page 17037)	This is SetUseParent, a member of class TXMLDisplayParent.

Public Events

	Name	Description
	OnChange (see page 16914)	This is OnChange, a member of class TWebDisplay.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 17036)	This is Create, a member of class TXMLDisplayParent.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Notification (see page 16913)	This is Notification, a member of class TWebDisplay.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	DisplayComponent (see page 16914)	This is DisplayComponent, a member of class TWebDisplay.
R	Parent (see page 16914)	This is Parent, a member of class TWebDisplay.

Published Properties

	Name	Description
	UseParent (see page 17037)	This is UseParent, a member of class TXMLDisplayParent.

99.1.67.2 TXMLDisplayParent.Create Constructor

Pascal

```
constructor Create(AParent: TComponent);
```

C++

```
__fastcall TXMLDisplayParent(TComponent * AParent);
```

Description

This is Create, a member of class TXMLDisplayParent.

99.1.67.3 TXMLDisplayParent Methods

The methods of the TXMLDisplayParent class are listed here.

Protected Methods

	Name	Description
	ChangedDisplayComponent (see page 17036)	This is ChangedDisplayComponent, a member of class TXMLDisplayParent.
	ChangedUseParent (see page 17036)	This is ChangedUseParent, a member of class TXMLDisplayParent.
	GetDisplayComponent (see page 17037)	This is GetDisplayComponent, a member of class TXMLDisplayParent.
	SetUseParent (see page 17037)	This is SetUseParent, a member of class TXMLDisplayParent.

99.1.67.3.1 TXMLDisplayParent.ChangedDisplayComponent Method

Pascal

```
procedure ChangedDisplayComponent; override;
```

C++

```
virtual __fastcall ChangedDisplayComponent();
```

Description

This is ChangedDisplayComponent, a member of class TXMLDisplayParent.

99.1.67.3.2 TXMLDisplayParent.ChangedUseParent Method

Pascal

```
procedure ChangedUseParent; virtual;
```

C++

```
virtual __fastcall ChangedUseParent();
```

Description

This is ChangedUseParent, a member of class TXMLDisplayParent.

99.1.67.3.3 TXMLDisplayParent.GetDisplayComponent Method

Pascal

```
function GetDisplayComponent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetDisplayComponent();
```

Description

This is GetDisplayComponent, a member of class TXMLDisplayParent.

99.1.67.3.4 TXMLDisplayParent.SetUseParent Method

Pascal

```
procedure SetUseParent(const Value: Boolean);
```

C++

```
__fastcall SetUseParent(const Boolean Value);
```

Description

This is SetUseParent, a member of class TXMLDisplayParent.

99.1.67.4 TXMLDisplayParent Properties

The properties of the TXMLDisplayParent class are listed here.

Published Properties

	Name	Description
	UseParent (see page 17037)	This is UseParent, a member of class TXMLDisplayParent.

99.1.67.4.1 TXMLDisplayParent.UseParent Property

Pascal

```
property UseParent: Boolean;
```

C++

```
__property Boolean UseParent;
```

Description

This is UseParent, a member of class TXMLDisplayParent.

99.1.68 TXMLDisplayReferenceButton Class

TXMLDisplayReferenceButton is the base class for Web items that generate HTML buttons for influencing controls that display data.

Class Hierarchy

Pascal

```
TXMLDisplayReferenceButton = class(TWebButton);
```

C++

```
class TXMLDisplayReferenceButton : public TWebButton;
```

File

MidItems

Description

Use TXMLDisplayReferenceButton as a base class for components that generate the HTML statements defining a specialized button control for working with a data display control in the Web page produced by TInetXPageProducer.

TXMLDisplayReferenceButton defines properties and methods for

Generating the HTML code to define the button.

Associating the button with another Web item that generates a data display control.

Specifying tag attributes of the HTML button control, including those defined by a style sheet.

Fitting the component into a hierarchy of Web items, each of which generates part of a larger HTML document.

In order to allow other Web items to use the HTML generated by the button control, TXMLDisplayReferenceButton inherits support for the IWebContent interface from TWebButton (see page 16863).

Do not create instances of TXMLDisplayReferenceButton. TXMLDisplayReferenceButton relies on anabstract or, in C++ terminology, pure virtual method to generate the HTML statements defining a button control. Instead, create descendants of TXMLDisplayReferenceButton, such as TPostButton (see page 16704), TInsertButton (see page 16677), and so on.

TSubmitQueryButton (see page 16833)

99.1.68.1 TXMLDisplayReferenceButton Members

The following tables list the members exposed by TXMLDisplayReferenceButton.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDisplayComponent (see page 17043)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 17043)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXmlDisplayName (see page 17043)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 17044)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.

V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayComponent (see page 17044)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 17044)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.
R	XMLDisplay (see page 17045)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 17042)	Creates and initializes an instance of TXMLDisplayReferenceButton (see page 17037).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 17042)	Frees an instance of TXMLDisplayReferenceButton (see page 17037).

	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.

R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLComponent (see page 17045)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 17045)	Specifies whether the button is associated with its parent's display object.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.68.2 TXMLDisplayReferenceButton.Create Constructor

Creates and initializes an instance of TXMLDisplayReferenceButton (see page 17037).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TXMLDisplayReferenceButton(TComponent * AOwner);
```

Description

Call Create to instantiate a dataset button at runtime. Buttons (see page 2289) added at design time using the Web Page editor are instantiated automatically.

99.1.68.3 TXMLDisplayReferenceButton.Destroy Destructor

Frees an instance of TXMLDisplayReferenceButton (see page 17037).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLDisplayReferenceButton();
```

Description

Destroy removes the button from its parent's list of components that generate HTML.

99.1.68.4 TXMLDisplayReferenceButton Methods

The methods of the TXMLDisplayReferenceButton class are listed here.

Protected Methods

	Name	Description
	GetDisplayComponent (see page 17043)	This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	GetDisplayComponentParent (see page 17043)	This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.
	GetXmlDisplayName (see page 17043)	This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.
V	Notification (see page 17044)	Forwards notification messages to all owned components.
	SetDisplayComponent (see page 17044)	This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.
	SetDisplayComponentParent (see page 17044)	This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

99.1.68.4.1 TXMLDisplayReferenceButton.GetDisplayComponent Method

Pascal

```
function GetDisplayComponent: TComponent;
```

C++

```
__fastcall TComponent * GetDisplayComponent();
```

Description

This is GetDisplayComponent, a member of class TXMLDisplayReferenceButton.

99.1.68.4.2 TXMLDisplayReferenceButton.GetDisplayComponentParent Method

Pascal

```
function GetDisplayComponentParent: Boolean;
```

C++

```
__fastcall Boolean GetDisplayComponentParent();
```

Description

This is GetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

99.1.68.4.3 TXMLDisplayReferenceButton.GetXmlDisplayName Method

Pascal

```
function GetXmlDisplayName: string;
```

C++

```
__fastcall AnsiString GetXmlDisplayName();
```

Description

This is GetXmlDisplayName, a member of class TXMLDisplayReferenceButton.

99.1.68.4.4 TXMLDisplayReferenceButton.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

99.1.68.4.5 TXMLDisplayReferenceButton.SetDisplayComponent Method

Pascal

```
procedure SetDisplayComponent(const Value: TComponent);
```

C++

```
__fastcall SetDisplayComponent(const TComponent * Value);
```

Description

This is SetDisplayComponent, a member of class TXMLDisplayReferenceButton.

99.1.68.4.6 TXMLDisplayReferenceButton.SetDisplayComponentParent Method

Pascal

```
procedure SetDisplayComponentParent(const Value: Boolean);
```

C++

```
__fastcall SetDisplayComponentParent(const Boolean Value);
```

Description

This is SetDisplayComponentParent, a member of class TXMLDisplayReferenceButton.

99.1.68.5 TXMLDisplayReferenceButton Properties

The properties of the TXMLDisplayReferenceButton class are listed here.

Protected Properties

	Name	Description
	XMLDisplay (see page 17045)	This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

Public Properties

	Name	Description
	XMLComponent (see page 17045)	Associates the button with the component that generates the display control it influences.
	XMLUseParent (see page 17045)	Specifies whether the button is associated with its parent's display object.

99.1.68.5.1 TXMLDisplayReferenceButton.XMLComponent Property

Associates the button with the component that generates the display control it influences.

Pascal

```
property XMLComponent: TComponent;
```

C++

```
__property TComponent * XMLComponent;
```

Description

Set XMLComponent to specify the Web item that generates a display control that the button influences.

Note: Typically, descendants of TXMLDisplayReferenceButton (see page 17037) are used by a descendant of TXMLDisplayReferenceGroup (see page 17046), which has its own XMLComponent property. If the button influences this same component, you need not set the XMLComponent property. Instead, setting the XMLUseParent (see page 17045) property to true (the default) sets XMLComponent to the value of the parent's XMLComponent property.

See Also

XMLUseParent (see page 17045)

99.1.68.5.2 TXMLDisplayReferenceButton.XMLDisplay Property

Pascal

```
property XMLDisplay: TXMLDisplayParent;
```

C++

```
__property TXMLDisplayParent XMLDisplay;
```

Description

This is XMLDisplay, a member of class TXMLDisplayReferenceButton.

99.1.68.5.3 TXMLDisplayReferenceButton.XMLUseParent Property

Specifies whether the button is associated with its parent's display object.

Pascal

```
property XMLUseParent: Boolean;
```

C++

```
__property Boolean XMLUseParent;
```

Description

Use XMLUseParent to indicate how the dataset button determines the component that it influences. When XMLUseParent is false, the XMLComponent (see page 17045) property must be set to indicate the display component. When XMLUseParent is true, the button influences the component specified by its parent's XMLComponent (see page 17045) property.

The button's parent is the Web item that uses the button to assemble its own HTML content (typically a TDataNavigator (see page 16569) or TQueryButtons (see page 16730) object). If the parent does not have an associated display component, setting XMLUseParent to true sets the XMLComponent (see page 17045) property to nil (Delphi) or NULL (C++).

See Also

XMLComponent (see page 17045)

XMLComponent (see page 17051)

99.1.69 TXMLDisplayReferenceGroup Class

TXMLDisplayReferenceGroup is the base class for Web items that arrange a set of button controls that influence a control that displays data.

Class Hierarchy

Pascal

```
TXMLDisplayReferenceGroup = class(TWebDisplayReferenceGroup);
```

C++

```
class TXMLDisplayReferenceGroup : public TWebDisplayReferenceGroup;
```

File

MidItems

Description

Use TXMLDisplayReferenceGroup as a base class for Web items that generate the HTML to arrange a collection of button controls. Each TXMLDisplayGroup (see page 17019) object has an associated Web item that generates controls that display data in the final HTML document. The buttons arranged by TXMLDisplayReferenceGroup manipulate the information the display controls show.

In order to let other Web items use the HTML that the TXMLDisplayReferenceGroup object generates,

TXMLDisplayReferenceGroup inherits the IWebContent interface from TWebControlGroup (see page 16872).

Do not create instances of TXMLDisplayReferenceGroup. TXMLDisplayReferenceGroup manages the Web items that generate buttons and the association to a display generator, but does not produce any content. Instead, use a descendant of TXMLDisplayReferenceGroup that generates the HTML for its set of specialized buttons such as TDataNavigator (see page 16569) or TQueryButtons (see page 16730).

See Also

TDataNavigator (see page 16569)

IWebContent (see page 24792)

99.1.69.1 TXMLDisplayReferenceGroup Members

The following tables list the members exposed by TXMLDisplayReferenceGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.

	GetWebDisplayComponent (see page 16920)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	ImplAddElements (see page 17051)	Provides the underlying implementation for the AddElements method.
V	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16920)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
V	SetWebDisplayComponent (see page 16921)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.

R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebDisplay (see page 16921)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 16921)	
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
V	Create (see page 16919)	Creates an instance of TWebDisplayReferenceGroup (see page 16915).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).
V	Destroy (see page 16919)	Frees an instance of TWebDisplayReferenceGroup (see page 16915).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.

	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetWebDisplayComponent (see page 17081)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebDisplayComponent (see page 17081)	
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

	XMLComponent (see page 17051)	Associates the group with a component that generates HTML display controls.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

99.1.69.2 TXMLDisplayReferenceGroup Methods

The methods of the TXMLDisplayReferenceGroup class are listed here.

Protected Methods

	Name	Description
	ImplAddElements (see page 17051)	Provides the underlying implementation for the AddElements method.

99.1.69.2.1 TXMLDisplayReferenceGroup.ImplAddElements Method

Provides the underlying implementation for the AddElements method.

Pascal

```
procedure ImplAddElements(AddIntf: IAddScriptElements); override;
```

C++

```
virtual __fastcall ImplAddElements(IAddScriptElements AddIntf);
```

Description

The AddElements method calls ImplAddElements to add any script declarations by calling the AddIntf interface. These declarations allow the generated display control to call script methods in response to user events by ensuring that the required methods are declared.

As implemented in TWebControlGroup, ImplAddElements does nothing. TWebControlGroup descendants override ImplAddElements to add any required declarations.

See Also

AddElements (see page 16878)

99.1.69.3 TXMLDisplayReferenceGroup Properties

The properties of the TXMLDisplayReferenceGroup class are listed here.

Public Properties

	Name	Description
	XMLComponent (see page 17051)	Associates the group with a component that generates HTML display controls.

99.1.69.3.1 TXMLDisplayReferenceGroup.XMLComponent Property

Associates the group with a component that generates HTML display controls.

Pascal

```
property XMLComponent: TComponent;
```

C++

```
__property TComponent * XMLComponent;
```

Description

Use XMLComponent to associate the group of buttons with a Web item that generates the display controls those buttons influence. Typical values of XMLComponent are TFieldGroup (see page 16591) or TDataGrid (see page 16560).

If all the buttons arranged by the TXMLDisplayReferenceGroup (see page 17046) object operate on the same set of display controls, it is most efficient to specify the Web item generating these controls as the value of XMLComponent. Then, each button uses this value to determine its associated display controls when its XMLUseParent property is true. Any buttons that do not operate on the display controls generated by XMLComponent can set their own XMLComponent property to another Web item.

See Also

XMLComponent (see page 17045)

XMLUseParent (see page 17045)

TFieldGroup (see page 16591)

TDataGrid (see page 16560)

TQueryFieldGroup (see page 16736)

99.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IDataSetComponent (see page 17053)	IDataSetComponent defines the methods that bind a Web item to an XML broker.
	IDataSetField (see page 17057)	This is class MidItems.IDataSetField.
	IDataSetFields (see page 17059)	This is class MidItems.IDataSetFields.
	IFormatColumn (see page 17061)	This is class MidItems.IFormatColumn.
	IHTMLField (see page 17062)	IHTMLField is an interface that must be implemented by Web items that generate <INPUT> elements.
	IHTMLForm (see page 17064)	IHTMLForm is an interface that must be implemented by Web items that generate forms.
	IInetXWebDataSet (see page 17066)	IInetXWebDataSet lets a Web item interact with information about a dataset in an XML broker's data packet.
	IQueryField (see page 17070)	This is class MidItems.IQueryField.
	IQueryFields (see page 17073)	This is class MidItems.IQueryFields.
	IQueryForm (see page 17074)	This is class MidItems.IQueryForm.
	IRestoreDefaults (see page 17074)	This is class MidItems.IRestoreDefaults.
	IStatusField (see page 17075)	This is class MidItems.IStatusField.
	IValidateField (see page 17076)	This is class MidItems.IValidateField.
	IValidateFields (see page 17077)	This is class MidItems.IValidateFields.
	IWebDisplay (see page 17079)	
	IWebDisplayReference (see page 17080)	
	IXMLDisplay (see page 17082)	This is class MidItems.IXMLDisplay.

99.2.1 IDataSetComponent Interface

IDataSetComponent defines the methods that bind a Web item to an XML broker.

Class Hierarchy

MidItems.IDataSetComponent

Pascal

```
IDataSetComponent = interface;
```

C++

```
__interface IDataSetComponent;
```

File

MidItems

Description

The TXMLDisplayGroup (see page 17019) class implements IDataSetComponent to provide information about the dataset from which its child controls obtain their data. The child Web items use this information to determine the default data binding.

Most Web items that generate a group of data-aware controls inherit the support for IDataSetComponent from TXMLDisplayGroup (see page 17019).

See Also

TXMLDisplayGroup (see page 17019)

TXMLBroker (see page 26049)

99.2.1.1 IDataSetComponent Members

The following tables list the members exposed by IDataSetComponent.

Public Methods

	Name	Description
	GetDataSet (see page 17054)	Returns the value of the DataSet (see page 17055) property.
	GetXMLBroker (see page 17054)	Returns the value of the XMLBroker (see page 17056) property.
	GetXMLDataSet (see page 17055)	Returns the value of the XMLDataSet (see page 17056) property.

Public Properties

	Name	Description
R	DataSet (see page 17055)	Provides access to an interface for working with the associated dataset.
R	XMLBroker (see page 17056)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
R	XMLDataSet (see page 17056)	Indicates the TXMLDataSet (see page 17006) object that represents the dataset to which the Web item is bound.

99.2.1.2 IDataSetComponent Methods

The methods of the IDataSetComponent class are listed here.

Public Methods

	Name	Description
	GetDataSet (see page 17054)	Returns the value of the DataSet (see page 17055) property.
	GetXMLBroker (see page 17054)	Returns the value of the XMLBroker (see page 17056) property.
	GetXMLDataSet (see page 17055)	Returns the value of the XMLDataSet (see page 17056) property.

99.2.1.2.1 IDataSetComponent.GetDataSet Method

Returns the value of the DataSet (see page 17055) property.

Pascal

```
function GetDataSet: IInetXWebDataSet;
```

C++

```
__fastcall IInetXWebDataSet GetDataSet();
```

Description

GetDataSet is the read access method for the DataSet (see page 17055) property.

See Also

DataSet (see page 17055)

99.2.1.2.2 IDataSetComponent.GetXMLBroker Method

Returns the value of the XMLBroker (see page 17056) property.

Pascal

```
function GetXMLBroker: TXMLBroker;
```

C++

```
__fastcall TXMLBroker GetXMLBroker();
```

Description

GetXMLBroker is the read access method for the XMLBroker (see page 17056) property.

See Also

XMLBroker (see page 17056)

99.2.1.2.3 IDataSetComponent.GetXMLDataSet Method

Returns the value of the XMLDataSet (see page 17056) property.

Pascal

```
function GetXMLDataSet: TXMLDataSet;
```

C++

```
__fastcall TXMLDataSet GetXMLDataSet();
```

Description

GetXMLDataSet is the read access method for the XMLDataSet (see page 17056) property.

See Also

XMLDataSet (see page 17056)

99.2.1.3 IDataSetComponent Properties

The properties of the IDataSetComponent class are listed here.

Public Properties

	Name	Description
R	DataSet (see page 17055)	Provides access to an interface for working with the associated dataset.
R	XMLBroker (see page 17056)	Indicates the XML broker that fetches the data packets to which the Web item is bound.
R	XMLDataSet (see page 17056)	Indicates the TXMLDataSet (see page 17006) object that represents the dataset to which the Web item is bound.

99.2.1.3.1 IDataSetComponent.DataSet Property

Provides access to an interface for working with the associated dataset.

Pascal

```
property DataSet: IInetXWebDataSet;
```

C++

```
__property IInetXWebDataSet DataSet;
```

Description

The child Web items of the item that implements IDataSetComponent (see page 17053) use the DataSet property to obtain information about the dataset to which they are bound and to respond when this information changes. This information includes

details about the available fields and parameters in the dataset to which they can be bound.

See Also

XMLDataSet (see page 17056)

99.2.1.3.2 IDataSetComponent.XMLBroker Property

Indicates the XML broker that fetches the data packets to which the Web item is bound.

Pascal

```
property XMLBroker: TXMLBroker;
```

C++

```
__property TXMLBroker XMLBroker;
```

Description

Use XMLBroker to access the TXMLBroker object that fetches XML data packets from the application server. The XML broker can be used to obtain information about the source of the dataset, the form that contains the XML data packet, the javascript variables that represent this data packet, and so on.

Note: The dataset represented by the Web item may not correspond directly to the XML broker's dataset. It may be a nested dataset contained by that dataset. The XMLDataSet (see page 17056) property indicates whether the dataset is nested, and if so, describes the field that represents it.

See Also

XMLDataSet (see page 17056)

DataSet (see page 17055)

99.2.1.3.3 IDataSetComponent.XMLDataSet Property

Indicates the TXMLDataSet (see page 17006) object that represents the dataset to which the Web item is bound.

Pascal

```
property XMLDataSet: TXMLDataSet;
```

C++

```
__property TXMLDataSet XMLDataSet;
```

Description

XMLDataSet describes how to locate the appropriate dataset, given the XML broker that provides its XML data packet. This dataset may be the main dataset of the XML broker, or it may be a nested dataset that is represented by a dataset field within that dataset (or a dataset field nested in a dataset field, and so on).

See Also

DataSet (see page 17055)

XMLBroker (see page 17056)

99.2.2 IDataSetField Interface

Class Hierarchy

Pascal

```
IDataSetField = interface(IHTMLField);
```

C++

```
__interface IDataSetField : public IHTMLField;
```

File

MidItems

Description

This is class MidItems.IDataSetField.

99.2.2.1 IDataSetField Members

The following tables list the members exposed by IDataSetField.

Public Methods

	Name	Description
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.

Public Properties

	Name	Description
	FieldName (see page 17058)	This is FieldName, a member of class IDataSetField.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.

99.2.2.2 IDataSetField Methods

The methods of the IDataSetField class are listed here.

Public Methods

	Name	Description
	GetFieldName (see page 17057)	This is GetFieldName, a member of class IDataSetField.
	GetRowSetFieldAttributes (see page 17058)	This is GetRowSetFieldAttributes, a member of class IDataSetField.
	SetFieldName (see page 17058)	This is SetFieldName, a member of class IDataSetField.

99.2.2.2.1 IDataSetField.GetFieldName Method

Pascal

```
function GetFieldName: string;
```

C++

```
__fastcall AnsiString GetFieldName();
```

Description

This is GetFieldName, a member of class IDataSetField.

99.2.2.2.2 IDataSetField.GetRowSetFieldAttributes Method

Pascal

```
function GetRowSetFieldAttributes(const FieldVarName: string): string;
```

C++

```
__fastcall AnsiString GetRowSetFieldAttributes(const AnsiString FieldVarName);
```

Description

This is GetRowSetFieldAttributes, a member of class IDataSetField.

99.2.2.2.3 IDataSetField.SetFieldName Method

Pascal

```
procedure SetFieldName(AFieldName: string);
```

C++

```
__fastcall SetFieldName(AnsiString AFieldName);
```

Description

This is SetFieldName, a member of class IDataSetField.

99.2.2.3 IDataSetField Properties

The properties of the IDataSetField class are listed here.

Public Properties

	Name	Description
	FieldName (see page 17058)	This is FieldName, a member of class IDataSetField.

99.2.2.3.1 IDataSetField.FieldName Property

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;
```

Description

This is FieldName, a member of class IDataSetField.

99.2.3 IDataSetFields Interface

Class Hierarchy

MidItems.IDataSetFields

Pascal

```
IDataSetFields = interface;
```

C++

```
__interface IDataSetFields;
```

File

MidItems

Description

This is class MidItems.IDataSetFields.

99.2.3.1 IDataSetFields Members

The following tables list the members exposed by IDataSetFields.

Public Methods

	Name	Description
	GetFieldsList (see page 17060)	This is GetFieldsList, a member of class IDataSetFields.
	GetVisibleFields (see page 17060)	This is GetVisibleFields, a member of class IDataSetFields.
	HasStatusField (see page 17060)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 17060)	This is IsFieldInUse, a member of class IDataSetFields.
	ValidateDataSet (see page 17060)	This is ValidateDataSet, a member of class IDataSetFields.

Public Properties

	Name	Description
R	VisibleFields (see page 17061)	This is VisibleFields, a member of class IDataSetFields.

99.2.3.2 IDataSetFields Methods

The methods of the IDataSetFields class are listed here.

Public Methods

	Name	Description
	GetFieldsList (see page 17060)	This is GetFieldsList, a member of class IDataSetFields.
	GetVisibleFields (see page 17060)	This is GetVisibleFields, a member of class IDataSetFields.
	HasStatusField (see page 17060)	This is HasStatusField, a member of class IDataSetFields.
	IsFieldInUse (see page 17060)	This is IsFieldInUse, a member of class IDataSetFields.
	ValidateDataSet (see page 17060)	This is ValidateDataSet, a member of class IDataSetFields.

99.2.3.2.1 IDataSetFields.GetFieldsList Method

Pascal

```
procedure GetFieldsList(AList: TStrings);
```

C++

```
__fastcall GetFieldsList(TStrings AList);
```

Description

This is GetFieldsList, a member of class IDataSetFields.

99.2.3.2.2 IDataSetFields.GetVisibleFields Method

Pascal

```
function GetVisibleFields: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleFields();
```

Description

This is GetVisibleFields, a member of class IDataSetFields.

99.2.3.2.3 IDataSetFields.HasStatusField Method

Pascal

```
function HasStatusField: Boolean;
```

C++

```
__fastcall Boolean HasStatusField();
```

Description

This is HasStatusField, a member of class IDataSetFields.

99.2.3.2.4 IDataSetFields.IsFieldInUse Method

Pascal

```
function IsFieldInUse(AName: string): Boolean;
```

C++

```
__fastcall Boolean IsFieldInUse(AnsiString AName);
```

Description

This is IsFieldInUse, a member of class IDataSetFields.

99.2.3.2.5 IDataSetFields.ValidateDataSet Method

Pascal

```
procedure ValidateDataSet;
```

C++

```
__fastcall ValidateDataSet();
```

Description

This is ValidateDataSet, a member of class IDataSetFields.

99.2.3.3 IDataSetFields Properties

The properties of the IDataSetFields class are listed here.

Public Properties

	Name	Description
R	VisibleFields (see page 17061)	This is VisibleFields, a member of class IDataSetFields.

99.2.3.3.1 IDataSetFields.VisibleFields Property

Pascal

```
property VisibleFields: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleFields;
```

Description

This is VisibleFields, a member of class IDataSetFields.

99.2.4 IFormatColumn Interface

Class Hierarchy

MidItems.IFormatColumn

Pascal

```
IFormatColumn = interface;
```

C++

```
__interface IFormatColumn;
```

File

MidItems

Description

This is class MidItems.IFormatColumn.

99.2.4.1 IFormatColumn Members

The following tables list the members exposed by IFormatColumn.

Public Methods

	Name	Description
	FormatColumnData (see page 17062)	This is FormatColumnData, a member of class IFormatColumn.
	FormatColumnHeading (see page 17062)	This is FormatColumnHeading, a member of class IFormatColumn.

99.2.4.2 IFormatColumn Methods

The methods of the IFormatColumn class are listed here.

Public Methods

	Name	Description
	FormatColumnData (see page 17062)	This is FormatColumnData, a member of class IFormatColumn.
	FormatColumnHeading (see page 17062)	This is FormatColumnHeading, a member of class IFormatColumn.

99.2.4.2.1 IFormatColumn.FormatColumnData Method

Pascal

```
function FormatColumnData(const Content: string; Options: TWebContentOptions): string;
```

C++

```
__fastcall AnsiString FormatColumnData(const AnsiString Content, TWebContentOptions Options);
```

Description

This is FormatColumnData, a member of class IFormatColumn.

99.2.4.2.2 IFormatColumn.FormatColumnHeading Method

Pascal

```
function FormatColumnHeading(Options: TWebContentOptions): string;
```

C++

```
__fastcall AnsiString FormatColumnHeading(TWebContentOptions Options);
```

Description

This is FormatColumnHeading, a member of class IFormatColumn.

99.2.5 IHTMLField Interface

IHTMLField is an interface that must be implemented by Web items that generate <INPUT> elements.

Class Hierarchy

MidItems.IHTMLField

Pascal

```
IHTMLField = interface;
```

C++

```
__interface IHTMLField;
```

File

MidItems

Description

The TWebDataDisplay (see page 16884) class implements IHTMLField to provide information about information about the

HTML control it represents. This interface is used when generating javascript that refers to the control.

Most Web items that generate HTML <INPUT> elements inherit the support for IHTMLField from TWebDataDisplay (see page 16884). However, when writing custom Web items that generate <INPUT> tags but that do not descend from TWebDataDisplay (see page 16884), component writers must ensure that the Web item supports the IHTMLField interface.

See Also

TWebDataDisplay (see page 16884)

99.2.5.1 IHTMLField Members

The following tables list the members exposed by IHTMLField.

Public Methods

	Name	Description
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.

Public Properties

	Name	Description
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.

99.2.5.2 IHTMLField Methods

The methods of the IHTMLField class are listed here.

Public Methods

	Name	Description
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.

99.2.5.2.1 IHTMLField.GetHTMLControlName Method

Returns the name of the generated HTML <INPUT> control.

Pascal

```
function GetHTMLControlName: string;
```

C++

```
__fastcall AnsiString GetHTMLControlName();
```

Description

GetHTMLFormName is the read access method for the HTMLControlName (see page 17064) property.

See Also

HTMLControlName (see page 17064)

99.2.5.3 IHTMLField Properties

The properties of the IHTMLField class are listed here.

Public Properties

	Name	Description
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.

99.2.5.3.1 IHTMLField.HTMLControlName Property

Indicates the name of the generated HTML control.

Pascal

```
property HTMLControlName: string;
```

C++

```
__property AnsiString HTMLControlName;
```

Description

HTMLControlName is the value of the NAME option on the generated <INPUT> tag. This value is used when creating javascript references to the control.

99.2.6 IHTMLForm Interface

IHTMLForm is an interface that must be implemented by Web items that generate forms.

Class Hierarchy

MidItems.IHTMLForm

Pascal

```
IHTMLForm = interface;
```

C++

```
__interface IHTMLForm;
```

File

MidItems

Description

Web items that produce forms (such as TQueryForm (see page 16745) or TDataForm (see page 16554)) must implement the IHTML form interface. This interface allows other Web items to access information about form elements when generating javascript declarations and method calls.

See Also

TQueryForm (see page 16745)

TDataForm (see page 16554)

99.2.6.1 IHTMLForm Members

The following tables list the members exposed by IHTMLForm.

Public Methods

	Name	Description
	GetHTMLFormName (see page 17065)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 17065)	Returns the name of the javascript variable that refers to the generated form.

Public Properties

	Name	Description
R	HTMLFormName (see page 17066)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 17066)	Indicates the name of the javascript variable that represents the HTML form.

99.2.6.2 IHTMLForm Methods

The methods of the IHTMLForm class are listed here.

Public Methods

	Name	Description
	GetHTMLFormName (see page 17065)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 17065)	Returns the name of the javascript variable that refers to the generated form.

99.2.6.2.1 IHTMLForm.GetHTMLFormName Method

Returns the name of the generated HTML form.

Pascal

```
function GetHTMLFormName: string;
```

C++

```
__fastcall AnsiString GetHTMLFormName();
```

Description

GetHTMLFormName is the read access method for the HTMLFormName (see page 17066) property.

See Also

HTMLFormName (see page 17066)

99.2.6.2.2 IHTMLForm.GetHTMLFormVarName Method

Returns the name of the javascript variable that refers to the generated form.

Pascal

```
function GetHTMLFormVarName: string;
```

C++

```
__fastcall AnsiString GetHTMLFormVarName();
```

Description

GetHTMLFormVarName is the read access method for the HTMLFormVarName (see page 17066) property.

See Also

HTMLFormVarName (see page 17066)

99.2.6.3 IHTMLForm Properties

The properties of the IHTMLForm class are listed here.

Public Properties

	Name	Description
R	HTMLFormName (see page 17066)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 17066)	Indicates the name of the javascript variable that represents the HTML form.

99.2.6.3.1 IHTMLForm.HTMLFormName Property

Indicates the name of the generated HTML form.

Pascal

```
property HTMLFormName: string;
```

C++

```
__property AnsiString HTMLFormName;
```

Description

HTMLFormName is the value of the NAME option on the generated form. Other Web items can use this property when they need to refer to the form name. For example, this property is used to declare the javascript variable that represents the form.

See Also

HTMLFormVarName (see page 17066)

99.2.6.3.2 IHTMLForm.HTMLFormVarName Property

Indicates the name of the javascript variable that represents the HTML form.

Pascal

```
property HTMLFormVarName: string;
```

C++

```
__property AnsiString HTMLFormVarName;
```

Description

HTMLFormVarName is the value of the javascript variable for the form. Other Web items can use this property when they need to refer to the form in generated javascript code.

See Also

HTMLFormName (see page 17066)

99.2.7 IInetXWebDataSet Interface

IInetXWebDataSet lets a Web item interact with information about a dataset in an XML broker's data packet.

Class Hierarchy

MidItems.IInetXWebDataSet

Pascal

```
IInetXWebDataSet = interface;
```

C++

```
__interface IInetXWebDataSet;
```

File

MidItems

Description

Web items use the IInetXWebDataSet interface (formerly known as IMidasWebDataSet (see page 17093)) to obtain information about a dataset supplied by an XML broker. By using this interface, the Web item does not need to worry about whether the dataset is the top-level dataset in the XML data packet or a nested dataset in that data packet.

IInetXWebDataSet defines methods for obtaining information about the fields and parameters of the associated dataset. It also defines methods for assigning an event handler that receives notifications when this information changes.

Note: VCL Method declarations that use IInetXWebDataSet use the _di_IInetXWebDataSet type instead. This type is a DelphiInterface wrapper around the IInetXWebDataSet interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IInetXWebDataSet >
_di_IInetXWebDataSet;
```

See Also

TXMLDataSet (see page 17006)

TXMLBroker (see page 26049)

99.2.7.1 IInetXWebDataSet Members

The following tables list the members exposed by IInetXWebDataSet.

Public Methods

	Name	Description
	AddOnDataChange (see page 17068)	Adds an event handler to the list of event handlers that are called when the fields or parameters of the dataset change.
	FetchParams (see page 17068)	Tells the XML broker that manages the associated dataset to fetch parameter values from the application server.
	FieldCount (see page 17068)	Returns the number of fields in the associated dataset.
	Fields (see page 17069)	Returns the set of fields in the associated dataset.
	ParamCount (see page 17069)	Returns the number of parameters for the associated dataset.
	Params (see page 17069)	Returns the set of parameters in the associated dataset.
	RemoveOnDataChange (see page 17070)	Removes an event handler from the list of event handlers that are called when the fields or parameters of the dataset change.

99.2.7.2 IInetXWebDataSet Methods

The methods of the IInetXWebDataSet class are listed here.

Public Methods

	Name	Description
	AddOnDataChange (see page 17068)	Adds an event handler to the list of event handlers that are called when the fields or parameters of the dataset change.

	FetchParams (see page 17068)	Tells the XML broker that manages the associated dataset to fetch parameter values from the application server.
	FieldCount (see page 17068)	Returns the number of fields in the associated dataset.
	Fields (see page 17069)	Returns the set of fields in the associated dataset.
	ParamCount (see page 17069)	Returns the number of parameters for the associated dataset.
	Params (see page 17069)	Returns the set of parameters in the associated dataset.
	RemoveOnDataChange (see page 17070)	Removes an event handler from the list of event handlers that are called when the fields or parameters of the dataset change.

99.2.7.2.1 IInetXWebDataSet.AddOnDataChange Method

Adds an event handler to the list of event handlers that are called when the fields or parameters of the dataset change.

Pascal

```
procedure AddOnDataChange(const Value: TNotifyEvent);
```

C++

```
__fastcall AddOnDataChange(const TNotifyEvent Value);
```

Description

Call AddOnDataChange to specify an event handler that is called when the fields or parameters of the dataset change. This allows Web items to update their data bindings to reflect changes in the associated data packet.

Value specifies the event handler that is added to the list.

See Also

RemoveOnDataChange (see page 17070)

99.2.7.2.2 IInetXWebDataSet.FetchParams Method

Tells the XML broker that manages the associated dataset to fetch parameter values from the application server.

Pascal

```
procedure FetchParams;
```

C++

```
__fastcall FetchParams();
```

Description

Call FetchParams to tell the XML broker to fetch parameter values from the application server. This ensures that the Params (see page 17069) method returns the current values of any parameters on the server.

See Also

FetchParams (see page 26058)

Params (see page 17069)

99.2.7.2.3 IInetXWebDataSet.FieldCount Method

Returns the number of fields in the associated dataset.

Pascal

```
function FieldCount: Integer;
```

C++

```
__fastcall int FieldCount();
```

Description

Call FieldCount to determine the number of fields returned by the Fields (see page 17069) method. This is the number of fields in the XML data packet belonging to the associated dataset.

See Also

Fields (see page 17069)

99.2.7.2.4 IInetXWebDataSet.Fields Method

Returns the set of fields in the associated dataset.

Pascal

```
function Fields: TFields;
```

C++

```
__fastcall TFields Fields();
```

Description

Call Fields to obtain access to the field objects (TField) that represent the fields in the XML data packet. Each field object can be used to read the value of the field, determine its type, and so on.

See Also

FieldCount (see page 17068)

99.2.7.2.5 IInetXWebDataSet.ParamCount Method

Returns the number of parameters for the associated dataset.

Pascal

```
function ParamCount: Integer;
```

C++

```
__fastcall int ParamCount();
```

Description

Call ParamCount to determine the number of parameters returned by the Params (see page 17069) method. This is the number of parameters in the XML data packet belonging to the associated dataset.

See Also

Params (see page 17069)

99.2.7.2.6 IInetXWebDataSet.Params Method

Returns the set of parameters in the associated dataset.

Pascal

```
function Params: TParams;
```

C++

```
__fastcall TParams Params();
```

Description

Call Params to obtain access to the parameter objects (TParam) that represent the parameters in the XML data packet. Each parameter object can be used to read the value of the parameter, determine its type, and so on.

See Also

ParamCount (see page 17069)

FetchParams (see page 17068)

99.2.7.2.7 IInetXWebDataSet.RemoveOnDataChange Method

Removes an event handler from the list of event handlers that are called when the fields or parameters of the dataset change.

Pascal

```
procedure RemoveOnDataChange(const Value: TNotifyEvent);
```

C++

```
__fastcall RemoveOnDataChange(const TNotifyEvent Value);
```

Description

Call RemoveOnDataChange to remove an event handler that was added using the AddOnDataChange (see page 17068) method.

Value specifies the event handler to remove from the list.

See Also

AddOnDataChange (see page 17068)

99.2.8 IQueryField Interface

Class Hierarchy

Pascal

```
IQueryField = interface(IHTMLField);
```

C++

```
__interface IQueryField : public IHTMLField;
```

File

MidItems

Description

This is class MidItems.IQueryField.

99.2.8.1 IQueryField Members

The following tables list the members exposed by IQueryField.

Public Methods

	Name	Description
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetParamName (see page 17071)	This is GetParamName, a member of class IQueryField.
	GetText (see page 17071)	This is GetText, a member of class IQueryField.
	SetParamName (see page 17071)	This is SetParamName, a member of class IQueryField.
	SetText (see page 17072)	This is SetText, a member of class IQueryField.

Public Properties

	Name	Description
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	ParamName (see page 17072)	This is ParamName, a member of class IQueryField.
	Text (see page 17072)	This is Text, a member of class IQueryField.

99.2.8.2 IQueryField Methods

The methods of the IQueryField class are listed here.

Public Methods

	Name	Description
	GetParamName (see page 17071)	This is GetParamName, a member of class IQueryField.
	GetText (see page 17071)	This is GetText, a member of class IQueryField.
	SetParamName (see page 17071)	This is SetParamName, a member of class IQueryField.
	SetText (see page 17072)	This is SetText, a member of class IQueryField.

99.2.8.2.1 IQueryField.GetParamName Method

Pascal

```
function GetParamName: string;
```

C++

```
__fastcall AnsiString GetParamName();
```

Description

This is GetParamName, a member of class IQueryField.

99.2.8.2.2 IQueryField.GetText Method

Pascal

```
function GetText: string;
```

C++

```
__fastcall AnsiString GetText();
```

Description

This is GetText, a member of class IQueryField.

99.2.8.2.3 IQueryField.SetParamName Method

Pascal

```
procedure SetParamName(AParamName: string);
```

C++

```
__fastcall SetParamName(AnsiString AParamName);
```

Description

This is SetParamName, a member of class IQueryField.

99.2.8.2.4 IQueryField.SetText Method

Pascal

```
procedure SetText(const Value: string);
```

C++

```
__fastcall SetText(const AnsiString Value);
```

Description

This is SetText, a member of class IQueryField.

99.2.8.3 IQueryField Properties

The properties of the IQueryField class are listed here.

Public Properties

	Name	Description
	ParamName (see page 17072)	This is ParamName, a member of class IQueryField.
	Text (see page 17072)	This is Text, a member of class IQueryField.

99.2.8.3.1 IQueryField.ParamName Property

Pascal

```
property ParamName: string;
```

C++

```
__property AnsiString ParamName;
```

Description

This is ParamName, a member of class IQueryField.

99.2.8.3.2 IQueryField.Text Property

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

This is Text, a member of class IQueryField.

99.2.9 IQueryFields Interface

Class Hierarchy

MidItems.IQueryFields

Pascal

```
IQueryFields = interface;
```

C++

```
__interface IQueryFields;
```

File

MidItems

Description

This is class MidItems.IQueryFields.

99.2.9.1 IQueryFields Members

The following tables list the members exposed by IQueryFields.

Public Methods

	Name	Description
	GetParamsList (see page 17073)	This is GetParamsList, a member of class IQueryFields.
	IsParamInUse (see page 17074)	This is IsParamInUse, a member of class IQueryFields.
	ValidateDataSet (see page 17074)	This is ValidateDataSet, a member of class IQueryFields.

99.2.9.2 IQueryFields Methods

The methods of the IQueryFields class are listed here.

Public Methods

	Name	Description
	GetParamsList (see page 17073)	This is GetParamsList, a member of class IQueryFields.
	IsParamInUse (see page 17074)	This is IsParamInUse, a member of class IQueryFields.
	ValidateDataSet (see page 17074)	This is ValidateDataSet, a member of class IQueryFields.

99.2.9.2.1 IQueryFields.GetParamsList Method

Pascal

```
procedure GetParamsList(AList: TStrings);
```

C++

```
__fastcall GetParamsList(TStrings AList);
```

Description

This is GetParamsList, a member of class IQueryFields.

99.2.9.2.2 IQueryFields.IsParamInUse Method

Pascal

```
function IsParamInUse(AName: string): Boolean;
```

C++

```
__fastcall Boolean IsParamInUse(AnsiString AName);
```

Description

This is IsParamInUse, a member of class IQueryFields.

99.2.9.2.3 IQueryFields.ValidateDataSet Method

Pascal

```
procedure ValidateDataSet;
```

C++

```
__fastcall ValidateDataSet();
```

Description

This is ValidateDataSet, a member of class IQueryFields.

99.2.10 IQueryForm Interface

Class Hierarchy

MidItems.IQueryForm

Pascal

```
IQueryForm = interface;
```

C++

```
__interface IQueryForm;
```

File

MidItems

Description

This is class MidItems.IQueryForm.

99.2.11 IRestoreDefaults Interface

Class Hierarchy

MidItems.IRestoreDefaults

Pascal

```
IRestoreDefaults = interface;
```

C++

```
__interface IRestoreDefaults;
```

File

MidItems

Description

This is class MidItems.IRestoreDefaults.

99.2.11.1 IRestoreDefaults Members

The following tables list the members exposed by IRestoreDefaults.

Public Methods

	Name	Description
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.

99.2.11.2 IRestoreDefaults Methods

The methods of the IRestoreDefaults class are listed here.

Public Methods

	Name	Description
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.

99.2.11.2.1 IRestoreDefaults.RestoreDefaults Method

Pascal

```
procedure RestoreDefaults;
```

C++

```
__fastcall RestoreDefaults();
```

Description

This is RestoreDefaults, a member of class IRestoreDefaults.

99.2.12 IStatusField Interface

Class Hierarchy

Pascal

```
IStatusField = interface(IHTMLField);
```

C++

```
__interface IStatusField : public IHTMLField;
```

File

MidItems

Description

This is class MidItems.IStatusField.

99.2.13 IValidateField Interface

Class Hierarchy

MidItems.IValidateField

Pascal

```
IValidateField = interface;
```

C++

```
__interface IValidateField;
```

File

MidItems

Description

This is class MidItems.IValidateField.

99.2.13.1 IValidateField Members

The following tables list the members exposed by IValidateField.

Public Methods

	Name	Description
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

99.2.13.2 IValidateField Methods

The methods of the IValidateField class are listed here.

Public Methods

	Name	Description
	ValidateField (see page 17076)	This is ValidateField, a member of class IValidateField.

99.2.13.2.1 IValidateField.ValidateField Method

Pascal

```
function ValidateField(DataSet: IInetXWebDataSet; AddIntf: IAddScriptElements): Boolean;
```

C++

```
__fastcall Boolean ValidateField(IInetXWebDataSet DataSet, IAddScriptElements AddIntf);
```

Description

This is ValidateField, a member of class IValidateField.

99.2.14 IValidateFields Interface

Class Hierarchy

MidItems.IValidateFields

Pascal

```
IValidateFields = interface;
```

C++

```
__interface IValidateFields;
```

File

MidItems

Description

This is class MidItems.IValidateFields.

99.2.14.1 IValidateFields Members

The following tables list the members exposed by IValidateFields.

Public Methods

	Name	Description
	GetEnableValidateFields (see page 17078)	This is GetEnableValidateFields, a member of class IValidateFields.
	SetEnableValidateFields (see page 17078)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateFields (see page 17078)	This is ValidateFields, a member of class IValidateFields.

Public Properties

	Name	Description
	EnableValidateFields (see page 17078)	This is EnableValidateFields, a member of class IValidateFields.

99.2.14.2 IValidateFields Methods

The methods of the IValidateFields class are listed here.

Public Methods

	Name	Description
	GetEnableValidateFields (see page 17078)	This is GetEnableValidateFields, a member of class IValidateFields.
	SetEnableValidateFields (see page 17078)	This is SetEnableValidateFields, a member of class IValidateFields.
	ValidateFields (see page 17078)	This is ValidateFields, a member of class IValidateFields.

99.2.14.2.1 IValidateFields.GetEnableValidateFields Method

Pascal

```
function GetEnableValidateFields: Boolean;
```

C++

```
__fastcall Boolean GetEnableValidateFields();
```

Description

This is GetEnableValidateFields, a member of class IValidateFields.

99.2.14.2.2 IValidateFields.SetEnableValidateFields Method

Pascal

```
procedure SetEnableValidateFields(Value: Boolean);
```

C++

```
__fastcall SetEnableValidateFields(Boolean Value);
```

Description

This is SetEnableValidateFields, a member of class IValidateFields.

99.2.14.2.3 IValidateFields.ValidateFields Method

Pascal

```
function ValidateFields(AddIntf: IAddScriptElements): Boolean;
```

C++

```
__fastcall Boolean ValidateFields(IAddScriptElements AddIntf);
```

Description

This is ValidateFields, a member of class IValidateFields.

99.2.14.3 IValidateFields Properties

The properties of the IValidateFields class are listed here.

Public Properties

	Name	Description
	EnableValidateFields (see page 17078)	This is EnableValidateFields, a member of class IValidateFields.

99.2.14.3.1 IValidateFields.EnableValidateFields Property

Pascal

```
property EnableValidateFields: Boolean;
```

C++

```
__property Boolean EnableValidateFields;
```

Description

This is EnableValidateFields, a member of class IValidateFields.

99.2.15 IWebDisplay Interface

Class Hierarchy

MidItems.IWebDisplay

Pascal

```
IWebDisplay = interface;
```

C++

```
__interface IWebDisplay;
```

File

MidItems

See Also

TWebDisplay (see page 16911)

99.2.15.1 IWebDisplay Members

The following tables list the members exposed by IWebDisplay.

Public Methods

	Name	Description
	GetIsMultipleRecordView (see page 17079)	This is GetIsMultipleRecordView, a member of class IWebDisplay.

Public Properties

	Name	Description
R	IsMultipleRecordView (see page 17080)	

99.2.15.2 IWebDisplay Methods

The methods of the IWebDisplay class are listed here.

Public Methods

	Name	Description
	GetIsMultipleRecordView (see page 17079)	This is GetIsMultipleRecordView, a member of class IWebDisplay.

99.2.15.2.1 IWebDisplay.GetIsMultipleRecordView Method

Pascal

```
function GetIsMultipleRecordView: Boolean;
```

C++

```
__fastcall Boolean GetIsMultipleRecordView();
```

Description

This is GetIsMultipleRecordView, a member of class IWebDisplay.

99.2.15.3 IWebDisplay Properties

The properties of the IWebDisplay class are listed here.

Public Properties

	Name	Description
R	IsMultipleRecordView (see page 17080)	

99.2.15.3.1 IWebDisplay.IsMultipleRecordView Property

Pascal

```
property IsMultipleRecordView: Boolean;
```

C++

```
__property Boolean IsMultipleRecordView;
```

Description

.

See Also

GetIsMultipleRecordView (see page 17079)

99.2.16 IWebDisplayReference Interface

Class Hierarchy

MidItems.IWebDisplayReference

Pascal

```
IWebDisplayReference = interface;
```

C++

```
__interface IWebDisplayReference;
```

File

MidItems

See Also

TWebDisplay (see page 16911)

99.2.16.1 IWebDisplayReference Members

The following tables list the members exposed by IWebDisplayReference.

Public Methods

	Name	Description
	GetWebDisplayComponent (see page 17081)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.

Public Properties

	Name	Description
R	WebDisplayComponent (see page 17081)	

99.2.16.2 IWebDisplayReference Methods

The methods of the IWebDisplayReference class are listed here.

Public Methods

	Name	Description
	GetWebDisplayComponent (see page 17081)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.

99.2.16.2.1 IWebDisplayReference.GetWebDisplayComponent Method

Pascal

```
function GetWebDisplayComponent: TComponent;
```

C++

```
__fastcall TComponent * GetWebDisplayComponent();
```

Description

This is GetWebDisplayComponent, a member of class IWebDisplayReference.

99.2.16.3 IWebDisplayReference Properties

The properties of the IWebDisplayReference class are listed here.

Public Properties

	Name	Description
R	WebDisplayComponent (see page 17081)	

99.2.16.3.1 IWebDisplayReference.WebDisplayComponent Property

Pascal

```
property WebDisplayComponent: TComponent;
```

C++

```
__property TComponent * WebDisplayComponent;
```

See Also

GetWebDisplayComponent (see page 17081)

99.2.17 IXMLDisplay Interface

Class Hierarchy

Pascal

```
IXMLDisplay = interface(IWebDisplay);
```

C++

```
__interface IXMLDisplay : public IWebDisplay;
```

File

MidItems

Description

This is class MidItems.IXMLDisplay.

99.2.17.1 IXMLDisplay Members

The following tables list the members exposed by IXMLDisplay.

Public Methods

	Name	Description
	GetIsMultipleRecordView (see page 17082)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetXMLDisplayName (see page 17083)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 17083)	This is GetXMLRowSetName, a member of class IXMLDisplay.

Public Properties

	Name	Description
R	IsMultipleRecordView (see page 17083)	
R	XMLDisplayName (see page 17084)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 17084)	This is XMLRowSetName, a member of class IXMLDisplay.

99.2.17.2 IXMLDisplay Methods

The methods of the IXMLDisplay class are listed here.

Public Methods

	Name	Description
	GetIsMultipleRecordView (see page 17082)	This is GetIsMultipleRecordView, a member of class IXMLDisplay.
	GetXMLDisplayName (see page 17083)	This is GetXMLDisplayName, a member of class IXMLDisplay.
	GetXMLRowSetName (see page 17083)	This is GetXMLRowSetName, a member of class IXMLDisplay.

99.2.17.2.1 IXMLDisplay.GetIsMultipleRecordView Method

Pascal

```
function GetIsMultipleRecordView: Boolean;
```

C++

```
__fastcall Boolean GetIsMultipleRecordView();
```

Description

This is GetIsMultipleRecordView, a member of class IXMLDisplay.

99.2.17.2.2 IXMLDisplay.GetXMLDisplayName Method

Pascal

```
function GetXMLDisplayName: string;
```

C++

```
__fastcall AnsiString GetXMLDisplayName();
```

Description

This is GetXMLDisplayName, a member of class IXMLDisplay.

99.2.17.2.3 IXMLDisplay.GetXMLRowSetName Method

Pascal

```
function GetXMLRowSetName: string;
```

C++

```
__fastcall AnsiString GetXMLRowSetName();
```

Description

This is GetXMLRowSetName, a member of class IXMLDisplay.

99.2.17.3 IXMLDisplay Properties

The properties of the IXMLDisplay class are listed here.

Public Properties

	Name	Description
R	IsMultipleRecordView (see page 17083)	
R	XMLDisplayName (see page 17084)	This is XMLDisplayName, a member of class IXMLDisplay.
R	XMLRowSetName (see page 17084)	This is XMLRowSetName, a member of class IXMLDisplay.

99.2.17.3.1 IXMLDisplay.IsMultipleRecordView Property

Pascal

```
property IsMultipleRecordView: Boolean;
```

C++

```
__property Boolean IsMultipleRecordView;
```

Description

.

See Also

GetIsMultipleRecordView (see page 17079)

99.2.17.3.2 IXMLDisplay.XMLDisplayName Property

Pascal

```
property XMLDisplayName: string;
```

C++

```
__property AnsiString XMLDisplayName;
```

Description

This is XMLDisplayName, a member of class IXMLDisplay.

99.2.17.3.3 IXMLDisplay.XMLRowSetName Property

Pascal

```
property XMLRowSetName: string;
```

C++

```
__property AnsiString XMLRowSetName;
```

Description

This is XMLRowSetName, a member of class IXMLDisplay.

99.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AddBoolAttrib (see page 17085)	This is function MidItems.AddBoolAttrib.
	AddCustomAttrib (see page 17085)	This is function MidItems.AddCustomAttrib.
	AddIntAttrib (see page 17086)	This is function MidItems.AddIntAttrib.
	AddQuotedAttrib (see page 17086)	This is function MidItems.AddQuotedAttrib.
	AddStringAttrib (see page 17086)	This is function MidItems.AddStringAttrib.
	CanAddClassHelper (see page 17087)	This is function MidItems.CanAddClassHelper.
	CreateDefaultButtonClasses (see page 17087)	This is function MidItems.CreateDefaultButtonClasses.
	DeclareSubmitForm (see page 17087)	This is function MidItems.DeclareSubmitForm.
	FindDispatcher (see page 17088)	This is function MidItems.FindDispatcher.
	FindProducer (see page 17088)	This is function MidItems.FindProducer.
	FormatColumnData (see page 17088)	This is function MidItems.FormatColumnData.
	FormatColumnHeading (see page 17089)	This is function MidItems.FormatColumnHeading.
	GetItemValuesFromDataSet (see page 17089)	This is function MidItems.GetItemValuesFromDataSet.

99.3.1 MidItems.AddBoolAttrib Function

Pascal

```
procedure AddBoolAttrib(var Attribs: string; const Attrib: string; Value: Boolean);
```

C++

```
AddBoolAttrib(AnsiString Attribs, const AnsiString Attrib, Boolean Value);
```

File

MidItems

Description

This is function MidItems.AddBoolAttrib.

99.3.2 MidItems.AddCustomAttrib Function

Pascal

```
procedure AddCustomAttrib(var Attribs: string; Value: string);
```

C++

```
AddCustomAttrib(AnsiString Attribs, AnsiString Value);
```

File

MidItems

Description

This is function MidItems.AddCustomAttrib.

99.3.3 MidItems.AddIntAttrib Function

Pascal

```
procedure AddIntAttrib(var Attribs: string; const Attrib: string; Value: Integer);
```

C++

```
AddIntAttrib(AnsiString Attribs, const AnsiString Attrib, int Value);
```

File

MidItems

Description

This is function MidItems.AddIntAttrib.

99.3.4 MidItems.AddQuotedAttrib Function

Pascal

```
procedure AddQuotedAttrib(var Attribs: string; const Attrib: string; const Value: string);
```

C++

```
AddQuotedAttrib(AnsiString Attribs, const AnsiString Attrib, const AnsiString Value);
```

File

MidItems

Description

This is function MidItems.AddQuotedAttrib.

99.3.5 MidItems.AddStringAttrib Function

Pascal

```
procedure AddStringAttrib(var Attribs: string; const Attrib: string; const Value: string);
```

C++

```
AddStringAttrib(AnsiString Attribs, const AnsiString Attrib, const AnsiString Value);
```

File

MidItems

Description

This is function MidItems.AddStringAttrib.

99.3.6 MidItems.CanAddClassHelper Function

Pascal

```
function CanAddClassHelper(AEditor: TComponent; AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
Boolean CanAddClassHelper(TComponent * AEditor, TComponent * AParent, TClass AClass);
```

File

MidItems

Description

This is function MidItems.CanAddClassHelper.

99.3.7 MidItems.CreateDefaultButtonClasses Function

Pascal

```
procedure CreateDefaultButtonClasses(const Classes: array of TWebButtonClass; Container:
TWebComponentList);
```

C++

```
CreateDefaultButtonClasses(const array of TWebButtonClass Classes, TWebComponentList
Container);
```

File

MidItems

Description

This is function MidItems.CreateDefaultButtonClasses.

99.3.8 MidItems.DeclareSubmitForm Function

Pascal

```
procedure DeclareSubmitForm(Component: TComponent; XMLBroker: TXMLBroker; AddIntf:
IAddScriptElements);
```

C++

```
DeclareSubmitForm(TComponent * Component, TXMLBroker XMLBroker, IAddScriptElements AddIntf);
```

File

MidItems

Description

This is function MidItems.DeclareSubmitForm.

99.3.9 MidItems.FindDispatcher Function

Pascal

```
function FindDispatcher(Component: TComponent): IWebDispatcherAccess;
```

C++

```
IWebDispatcherAccess FindDispatcher(TComponent * Component);
```

File

MidItems

Description

This is function MidItems.FindDispatcher.

99.3.10 MidItems.FindProducer Function

Pascal

```
function FindProducer(Component: TComponent): TCustomContentProducer;
```

C++

```
TCustomContentProducer FindProducer(TComponent * Component);
```

File

MidItems

Description

This is function MidItems.FindProducer.

99.3.11 MidItems.FormatColumnData Function

Pascal

```
function FormatColumnData(Field: TWebDataDisplay; Content: string): string;
```

C++

```
AnsiString FormatColumnData(TWebDataDisplay Field, AnsiString Content);
```

File

MidItems

Description

This is function MidItems.FormatColumnData.

99.3.12 MidItems.FormatColumnHeading Function

Pascal

```
function FormatColumnHeading(Field: TWebDataDisplay): string;
```

C++

```
AnsiString FormatColumnHeading(TWebDataDisplay Field);
```

File

MidItems

Description

This is function MidItems.FormatColumnHeading.

99.3.13 MidItems.GetItemValuesFromDataSet Function

Pascal

```
function GetItemValuesFromDataSet(DataSet: TDataSet; const ItemsField: string; const
ValuesField: string; var ItemsStrings: TStrings; var ValuesStrings: TStrings): Boolean;
```

C++

```
Boolean GetItemValuesFromDataSet(TDataSet DataSet, const AnsiString ItemsField, const
AnsiString ValuesField, TStrings ItemsStrings, TStrings ValuesStrings);
```

File

MidItems

Description

This is function MidItems.GetItemValuesFromDataSet.

99.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCaptionPosition (see page 17090)	TCaptionPosition indicates the relative position of a label to the HTML control it labels.
	TFormMethod (see page 17091)	TFormMethod represents the method attribute on the <form> tag of an HTML form.
	TLayoutState (see page 17091)	This is record MidItems.TLayoutState.
	TTextAreaWrap (see page 17092)	TTextAreaWrap indicates how an HTML display control should treat items that are too wide for the physical width of the control.

99.4.1 MidItems.TCaptionPosition Enumeration

TCaptionPosition indicates the relative position of a label to the HTML control it labels.

Pascal

```
TCaptionPosition = (
  capLeft,
  capRight,
  capAbove,
  capBelow
);
```

C++

```
enum TCaptionPosition {
  capLeft,
  capRight,
  capAbove,
  capBelow
};
```

File

MidItems

Description

TCaptionPosition can have one of the following values.

Value	Meaning
capLeft	The caption appears to the left of the HTML control.
capRight	The caption appears to the right of the HTML control.
capAbove	The caption appears above the HTML control.
capBelow	The caption appears below the HTML control.

99.4.2 MidItems.TFormMethod Enumeration

TFormMethod represents the method attribute on the <form> tag of an HTML form.

Pascal

```
TFormMethod = (
  fmPost,
  fmGet
);
```

C++

```
enum TFormMethod {
  fmPost,
  fmGet
};
```

File

MidItems

Description

HTML forms include a <form> tag that distinguishes them from other types of HTML pages. This<form> tag includes a method attribute, which determines the method header of the HTTP request message that the form sends to its server. The method type corresponds to the MethodType property of the HTTP request message.

Components that generate HTML forms use TFormMethod to specify the method attribute of the <form> tag they generate, and hence the method header of the messages that they send to the server.

The following table describes the possible values:

Value	Corresponding MethodType	Meaning
fmPost	mtPost	The value of the method attribute is 'post'. The form submits messages that post displayed values to the server application. Named value pairs are passed as content fields of the HTTP message.
fmGet	mtGet	The value of the method attribute is 'get'. The form submits messages that request values it can display. Named value pairs are supplied as query fields in the URL.

See Also

TWebRequest

99.4.3 MidItems.TLayoutState Enumeration

Pascal

```
TLayoutState = (
  lsUnknown,
  lsFields,
  lsButtons
);
```

C++

```
enum TLayoutState {
```

```
    lsUnknown,
    lsFields,
    lsButtons
  };
```

File

MidItems

Description

This is record MidItems.TLayoutState.

99.4.4 MidItems.TTextAreaWrap Enumeration

TTextAreaWrap indicates how an HTML display control should treat items that are too wide for the physical width of the control.

Pascal

```
  TTextAreaWrap = (
    wrOff,
    wrPhysical,
    wrVirtual
  );
```

C++

```
  enum TTextAreaWrap {
    wrOff,
    wrPhysical,
    wrVirtual
  };
```

File

MidItems

Description

TTextAreaWrap can have one of the following values.

Value	Meaning
wrOff	The control does not wrap long lines. Only newline characters that are part of the text string cause the lines in the control to wrap.
wrPhysical	The control formats its text value by wrapping long lines so that no text is hidden. The control inserts carriage returns into the text string.
wrVirtual	The control formats its text value by wrapping long lines so that no text is hidden but does not change the actual value of the text string.

99.5 Types

The following table lists types in this documentation.

Types

Name	Description
IMidasWebDataSet (see page 17093)	This is type MidItems.IMidasWebDataSet.
TWebButtonClass (see page 17093)	This is type MidItems.TWebButtonClass.
TWebDataDisplayClass (see page 17094)	This is type MidItems.TWebDataDisplayClass.
TWebDataInputClass (see page 17094)	This is type MidItems.TWebDataInputClass.
TWebStatusClass (see page 17094)	This is type MidItems.TWebStatusClass.

99.5.1 MidItems.IMidasWebDataSet Type

Pascal

```
IMidasWebDataSet = IInetXWebDataSet;
```

C++

```
IInetXWebDataSet IMidasWebDataSet;
```

File

MidItems

Description

This is type MidItems.IMidasWebDataSet.

99.5.2 MidItems.TWebButtonClass Type

Pascal

```
TWebButtonClass = class of TWebButton;
```

C++

```
TWebButton TWebButtonClass;
```

File

MidItems

Description

This is type MidItems.TWebButtonClass.

99.5.3 MidItems.TWebDataDisplayClass Type

Pascal

```
TWebDataDisplayClass = class of TWebDataDisplay;
```

C++

```
TWebDataDisplay TWebDataDisplayClass;
```

File

MidItems

Description

This is type MidItems.TWebDataDisplayClass.

99.5.4 MidItems.TWebDataInputClass Type

Pascal

```
TWebDataInputClass = class of TWebDataInput;
```

C++

```
TWebDataInput TWebDataInputClass;
```

File

MidItems

Description

This is type MidItems.TWebDataInputClass.

99.5.5 MidItems.TWebStatusClass Type

Pascal

```
TWebStatusClass = class of TWebStatus;
```

C++

```
TWebStatus TWebStatusClass;
```

File

MidItems

Description

This is type MidItems.TWebStatusClass.

99.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
FormMethodNames (see page 17095)	This is constant MidItems.FormMethodNames.
HTMLAlignValues (see page 17096)	This is constant MidItems.HTMLAlignValues.
HTMLVAlignValues (see page 17096)	This is constant MidItems.HTMLVAlignValues.
sActionAttr (see page 17096)	This is constant MidItems.sActionAttr.
sAlignAttr (see page 17097)	This is constant MidItems.sAlignAttr.
sBgColorAttr (see page 17097)	This is constant MidItems.sBgColorAttr.
sBorderAttr (see page 17097)	This is constant MidItems.sBorderAttr.
sCellPaddingAttr (see page 17098)	This is constant MidItems.sCellPaddingAttr.
sCellSpacingAttr (see page 17098)	This is constant MidItems.sCellSpacingAttr.
sCheckedAttr (see page 17098)	This is constant MidItems.sCheckedAttr.
sClassAttr (see page 17099)	This is constant MidItems.sClassAttr.
sColsAttr (see page 17099)	This is constant MidItems.sColsAttr.
sColSpanAttr (see page 17099)	This is constant MidItems.sColSpanAttr.
sEncTypeAttr (see page 17100)	This is constant MidItems.sEncTypeAttr.
sImageHeightAttr (see page 17100)	This is constant MidItems.sImageHeightAttr.
sImageWidthAttr (see page 17100)	This is constant MidItems.sImageWidthAttr.
sMaxLengthAttr (see page 17101)	This is constant MidItems.sMaxLengthAttr.
sMethodAttr (see page 17101)	This is constant MidItems.sMethodAttr.
sMultipleAttr (see page 17101)	This is constant MidItems.sMultipleAttr.
sNameAttr (see page 17102)	This is constant MidItems.sNameAttr.
sOnClickAttr (see page 17102)	This is constant MidItems.sOnClickAttr.
sReadOnlyAttr (see page 17102)	This is constant MidItems.sReadOnlyAttr.
sRowsAttr (see page 17103)	This is constant MidItems.sRowsAttr.
sSelectedAttr (see page 17103)	This is constant MidItems.sSelectedAttr.
sSizeAttr (see page 17103)	This is constant MidItems.sSizeAttr.
sStyleAttr (see page 17104)	This is constant MidItems.sStyleAttr.
sTabIndexAttr (see page 17104)	This is constant MidItems.sTabIndexAttr.
sTypeAttr (see page 17104)	This is constant MidItems.sTypeAttr.
sVAlignAttr (see page 17105)	This is constant MidItems.sVAlignAttr.
sValueAttr (see page 17105)	This is constant MidItems.sValueAttr.
sWidthAttr (see page 17105)	This is constant MidItems.sWidthAttr.
sWrapAttr (see page 17106)	This is constant MidItems.sWrapAttr.
TextAreaWrap (see page 17106)	This is constant MidItems.TextAreaWrap.

99.6.1 MidItems.FormMethodNames Constant

Pascal

```
FormMethodNames: array[TFormMethod] of string = ('POST', 'GET');
```

C++

```
array[TFormMethod] of string FormMethodNames = ('POST', 'GET');
```

File

MidItems

Description

This is constant MidItems.FormMethodNames.

99.6.2 MidItems.HTMLAlignValues Constant

Pascal

```
HTMLAlignValues: array[THTMLAlign] of string = ('', 'left', 'right', 'center');
```

C++

```
array[THTMLAlign] of string HTMLAlignValues = ('', 'left', 'right', 'center');
```

File

MidItems

Description

This is constant MidItems.HTMLAlignValues.

99.6.3 MidItems.HTMLVAlignValues Constant

Pascal

```
HTMLVAlignValues: array[THTMLVAlign] of string = ('', 'top', 'middle', 'bottom', 'baseline');
```

C++

```
array[THTMLVAlign] of string HTMLVAlignValues = ('', 'top', 'middle', 'bottom', 'baseline');
```

File

MidItems

Description

This is constant MidItems.HTMLVAlignValues.

99.6.4 MidItems.sActionAttr Constant

Pascal

```
sActionAttr = 'action';
```

C++

```
sActionAttr = 'action';
```

File

MidItems

Description

This is constant MidItems.sActionAttr.

99.6.5 MidItems.sAlignAttr Constant

Pascal

```
sAlignAttr = 'align';
```

C++

```
sAlignAttr = 'align';
```

File

MidItems

Description

This is constant MidItems.sAlignAttr.

99.6.6 MidItems.sBgColorAttr Constant

Pascal

```
sBgColorAttr = 'bgcolor';
```

C++

```
sBgColorAttr = 'bgcolor';
```

File

MidItems

Description

This is constant MidItems.sBgColorAttr.

99.6.7 MidItems.sBorderAttr Constant

Pascal

```
sBorderAttr = 'border';
```

C++

```
sBorderAttr = 'border';
```

File

MidItems

Description

This is constant MidItems.sBorderAttr.

99.6.8 MidItems.sCellPaddingAttr Constant

Pascal

```
sCellPaddingAttr = 'cellpadding';
```

C++

```
sCellPaddingAttr = 'cellpadding';
```

File

MidItems

Description

This is constant MidItems.sCellPaddingAttr.

99.6.9 MidItems.sCellSpacingAttr Constant

Pascal

```
sCellSpacingAttr = 'cellspacing';
```

C++

```
sCellSpacingAttr = 'cellspacing';
```

File

MidItems

Description

This is constant MidItems.sCellSpacingAttr.

99.6.10 MidItems.sCheckedAttr Constant

Pascal

```
sCheckedAttr = 'checked';
```

C++

```
sCheckedAttr = 'checked';
```

File

MidItems

Description

This is constant MidItems.sCheckedAttr.

99.6.11 MidItems.sClassAttr Constant

Pascal

```
sClassAttr = 'class';
```

C++

```
sClassAttr = 'class';
```

File

MidItems

Description

This is constant MidItems.sClassAttr.

99.6.12 MidItems.sColsAttr Constant

Pascal

```
sColsAttr = 'cols';
```

C++

```
sColsAttr = 'cols';
```

File

MidItems

Description

This is constant MidItems.sColsAttr.

99.6.13 MidItems.sColSpanAttr Constant

Pascal

```
sColSpanAttr = 'colspan';
```

C++

```
sColSpanAttr = 'colspan';
```

File

MidItems

Description

This is constant MidItems.sColSpanAttr.

99.6.14 MidItems.sEncTypeAttr Constant

Pascal

```
sEncTypeAttr = 'enctype';
```

C++

```
sEncTypeAttr = 'enctype';
```

File

MidItems

Description

This is constant MidItems.sEncTypeAttr.

99.6.15 MidItems.sImageHeightAttr Constant

Pascal

```
sImageHeightAttr = 'imageheight';
```

C++

```
sImageHeightAttr = 'imageheight';
```

File

MidItems

Description

This is constant MidItems.sImageHeightAttr.

99.6.16 MidItems.sImageWidthAttr Constant

Pascal

```
sImageWidthAttr = 'imagewidth';
```

C++

```
sImageWidthAttr = 'imagewidth';
```

File

MidItems

Description

This is constant MidItems.sImageWidthAttr.

99.6.17 MidItems.sMaxLengthAttr Constant

Pascal

```
sMaxLengthAttr = 'maxlength';
```

C++

```
sMaxLengthAttr = 'maxlength';
```

File

MidItems

Description

This is constant MidItems.sMaxLengthAttr.

99.6.18 MidItems.sMethodAttr Constant

Pascal

```
sMethodAttr = 'method';
```

C++

```
sMethodAttr = 'method';
```

File

MidItems

Description

This is constant MidItems.sMethodAttr.

99.6.19 MidItems.sMultipleAttr Constant

Pascal

```
sMultipleAttr = 'multiple';
```

C++

```
sMultipleAttr = 'multiple';
```

File

MidItems

Description

This is constant MidItems.sMultipleAttr.

99.6.20 MidItems.sNameAttr Constant

Pascal

```
sNameAttr = 'name';
```

C++

```
sNameAttr = 'name';
```

File

MidItems

Description

This is constant MidItems.sNameAttr.

99.6.21 MidItems.sOnClickAttr Constant

Pascal

```
sOnClickAttr = 'onclick';
```

C++

```
sOnClickAttr = 'onclick';
```

File

MidItems

Description

This is constant MidItems.sOnClickAttr.

99.6.22 MidItems.sReadOnlyAttr Constant

Pascal

```
sReadOnlyAttr = 'readonly';
```

C++

```
sReadOnlyAttr = 'readonly';
```

File

MidItems

Description

This is constant MidItems.sReadOnlyAttr.

99.6.23 MidItems.sRowsAttr Constant

Pascal

```
sRowsAttr = 'rows';
```

C++

```
sRowsAttr = 'rows';
```

File

MidItems

Description

This is constant MidItems.sRowsAttr.

99.6.24 MidItems.sSelectedAttr Constant

Pascal

```
sSelectedAttr = 'selected';
```

C++

```
sSelectedAttr = 'selected';
```

File

MidItems

Description

This is constant MidItems.sSelectedAttr.

99.6.25 MidItems.sSizeAttr Constant

Pascal

```
sSizeAttr = 'size';
```

C++

```
sSizeAttr = 'size';
```

File

MidItems

Description

This is constant MidItems.sSizeAttr.

99.6.26 MidItems.sStyleAttr Constant

Pascal

```
sStyleAttr = 'style';
```

C++

```
sStyleAttr = 'style';
```

File

MidItems

Description

This is constant MidItems.sStyleAttr.

99.6.27 MidItems.sTabIndexAttr Constant

Pascal

```
sTabIndexAttr = 'tabindex';
```

C++

```
sTabIndexAttr = 'tabindex';
```

File

MidItems

Description

This is constant MidItems.sTabIndexAttr.

99.6.28 MidItems.sTypeAttr Constant

Pascal

```
sTypeAttr = 'type';
```

C++

```
sTypeAttr = 'type';
```

File

MidItems

Description

This is constant MidItems.sTypeAttr.

99.6.29 MidItems.sVAlignAttr Constant

Pascal

```
sVAlignAttr = 'valign';
```

C++

```
sVAlignAttr = 'valign';
```

File

MidItems

Description

This is constant MidItems.sVAlignAttr.

99.6.30 MidItems.sValueAttr Constant

Pascal

```
sValueAttr = 'value';
```

C++

```
sValueAttr = 'value';
```

File

MidItems

Description

This is constant MidItems.sValueAttr.

99.6.31 MidItems.sWidthAttr Constant

Pascal

```
sWidthAttr = 'width';
```

C++

```
sWidthAttr = 'width';
```

File

MidItems

Description

This is constant MidItems.sWidthAttr.

99.6.32 MidItems.sWrapAttr Constant

Pascal

```
sWrapAttr = 'wrap';
```

C++

```
sWrapAttr = 'wrap';
```

File

MidItems

Description

This is constant MidItems.sWrapAttr.

99.6.33 MidItems.TextAreaWrap Constant

Pascal

```
TextAreaWrap: array[TTextAreaWrap] of string = ('OFF', 'PHYSICAL', 'VIRTUAL');
```

C++

```
array[TTextAreaWrap] of string TextAreaWrap = ('OFF', 'PHYSICAL', 'VIRTUAL');
```

File

MidItems

Description

This is constant MidItems.TextAreaWrap.

100 MidProd Namespace

This is namespace MidProd.

Topics

Name	Description
Classes (see page 17109)	The following table lists classes in this documentation.
Functions (see page 17160)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 17161)	The following table lists structs, records, enums in this documentation.
Types (see page 17162)	The following table lists types in this documentation.
Constants (see page 17164)	The following table lists constants in this documentation.

Classes

	Name	Description
	TBaseInetXPageProducer (see page 17109)	TBaseInetXPageProducer is an base class for InternetExpress page producer classes.
	TCustomInetXPageProducer (see page 17131)	TCustomInetXPageProducer is the base class for page producers that display live database information in an InternetExpress application.
	TInetXPageElements (see page 17142)	This is class MidProd.TInetXPageElements.
	TInetXPageProducer (see page 17145)	TInetXPageProducer assembles an HTML document that represents live database information from an application server.
	TMidasPageProducer (see page 17158)	TMidasPageProducer assembles an HTML document that represents live database information from an application server.

Constants

Name	Description
sXMLBroker (see page 17164)	This is constant MidProd.sXMLBroker.
sXMLReadyVar (see page 17164)	This is constant MidProd.sXMLReadyVar.

Functions

	Name	Description
	AddStdIncludes (see page 17160)	This is function MidProd.AddStdIncludes.
	PathInfoToRelativePath (see page 17160)	This is function MidProd.PathInfoToRelativePath.

Structs, Records, Enums

	Name	Description
	TStdInclude (see page 17161)	This is record MidProd.TStdInclude.

Types

Name	Description
TBaseMidasPageProducer (see page 17162)	This is type MidProd.TBaseMidasPageProducer.
TCustomMidasPageProducer (see page 17162)	This is type MidProd.TCustomMidasPageProducer.
TMidasPageElements (see page 17163)	This is type MidProd.TMidasPageElements.
TStdIncludes (see page 17163)	This is type MidProd.TStdIncludes.
TXMLDataEvent (see page 17163)	This is type MidProd.TXMLDataEvent.

100.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TBaseInetXPageProducer (see page 17109)	TBaseInetXPageProducer is an base class for InternetExpress page producer classes.
	TCustomInetXPageProducer (see page 17131)	TCustomInetXPageProducer is the base class for page producers that display live database information in an InternetExpress application.
	TInetXPageElements (see page 17142)	This is class MidProd.TInetXPageElements.
	TInetXPageProducer (see page 17145)	TInetXPageProducer assembles an HTML document that represents live database information from an application server.
	TMidasPageProducer (see page 17158)	TMidasPageProducer assembles an HTML document that represents live database information from an application server.

100.1.1 TBaseInetXPageProducer Class

TBaseInetXPageProducer is an base class for InternetExpress page producer classes.

Class Hierarchy

Pascal

```
TBaseInetXPageProducer = class(TBasePageItemsProducer, IWebComponentEditor, IScriptProducer,
ISetWebContentOptions);
```

C++

```
class TBaseInetXPageProducer : public TBasePageItemsProducer, public IWebComponentEditor,
public IScriptProducer, public ISetWebContentOptions;
```

File

MidProd

Description

Do not create instances of TBaseInetXPageProducer. Instead, use one of its descendant classes, such as TInetXPageProducer (see page 17145).

TBaseInetXPageProducer introduces the logic for working with an XML broker to obtain database information and for translating the special HTML-transparent tags that are used in InternetExpress applications. Unlike its immediate descendant (TCustomInetXPageProducer (see page 17131)) however, TBaseInetXPageProducer does not initialize the HTMLDoc property to the default template for an InternetExpress application, although it dynamically generates the InternetExpress-specific tags.

You can use TBaseInetXPageProducer as a base class when writing a page producer that does not use the default template, but which translates InternetExpress tags into HTML and javascript.

See Also

TInetXPageProducer (see page 17145)

TXMLBroker (see page 26049)

100.1.1.1 TBaseInetXPageProducer Members

The following tables list the members exposed by TBaseInetXPageProducer.

Protected Events

	Name	Description
	OnHTMLTag (see page 15280)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddIncludes (see page 17116)	This is AddIncludes, a member of class TBaseInetXPageProducer.
V	AddScriptComponents (see page 17117)	This is AddScriptComponents, a member of class TBaseInetXPageProducer.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 17117)	Indicates whether a specified class can be used as a child Web item.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreatePageElements (see page 17118)	This is CreatePageElements, a member of class TBaseInetXPageProducer.
V	CreateScriptManager (see page 17118)	This is CreateScriptManager, a member of class TBaseInetXPageProducer.
V	DeclareFunctions (see page 17118)	This is DeclareFunctions, a member of class TBaseInetXPageProducer.
V	DeclareIncludes (see page 17118)	This is DeclareIncludes, a member of class TBaseInetXPageProducer.
V	DeclareRowSets (see page 17119)	This is DeclareRowSets, a member of class TBaseInetXPageProducer.
V	DeclareScript (see page 17119)	This is DeclareScript, a member of class TBaseInetXPageProducer.
V	DeclareStyles (see page 17119)	This is DeclareStyles, a member of class TBaseInetXPageProducer.
V	DeclareWarnings (see page 17119)	This is DeclareWarnings, a member of class TBaseInetXPageProducer.
V	DeclareXMLDocuments (see page 17120)	This is DeclareXMLDocuments, a member of class TBaseInetXPageProducer.
V	DeclareXMLIslands (see page 17120)	This is DeclareXMLIslands, a member of class TBaseInetXPageProducer.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAfterGetContent (see page 17120)	This is DoAfterGetContent, a member of class TBaseInetXPageProducer.
	DoAfterGetXMLData (see page 17120)	This is DoAfterGetXMLData, a member of class TBaseInetXPageProducer.
	DoBeforeGetContent (see page 17120)	This is DoBeforeGetContent, a member of class TBaseInetXPageProducer.
	DoBeforeGetXMLData (see page 17121)	This is DoBeforeGetXMLData, a member of class TBaseInetXPageProducer.
	DoTagEvent (see page 17121)	This is DoTagEvent, a member of class TBaseInetXPageProducer.
	FindComponent (see page 5619)	This is FindComponent, a member of class TComponentsPageProducer.
	FindComponentName (see page 5619)	This is FindComponentName, a member of class TComponentsPageProducer.
	GeneratePageElements (see page 17122)	This is GeneratePageElements, a member of class TBaseInetXPageProducer.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 18381)	This is GetChildren, a member of class TBasePageItemsProducer.
	GetComponentContent (see page 5619)	This is GetComponentContent, a member of class TComponentsPageProducer.
	GetComponentList (see page 18382)	This is GetComponentList, a member of class TBasePageItemsProducer.
	GetContentOptions (see page 17122)	This is GetContentOptions, a member of class TBaseInetXPageProducer.
	GetDefaultComponentList (see page 18382)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
	GetDefaultTemplate (see page 17122)	This is GetDefaultTemplate, a member of class TBaseInetXPageProducer.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetScriptManager (see page 17123)	This is GetScriptManager, a member of class TBaseInetXPageProducer.
	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
	GetTemplateFileName (see page 15277)	This is GetTemplateFileName, a member of class TBasePageProducer.
	GetTemplateStream (see page 15277)	This is GetTemplateStream, a member of class TBasePageProducer.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetUseXMLIslands (see page 17123)	This is GetUseXMLIslands, a member of class TBaseInetXPageProducer.
	GetXMLDelta (see page 17124)	This is GetXMLDelta, a member of class TBaseInetXPageProducer.
	GetXMLErrors (see page 17124)	This is GetXMLErrors, a member of class TBaseInetXPageProducer.
	HandleScriptTag (see page 15277)	This is HandleScriptTag, a member of class TBasePageProducer.
	HandleTag (see page 5620)	This is HandleTag, a member of class TComponentsPageProducer.
	HandleTag (see page 15278)	This is HandleTag, a member of class TBasePageProducer.
	ImplCanAddClass (see page 17124)	This is ImplCanAddClass, a member of class TBaseInetXPageProducer.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.

	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 18382)	This is SetChildOrder, a member of class TBasePageItemsProducer.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetWebContentOptions (see page 17126)	This is SetWebContentOptions, a member of class TBaseInetXPageProducer.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
V	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	PageElements (see page 17127)	This is PageElements, a member of class TBaseInetXPageProducer.
R	ScriptManager (see page 17127)	This is ScriptManager, a member of class TBaseInetXPageProducer.

Public Events

	Name	Description
	OnAfterGetContent (see page 17129)	Occurs after the page producer generates its HTML document.
	OnAfterGetXMLData (see page 17129)	Occurs after the page producer translates fetches an XML data packet from an XML broker.
	OnBeforeGetContent (see page 17130)	Occurs when the Content method is called.
	OnBeforeGetXMLData (see page 17130)	Occurs before the page producer fetches an XML data packet from an XML broker.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Content (see page 15106)	Returns the content produced by the content producer.
V	Content (see page 15274)	Returns the content produced by the content producer.

	ContentFromStream (see page 17117)	Returns the content produced in response to input read from a stream.
	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
	ContentFromString (see page 15275)	Returns the content produced in response to an input string.
	Create (see page 17115)	Creates an instance of a TBaseInetXPageProducer (see page 17109).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 17115)	Destroys the instance of the TBasePageItemsProducer.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Evaluate (see page 15324)	This is Evaluate, a member of class IScriptProducer.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindXMLBroker (see page 17121)	Returns the XML broker that supplies the data packet specified by a DATAPACKET tag.
	FindXMLBrokerName (see page 17122)	Returns the name of an XML broker given the parameters in a DATAPACKET tag..
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContent (see page 15324)	This is GetContent, a member of class IScriptProducer.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetErrors (see page 15324)	This is GetErrors, a member of class IScriptProducer.
	GetHTMLBlock (see page 15325)	This is GetHTMLBlock, a member of class IScriptProducer.
	GetHTMLBlockCount (see page 15325)	This is GetHTMLBlockCount, a member of class IScriptProducer.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	GetRequiredTags (see page 17123)	Returns the default set of HTML-transparent tags for an InternetExpress page producer.
	GetWebModuleContext (see page 15322)	This is GetWebModuleContext, a member of class IScriptContext.
	GetXMLData (see page 17124)	Obtains an XML data packet from a specified XML broker.
	HandleScriptError (see page 15325)	This is HandleScriptError, a member of class IScriptProducer.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParseStream (see page 15325)	This is ParseStream, a member of class IScriptProducer.
	ParseString (see page 15325)	This is ParseString, a member of class IScriptProducer.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	ReplaceTags (see page 15326)	This is ReplaceTags, a member of class IScriptProducer.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetContent (see page 15326)	This is SetContent, a member of class IScriptProducer.
	SetIncludePathURL (see page 17125)	Assigns a value to the IncludePathURL (see page 17127) property.
	SetStyles (see page 17125)	Assigns a value to the Styles (see page 17127) property.
	SetStylesFile (see page 17125)	Assigns a value to the StylesFile (see page 17128) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Write (see page 15326)	This is the overview for the Write method overload.
	WriteItem (see page 15327)	This is WriteItem, a member of class IScriptProducer.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Content (see page 15327)	This is Content, a member of class IScriptProducer.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
	EnableXMLIslands (see page 17126)	Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.
R	Errors (see page 15327)	This is Errors, a member of class IScriptProducer.
R	HTMLBlockCount (see page 15328)	This is HTMLBlockCount, a member of class IScriptProducer.
R	HTMLBlocks (see page 15328)	This is HTMLBlocks, a member of class IScriptProducer.
	IncludePathURL (see page 17127)	Indicates the URL where the javascript libraries are installed.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ScriptEngine (see page 15279)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 15279)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	Styles (see page 17127)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 17128)	Specifies a file containing the individual styles for the page producer's style sheet.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

R	WebModuleContext (see page 15322)	This is WebModuleContext, a member of class IScriptContext.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.
R	WebPageItems (see page 18382)	Maintains a list of components that generate HTML content for the producer.

Published Events

	Name	Description
	OnHTMLTag (see page 5620)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

100.1.1.2 TBaseInetXPageProducer.Create Constructor

Creates an instance of a TBaseInetXPageProducer (see page 17109).

Pascal

```
constructor Create(AComponent: TComponent); override;
```

C++

```
virtual __fastcall TBaseInetXPageProducer(TComponent * AComponent);
```

Description

Call Create to instantiate a TBaseInetXPageProducer (see page 17109) component at runtime if it was not created at design time.

AOwner is the component, typically the Web module, that becomes the value of this page producer's Owner property. The Owner is responsible for freeing the TBaseInetXPageProducer (see page 17109) instance.

See Also

Owner (see page 2807)

100.1.1.3 TBaseInetXPageProducer.Destroy Destructor

Destroys the instance of the TBasePageItemsProducer.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBaseInetXPageProducer();
```

Description

Do not call Destroy directly. Instead call Free, which checks that the TBasePageItemsProducer reference is not nil before calling Destroy.

See Also

Create (see page 18380)

Free (see page 22300)

100.1.1.4 TBaseInetXPageProducer Methods

The methods of the TBaseInetXPageProducer class are listed here.

Protected Methods

	Name	Description
	AddIncludes (see page 17116)	This is AddIncludes, a member of class TBaseInetXPageProducer.
	AddScriptComponents (see page 17117)	This is AddScriptComponents, a member of class TBaseInetXPageProducer.
	CanAddClass (see page 17117)	Indicates whether a specified class can be used as a child Web item.
	CreatePageElements (see page 17118)	This is CreatePageElements, a member of class TBaseInetXPageProducer.
	CreateScriptManager (see page 17118)	This is CreateScriptManager, a member of class TBaseInetXPageProducer.
	DeclareFunctions (see page 17118)	This is DeclareFunctions, a member of class TBaseInetXPageProducer.
	DeclareIncludes (see page 17118)	This is DeclareIncludes, a member of class TBaseInetXPageProducer.
	DeclareRowSets (see page 17119)	This is DeclareRowSets, a member of class TBaseInetXPageProducer.
	DeclareScript (see page 17119)	This is DeclareScript, a member of class TBaseInetXPageProducer.
	DeclareStyles (see page 17119)	This is DeclareStyles, a member of class TBaseInetXPageProducer.
	DeclareWarnings (see page 17119)	This is DeclareWarnings, a member of class TBaseInetXPageProducer.
	DeclareXMLDocuments (see page 17120)	This is DeclareXMLDocuments, a member of class TBaseInetXPageProducer.
	DeclareXMLIslands (see page 17120)	This is DeclareXMLIslands, a member of class TBaseInetXPageProducer.
	DoAfterGetContent (see page 17120)	This is DoAfterGetContent, a member of class TBaseInetXPageProducer.
	DoAfterGetXMLData (see page 17120)	This is DoAfterGetXMLData, a member of class TBaseInetXPageProducer.
	DoBeforeGetContent (see page 17120)	This is DoBeforeGetContent, a member of class TBaseInetXPageProducer.
	DoBeforeGetXMLData (see page 17121)	This is DoBeforeGetXMLData, a member of class TBaseInetXPageProducer.
	DoTagEvent (see page 17121)	This is DoTagEvent, a member of class TBaseInetXPageProducer.
	GeneratePageElements (see page 17122)	This is GeneratePageElements, a member of class TBaseInetXPageProducer.
	GetContentOptions (see page 17122)	This is GetContentOptions, a member of class TBaseInetXPageProducer.
	GetDefaultTemplate (see page 17122)	This is GetDefaultTemplate, a member of class TBaseInetXPageProducer.
	GetScriptManager (see page 17123)	This is GetScriptManager, a member of class TBaseInetXPageProducer.
	GetUseXMLIslands (see page 17123)	This is GetUseXMLIslands, a member of class TBaseInetXPageProducer.
	GetXMLDelta (see page 17124)	This is GetXMLDelta, a member of class TBaseInetXPageProducer.
	GetXMLErrors (see page 17124)	This is GetXMLErrors, a member of class TBaseInetXPageProducer.
	ImplCanAddClass (see page 17124)	This is ImplCanAddClass, a member of class TBaseInetXPageProducer.
	SetWebContentOptions (see page 17126)	This is SetWebContentOptions, a member of class TBaseInetXPageProducer.

Public Methods

	Name	Description
	ContentFromStream (see page 17117)	Returns the content produced in response to input read from a stream.
	FindXMLBroker (see page 17121)	Returns the XML broker that supplies the data packet specified by a DATAPACKET tag.
	FindXMLBrokerName (see page 17122)	Returns the name of an XML broker given the parameters in a DATAPACKET tag..
	GetRequiredTags (see page 17123)	Returns the default set of HTML-transparent tags for an InternetExpress page producer.
	GetXMLData (see page 17124)	Obtains an XML data packet from a specified XML broker.
	SetIncludePathURL (see page 17125)	Assigns a value to the IncludePathURL (see page 17127) property.
	SetStyles (see page 17125)	Assigns a value to the Styles (see page 17127) property.
	SetStylesFile (see page 17125)	Assigns a value to the StylesFile (see page 17128) property.

100.1.1.4.1 TBaseInetXPageProducer.AddIncludes Method

Pascal

```
procedure AddIncludes; virtual;
```

C++

```
virtual __fastcall AddIncludes();
```

Description

This is AddIncludes, a member of class TBaseInetXPageProducer.

100.1.1.4.2 TBaseInetXPageProducer.AddScriptComponents Method

Pascal

```
procedure AddScriptComponents; virtual;
```

C++

```
virtual __fastcall AddScriptComponents();
```

Description

This is AddScriptComponents, a member of class TBaseInetXPageProducer.

100.1.1.4.3 TBaseInetXPageProducer.CanAddClass Method

Indicates whether a specified class can be used as a child Web item.

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

The Web page editor calls CanAddClass to determine what Web items can be added to supply content for the Web item that implements this interface.

AParent is the Web item that will act as a parent to the added Web item.

AClass is the class of the proposed child Web item.

CanAddClass returns true if the Web item can use content generated by a component of type AClass, false otherwise.

100.1.1.4.4 TBaseInetXPageProducer.ContentFromStream Method

Returns the content produced in response to input read from a stream.

Pascal

```
function ContentFromStream(InStream: TStream): string; override;
```

C++

```
virtual __fastcall AnsiString ContentFromStream(TStream InStream);
```

Description

Call ContentFromStream to retrieve the content produced by the content producer based on the information provided by the Stream parameter. ContentFromStream

1. Generates an OnBeforeGetContent (see page 17130) event.

2. Translates the HTML template that is the value of Stream, using information produced by the items listed in the WebPageItems property.
3. Generates an OnAfterGetContent (see page 17129) event.
4. Returns the HTML produced in step 2.

See Also

Content (see page 15274)

OnBeforeGetContent (see page 17130)

WebPageItems (see page 18382)

OnAfterGetContent (see page 17129)

100.1.1.4.5 TBaseInetXPageProducer.CreatePageElements Method

Pascal

```
function CreatePageElements: TInetxPageElements; virtual;
```

C++

```
virtual __fastcall TInetxPageElements CreatePageElements();
```

Description

This is CreatePageElements, a member of class TBaseInetXPageProducer.

100.1.1.4.6 TBaseInetXPageProducer.CreateScriptManager Method

Pascal

```
function CreateScriptManager(Options: TWebContentOptions): TObject; virtual;
```

C++

```
virtual __fastcall TObject * CreateScriptManager(TWebContentOptions Options);
```

Description

This is CreateScriptManager, a member of class TBaseInetXPageProducer.

100.1.1.4.7 TBaseInetXPageProducer.DeclareFunctions Method

Pascal

```
function DeclareFunctions: string; virtual;
```

C++

```
virtual __fastcall AnsiString DeclareFunctions();
```

Description

This is DeclareFunctions, a member of class TBaseInetXPageProducer.

100.1.1.4.8 TBaseInetXPageProducer.DeclareIncludes Method

Pascal

```
function DeclareIncludes: string; virtual;
```

C++

```
virtual __fastcall AnsiString DeclareIncludes();
```

Description

This is DeclareIncludes, a member of class TBaseInetXPageProducer.

100.1.1.4.9 TBaseInetXPageProducer.DeclareRowSets Method

Pascal

```
function DeclareRowSets: string; virtual;
```

C++

```
virtual __fastcall AnsiString DeclareRowSets();
```

Description

This is DeclareRowSets, a member of class TBaseInetXPageProducer.

100.1.1.4.10 TBaseInetXPageProducer.DeclareScript Method

Pascal

```
function DeclareScript(XMLIslands: Boolean): string; virtual;
```

C++

```
virtual __fastcall AnsiString DeclareScript(Boolean XMLIslands);
```

Description

This is DeclareScript, a member of class TBaseInetXPageProducer.

100.1.1.4.11 TBaseInetXPageProducer.DeclareStyles Method

Pascal

```
function DeclareStyles: string; virtual;
```

C++

```
virtual __fastcall AnsiString DeclareStyles();
```

Description

This is DeclareStyles, a member of class TBaseInetXPageProducer.

100.1.1.4.12 TBaseInetXPageProducer.DeclareWarnings Method

Pascal

```
function DeclareWarnings(Warnings: TStrings): string; virtual;
```

C++

```
virtual __fastcall AnsiString DeclareWarnings(TStrings Warnings);
```

Description

This is DeclareWarnings, a member of class TBaseInetXPageProducer.

100.1.1.4.13 TBaseInetXPageProducer.DeclareXMLDocuments Method

Pascal

```
function DeclareXMLDocuments: string; virtual;
```

C++

```
virtual __fastcall AnsiString DeclareXMLDocuments();
```

Description

This is DeclareXMLDocuments, a member of class TBaseInetXPageProducer.

100.1.1.4.14 TBaseInetXPageProducer.DeclareXMLIslands Method

Pascal

```
function DeclareXMLIslands: string; virtual;
```

C++

```
virtual __fastcall AnsiString DeclareXMLIslands();
```

Description

This is DeclareXMLIslands, a member of class TBaseInetXPageProducer.

100.1.1.4.15 TBaseInetXPageProducer.DoAfterGetContent Method

Pascal

```
procedure DoAfterGetContent;
```

C++

```
__fastcall DoAfterGetContent();
```

Description

This is DoAfterGetContent, a member of class TBaseInetXPageProducer.

100.1.1.4.16 TBaseInetXPageProducer.DoAfterGetXMLData Method

Pascal

```
procedure DoAfterGetXMLData(XMLBroker: TXMLBroker; var OwnerData: OleVariant);
```

C++

```
__fastcall DoAfterGetXMLData(TXMLBroker XMLBroker, OleVariant OwnerData);
```

Description

This is DoAfterGetXMLData, a member of class TBaseInetXPageProducer.

100.1.1.4.17 TBaseInetXPageProducer.DoBeforeGetContent Method

Pascal

```
procedure DoBeforeGetContent;
```

C++

```
__fastcall DoBeforeGetContent();
```

Description

This is DoBeforeGetContent, a member of class TBaseInetXPageProducer.

100.1.1.4.18 TBaseInetXPageProducer.DoBeforeGetXMLData Method

Pascal

```
procedure DoBeforeGetXMLData(XMLBroker: TXMLBroker; var OwnerData: OleVariant);
```

C++

```
__fastcall DoBeforeGetXMLData(TXMLBroker XMLBroker, OleVariant OwnerData);
```

Description

This is DoBeforeGetXMLData, a member of class TBaseInetXPageProducer.

100.1.1.4.19 TBaseInetXPageProducer.DoTagEvent Method

Pascal

```
procedure DoTagEvent(Tag: TTag; const TagString: string; TagParams: TStrings; var ReplaceText:
string); override;
```

C++

```
virtual __fastcall DoTagEvent(TTag Tag, const AnsiString TagString, TStrings TagParams,
AnsiString ReplaceText);
```

Description

This is DoTagEvent, a member of class TBaseInetXPageProducer.

100.1.1.4.20 TBaseInetXPageProducer.FindXMLBroker Method

Returns the XML broker that supplies the data packet specified by a DATAPACKET tag.

Pascal

```
function FindXMLBroker(TagParams: TStrings): TXMLBroker; virtual;
```

C++

```
virtual __fastcall TXMLBroker FindXMLBroker(TStrings TagParams);
```

Description

The page producer translates HTML-transparent tags of the form

```
<#DATAPACKET XMLBroker=BrokerName>
```

into the XML returned by the XML broker. To do so, it calls FindXMLBroker to locate the XML broker specified by the XMLBroker parameter.

TagParams is a set of Name=Value pairs. This comes from the parameter portion of the DATAPACKET tag.

FindXMLBroker returns the XML broker with the name specified by the XMLBroker parameter. If TagParams does not contain a string of the form XMLBroker=BrokerName, FindXMLBroker returns nil (Delphi) or NULL (C++).

See Also

FindXMLBrokerName (see page 17122)

GetXMLData (see page 17124)

100.1.1.4.21 TBaseInetXPageProducer.FindXMLBrokerName Method

Returns the name of an XML broker given the parameters in a DATAPACKET tag..

Pascal

```
function FindXMLBrokerName(TagParams: TStrings): string; virtual;
```

C++

```
virtual __fastcall AnsiString FindXMLBrokerName(TStrings TagParams);
```

Description

The page producer translates HTML-transparent tags of the form

```
<#DATAPACKET XMLBroker=BrokerName>
```

into the XML returned by the XML broker. To do so, it calls FindXMLBrokerName to parse the parameters for the value of the XMLBroker parameter.

TagParams is a set of Name=Value pairs. This comes from the parameter portion of the DATAPACKET tag.

FindXMLBrokerName returns the value string from the XMLBroker parameter. If TagParams does not contain a string of the form XMLBroker=BrokerName, FindXMLBrokerName returns an empty string.

See Also

FindXMLBroker (see page 17121)

GetXMLData (see page 17124)

100.1.1.4.22 TBaseInetXPageProducer.GeneratePageElements Method

Pascal

```
procedure GeneratePageElements; virtual;
```

C++

```
virtual __fastcall GeneratePageElements();
```

Description

This is GeneratePageElements, a member of class TBaseInetXPageProducer.

100.1.1.4.23 TBaseInetXPageProducer.GetContentOptions Method

Pascal

```
function GetContentOptions(var Owned: Boolean): TWebContentOptions; override;
```

C++

```
virtual __fastcall TWebContentOptions GetContentOptions(Boolean Owned);
```

Description

This is GetContentOptions, a member of class TBaseInetXPageProducer.

100.1.1.4.24 TBaseInetXPageProducer.GetDefaultTemplate Method

Pascal

```
function GetDefaultTemplate: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetDefaultTemplate();
```

Description

This is GetDefaultTemplate, a member of class TBaseInetXPageProducer.

100.1.1.4.25 TBaseInetXPageProducer.GetRequiredTags Method

Returns the default set of HTML-transparent tags for an InternetExpress page producer.

Pascal

```
class function GetRequiredTags: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetRequiredTags();
```

Description

GetRequiredTags dynamically generates the InternetExpress-specific tags that form the basis of an InternetExpress page producer's default template.

GetRequiredTags returns the string

```
<#INCLUDES> <#STYLES> <#WARNINGS> <#FORMS> <#SCRIPT>
```

See Also

HTMLDoc (see page 17140)

Content (see page 17138)

100.1.1.4.26 TBaseInetXPageProducer.GetScriptManager Method

Pascal

```
function GetScriptManager: IScriptManager;
```

C++

```
__fastcall IScriptManager GetScriptManager();
```

Description

This is GetScriptManager, a member of class TBaseInetXPageProducer.

100.1.1.4.27 TBaseInetXPageProducer.GetUseXMLIslands Method

Pascal

```
function GetUseXMLIslands: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetUseXMLIslands();
```

Description

This is GetUseXMLIslands, a member of class TBaseInetXPageProducer.

100.1.1.4.28 TBaseInetXPageProducer.GetXMLData Method

Obtains an XML data packet from a specified XML broker.

Pascal

```
function GetXMLData(XMLBroker: TXMLBroker; XMLOptions: TXMLOptions): string; virtual;
```

C++

```
virtual __fastcall AnsiString GetXMLData(TXMLBroker XMLBroker, TXMLOptions XMLOptions);
```

Description

GetXMLData first generates an OnBeforeGetXMLData (see page 17130) event. It then calls the RequestRecords method of the XML broker specified by XMLBroker, passing in the formatting options specified by XMLOptions. Finally, it generates an OnAfterGetXMLData (see page 17129) event.

GetXMLData returns the XML data packet that XMLBroker supplies.

See Also

OnAfterGetXMLData (see page 17129)

OnBeforeGetXMLData (see page 17130)

Content (see page 15274)

RequestRecords (see page 26064)

100.1.1.4.29 TBaseInetXPageProducer.GetXMLDelta Method

Pascal

```
function GetXMLDelta(XMLBroker: TXMLBroker): string;
```

C++

```
__fastcall AnsiString GetXMLDelta(TXMLBroker XMLBroker);
```

Description

This is GetXMLDelta, a member of class TBaseInetXPageProducer.

100.1.1.4.30 TBaseInetXPageProducer.GetXMLErrors Method

Pascal

```
function GetXMLErrors(XMLBroker: TXMLBroker): string;
```

C++

```
__fastcall AnsiString GetXMLErrors(TXMLBroker XMLBroker);
```

Description

This is GetXMLErrors, a member of class TBaseInetXPageProducer.

100.1.1.4.31 TBaseInetXPageProducer.ImplCanAddClass Method

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

This is ImplCanAddClass, a member of class TBaseInetXPageProducer.

100.1.1.4.32 TBaseInetXPageProducer.SetIncludePathURL Method

Assigns a value to the IncludePathURL (see page 17127) property.

Pascal

```
procedure SetIncludePathURL(const Value: string);
```

C++

```
__fastcall SetIncludePathURL(const AnsiString Value);
```

Description

SetIncludePathURL is the write implementation of the IncludePathURL (see page 17127) property.

See Also

IncludePathURL (see page 17127)

100.1.1.4.33 TBaseInetXPageProducer.SetStyles Method

Assigns a value to the Styles (see page 17127) property.

Pascal

```
procedure SetStyles(Value: TStrings);
```

C++

```
__fastcall SetStyles(TStrings Value);
```

Description

SetStyles is the write implementation of the Styles (see page 17127) property.

See Also

Styles (see page 17127)

100.1.1.4.34 TBaseInetXPageProducer.SetStylesFile Method

Assigns a value to the StylesFile (see page 17128) property.

Pascal

```
procedure SetStylesFile(const Value: TFileName);
```

C++

```
__fastcall SetStylesFile(const TFileName Value);
```

Description

SetStylesFile is the write implementation of the StylesFile (see page 17128) property.

See Also

StylesFile (see page 17128)

100.1.1.4.35 TBaseInetXPageProducer.SetWebContentOptions Method

Pascal

```
procedure SetWebContentOptions(AOptions: TWebContentOptions);
```

C++

```
__fastcall SetWebContentOptions(TWebContentOptions AOptions);
```

Description

This is SetWebContentOptions, a member of class TBaseInetXPageProducer.

100.1.1.5 TBaseInetXPageProducer Properties

The properties of the TBaseInetXPageProducer class are listed here.

Protected Properties

	Name	Description
	PageElements (see page 17127)	This is PageElements, a member of class TBaseInetXPageProducer.
	ScriptManager (see page 17127)	This is ScriptManager, a member of class TBaseInetXPageProducer.

Public Properties

	Name	Description
	EnableXMLIslands (see page 17126)	Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.
	IncludePathURL (see page 17127)	Indicates the URL where the javascript libraries are installed.
	Styles (see page 17127)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 17128)	Specifies a file containing the individual styles for the page producer's style sheet.

100.1.1.5.1 TBaseInetXPageProducer.EnableXMLIslands Property

Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.

Pascal

```
property EnableXMLIslands: Boolean;
```

C++

```
__property Boolean EnableXMLIslands;
```

Description

Set EnableXMLIslands to indicate whether the XML in the generated HTML document should be declared using XML islands. XML islands are only used if the document is created in response to a request message whose headers indicate that the browser supports XML islands.

Set EnableXMLIslands to false to prevent the page producer from declaring XML islands even if the requesting browser supports them.

See Also

GetXMLData (see page 17124)

Content (see page 15274)

100.1.1.5.2 TBaseInetXPageProducer.IncludePathURL Property

Indicates the URL where the javascript libraries are installed.

Pascal

```
property IncludePathURL: string;
```

C++

```
__property AnsiString IncludePathURL;
```

Description

Set IncludePathURL to indicate where the javascript libraries are installed. The page producer uses this value to create HTML statements that include the libraries in the generated HTML document. These statements have the form

```
<SCRIPT language=Javascript type="text/javascript" SRC="IncludePathURL/xmldb.js"> </SCRIPT>
```

The javascript libraries define classes and methods that allow the HTML document to interpret XML data packets if the Web browser is not XML-enabled, and that enable controls in the document to navigate the data, post changes, and apply updates.

Creating Web Pages with an InternetExpress Page Producer

100.1.1.5.3 TBaseInetXPageProducer.PageElements Property

Pascal

```
property PageElements: TInetxPageElements;
```

C++

```
__property TInetxPageElements PageElements;
```

Description

This is PageElements, a member of class TBaseInetXPageProducer.

100.1.1.5.4 TBaseInetXPageProducer.ScriptManager Property

Pascal

```
property ScriptManager: IScriptManager;
```

C++

```
__property IScriptManager ScriptManager;
```

Description

This is ScriptManager, a member of class TBaseInetXPageProducer.

100.1.1.5.5 TBaseInetXPageProducer.Styles Property

Defines the styles that can be used by the page producer and its Web items.

Pascal

```
property Styles: TStrings;
```

C++

```
__property TStrings Styles;
```

Description

Use Styles to define a style sheet for the HTML document produced by TBaseInetXPageProducer (see page 17109). Each string in the TStrings object specifies a specific style by giving a style selector followed by a set of attributes in curly braces. These definitions can define styles for standard HTML elements such as

```
H2 B  {color: red}
```

or they can define styles that you name, such as

```
.MyStyle  {font-family: arial; font-weight: bold; font-size: 18px }
```

Note that user-defined style names must begin with a dot.

Styles for standard elements are applied automatically to HTML that uses the tag or tags that form the style selector. User-defined styles can be applied by setting the StyleRule property of a Web item to the user-defined style name that forms the selector.

Note: If you are sharing a set of styles between multiple page producers or multiple applications, you can define the styles in a file. To define the styles in a file, use the StylesFile (see page 17128) property instead. If StylesFile (see page 17128) is defined, it takes precedence over the Styles property.

Customizing the InternetExpress Page Producer Template

Setting Web Item Properties

100.1.1.5.6 TBaseInetXPageProducer.StylesFile Property

Specifies a file containing the individual styles for the page producer's style sheet.

Pascal

```
property StylesFile: TFileName;
```

C++

```
__property TFileName StylesFile;
```

Description

Set StylesFile to the name of a file containing the style definitions used by the page producer. The page producer uses these style definitions to declare a style sheet in the HTML document it generates.

Styles (see page 17127) for standard elements are applied automatically to HTML in the document. User-defined styles can be applied by setting the StyleRule property of a Web item to the user-defined style name that forms the selector of a style definition.

Note: If the StylesFile property is not set, you can specify the style definitions using the Styles (see page 17127) property instead.

100.1.1.6 TBaseInetXPageProducer Events

The events of the TBaseInetXPageProducer class are listed here.

Public Events

	Name	Description
	OnAfterGetContent (see page 17129)	Occurs after the page producer generates its HTML document.
	OnAfterGetXMLData (see page 17129)	Occurs after the page producer translates fetches an XML data packet from an XML broker.
	OnBeforeGetContent (see page 17130)	Occurs when the Content method is called.
	OnBeforeGetXMLData (see page 17130)	Occurs before the page producer fetches an XML data packet from an XML broker.

100.1.1.6.1 TBaseInetXPageProducer.OnAfterGetContent Event

Occurs after the page producer generates its HTML document.

Pascal

```
property OnAfterGetContent: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAfterGetContent;
```

Description

Write an OnAfterGetContent event handler to take specific action immediately after the page producer generates an HTML document. This event occurs immediately before the Content method returns the generated document. Typically it is used in applications where the page producer automatically responds to messages as the Provider (see page 18419) property of an action item or the Response producer property of an XML broker.

See Also

OnBeforeGetContent (see page 17130)

Content (see page 15274)

Producer (see page 15138)

100.1.1.6.2 TBaseInetXPageProducer.OnAfterGetXMLData Event

Occurs after the page producer translates fetches an XML data packet from an XML broker.

Pascal

```
property OnAfterGetXMLData: TXMLDataEvent;
```

C++

```
__property TXMLDataEvent OnAfterGetXMLData;
```

Description

Write an OnAfterGetXMLData event handler to take specific action immediately after the page producer obtains an XML data

packet from an XML broker. Typically, the OnAfterGetXMLData event handler responds to any values returned by the provider on the application server as the OwnerData parameter.

When the page producer generates its HTML document (that is, when the Content method executes), it adds code to define the XML data packets manipulated in the document. To fetch these XML data packets, the page producer calls an XML broker's RequestRecords method. OnAfterGetXMLData occurs after the page producer has returned an XML data packet but before it is assigned as part of the emerging content.

See Also

OnBeforeGetXMLData (see page 17130)

GetXMLData (see page 17124)

OnHTMLTag (see page 15280)

Content (see page 15274)

100.1.1.6.3 TBaseInetXPageProducer.OnBeforeGetContent Event

Occurs when the Content method is called.

Pascal

```
property OnBeforeGetContent: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnBeforeGetContent;
```

Description

Write an OnBeforeGetContent event handler to take specific action immediately before the page producer generates an HTML document. This event occurs when the Content method is called before the page producer starts assembling its HTML document. Typically it is used in applications where the page producer automatically responds to messages as the Provider (see page 18419) property of an action item or the Response producer property of an XML broker.

See Also

OnAfterGetContent (see page 17129)

Content (see page 15274)

Producer (see page 15138)

100.1.1.6.4 TBaseInetXPageProducer.OnBeforeGetXMLData Event

Occurs before the page producer fetches an XML data packet from an XML broker.

Pascal

```
property OnBeforeGetXMLData: TXMLDataEvent;
```

C++

```
__property TXMLDataEvent OnBeforeGetXMLData;
```

Description

Write an OnBeforeGetXMLData event handler to take specific action immediately before the page producer requests an XML data packet from an XML broker. Typically, the OnBeforeGetXMLData event handler encodes any values for the provider on the application server as the OwnerData parameter or initializes properties on the XML broker that affect the data packet.

When the page producer generates its HTML document (that is, when the Content method executes), it adds code to define the

XML data packets manipulated in the document. To fetch these XML data packets, the page producer calls an XML broker's RequestRecords method. OnBeforeGetXMLData occurs immediately before the page producer requests an XML data packet. Any value assigned to the OwnerData parameter is passed to the XML broker's OnRequestRecords event handler, and from there to the provider's OnBeforeGetRecords event handler.

Params (see page 26073)

100.1.2 TCustomInetXPageProducer Class

TCustomInetXPageProducer is the base class for page producers that display live database information in an InternetExpress application.

Class Hierarchy

Pascal

```
TCustomInetXPageProducer = class(TBaseInetXPageProducer, IWebContent);
```

C++

```
class TCustomInetXPageProducer : public TBaseInetXPageProducer, public IWebContent;
```

File

MidProd

Description

Use TCustomInetXPageProducer as a base class for components that create Web pages in an InternetExpress Web application. These pages display database information from an application server and include data packets encoded in XML and javascript that lets Web browsers navigate that data, post changes, and apply updates back to the application server.

The InetX page producer creates its HTML document from a template. The InetX page producer has a default template that coordinates several top-level declarations for the HTML document with content produced by other components. The other components that generate HTML content for the InetX page producer can be added at design time using the Web Page editor.

Do not instantiate TCustomInetXPageProducer. To create a producer that generates HTML pages with javascript database functions and XML data packets, use a descendant class such as TInetXPageProducer (see page 17145).

See Also

TXMLBroker (see page 26049)

100.1.2.1 TCustomInetXPageProducer Members

The following tables list the members exposed by TCustomInetXPageProducer.

Protected Events

	Name	Description
	OnHTMLTag (see page 15280)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddIncludes (see page 17116)	This is AddIncludes, a member of class TBaseInetXPageProducer.
V	AddScriptComponents (see page 17117)	This is AddScriptComponents, a member of class TBaseInetXPageProducer.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 17117)	Indicates whether a specified class can be used as a child Web item.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreatePageElements (see page 17118)	This is CreatePageElements, a member of class TBaseInetXPageProducer.
V	CreateScriptManager (see page 17118)	This is CreateScriptManager, a member of class TBaseInetXPageProducer.
V	DeclareFunctions (see page 17118)	This is DeclareFunctions, a member of class TBaseInetXPageProducer.
V	DeclareIncludes (see page 17118)	This is DeclareIncludes, a member of class TBaseInetXPageProducer.
V	DeclareRowSets (see page 17119)	This is DeclareRowSets, a member of class TBaseInetXPageProducer.
V	DeclareScript (see page 17119)	This is DeclareScript, a member of class TBaseInetXPageProducer.
V	DeclareStyles (see page 17119)	This is DeclareStyles, a member of class TBaseInetXPageProducer.
V	DeclareWarnings (see page 17119)	This is DeclareWarnings, a member of class TBaseInetXPageProducer.
V	DeclareXMLDocuments (see page 17120)	This is DeclareXMLDocuments, a member of class TBaseInetXPageProducer.
V	DeclareXMLIslands (see page 17120)	This is DeclareXMLIslands, a member of class TBaseInetXPageProducer.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAfterGetContent (see page 17120)	This is DoAfterGetContent, a member of class TBaseInetXPageProducer.
	DoAfterGetXMLData (see page 17120)	This is DoAfterGetXMLData, a member of class TBaseInetXPageProducer.

	DoBeforeGetContent (see page 17120)	This is DoBeforeGetContent, a member of class TBaseInetXPageProducer.
	DoBeforeGetXMLData (see page 17121)	This is DoBeforeGetXMLData, a member of class TBaseInetXPageProducer.
V	DoTagEvent (see page 5618)	This is DoTagEvent, a member of class TComponentsPageProducer.
	DoTagEvent (see page 15276)	This is DoTagEvent, a member of class TBasePageProducer.
V	DoTagEvent (see page 17121)	This is DoTagEvent, a member of class TBaseInetXPageProducer.
V	FindComponent (see page 5619)	This is FindComponent, a member of class TComponentsPageProducer.
	FindComponentName (see page 5619)	This is FindComponentName, a member of class TComponentsPageProducer.
V	GeneratePageElements (see page 17122)	This is GeneratePageElements, a member of class TBaseInetXPageProducer.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 18381)	This is GetChildren, a member of class TBasePageItemsProducer.
V	GetComponentContent (see page 5619)	This is GetComponentContent, a member of class TComponentsPageProducer.
	GetComponentList (see page 18382)	This is GetComponentList, a member of class TBasePageItemsProducer.
V	GetContentOptions (see page 5619)	This is GetContentOptions, a member of class TComponentsPageProducer.
V	GetContentOptions (see page 17122)	This is GetContentOptions, a member of class TBaseInetXPageProducer.
	GetDefaultComponentList (see page 18382)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
V	GetDefaultTemplate (see page 17122)	This is GetDefaultTemplate, a member of class TBaseInetXPageProducer.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
V	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetScriptManager (see page 17123)	This is GetScriptManager, a member of class TBaseInetXPageProducer.
	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 17139)	This is GetTemplateFileName, a member of class TCustomInetXPageProducer.
V	GetTemplateStream (see page 17139)	This is GetTemplateStream, a member of class TCustomInetXPageProducer.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	GetUseXMLIslands (see page 17123)	This is GetUseXMLIslands, a member of class TBaseInetXPageProducer.
	GetXMLDelta (see page 17124)	This is GetXMLDelta, a member of class TBaseInetXPageProducer.
	GetXMLErrors (see page 17124)	This is GetXMLErrors, a member of class TBaseInetXPageProducer.
V	HandleScriptTag (see page 15277)	This is HandleScriptTag, a member of class TBasePageProducer.
V	HandleTag (see page 5620)	This is HandleTag, a member of class TComponentsPageProducer.
V	HandleTag (see page 15278)	This is HandleTag, a member of class TBasePageProducer.
V	ImplCanAddClass (see page 17124)	This is ImplCanAddClass, a member of class TBaseInetXPageProducer.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.

	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 18382)	This is SetChildOrder, a member of class TBasePageItemsProducer.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetWebContentOptions (see page 17126)	This is SetWebContentOptions, a member of class TBaseInetXPageProducer.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
V	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebContent (see page 17140)	This is WebContent, a member of class TCustomInetXPageProducer.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	PageElements (see page 17127)	This is PageElements, a member of class TBaseInetXPageProducer.
R	ScriptManager (see page 17127)	This is ScriptManager, a member of class TBaseInetXPageProducer.

Public Events

	Name	Description
	OnAfterGetContent (see page 17129)	Occurs after the page producer generates its HTML document.
	OnAfterGetXMLData (see page 17129)	Occurs after the page producer translates fetches an XML data packet from an XML broker.
	OnBeforeGetContent (see page 17130)	Occurs when the Content method is called.
	OnBeforeGetXMLData (see page 17130)	Occurs before the page producer fetches an XML data packet from an XML broker.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Content (see page 17138)	Returns the HTML document assembled by the InternetExpress page producer.

	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
	ContentFromStream (see page 15275)	Returns the content produced in response to input read from a stream.
	ContentFromStream (see page 17117)	Returns the content produced in response to input read from a stream.
	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
	ContentFromString (see page 15275)	Returns the content produced in response to an input string.
	Create (see page 17137)	Creates and initializes an instance of TCustomInetXPageProducer (see page 17131).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 17137)	Frees an instance of TCustomInetXPageProducer (see page 17131).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Evaluate (see page 15324)	This is Evaluate, a member of class IScriptProducer.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindXMLBroker (see page 17121)	Returns the XML broker that supplies the data packet specified by a DATAPACKET tag.
	FindXMLBrokerName (see page 17122)	Returns the name of an XML broker given the parameters in a DATAPACKET tag..
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContent (see page 15324)	This is GetContent, a member of class IScriptProducer.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetErrors (see page 15324)	This is GetErrors, a member of class IScriptProducer.
	GetHTMLBlock (see page 15325)	This is GetHTMLBlock, a member of class IScriptProducer.
	GetHTMLBlockCount (see page 15325)	This is GetHTMLBlockCount, a member of class IScriptProducer.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	GetRequiredTags (see page 17123)	Returns the default set of HTML-transparent tags for an InternetExpress page producer.
	GetWebModuleContext (see page 15322)	This is GetWebModuleContext, a member of class IScriptContext.
	GetXMLData (see page 17124)	Obtains an XML data packet from a specified XML broker.
	HandleScriptError (see page 15325)	This is HandleScriptError, a member of class IScriptProducer.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParseStream (see page 15325)	This is ParseStream, a member of class IScriptProducer.
	ParseString (see page 15325)	This is ParseString, a member of class IScriptProducer.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	ReplaceTags (see page 15326)	This is ReplaceTags, a member of class IScriptProducer.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetContent (see page 15326)	This is SetContent, a member of class IScriptProducer.
	SetIncludePathURL (see page 17125)	Assigns a value to the IncludePathURL (see page 17127) property.
	SetStyles (see page 17125)	Assigns a value to the Styles (see page 17127) property.
	SetStylesFile (see page 17125)	Assigns a value to the StylesFile (see page 17128) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetWebContentOptions (see page 24782)	This is SetWebContentOptions, a member of class ISetWebContentOptions.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Write (see page 15326)	This is the overview for the Write method overload.
	WriteItem (see page 15327)	This is WriteItem, a member of class IScriptProducer.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
	EnableXMLIslands (see page 17126)	Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.
R	Errors (see page 15327)	This is Errors, a member of class IScriptProducer.
R	HTMLBlockCount (see page 15328)	This is HTMLBlockCount, a member of class IScriptProducer.
R	HTMLBlocks (see page 15328)	This is HTMLBlocks, a member of class IScriptProducer.
	HTMLDoc (see page 17140)	Specifies the HTML template used to generate the value returned by the Content (see page 17138) method.
	HTMLFile (see page 17141)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content (see page 17138) method.
	IncludePathURL (see page 17127)	Indicates the URL where the javascript libraries are installed.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.

	ScriptEngine (see page 15279)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 15279)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	Styles (see page 17127)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 17128)	Specifies a file containing the individual styles for the page producer's style sheet.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebModuleContext (see page 15322)	This is WebModuleContext, a member of class IScriptContext.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.
R	WebPageItems (see page 18382)	Maintains a list of components that generate HTML content for the producer.

Published Events

	Name	Description
	OnHTMLTag (see page 5620)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

100.1.2.2 TCustomInetXPageProducer.Create Constructor

Creates and initializes an instance of TCustomInetXPageProducer (see page 17131).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomInetXPageProducer(TComponent * AOwner);
```

Description

Call Create to instantiate an InternetExpress page producer at runtime. InternetExpress page producers placed in a Web module at design time are instantiated automatically.

AOwner is a component, typically a Web module, that becomes the value of the Owner property. The Owner is responsible for freeing the TCustomInetXPageProducer (see page 17131) instance.

See Also

Owner (see page 2807)

100.1.2.3 TCustomInetXPageProducer.Destroy Destructor

Frees an instance of TCustomInetXPageProducer (see page 17131).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomInetXPageProducer();
```

Description

Do not call Destroy directly. Instead, call the Free method, which checks whether the reference to the producer is not nil before calling Destroy.

See Also

Free (see page 22300)

100.1.2.4 TCustomInetXPageProducer Methods

The methods of the TCustomInetXPageProducer class are listed here.

Protected Methods

	Name	Description
	GetTemplateFileName (see page 17139)	This is GetTemplateFileName, a member of class TCustomInetXPageProducer.
	GetTemplateStream (see page 17139)	This is GetTemplateStream, a member of class TCustomInetXPageProducer.
	WebContent (see page 17140)	This is WebContent, a member of class TCustomInetXPageProducer.

Public Methods

	Name	Description
	Content (see page 17138)	Returns the HTML document assembled by the InternetExpress page producer.

100.1.2.4.1 TCustomInetXPageProducer.Content Method

Returns the HTML document assembled by the InternetExpress page producer.

Pascal

```
function Content: string; override;
```

C++

```
virtual __fastcall AnsiString Content();
```

Description

Call Content to get the HTML document produced by TCustomInetXPageProducer (see page 17131). This document contains a mixture of HTML, XML, and javascript. It allows Web browsers to view and edit data from an application server.

The InternetExpress page producer creates its content by replacing HTML-transparent tags in the template specified by HTMLDoc (see page 17140) or HTMLFile (see page 17141).

By default, this template has the form

```
<HTML>
<HEAD>
</HEAD>
<BODY>
<#INCLUDES> <#STYLES> <#WARNINGS> <#FORMS> <#SCRIPT>
</BODY>
</HTML>
```

Although the template can be changed to include any combination of these tags with tags of the following forms

```
<#COMPONENT Name=WebItemName>
<#DATAPACKET XMLBroker=BrokerName>
```

which are also translated automatically. The template can replace the default HTML-transparent tags with the tag

```
<#BODYELEMENTS>
```

Finally, the template can include any tags translated by the OnHTMLTag event handler.

The Content method translates the tags listed above as follows:

<#INCLUDES> generates the statements that include the javascript libraries at the location specified by IncludePathURL (see

page 17127).

<#STYLES> generates the statements that defines a style sheet from the definitions listed in the Styles (see page 17127) or StylesFile (see page 17128) property.

<#WARNINGS> generates nothing at runtime. At design time, it adds warning messages for problems detected while generating the HTML document. You can see these messages in the Web page editor.

<#FORMS> generates the HTML produced by the components listed in the WebPageItems property. The HTML from each component is listed in the order it appears in WebPageItems.

<#SCRIPT> generates a block of javascript declarations that are used by the components listed in WebPageItems.

<#BODYELEMENTS> generates the same HTML as results from the 5 tags in the default template. It is useful when generating a template in an HTML editor when you want to use the default layout but add additional elements (such as style sheets) using the editor.

<#COMPONENT> is replaced with the content produced by the specified component. Typically, this is a component listed in the WebPageItems property, but it can be any component that supports the IWebContent interface and has the same Owner as the INETX page producer.

<#DATAPACKET> is replaced with the XML data packet obtained from the specified XML broker.

The string returned by Content can be used as the Content property of the response to an HTTP request message.

Customizing the InternetExpress Page Producer Template

100.1.2.4.2 TCustomInetXPageProducer.GetTemplateFileName Method

Pascal

```
function GetTemplateFileName: string; override;
```

C++

```
virtual __fastcall AnsiString GetTemplateFileName();
```

Description

This is GetTemplateFileName, a member of class TCustomInetXPageProducer.

100.1.2.4.3 TCustomInetXPageProducer.GetTemplateStream Method

Pascal

```
function GetTemplateStream(out AOwned: Boolean): TStream; override;
```

C++

```
virtual __fastcall TStream GetTemplateStream(Boolean AOwned);
```

Description

This is GetTemplateStream, a member of class TCustomInetXPageProducer.

100.1.2.4.4 TCustomInetXPageProducer.WebContent Method

Pascal

```
function WebContent(Options: TWebContentOptions; Layout: TLayout): string;
```

C++

```
__fastcall AnsiString WebContent(TWebContentOptions Options, TLayout Layout);
```

Description

This is WebContent, a member of class TCustomInetXPageProducer.

100.1.2.5 TCustomInetXPageProducer Properties

The properties of the TCustomInetXPageProducer class are listed here.

Public Properties

	Name	Description
	HTMLDoc (see page 17140)	Specifies the HTML template used to generate the value returned by the Content (see page 17138) method.
	HTMLFile (see page 17141)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content (see page 17138) method.

100.1.2.5.1 TCustomInetXPageProducer.HTMLDoc Property

Specifies the HTML template used to generate the value returned by the Content (see page 17138) method.

Pascal

```
property HTMLDoc: TStrings;
```

C++

```
__property TStrings HTMLDoc;
```

Description

Set HTMLDoc to a set of strings that make up the HTML template. By default, HTMLDoc is initialized to the following template:

```
<HTML>
<HEAD>
</HEAD>
<BODY>
<#INCLUDES> <#STYLES> <#WARNINGS> <#FORMS> <#SCRIPT>
</BODY>
</HTML>
```

Each string is a sequence of one or more HTML commands or HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. Following the tag name, the HTML-transparent tag can optionally include

parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. TCustomInetXPageProducer (see page 17131) automatically handles the conversion of the HTML-transparent tags in the default template, as well as the tags described in the help for the Content (see page 17138) method. If you set HTMLDoc to include other HTML-transparent tags, you must translate these in an OnHTMLTag event handler.

Note: Setting HTMLDoc clears the HTMLFile (see page 17141) property.

OnHTMLTag (see page 15280)

Creating Web Pages with an InternetExpress Page Producer

Customizing the InternetExpress Page Producer Template

100.1.2.5.2 TCustomInetXPageProducer.HTMLFile Property

Specifies the name of a file that contains the HTML template used to generate the value returned by the Content (see page 17138) method.

Pascal

```
property HTMLFile: TFileName;
```

C++

```
__property TFileName HTMLFile;
```

Description

Set HTMLFile to the name of the file that contains an HTML template. The HTML template is a sequence of HTML commands and HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLFile clears the HTMLDoc (see page 17140) property.

Note: When distributing applications that contain page producers which use the HTMLFile property, be sure to distribute the file along with the application. Also, be sure that the value of HTMLFile does not include a hard-coded path name that will not be available on the user's disk.

100.1.3 TInetXPageElements Class

Class Hierarchy

Pascal

```
TInetXPageElements = class(TObject);
```

C++

```
class TInetXPageElements : public TObject;
```

File

MidProd

Description

This is class MidProd.TInetXPageElements.

100.1.3.1 TInetXPageElements Members

The following tables list the members exposed by TInetXPageElements.

Public Fields

	Name	Description
	FormsContent (see page 17143)	This is FormsContent, a member of class TInetXPageElements.
	IncludesContent (see page 17143)	This is IncludesContent, a member of class TInetXPageElements.
	ScriptContent (see page 17144)	This is ScriptContent, a member of class TInetXPageElements.
	StylesContent (see page 17144)	This is StylesContent, a member of class TInetXPageElements.
	WarningsContent (see page 17144)	This is WarningsContent, a member of class TInetXPageElements.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BodyContent (see page 17144)	This is BodyContent, a member of class TInetXPageElements.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

100.1.3.2 TInetXPageElements Fields

The fields of the TInetXPageElements class are listed here.

Public Fields

	Name	Description
	FormsContent (see page 17143)	This is FormsContent, a member of class TInetXPageElements.
	IncludesContent (see page 17143)	This is IncludesContent, a member of class TInetXPageElements.
	ScriptContent (see page 17144)	This is ScriptContent, a member of class TInetXPageElements.
	StylesContent (see page 17144)	This is StylesContent, a member of class TInetXPageElements.
	WarningsContent (see page 17144)	This is WarningsContent, a member of class TInetXPageElements.

100.1.3.2.1 TInetXPageElements.FormsContent Field

Pascal

```
FormsContent: string;
```

C++

```
AnsiString FormsContent;
```

Description

This is FormsContent, a member of class TInetXPageElements.

100.1.3.2.2 TInetXPageElements.IncludesContent Field

Pascal

```
IncludesContent: string;
```

C++

```
AnsiString IncludesContent;
```

Description

This is IncludesContent, a member of class TInetXPageElements.

100.1.3.2.3 TInetXPageElements.ScriptContent Field

Pascal

```
ScriptContent: string;
```

C++

```
AnsiString ScriptContent;
```

Description

This is ScriptContent, a member of class TInetXPageElements.

100.1.3.2.4 TInetXPageElements.StylesContent Field

Pascal

```
StylesContent: string;
```

C++

```
AnsiString StylesContent;
```

Description

This is StylesContent, a member of class TInetXPageElements.

100.1.3.2.5 TInetXPageElements.WarningsContent Field

Pascal

```
WarningsContent: string;
```

C++

```
AnsiString WarningsContent;
```

Description

This is WarningsContent, a member of class TInetXPageElements.

100.1.3.3 TInetXPageElements Methods

The methods of the TInetXPageElements class are listed here.

Public Methods

	Name	Description
	BodyContent (see page 17144)	This is BodyContent, a member of class TInetXPageElements.

100.1.3.3.1 TInetXPageElements.BodyContent Method

Pascal

```
function BodyContent: string; virtual;
```

C++

```
virtual __fastcall AnsiString BodyContent();
```

Description

This is BodyContent, a member of class TInetXPageElements.

100.1.4 TInetXPageProducer Class

TInetXPageProducer assembles an HTML document that represents live database information from an application server.

Class Hierarchy

Pascal

```
TInetXPageProducer = class(TCustomInetXPageProducer);
```

C++

```
class TInetXPageProducer : public TCustomInetXPageProducer;
```

File

MidProd

Description

Use TInetXPageProducer to create Web pages for an InternetExpress application. These pages display database information from an application server and include data packets encoded in XML and javascript that lets Web browsers navigate that data, post changes, and apply updates back to the application server.

The InetX page producer is assigned as the Producer property of a Web action item or called from an OnAction event handler.

The InetX page producer creates its HTML document from a template. Unlike other page producers, the InetX page producer has a default template that coordinates several top-level declarations for the HTML document with content produced by other components. The other components that generate HTML content for the InetX page producer can be added at design time using the Web Page editor.

100.1.4.1 TInetXPageProducer Members

The following tables list the members exposed by TInetXPageProducer.

Protected Events

	Name	Description
	OnHTMLTag (see page 15280)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddIncludes (see page 17116)	This is AddIncludes, a member of class TBaseInetXPageProducer.
	AddScriptComponents (see page 17117)	This is AddScriptComponents, a member of class TBaseInetXPageProducer.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 17117)	Indicates whether a specified class can be used as a child Web item.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CreatePageElements (see page 17118)	This is CreatePageElements, a member of class TBaseInetXPageProducer.
	CreateScriptManager (see page 17118)	This is CreateScriptManager, a member of class TBaseInetXPageProducer.
	DeclareFunctions (see page 17118)	This is DeclareFunctions, a member of class TBaseInetXPageProducer.
	DeclareIncludes (see page 17118)	This is DeclareIncludes, a member of class TBaseInetXPageProducer.
	DeclareRowSets (see page 17119)	This is DeclareRowSets, a member of class TBaseInetXPageProducer.
	DeclareScript (see page 17119)	This is DeclareScript, a member of class TBaseInetXPageProducer.
	DeclareStyles (see page 17119)	This is DeclareStyles, a member of class TBaseInetXPageProducer.
	DeclareWarnings (see page 17119)	This is DeclareWarnings, a member of class TBaseInetXPageProducer.
	DeclareXMLDocuments (see page 17120)	This is DeclareXMLDocuments, a member of class TBaseInetXPageProducer.
	DeclareXMLIslands (see page 17120)	This is DeclareXMLIslands, a member of class TBaseInetXPageProducer.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAfterGetContent (see page 17120)	This is DoAfterGetContent, a member of class TBaseInetXPageProducer.
	DoAfterGetXMLData (see page 17120)	This is DoAfterGetXMLData, a member of class TBaseInetXPageProducer.
	DoBeforeGetContent (see page 17120)	This is DoBeforeGetContent, a member of class TBaseInetXPageProducer.
	DoBeforeGetXMLData (see page 17121)	This is DoBeforeGetXMLData, a member of class TBaseInetXPageProducer.
	DoTagEvent (see page 5618)	This is DoTagEvent, a member of class TComponentsPageProducer.
	DoTagEvent (see page 15276)	This is DoTagEvent, a member of class TBasePageProducer.
	DoTagEvent (see page 17121)	This is DoTagEvent, a member of class TBaseInetXPageProducer.
	FindComponent (see page 5619)	This is FindComponent, a member of class TComponentsPageProducer.
	FindComponentName (see page 5619)	This is FindComponentName, a member of class TComponentsPageProducer.
	GeneratePageElements (see page 17122)	This is GeneratePageElements, a member of class TBaseInetXPageProducer.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.

	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 18381)	This is GetChildren, a member of class TBasePageItemsProducer.
	GetComponentContent (see page 5619)	This is GetComponentContent, a member of class TComponentsPageProducer.
	GetComponentList (see page 18382)	This is GetComponentList, a member of class TBasePageItemsProducer.
	GetContentOptions (see page 5619)	This is GetContentOptions, a member of class TComponentsPageProducer.
	GetContentOptions (see page 17122)	This is GetContentOptions, a member of class TBaseInetXPageProducer.
	GetDefaultComponentList (see page 18382)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
	GetDefaultTemplate (see page 17122)	This is GetDefaultTemplate, a member of class TBaseInetXPageProducer.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetScriptManager (see page 17123)	This is GetScriptManager, a member of class TBaseInetXPageProducer.
	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
	GetTemplateFileName (see page 15277)	This is GetTemplateFileName, a member of class TBasePageProducer.
	GetTemplateFileName (see page 17139)	This is GetTemplateFileName, a member of class TCustomInetXPageProducer.
	GetTemplateStream (see page 15277)	This is GetTemplateStream, a member of class TBasePageProducer.
	GetTemplateStream (see page 17139)	This is GetTemplateStream, a member of class TCustomInetXPageProducer.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetUseXMLIslands (see page 17123)	This is GetUseXMLIslands, a member of class TBaseInetXPageProducer.
	GetXMLDelta (see page 17124)	This is GetXMLDelta, a member of class TBaseInetXPageProducer.
	GetXMLErrors (see page 17124)	This is GetXMLErrors, a member of class TBaseInetXPageProducer.
	HandleScriptTag (see page 15277)	This is HandleScriptTag, a member of class TBasePageProducer.
	HandleTag (see page 5620)	This is HandleTag, a member of class TComponentsPageProducer.
	HandleTag (see page 15278)	This is HandleTag, a member of class TBasePageProducer.
	ImplCanAddClass (see page 17124)	This is ImplCanAddClass, a member of class TBaseInetXPageProducer.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 18382)	This is SetChildOrder, a member of class TBasePageItemsProducer.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.

	SetWebContentOptions (see page 17126)	This is SetWebContentOptions, a member of class TBaseInetXPageProducer.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
V	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebContent (see page 17140)	This is WebContent, a member of class TCustomInetXPageProducer.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	PageElements (see page 17127)	This is PageElements, a member of class TBaseInetXPageProducer.
R	ScriptManager (see page 17127)	This is ScriptManager, a member of class TBaseInetXPageProducer.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Content (see page 15106)	Returns the content produced by the content producer.
V	Content (see page 15274)	Returns the content produced by the content producer.
V	Content (see page 17138)	Returns the HTML document assembled by the InternetExpress page producer.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
V	ContentFromStream (see page 15275)	Returns the content produced in response to input read from a stream.
V	ContentFromStream (see page 17117)	Returns the content produced in response to input read from a stream.
V	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
V	ContentFromString (see page 15275)	Returns the content produced in response to an input string.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 15274)	Creates an instance of TBasePageProducer (see page 15269).
V	Create (see page 17115)	Creates an instance of a TBaseInetXPageProducer (see page 17109).
V	Create (see page 17137)	Creates and initializes an instance of TCustomInetXPageProducer (see page 17131).
V	Create (see page 18380)	Creates an instance of a TBasePageItemsProducer (see page 18376).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.

	Destroy (see page 17115)	Destroys the instance of the TBasePageItemsProducer.
	Destroy (see page 17137)	Frees an instance of TCustomInetXPageProducer (see page 17131).
	Destroy (see page 18381)	Destroys the instance of the TBasePageItemsProducer (see page 18376).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Evaluate (see page 15324)	This is Evaluate, a member of class IScriptProducer.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindXMLBroker (see page 17121)	Returns the XML broker that supplies the data packet specified by a DATAPACKET tag.
	FindXMLBrokerName (see page 17122)	Returns the name of an XML broker given the parameters in a DATAPACKET tag..
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContent (see page 15324)	This is GetContent, a member of class IScriptProducer.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetErrors (see page 15324)	This is GetErrors, a member of class IScriptProducer.
	GetHTMLBlock (see page 15325)	This is GetHTMLBlock, a member of class IScriptProducer.
	GetHTMLBlockCount (see page 15325)	This is GetHTMLBlockCount, a member of class IScriptProducer.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	GetRequiredTags (see page 17123)	Returns the default set of HTML-transparent tags for an InternetExpress page producer.
	GetWebModuleContext (see page 15322)	This is GetWebModuleContext, a member of class IScriptContext.
	GetXMLData (see page 17124)	Obtains an XML data packet from a specified XML broker.
	HandleScriptError (see page 15325)	This is HandleScriptError, a member of class IScriptProducer.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	ParseStream (see page 15325)	This is ParseStream, a member of class IScriptProducer.
	ParseString (see page 15325)	This is ParseString, a member of class IScriptProducer.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	ReplaceTags (see page 15326)	This is ReplaceTags, a member of class IScriptProducer.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetContent (see page 15326)	This is SetContent, a member of class IScriptProducer.
	SetIncludePathURL (see page 17125)	Assigns a value to the IncludePathURL (see page 17127) property.
	SetStyles (see page 17125)	Assigns a value to the Styles (see page 17127) property.
	SetStylesFile (see page 17125)	Assigns a value to the StylesFile (see page 17128) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetWebContentOptions (see page 24782)	This is SetWebContentOptions, a member of class ISetWebContentOptions.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	Write (see page 15326)	This is the overview for the Write method overload.
	WriteItem (see page 15327)	This is WriteItem, a member of class IScriptProducer.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Content (see page 15327)	This is Content, a member of class IScriptProducer.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
R	Errors (see page 15327)	This is Errors, a member of class IScriptProducer.
R	HTMLBlockCount (see page 15328)	This is HTMLBlockCount, a member of class IScriptProducer.
R	HTMLBlocks (see page 15328)	This is HTMLBlocks, a member of class IScriptProducer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	StripParamQuotes (see page 15279)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebModuleContext (see page 15322)	This is WebModuleContext, a member of class IScriptContext.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.

Published Events

	Name	Description
	OnAfterGetContent (see page 17156)	Occurs after the page producer generates its HTML document.
	OnAfterGetXMLData (see page 17156)	Occurs after the page producer translates fetches an XML data packet from an XML broker.

	OnBeforeGetContent (see page 17157)	Occurs when the Content method is called.
	OnBeforeGetXMLData (see page 17157)	Occurs before the page producer fetches an XML data packet from an XML broker.
	OnHTMLTag (see page 5620)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Published Properties

	Name	Description
	EnableXMLIslands (see page 17151)	Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.
	HTMLDoc (see page 17152)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 17153)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
	IncludePathURL (see page 17153)	Indicates the URL where the javascript libraries are installed.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ScriptEngine (see page 17154)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	Styles (see page 17154)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 17155)	Specifies a file containing the individual styles for the page producer's style sheet.
	Tag (see page 2808)	Stores an integer value as part of a component.
	WebPageItems (see page 17155)	Maintains a list of components that generate HTML content for the producer.

100.1.4.2 TInetXPageProducer Properties

The properties of the TInetXPageProducer class are listed here.

Published Properties

	Name	Description
	EnableXMLIslands (see page 17151)	Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.
	HTMLDoc (see page 17152)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 17153)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
	IncludePathURL (see page 17153)	Indicates the URL where the javascript libraries are installed.
	ScriptEngine (see page 17154)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	Styles (see page 17154)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 17155)	Specifies a file containing the individual styles for the page producer's style sheet.
	WebPageItems (see page 17155)	Maintains a list of components that generate HTML content for the producer.

100.1.4.2.1 TInetXPageProducer.EnableXMLIslands Property

Specifies whether XML data packets should be declared using XML islands if the requesting browser supports them.

Pascal

```
property EnableXMLIslands: Boolean;
```

C++

```
__property Boolean EnableXMLIslands;
```

Description

Set EnableXMLIslands to indicate whether the XML in the generated HTML document should be declared using XML islands. XML islands are only used if the document is created in response to a request message whose headers indicate that the browser supports XML islands.

Set EnableXMLIslands to false to prevent the page producer from declaring XML islands even if the requesting browser supports them.

See Also

GetXMLData (see page 17124)

Content (see page 15274)

100.1.4.2.2 TInetXPageProducer.HTMLDoc Property

Specifies the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLDoc: TStrings;
```

C++

```
__property TStrings HTMLDoc;
```

Description

Set HTMLDoc to a set of strings that make up the HTML template. By default, HTMLDoc is initialized to the following template:

```
<HTML>
<HEAD>
</HEAD>
<BODY>
<#INCLUDES> <#STYLES> <#WARNINGS> <#FORMS> <#SCRIPT>
</BODY>
</HTML>
```

Each string is a sequence of one or more HTML commands or HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. TCustomInetXPageProducer automatically handles the conversion of the HTML-transparent tags in the default template, as well as the tags described in the help for the Content method. If you set HTMLDoc to include other HTML-transparent tags, you must translate these in an OnHTMLTag event handler.

Note: Setting HTMLDoc clears the HTMLFile property.

HTMLFile (see page 17141)

OnHTMLTag (see page 15280)

Creating Web Pages with an InternetExpress Page Producer

Customizing the InternetExpress Page Producer Template

100.1.4.2.3 TInetXPageProducer.HTMLFile Property

Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLFile: TFileName;
```

C++

```
__property TFileName HTMLFile;
```

Description

Set HTMLFile to the name of the file that contains an HTML template. The HTML template is a sequence of HTML commands and HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLFile clears the HTMLDoc property.

Note: When distributing applications that contain page producers which use the HTMLFile property, be sure to distribute the file along with the application. Also, be sure that the value of HTMLFile does not include a hard-coded path name that will not be available on the user's disk.

See Also

Content (see page 17138)

HTMLDoc (see page 17140)

Customizing the InternetExpress Page Producer Template

100.1.4.2.4 TInetXPageProducer.IncludePathURL Property

Indicates the URL where the javascript libraries are installed.

Pascal

```
property IncludePathURL: string;
```

C++

```
__property AnsiString IncludePathURL;
```

Description

Set IncludePathURL to indicate where the javascript libraries are installed. The page producer uses this value to create HTML statements that include the libraries in the generated HTML document. These statements have the form

```
<SCRIPT language=Javascript type="text/javascript" SRC="IncludePathURL/xmldb.js"> </SCRIPT>
```

The javascript libraries define classes and methods that allow the HTML document to interpret XML data packets if the Web

browser is not XML-enabled, and that enable controls in the document to navigate the data, post changes, and apply updates.

SetIncludePathURL (see page 17125)

Content (see page 15274)

Creating Web Pages with an InternetExpress Page Producer

100.1.4.2.5 TInetXPageProducer.ScriptEngine Property

Names the script engine that generates or interprets script embedded in the documents that this producer creates.

Pascal

```
property ScriptEngine: string;
```

C++

```
__property AnsiString ScriptEngine;
```

Description

ScriptEngine indicates the scripting language that the producer uses in its generated documents. For example, if the producer generates code that includes jscript, the value of ScriptEngine is 'JSCRIPT'.

When ScriptEngine is defined, the page producer generates its content using a special script-producer component. When ScriptEngine is not defined, the page producer uses only the OnHTMLTag event, plus any other built-in translations provided by a descendant class.

See Also

OnHTMLTag (see page 15280)

100.1.4.2.6 TInetXPageProducer.Styles Property

Defines the styles that can be used by the page producer and its Web items.

Pascal

```
property Styles: TStrings;
```

C++

```
__property TStrings Styles;
```

Description

Use Styles to define a style sheet for the HTML document produced by TBaseInetXPageProducer. Each string in the TStrings object specifies a specific style by giving a style selector followed by a set of attributes in curly braces. These definitions can define styles for standard HTML elements such as

```
H2 B  {color: red}
```

or they can define styles that you name, such as

```
.MyStyle  {font-family: arial; font-weight: bold; font-size: 18px }
```

Note that user-defined style names must begin with a dot.

Styles for standard elements are applied automatically to HTML that uses the tag or tags that form the style selector. User-defined styles can be applied by setting the StyleRule property of a Web item to the user-defined style name that forms the selector.

Note: If you are sharing a set of styles between multiple page producers or multiple applications, you can define the styles in a

file. To define the styles in a file, use the StylesFile property instead. If StylesFile is defined, it takes precedence over the Styles property.

Content (see page 15274)

Customizing the InternetExpress Page Producer Template

Setting Web Item Properties

100.1.4.2.7 TInetXPageProducer.StylesFile Property

Specifies a file containing the individual styles for the page producer's style sheet.

Pascal

```
property StylesFile: TFileName;
```

C++

```
__property TFileName StylesFile;
```

Description

Set StylesFile to the name of a file containing the style definitions used by the page producer. The page producer uses these style definitions to declare a style sheet in the HTML document it generates.

Styles for standard elements are applied automatically to HTML in the document. User-defined styles can be applied by setting the StyleRule property of a Web item to the user-defined style name that forms the selector of a style definition.

Note: If the StylesFile property is not set, you can specify the style definitions using the Styles property instead.

Customizing the InternetExpress Page Producer Template

Setting Web Item Properties

100.1.4.2.8 TInetXPageProducer.WebPageItems Property

Maintains a list of components that generate HTML content for the producer.

Pascal

```
property WebPageItems: TWebComponentList;
```

C++

```
__property TWebComponentList WebPageItems;
```

Description

WebPageItems lists the components that generate content for the page items producer. Each of these components supports the IWebContent interface, and can contain its own list of Web items that help it generate its content.

The type of items that can be added to the WebPageItems list are restricted by a protected method that is abstract or, in C++ terminology, pure virtual in TBasePageItemsProducer. Descendant classes implement this protected method to indicate what types of items can be added to the list.

At design time, use the Web page editor to add components to the WebPageItems property.

Note: Typically, WebPageItems lists all the components that generate content for the page items producer, in the order that the generated content appears in the final HTML document. However, the page items producer can transform COMPONENT tags in its template using components that are not in this list, as long as they have the same owner as the page items producer..

100.1.4.3 TInetXPageProducer Events

The events of the TInetXPageProducer class are listed here.

Published Events

	Name	Description
	OnAfterGetContent (see page 17156)	Occurs after the page producer generates its HTML document.
	OnAfterGetXMLData (see page 17156)	Occurs after the page producer translates fetches an XML data packet from an XML broker.
	OnBeforeGetContent (see page 17157)	Occurs when the Content method is called.
	OnBeforeGetXMLData (see page 17157)	Occurs before the page producer fetches an XML data packet from an XML broker.

100.1.4.3.1 TInetXPageProducer.OnAfterGetContent Event

Occurs after the page producer generates its HTML document.

Pascal

```
property OnAfterGetContent: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAfterGetContent;
```

Description

Write an OnAfterGetContent event handler to take specific action immediately after the page producer generates an HTML document. This event occurs immediately before the Content method returns the generated document. Typically it is used in applications where the page producer automatically responds to messages as the Provider property of an action item or the Response producer property of an XML broker.

See Also

OnBeforeGetContent (see page 17130)

Content (see page 15274)

Producer (see page 15138)

100.1.4.3.2 TInetXPageProducer.OnAfterGetXMLData Event

Occurs after the page producer translates fetches an XML data packet from an XML broker.

Pascal

```
property OnAfterGetXMLData: TXMLDataEvent;
```

C++

```
__property TXMLDataEvent OnAfterGetXMLData;
```

Description

Write an OnAfterGetXMLData event handler to take specific action immediately after the page producer obtains an XML data packet from an XML broker. Typically, the OnAfterGetXMLData event handler responds to any values returned by the provider on the application server as the OwnerData parameter.

When the page producer generates its HTML document (that is, when the Content method executes), it adds code to define the XML data packets manipulated in the document. To fetch these XML data packets, the page producer calls an XML broker's RequestRecords method. OnAfterGetXMLData occurs after the page producer has returned an XML data packet but before it is assigned as part of the emerging content.

See Also

OnBeforeGetXMLData (see page 17130)

GetXMLData (see page 17124)

OnHTMLTag (see page 15280)

Content (see page 15274)

100.1.4.3.3 TInetXPageProducer.OnBeforeGetContent Event

Occurs when the Content method is called.

Pascal

```
property OnBeforeGetContent: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnBeforeGetContent;
```

Description

Write an OnBeforeGetContent event handler to take specific action immediately before the page producer generates an HTML document. This event occurs when the Content method is called before the page producer starts assembling its HTML document. Typically it is used in applications where the page producer automatically responds to messages as the Provider property of an action item or the Response producer property of an XML broker.

See Also

OnAfterGetContent (see page 17129)

Content (see page 15274)

Producer (see page 15138)

100.1.4.3.4 TInetXPageProducer.OnBeforeGetXMLData Event

Occurs before the page producer fetches an XML data packet from an XML broker.

Pascal

```
property OnBeforeGetXMLData: TXMLDataEvent;
```

C++

```
__property TXMLDataEvent OnBeforeGetXMLData;
```

Description

Write an OnBeforeGetXMLData event handler to take specific action immediately before the page producer requests an XML data packet from an XML broker. Typically, the OnBeforeGetXMLData event handler encodes any values for the provider on the application server as the OwnerData parameter or initializes properties on the XML broker that affect the data packet.

When the page producer generates its HTML document (that is, when the Content method executes), it adds code to define the XML data packets manipulated in the document. To fetch these XML data packets, the page producer calls an XML broker's RequestRecords method. OnBeforeGetXMLData occurs immediately before the page producer requests an XML data packet. Any value assigned to the OwnerData parameter is passed to the XML broker's OnRequestRecords event handler, and from there to the provider's OnBeforeGetRecords event handler.

100.1.5 TMidasPageProducer Class

TMidasPageProducer assembles an HTML document that represents live database information from an application server.

Class Hierarchy

Pascal

```
TMidasPageProducer = class(TInetXPageProducer);
```

C++

```
class TMidasPageProducer : public TInetXPageProducer;
```

File

MidProd

Description

Do not use TMidasPageProducer. It is included only for backward compatibility. To add a page producer that assembles Web pages in an InternetExpress application, use TInetXPageProducer (see page 17145) instead.

See Also

TWebActionItem (see page 15130)

TWebActionItem (see page 15130)

100.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AddStdIncludes (see page 17160)	This is function MidProd.AddStdIncludes.
	PathInfoToRelativePath (see page 17160)	This is function MidProd.PathInfoToRelativePath.

100.2.1 MidProd.AddStdIncludes Function

Pascal

```
procedure AddStdIncludes(StdIncludes: TStdIncludes; AddIntf: IAddScriptElements);
```

C++

```
AddStdIncludes(TStdIncludes StdIncludes, IAddScriptElements AddIntf);
```

File

MidProd

Description

This is function MidProd.AddStdIncludes.

100.2.2 MidProd.PathInfoToRelativePath Function

Pascal

```
function PathInfoToRelativePath(const PathInfo: string): string;
```

C++

```
AnsiString PathInfoToRelativePath(const AnsiString PathInfo);
```

File

MidProd

Description

This is function MidProd.PathInfoToRelativePath.

100.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TStdInclude (see page 17161)	This is record MidProd.TStdInclude.

100.3.1 MidProd.TStdInclude Enumeration

Pascal

```
TStdInclude = (
  jsDom,
  jsDB,
  jsDisp,
  jsBind,
  jsErrDisp,
  jsShow
);
```

C++

```
enum TStdInclude {
  jsDom,
  jsDB,
  jsDisp,
  jsBind,
  jsErrDisp,
  jsShow
};
```

File

MidProd

Description

This is record MidProd.TStdInclude.

100.4 Types

The following table lists types in this documentation.

Types

Name	Description
TBaseMidasPageProducer (see page 17162)	This is type MidProd.TBaseMidasPageProducer.
TCustomMidasPageProducer (see page 17162)	This is type MidProd.TCustomMidasPageProducer.
TMidasPageElements (see page 17163)	This is type MidProd.TMidasPageElements.
TStdIncludes (see page 17163)	This is type MidProd.TStdIncludes.
TXMLDataEvent (see page 17163)	This is type MidProd.TXMLDataEvent.

100.4.1 MidProd.TBaseMidasPageProducer Type

Pascal

```
TBaseMidasPageProducer = TBaseInetXPageProducer;
```

C++

```
TBaseInetXPageProducer TBaseMidasPageProducer;
```

File

MidProd

Description

This is type MidProd.TBaseMidasPageProducer.

100.4.2 MidProd.TCustomMidasPageProducer Type

Pascal

```
TCustomMidasPageProducer = TCustomInetXPageProducer;
```

C++

```
TCustomInetXPageProducer TCustomMidasPageProducer;
```

File

MidProd

Description

This is type MidProd.TCustomMidasPageProducer.

100.4.3 MidProd.TMidasPageElements Type

Pascal

```
TMidasPageElements = TInetXPageElements;
```

C++

```
TInetXPageElements TMidasPageElements;
```

File

MidProd

Description

This is type MidProd.TMidasPageElements.

100.4.4 MidProd.TStdIncludes Type

Pascal

```
TStdIncludes = set of TStdInclude;
```

C++

```
TStdInclude TStdIncludes;
```

File

MidProd

Description

This is type MidProd.TStdIncludes.

100.4.5 MidProd.TXMLDataEvent Type

Pascal

```
TXMLDataEvent = procedure (Sender: TObject; Request: TWebRequest; XMLBroker: TXMLBroker; var
OwnerData: OleVariant) of object;
```

C++

```
(Sender: TObject; Request: TWebRequest; XMLBroker: TXMLBroker; var OwnerData: OleVariant) (
TXMLDataEvent)();
```

File

MidProd

Description

This is type MidProd.TXMLDataEvent.

100.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
sXMLBroker (see page 17164)	This is constant MidProd.sXMLBroker.
sXMLReadyVar (see page 17164)	This is constant MidProd.sXMLReadyVar.

100.5.1 MidProd.sXMLBroker Constant

Pascal

```
sXMLBroker = 'XMLBROKER';
```

C++

```
sXMLBroker = 'XMLBROKER';
```

File

MidProd

Description

This is constant MidProd.sXMLBroker.

100.5.2 MidProd.sXMLReadyVar Constant

Pascal

```
sXMLReadyVar = 'xml_ready';
```

C++

```
sXMLReadyVar = 'xml_ready';
```

File

MidProd

Description

This is constant MidProd.sXMLReadyVar.

101 MPlayer Namespace

This is namespace MPlayer.

Topics

Name	Description
Classes (see page 17167)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 17229)	The following table lists structs, records, enums in this documentation.
Types (see page 17237)	The following table lists types in this documentation.

Classes

	Name	Description
	EMCIDeviceError (see page 17167)	EMCIDeviceError is the exception class for devices that provide a Media Control Interface (MCI) driver.
	TMediaPlayer (see page 17167)	TMediaPlayer controls devices that provide a Media Control Interface (MCI) driver.

Structs, Records, Enums

	Name	Description
	TMPBtnType (see page 17229)	TMPBtnType defines the possible buttons in a TMediaPlayer (see page 17167) component and TButtonSet (see page 17238) represents a set of those buttons.
	TMPButton (see page 17230)	This is record MPlayer.TMPButton.
	TMPDevCaps (see page 17231)	TMPDevCaps defines the capabilities of a TMediaPlayer (see page 17167) component and TMPDevCapsSet (see page 17238) represents a set of those capabilities.
	TMPDeviceTypes (see page 17231)	TMPDeviceTypes identifies a multimedia device.
	TMPGlyph (see page 17233)	This is record MPlayer.TMPGlyph.
	TMPModes (see page 17233)	TMPModes identifies the state of a TMediaPlayer (see page 17167) component.
	TMPNotifyValues (see page 17234)	TMPNotifyValues identifies the types of notifications a media device can give a TMediaPlayer (see page 17167) component.
	TMPTimeFormats (see page 17235)	TMPTimeFormats indicates the format a media player uses to indicate position.

Types

Name	Description
EMPNotify (see page 17237)	EMPNotify is the type of event handlers that respond when the user interacts with a TMediaPlayer (see page 17167) component.
EMPPostNotify (see page 17237)	EMPPostNotify is the type of a media player's OnPostClick event handler.
TButtonSet (see page 17238)	TButtonSet is a set of TMPBtnType (see page 17229) values.

TMPDevCapsSet (see page 17238)	This is type MPlayer.TMPDevCapsSet.

101.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EMCIDeviceError (see page 17167)	EMCIDeviceError is the exception class for devices that provide a Media Control Interface (MCI) driver.
	TMediaPlayer (see page 17167)	TMediaPlayer controls devices that provide a Media Control Interface (MCI) driver.

101.1.1 EMCIDeviceError Class

EMCIDeviceError is the exception class for devices that provide a Media Control Interface (MCI) driver.

Class Hierarchy

Pascal

```
EMCIDeviceError = class(Exception);
```

C++

```
class EMCIDeviceError : public Exception;
```

File

MPlayer

Description

EMCIDeviceError is raised if an error occurs when accessing a multimedia device. The most common cause for the exception is trying to access a multimedia device before it has been opened with the Open method of TMediaPlayer (see page 17167).

See Also

TMediaPlayer (see page 17167)

TMediaPlayer (see page 17167)

101.1.2 TMediaPlayer Class

TMediaPlayer controls devices that provide a Media Control Interface (MCI) driver.

Class Hierarchy

Pascal

```
TMediaPlayer = class(TCustomControl);
```

C++

```
class TMediaPlayer : public TCustomControl;
```

File

MPlayer

Description

The TMediaPlayer component includes a set of buttons (Play (see page 17190), Stop (see page 17195), Eject (see page 17184), and so on) that control a multimedia device such as a CD-ROM drive, MIDI sequencer, or VCR. A multimedia device may be hardware or software.

The media player component contains of multiple buttons. These buttons can be clicked with the mouse, but are not separate objects or button components.

ButtonValueAction

Button	Value	Action
Play (see page 17190)	btPlay	Plays the media player
Pause (see page 17189)	btPause	Pauses playing or recording. If already paused when clicked, resumes playing or recording.
Stop (see page 17195)	btStop	Stops playing or recording
Next (see page 17187)	btNext	Skips to the next track, or to the end if the medium doesn't use tracks
Prev	btPrev	Skips to the previous track, or to the beginning if the medium doesn't use tracks
Step (see page 17194)	btStep	Moves forward a number of frames
Back (see page 17182)	btBack	Moves backward a number of frames
Record	btRecord	Starts recording
Eject (see page 17184)	btEject	Ejects the medium

The multimedia device is played, paused, stopped, and so on when the user clicks the corresponding button on the TMediaPlayer component. The device can also be controlled by the control methods that correspond to the buttons (Play (see page 17190), Pause (see page 17189), Stop (see page 17195), Next (see page 17187), Previous (see page 17191), Step (see page 17194), Back (see page 17182), StartRecording (see page 17194), and Eject (see page 17184)).

The type of multimedia device (such as dtWaveAudio or dtVideodisc) is specified by the DeviceType (see page 17201) property. If the device stores its media in a file, the name of the media file is specified by the FileName (see page 17205) property. If DeviceType (see page 17201) is dtAutoSelect, the media player attempts to determine the type of device from the extension of the file specified by FileName (see page 17205).

To have the media player attempt to open the device specified by DeviceType (see page 17201) automatically when the media player component is created at runtime, set the AutoOpen (see page 17198) property to true.

101.1.2.1 TMediaPlayer Members

The following tables list the members exposed by TMediaPlayer.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.

	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	AutoButtonSet (see page 17181)	Enables or Disables the media player's buttons.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 17182)	Generates an OnClick (see page 17222) event.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.

	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoNotify (see page 17184)	Generates an OnNotify (see page 17228) event.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.

	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 17186)	Provides responses when the user types arrow keys or the space bar.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 17186)	Initializes the media player after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MMNotify (see page 17187)	Responds to a notification that the MCI device has completed an operation.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 17188)	Responds when components are about to be inserted or removed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 17189)	Renders the image of the media player.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	PostClick (see page 17191)	Determines the action that takes place when an OnPostClick (see page 17228) event occurs.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.

	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
V	Updated (see page 17195)	Signals that the media player has finished updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.

	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.

	Back (see page 17182)	Steps backward a number of frames (determined by the value of the Frames (see page 17205) property) in the currently loaded medium.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	Close (see page 17183)	Closes the open multimedia device.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 17180)	Creates a media player object.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 17180)	Destroys an instance of the media player.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	Eject (see page 17184)	Releases the loaded medium from the open multimedia device.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 17187)	Moves to the beginning of the next track of the currently loaded medium.
	Open (see page 17188)	Opens a multimedia device.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Pause (see page 17189)	Toggles the open multimedia device on or off.
	PauseOnly (see page 17190)	Pauses the open multimedia device.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	Play (see page 17190)	Plays the media loaded in the open multimedia device.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	Previous (see page 17191)	Sets the current position to the beginning of the previous track if the position was at the beginning of a track when Previous was called.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.

	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	Resume (see page 17192)	Resumes playing or recording the currently paused multimedia device.
	Rewind (see page 17193)	Sets the current position to the beginning of the the medium, which is stored in the Start (see page 17215) property.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Save (see page 17193)	Saves the currently loaded medium to the file specified in the FileName (see page 17205) property.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	StartRecording (see page 17194)	Begins recording from the current Position (see page 17213) or from the position specified in StartPos (see page 17216).
	Step (see page 17194)	Moves forward a number of frames (determined by the Frames (see page 17205) property) in the currently loaded medium.
	Stop (see page 17195)	Halts playing or recording.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Capabilities (see page 17199)	Determines the capabilities of the open multimedia device.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.

R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DeviceID (see page 17201)	Specifies the device ID for the currently open multimedia device.
	DisplayRect (see page 17202)	Specifies a rectangular area in the control specified by the Display (see page 17202) property that is used to display output from a multimedia device.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	EndPos (see page 17204)	Specifies the position within the currently loaded medium at which to stop playing or recording.
R	Error (see page 17204)	Specifies the MCI error code returned by the media control method.
R	ErrorMessage (see page 17205)	Describes the error code stored in the Error (see page 17204) property.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	Frames (see page 17205)	Specifies the number of frames moved forward or backward.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
R	Length (see page 17206)	Specifies the length of the medium in the open multimedia device.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	Mode (see page 17206)	Indicates the state of the currently open multimedia device.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	Notify (see page 17206)	Determines whether an OnNotify (see page 17228) event is generated.
R	NotifyValue (see page 17207)	Indicates the result of the last media control method that requested a notification.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	Position (see page 17213)	Specifies the current position within the currently loaded medium.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
R	Start (see page 17215)	Specifies the starting position within the currently loaded medium.
	StartPos (see page 17216)	Specifies the position within the currently loaded medium from which to begin playing or recording.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TimeFormat (see page 17217)	Determines the format used to specify position information.

R	TrackLength (see page 17218)	Reports the length of the track.
R	TrackPosition (see page 17218)	Reports the starting position of the track.
R	Tracks (see page 17218)	Specifies the number of playable tracks on the open multimedia device.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.
	Wait (see page 17221)	Determines whether a media control method returns control to the application only after it has been completed.

Published Events

	Name	Description
	OnClick (see page 17222)	Occurs when the user presses and releases the mouse button while the mouse pointer is over one of the control buttons, or when the user presses Spacebar while the media player control has focus.
	OnContextPopup (see page 17222)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnEnter (see page 17223)	Occurs when a control receives the input focus.
	OnExit (see page 17226)	Occurs when the input focus shifts away from one control to another.
	OnMouseEnter (see page 17227)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 17227)	Occurs when the user moves the mouse outside of a control.
	OnNotify (see page 17228)	Occurs upon the completion of a media control method.
	OnPostClick (see page 17228)	Occurs after the OnClick (see page 17222) event handler is called.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 17197)	Specifies how the control is anchored to its parent.
	AutoEnable (see page 17197)	Determines whether the media player automatically enables and disables individual buttons in the component.
	AutoOpen (see page 17198)	Determines if the media player is opened automatically when the application is run.
	AutoRewind (see page 17199)	Determines if the media player control rewinds before playing or recording.
	ColoredButtons (see page 17200)	Determines which buttons on the media player control have color.
	Constraints (see page 17200)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DeviceType (see page 17201)	Specifies a multimedia device type to open the media player.
	Display (see page 17202)	Specifies the display window for a multimedia device that uses a window for output.
	Enabled (see page 17203)	Controls whether the control responds to mouse, keyboard, and timer events.
	EnabledButtons (see page 17203)	Determines which buttons on the media player are usable.
	FileName (see page 17205)	Specifies the opened or saved media file.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentShowHint (see page 17208)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 17208)	Identifies the pop-up menu associated with the control.
	Shareable (see page 17213)	Determines whether more than one application can share a multimedia device.

	ShowHint (see page 17214)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 17216)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 17217)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 17219)	Determines whether the component appears onscreen.
	VisibleButtons (see page 17220)	Indicates which of the buttons on the media player are visible.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

101.1.2.2 TMediaPlayer.Create Constructor

Creates a media player object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMediaPlayer(TComponent * AOwner);
```

Description

Call Create to instantiate a media player at runtime. For media players created at design time, Create is called automatically.

Create allocates memory for a media player and calls the inherited Create. Then it loads the bitmaps for the media player's buttons and initializes its properties, setting AutoEnable (see page 17197), AutoRewind (see page 17199), Colored, Enabled (see page 17203), and Visible (see page 17219) to true, AutoOpen (see page 17198) to false, and DeviceType (see page 17201) to dtAutoSelect.

See Also

Create (see page 5918)

ParentWindow (see page 6210)

101.1.2.3 TMediaPlayer.Destroy Destructor

Destroys an instance of the media player.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMediaPlayer();
```

Description

Do not call Destroy directly in an application. Call Free instead. Free checks that the TMediaPlayer (see page 17167) reference is not nil before it calls Destroy.

Destroy first verifies that no device is open, then destroys the bitmaps used for the media player's buttons and calls the inherited Destroy.

See Also

Destroy (see page 5919)

Free (see page 22300)

101.1.2.4 TMediaPlayer Methods

The methods of the TMediaPlayer class are listed here.

Protected Methods

	Name	Description
	AutoButtonSet (see page 17181)	Enables or Disables the media player's buttons.
	Click (see page 17182)	Generates an OnClick (see page 17222) event.
	DoNotify (see page 17184)	Generates an OnNotify (see page 17228) event.
V	KeyDown (see page 17186)	Provides responses when the user types arrow keys or the space bar.
V	Loaded (see page 17186)	Initializes the media player after it is loaded from a stream.
	MMNotify (see page 17187)	Responds to a notification that the MCI device has completed an operation.
V	Notification (see page 17188)	Responds when components are about to be inserted or removed.
V	Paint (see page 17189)	Renders the image of the media player.
	PostClick (see page 17191)	Determines the action that takes place when an OnPostClick (see page 17228) event occurs.
V	Updated (see page 17195)	Signals that the media player has finished updating.

Public Methods

	Name	Description
	Back (see page 17182)	Steps backward a number of frames (determined by the value of the Frames (see page 17205) property) in the currently loaded medium.
	Close (see page 17183)	Closes the open multimedia device.
	Eject (see page 17184)	Releases the loaded medium from the open multimedia device.
	Next (see page 17187)	Moves to the beginning of the next track of the currently loaded medium.
	Open (see page 17188)	Opens a multimedia device.
	Pause (see page 17189)	Toggles the open multimedia device on or off.
	PauseOnly (see page 17190)	Pauses the open multimedia device.
	Play (see page 17190)	Plays the media loaded in the open multimedia device.
	Previous (see page 17191)	Sets the current position to the beginning of the previous track if the position was at the beginning of a track when Previous was called.
	Resume (see page 17192)	Resumes playing or recording the currently paused multimedia device.
	Rewind (see page 17193)	Sets the current position to the beginning of the the medium, which is stored in the Start (see page 17215) property.
	Save (see page 17193)	Saves the currently loaded medium to the file specified in the FileName (see page 17205) property.
	StartRecording (see page 17194)	Begins recording from the current Position (see page 17213) or from the position specified in StartPos (see page 17216).
	Step (see page 17194)	Moves forward a number of frames (determined by the Frames (see page 17205) property) in the currently loaded medium.
	Stop (see page 17195)	Halts playing or recording.

101.1.2.4.1 TMediaPlayer.AutoButtonSet Method

Enables or Disables the media player's buttons.

Pascal

```
procedure AutoButtonSet(Btn: TMPBtnType); dynamic;
```

C++

```
__fastcall AutoButtonSet(TMPBtnType Btn);
```

Description

AutoButtonSet implements the automatic enabling and disabling of the media player's buttons when the AutoEnable (see page 17197) property is true. The Btn parameter indicates which of the media player's buttons the user pressed.

See Also

AutoEnable (see page 17197)

EnabledButtons (see page 17203)

101.1.2.4.2 TMediaPlayer.Back Method

Steps backward a number of frames (determined by the value of the Frames (see page 17205) property) in the currently loaded medium.

Pascal

```
procedure Back;
```

C++

```
__fastcall Back();
```

Description

Back is called when the Back button on the media player control is clicked at runtime.

Upon completion, Back stores a numerical error code in the Error (see page 17204) property and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the Back method has been completed. The Notify (see page 17206) property determines whether Back generates an OnNotify (see page 17228) event.

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Wait (see page 17221)

Adding Audio and/or Video Clips to an Application

101.1.2.4.3 TMediaPlayer.Click Method

Generates an OnClick (see page 17222) event.

Pascal

```
procedure Click(Button: TMPBtnType; var DoDefault: Boolean); dynamic; reintroduce;
```

C++

```
__fastcall Click(TMPBtnType Button, Boolean DoDefault);
```

Description

Click for media-player components is the implementation method for the OnClick (see page 17222) event. By default, Click does nothing other than call any event handler attached to the media player's OnClick (see page 17222) event. Click can be overridden in descendant classes to customize responses to clicks.

See Also

OnClick (see page 17222)

101.1.2.4.4 TMediaPlayer.Close Method

Closes the open multimedia device.

Pascal

```
procedure Close;
```

C++

```
__fastcall Close();
```

Description

Upon completion, Close stores a numerical error code in the Error (see page 17204) property, and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the Close method is completed. The Notify (see page 17206) property determines whether Close generates an OnNotify (see page 17228) event.

Close is called automatically when the application is terminated.

C++ Examples:

```
/*
This code ejects the CD from the CD-ROM player and shuts
down the media player after 10 seconds. For the code to run
correctly, you must have your CD audio device installed
correctly, and the device must have software-ejecting
capabilities.
*/

Word TimeOver;

void __fastcall TForm1::FormClick(TObject *Sender)
{
  MediaPlayer1->DeviceType = dtCDAudio;
  MediaPlayer1->Open();
  MediaPlayer1->Play();
  Timer1->Enabled = true;
  TimeOver = 0;
}

void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  if (TimeOver == 10)
  {
    MediaPlayer1->Eject();
    MediaPlayer1->Close();
    // disable the timer, as we are done
    Timer1->Enabled = false;
  }
  else
    TimeOver++;
}
```

Delphi Examples:

```
{
This code ejects the CD from the CD-ROM player and shuts
down the media player after 10 seconds. For the code to run
correctly, you must have your CD audio device installed
correctly, and the device must have software-ejecting
capabilities.
}
var
```

```
    TimerOver: Word;

  procedure TForm1.FormClick(Sender: TObject);
  begin
    MediaPlayer1.DeviceType := dtCDAudio;
    MediaPlayer1.Open;
    MediaPlayer1.Play;
  end;

  procedure TForm1.Timer1Timer(Sender: TObject);
  begin
    if TimeOver = 10 then
    begin
      MediaPlayer1.Eject;
      MediaPlayer1.Close;
      { disable the timer, as we are done }
      Timer1.Enabled := False;
    end
    else
      if (MediaPlayer1.Mode = mpOpen) then
       Inc(TimeOver);
  end;
```

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Wait (see page 17221)

101.1.2.4.5 TMediaPlayer.DoNotify Method

Generates an OnNotify (see page 17228) event.

Pascal

```
procedure DoNotify; dynamic;
```

C++

```
__fastcall DoNotify();
```

Description

DoNotify is the implementation method for a media-player component's OnNotify (see page 17228) event. The media player's MMNotify (see page 17187) method calls DoNotify after correcting the enabling and disabling of buttons and setting internal flags from the values passed in the notification message parameters.

By default, DoNotify does nothing except call any event handler attached to the media player's OnNotify (see page 17228) event. DoNotify can be overridden to provide other responses in addition to the inherited event-handler call.

See Also

MMNotify (see page 17187)

OnNotify (see page 17228)

101.1.2.4.6 TMediaPlayer.Eject Method

Releases the loaded medium from the open multimedia device.

Pascal

```
procedure Eject;
```

C++

```
__fastcall Eject();
```

Description

Eject is called when the Eject button on the media player control is clicked at runtime. It ejects the loaded medium from the open multimedia device.

Upon completion, Eject stores a numerical error code in the Error (see page 17204) property, and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the Eject method has been completed. The Notify (see page 17206) property determines whether Eject generates an OnNotify (see page 17228) event.

C++ Examples:

```
/*
This code ejects the CD from the CD-ROM player and shuts
down the media player after 10 seconds. For the code to run
correctly, you must have your CD audio device installed
correctly, and the device must have software-ejecting
capabilities.
*/

Word TimeOver;

void __fastcall TForm1::FormClick(TObject *Sender)
{
  MediaPlayer1->DeviceType = dtCDAudio;
  MediaPlayer1->Open();
  MediaPlayer1->Play();
  Timer1->Enabled = true;
  TimeOver = 0;
}

void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  if (TimeOver == 10)
  {
    MediaPlayer1->Eject();
    MediaPlayer1->Close();
    // disable the timer, as we are done
    Timer1->Enabled = false;
  }
  else
    TimeOver++;
}
```

Delphi Examples:

```
{
This code ejects the CD from the CD-ROM player and shuts
down the media player after 10 seconds. For the code to run
correctly, you must have your CD audio device installed
correctly, and the device must have software-ejecting
capabilities.
}
var
  TimerOver: Word;

procedure TForm1.FormClick(Sender: TObject);
```

```
begin
  MediaPlayer1.DeviceType := dtCDAudio;
  MediaPlayer1.Open;
  MediaPlayer1.Play;
end;

procedure TForm1.Timer1Timer(Sender: TObject);
begin
  if TimeOver = 10 then
  begin
    MediaPlayer1.Eject;
    MediaPlayer1.Close;
    { disable the timer, as we are done }
    Timer1.Enabled := False;
  end
  else
    if (MediaPlayer1.Mode = mpOpen) then
     Inc(TimeOver);
end;
```

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Wait (see page 17221)

Adding Audio and/or Video Clips to an Application

101.1.2.4.7 TMediaPlayer.KeyDown Method

Provides responses when the user types arrow keys or the space bar.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

KeyDown overrides the inherited method to implement the media player's response to certain keystrokes. It changes the current button when the user types the left or right arrow keys. When the user presses the space bar, KeyDown simulates a click on the current button.

See Also

EnabledButtons (see page 17203)

KeyDown (see page 6163)

101.1.2.4.8 TMediaPlayer.Loaded Method

Initializes the media player after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Loaded provides an opportunity for a component to initialize itself after all its parts have loaded from a stream. TMediaPlayer (see page 17167) overrides the inherited method to implement the AutoOpen (see page 17198) property.

See Also

Create (see page 17180)

AutoOpen (see page 17198)

101.1.2.4.9 TMediaPlayer.MMNotify Method

Responds to a notification that the MCI device has completed an operation.

Pascal

```
procedure MMNotify(var Message: TMessage); message MM_MCINOTIFY;
```

C++

```
__fastcall MMNotify(TMessage Message);
```

Description

MMNotify responds to a notification message from Windows that a multimedia command completed by updating button states if the AutoEnable (see page 17197) property is true, setting internal flags to reflect the outcome of the command, then calling the DoNotify (see page 17184) method to trigger the OnNotify (see page 17228) event and any other special responses.

See Also

AutoEnable (see page 17197)

DoNotify (see page 17184)

OnNotify (see page 17228)

101.1.2.4.10 TMediaPlayer.Next Method

Moves to the beginning of the next track of the currently loaded medium.

Pascal

```
procedure Next;
```

C++

```
__fastcall Next();
```

Description

If the current position is at the last track when Next is called, Next makes the current position the beginning of the last track. If the multimedia device doesn't use tracks, Next goes to the end of the medium. Next is called when the Next button on the media player control is clicked at runtime.

Upon completion, Next stores a numerical error code in the Error (see page 17204) property, and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the Next method has completed. The Notify (see page 17206) property determines whether Next generates an OnNotify (see page 17228) event.

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Wait (see page 17221)

Adding Audio and/or Video Clips to an Application

101.1.2.4.11 TMediaPlayer.Notification Method

Responds when components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

By default, components pass along the notification to their owned components, if any. Notification calls the inherited Notification and then, if the Display (see page 17202) window is deleted at runtime, it sets the video display back to original window.

See Also

Notification (see page 5775)

Display (see page 17202)

101.1.2.4.12 TMediaPlayer.Open Method

Opens a multimedia device.

Pascal

```
procedure Open;
```

C++

```
__fastcall Open();
```

Description

Use Open to open a multimedia device. The multimedia device type must be specified in the DeviceType (see page 17201) property before a device can be opened.

Upon completion, Open stores a numerical error code in the Error (see page 17204) property, and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the Open method is completed. The Notify (see page 17206) property determines whether Open generates an OnNotify (see page 17228) event.

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Wait (see page 17221)

Adding Audio and/or Video Clips to an Application

101.1.2.4.13 TMediaPlayer.Paint Method

Renders the image of the media player.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

When the media player component receives a WM_PAINT message, like other custom controls, it responds by initializing the control's canvas and calling Paint. Paint draws the frame and all visible buttons.

When creating a descendant media player class, Paint can be overridden to draw the image of the corresponding media player object.

See Also

VisibleButtons (see page 17220)

101.1.2.4.14 TMediaPlayer.Pause Method

Toggles the open multimedia device on or off.

Pascal

```
procedure Pause;
```

C++

```
__fastcall Pause();
```

Description

If the device is already paused when Pause is called, the device resumes playing or recording by calling the Resume (see page 17192) method. Pause is called when the Pause button on the media player control is clicked at runtime.

Upon completion, Pause stores a numerical error code in the Error (see page 17204) property and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the Pause method has completed. The Notify (see page 17206) property determines whether Pause generates an OnNotify (see page 17228) event.

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Resume (see page 17192)

Wait (see page 17221)

Adding Audio and/or Video Clips to an Application

101.1.2.4.15 TMediaPlayer.PauseOnly Method

Pauses the open multimedia device.

Pascal

```
procedure PauseOnly;
```

C++

```
__fastcall PauseOnly();
```

Description

If the device is already paused when PauseOnly is called, the device will remain paused.

Upon completion, PauseOnly stores a numerical error code in the Error (see page 17204) property and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the PauseOnly method has completed. The Notify (see page 17206) property determines whether PauseOnly generates an OnNotify (see page 17228) event.

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Wait (see page 17221)

101.1.2.4.16 TMediaPlayer.Play Method

Plays the media loaded in the open multimedia device.

Pascal

```
procedure Play;
```

C++

```
__fastcall Play();
```

Description

Play is called when the Play button on the media player control is clicked at runtime.

Upon completion, Play stores a numerical error code in the Error (see page 17204) property and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the Play method has completed. The Notify (see page 17206) property determines whether Play generates an OnNotify (see page 17228) event.

If the StartPos (see page 17216) property is set, playing starts at the position specified in StartPos (see page 17216). Otherwise, playing starts at the current position, specified in the Position (see page 17213) property. Similarly, if the EndPos

(see page 17204) property is set, playing stops at the position specified in EndPos (see page 17204). Otherwise, playing stops at the end of the medium.

Whether the medium (specified in the Position (see page 17213) property) is rewound before playing starts depends on the AutoRewind (see page 17199) property.

See Also

AutoRewind (see page 17199)

EndPos (see page 17204)

Error (see page 17204)

ErrorMessage (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Position (see page 17213)

Resume (see page 17192)

StartPos (see page 17216)

Wait (see page 17221)

Adding Audio and/or Video Clips to an Application

101.1.2.4.17 TMediaPlayer.PostClick Method

Determines the action that takes place when an OnPostClick (see page 17228) event occurs.

Pascal

```
procedure PostClick(Button: TMPBtnType); dynamic;
```

C++

```
__fastcall PostClick(TMPBtnType Button);
```

Description

PostClick is the implementation method for the OnPostClick (see page 17228) event. By default, PostClick does nothing other than call any event handler attached to the media player's OnPostClick (see page 17228) event. PostClick can be overridden in descendant types to customize responses to clicks.

See Also

OnPostClick (see page 17228)

101.1.2.4.18 TMediaPlayer.Previous Method

Sets the current position to the beginning of the previous track if the position was at the beginning of a track when Previous was called.

Pascal

```
procedure Previous;
```

C++

```
__fastcall Previous();
```

Description

If the position is at the first track or somewhere other than the beginning of a track when Previous was called, Previous sets the current position to the beginning of the current track. If the device doesn't use tracks, Previous sets the current position to the beginning of the medium, which is specified in the Start (see page 17215) property. Previous is called when the Previous button on the media player control is clicked at runtime.

Upon completion, Previous stores a numerical error code in the Error (see page 17204) property and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the Previous method has completed. The Notify (see page 17206) property determines whether Previous generates an OnNotify (see page 17228) event.

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Start (see page 17215)

Wait (see page 17221)

Adding Audio and/or Video Clips to an Application

101.1.2.4.19 TMediaPlayer.Resume Method

Resumes playing or recording the currently paused multimedia device.

Pascal

```
procedure Resume;
```

C++

```
__fastcall Resume();
```

Description

Resume is called when the Pause (see page 17189) button on the media player control is clicked at runtime, when the device is paused.

Upon completion, Resume stores a numerical error code in the Error (see page 17204) property, and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the Resume method has completed. The Notify (see page 17206) property determines whether Resume generates an OnNotify (see page 17228) event.

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Wait (see page 17221)

101.1.2.4.20 TMediaPlayer.Rewind Method

Sets the current position to the beginning of the the medium, which is stored in the Start (see page 17215) property.

Pascal

```
procedure Rewind;
```

C++

```
__fastcall Rewind();
```

Description

Upon completion, Rewind stores a numerical error code in the Error (see page 17204) property, and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the Rewind method has completed. The Notify (see page 17206) property determines whether Rewind generates an OnNotify (see page 17228) event.

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Start (see page 17215)

Wait (see page 17221)

101.1.2.4.21 TMediaPlayer.Save Method

Saves the currently loaded medium to the file specified in the FileName (see page 17205) property.

Pascal

```
procedure Save;
```

C++

```
__fastcall Save();
```

Description

Save is ignored for devices that don't use media stored in files (videodiscs, for example).

Upon completion, Save stores a numerical error code in the Error (see page 17204) property, and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the Save method has completed. The Notify (see page 17206) property determines whether Save generates an OnNotify (see page 17228) event.

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

FileName (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Wait (see page 17221)

101.1.2.4.22 TMediaPlayer.StartRecording Method

Begins recording from the current Position (see page 17213) or from the position specified in StartPos (see page 17216).

Pascal

```
procedure StartRecording;
```

C++

```
__fastcall StartRecording();
```

Description

StartRecording is called when the Record button on the media player control is clicked at runtime.

Upon completion, StartRecording stores a numerical error code in the Error (see page 17204) property and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the StartRecording method has completed. The Notify (see page 17206) property determines whether StartRecording generates an OnNotify (see page 17228) event.

By default, the Notify (see page 17206) property becomes true, and the Wait (see page 17221) property becomes false upon completion of the StartRecording method. However, if these properties have been set to specific values prior to calling StartRecording, they remain unchanged.

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Position (see page 17213)

StartPos (see page 17216)

Wait (see page 17221)

101.1.2.4.23 TMediaPlayer.Step Method

Moves forward a number of frames (determined by the Frames (see page 17205) property) in the currently loaded medium.

Pascal

```
procedure Step;
```

C++

```
__fastcall Step();
```

Description

Step is called when the Step button on the media player control is clicked at runtime.

Upon completion, Step stores a numerical error code in the Error (see page 17204) property and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the Step method has completed. The Notify (see page 17206) property determines whether Step generates an OnNotify (see page 17228) event.

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

Frames (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Wait (see page 17221)

Adding Audio and/or Video Clips to an Application

101.1.2.4.24 TMediaPlayer.Stop Method

Halts playing or recording.

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

Stop is called when the Stop button on the media player control is clicked at runtime.

Upon completion, Stop stores a numerical error code in the Error (see page 17204) property, and the corresponding error message in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before the Stop method has completed. The Notify (see page 17206) property determines whether Stop generates an OnNotify (see page 17228) event.

See Also

Error (see page 17204)

ErrorMessage (see page 17205)

FileName (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Wait (see page 17221)

Adding Audio and/or Video Clips to an Application

101.1.2.4.25 TMediaPlayer.Updated Method

Signals that the media player has finished updating.

Pascal

```
procedure Updated; override;
```

C++

```
virtual __fastcall Updated();
```

Description

Updated calls the inherited Updated before it modifies the layout of the media player buttons and forces a repaint.

See Also

Updated (see page 2791)

101.1.2.5 TMediaPlayer Properties

The properties of the TMediaPlayer class are listed here.

Public Properties

	Name	Description
R	Capabilities (see page 17199)	Determines the capabilities of the open multimedia device.
R	DeviceID (see page 17201)	Specifies the device ID for the currently open multimedia device.
	DisplayRect (see page 17202)	Specifies a rectangular area in the control specified by the Display (see page 17202) property that is used to display output from a multimedia device.
	EndPos (see page 17204)	Specifies the position within the currently loaded medium at which to stop playing or recording.
R	Error (see page 17204)	Specifies the MCI error code returned by the media control method.
R	ErrorMessage (see page 17205)	Describes the error code stored in the Error (see page 17204) property.
	Frames (see page 17205)	Specifies the number of frames moved forward or backward.
R	Length (see page 17206)	Specifies the length of the medium in the open multimedia device.
R	Mode (see page 17206)	Indicates the state of the currently open multimedia device.
	Notify (see page 17206)	Determines whether an OnNotify (see page 17228) event is generated.
R	NotifyValue (see page 17207)	Indicates the result of the last media control method that requested a notification.
	Position (see page 17213)	Specifies the current position within the currently loaded medium.
R	Start (see page 17215)	Specifies the starting position within the currently loaded medium.
	StartPos (see page 17216)	Specifies the position within the currently loaded medium from which to begin playing or recording.
	TimeFormat (see page 17217)	Determines the format used to specify position information.
R	TrackLength (see page 17218)	Reports the length of the track.
R	TrackPosition (see page 17218)	Reports the starting position of the track.
R	Tracks (see page 17218)	Specifies the number of playable tracks on the open multimedia device.
	Wait (see page 17221)	Determines whether a media control method returns control to the application only after it has been completed.

Published Properties

	Name	Description
	Anchors (see page 17197)	Specifies how the control is anchored to its parent.
	AutoEnable (see page 17197)	Determines whether the media player automatically enables and disables individual buttons in the component.
	AutoOpen (see page 17198)	Determines if the media player is opened automatically when the application is run.
	AutoRewind (see page 17199)	Determines if the media player control rewinds before playing or recording.
	ColoredButtons (see page 17200)	Determines which buttons on the media player control have color.
	Constraints (see page 17200)	Specifies the size constraints for the control.
	DeviceType (see page 17201)	Specifies a multimedia device type to open the media player.
	Display (see page 17202)	Specifies the display window for a multimedia device that uses a window for output.
	Enabled (see page 17203)	Controls whether the control responds to mouse, keyboard, and timer events.
	EnabledButtons (see page 17203)	Determines which buttons on the media player are usable.
	FileName (see page 17205)	Specifies the opened or saved media file.

	ParentShowHint (see page 17208)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 17208)	Identifies the pop-up menu associated with the control.
	Shareable (see page 17213)	Determines whether more than one application can share a multimedia device.
	ShowHint (see page 17214)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 17216)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 17217)	Determines if the user can tab to a control.
	Visible (see page 17219)	Determines whether the component appears onscreen.
	VisibleButtons (see page 17220)	Indicates which of the buttons on the media player are visible.

101.1.2.5.1 TMediaPlayer.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

101.1.2.5.2 TMediaPlayer.AutoEnable Property

Determines whether the media player automatically enables and disables individual buttons in the component.

Pascal

```
property AutoEnable: Boolean;
```

C++

```
__property Boolean AutoEnable;
```

Description

Use AutoEnable to automatically enable or disable the control buttons on the media player. If AutoEnable is true, the media player automatically enables or disables its control buttons. The media player determines which buttons to enable or disable by the current mode specified in the Mode (see page 17206) property, and the current multimedia device type specified in the DeviceType (see page 17201) property.

AutoEnable overrides the EnabledButtons (see page 17203) property. The buttons enabled or disabled automatically by the media player supersede any buttons enabled or disabled with EnabledButtons (see page 17203).

If AutoEnable is false, the media player does not enable or disable buttons. The buttons must enabled or disabled with the EnabledButtons (see page 17203) property.

The following table shows whether buttons are automatically enabled or disabled for each device mode:

Button	Play (see page 17190)	Record	Pause (see page 17189)	Stop (see page 17195)	Not Open (see page 17188)
Back (see page 17182)	Enabled (see page 17203)	Enabled (see page 17203)	Enabled (see page 17203)	Enabled (see page 17203)	Disabled
Eject (see page 17184)	Enabled (see page 17203)	Enabled (see page 17203)	Enabled (see page 17203)	Enabled (see page 17203)	Disabled
Next (see page 17187)	Enabled (see page 17203)	Enabled (see page 17203)	Enabled (see page 17203)	Enabled (see page 17203)	Disabled
Pause (see page 17189)	Enabled (see page 17203)	Enabled (see page 17203)	Enabled (see page 17203)	Disabled	Disabled
Play (see page 17190)	Disabled	Disabled	Enabled (see page 17203)	Enabled (see page 17203)	Disabled
Prev	Enabled (see page 17203)	Enabled (see page 17203)	Enabled (see page 17203)	Enabled (see page 17203)	Disabled
Record	Disabled	Disabled	Enabled (see page 17203)	Enabled (see page 17203)	Disabled
Step (see page 17194)	Enabled (see page 17203)	Enabled (see page 17203)	Enabled (see page 17203)	Enabled (see page 17203)	Disabled
Stop (see page 17195)	Enabled (see page 17203)	Enabled (see page 17203)	Disabled	Disabled	Disabled

See Also

AutoButtonSet (see page 17181)

DeviceType (see page 17201)

EnabledButtons (see page 17203)

MMNotify (see page 17187)

Mode (see page 17206)

Adding Audio and/or Video Clips to an Application

101.1.2.5.3 TMediaPlayer.AutoOpen Property

Determines if the media player is opened automatically when the application is run.

Pascal

```
property AutoOpen: Boolean;
```

C++

```
__property Boolean AutoOpen;
```

Description

Use AutoOpen to have the media player automatically open at runtime.

If AutoOpen is true, the media player attempts to open the multimedia device specified by the DeviceType (see page 17201) property (or FileName (see page 17205) if DeviceType (see page 17201) is dtAutoSelect) when the form containing the media player component is created at runtime.

If AutoOpen is false, the device must be opened with a call to the Open (see page 17188) method.

If an error occurs when opening the device, an exception of type EMCIDeviceError (see page 17167) exception is raised that contains the error message. Upon completion, a numerical error code is stored in the Error (see page 17204) property, and the corresponding error message is stored in the ErrorMessage (see page 17205) property.

The Wait (see page 17221) property determines whether control is returned to the application before opening the multimedia device. The Notify (see page 17206) property determines whether opening the device generates an OnNotify (see page 17228) event.

See Also

DeviceType (see page 17201)

EMCIDeviceError (see page 17167)

Error (see page 17204)

ErrorMessage (see page 17205)

FileName (see page 17205)

Notify (see page 17206)

OnNotify (see page 17228)

Wait (see page 17221)

Adding Audio and/or Video Clips to an Application

101.1.2.5.4 TMediaPlayer.AutoRewind Property

Determines if the media player control rewinds before playing or recording.

Pascal

```
property AutoRewind: Boolean;
```

C++

```
__property Boolean AutoRewind;
```

Description

If AutoRewind is true and the current position is at the end of the medium, Play (see page 17190) or StartRecording (see page 17194) moves the current position to the beginning of the medium before playing or recording. If AutoRewind is false, the user must click the Prev button or write code to call Previous (see page 17191) to move to the beginning.

If values have been assigned to StartPos (see page 17216) or EndPos (see page 17204) or if the multimedia device uses tracks, AutoRewind has no effect on playing or recording. When calling Play (see page 17190) or StartRecording (see page 17194), the current position remains at the end of the medium.

See Also

Previous (see page 17191)

101.1.2.5.5 TMediaPlayer.Capabilities Property

Determines the capabilities of the open multimedia device.

Pascal

```
property Capabilities: TMPDevCapsSet;
```

C++

```
__property TMPDevCapsSet Capabilities;
```

Description

The various capabilities specified in Capabilities are determined when the device is opened with the Open (see page 17188) method.

Note: Currently, there is no way to check whether a device can step forward or backward. Capabilities includes mpCanStep only if the device type (specified in the DeviceType (see page 17201) property) is Animation, AVI Video, Digital Video, Overlay, or VCR.

See Also

DeviceType (see page 17201)

Open (see page 17188)

101.1.2.5.6 TMediaPlayer.ColoredButtons Property

Determines which buttons on the media player control have color.

Pascal

```
property ColoredButtons: TButtonSet;
```

C++

```
__property TButtonSet ColoredButtons;
```

Description

ColoredButtons controls which buttons on the media player are colored.

If a button is not colored with ColoredButtons, it appears in black-and-white when visible. All media player control buttons are colored by default.

See Also

EnabledButtons (see page 17203)

VisibleButtons (see page 17220)

101.1.2.5.7 TMediaPlayer.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the

title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

101.1.2.5.8 TMediaPlayer.DeviceID Property

Specifies the device ID for the currently open multimedia device.

Pascal

```
property DeviceID: Word;
```

C++

```
__property Word DeviceID;
```

Description

The value of DeviceID is determined when a device is opened with the Open (see page 17188) method. If no device is open, DeviceID is 0.

See Also

Open (see page 17188)

101.1.2.5.9 TMediaPlayer.DeviceType Property

Specifies a multimedia device type to open the media player.

Pascal

```
property DeviceType: TMPDeviceTypes;
```

C++

```
__property TMPDeviceTypes DeviceType;
```

Description

DeviceType specifies a multimedia device type to open with the Open (see page 17188) method. The default is dtAutoSelect.

If DeviceType is dtAutoSelect, the device type is determined by the file extension specified in the FileName (see page 17205) property. If no device type is associated with the extension, the correct device type must be explicitly specified by setting DeviceType to a value other than dtAutoSelect.

A multimedia device is typically associated with an appropriate file name extension when the device is installed. Associations are specified in the registry or SYSTEM.INI file. See the documentation for the specific device for instructions about how to associate file name extensions with the device.

See Also

FileName (see page 17205)

Open (see page 17188)

Adding Audio and/or Video Clips to an Application

101.1.2.5.10 TMediaPlayer.Display Property

Specifies the display window for a multimedia device that uses a window for output.

Pascal

```
property Display: TWinControl;
```

C++

```
__property TWinControl * Display;
```

Description

To use Display, assign the name of a windowed control such as a form or panel to Display to display output in that control.

The default value of Display is nil (Delphi) or NULL (C++), meaning that the device creates its own window to display output. Also, by freeing the control assigned to Display after the device has been opened, video output will be in its own default window.

Examples of multimedia devices that use a window to display output are Animation, AVI Video, Digital Video, Overlay, and VCR.

See Also

DisplayRect (see page 17202)

Adding Audio and/or Video Clips to an Application

101.1.2.5.11 TMediaPlayer.DisplayRect Property

Specifies a rectangular area in the control specified by the Display (see page 17202) property that is used to display output from a multimedia device.

Pascal

```
property DisplayRect: TRect;
```

C++

```
__property TRect DisplayRect;
```

Description

To display output in a specific rectangle area on a form assign a TRect record to DisplayRect. The Rect function can be used to create a TRect record.

Media that use a rectangle to display output usually perform best if the default DisplayRect size is used. To set DisplayRect to the default size, position the rectangle in the upper left corner and use 0, 0 for the lower right corner.

DisplayRect is ignored if Display (see page 17202) is nil (Delphi) or NULL (C++).

Examples of multimedia devices that use a window to display output are Animation, AVI Video, Digital Video, Overlay, and VCR.

Note: DisplayRect can be set only after the media device is opened.

See Also

Display (see page 17202)

Open (see page 17188)

101.1.2.5.12 TMediaPlayer.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

101.1.2.5.13 TMediaPlayer.EnabledButtons Property

Determines which buttons on the media player are usable.

Pascal

```
property EnabledButtons: TButtonSet;
```

C++

```
__property TButtonSet EnabledButtons;
```

Description

EnabledButtons controls which buttons on the media player are enabled and usable.

An enabled button is colored and usable. A disabled button is dimmed and not usable. If a button is not enabled with EnabledButtons, it is disabled. By default, all buttons are enabled.

If the AutoEnable (see page 17197) property is true, AutoEnable (see page 17197) supersedes EnabledButtons. The buttons automatically enabled or disabled by the media player override any buttons enabled or disabled with the EnabledButtons property.

See Also

ColoredButtons (see page 17200)

VisibleButtons (see page 17220)

Adding Audio and/or Video Clips to an Application

101.1.2.5.14 TMediaPlayer.EndPos Property

Specifies the position within the currently loaded medium at which to stop playing or recording.

Pascal

```
property EndPos: Longint;
```

C++

```
__property Longint EndPos;
```

Description

EndPos is specified using the current time format, which is specified in the TimeFormat (see page 17217) property.

The EndPos property affects only the next Play (see page 17190) or StartRecording (see page 17194) method called after setting EndPos. Reset EndPos to affect any subsequent calls to Play (see page 17190) or StartRecording (see page 17194).

See Also

Play (see page 17190)

StartRecording (see page 17194)

TimeFormat (see page 17217)

101.1.2.5.15 TMediaPlayer.Error Property

Specifies the MCI error code returned by the media control method.

Pascal

```
property Error: Longint;
```

C++

```
__property Longint Error;
```

Description

Error specifies the MCI error code returned by the most recent media control method (Back (see page 17182), Close (see page 17183), Eject (see page 17184), Next (see page 17187), Open (see page 17188), Pause (see page 17189), PauseOnly (see page 17190), Play (see page 17190), Previous (see page 17191), StartRecording (see page 17194), Resume (see page 17192), Rewind (see page 17193), Step (see page 17194), or Stop (see page 17195)). The ErrorMessage (see page 17205) property describes the Error.

The error code returned by media control methods are the same error code returned by the mciSendCommand function. The message describing the error code is stored in the ErrorMessage (see page 17205) property.

The value of Error is zero if the most recent media control method didn't cause an error. If a method results in an error, a value other than zero is stored in Error. If the error occurs during the opening of the device, an EMCIDeviceError (see page 17167) exception occurs.

See Also

EMCIDeviceError (see page 17167)

ErrorMessage (see page 17205)

Play (see page 17190)

StartRecording (see page 17194)

TimeFormat (see page 17217)

101.1.2.5.16 TMediaPlayer.ErrorMessage Property

Describes the error code stored in the Error (see page 17204) property.

Pascal

```
property ErrorMessage: string;
```

C++

```
__property AnsiString ErrorMessage;
```

Description

ErrorMessage specifies the error message that describes the error code returned from the most recent media control method (Back (see page 17182), Close (see page 17183), Eject (see page 17184), Next (see page 17187), Open (see page 17188), Pause (see page 17189), PauseOnly (see page 17190), Play (see page 17190), Previous (see page 17191), StartRecording (see page 17194), Resume (see page 17192), Rewind (see page 17193), Step (see page 17194), or Stop (see page 17195)).

The error code described by the message is stored in the Error (see page 17204) property.

See Also

Error (see page 17204)

101.1.2.5.17 TMediaPlayer.FileName Property

Specifies the opened or saved media file.

Pascal

```
property FileName: string;
```

C++

```
__property AnsiString FileName;
```

Description

FileName specifies the media file to be opened by the Open (see page 17188) method, or the file to save by the Save (see page 17193) method.

At design time, use a file open dialog box to specify the FileName property by clicking the ellipsis button (...) in the Object Inspector.

See Also

Open (see page 17188)

Save (see page 17193)

Adding Audio and/or Video Clips to an Application

101.1.2.5.18 TMediaPlayer.Frames Property

Specifies the number of frames moved forward or backward.

Pascal

```
property Frames: Longint;
```

C++

```
__property Longint Frames;
```

Description

Frames specifies the number of frames the Step (see page 17194) method steps forward or the Back (see page 17182) method steps backward. Frames defaults to ten percent of the length of the currently loaded medium, which is specified by the Length (see page 17206) property.

The definition of a frame varies by multimedia device. For display media, a frame is one still image.

See Also

Back (see page 17182)

Length (see page 17206)

Step (see page 17194)

101.1.2.5.19 TMediaPlayer.Length Property

Specifies the length of the medium in the open multimedia device.

Pascal

```
property Length: Longint;
```

C++

```
__property Longint Length;
```

Description

Length is specified using the current time format, which is specified by the TimeFormat (see page 17217) property.

See Also

TimeFormat (see page 17217)

101.1.2.5.20 TMediaPlayer.Mode Property

Indicates the state of the currently open multimedia device.

Pascal

```
property Mode: TMPModes;
```

C++

```
__property TMPModes Mode;
```

Description

Mode specifies the current state or mode of the currently open multimedia device.

The TMPModes (see page 17233) type defines the modes for a multimedia device used with a TMediaPlayer (see page 17167).

See Also

OnNotify (see page 17228)

101.1.2.5.21 TMediaPlayer.Notify Property

Determines whether an OnNotify (see page 17228) event is generated.

Pascal

```
property Notify: Boolean;
```

C++

```
__property Boolean Notify;
```

Description

Notify determines whether the next call to a media control method (Back (see page 17182), Close (see page 17183), Eject (see page 17184), Next (see page 17187), Open (see page 17188), Pause (see page 17189), PauseOnly (see page 17190), Play (see page 17190), Previous (see page 17191), StartRecording (see page 17194), Resume (see page 17192), Rewind (see page 17193), Step (see page 17194), or Stop (see page 17195)) generates an OnNotify (see page 17228) event when the method has completed.

If Notify is true, the next media control method generates OnNotify (see page 17228) event upon completion and stores the notification message in the NotifyValue (see page 17207) property. If Notify is false, the method does not generate an OnNotify (see page 17228) event and NotifyValue (see page 17207) remains unchanged.

Notify affects only the next call to a media control method. After an OnNotify (see page 17228) event, Notify must be reset to affect any subsequent media control methods.

By default, Play (see page 17190) and StartRecording (see page 17194) function as if Notify is true. Set Notify to false before calling Play (see page 17190) or StartRecording (see page 17194) to prevent an OnNotify (see page 17228) event from being generated when playing or recording has finished. By default, all other media control methods function as if Notify is false.

Tip: Set Notify to true if the next media control is expected to take a long time, so the application is notified when the media control method has completed. If Notify is set to true, it is recommended to set Wait (see page 17221) to false so that control returns to the application before the media control method is finished.

Note: When trying to resume a device that doesn't support Resume (see page 17192), the device is resumed as if the Play (see page 17190) method was called. If Notify was assigned true before calling Resume (see page 17192) (or any other media control method), Notify doesn't affect the call to Resume (see page 17192). Resume (see page 17192) does not generate an OnNotify (see page 17228) event upon completion, and NotifyValue (see page 17207) remains unchanged.

See Also

NotifyValue (see page 17207)

OnNotify (see page 17228)

Resume (see page 17192)

Wait (see page 17221)

101.1.2.5.22 TMediaPlayer.NotifyValue Property

Indicates the result of the last media control method that requested a notification.

Pascal

```
property NotifyValue: TMPNotifyValues;
```

C++

```
__property TMPNotifyValues NotifyValue;
```

Description

NotifyValue reports the result of the last media control method (Back (see page 17182), Close (see page 17183), Eject (

see page 17184), Next (see page 17187), Open (see page 17188), Pause (see page 17189), PauseOnly (see page 17190), Play (see page 17190), Previous (see page 17191), StartRecording (see page 17194), Resume (see page 17192), Rewind (see page 17193), Step (see page 17194), or Stop (see page 17195)) that requested a notification.

To request notification, set Notify (see page 17206) to true before calling a media control method.

See Also

OnNotify (see page 17228)

Notify (see page 17206)

101.1.2.5.23 TMediaPlayer.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

101.1.2.5.24 TMediaPlayer.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup

property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
```

```
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
```

```
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
```

```
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

101.1.2.5.25 TMediaPlayer.Position Property

Specifies the current position within the currently loaded medium.

Pascal

```
property Position: Longint;
```

C++

```
__property Longint Position;
```

Description

The value of Position is specified according to the current time format, which is specified in the TimeFormat (see page 17217) property.

Position defaults to the beginning of the medium. If the medium supports multiple tracks, Position defaults to the beginning of the first track.

See Also

TimeFormat (see page 17217)

101.1.2.5.26 TMediaPlayer.Shareable Property

Determines whether more than one application can share a multimedia device.

Pascal

```
property Shareable: Boolean;
```

C++

```
__property Boolean Shareable;
```

Description

If Shareable is false, no other components or applications can access the device. If Shareable is true, more than one component or application can access the device. Shareable defaults to false.

Be sure to set Shareable before opening a device.

Some devices are not shareable. If Shareable is set to true for a device that isn't shareable, the Open (see page 17188)

method fails and the error code is returned to the Error (see page 17204) property.

See Also

Error (see page 17204)

Open (see page 17188)

101.1.2.5.27 TMediaPlayer.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

Displaying Fly-over Help

101.1.2.5.28 TMediaPlayer.Start Property

Specifies the starting position within the currently loaded medium.

Pascal

```
property Start: Longint;
```

C++

```
__property Longint Start;
```

Description

Start is the beginning of the medium for devices that don't use tracks, or the beginning of the first track for devices that use tracks. Start is defined when a multimedia device is opened with the Open (see page 17188) method. Start is specified according to the current time format, which is stored in the TimeFormat (see page 17217) property. Start is read-only at runtime and is unavailable at design time.

See Also

Open (see page 17188)

TimeFormat (see page 17217)

101.1.2.5.29 TMediaPlayer.StartPos Property

Specifies the position within the currently loaded medium from which to begin playing or recording.

Pascal

```
property StartPos: Longint;
```

C++

```
__property Longint StartPos;
```

Description

StartPos is specified using the current time format, which is specified in the TimeFormat (see page 17217) property.

The StartPos property affects only the next Play (see page 17190) or StartRecording (see page 17194) method called after setting StartPos. Reset must be set to StartPos to affect any subsequent calls to Play (see page 17190) or StartRecording (see page 17194).

StartPos does not affect the current position of the medium (specified in the Position (see page 17213) property) until the next Play (see page 17190) or StartRecording (see page 17194) method is called.

See Also

Play (see page 17190)

StartRecording (see page 17194)

TimeFormat (see page 17217)

101.1.2.5.30 TMediaPlayer.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

101.1.2.5.31 TMediaPlayer.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

101.1.2.5.32 TMediaPlayer.TimeFormat Property

Determines the format used to specify position information.

Pascal

```
property TimeFormat: TMPTimeFormats;
```

C++

```
__property TMPTimeFormats TimeFormat;
```

Description

TimeFormat determines how the StartPos (see page 17216), Length (see page 17206), Position (see page 17213), Start (see page 17215), and EndPos (see page 17204) properties are interpreted. For example, if Position (see page 17213) is 180 and TimeFormat is tfMilliseconds, the current position is 180 milliseconds into the medium. If Position (see page 17213) is 180 and TimeFormat is tfMSF, the current position is 180 minutes into the medium.

Not all formats are supported by every device. When trying to set an unsupported format, the assignment is ignored.

The current timing information is always passed in a 4-byte integer. In some formats, the timing information returned is not really one integer, but single bytes of information packed in the long integer.

See Also

EndPos (see page 17204)

Length (see page 17206)

Position (see page 17213)

Start (see page 17215)

StartPos (see page 17216)

101.1.2.5.33 TMediaPlayer.TrackLength Property

Reports the length of the track.

Pascal

```
property TrackLength [TrackNum: Integer]: Longint;
```

C++

```
__property Longint TrackLength[int TrackNum];
```

Description

TrackLength reports the length of the track specified by the TrackNum index.

The value of TrackLength is specified according to the current time format, which is specified in the TimeFormat (see page 17217) property.

See Also

TimeFormat (see page 17217)

Tracks (see page 17218)

101.1.2.5.34 TMediaPlayer.TrackPosition Property

Reports the starting position of the track.

Pascal

```
property TrackPosition [TrackNum: Integer]: Longint;
```

C++

```
__property Longint TrackPosition[int TrackNum];
```

Description

TrackPosition reports the starting position of the track specified by the TrackNum index.

The value of TrackPosition is specified according to the current time format, which is specified in the TimeFormat (see page 17217) property.

See Also

TimeFormat (see page 17217)

Tracks (see page 17218)

101.1.2.5.35 TMediaPlayer.Tracks Property

Specifies the number of playable tracks on the open multimedia device.

Pascal

```
property Tracks: Longint;
```

C++

```
__property Longint Tracks;
```

Description

Tracks indicates how many of playable tracks are available on the open multimedia device.

Tracks is undefined for devices that don't use tracks.

See Also

TrackLength (see page 17218)

TrackPosition (see page 17218)

Adding Audio and/or Video Clips to an Application

101.1.2.5.36 TMediaPlayer.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
```

```
  edit control placed somewhere on the client area of the
  sheet.  Unchecking the checkbox will cause the client area
  (not the tab area) of the Tab Control to become invisible.
  }
  procedure TForm1.CheckBox1Click(Sender: TObject);
  begin
    PageControl1.ActivePage.Visible := CheckBox1.Checked;
  end;

  procedure TForm1.PageControl1Change(Sender: TObject);
  begin
    CheckBox1.Checked := PageControl1.ActivePage.Visible;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  var
    i: Integer;
  begin
    for i := 0 to 9 do
      with TTabSheet.Create(Self) do
      begin
        PageControl := PageControl1;
        Caption := 'TabSheet' + IntToStr(i);
        with TEdit.Create(Self) do
        begin
          Parent := PageControl1.Pages[i];
          Left := Random(PageControl1.ActivePage.ClientWidth - Width);
          Top := Random(PageControl1.ActivePage.ClientHeight - Height);
        end;
      end;
      PageControl1Change(Sender);
  end;
```

See Also

Enabled (see page 5821)

Hide (see page 5769)

Show (see page 5788)

VisibleChanging (see page 5791)

101.1.2.5.37 TMediaPlayer.VisibleButtons Property

Indicates which of the buttons on the media player are visible.

Pascal

```
property VisibleButtons: TButtonSet;
```

C++

```
__property TButtonSet VisibleButtons;
```

Description

VisibleButtons determines which buttons on the media player that are visible. If a button is not made visible with VisibleButtons, it does not appear on the media player control. By default, all buttons are visible when a media player component is added to a form.

See Also

ColoredButtons (see page 17200)

EnabledButtons (see page 17203)

101.1.2.5.38 TMediaPlayer.Wait Property

Determines whether a media control method returns control to the application only after it has been completed.

Pascal

```
property Wait: Boolean;
```

C++

```
__property Boolean Wait;
```

Description

Wait determines whether a media control method (Back (see page 17182), Close (see page 17183), Eject (see page 17184), Next (see page 17187), Open (see page 17188), Pause (see page 17189), PauseOnly (see page 17190), Play (see page 17190), Previous (see page 17191), StartRecording (see page 17194), Resume (see page 17192), Rewind (see page 17193), Step (see page 17194), or Stop (see page 17195)) returns control to the application only after it has been completed.

Wait is unavailable at design time.

If Wait is true, the media player component waits until the next media control method has completed before returning control to the application. If Wait is false, the application won't wait for the next media control method to finish before continuing.

Wait affects only the next media control method called after setting Wait. Wait must be reset to affect any subsequent call to a media control method.

By default, Play (see page 17190) and StartRecording (see page 17194) function as if Wait is false. Wait must be set to true before calling Play (see page 17190) or StartRecording (see page 17194) to prevent control from returning to the application before playing or recording has finished. By default, all other media control methods function as if Wait is true.

Note: Wait is usually set to false only if the next media control is expected to take a long time, so that the application can execute other code before the media control method has completed. If Wait is set to false, you should set Notify (see page 17206) to true so the application is notified when the media control method completes.

See Also

Notify (see page 17206)

101.1.2.6 TMediaPlayer Events

The events of the TMediaPlayer class are listed here.

Published Events

	Name	Description
	OnClick (see page 17222)	Occurs when the user presses and releases the mouse button while the mouse pointer is over one of the control buttons, or when the user presses Spacebar while the media player control has focus.
	OnContextPopup (see page 17222)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnEnter (see page 17223)	Occurs when a control receives the input focus.
	OnExit (see page 17226)	Occurs when the input focus shifts away from one control to another.
	OnMouseEnter (see page 17227)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 17227)	Occurs when the user moves the mouse outside of a control.
	OnNotify (see page 17228)	Occurs upon the completion of a media control method.
	OnPostClick (see page 17228)	Occurs after the OnClick (see page 17222) event handler is called.

101.1.2.6.1 TMediaPlayer.OnClick Event

Occurs when the user presses and releases the mouse button while the mouse pointer is over one of the control buttons, or when the user presses Spacebar while the media player control has focus.

Pascal

```
property OnClick: EMPNotify;
```

C++

```
__property EMPNotify OnClick;
```

Description

When the media player control has focus and the Spacebar is pressed, the user can use the Left Arrow or Right Arrow keys to select which control button to click.

The EMPNotify (see page 17237) type is a method pointer that is called when an OnClick event for a TMediaPlayer (see page 17167) components occurs. The Button argument can be one of the following values: btBack, btEject, btNext, btPause, btPlay, btPrev, btRecord, btStep, or btStop.

The default value of the event handler's DoDefault argument is true. If DoDefault is true, the media player control calls the method that corresponds to the clicked button. For example, if the user clicks the Play (see page 17190) button (btPlay), the Play (see page 17190) method is called.

If DoDefault is false, the user must write code that executes when a media player control button is clicked in the OnClick event handler. The following table lists the default methods corresponding to the media player control buttons:

Control button	Button value	Method called
Play (see page 17190)	btPlay	Play (see page 17190)
Record	btRecord	StartRecording (see page 17194)
Stop (see page 17195)	btStop	Stop (see page 17195)
Next (see page 17187)	btNext	Next (see page 17187)
Prev	btPrev	Previous (see page 17191)
Step (see page 17194)	btStep	Step (see page 17194)
Back (see page 17182)	btBack	Back (see page 17182)
Pause (see page 17189)	btPause	Pause (see page 17189)
Eject (see page 17184)	btEject	Eject (see page 17184)

See Also

Click (see page 17182)

101.1.2.6.2 TMediaPlayer.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

See Also

TPopupMenu (see page 16169)

PopupMenu (see page 5835)

AutoPopup (see page 16178)

101.1.2.6.3 TMediaPlayer.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
```

```
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------

101.1.2.6.4 TMediaPlayer.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

OnEnter (see page 6219)

ActiveControl (see page 13896)

101.1.2.6.5 TMediaPlayer.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

101.1.2.6.6 TMediaPlayer.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse

outside of a control when the parent top-level form is not active.

101.1.2.6.7 TMediaPlayer.OnNotify Event

Occurs upon the completion of a media control method.

Pascal

```
property OnNotify: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnNotify;
```

Description

OnNotify occurs upon the completion of a media control method (Back (see page 17182), Close (see page 17183), Eject (see page 17184), Next (see page 17187), Open (see page 17188), Pause (see page 17189), PauseOnly (see page 17190), Play (see page 17190), Previous (see page 17191), Resume (see page 17192), Rewind (see page 17193), StartRecording (see page 17194), Step (see page 17194), or Stop (see page 17195)) when the Notify (see page 17206) property is set to true before the call to the media control method. After an OnNotify event, the Notify (see page 17206) property must be reset to true for the next OnNotify event to occur.

See Also

DoNotify (see page 17184)

MMNotify (see page 17187)

Notify (see page 17206)

101.1.2.6.8 TMediaPlayer.OnPostClick Event

Occurs after the OnClick (see page 17222) event handler is called.

Pascal

```
property OnPostClick: EMPPostNotify;
```

C++

```
__property EMPPostNotify OnPostClick;
```

Description

OnPostClick is generated after the code of the OnClick (see page 17222) event handler has been called. If Wait (see page 17221) is true when the media player was clicked, OnPostClick won't be called until the completion of the OnClick (see page 17222) code. If Wait (see page 17221) is false, control can return to the application before completion of the OnClick (see page 17222) code; therefore, the OnPostClick event may occur before the actions initiated by the OnClick (see page 17222) event have completed.

For example, if the user clicks the Play (see page 17190) button and the DoDefault parameter of the OnClick (see page 17222) event handler for the media player is true, the media is played. If the media is long enough, it will still be playing when the OnPostClick event is generated if Wait (see page 17221) is true. If Wait (see page 17221) is false, however, OnPostClick won't occur until the media has finished playing.

See Also

OnClick (see page 17222)

PostClick (see page 17191)

Wait (see page 17221)

101.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TMPBtnType (see page 17229)	TMPBtnType defines the possible buttons in a TMediaPlayer (see page 17167) component and TButtonSet (see page 17238) represents a set of those buttons.
	TMPDevCaps (see page 17231)	TMPDevCaps defines the capabilities of a TMediaPlayer (see page 17167) component and TMPDevCapsSet (see page 17238) represents a set of those capabilities.
	TMPDeviceTypes (see page 17231)	TMPDeviceTypes identifies a multimedia device.
	TMPGlyph (see page 17233)	This is record MPlayer.TMPGlyph.
	TMPModes (see page 17233)	TMPModes identifies the state of a TMediaPlayer (see page 17167) component.
	TMPNotifyValues (see page 17234)	TMPNotifyValues identifies the types of notifications a media device can give a TMediaPlayer (see page 17167) component.
	TMPTimeFormats (see page 17235)	TMPTimeFormats indicates the format a media player uses to indicate position.

Records

	Name	Description
	TMPButton (see page 17230)	This is record MPlayer.TMPButton.

101.2.1 MPlayer.TMPBtnType Enumeration

TMPBtnType defines the possible buttons in a TMediaPlayer (see page 17167) component and TButtonSet (see page 17238) represents a set of those buttons.

Pascal

```
TMPBtnType = (
  btPlay,
  btPause,
  btStop,
  btNext,
  btPrev,
  btStep,
  btBack,
  btRecord,
  btEject
);
```

C++

```
enum TMPBtnType {
  btPlay,
  btPause,
  btStop,
  btNext,
  btPrev,
  btStep,
  btBack,
  btRecord,
  btEject
```

```
};
```

File

MPlayer

Description

TMPBtnType represents the type of a media player button. TButtonSet (see page 17238) is a set of button types for the media player.

Each button type has an associated action on the media player. The following table lists the button types and their associated actions:

Value	Action
btPlay	Plays the media player.
btRecord	Starts recording.
btStop	Stops playing or recording.
btNext	Skips to the next track, or to the end if the medium doesn't use tracks.
btPrev	Skips to the previous track, or to the beginning if the medium doesn't use tracks.
btStep	Moves forward a number of frames.
btBack	Moves backward a number of frames.
btPause	Pauses playing or recording. If already paused when clicked, resumes playing or recording.
btEject	Ejects the medium.

TBitBtn

TSpeedButton

101.2.2 MPlayer.TMPButton Record

Pascal

```
TMPButton = record
  Visible: Boolean;
  Enabled: Boolean;
  Colored: Boolean;
  Auto: Boolean;
  Bitmaps: array[TMPGlyph] of TBitmap;
end;
```

C++

```
struct TMPButton {
  Boolean Visible;
  Boolean Enabled;
  Boolean Colored;
  Boolean Auto;
  array[TMPGlyph] of TBitmap Bitmaps;
};
```

File

MPlayer

Description

This is record MPlayer.TMPButton.

101.2.3 MPlayer.TMPDevCaps Enumeration

TMPDevCaps defines the capabilities of a TMediaPlayer (see page 17167) component and TMPDevCapsSet (see page 17238) represents a set of those capabilities.

Pascal

```
TMPDevCaps = (
  mpCanStep,
  mpCanEject,
  mpCanPlay,
  mpCanRecord,
  mpUsesWindow
);
```

C++

```
enum TMPDevCaps {
  mpCanStep,
  mpCanEject,
  mpCanPlay,
  mpCanRecord,
  mpUsesWindow
};
```

File

MPlayer

Description

TMPDevCaps represents the capabilities of a media player control. TMPDevCapsSet (see page 17238) is a set of TMPDevCaps values.

The following table lists the possible TMPDevCaps values:

Value	Capability
mpCanEject	Can eject media
mpCanPlay	Can play media
mpCanRecord	Can record media
mpCanStep	Can step forward or backward within media
mpUsesWindow	Uses a window for displaying output

See Also

TMediaPlayer

101.2.4 MPlayer.TMPDeviceTypes Enumeration

TMPDeviceTypes identifies a multimedia device.

Pascal

```
TMPDeviceTypes = (
  dtAutoSelect,
  dtAVIVideo,
  dtCDAudio,
  dtDAT,
  dtDigitalVideo,
  dtMMMovie,
  dtOther,
  dtOverlay,
  dtScanner,
  dtSequencer,
  dtVCR,
  dtVideodisc,
  dtWaveAudio
);
```

C++

```
enum TMPDeviceTypes {
  dtAutoSelect,
  dtAVIVideo,
  dtCDAudio,
  dtDAT,
  dtDigitalVideo,
  dtMMMovie,
  dtOther,
  dtOverlay,
  dtScanner,
  dtSequencer,
  dtVCR,
  dtVideodisc,
  dtWaveAudio
};
```

File

MPlayer

Description

TMPDeviceTypes type identifies the multimedia device types that can be opened by a TMediaPlayer (see page 17167) component.

The following table lists the possible values:

Value	Meaning
dtAutoSelect	the device type is determined by the file extension.
dtAVIVideo	AVI clip
dtCDAudio	Audio CD recording
dtDAT	DAT file
dtDigitalVideo	Digital video recording
dtMMMovie	MM recording
dtOther	media type not identified by other categories
dtOverlay	Overlay
dtScanner	scanner
dtSequencer	sequencer
dtVCR	VCR

dtVideodisc	Videodisc
dtWaveAudio	.wav file

TMediaPlayer

101.2.5 MPlayer.TMPGlyph Enumeration

Pascal

```
TMPGlyph = (
  mgEnabled,
  mgDisabled,
  mgColored
);
```

C++

```
enum TMPGlyph {
  mgEnabled,
  mgDisabled,
  mgColored
};
```

File

MPlayer

Description

This is record MPlayer.TMPGlyph.

101.2.6 MPlayer.TMPModes Enumeration

TMPModes identifies the state of a TMediaPlayer (see page 17167) component.

Pascal

```
TMPModes = (
  mpNotReady,
  mpStopped,
  mpPlaying,
  mpRecording,
  mpSeeking,
  mpPaused,
  mpOpen
);
```

C++

```
enum TMPModes {
  mpNotReady,
  mpStopped,
  mpPlaying,
  mpRecording,
  mpSeeking,
  mpPaused,
  mpOpen
```

```
};
```

File

MPlayer

Description

TMPModes type identifies the state of a media player. The following table lists the possible values:

Value	Mode
mpNotReady	Not ready
mpStopped	Stopped
mpPlaying	Playing
mpRecording	Recording
mpSeeking	Seeking
mpPaused	Paused
mpOpen	Open

See Also

TMediaPlayer

101.2.7 MPlayer.TMPNotifyValues Enumeration

TMPNotifyValues identifies the types of notifications a media device can give a TMediaPlayer (see page 17167) component.

Pascal

```
TMPNotifyValues = (
  nvSuccessful,
  nvSuperseded,
  nvAborted,
  nvFailure
);
```

C++

```
enum TMPNotifyValues {
  nvSuccessful,
  nvSuperseded,
  nvAborted,
  nvFailure
};
```

File

MPlayer

Description

The TMPNotifyValues type defines the notification values for a multimedia device used with a TMediaPlayer (see page 17167). The possible values for the TMPNotifyValues type are as follows.

Value	Meaning
nvSuccessful	Command completed successfully
nvSuperseded	Command was superseded by another command

nvAborted	Command was aborted by the user
nvFailure	Command failed

See Also

TMediaPlayer

101.2.8 MPlayer.TMPTimeFormats Enumeration

TMPTimeFormats indicates the format a media player uses to indicate position.

Pascal

```
TMPTimeFormats = (
  tfMilliseconds,
  tfHMS,
  tfMSF,
  tfFrames,
  tfSMPTE24,
  tfSMPTE25,
  tfSMPTE30,
  tfSMPTE30Drop,
  tfBytes,
  tfSamples,
  tfTMSF
);
```

C++

```
enum TMPTimeFormats {
  tfMilliseconds,
  tfHMS,
  tfMSF,
  tfFrames,
  tfSMPTE24,
  tfSMPTE25,
  tfSMPTE30,
  tfSMPTE30Drop,
  tfBytes,
  tfSamples,
  tfTMSF
};
```

File

MPlayer

Description

The TMPTimeFormats type defines the time formats for a multimedia device used with a TMediaPlayer (see page 17167). The following table lists the possible values for the TMPTimeFormats type:

Value	Time format
tfMilliseconds	Milliseconds are stored as a 4-byte integer variable.
tfHMS	Hours, minutes, and seconds packed into a 4-byte integer. From least significant to most significant byte, the data values are
Hours (least significant byte)	
Minutes	

Seconds	
Unused (most significant byte)	
tfMSF	Minutes, seconds, and frames packed into a 4-byte integer. From least significant to most significant byte, the data values are
Minutes (least significant byte)	
Seconds	
Frames	
Unused (most significant byte)	
tfFrames	Frames are stored as a 4-byte integer variable.
tfSMPTE24	24-frame SMPTE packs values in a 4-byte variable. From least significant to most significant byte, the data values are
Hours (least significant byte)	
Minutes	
Seconds	
Frames (most significant byte)	
SMPTE (Society of Motion Picture and Television Engineers) time is an absolute time format expressed in hours, minutes, seconds, and frames. The standard SMPTE division types are 24, 25, and 30 frames per second.	
tfSMPTE25	25-frame SMPTE packs data into a 4-byte variable in the same order as 24-frame SMPTE.
tfSMPTE30	30-frame SMPTE packs data into the 4-byte variable in the same order as 24-frame SMPTE.
tfSMPTE30Drop	30-drop-frame SMPTE packs data into the 4-byte variable in the same order as 24-frame SMPTE.
tfBytes	Bytes are stored as a 4-byte integer variable.
tfSamples	Samples are stored as a 4-byte integer variable.
tfTMSF	Tracks, minutes, seconds, and frames are packed in the 4-byte variable. From least significant to most significant byte, the data values are
Tracks (least significant byte)	
Minutes	
Seconds	
Frames (most significant byte)	

Note that MCI uses continuous track numbering.

Note: Functions provided with MCI to help decoding the 4-byte integer specified in a given time format are documented under MCI Macros for Encoding and Decoding Time Data in the MMSYSTEM.HLP Help file.

TMediaPlayer

101.3 Types

The following table lists types in this documentation.

Types

Name	Description
EMPNotify (see page 17237)	EMPNotify is the type of event handlers that respond when the user interacts with a TMediaPlayer (see page 17167) component.
EMPPostNotify (see page 17237)	EMPPostNotify is the type of a media player's OnPostClick event handler.
TButtonSet (see page 17238)	TButtonSet is a set of TMPBtnType (see page 17229) values.
TMPDevCapsSet (see page 17238)	This is type MPlayer.TMPDevCapsSet.

101.3.1 MPlayer.EMPNotify Type

EMPNotify is the type of event handlers that respond when the user interacts with a TMediaPlayer (see page 17167) component.

Pascal

```
EMPNotify = procedure (Sender: TObject; Button: TMPBtnType; var DoDefault: Boolean) of object;
```

C++

```
(Sender: TObject; Button: TMPBtnType; var DoDefault: Boolean) ( EMPNotify)();
```

File

MPlayer

Description

Sender is the TMediaPlayer (see page 17167) component whose button was clicked.

Button indicates the button that was clicked. It can be one of the following values: btBack, btEject, btNext, btPause, btPlay, btPrev, btRecord, btStep, or btStop.

DoDefault returns an indication of whether the media player should make its default response after the event handler exits.

See Also

TMediaPlayer

101.3.2 MPlayer.EMPPostNotify Type

EMPPostNotify is the type of a media player's OnPostClick event handler.

Pascal

```
EMPPostNotify = procedure (Sender: TObject; Button: TMPBtnType) of object;
```

C++

```
(Sender: TObject; Button: TMPBtnType) ( EMPPostNotify)();
```

File

MPlayer

Description

Sender is the TMediaPlayer (see page 17167) component whose button was clicked.

Button indicates the button that was clicked. It can be one of the following values: btBack, btEject, btNext, btPause, btPlay, btPrev, btRecord, btStep, or btStop.

See Also

TMediaPlayer (see page 17167)

101.3.3 MPlayer.TButtonSet Type

TButtonSet is a set of TMPBtnType (see page 17229) values.

Pascal

```
TButtonSet = set of TMPBtnType;
```

C++

```
TMPBtnType TButtonSet;
```

File

MPlayer

Description

TButtonSet represents a set of zero or more of the buttons that can appear on a TMPDeviceType control.

101.3.4 MPlayer.TMPDevCapsSet Type

Pascal

```
TMPDevCapsSet = set of TMPDevCaps;
```

C++

```
TMPDevCaps TMPDevCapsSet;
```

File

MPlayer

Description

This is type MPlayer.TMPDevCapsSet.

102 Mtsobj Namespace

This is namespace Mtsobj.

Topics

Name	Description
Classes (see page 17240)	The following table lists classes in this documentation.

Classes

	Name	Description
	TMtsAutoObject (see page 17240)	TMtsAutoObject encapsulates the objects and interfaces of the MTS application server.

102.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TMtsAutoObject (see page 17240)	TMtsAutoObject encapsulates the objects and interfaces of the MTS application server.

102.1.1 TMtsAutoObject Class

TMtsAutoObject encapsulates the objects and interfaces of the MTS application server.

Class Hierarchy

Pascal

```
TMtsAutoObject = class(TAutoObject, IObjectControl);
```

C++

```
class TMtsAutoObject : public TAutoObject, public IObjectControl;
```

File

Mtsobj

Description

Use a TMtsAutoObject object as the central repository for all objects in an MTS-enabled application server.

MTS Automation objects are dual-interface Automation servers that implement the IObjectControl interface. MTS Automation objects are like any Automation server with additional features that encapsulate MTS services such as transaction support and security.

Writing Applications Using COM

102.1.1.1 TMtsAutoObject Members

The following tables list the members exposed by TMtsAutoObject.

Protected Methods

	Name	Description
	_AddRef (see page 5558)	This is _AddRef, a member of class TComObject.
	_Release (see page 5558)	This is _Release, a member of class TComObject.
	Activate (see page 17243)	This is Activate, a member of class TMtsAutoObject.
V	CanBePooled (see page 17243)	This is CanBePooled, a member of class TMtsAutoObject.
	Deactivate (see page 17243)	This is Deactivate, a member of class TMtsAutoObject.
	EventConnect (see page 5542)	This is EventConnect, a member of class TAutoObject.
V	EventSinkChanged (see page 5543)	This is EventSinkChanged, a member of class TAutoObject.
	GetClassInfo (see page 5583)	Returns a pointer to a TTypedComObject (see page 5581)'s type information.
V	GetIDsOfNames (see page 5543)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetTypeInfo (see page 5543)	Retrieves the type information for an object.
V	GetTypeInfoCount (see page 5544)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InterfaceSupportsErrorInfo (see page 5559)	This is InterfaceSupportsErrorInfo, a member of class TComObject.
V	Invoke (see page 5544)	Provides access to Automation properties and methods exposed by an object that supports the IDispatch interface.
V	OnActivate (see page 17246)	This is OnActivate, a member of class TMtsAutoObject.
V	OnDeactivate (see page 17246)	This is OnDeactivate, a member of class TMtsAutoObject.
	QueryInterface (see page 5560)	This is QueryInterface, a member of class TComObject.

Protected Properties

	Name	Description
R	AutoFactory (see page 5545)	The class factory that created this TAutoObject (see page 5540).
	EventSink (see page 5545)	This is EventSink, a member of class TAutoObject.
R	ObjectContext (see page 17247)	This is ObjectContext, a member of class TMtsAutoObject.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 5555)	Instantiates a COM object that is not part of an aggregate.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateAggregated (see page 5556)	Instantiates a COM object that is part of an aggregate.
	CreateFromFactory (see page 5556)	Instantiates a COM object and initializes its values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 5557)	Disposes of an instance of a COM object.
V	Destroy (see page 22287)	Disposes of an object instance.
	DisableCommit (see page 17243)	Prevents clients from completing transactions.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EnableCommit (see page 17244)	Allows clients to complete transactions without releasing state information.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 5544)	Provides an interface to a method that initializes the Automation object.
V	Initialize (see page 5558)	Provides an interface to a method that initializes the COM object.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	IsCallerInRole (see page 17245)	Indicates whether the current client matches a particular security role.
	IsInTransaction (see page 17245)	Indicates whether the MTS Automation object is running in a transaction.
	IsSecurityEnabled (see page 17246)	This is IsSecurityEnabled, a member of class TMtsAutoObject.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	ObjAddRef (see page 5559)	Implements the AddRef method of the IUnknown interface.
V	ObjQueryInterface (see page 5559)	Implements the QueryInterface (see page 5560) method of the IUnknown interface.
V	ObjRelease (see page 5559)	Implements the Release method of the IUnknown interface.
V	SafeCallException (see page 5560)	Handles OLE exceptions.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAbort (see page 17246)	Allows the MTS Automation object to be deactivated and aborts any current transactions.
	SetComplete (see page 17247)	Indicates that the MTS Automation object has successfully completed its current task.

Public Properties

	Name	Description
R	Controller (see page 5561)	Specifies the controlling IUnknown interface that controls interfaces within an aggregate object.
R	Factory (see page 5561)	Specifies the class factory object for the TComObject (see page 5553) class.
	Pooled (see page 17248)	Indicates whether the object can be pooled when installed under COM+.
R	RefCount (see page 5562)	Indicates the number of references to the COM object that are currently in use.
	ServerExceptionHandler (see page 5562)	Provides access to the SafeCall exception notification process.

102.1.1.2 TMtsAutoObject Methods

The methods of the TMtsAutoObject class are listed here.

Protected Methods

	Name	Description
	Activate (see page 17243)	This is Activate, a member of class TMtsAutoObject.
V	CanBePooled (see page 17243)	This is CanBePooled, a member of class TMtsAutoObject.
	Deactivate (see page 17243)	This is Deactivate, a member of class TMtsAutoObject.
V	OnActivate (see page 17246)	This is OnActivate, a member of class TMtsAutoObject.
V	OnDeactivate (see page 17246)	This is OnDeactivate, a member of class TMtsAutoObject.

Public Methods

	Name	Description
	DisableCommit (see page 17243)	Prevents clients from completing transactions.

	EnableCommit (see page 17244)	Allows clients to complete transactions without releasing state information.
	IsCallerInRole (see page 17245)	Indicates whether the current client matches a particular security role.
	IsInTransaction (see page 17245)	Indicates whether the MTS Automation object is running in a transaction.
	IsSecurityEnabled (see page 17246)	This is IsSecurityEnabled, a member of class TMtsAutoObject.
	SetAbort (see page 17246)	Allows the MTS Automation object to be deactivated and aborts any current transactions.
	SetComplete (see page 17247)	Indicates that the MTS Automation object has successfully completed its current task.

102.1.1.2.1 TMtsAutoObject.Activate Method

Pascal

```
procedure Activate; safecall;
```

C++

```
__fastcall Activate();
```

Description

This is Activate, a member of class TMtsAutoObject.

102.1.1.2.2 TMtsAutoObject.CanBePooled Method

Pascal

```
function CanBePooled: Bool; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall Bool CanBePooled();
```

Description

This is CanBePooled, a member of class TMtsAutoObject.

102.1.1.2.3 TMtsAutoObject.Deactivate Method

Pascal

```
procedure Deactivate; stdcall;
```

C++

```
__fastcall __stdcall Deactivate();
```

Description

This is Deactivate, a member of class TMtsAutoObject.

102.1.1.2.4 TMtsAutoObject.DisableCommit Method

Prevents clients from completing transactions.

Pascal

```
procedure DisableCommit;
```

C++

```
__fastcall DisableCommit();
```

Description

Call DisableCommit to indicate that the MTS Automation object cannot complete its current transaction or release state information until it receives further method invocations from the client. After calling DisableCommit, the current transaction (if any) cannot be completed until the MTS Automation object calls EnableCommit (see page 17244) or SetComplete (see page 17247).

With transactions that are started automatically when the MTS Automation object's interface is called, DisableCommit is not necessary. These transactions are not committed until the MTS Automation object calls SetComplete (see page 17247). However, when the MTS Automation object is enlisted in a transaction that was started previously, the client controls the transaction and can attempt to commit it before the MTS Automation object has completed its part. Calling DisableCommit prevents the client from prematurely committing a transaction. If a client tries to commit a transaction after the MTS Automation object has called DisableCommit, the transaction aborts.

Tip: Call DisableCommit at the beginning of a method to protect your MTS Automation object from committing prematurely in the event of an unexpected return. If the method call finishes normally, calling EnableCommit (see page 17244) or SetComplete (see page 17247) reverses this affect and allows the transaction to complete.

EnableCommit (see page 17244)

SetAbort (see page 17246)

SetComplete (see page 17247)

IsInTransaction (see page 17245)

102.1.1.2.5 TMtsAutoObject.EnableCommit Method

Allows clients to complete transactions without releasing state information.

Pascal

```
procedure EnableCommit;
```

C++

```
__fastcall EnableCommit();
```

Description

Call EnableCommit to indicate that the MTS Automation object can complete its current transaction without releasing state information. Unlike the SetComplete (see page 17247) method (which also signals that the current transaction can be committed), EnableCommit does not allow MTS to deactivate the MTS Automation object. This lets the MTS Automation object preserve state information over multiple interface calls, while still allowing clients that have enlisted the object in a transaction to commit.

By default, transactions can be completed when an interface call ends, unless the DisableCommit (see page 17243) method is called. There is no need to call EnableCommit unless the MTS Automation object has previously called DisableCommit (see page 17243).

Note: Although EnableCommit permits the current transaction to be completed, it does not automatically commit the transaction. The client that enlisted the MTS Automation object must still explicitly commit that transaction. If MTS started the transaction automatically (because the MTS Automation object requires a transaction for its interface calls), the transaction is not committed until the data module calls SetComplete (see page 17247).

See Also

DisableCommit (see page 17243)

SetComplete (see page 17247)

SetAbort (see page 17246)

IsInTransaction (see page 17245)

102.1.1.2.6 TMtsAutoObject.IsCallerInRole Method

Indicates whether the current client matches a particular security role.

Pascal

```
function IsCallerInRole(const Role: WideString): Bool;
```

C++

```
__fastcall Bool IsCallerInRole(const BSTR Role);
```

Description

MTS provides role-based security. Each level of access to your application server can be assigned a role. Using the MTS Explorer, administrators can prevent clients from using an interface based on their role. (This is called declarative security.) In addition, however, programs can provide more fine-grained security programmatically. To do this, use IsCallerInRole to provide access to blocks of code based on the caller's security role.

IsCallerInRole checks whether the current client is part of the role named by the Role parameter. It returns true if the client matches the named role, and False otherwise. Use IsCallerInRole to prevent clients from invoking certain blocks of code if they do not have the appropriate security role.

Note: MTS security is not available on servers running Windows95. If the MTS application is running on Windows95, IsCallerInRole always returns true . In addition, IsCallerInRole always returns True if the application is part of an MTS Library package (which runs in the client's process space).

102.1.1.2.7 TMtsAutoObject.IsInTransaction Method

Indicates whether the MTS Automation object is running in a transaction.

Pascal

```
function IsInTransaction: Bool;
```

C++

```
__fastcall Bool IsInTransaction();
```

Description

Call IsInTransaction to determine whether the MTS Automation object is currently running in a transaction. For example, if the MTS Automation object requires a transaction, use IsInTransaction to check that this requirement has not been turned off by an administrator using the MTS Explorer, and to raise an exception if it has.

Note: If IsInTransaction returns False, the EnableCommit (see page 17244) and DisableCommit (see page 17243) methods have no effect.

See Also

EnableCommit (see page 17244)

DisableCommit (see page 17243)

102.1.1.2.8 TMtsAutoObject.IsSecurityEnabled Method

Pascal

```
function IsSecurityEnabled: Bool;
```

C++

```
__fastcall Bool IsSecurityEnabled();
```

Description

This is IsSecurityEnabled, a member of class TMtsAutoObject.

102.1.1.2.9 TMtsAutoObject.OnActivate Method

Pascal

```
procedure OnActivate; virtual;
```

C++

```
virtual __fastcall OnActivate();
```

Description

This is OnActivate, a member of class TMtsAutoObject.

102.1.1.2.10 TMtsAutoObject.OnDeactivate Method

Pascal

```
procedure OnDeactivate; virtual;
```

C++

```
virtual __fastcall OnDeactivate();
```

Description

This is OnDeactivate, a member of class TMtsAutoObject.

102.1.1.2.11 TMtsAutoObject.SetAbort Method

Allows the MTS Automation object to be deactivated and aborts any current transactions.

Pascal

```
procedure SetAbort;
```

C++

```
__fastcall SetAbort();
```

Description

Call SetAbort to indicate that any current transaction that includes the MTS Automation object to abort. If MTS started a transaction automatically, the transaction aborts when the current method call exits. If the MTS Automation object was enlisted in a pre-existing transaction, the client transaction will eventually fail. Usually, SetAbort is called in the except block of a try...except statement.

In addition to aborting any current transaction, SetAbort indicates that the MTS Automation object can be deactivated when the current interface call exits. This means that state information is not preserved for the next time and the client calls the Automation object's interface. To prevent transactions from committing successfully without losing state information, use the

DisableCommit (see page 17243) method instead.

Tip: Call SetAbort at the beginning of a method to protect your MTS data module from committing prematurely in the event of an unexpected return. If the method call finishes normally, calling SetComplete (see page 17247) reverses this affect and allows the transaction to complete.

102.1.1.2.12 TMtsAutoObject.SetComplete Method

Indicates that the MTS Automation object has successfully completed its current task.

Pascal

```
procedure SetComplete;
```

C++

```
__fastcall SetComplete();
```

Description

Call SetComplete to indicate that the MTS Automation object no longer needs to maintain state information. After calling SetComplete, the MTS Automation object is deactivated when the current method call exits.

If the MTS Automation object is part of a transaction, SetComplete indicates that this part of the transaction can commit. If MTS started the transaction automatically when the client called the MTS Automation object's methods, MTS tries to commit the transaction when the current method exits.

Note: This transaction may still fail if the current transaction included another MTS object that called SetAbort (see page 17246) or DisableCommit (see page 17243).

See Also

EnableCommit (see page 17262)

102.1.1.3 TMtsAutoObject Properties

The properties of the TMtsAutoObject class are listed here.

Protected Properties

	Name	Description
	ObjectContext (see page 17247)	This is ObjectContext, a member of class TMtsAutoObject.

Public Properties

	Name	Description
	Pooled (see page 17248)	Indicates whether the object can be pooled when installed under COM+.

102.1.1.3.1 TMtsAutoObject.ObjectContext Property

Pascal

```
property ObjectContext: IObjectContext;
```

C++

```
__property IObjectContext ObjectContext;
```

Description

This is ObjectContext, a member of class TMtsAutoObject.

102.1.1.3.2 TMtsAutoObject.Pooled Property

Indicates whether the object can be pooled when installed under COM+.

Pascal

```
property Pooled: Boolean;
```

C++

```
__property Boolean Pooled;
```

Description

Set Pooled to indicate whether instances of the MTS Automation object can be pooled when installed under COM+. The MTS Automation object uses the Pooled property when implementing the IObjectControl method CanBePooled (see page 17243). This instructs COM+ that the object can be moved to an object pool when deactivated, so that the single instance is shared by all clients.

Warning: Do not set Pooled to True unless the MTS Automation object is stateless.

This is namespace MtsRdm.

Topics

Name	Description
Classes (see page 17250)	The following table lists classes in this documentation.

Classes

	Name	Description
	TMtsDataModule (see page 17250)	TMtsDataModule encapsulates the objects and interfaces of a transactional application server.

103.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TMtsDataModule (see page 17250)	TMtsDataModule encapsulates the objects and interfaces of a transactional application server.

103.1.1 TMtsDataModule Class

TMtsDataModule encapsulates the objects and interfaces of a transactional application server.

Class Hierarchy

Pascal

```
TMtsDataModule = class(TRemoteDataModule, IAppServer, IObjectControl);
```

C++

```
class TMtsDataModule : public TRemoteDataModule, public IAppServer, public IObjectControl;
```

File

MtsRdm

Description

Use a TMtsDataModule object as the central repository for all objects in a transactional application server that is written in Delphi. MTS data modules can contain any nonvisual components. . Typically these are data access components, such as datasets and the provider components that handle communication between these datasets and client applications. MTS data modules can also contain other nonvisual components, such as TTimer, or TImageList.

MTS data modules are dual-interface Automation servers that implement the IAppServer interface. Connection components on client applications are designed to look for this interface. The methods in this interface, however, do not call the SetComplete (see page 17265) method, so the MTS data module is not transactional. You may want to expand the MTS data module's interface to provide alternate versions of these methods that use the MTS data module's transaction.

The default interaction between a client dataset and an MTS data module does not rely on state information, so it is safe to use the MTS data module with just-in-time activation. However, you may need to provide a mechanism for communicating persistent state information to take advantage of some features such as incremental fetches.

To create an MTS data module at design time, choose File|New|Other, and select Transactional Data Module from the multitier page of the new items dialog. If you are writing the application server in Delphi, the Transactional Data Module Wizard then creates a new descendant of TMtsDataModule that supports an interface that descends from IAppServer.

Writing Applications Using COM

103.1.1.1 TMtsDataModule Members

The following tables list the members exposed by TMtsDataModule.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	Activate (see page 17255)	This is Activate, a member of class TMtsDataModule.
	AS_ApplyUpdates (see page 17255)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 17256)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 17257)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 17258)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 17258)	Returns a list of all the available providers on the remote data module.
	AS_GetRecords (see page 17259)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 17260)	Returns information from a specified record of the provider's dataset.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	CallComplete (see page 17261)	This is CallComplete, a member of class TMtsDataModule.
V	CanBePooled (see page 17261)	This is CanBePooled, a member of class TMtsDataModule.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Deactivate (see page 17261)	This is Deactivate, a member of class TMtsDataModule.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2830)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoCreate (see page 2831)	This is DoCreate, a member of class TDataModule.
V	DoDestroy (see page 2831)	This is DoDestroy, a member of class TDataModule.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 2831)	This is GetChildren, a member of class TDataModule.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetProvider (see page 6595)	This is GetProvider, a member of class TRemoteDataModule.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleCreateException (see page 2831)	This is HandleCreateException, a member of class TDataModule.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 2832)	This is ReadState, a member of class TDataModule.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
V	UpdateRegistry (see page 6597)	Registers the remote data module in the system registry as an automation server.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ObjectContext (see page 17266)	This is ObjectContext, a member of class TMtsDataModule.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 2829)	Generates an OnCreate (see page 2833) event.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 2830)	Generates an OnDestroy (see page 2834) event.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 17254)	Creates an MTS data module instance.
V	CreateNew (see page 2828)	Creates an instance of a data module and registers with the global screen object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2829)	Destroys the instance of the data module.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6589)	Frees a remote data module instance.

	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableCommit (see page 17261)	Prevents clients from completing transactions.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EnableCommit (see page 17262)	Allows clients to complete transactions without releasing state information.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	IsCallerInRole (see page 17263)	Indicates whether the current client fits into a particular security role.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsInTransaction (see page 17263)	Indicates whether the MTS data module is running in a transaction.
	IsSecurityEnabled (see page 17264)	This is IsSecurityEnabled, a member of class TMtsDataModule.
	Lock (see page 6595)	Locks the remote data module so that it can't be locked by other threads.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterProvider (see page 6596)	Adds a provider to the list returned by AS_GetProviderNames (see page 6593).
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAbort (see page 17264)	Allows the MTS data module to be deactivated and aborts any current transactions.

	SetComplete (see page 17265)	Indicates that the MTS data module has successfully completed its current task.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	Unlock (see page 6596)	Unlocks the remote data module after it was locked by a call to the Lock (see page 6595) method.
V	UnRegisterProvider (see page 6597)	Removes a provider from the list returned by AS_GetProviderNames (see page 6593).
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignOffset (see page 2832)	Specifies the design offset for the data module at design time.
	DesignSize (see page 2832)	Specifies the design size for the data module at design time.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	ProviderCount (see page 6599)	Indicates the number of providers registered with the remote data module.
R	Providers (see page 6599)	This is Providers, a member of class TRemoteDataModule.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnActivate (see page 17267)	Occurs when an instance of TMtsDataModule (see page 17250) is activated.
	OnCreate (see page 2833)	Occurs when an application instantiates a data module.
	OnDeactivate (see page 17267)	Occurs when an instance of TMtsDataModule (see page 17250) is deactivated.
	OnDestroy (see page 2834)	Occurs when the data module is about to be destroyed.

Published Properties

	Name	Description
	AutoComplete (see page 17265)	Specifies whether the IAppServer methods are transactional.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 2833)	Specifies when OnCreate (see page 2833) and OnDestroy (see page 2834) events occur.
	Pooled (see page 17266)	Indicates whether the data module can be pooled when installed under COM+.
	Tag (see page 2808)	Stores an integer value as part of a component.

103.1.1.2 TMtsDataModule.Create Constructor

Creates an MTS data module instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TMtsDataModule(TComponent * AOwner);
```

Description

Most applications do not need to call the constructor for TMtsDataModule (see page 17250). Instead, add a remote data module to a server application using the transactional data module wizard on the multi-tier page of the new items dialog.

AOwner specifies the component that is responsible for freeing the remote data module (typically the application).

See Also

Create (see page 2827)

103.1.1.3 TMtsDataModule Methods

The methods of the TMtsDataModule class are listed here.

Protected Methods

	Name	Description
	Activate (see page 17255)	This is Activate, a member of class TMtsDataModule.
	AS_ApplyUpdates (see page 17255)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 17256)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 17257)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 17258)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 17258)	Returns a list of all the available providers on the remote data module.
	AS_GetRecords (see page 17259)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 17260)	Returns information from a specified record of the provider's dataset.
V	CallComplete (see page 17261)	This is CallComplete, a member of class TMtsDataModule.
V	CanBePooled (see page 17261)	This is CanBePooled, a member of class TMtsDataModule.
	Deactivate (see page 17261)	This is Deactivate, a member of class TMtsDataModule.

Public Methods

	Name	Description
	DisableCommit (see page 17261)	Prevents clients from completing transactions.
	EnableCommit (see page 17262)	Allows clients to complete transactions without releasing state information.
	IsCallerInRole (see page 17263)	Indicates whether the current client fits into a particular security role.
	IsInTransaction (see page 17263)	Indicates whether the MTS data module is running in a transaction.
	IsSecurityEnabled (see page 17264)	This is IsSecurityEnabled, a member of class TMtsDataModule.
	SetAbort (see page 17264)	Allows the MTS data module to be deactivated and aborts any current transactions.
	SetComplete (see page 17265)	Indicates that the MTS data module has successfully completed its current task.

103.1.1.3.1 TMtsDataModule.Activate Method

Pascal

```
procedure Activate; safecall;
```

C++

```
__fastcall Activate();
```

Description

This is Activate, a member of class TMtsDataModule.

103.1.1.3.2 TMtsDataModule.AS_ApplyUpdates Method

Applies updates received from a client dataset using a specified provider.

Pascal

```
function AS_ApplyUpdates(const ProviderName: WideString; Delta: OleVariant; MaxErrors:
Integer; out ErrorCount: Integer; var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_ApplyUpdates(const BSTR ProviderName, OleVariant Delta, int
MaxErrors, int ErrorCount, OleVariant OwnerData);
```

Description

AS_AS_ApplyUpdates writes client updates to a dataset or database server. ProviderName specifies the name of the provider component that manages the update operation. Delta is a Variant containing the updated, inserted, and deleted records to write to the database. MaxErrors indicates the maximum number of errors to permit before rolling back the update operation; ErrorCount returns the actual number of errors encountered during the update operation. OwnerData is information supplied by the client application in a BeforeAS_ApplyUpdates event handler and returned to the client application in an AfterAS_ApplyUpdates event handler. It is passed to the provider's BeforeAS_ApplyUpdates event handler and returned from the provider's AfterAS_ApplyUpdates event handler.

AS_AS_ApplyUpdates The AS_ApplyUpdates_result parameter returns a Variant that is a data packet containing all records that could not be applied.

Note: Applications can only call the protected AS_AS_ApplyUpdates method using the IAppServer interface. To apply updates directly in code from the application server, use the provider component's AS_ApplyUpdates method.

See Also

ApplyUpdates (see page 8394)

applyupdates (see page 18459)

BeforeApplyUpdates (see page 18479)

AfterApplyUpdates (see page 18475)

BeforeApplyUpdates (see page 8511)

AfterApplyUpdates (see page 8497)

providers (see page 6599)

IAppServer (see page 16450)

103.1.1.3.3 TMtsDataModule.AS_DataRequest Method

Generates an OnAS_DataRequest event on the specified provider component.

Pascal

```
function AS_DataRequest(const ProviderName: WideString; Data: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_DataRequest(const BSTR ProviderName, OleVariant Data);
```

Description

Use AS_AS_DataRequest to invoke an OnAS_DataRequest event handler of the provider named by ProviderName. This method is provided to allow application developers to customize the communication between a client application and a provider component. There is no predefined meaning for the Data parameter or the return value AS_DataRequest_result parameter, which is returned to the caller.

Note: Applications can only call the protected AS_AS_DataRequest method using the IAppServer interface.

See Also

OnDataRequest (see page 18482)

providers (see page 6599)

DataRequest (see page 8404)

IAppServer (see page 16450)

103.1.1.3.4 TMtsDataModule.AS_Execute Method

AS_Executes the query or stored procedure bound to a specified provider.

Pascal

```
procedure AS_Execute(const ProviderName: WideString; const CommandText: WideString; var
Params: OleVariant; var OwnerData: OleVariant); safecall;
```

C++

```
__fastcall AS_Execute(const BSTR ProviderName, const BSTR CommandText, OleVariant Params,
OleVariant OwnerData);
```

Description

Use AS_AS_Execute to pass an execute command to a remote provider, using a specified set of parameters. AS_AS_Execute calls the AS_Execute method of the specified provider after assigning any parameters. Output parameters that result from executing a query or stored procedure are returned in the Params parameter.

The provider's AS_Execute method generates a BeforeAS_Execute event, passes the command on to its associated dataset, and generates an AfterAS_Execute event. The dataset must represent a query or stored procedure that does not return a cursor.

The ProviderName parameter specifies the name of the provider component associated with the query or stored procedure.

CommandText specifies an optional SQL statement that replaces the SQL of the query, or the name of a stored procedure that replaces the dataset's stored procedure. This parameter is ignored if the provider's Options property does not include poAllowCommandText.

The Params parameter encodes any parameters expected by the query or stored procedure and returns any output parameters. To create a properly encoded value for Params from a TParams object, use the PackageParams routine. To decode Params into a TParams object, use the Unpackparams routine.

The OwnerData parameter contains custom information that appears as an argument to the provider's BeforeAS_Execute and AfterAS_Execute event handlers. This information originates in a client dataset's BeforeAS_Execute event handler. The value returned in OwnerData is passed to the client dataset's AfterAS_Execute event handler.

Communicating with the Client Dataset

103.1.1.3.5 TMtsDataModule.AS_GetParams Method

Fetches current parameter values from the dataset bound to a specified provider.

Pascal

```
function AS_GetParams(const ProviderName: WideString; var OwnerData: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_GetParams(const BSTR ProviderName, OleVariant OwnerData);
```

Description

Use AS_AS_GetParams to retrieve the current parameter values from the dataset associated with a provider.

The ProviderName parameter specifies the name of the provider component whose dataset has the parameters.

The OwnerData represents custom information that originates in a client dataset's BeforeAS_GetParams event handler and returns information that is passed to the client dataset's AfterAS_GetParams event handler.

AS_GetParams_result (C++) or AS_AS_GetParams (Delphi) returns the parameters, encoded as a Variant array, where each element is a 2-element Variant array containing a parameter name and a parameter value. These parameters can be converted to a TParams object using the UnpackParams procedure. If the dataset has no parameters, or if the provider does not support parameter fetching, AS_GetParams_result (C++) or AS_AS_GetParams (Delphi) returns a Null Variant.

Note: AS_AS_GetParams should not be used to retrieve output parameters from stateless application servers, because parameter values may be changed by other applications. When writing a stateless application server, retrieve parameter values using the AS_Execute method instead.

Communicating with the Client Dataset

103.1.1.3.6 TMtsDataModule.AS_GetProviderNames Method

Returns a list of all the available providers on the remote data module.

Pascal

```
function AS_GetProviderNames: OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetProviderNames();
```

Description

Call AS_AS_GetProviderNames for a list of all registered providers available from a remote data module. These values indicate the possible values for the ProviderName property of a client dataset that connects to the remote data module. When calling any of the remote data modules through the IAppServer interface, pass one of these names to indicate the provider that is the target of the method call.

AS_AS_GetProviderNames returns the names of the providers in a Variant array. Client datasets are associated with a provider by setting their ProviderName property to one of these names.

Note: Applications can only call the protected AS_AS_GetProviderNames method using the IAppServer interface.

See Also

ProviderName (see page 8492)

providers (see page 6599)

IAppServer (see page 16450)

Exported (see page 18474)

103.1.1.3.7 TMtsDataModule.AS_GetRecords Method

Returns a data packet that contains the specified data.

Pascal

```
function AS_GetRecords(const ProviderName: WideString; Count: Integer; out RecsOut: Integer;
Options: Integer; const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetRecords(const BSTR ProviderName, int Count, int RecsOut, int
Options, const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

Call AS_AS_GetRecords to retrieve a specified number of records. AS_AS_GetRecords returns the requested records, starting with the current record of the provider's dataset. When working with a stateless remote data module, you may need to reposition the cursor or re-execute a query or stored procedure in the provider's BeforeAS_GetRecords event handler.

ProviderName gives the name of the provider component that provides the records.

Count indicates the number or type of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only Count records are retrieved.

RecsOut returns the actual number of records retrieved.

Options indicates what information should be added to the data packet in addition to data. It is a combination of the GetRecordOption constants. For example, the following value requests metadata along with a data packet encoded in XML:

```
MetaDataOption + XMLOption
MetaDataOption || XMLOption
```

CommandText specifies an optional SQL statement that replaces the SQL of the provider's query, or the name of a table or stored procedure that replaces the provider's underlying database table or stored procedure. This parameter is ignored if the provider's Options property does not include poAllowCommandText.

Params is a Variant containing any parameters that should be passed to the provider's dataset before it executes to generate the

requested data. It returns any output parameters.

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_GetRecords event handler. This information is passed to the provider's BeforeAS_GetRecords event handler. OwnerData returns information supplied by the provider's AfterAS_GetRecords event handler.

Records are returned as a data packet in a Variant parameter, AS_GetRecords_result.

Note: Applications can only call the protected AS_AS_GetRecords method using the IAppServer interface. To fetch records directly in code from the application server, use the provider component's AS_GetRecords method.

103.1.1.3.8 TMtsDataModule.AS_RowRequest Method

Returns information from a specified record of the provider's dataset.

Pascal

```
function AS_RowRequest(const ProviderName: WideString; Row: OleVariant; RequestType: Integer;
var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_RowRequest(const BSTR ProviderName, OleVariant Row, int RequestType,
OleVariant OwnerData);
```

Description

Client datasets call AS_AS_RowRequest automatically to implement their FetchBlobs, FetchDetails , or RefreshRecord method.

The ProviderName parameter indicates the provider associated with the dataset from which information should be fetched.

The Row parameter is an OleVariant that describes the current record on the client dataset.

The RequestType parameter indicates the type of information required. It is an integer version of the TFetchOptions type. (An integer because the value may be marshaled to a remote application server). To create a value for RequestType, take the corresponding TFetchOptions value, cast it to a Byte, and cast the result to an Integer:

```
Integer(Byte([foBlobs, foDetails]));
(int) (Byte) (TFetchOptions() << foBlobs << foDetails);
```

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_RowRequest event handler. This information is passed to the provider's BeforeAS_RowRequest event handler. OwnerData returns custom information supplied by the provider's AfterAS_RowRequest event handler.

The requested data is returned as a delta packet.

Note: Applications can only call the protected AS_AS_RowRequest method using the IAppServer interface.

103.1.1.3.9 TMtsDataModule.CallComplete Method

Pascal

```
procedure CallComplete(Complete: Boolean); virtual;
```

C++

```
virtual __fastcall CallComplete(Boolean Complete);
```

Description

This is CallComplete, a member of class TMtsDataModule.

103.1.1.3.10 TMtsDataModule.CanBePooled Method

Pascal

```
function CanBePooled: Bool; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall Bool CanBePooled();
```

Description

This is CanBePooled, a member of class TMtsDataModule.

103.1.1.3.11 TMtsDataModule.Deactivate Method

Pascal

```
procedure Deactivate; stdcall;
```

C++

```
__fastcall __stdcall Deactivate();
```

Description

This is Deactivate, a member of class TMtsDataModule.

103.1.1.3.12 TMtsDataModule.DisableCommit Method

Prevents clients from completing transactions.

Pascal

```
procedure DisableCommit;
```

C++

```
__fastcall DisableCommit();
```

Description

Call DisableCommit to indicate that the MTS data module can't complete its current transaction or release state information (properties) until it receives further method invocations from the client. After calling DisableCommit, the current transaction (if any) can't be completed until the MTS data module calls EnableCommit (see page 17262) or SetComplete (see page 17265).

With transactions that are started automatically when the MTS data module's interface is called, DisableCommit is not necessary. These automatically generated transactions are not committed until the MTS data module calls SetComplete (see page 17265). However, when the MTS data module is enlisted in a transaction that was started previously, the client controls the transaction and can attempt to commit it before the MTS data module has completed its part. Calling DisableCommit prevents the client from prematurely committing a transaction. If a client tries to commit a transaction after the MTS data module has called DisableCommit, the transaction aborts.

Tip: Call DisableCommit at the beginning of a method to protect your MTS data module from committing prematurely in the event of an unexpected return. If the method call finishes normally, calling EnableCommit (see page 17262) or SetComplete (see page 17265) reverses this affect and allows the transaction to complete.

See Also

EnableCommit (see page 17262)

SetComplete (see page 17265)

SetAbort (see page 17264)

IsInTransaction (see page 17263)

103.1.1.3.13 TMtsDataModule.EnableCommit Method

Allows clients to complete transactions without releasing state information.

Pascal

```
procedure EnableCommit;
```

C++

```
__fastcall EnableCommit();
```

Description

Call EnableCommit to indicate that the MTS data module can complete its current transaction without releasing state information (properties). Unlike the SetComplete (see page 17265) method (which also signals that the current transaction can be committed), EnableCommit does not allow the data module to be deactivated. This lets the MTS data module preserve state information over multiple interface calls, while still allowing clients that have enlisted the data module in a transaction to commit.

By default, transactions can be completed when interface calls finish, unless the DisableCommit (see page 17261) method is called. There is no need to call EnableCommit unless the MTS data module has previously called DisableCommit (see page 17261).

Note: Although EnableCommit permits the current transaction to be completed, it does not automatically commit the transaction. The client that enlisted the MTS data module in a transaction must still explicitly commit that transaction. If the transaction was started automatically (because the MTS data module requires a transaction for its interface calls), the transaction is not

committed until the data module calls SetComplete (see page 17265).

See Also

DisableCommit (see page 17261)

SetComplete (see page 17265)

SetAbort (see page 17264)

IsInTransaction (see page 17263)

103.1.1.3.14 TMtsDataModule.IsCallerInRole Method

Indicates whether the current client fits into a particular security role.

Pascal

```
function IsCallerInRole(const Role: WideString): Bool;
```

C++

```
__fastcall Bool IsCallerInRole(const BSTR Role);
```

Description

MTS provides role-based security. Each level of access to the application server can be assigned a name, called a role. Using the MTS Explorer or COM+ administrator, administrators can prevent clients from using an interface based on their role. (This is called declarative security.) In addition, however, programs can provide more fine-grained security programmatically. To do this, use IsCallerInRole to provide access to blocks of code based on the caller's security role.

IsCallerInRole checks whether the current client is part of the role named by the Role parameter. It returns true if the client fits the named role, and false otherwise. Use IsCallerInRole to prevent clients that do not have the appropriate security roles from invoking certain blocks of code.

Note: MTS security is not available on servers running Windows95. If the application server is running on Windows95, IsCallerInRole always returns true. In addition, IsCallerInRole always returns true if the application server is part of an MTS Library package (which runs in the client's process space).

See Also

issecurityenabled (see page 17264)

Using Transactional Data Modules

103.1.1.3.15 TMtsDataModule.IsInTransaction Method

Indicates whether the MTS data module is running in a transaction.

Pascal

```
function IsInTransaction: Bool;
```

C++

```
__fastcall Bool IsInTransaction();
```

Description

Call IsInTransaction to determine whether the MTS data module is currently running in a transaction. For example, if the MTS data module requires a transaction, use IsInTransaction to check that this requirement has not been turned off using the MTS Explorer or COM+ administrator, and to raise an exception if it has.

Note: If IsInTransaction returns false, the EnableCommit (see page 17262) and DisableCommit (see page 17261) methods

have no effect.

See Also

EnableCommit (see page 17262)

DisableCommit (see page 17261)

SetComplete (see page 17265)

SetAbort (see page 17264)

103.1.1.3.16 TMtsDataModule.IsSecurityEnabled Method

Pascal

```
function IsSecurityEnabled: Bool;
```

C++

```
__fastcall Bool IsSecurityEnabled();
```

Description

This is IsSecurityEnabled, a member of class TMtsDataModule.

103.1.1.3.17 TMtsDataModule.SetAbort Method

Allows the MTS data module to be deactivated and aborts any current transactions.

Pascal

```
procedure SetAbort;
```

C++

```
__fastcall SetAbort();
```

Description

Call SetAbort to indicate that any current transaction that includes the MTS data module should abort. If MTS or COM+ started a transaction automatically (because the data module requires one), that transaction aborts when the current method call exits. If the MTS data module was enlisted in a pre-existing transaction, the client transaction will eventually fail. Usually, SetAbort is called in the except block of a try..exceptstatement.

In addition to aborting any current transaction, SetAbort indicates that the MTS data module can be deactivated when the current interface call exits. This means that state information is not preserved for the next time the client calls the data module's interface. To prevent transactions from committing successfully without losing state information, use the DisableCommit (see page 17261) method instead.

Tip: Call SetAbort at the beginning of a method to protect your MTS data module from committing prematurely in the event of an unexpected return. If the method call finishes normally, calling SetComplete (see page 17265) reverses this affect and allows the transaction to complete.

See Also

SetComplete (see page 17265)

DisableCommit (see page 17261)

EnableCommit (see page 17262)

IsInTransaction (see page 17263)

103.1.1.3.18 TMtsDataModule.SetComplete Method

Indicates that the MTS data module has successfully completed its current task.

Pascal

```
procedure SetComplete;
```

C++

```
__fastcall SetComplete();
```

Description

Call SetComplete to indicate that the MTS data module no longer needs to maintain state information. After calling SetComplete, the MTS data module is deactivated when the current method call exits.

If the MTS data module is part of a transaction, SetComplete indicates that this part of the transaction can commit. If MTS or COM+ started the transaction automatically when the client called the MTS data module's method (because the MTS data module requires a transaction), it tries to commit the transaction when the current method exits.

Note: This transaction may still fail if the current transaction included another MTS or COM+ object that called SetAbort (see page 17264) or DisableCommit (see page 17261).

See Also

SetAbort (see page 17264)

DisableCommit (see page 17261)

EnableCommit (see page 17262)

IsInTransaction (see page 17263)

Extending the Interface of the Application Server

103.1.1.4 TMtsDataModule Properties

The properties of the TMtsDataModule class are listed here.

Protected Properties

	Name	Description
	ObjectContext (see page 17266)	This is ObjectContext, a member of class TMtsDataModule.

Published Properties

	Name	Description
	AutoComplete (see page 17265)	Specifies whether the IAppServer methods are transactional.
	Pooled (see page 17266)	Indicates whether the data module can be pooled when installed under COM+.

103.1.1.4.1 TMtsDataModule.AutoComplete Property

Specifies whether the IAppServer methods are transactional.

Pascal

```
property AutoComplete: Boolean;
```

C++

```
__property Boolean AutoComplete;
```

Description

AutoComplete controls whether calls made using the IAppServer interface end in a call to SetComplete (see page 17265) or SetAbort (see page 17264). By calling SetComplete (see page 17265) or SetAbort (see page 17264), the MTS data module indicates that no state information needs to be preserved when the call exits. This allows any MTS transactions to complete (or roll back) and allows COM+ or the MTS proxy to deactivate the MTS data module.

When AutoComplete is true, all IAppServer methods call SetComplete (see page 17265) when they are done with two exceptions:

AS_ApplyUpdates (see page 17255) calls SetAbort (see page 17264) if an exception is raised or if the error count exceeds the specified maximum.

AS_DataRequest (see page 17256) doesn't call either SetComplete (see page 17265) or SetAbort (see page 17264). You must add the appropriate call to the OnDataRequest event handler.

Set AutoComplete to false if the MTS data module needs to preserve state information (such as the current record in a dataset) after an IAppServer call exits. When AutoComplete is false, you must add your own interface methods that call SetComplete (see page 17265) or SetAbort (see page 17264) when the MTS data module can be safely deactivated.

See Also

IAppServer (see page 16450)

SetComplete (see page 17265)

SetAbort (see page 17264)

103.1.1.4.2 TMtsDataModule.ObjectContext Property

Pascal

```
property ObjectContext: IObjectContext;
```

C++

```
__property IObjectContext ObjectContext;
```

Description

This is ObjectContext, a member of class TMtsDataModule.

103.1.1.4.3 TMtsDataModule.Pooled Property

Indicates whether the data module can be pooled when installed under COM+.

Pascal

```
property Pooled: Boolean;
```

C++

```
__property Boolean Pooled;
```

Description

Set Pooled to indicate whether instances of the MTS data module can be pooled when installed under COM+. The MTS remote data module uses the Pooled property when implementing the IObjectControl method CanBePooled (see page 17261). This instructs COM+ that the object can be moved to an object pool when deactivated, so that the single instance is shared by all clients.

Warning: Do not set Pooled to True unless the MTS data module is stateless.

103.1.1.5 TMtsDataModule Events

The events of the TMtsDataModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 17267)	Occurs when an instance of TMtsDataModule (see page 17250) is activated.
	OnDeactivate (see page 17267)	Occurs when an instance of TMtsDataModule (see page 17250) is deactivated.

103.1.1.5.1 TMtsDataModule.OnActivate Event

Occurs when an instance of TMtsDataModule (see page 17250) is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to take specific action when COMN+ or the MTS proxy activates the MTS data module. This is the point when any database connections should be established. Database connections must not opened before the MTS data module is activated.

Note: In traditional MTS or COM+ programming, objects acquire their context object when they are activated. However, TMtsDataModule (see page 17250) handles this task automatically.

See Also

OnDeactivate (see page 17267)

103.1.1.5.2 TMtsDataModule.OnDeactivate Event

Occurs when an instance of TMtsDataModule (see page 17250) is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to take specific action when COM+ or the MTS proxy releases an instance of the MTS data module. Use this method to close any database connections that were opened when the MTS data module was activated. Database connections must not be left open after the MTS data module is deactivated.

Note: In traditional COM+ and MTS programming, objects release their context object when they are deactivated. However, TMtsDataModule (see page 17250) handles this task automatically.

See Also

OnActivate (see page 17267)

mtsErrCtxActivityTimeout (see page 17299)	This is constant Mtx.mtsErrCtxActivityTimeout.
mtsErrCtxNoContext (see page 17300)	This is constant Mtx.mtsErrCtxNoContext.
mtsErrCtxNoSecurity (see page 17300)	This is constant Mtx.mtsErrCtxNoSecurity.
mtsErrCtxNotRegistered (see page 17300)	This is constant Mtx.mtsErrCtxNotRegistered.
mtsErrCtxOldReference (see page 17301)	This is constant Mtx.mtsErrCtxOldReference.
mtsErrCtxRoleNotFound (see page 17301)	This is constant Mtx.mtsErrCtxRoleNotFound.
mtsErrCtxTMNotAvailable (see page 17301)	This is constant Mtx.mtsErrCtxTMNotAvailable.
mtsErrCtxWrongThread (see page 17302)	This is constant Mtx.mtsErrCtxWrongThread.
Process (see page 17302)	This is constant Mtx.Process.
Standard (see page 17302)	This is constant Mtx.Standard.

Functions

	Name	Description
	CreateSharedPropertyGroup (see page 17292)	Returns the interface for a SharedPropertyGroup that allows MTS objects within a server process to share state.
	CreateSharedPropertyGroupManager (see page 17293)	Returns an interface for a new shared property group manager that creates and coordinates shared properties of MTS objects.
	CreateTransactionContext (see page 17293)	Starts an MTS transaction.

	CreateTransactionContextEx (see page 17294)	Instantiates a TransactionContextEx object, which marks the beginning of a transaction.
	GetObjectContext (see page 17295)	Fetches the IObjectContext (see page 17274) interface for the current thread.
	SafeRef (see page 17295)	Returns a reference to a transactional object that is safe to pass outside its context.

Interfaces

	Name	Description
	IEnumNames (see page 17271)	This is class Mtx.IEnumNames.
	IGetContextProperties (see page 17273)	This is class Mtx.IGetContextProperties.
	IObjectContext (see page 17274)	This is class Mtx.IObjectContext.
	IObjectContextActivity (see page 17277)	This is class Mtx.IObjectContextActivity.
	IObjectControl (see page 17278)	This is class Mtx.IObjectControl.
	ISecurityProperty (see page 17279)	This is class Mtx.ISecurityProperty.
	ISharedProperty (see page 17281)	This is class Mtx.ISharedProperty.
	ISharedPropertyGroup (see page 17283)	This is class Mtx.ISharedPropertyGroup.
	ISharedPropertyGroupManager (see page 17285)	This is class Mtx.ISharedPropertyGroupManager.
	ITransactionContext (see page 17288)	This is class Mtx.ITransactionContext.
	ITransactionContextEx (see page 17289)	This is class Mtx.ITransactionContextEx.

104.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IEnumNames (see page 17271)	This is class Mtx.IEnumNames.
	IGetContextProperties (see page 17273)	This is class Mtx.IGetContextProperties.
	IObjectContext (see page 17274)	This is class Mtx.IObjectContext.
	IObjectContextActivity (see page 17277)	This is class Mtx.IObjectContextActivity.
	IObjectControl (see page 17278)	This is class Mtx.IObjectControl.
	ISecurityProperty (see page 17279)	This is class Mtx.ISecurityProperty.
	ISharedProperty (see page 17281)	This is class Mtx.ISharedProperty.
	ISharedPropertyGroup (see page 17283)	This is class Mtx.ISharedPropertyGroup.
	ISharedPropertyGroupManager (see page 17285)	This is class Mtx.ISharedPropertyGroupManager.
	ITransactionContext (see page 17288)	This is class Mtx.ITransactionContext.
	ITransactionContextEx (see page 17289)	This is class Mtx.ITransactionContextEx.

104.1.1 IEnumNames Interface

Class Hierarchy

Pascal

```
IEnumNames = interface(IUnknown);
```

C++

```
__interface IEnumNames : public IUnknown;
```

File

Mtx

Description

This is class Mtx.IEnumNames.

104.1.1.1 IEnumNames Members

The following tables list the members exposed by IEnumNames.

Public Methods

	Name	Description
	Clone (see page 17272)	This is Clone, a member of class IEnumNames.
	Next (see page 17272)	This is Next, a member of class IEnumNames.
	Reset (see page 17272)	This is Reset, a member of class IEnumNames.
	Skip (see page 17272)	This is Skip, a member of class IEnumNames.

104.1.1.2 IEnumNames Methods

The methods of the IEnumNames class are listed here.

Public Methods

	Name	Description
	Clone (see page 17272)	This is Clone, a member of class IEnumNames.
	Next (see page 17272)	This is Next, a member of class IEnumNames.
	Reset (see page 17272)	This is Reset, a member of class IEnumNames.
	Skip (see page 17272)	This is Skip, a member of class IEnumNames.

104.1.1.2.1 IEnumNames.Clone Method

Pascal

```
function Clone(out enm: IEnumNames): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Clone(IEnumNames enm);
```

Description

This is Clone, a member of class IEnumNames.

104.1.1.2.2 IEnumNames.Next Method

Pascal

```
function Next(celt: UINT; out rgname: WideString; out pceltFetched: UINT): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Next(UINT celt, BSTR rgname, UINT pceltFetched);
```

Description

This is Next, a member of class IEnumNames.

104.1.1.2.3 IEnumNames.Reset Method

Pascal

```
function Reset: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Reset();
```

Description

This is Reset, a member of class IEnumNames.

104.1.1.2.4 IEnumNames.Skip Method

Pascal

```
function Skip(celt: UINT): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Skip(UINT celt);
```

Description

This is Skip, a member of class IEnumNames.

104.1.2 IGetContextProperties Interface

Class Hierarchy

Pascal

```
IGetContextProperties = interface(IUnknown);
```

C++

```
__interface IGetContextProperties : public IUnknown;
```

File

Mtx

Description

This is class Mtx.IGetContextProperties.

104.1.2.1 IGetContextProperties Members

The following tables list the members exposed by IGetContextProperties.

Public Methods

	Name	Description
	Count (see page 17273)	This is Count, a member of class IGetContextProperties.
	EnumNames (see page 17274)	This is EnumNames, a member of class IGetContextProperties.
	GetProperty (see page 17274)	This is GetProperty, a member of class IGetContextProperties.

104.1.2.2 IGetContextProperties Methods

The methods of the IGetContextProperties class are listed here.

Public Methods

	Name	Description
	Count (see page 17273)	This is Count, a member of class IGetContextProperties.
	EnumNames (see page 17274)	This is EnumNames, a member of class IGetContextProperties.
	GetProperty (see page 17274)	This is GetProperty, a member of class IGetContextProperties.

104.1.2.2.1 IGetContextProperties.Count Method

Pascal

```
function Count: Integer; safecall;
```

C++

```
__fastcall int Count();
```

Description

This is Count, a member of class IGetContextProperties.

104.1.2.2.2 IGetContextProperties.EnumNames Method

Pascal

```
function EnumNames: IEnumNames; safecall;
```

C++

```
__fastcall IEnumNames EnumNames();
```

Description

This is EnumNames, a member of class IGetContextProperties.

104.1.2.2.3 IGetContextProperties.GetProperty Method

Pascal

```
function GetProperty(const name: WideString): OleVariant; safecall;
```

C++

```
__fastcall OleVariant GetProperty(const BSTR name);
```

Description

This is GetProperty, a member of class IGetContextProperties.

104.1.3 IObjectContext Interface

Class Hierarchy

Pascal

```
IObjectContext = interface(IUnknown);
```

C++

```
__interface IObjectContext : public IUnknown;
```

File

Mtx

Description

This is class Mtx.IObjectContext.

104.1.3.1 IObjectContext Members

The following tables list the members exposed by IObjectContext.

Public Methods

	Name	Description
	CreateInstance (see page 17275)	This is CreateInstance, a member of class IObjectContext.
	DisableCommit (see page 17275)	This is DisableCommit, a member of class IObjectContext.
	EnableCommit (see page 17276)	This is EnableCommit, a member of class IObjectContext.
	IsCallerInRole (see page 17276)	This is IsCallerInRole, a member of class IObjectContext.
	IsInTransaction (see page 17276)	This is IsInTransaction, a member of class IObjectContext.
	IsSecurityEnabled (see page 17276)	This is IsSecurityEnabled, a member of class IObjectContext.
	SetAbort (see page 17276)	This is SetAbort, a member of class IObjectContext.
	SetComplete (see page 17277)	This is SetComplete, a member of class IObjectContext.

104.1.3.2 IObjectContext Methods

The methods of the IObjectContext class are listed here.

Public Methods

	Name	Description
	CreateInstance (see page 17275)	This is CreateInstance, a member of class IObjectContext.
	DisableCommit (see page 17275)	This is DisableCommit, a member of class IObjectContext.
	EnableCommit (see page 17276)	This is EnableCommit, a member of class IObjectContext.
	IsCallerInRole (see page 17276)	This is IsCallerInRole, a member of class IObjectContext.
	IsInTransaction (see page 17276)	This is IsInTransaction, a member of class IObjectContext.
	IsSecurityEnabled (see page 17276)	This is IsSecurityEnabled, a member of class IObjectContext.
	SetAbort (see page 17276)	This is SetAbort, a member of class IObjectContext.
	SetComplete (see page 17277)	This is SetComplete, a member of class IObjectContext.

104.1.3.2.1 IObjectContext.CreateInstance Method

Pascal

```
function CreateInstance(const cid: TGUID; const rid: TGUID; out pv): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT CreateInstance(const TGUID cid, const TGUID rid,  pv);
```

Description

This is CreateInstance, a member of class IObjectContext.

104.1.3.2.2 IObjectContext.DisableCommit Method

Pascal

```
procedure DisableCommit; safecall;
```

C++

```
__fastcall DisableCommit();
```

Description

This is DisableCommit, a member of class IObjectContext.

104.1.3.2.3 IObjectContext.EnableCommit Method

Pascal

```
procedure EnableCommit; safecall;
```

C++

```
__fastcall EnableCommit();
```

Description

This is EnableCommit, a member of class IObjectContext.

104.1.3.2.4 IObjectContext.IsCallerInRole Method

Pascal

```
function IsCallerInRole(const bstrRole: WideString): Bool; safecall;
```

C++

```
__fastcall Bool IsCallerInRole(const BSTR bstrRole);
```

Description

This is IsCallerInRole, a member of class IObjectContext.

104.1.3.2.5 IObjectContext.IsInTransaction Method

Pascal

```
function IsInTransaction: Bool; stdcall;
```

C++

```
__fastcall __stdcall Bool IsInTransaction();
```

Description

This is IsInTransaction, a member of class IObjectContext.

104.1.3.2.6 IObjectContext.IsSecurityEnabled Method

Pascal

```
function IsSecurityEnabled: Bool; stdcall;
```

C++

```
__fastcall __stdcall Bool IsSecurityEnabled();
```

Description

This is IsSecurityEnabled, a member of class IObjectContext.

104.1.3.2.7 IObjectContext.SetAbort Method

Pascal

```
procedure SetAbort; safecall;
```

C++

```
__fastcall SetAbort();
```

Description

This is SetAbort, a member of class IObjectContext.

104.1.3.2.8 IObjectContext.SetComplete Method

Pascal

```
procedure SetComplete; safecall;
```

C++

```
__fastcall SetComplete();
```

Description

This is SetComplete, a member of class IObjectContext.

104.1.4 IObjectContextActivity Interface

Class Hierarchy

Pascal

```
IObjectContextActivity = interface(IUnknown);
```

C++

```
__interface IObjectContextActivity : public IUnknown;
```

File

Mtx

Description

This is class Mtx.IObjectContextActivity.

104.1.4.1 IObjectContextActivity Members

The following tables list the members exposed by IObjectContextActivity.

Public Methods

	Name	Description
	GetActivityId (see page 17278)	This is GetActivityId, a member of class IObjectContextActivity.

104.1.4.2 IObjectContextActivity Methods

The methods of the IObjectContextActivity class are listed here.

Public Methods

	Name	Description
	GetActivityId (see page 17278)	This is GetActivityId, a member of class IObjectContextActivity.

104.1.4.2.1 IObjectContextActivity.GetActivityId Method

Pascal

```
function GetActivityId: TGuid; safecall;
```

C++

```
__fastcall TGuid GetActivityId();
```

Description

This is GetActivityId, a member of class IObjectContextActivity.

104.1.5 IObjectControl Interface

Class Hierarchy

Pascal

```
IObjectControl = interface(IUnknown);
```

C++

```
__interface IObjectControl : public IUnknown;
```

File

Mtx

Description

This is class Mtx.IObjectControl.

104.1.5.1 IObjectControl Members

The following tables list the members exposed by IObjectControl.

Public Methods

	Name	Description
	Activate (see page 17279)	This is Activate, a member of class IObjectControl.
	CanBePooled (see page 17279)	This is CanBePooled, a member of class IObjectControl.
	Deactivate (see page 17279)	This is Deactivate, a member of class IObjectControl.

104.1.5.2 IObjectControl Methods

The methods of the IObjectControl class are listed here.

Public Methods

	Name	Description
	Activate (see page 17279)	This is Activate, a member of class IObjectControl.
	CanBePooled (see page 17279)	This is CanBePooled, a member of class IObjectControl.
	Deactivate (see page 17279)	This is Deactivate, a member of class IObjectControl.

104.1.5.2.1 IObjectControl.Activate Method

Pascal

```
procedure Activate; safecall;
```

C++

```
__fastcall Activate();
```

Description

This is Activate, a member of class IObjectControl.

104.1.5.2.2 IObjectControl.CanBePooled Method

Pascal

```
function CanBePooled: Bool; stdcall;
```

C++

```
__fastcall __stdcall Bool CanBePooled();
```

Description

This is CanBePooled, a member of class IObjectControl.

104.1.5.2.3 IObjectControl.Deactivate Method

Pascal

```
procedure Deactivate; stdcall;
```

C++

```
__fastcall __stdcall Deactivate();
```

Description

This is Deactivate, a member of class IObjectControl.

104.1.6 ISecurityProperty Interface

Class Hierarchy

Pascal

```
ISecurityProperty = interface(IUnknown);
```

C++

```
__interface ISecurityProperty : public IUnknown;
```

File

Mtx

Description

This is class Mtx.ISecurityProperty.

104.1.6.1 ISecurityProperty Members

The following tables list the members exposed by ISecurityProperty.

Public Methods

	Name	Description
	GetDirectCallerSID (see page 17280)	This is GetDirectCallerSID, a member of class ISecurityProperty.
	GetDirectCreatorSID (see page 17280)	This is GetDirectCreatorSID, a member of class ISecurityProperty.
	GetOriginalCallerSID (see page 17280)	This is GetOriginalCallerSID, a member of class ISecurityProperty.
	GetOriginalCreatorSID (see page 17281)	This is GetOriginalCreatorSID, a member of class ISecurityProperty.
	ReleaseSID (see page 17281)	This is ReleaseSID, a member of class ISecurityProperty.

104.1.6.2 ISecurityProperty Methods

The methods of the ISecurityProperty class are listed here.

Public Methods

	Name	Description
	GetDirectCallerSID (see page 17280)	This is GetDirectCallerSID, a member of class ISecurityProperty.
	GetDirectCreatorSID (see page 17280)	This is GetDirectCreatorSID, a member of class ISecurityProperty.
	GetOriginalCallerSID (see page 17280)	This is GetOriginalCallerSID, a member of class ISecurityProperty.
	GetOriginalCreatorSID (see page 17281)	This is GetOriginalCreatorSID, a member of class ISecurityProperty.
	ReleaseSID (see page 17281)	This is ReleaseSID, a member of class ISecurityProperty.

104.1.6.2.1 ISecurityProperty.GetDirectCallerSID Method

Pascal

```
function GetDirectCallerSID(out sid: PSID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetDirectCallerSID(PSID sid);
```

Description

This is GetDirectCallerSID, a member of class ISecurityProperty.

104.1.6.2.2 ISecurityProperty.GetDirectCreatorSID Method

Pascal

```
function GetDirectCreatorSID(out sid: PSID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetDirectCreatorSID(PSID sid);
```

Description

This is GetDirectCreatorSID, a member of class ISecurityProperty.

104.1.6.2.3 ISecurityProperty.GetOriginalCallerSID Method

Pascal

```
function GetOriginalCallerSID(out sid: PSID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetOriginalCallerSID(PSID sid);
```

Description

This is GetOriginalCallerSID, a member of class ISecurityProperty.

104.1.6.2.4 ISecurityProperty.GetOriginalCreatorSID Method

Pascal

```
function GetOriginalCreatorSID(out sid: PSID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetOriginalCreatorSID(PSID sid);
```

Description

This is GetOriginalCreatorSID, a member of class ISecurityProperty.

104.1.6.2.5 ISecurityProperty.ReleaseSID Method

Pascal

```
function ReleaseSID(sid: PSID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT ReleaseSID(PSID sid);
```

Description

This is ReleaseSID, a member of class ISecurityProperty.

104.1.7 ISharedProperty Interface

Class Hierarchy

Pascal

```
ISharedProperty = interface(IDispatch);
```

C++

```
__interface ISharedProperty : public IDispatch;
```

File

Mtx

Description

This is class Mtx.ISharedProperty.

104.1.7.1 ISharedProperty Members

The following tables list the members exposed by ISharedProperty.

Public Methods

	Name	Description
	Get_Value (see page 17282)	This is Get_Value, a member of class ISharedProperty.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	Set_Value (see page 17282)	This is Set_Value, a member of class ISharedProperty.

Public Properties

	Name	Description
	Value (see page 17283)	This is Value, a member of class ISharedProperty.

104.1.7.2 ISharedProperty Methods

The methods of the ISharedProperty class are listed here.

Public Methods

	Name	Description
	Get_Value (see page 17282)	This is Get_Value, a member of class ISharedProperty.
	Set_Value (see page 17282)	This is Set_Value, a member of class ISharedProperty.

104.1.7.2.1 ISharedProperty.Get_Value Method

Pascal

```
function Get_Value: OleVariant; safecall;
```

C++

```
__fastcall OleVariant Get_Value();
```

Description

This is Get_Value, a member of class ISharedProperty.

104.1.7.2.2 ISharedProperty.Set_Value Method

Pascal

```
procedure Set_Value(pVal: OleVariant); safecall;
```

C++

```
__fastcall Set_Value(OleVariant pVal);
```

Description

This is Set_Value, a member of class ISharedProperty.

104.1.7.3 ISharedProperty Properties

The properties of the ISharedProperty class are listed here.

Public Properties

	Name	Description
	Value (see page 17283)	This is Value, a member of class ISharedProperty.

104.1.7.3.1 ISharedProperty.Value Property

Pascal

```
property Value: OleVariant;
```

C++

```
__property OleVariant Value;
```

Description

This is Value, a member of class ISharedProperty.

104.1.8 ISharedPropertyGroup Interface

Class Hierarchy

Pascal

```
ISharedPropertyGroup = interface(IDispatch);
```

C++

```
__interface ISharedPropertyGroup : public IDispatch;
```

File

Mtx

Description

This is class Mtx.ISharedPropertyGroup.

104.1.8.1 ISharedPropertyGroup Members

The following tables list the members exposed by ISharedPropertyGroup.

Public Methods

	Name	Description
	CreateProperty (see page 17284)	This is CreateProperty, a member of class ISharedPropertyGroup.
	CreatePropertyByPosition (see page 17284)	This is CreatePropertyByPosition, a member of class ISharedPropertyGroup.
	Get_PropertyByName (see page 17284)	This is Get_PropertyByName, a member of class ISharedPropertyGroup.
	Get_PropertyByPosition (see page 17285)	This is Get_PropertyByPosition, a member of class ISharedPropertyGroup.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.

Public Properties

	Name	Description
R	PropertyByName (see page 17285)	This is PropertyByName, a member of class ISharedPropertyGroup.
R	PropertyByPosition (see page 17285)	This is PropertyByPosition, a member of class ISharedPropertyGroup.

104.1.8.2 ISharedPropertyGroup Methods

The methods of the ISharedPropertyGroup class are listed here.

Public Methods

	Name	Description
	CreateProperty (see page 17284)	This is CreateProperty, a member of class ISharedPropertyGroup.
	CreatePropertyByPosition (see page 17284)	This is CreatePropertyByPosition, a member of class ISharedPropertyGroup.
	Get_PropertyByName (see page 17284)	This is Get_PropertyByName, a member of class ISharedPropertyGroup.
	Get_PropertyByPosition (see page 17285)	This is Get_PropertyByPosition, a member of class ISharedPropertyGroup.

104.1.8.2.1 ISharedPropertyGroup.CreateProperty Method

Pascal

```
function CreateProperty(const Name: WideString; out fExists: WordBool): ISharedProperty;
safecall;
```

C++

```
__fastcall ISharedProperty CreateProperty(const BSTR Name, WordBool fExists);
```

Description

This is CreateProperty, a member of class ISharedPropertyGroup.

104.1.8.2.2 ISharedPropertyGroup.CreatePropertyByPosition Method

Pascal

```
function CreatePropertyByPosition(Index: Integer; out fExists: WordBool): ISharedProperty;
safecall;
```

C++

```
__fastcall ISharedProperty CreatePropertyByPosition(int Index, WordBool fExists);
```

Description

This is CreatePropertyByPosition, a member of class ISharedPropertyGroup.

104.1.8.2.3 ISharedPropertyGroup.Get_PropertyByName Method

Pascal

```
function Get_PropertyByName(const Name: WideString): ISharedProperty; safecall;
```

C++

```
__fastcall ISharedProperty Get_PropertyByName(const BSTR Name);
```

Description

This is Get_PropertyByName, a member of class ISharedPropertyGroup.

104.1.8.2.4 ISharedPropertyGroup.Get_PropertyByPosition Method

Pascal

```
function Get_PropertyByPosition(Index: Integer): ISharedProperty; safecall;
```

C++

```
__fastcall ISharedProperty Get_PropertyByPosition(int Index);
```

Description

This is Get_PropertyByPosition, a member of class ISharedPropertyGroup.

104.1.8.3 ISharedPropertyGroup Properties

The properties of the ISharedPropertyGroup class are listed here.

Public Properties

	Name	Description
R	PropertyByName (see page 17285)	This is PropertyByName, a member of class ISharedPropertyGroup.
R	PropertyByPosition (see page 17285)	This is PropertyByPosition, a member of class ISharedPropertyGroup.

104.1.8.3.1 ISharedPropertyGroup.PropertyByName Property

Pascal

```
property PropertyByName [const Name: WideString]: ISharedProperty;
```

C++

```
__property ISharedProperty PropertyByName[BSTR const Name];
```

Description

This is PropertyByName, a member of class ISharedPropertyGroup.

104.1.8.3.2 ISharedPropertyGroup.PropertyByPosition Property

Pascal

```
property PropertyByPosition [Index: Integer]: ISharedProperty;
```

C++

```
__property ISharedProperty PropertyByPosition[int Index];
```

Description

This is PropertyByPosition, a member of class ISharedPropertyGroup.

104.1.9 ISharedPropertyGroupManager Interface

Class Hierarchy

Pascal

```
ISharedPropertyGroupManager = interface(IDispatch);
```

C++

```
__interface ISharedPropertyGroupManager : public IDispatch;
```

File

Mtx

Description

This is class Mtx.ISharedPropertyGroupManager.

104.1.9.1 ISharedPropertyGroupManager Members

The following tables list the members exposed by ISharedPropertyGroupManager.

Public Methods

	Name	Description
	CreatePropertyGroup (see page 17286)	This is CreatePropertyGroup, a member of class ISharedPropertyGroupManager.
	Get__NewEnum (see page 17287)	This is Get__NewEnum, a member of class ISharedPropertyGroupManager.
	Get_Group (see page 17287)	This is Get_Group, a member of class ISharedPropertyGroupManager.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.

Public Properties

	Name	Description
R	_NewEnum (see page 17287)	This is _NewEnum, a member of class ISharedPropertyGroupManager.
R	Group (see page 17287)	This is Group, a member of class ISharedPropertyGroupManager.

104.1.9.2 ISharedPropertyGroupManager Methods

The methods of the ISharedPropertyGroupManager class are listed here.

Public Methods

	Name	Description
	CreatePropertyGroup (see page 17286)	This is CreatePropertyGroup, a member of class ISharedPropertyGroupManager.
	Get__NewEnum (see page 17287)	This is Get__NewEnum, a member of class ISharedPropertyGroupManager.
	Get_Group (see page 17287)	This is Get_Group, a member of class ISharedPropertyGroupManager.

104.1.9.2.1 ISharedPropertyGroupManager.CreatePropertyGroup Method

Pascal

```
function CreatePropertyGroup(const Name: WideString; var LockMode: Integer; var RelMode:
Integer; out fExists: WordBool): ISharedPropertyGroup; safecall;
```

C++

```
__fastcall ISharedPropertyGroup CreatePropertyGroup(const BSTR Name, int LockMode, int
RelMode, WordBool fExists);
```

Description

This is CreatePropertyGroup, a member of class ISharedPropertyGroupManager.

104.1.9.2.2 ISharedPropertyGroupManager.Get__NewEnum Method

Pascal

```
function Get__NewEnum: IUnknown; safecall;
```

C++

```
__fastcall IUnknown Get__NewEnum();
```

Description

This is Get__NewEnum, a member of class ISharedPropertyGroupManager.

104.1.9.2.3 ISharedPropertyGroupManager.Get_Group Method

Pascal

```
function Get_Group(const Name: WideString): ISharedPropertyGroup; safecall;
```

C++

```
__fastcall ISharedPropertyGroup Get_Group(const BSTR Name);
```

Description

This is Get_Group, a member of class ISharedPropertyGroupManager.

104.1.9.3 ISharedPropertyGroupManager Properties

The properties of the ISharedPropertyGroupManager class are listed here.

Public Properties

	Name	Description
R	_NewEnum (see page 17287)	This is _NewEnum, a member of class ISharedPropertyGroupManager.
R	Group (see page 17287)	This is Group, a member of class ISharedPropertyGroupManager.

104.1.9.3.1 ISharedPropertyGroupManager._NewEnum Property

Pascal

```
property _NewEnum: IUnknown;
```

C++

```
__property IUnknown _NewEnum;
```

Description

This is _NewEnum, a member of class ISharedPropertyGroupManager.

104.1.9.3.2 ISharedPropertyGroupManager.Group Property

Pascal

```
property Group [const Name: WideString]: ISharedPropertyGroup;
```

C++

```
__property ISharedPropertyGroup Group[BSTR const Name];
```

Description

This is Group, a member of class ISharedPropertyGroupManager.

104.1.10 ITransactionContext Interface

Class Hierarchy

Pascal

```
ITransactionContext = interface(IDispatch);
```

C++

```
__interface ITransactionContext : public IDispatch;
```

File

Mtx

Description

This is class Mtx.ITransactionContext.

104.1.10.1 ITransactionContext Members

The following tables list the members exposed by ITransactionContext.

Public Methods

	Name	Description
	Abort (see page 17289)	This is Abort, a member of class ITransactionContext.
	Commit (see page 17289)	This is Commit, a member of class ITransactionContext.
	CreateInstance (see page 17289)	This is CreateInstance, a member of class ITransactionContext.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.

104.1.10.2 ITransactionContext Methods

The methods of the ITransactionContext class are listed here.

Public Methods

	Name	Description
	Abort (see page 17289)	This is Abort, a member of class ITransactionContext.
	Commit (see page 17289)	This is Commit, a member of class ITransactionContext.
	CreateInstance (see page 17289)	This is CreateInstance, a member of class ITransactionContext.

104.1.10.2.1 ITransactionContext.Abort Method

Pascal

```
procedure Abort; safecall;
```

C++

```
__fastcall Abort();
```

Description

This is Abort, a member of class ITransactionContext.

104.1.10.2.2 ITransactionContext.Commit Method

Pascal

```
procedure Commit; safecall;
```

C++

```
__fastcall Commit();
```

Description

This is Commit, a member of class ITransactionContext.

104.1.10.2.3 ITransactionContext.CreateInstance Method

Pascal

```
function CreateInstance(const pszProgId: WideString): OleVariant; safecall;
```

C++

```
__fastcall OleVariant CreateInstance(const BSTR pszProgId);
```

Description

This is CreateInstance, a member of class ITransactionContext.

104.1.11 ITransactionContextEx Interface

Class Hierarchy

Pascal

```
ITransactionContextEx = interface(IUnknown);
```

C++

```
__interface ITransactionContextEx : public IUnknown;
```

File

Mtx

Description

This is class Mtx.ITransactionContextEx.

104.1.11.1 ITransactionContextEx Members

The following tables list the members exposed by ITransactionContextEx.

Public Methods

	Name	Description
	Abort (see page 17290)	This is Abort, a member of class ITransactionContextEx.
	Commit (see page 17290)	This is Commit, a member of class ITransactionContextEx.
	CreateInstance (see page 17290)	This is CreateInstance, a member of class ITransactionContextEx.

104.1.11.2 ITransactionContextEx Methods

The methods of the ITransactionContextEx class are listed here.

Public Methods

	Name	Description
	Abort (see page 17290)	This is Abort, a member of class ITransactionContextEx.
	Commit (see page 17290)	This is Commit, a member of class ITransactionContextEx.
	CreateInstance (see page 17290)	This is CreateInstance, a member of class ITransactionContextEx.

104.1.11.2.1 ITransactionContextEx.Abort Method

Pascal

```
function Abort: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Abort();
```

Description

This is Abort, a member of class ITransactionContextEx.

104.1.11.2.2 ITransactionContextEx.Commit Method

Pascal

```
function Commit: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Commit();
```

Description

This is Commit, a member of class ITransactionContextEx.

104.1.11.2.3 ITransactionContextEx.CreateInstance Method

Pascal

```
function CreateInstance(const cid: TGUID; const rid: TGUID; out pv): HRESULT; stdcall;
```

C++

```
__fastcall __stdcall HRESULT CreateInstance(const TGUID cid, const TGUID rid,  pv);
```

Description

This is CreateInstance, a member of class ITransactionContextEx.

104.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CreateSharedPropertyGroup (see page 17292)	Returns the interface for a SharedPropertyGroup that allows MTS objects within a server process to share state.
	CreateSharedPropertyGroupManager (see page 17293)	Returns an interface for a new shared property group manager that creates and coordinates shared properties of MTS objects.
	CreateTransactionContext (see page 17293)	Starts an MTS transaction.
	CreateTransactionContextEx (see page 17294)	Instantiates a TransactionContextEx object, which marks the beginning of a transaction.
	GetObjectContext (see page 17295)	Fetches the IObjectContext (see page 17274) interface for the current thread.
	SafeRef (see page 17295)	Returns a reference to a transactional object that is safe to pass outside its context.

104.2.1 Mtx.CreateSharedPropertyGroup Function

Returns the interface for a SharedPropertyGroup that allows MTS objects within a server process to share state.

Pascal

```
function CreateSharedPropertyGroup(const Name: WideString): ISharedPropertyGroup;
```

C++

```
ISharedPropertyGroup CreateSharedPropertyGroup(const BSTR Name);
```

File

Mtx

Description

CreateSharedPropertyGroup returns an interface to a new shared property group. If a property group of the specified name exists, it returns a reference to the existing shared property group. Use this function to create and access the shared properties of a shared property group.

CreateSharedPropertyGroup sets up a SharedPropertyGroup with the default values of LockSetGet (see page 17298) for locking (isolation) mode, and Process (see page 17302) for release mode. LockSetGet (see page 17298) locks a property during every get or set operation on a shared property, making each operation atomic. This ensures that two clients cannot read or write to the same property at the same time, but it does not prevent other clients from concurrently accessing other properties in the same group. The Process (see page 17302) release mode ensures that the property group is not destroyed until the process in which it was created has terminated. (Objects that hold references on a property group must still call Release on their references).

To override these defaults, call CreateSharedPropertyGroupManager (see page 17293) and use the resulting interface to create a property group.

ISharedPropertyGroup (see page 17283) has several methods that can be used to share state among multiple objects in a server process. See ISharedPropertyGroup (see page 17283) in the MTS documentation for a list of methods.

By using shared property groups, you eliminate name collisions because they establish unique name spaces for the shared

properties they contain. The Shared Property Manager also implements locks and semaphores to protect shared properties from simultaneous access, which could result in lost updates and could leave the properties in an unpredictable state.

Note: Only objects running in the same process can share properties. If you want instances of different components to share properties, you have to install the components in the same MTS package. Because there is a risk that administrators will move components from one package to another, it's safest to limit the use of a shared property group to instances of components that are defined in the same DLL.

See Also

CreateSharedPropertyGroupManager

104.2.2 Mtx.CreateSharedPropertyGroupManager Function

Returns an interface for a new shared property group manager that creates and coordinates shared properties of MTS objects.

Pascal

```
function CreateSharedPropertyGroupManager: ISharedPropertyGroupManager;
```

C++

```
ISharedPropertyGroupManager CreateSharedPropertyGroupManager();
```

File

Mtx

Description

Call CreateSharedPropertyGroupManager before creating shared property groups if you are not using the CreateSharedPropertyGroup (see page 17292) function. The ISharedPropertyGroupManager (see page 17285) interface lets you create and access shared properties with more control that is provided by CreateSharedPropertyGroup (see page 17292).

By using shared property groups, you eliminate name collisions because they establish unique name spaces for the shared properties they contain. The Shared Property Manager also implements locks and semaphores to protect shared properties from simultaneous access, which could result in lost updates and could leave the properties in an unpredictable state.

For more information about the ISharedPropertyGroupManager (see page 17285) interface, see the MTS documentation.

CreateSharedPropertyGroup

104.2.3 Mtx.CreateTransactionContext Function

Starts an MTS transaction.

Pascal

```
function CreateTransactionContext: ITransactionContext;
```

C++

```
ITransactionContext CreateTransactionContext();
```

File

Mtx

Description

CreateTransactionContext allows client applications to control MTS transactions. CreateTransactionContext returns an interface to the new transaction context. Use this interface to enlist MTS server objects in the transaction, and to commit or roll back the transaction when done.

See Also

CreateTransactionContextEx

TMtsAutoObject

TMtsAutoObject

TMtsDataModule

TMtsDataModule

104.2.4 Mtx.CreateTransactionContextEx Function

Instantiates a TransactionContextEx object, which marks the beginning of a transaction.

Pascal

```
function CreateTransactionContextEx: ITransactionContextEx;
```

C++

```
ITransactionContextEx CreateTransactionContextEx();
```

File

Mtx

Description

MTS base clients use CreateTransactionEx to combine the work of one or more MTS objects into an atomic transaction and to commit or abort the transaction. Clients initiate a transaction by instantiating a CreateTransactionEx object. Clients end a transaction by calling Complete or Abort on the object.

Method	Description
Abort	Aborts the work of all MTS objects participating in the current transaction. The transaction is completed on return from this method.
Commit	Attempts to commit the work of all MTS objects participating in the current transaction. If any of the MTS objects participating in the transaction call SetAbort or DisableCommit, or if a system error occurs, the transaction is aborted. Otherwise, the transaction is committed. In either case, the transaction is completed on return from this method.
CreateInstance	Instantiates another MTS object. If the component that provides the object is configured to support or require a transaction, then the new object runs under the transaction of the TransactionContextEx object.

TMtsDataModule

104.2.5 Mtx.GetObjectContext Function

Fetches the IObjectContext (see page 17274) interface for the current thread.

Pascal

```
function GetObjectContext: IObjectContext;
```

C++

```
IObjectContext GetObjectContext();
```

File

Mtx

Description

When a COM object is created as part of the MTS environment or of a COM+ package (that is, a transactional object), a corresponding context object is also created. This context object exists for the entire lifetime of its transactional object, across one or more reactivation cycles. The object context keeps track of the object during deactivation. Call GetObjectContext to obtain an IObjectContext (see page 17274) interface pointer for the context object associated with the current thread.

Pass a pointer that receives the IObjectContext (see page 17274) interface pointer as ppInstanceContext.

GetObjectContext returns S_OK if it returns a pointer to the context object. Otherwise, it returns an error code.

Note: C++Builder automatically fetches the IObjectContext (see page 17274) interface when a transactional object is activated. The interface pointer is stored as the m_spObjectContext member of the transactional object's class.

Warning: When writing a transactional object that uses VCL classes, use the Get_ObjectContext method of TMtsDll instead. ComSvcs.h defines GetObjectContext using a macro so that it calls COM+ or MTS, depending on the system you use to build the transactional object. This macro interferes with the GetObjectContext method of some VCL classes, and so it is undefined when you include the VCL headers.

See Also

TMtsDll

104.2.6 Mtx.SafeRef Function

Returns a reference to a transactional object that is safe to pass outside its context.

Pascal

```
function SafeRef(const rid: TGUID; Unk: IUnknown): Pointer;
```

C++

```
void * SafeRef(const TGUID rid, IUnknown Unk);
```

File

Mtx

Description

SafeRef encapsulates the SafeRef MTS function that passes in

a reference to the interface ID of the interface (rid) that the current object wants to pass to another object or client

and

a reference to an interface on the current object (pUnk).

SafeRef returns a pointer to the interface specified in the rid parameter that is safe to pass outside the current object's context.

When using COM+, it is always safe to pass a self-reference to a client or other object. Thus, when you call SafeRef in an application that is running under a version of Windows that implemnts COM+, SafeRef simply returns the pointer passed as pUnk. Thus, it is not necessary to call SafeRef for COM+ applications. It will, however, do no harm in an application that is used under both MTS and COM+.

Under MTS, and should always call SafeRef before passing a self-reference to a client or other object and then pass the reference returned by this call. Under MTS, it is not safe for an object to pass a self pointer (Delphi) or this pointer (C++), or a self-reference obtained through an internal call to QueryInterface, to a client or to any other object. Once such a reference is passed outside the object's context, it is no longer a valid reference.

Calling SafeRef on a reference that is already safe returns the safe reference unchanged, except that the reference count on the interface is incremented.

When a client calls QueryInterface on a reference that is safe, MTS automatically ensures that the reference returned to the client is also a safe reference.

An object that obtains a safe reference must release the safe reference when it is finished with it.

Under MTS, safe references have different pointer values than their unsafe counterparts. For example, self or this and the safe version of self or this do not have the same value. It is important to be aware of this when testing whether two pointers refer to the same object. Calling QueryInterface for IID_IUnknown on each of the pointers and comparing the value of the returned pointers may result in the wrong conclusion. It is possible that both pointers refer to the same object, but that one is a safe reference and the other is not. If both references are safe references, they can be compared in the usual way. This is only a consideration for MTS objects, because clients should never have access to unsafe references.

Note: When writing a transactional object that may be installed under either MTS or COM+, use the SafeRef method of TMtsDll instead. TMtsDll automatically checks the current environment and returns the appropriate reference.

104.3 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CLASS_SharedPropertyGroupManager (see page 17297)	This is constant Mtx.CLASS_SharedPropertyGroupManager.
CLASS_TransactionContext (see page 17297)	This is constant Mtx.CLASS_TransactionContext.
CLASS_TransactionContextEx (see page 17298)	This is constant Mtx.CLASS_TransactionContextEx.
LockMethod (see page 17298)	This is constant Mtx.LockMethod.
LockSetGet (see page 17298)	This is constant Mtx.LockSetGet.
mtsErrCtxAborted (see page 17299)	This is constant Mtx.mtsErrCtxAborted.
mtsErrCtxAborting (see page 17299)	This is constant Mtx.mtsErrCtxAborting.
mtsErrCtxActivityTimeout (see page 17299)	This is constant Mtx.mtsErrCtxActivityTimeout.
mtsErrCtxNoContext (see page 17300)	This is constant Mtx.mtsErrCtxNoContext.
mtsErrCtxNoSecurity (see page 17300)	This is constant Mtx.mtsErrCtxNoSecurity.
mtsErrCtxNotRegistered (see page 17300)	This is constant Mtx.mtsErrCtxNotRegistered.
mtsErrCtxOldReference (see page 17301)	This is constant Mtx.mtsErrCtxOldReference.
mtsErrCtxRoleNotFound (see page 17301)	This is constant Mtx.mtsErrCtxRoleNotFound.
mtsErrCtxTMNotAvailable (see page 17301)	This is constant Mtx.mtsErrCtxTMNotAvailable.
mtsErrCtxWrongThread (see page 17302)	This is constant Mtx.mtsErrCtxWrongThread.
Process (see page 17302)	This is constant Mtx.Process.
Standard (see page 17302)	This is constant Mtx.Standard.

104.3.1 Mtx.CLASS_SharedPropertyGroupManager Constant

Pascal

```
CLASS_SharedPropertyGroupManager: TGUID = '{2A005C11-A5DE-11CF-9E66-00AA00A3F464}';
```

C++

```
TGUID CLASS_SharedPropertyGroupManager = '{2A005C11-A5DE-11CF-9E66-00AA00A3F464}';
```

File

Mtx

Description

This is constant Mtx.CLASS_SharedPropertyGroupManager.

104.3.2 Mtx.CLASS_TransactionContext Constant

Pascal

```
CLASS_TransactionContext: TGUID = '{7999FC25-D3C6-11CF-ACAB-00A024A55AEF}';
```

C++

```
TGUID CLASS_TransactionContext = '{7999FC25-D3C6-11CF-ACAB-00A024A55AEF}';
```

File

Mtx

Description

This is constant Mtx.CLASS_TransactionContext.

104.3.3 Mtx.CLASS_TransactionContextEx Constant

Pascal

```
CLASS_TransactionContextEx: TGUID = '{5CB66670-D3D4-11CF-ACAB-00A024A55AEF}';
```

C++

```
TGUID CLASS_TransactionContextEx = '{5CB66670-D3D4-11CF-ACAB-00A024A55AEF}';
```

File

Mtx

Description

This is constant Mtx.CLASS_TransactionContextEx.

104.3.4 Mtx.LockMethod Constant

Pascal

```
LockMethod = $00000001;
```

C++

```
LockMethod = 0x00000001;
```

File

Mtx

Description

This is constant Mtx.LockMethod.

104.3.5 Mtx.LockSetGet Constant

Pascal

```
LockSetGet = $00000000;
```

C++

```
LockSetGet = 0x00000000;
```

File

Mtx

Description

This is constant Mtx.LockSetGet.

104.3.6 Mtx.mtsErrCtxAborted Constant

Pascal

```
mtsErrCtxAborted = $8004E002;
```

C++

```
mtsErrCtxAborted = 0x8004E002;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxAborted.

104.3.7 Mtx.mtsErrCtxAborting Constant

Pascal

```
mtsErrCtxAborting = $8004E003;
```

C++

```
mtsErrCtxAborting = 0x8004E003;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxAborting.

104.3.8 Mtx.mtsErrCtxActivityTimeout Constant

Pascal

```
mtsErrCtxActivityTimeout = $8004E006;
```

C++

```
mtsErrCtxActivityTimeout = 0x8004E006;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxActivityTimeout.

104.3.9 Mtx.mtsErrCtxNoContext Constant

Pascal

```
mtsErrCtxNoContext = $8004E004;
```

C++

```
mtsErrCtxNoContext = 0x8004E004;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxNoContext.

104.3.10 Mtx.mtsErrCtxNoSecurity Constant

Pascal

```
mtsErrCtxNoSecurity = $8004E00D;
```

C++

```
mtsErrCtxNoSecurity = 0x8004E00D;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxNoSecurity.

104.3.11 Mtx.mtsErrCtxNotRegistered Constant

Pascal

```
mtsErrCtxNotRegistered = $8004E005;
```

C++

```
mtsErrCtxNotRegistered = 0x8004E005;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxNotRegistered.

104.3.12 Mtx.mtsErrCtxOldReference Constant

Pascal

```
mtsErrCtxOldReference = $8004E007;
```

C++

```
mtsErrCtxOldReference = 0x8004E007;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxOldReference.

104.3.13 Mtx.mtsErrCtxRoleNotFound Constant

Pascal

```
mtsErrCtxRoleNotFound = $8004E00C;
```

C++

```
mtsErrCtxRoleNotFound = 0x8004E00C;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxRoleNotFound.

104.3.14 Mtx.mtsErrCtxTMNotAvailable Constant

Pascal

```
mtsErrCtxTMNotAvailable = $8004E00F;
```

C++

```
mtsErrCtxTMNotAvailable = 0x8004E00F;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxTMNotAvailable.

104.3.15 Mtx.mtsErrCtxWrongThread Constant

Pascal

```
mtsErrCtxWrongThread = $8004E00E;
```

C++

```
mtsErrCtxWrongThread = 0x8004E00E;
```

File

Mtx

Description

This is constant Mtx.mtsErrCtxWrongThread.

104.3.16 Mtx.Process Constant

Pascal

```
Process = $00000001;
```

C++

```
Process = 0x00000001;
```

File

Mtx

Description

This is constant Mtx.Process.

104.3.17 Mtx.Standard Constant

Pascal

```
Standard = $00000000;
```

C++

```
Standard = 0x00000000;
```

File

Mtx

Description

This is constant Mtx.Standard.

105 Mxarrays Namespace

This is namespace Mxarrays.

Topics

Name	Description
Classes (see page 17305)	The following table lists classes in this documentation.
Functions (see page 17386)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 17387)	The following table lists structs, records, enums in this documentation.
Types (see page 17390)	The following table lists types in this documentation.
Constants (see page 17394)	The following table lists constants in this documentation.

Classes

	Name	Description
	EArrayError (see page 17305)	EArrayError is the exception class for failures that occur when manipulating a descendant of TBaseArray (see page 17307).
	EDynArrayRangeError (see page 17306)	This is class Mxarrays.EDynArrayRangeError.
	ELowCapacityError (see page 17306)	ELowCapacityError is the exception class for when an attempt is made to allocate more memory than is available for the decision cube.
	EUnsupportedTypeError (see page 17307)	EUnsupportedTypeError is the exception class for failures that occur when adding dimensions to the cache of a decision cube.
	TBaseArray (see page 17307)	TBaseArray is the base class for all arrays used by the decision cube components.
	TCurrencyArray (see page 17322)	This is class Mxarrays.TCurrencyArray.
	TCustomArray (see page 17328)	This is class Mxarrays.TCustomArray.
	TDoubleArray (see page 17337)	This is class Mxarrays.TDoubleArray.
	TIndexArray (see page 17342)	This is class Mxarrays.TIndexArray.
	TIntArray (see page 17346)	This is class Mxarrays.TIntArray.
	TPointerArray (see page 17351)	This is class Mxarrays.TPointerArray.
	TSingleArray (see page 17356)	This is class Mxarrays.TSingleArray.
	TSmallIntArray (see page 17361)	TSmallIntArray is a dynamically resizable array of 16-bit integers.
	TStringArray (see page 17367)	This is class Mxarrays.TStringArray.
	TThreadCustomArray (see page 17374)	This is class Mxarrays.TThreadCustomArray.
	TTwoDimArray (see page 17377)	This is class Mxarrays.TTwoDimArray.
	TWordArray (see page 17380)	This is class Mxarrays.TWordArray.

Constants

Name	Description
vMaxCol (see page 17394)	This is constant Mxarrays.vMaxCol.
vMaxRow (see page 17394)	This is constant Mxarrays.vMaxRow.

Functions

	Name	Description
	GetMemoryCapacity (see page 17386)	This is function Mxarrays.GetMemoryCapacity.
	SetMemoryCapacity (see page 17386)	This is function Mxarrays.SetMemoryCapacity.

Structs, Records, Enums

	Name	Description
	TArrayFlags (see page 17387)	This is record Mxarrays.TArrayFlags.
	TDuplicates (see page 17387)	This is record Mxarrays.TDuplicates.
	TSortOrder (see page 17388)	This is record Mxarrays.TSortOrder.
	TStringItem (see page 17388)	This is record Mxarrays.TStringItem.

Types

Name	Description
PIndexElements (see page 17390)	This is type Mxarrays.PIndexElements.
PMatrixElements (see page 17390)	This is type Mxarrays.PMatrixElements.
TArrayFlagSet (see page 17391)	This is type Mxarrays.TArrayFlagSet.
TCompareProc (see page 17391)	This is type Mxarrays.TCompareProc.
TDynArrayNDX (see page 17391)	This is type Mxarrays.TDynArrayNDX.
TIndexElements (see page 17392)	This is type Mxarrays.TIndexElements.
TIndexNDX (see page 17392)	This is type Mxarrays.TIndexNDX.
TMatrixElements (see page 17392)	This is type Mxarrays.TMatrixElements.
TMatrixNDX (see page 17393)	This is type Mxarrays.TMatrixNDX.

105.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EArrayError (see page 17305)	EArrayError is the exception class for failures that occur when manipulating a descendant of TBaseArray (see page 17307).
	EDynArrayRangeError (see page 17306)	This is class Mxarrays.EDynArrayRangeError.
	ELowCapacityError (see page 17306)	ELowCapacityError is the exception class for when an attempt is made to allocate more memory than is available for the decision cube.
	EUnsupportedTypeError (see page 17307)	EUnsupportedTypeError is the exception class for failures that occur when adding dimensions to the cache of a decision cube.
	TBaseArray (see page 17307)	TBaseArray is the base class for all arrays used by the decision cube components.
	TCurrencyArray (see page 17322)	This is class Mxarrays.TCurrencyArray.
	TCustomArray (see page 17328)	This is class Mxarrays.TCustomArray.
	TDoubleArray (see page 17337)	This is class Mxarrays.TDoubleArray.
	TIndexArray (see page 17342)	This is class Mxarrays.TIndexArray.
	TIntArray (see page 17346)	This is class Mxarrays.TIntArray.
	TPointerArray (see page 17351)	This is class Mxarrays.TPointerArray.
	TSingleArray (see page 17356)	This is class Mxarrays.TSingleArray.
	TSmallIntArray (see page 17361)	TSmallIntArray is a dynamically resizable array of 16-bit integers.
	TStringArray (see page 17367)	This is class Mxarrays.TStringArray.
	TThreadCustomArray (see page 17374)	This is class Mxarrays.TThreadCustomArray.
	TTwoDimArray (see page 17377)	This is class Mxarrays.TTwoDimArray.
	TWordArray (see page 17380)	This is class Mxarrays.TWordArray.

105.1.1 EArrayError Class

EArrayError is the exception class for failures that occur when manipulating a descendant of TBaseArray (see page 17307).

Class Hierarchy

Pascal

```
EArrayError = class(Exception);
```

C++

```
class EArrayError : public Exception;
```

File

Mxarrays

Description

EArrayError is raised when an application tries to

Use an invalid index when accessing the elements of an array.

Add too many elements into a fixed-capacity array.

Insert an element into a sorted array.

See Also

TBaseArray (see page 17307)

105.1.2 EDynArrayRangeError Class

Class Hierarchy

Pascal

```
EDynArrayRangeError = class(ERangeError);
```

C++

```
class EDynArrayRangeError : public ERangeError;
```

File

Mxarrays

Description

This is class Mxarrays.EDynArrayRangeError.

105.1.3 ELowCapacityError Class

ELowCapacityError is the exception class for when an attempt is made to allocate more memory than is available for the decision cube.

Class Hierarchy

Pascal

```
ELowCapacityError = class(Exception);
```

C++

```
class ELowCapacityError : public Exception;
```

File

Mxarrays

Description

ELowCapacityError is raised when the cache of a decision cube is too big. The memory available to the decision cube can be increased by changing the Capacity property of the decision cube or the memory demands of the decision cube can be reduced by deactivating some of the cube dimensions.

See Also

TCubeDim (see page 17754)

TDecisionCube (see page 17442)

105.1.4 EUnsupportedTypeError Class

EUnsupportedTypeError is the exception class for failures that occur when adding dimensions to the cache of a decision cube.

Class Hierarchy

Pascal

```
EUnsupportedTypeError = class(Exception);
```

C++

```
class EUnsupportedTypeError : public Exception;
```

File

Mxarrays

Description

EUnsupportedTypeError is raised when an invalid field type is chosen as an active dimension in a decision cube. For example, making a dimension that corresponds to a BLOB field active raises an EUnsupportedTypeError.

See Also

TBlobField (see page 6801)

TDecisionCube (see page 17442)

105.1.5 TBaseArray Class

TBaseArray is the base class for all arrays used by the decision cube components.

Class Hierarchy

Pascal

```
TBaseArray = class(TPersistent);
```

C++

```
class TBaseArray : public TPersistent;
```

File

Mxarrays

Description

Use TBaseArray as a base class when defining a specialized array for a specific data type. Like the TList or TStringList object, TBaseArray represents an ordered list of items that can grow dynamically. However, the elements of TBaseArray are arbitrary types whose size is specified in the constructor, while TStringList is limited to strings and TList is limited to pointers.

Descendants of TBaseArray represent arrays of specific data types such as short integers.

Note: TBaseArray is only available in the Enterprise edition.

See Also

TList (see page 2868)

TSmallIntArray (see page 17361)

TStringList (see page 3006)

105.1.5.1 TBaseArray Members

The following tables list the members exposed by TBaseArray.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BlockCopy (see page 17311)	This is BlockCopy, a member of class TBaseArray.
	ClearFlag (see page 17311)	This is ClearFlag, a member of class TBaseArray.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetAutoSize (see page 17313)	This is GetAutoSize, a member of class TBaseArray.
	GetOwner (see page 2932)	Returns the owner of an object.
	Grow (see page 17313)	This is Grow, a member of class TBaseArray.
	HasFlag (see page 17314)	This is HasFlag, a member of class TBaseArray.
	InternalHandleException (see page 17315)	This is InternalHandleException, a member of class TBaseArray.
	InvalidateItems (see page 17315)	This is InvalidateItems, a member of class TBaseArray.
	RemoveRange (see page 17316)	This is RemoveRange, a member of class TBaseArray.
	SetAutoSize (see page 17316)	This is SetAutoSize, a member of class TBaseArray.
	SetCapacity (see page 17317)	This is SetCapacity, a member of class TBaseArray.
	SetFlag (see page 17317)	This is SetFlag, a member of class TBaseArray.
	ValidateBounds (see page 17317)	This is ValidateBounds, a member of class TBaseArray.
	ValidIndex (see page 17318)	This is ValidIndex, a member of class TBaseArray.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 17311)	Clear removes all items from the array.
	Create (see page 17309)	Creates an instance of TBaseArray (see page 17307) for elements of a specific size.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 17312)	Removes an element from the array.
	Destroy (see page 17310)	Destroys an instance of TBaseArray (see page 17307).
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Exchange (see page 17312)	Provides the interface for a method that swaps the values of two elements in the array.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindItem (see page 17312)	Locates a value in a sorted array and indicates whether an element with that value already exists.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItem (see page 17313)	Returns the element in the array at the indicated position.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	IndexOf (see page 17314)	Returns the position of the first element with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	Insert (see page 17314)	Inserts an element into the array and assigns it a value.
	InsertAt (see page 17315)	Adds an element to the array at the position specified by Index.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PutItem (see page 17315)	Replaces the value of an element in the array.
	RemoveItem (see page 17316)	Removes an element from the array.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Sort (see page 17317)	Provides the interface for a method that sorts the elements in the array.

Public Properties

	Name	Description
	AutoSize (see page 17318)	Indicates whether the array grows dynamically as items are added.
	Capacity (see page 17319)	Specifies the maximum number of items that can be added to the array.
	CompareProc (see page 17319)	Implements a sort order for the elements of the array.
	Count (see page 17320)	Specifies the number of items in the array.
	Duplicates (see page 17320)	Specifies whether duplicate items can be added to sorted arrays.
R	ItemSize (see page 17321)	Indicates the number of bytes used to store each item in the array.
	Limit (see page 17321)	Specifies the size of the array.
R	List (see page 17321)	Points to the array of values maintained by TBaseArray (see page 17307).
	SortOrder (see page 17322)	Determines whether the array is sorted.

105.1.5.2 TBaseArray.Create Constructor

Creates an instance of TBaseArray (see page 17307) for elements of a specific size.

Pascal

```
constructor Create(itemcount: Integer; iSize: Integer); virtual;
```

C++

```
virtual __fastcall TBaseArray(int itemcount, int iSize);
```

Description

Call Create to create an array containing elements with the size specified by the iSize parameter.Create sets the Capacity (see page 17319) property to Itemcount and the ItemSize (see page 17321) property to iSize. It also initializes the AutoSize (see page 17318) property to true and the Count (see page 17320) property to 0.

See Also

AutoSize (see page 17318)

Capacity (see page 17319)

Count (see page 17320)

ItemSize (see page 17321)

Create (see page 22287)

105.1.5.3 TBaseArray.Destroy Destructor

Destroys an instance of TBaseArray (see page 17307).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBaseArray();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the array reference is not nil before calling Destroy.

Destroy frees the memory allocated to hold the list of elements before calling the inherited destructor.

See Also

Free (see page 22300)

105.1.5.4 TBaseArray Methods

The methods of the TBaseArray class are listed here.

Protected Methods

	Name	Description
	BlockCopy (see page 17311)	This is BlockCopy, a member of class TBaseArray.
	ClearFlag (see page 17311)	This is ClearFlag, a member of class TBaseArray.
	GetAutoSize (see page 17313)	This is GetAutoSize, a member of class TBaseArray.
V	Grow (see page 17313)	This is Grow, a member of class TBaseArray.
	HasFlag (see page 17314)	This is HasFlag, a member of class TBaseArray.
	InternalHandleException (see page 17315)	This is InternalHandleException, a member of class TBaseArray.
V	InvalidateItems (see page 17315)	This is InvalidateItems, a member of class TBaseArray.
	RemoveRange (see page 17316)	This is RemoveRange, a member of class TBaseArray.
	SetAutoSize (see page 17316)	This is SetAutoSize, a member of class TBaseArray.
V	SetCapacity (see page 17317)	This is SetCapacity, a member of class TBaseArray.
	SetFlag (see page 17317)	This is SetFlag, a member of class TBaseArray.
	ValidateBounds (see page 17317)	This is ValidateBounds, a member of class TBaseArray.
	ValidIndex (see page 17318)	This is ValidIndex, a member of class TBaseArray.

Public Methods

	Name	Description
	Clear (see page 17311)	Clear removes all items from the array.

	Delete (see page 17312)	Removes an element from the array.
	Exchange (see page 17312)	Provides the interface for a method that swaps the values of two elements in the array.
	FindItem (see page 17312)	Locates a value in a sorted array and indicates whether an element with that value already exists.
	GetItem (see page 17313)	Returns the element in the array at the indicated position.
	IndexOf (see page 17314)	Returns the position of the first element with a specified value.
	Insert (see page 17314)	Inserts an element into the array and assigns it a value.
	InsertAt (see page 17315)	Adds an element to the array at the position specified by Index.
	PutItem (see page 17315)	Replaces the value of an element in the array.
	RemoveItem (see page 17316)	Removes an element from the array.
	Sort (see page 17317)	Provides the interface for a method that sorts the elements in the array.

105.1.5.4.1 TBaseArray.BlockCopy Method

Pascal

```
procedure BlockCopy(Source: TBaseArray; fromIndex: Integer; toIndex: Integer; numitems:
Integer);
```

C++

```
__fastcall BlockCopy(TBaseArray Source, int fromIndex, int toIndex, int numitems);
```

Description

This is BlockCopy, a member of class TBaseArray.

105.1.5.4.2 TBaseArray.Clear Method

Clear removes all items from the array.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the array and free all associated memory. Clear does the same thing as setting both the Count (see page 17320) and Capacity (see page 17319) properties to 0.

See Also

Capacity (see page 17319)

Count (see page 17320)

105.1.5.4.3 TBaseArray.ClearFlag Method

Pascal

```
procedure ClearFlag(aFlag: TArrayFlags);
```

C++

```
__fastcall ClearFlag(TArrayFlags aFlag);
```

Description

This is ClearFlag, a member of class TBaseArray.

105.1.5.4.4 TBaseArray.Delete Method

Removes an element from the array.

Pascal

```
procedure Delete(Index: Integer); virtual;
```

C++

```
virtual __fastcall Delete(int Index);
```

Description

Call Delete to remove the element indicated by the Index parameter, where 0 is the first element, 1 is the second element, and so on. All subsequent elements in the array are moved up to fill the gap left when the element is removed.

See Also

Clear (see page 17311)

Insert (see page 17314)

105.1.5.4.5 TBaseArray.Exchange Method

Provides the interface for a method that swaps the values of two elements in the array.

Pascal

```
procedure Exchange(Index1: Integer; Index2: Integer); virtual;
```

C++

```
virtual __fastcall Exchange(int Index1, int Index2);
```

Description

The Exchange method for TBaseArray (see page 17307) does nothing other than provide an interface for a method that interchanges the values of two elements.

See Also

IndexOf (see page 17314)

GetItem (see page 17313)

105.1.5.4.6 TBaseArray.FindItem Method

Locates a value in a sorted array and indicates whether an element with that value already exists.

Pascal

```
function FindItem(var Index: Integer; var Value): Boolean;
```

C++

```
__fastcall Boolean FindItem(int Index,  Value);
```

Description

Use FindItem to obtain the index in a sorted array where an element with the value Value should be added. If an element with the value Value already exists in the array, FindItem returns true. If none of the elements in the array have the value Value, FindItem returns false.

The index where Value should appear is returned in the Index parameter. The value of Index is zero-based, where the first

element has the index 0, the second element has the index 1, and so on.

Note: FindItem assumes the SortOrder (see page 17322) property is TS_ASCENDING. For unsorted arrays, use the IndexOf (see page 17314) method instead. For descending arrays, invert the CompareProc (see page 17319) property before calling FindItem.

See Also

Duplicates (see page 17320)

IndexOf (see page 17314)

SortOrder (see page 17322)

105.1.5.4.7 TBaseArray.GetAutoSize Method

Pascal

```
function GetAutoSize: Boolean;
```

C++

```
__fastcall Boolean GetAutoSize();
```

Description

This is GetAutoSize, a member of class TBaseArray.

105.1.5.4.8 TBaseArray.GetItem Method

Returns the element in the array at the indicated position.

Pascal

```
procedure GetItem(index: Integer; var Value);
```

C++

```
__fastcall GetItem(int index,  Value);
```

Description

Call GetItem to obtain the value of an element in the array. The Index parameter indicates the element of the array, where the first element has the index 0, the second element has the index 1, and so on.

See Also

FindItem (see page 17312)

IndexOf (see page 17314)

105.1.5.4.9 TBaseArray.Grow Method

Pascal

```
procedure Grow; virtual;
```

C++

```
virtual __fastcall Grow();
```

Description

This is Grow, a member of class TBaseArray.

105.1.5.4.10 TBaseArray.HasFlag Method

Pascal

```
function HasFlag(aFlag: TArrayFlags): Boolean;
```

C++

```
__fastcall Boolean HasFlag(TArrayFlags aFlag);
```

Description

This is HasFlag, a member of class TBaseArray.

105.1.5.4.11 TBaseArray.IndexOf Method

Returns the position of the first element with a specified value.

Pascal

```
function IndexOf(var Item): Integer; virtual;
```

C++

```
virtual __fastcall int IndexOf( Item);
```

Description

Call IndexOf to obtain the position of the first occurrence of the value Value. IndexOf returns the 0-based index of the element. Thus, if Value matches the first element in the array, IndexOf returns 0, if Value matches the second element, IndexOf returns 1, and so on. If the value is not in the array, IndexOf returns -1.

Note: IndexOf does not work for arrays sorted in descending order.

See Also

FindItem (see page 17312)

GetItem (see page 17313)

105.1.5.4.12 TBaseArray.Insert Method

Inserts an element into the array and assigns it a value.

Pascal

```
procedure Insert(Index: Integer; var Value); virtual;
```

C++

```
virtual __fastcall Insert(int Index,  Value);
```

Description

Call InsertAt (see page 17315) to add an element to the array at the position specified by Index and assign it the value of Value. If Index is 0, the element is inserted at the beginning of the array. If Index is 1, the element is put in the second position of the array, and so on.

Note: Insert does not check the SortOrder (see page 17322) property. If the array is sorted, be sure to insert the element in the proper sort order position.

See Also

Delete (see page 17312)

PutItem (see page 17315)

SortOrder (see page 17322)

105.1.5.4.13 TBaseArray.InsertAt Method

Adds an element to the array at the position specified by Index.

Pascal

```
procedure InsertAt(Index: Integer; var Value);
```

C++

```
__fastcall InsertAt(int Index,  Value);
```

Description

InsertAt does the same thing as the Insert (see page 17314) method. For most purposes, use the Insert (see page 17314) method.

Descendants of TBaseArray (see page 17307) can override the Insert (see page 17314) method to raise an exception when an attempt is made to insert an element in a sorted array. InsertAt always succeeds as long as the value of Index is appropriate. InsertAt is intended for internal use when the value of Index is known to be appropriate.

See Also

Insert (see page 17314)

105.1.5.4.14 TBaseArray.InternalHandleException Method

Pascal

```
procedure InternalHandleException;
```

C++

```
__fastcall InternalHandleException();
```

Description

This is InternalHandleException, a member of class TBaseArray.

105.1.5.4.15 TBaseArray.InvalidateItems Method

Pascal

```
procedure InvalidateItems(atIndex: Integer; numItems: Integer); virtual;
```

C++

```
virtual __fastcall InvalidateItems(int atIndex, int numItems);
```

Description

This is InvalidateItems, a member of class TBaseArray.

105.1.5.4.16 TBaseArray.PutItem Method

Replaces the value of an element in the array.

Pascal

```
procedure PutItem(index: Integer; var Value);
```

C++

```
__fastcall PutItem(int index,  Value);
```

Description

Call PutItem to change the value of an element to the value Value. Unlike the Insert (see page 17314) method, PutItem does not add a new item to the array, but replaces the value of an existing element. The Index parameter indicates which element to change, where 0 specifies the first element, 1 specifies the second element, and so on.

Note: Calling PutItem with Index set to the value of the Count (see page 17320) property will add a new element to the end of the array. This is the only case where PutItem adds a new element instead of replacing an existing one.

See Also

Count (see page 17320)

GetItem (see page 17313)

Insert (see page 17314)

105.1.5.4.17 TBaseArray.RemoveItem Method

Removes an element from the array.

Pascal

```
procedure RemoveItem(Index: Integer);
```

C++

```
__fastcall RemoveItem(int Index);
```

Description

RemoveItem does the same thing as the Delete (see page 17312) method. Use the Delete (see page 17312) method instead.

See Also

Delete (see page 17312)

105.1.5.4.18 TBaseArray.RemoveRange Method

Pascal

```
procedure RemoveRange(atIndex: Integer; numItems: Integer);
```

C++

```
__fastcall RemoveRange(int atIndex, int numItems);
```

Description

This is RemoveRange, a member of class TBaseArray.

105.1.5.4.19 TBaseArray.SetAutoSize Method

Pascal

```
procedure SetAutoSize(aSize: Boolean);
```

C++

```
__fastcall SetAutoSize(Boolean aSize);
```

Description

This is SetAutoSize, a member of class TBaseArray.

105.1.5.4.20 TBaseArray.SetCapacity Method

Pascal

```
procedure SetCapacity(NewCapacity: Integer); virtual;
```

C++

```
virtual __fastcall SetCapacity(int NewCapacity);
```

Description

This is SetCapacity, a member of class TBaseArray.

105.1.5.4.21 TBaseArray.SetFlag Method

Pascal

```
procedure SetFlag(aFlag: TArrayFlags);
```

C++

```
__fastcall SetFlag(TArrayFlags aFlag);
```

Description

This is SetFlag, a member of class TBaseArray.

105.1.5.4.22 TBaseArray.Sort Method

Provides the interface for a method that sorts the elements in the array.

Pascal

```
procedure Sort(Compare: TCompareProc); virtual;
```

C++

```
virtual __fastcall Sort(TCompareProc Compare);
```

Description

The Sort method for TBaseArray (see page 17307) does nothing. Descendants of TBaseArray (see page 17307) override this method to sort the elements of the array using the ordering function provided in the Compare parameter.

See Also

CompareProc (see page 17319)

SortOrder (see page 17322)

105.1.5.4.23 TBaseArray.ValidateBounds Method

Pascal

```
function ValidateBounds(atIndex: Integer; var numItems: Integer): Boolean;
```

C++

```
__fastcall Boolean ValidateBounds(int atIndex, int numItems);
```

Description

This is ValidateBounds, a member of class TBaseArray.

105.1.5.4.24 TBaseArray.ValidIndex Method

Pascal

```
function ValidIndex(Index: Integer): Boolean;
```

C++

```
__fastcall Boolean ValidIndex(int Index);
```

Description

This is ValidIndex, a member of class TBaseArray.

105.1.5.5 TBaseArray Properties

The properties of the TBaseArray class are listed here.

Public Properties

	Name	Description
	AutoSize (see page 17318)	Indicates whether the array grows dynamically as items are added.
	Capacity (see page 17319)	Specifies the maximum number of items that can be added to the array.
	CompareProc (see page 17319)	Implements a sort order for the elements of the array.
	Count (see page 17320)	Specifies the number of items in the array.
	Duplicates (see page 17320)	Specifies whether duplicate items can be added to sorted arrays.
R	ItemSize (see page 17321)	Indicates the number of bytes used to store each item in the array.
	Limit (see page 17321)	Specifies the size of the array.
R	List (see page 17321)	Points to the array of values maintained by TBaseArray (see page 17307).
	SortOrder (see page 17322)	Determines whether the array is sorted.

105.1.5.5.1 TBaseArray.AutoSize Property

Indicates whether the array grows dynamically as items are added.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

Set AutoSize to true to allow the array to hold an arbitrary number of values. When AutoSize is true, the Capacity (see page 17319) property increases automatically when new items are added beyond the current capacity of the array. When AutoSize is false, the Capacity (see page 17319) property must be explicitly set to the number of entries allowed in the array. If an attempt is made to add items beyond the number specified in the Capacity (see page 17319) property, an EArrayError (see page 17305) exception is raised if AutoSize is false.

See Also

Capacity (see page 17319)

Count (see page 17320)

EArrayError (see page 17305)

105.1.5.5.2 TBaseArray.Capacity Property

Specifies the maximum number of items that can be added to the array.

Pascal

```
property Capacity: Integer;
```

C++

```
__property int Capacity;
```

Description

Set Capacity to change the amount of memory allocated for the array. Trying to set Capacity to a value less than the Count (see page 17320) property will raise an EArrayError (see page 17305) exception.

If the AutoSize (see page 17318) property is true, the Capacity of the array increases automatically when necessary to accommodate new items as they are added.

Note: To determine the amount of memory used by the array, use Capacity * ItemSize (see page 17321).

See Also

AutoSize (see page 17318)

Count (see page 17320)

EArrayError (see page 17305)

ItemSize (see page 17321)

105.1.5.5.3 TBaseArray.CompareProc Property

Implements a sort order for the elements of the array.

Pascal

```
property CompareProc: TCompareProc;
```

C++

```
__property TCompareProc CompareProc;
```

Description

Set CompareProc to change the function that is used to sort the items of the array. If the SortOrder (see page 17322) property is not TS_NONE, CompareProc is used to locate the position in which to add new items to the array and to locate items using the FindItem (see page 17312) method.

CompareProc should compare the two items given as parameters and return a value less than 0 if item1 comes before item2, return a value greater than 0 if item1 comes after item2, and return 0 if item1 is the same as item2.

See Also

FindItem (see page 17312)

Sort (see page 17317)

SortOrder (see page 17322)

105.1.5.5.4 TBaseArray.Count Property

Specifies the number of items in the array.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of entries in the array. Set Count to increase or decrease the number of entries. Increasing Count always increases the Capacity (see page 17319) if necessary, even if the AutoSize (see page 17318) property is false. Decreasing the Count property truncates the array after Count items, but does not affect the Capacity (see page 17319) of the array.

When the value of Count is increased, new entries with the value of 0 are added to the end of the array. If the array is sorted, this will throw off the internal sort order, and cause the FindItem (see page 17312) method to fail. If the array is sorted, call the Sort (see page 17317) method to restore the sort order after filling the newly added members of the array.

See Also

AutoSize (see page 17318)

Capacity (see page 17319)

FindItem (see page 17312)

Sort (see page 17317)

SortOrder (see page 17322)

105.1.5.5.5 TBaseArray.Duplicates Property

Specifies whether duplicate items can be added to sorted arrays.

Pascal

```
property Duplicates: TDuplicates;
```

C++

```
__property TDuplicates Duplicates;
```

Description

Set Duplicates to specify what should happen when an attempt is made to add a duplicate item to a sorted array. The value of Duplicates should be one of the following.

Value	Meaning
dupIgnore	Ignore attempts to add duplicate items to the sorted array.
dupError	raise an EArrayError (see page 17305) exception when an attempt is made to add duplicate items to the sorted array.
dupAccept	Permit duplicate items in the sorted array.

Set Duplicates before adding any items to the list. Setting Duplicates to dupIgnore or dupError does nothing about duplicate strings that are already in the array.

Note: Duplicates does nothing if the array is not sorted.

See Also

SortOrder (see page 17322)

EArrayError (see page 17305)

105.1.5.5.6 TBaseArray.ItemSize Property

Indicates the number of bytes used to store each item in the array.

Pascal

```
property ItemSize: Integer;
```

C++

```
__property int ItemSize;
```

Description

Read ItemSize to determine the size of the elements of the array. The value of ItemSize is set by the constructor to the value of the iSize parameter. Descendants of TBaseArray (see page 17307) change this value to the size of the data type they represent.

See Also

Create (see page 17309)

105.1.5.5.7 TBaseArray.Limit Property

Specifies the size of the array.

Pascal

```
property Limit: Integer;
```

C++

```
__property int Limit;
```

Description

Use Limit to determine the size of the array. If the array is empty, Limit is the same as the Capacity (see page 17319) property. If the array is not empty, Limit is the same as the Count (see page 17320) property, even if the value of Capacity (see page 17319) is larger than Count (see page 17320). Setting Limit sets the Capacity (see page 17319) of the array.

See Also

Capacity (see page 17319)

Count (see page 17320)

105.1.5.5.8 TBaseArray.List Property

Points to the array of values maintained by TBaseArray (see page 17307).

Pascal

```
property List: Pointer;
```

C++

```
__property void * List;
```

Description

Use List to get direct access to the memory used to store the array items. Calculate the position of individual items in the list using the ItemSize (see page 17321) property.

To access specific items in the list, use the GetItem (see page 17313) method.

See Also

GetItem (see page 17313)

ItemSize (see page 17321)

105.1.5.5.9 TBaseArray.SortOrder Property

Determines whether the array is sorted.

Pascal

```
property SortOrder: TSortOrder;
```

C++

```
__property TSortOrder SortOrder;
```

Description

Set SortOrder to indicate whether the array should be sorted using the CompareProc (see page 17319) property. When an array is sorted, all new items are added in the correct sort order position so as to maintain the sort order. SortOrder can have one of the following values:

Value	Meaning
TS_NONE	The array is unsorted.
TS_ASCENDING	The elements of the array are sorted in ascending order.
TS_DESCENDING	The elements of the array are sorted in descending order.

Setting the SortOrder property does not sort the items already in the array. If the array is not empty when the SortOrder property is changed to TS_ASCENDING or TS_DESCENDING, be sure to explicitly call the Sort (see page 17317) method to sort the existing items.

Note: The Duplicates (see page 17320) property has no effect when SortOrder is TS_NONE.

See Also

CompareProc (see page 17319)

Duplicates (see page 17320)

Sort (see page 17317)

105.1.6 TCurrencyArray Class

Class Hierarchy

Pascal

```
TCurrencyArray = class(TBaseArray);
```

C++

```
class TCurrencyArray : public TBaseArray;
```

File

Mxarrays

Description

This is class Mxarrays.TCurrencyArray.

105.1.6.1 TCurrencyArray Members

The following tables list the members exposed by TCurrencyArray.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BlockCopy (see page 17311)	This is BlockCopy, a member of class TBaseArray.
	ClearFlag (see page 17311)	This is ClearFlag, a member of class TBaseArray.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetAutoSize (see page 17313)	This is GetAutoSize, a member of class TBaseArray.
	GetOwner (see page 2932)	Returns the owner of an object.
	Grow (see page 17313)	This is Grow, a member of class TBaseArray.
	HasFlag (see page 17314)	This is HasFlag, a member of class TBaseArray.
	InternalHandleException (see page 17315)	This is InternalHandleException, a member of class TBaseArray.
	InvalidateItems (see page 17315)	This is InvalidateItems, a member of class TBaseArray.
	RemoveRange (see page 17316)	This is RemoveRange, a member of class TBaseArray.
	SetAutoSize (see page 17316)	This is SetAutoSize, a member of class TBaseArray.
	SetCapacity (see page 17317)	This is SetCapacity, a member of class TBaseArray.
	SetFlag (see page 17317)	This is SetFlag, a member of class TBaseArray.
	ValidateBounds (see page 17317)	This is ValidateBounds, a member of class TBaseArray.
	ValidIndex (see page 17318)	This is ValidIndex, a member of class TBaseArray.

Public Methods

	Name	Description
	Add (see page 17325)	This is Add, a member of class TCurrencyArray.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 17325)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 17311)	Clear removes all items from the array.
	Create (see page 17324)	Creates an instance of TBaseArray for elements of a specific size.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 17312)	Removes an element from the array.

V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 17310)	Destroys an instance of TBaseArray (see page 17307).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Exchange (see page 17312)	Provides the interface for a method that swaps the values of two elements in the array.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Find (see page 17326)	This is Find, a member of class TCurrencyArray.
	FindItem (see page 17312)	Locates a value in a sorted array and indicates whether an element with that value already exists.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItem (see page 17326)	This is GetItem, a member of class TCurrencyArray.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	IndexOf (see page 17327)	Returns the position of the first element with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	Insert (see page 17314)	Inserts an element into the array and assigns it a value.
	InsertAt (see page 17315)	Adds an element to the array at the position specified by Index.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PutItem (see page 17327)	This is PutItem, a member of class TCurrencyArray.
	RemoveItem (see page 17316)	Removes an element from the array.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Sort (see page 17317)	Provides the interface for a method that sorts the elements in the array.

Public Properties

	Name	Description
	AutoSize (see page 17318)	Indicates whether the array grows dynamically as items are added.
	Capacity (see page 17319)	Specifies the maximum number of items that can be added to the array.
	CompareProc (see page 17319)	Implements a sort order for the elements of the array.
	Count (see page 17320)	Specifies the number of items in the array.
	Duplicates (see page 17320)	Specifies whether duplicate items can be added to sorted arrays.
	Items (see page 17327)	This is Items, a member of class TCurrencyArray.
R	ItemSize (see page 17321)	Indicates the number of bytes used to store each item in the array.
	Limit (see page 17321)	Specifies the size of the array.
R	List (see page 17321)	Points to the array of values maintained by TBaseArray (see page 17307).
	SortOrder (see page 17322)	Determines whether the array is sorted.

105.1.6.2 TCurrencyArray.Create Constructor

Creates an instance of TBaseArray for elements of a specific size.

Pascal

```
constructor Create(itemcount: Integer; dummy: Integer); override;
```

C++

```
virtual __fastcall TCurrencyArray(int itemcount, int dummy);
```

Description

Call Create to create an array containing elements with the size specified by the iSize parameter.Create sets the Capacity property to Itemcount and the ItemSize property to iSize. It also initializes the AutoSize property to true and the Count property to 0.

See Also

AutoSize (see page 17318)

Capacity (see page 17319)

Count (see page 17320)

ItemSize (see page 17321)

Create (see page 22287)

105.1.6.3 TCurrencyArray Methods

The methods of the TCurrencyArray class are listed here.

Public Methods

	Name	Description
	Add (see page 17325)	This is Add, a member of class TCurrencyArray.
V	Assign (see page 17325)	Copies the contents of another, similar object.
	Find (see page 17326)	This is Find, a member of class TCurrencyArray.
	GetItem (see page 17326)	This is GetItem, a member of class TCurrencyArray.
V	IndexOf (see page 17327)	Returns the position of the first element with a specified value.
	PutItem (see page 17327)	This is PutItem, a member of class TCurrencyArray.

105.1.6.3.1 TCurrencyArray.Add Method

Pascal

```
function Add(Value: Currency): Integer;
```

C++

```
__fastcall int Add(Currency Value);
```

Description

This is Add, a member of class TCurrencyArray.

105.1.6.3.2 TCurrencyArray.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo (see page 2931)

EConvertError (see page 22724)

105.1.6.3.3 TCurrencyArray.Find Method

Pascal

```
function Find(var Index: Integer; Value: Currency): Boolean;
```

C++

```
__fastcall Boolean Find(int Index, Currency Value);
```

Description

This is Find, a member of class TCurrencyArray.

105.1.6.3.4 TCurrencyArray.GetItem Method

Pascal

```
function GetItem(index: Integer): Currency;
```

C++

```
__fastcall Currency GetItem(int index);
```

Description

This is GetItem, a member of class TCurrencyArray.

105.1.6.3.5 TCurrencyArray.IndexOf Method

Returns the position of the first element with a specified value.

Pascal

```
function IndexOf(var Item): Integer; override;
```

C++

```
virtual __fastcall int IndexOf( Item);
```

Description

Call IndexOf to obtain the position of the first occurrence of the value Value. IndexOf returns the 0-based index of the element. Thus, if Value matches the first element in the array, IndexOf returns 0, if Value matches the second element, IndexOf returns 1, and so on. If the value is not in the array, IndexOf returns -1.

Note: IndexOf does not work for arrays sorted in descending order.

See Also

FindItem (see page 17312)

GetItem (see page 17313)

105.1.6.3.6 TCurrencyArray.PutItem Method

Pascal

```
procedure PutItem(index: Integer; value: Currency);
```

C++

```
__fastcall PutItem(int index, Currency value);
```

Description

This is PutItem, a member of class TCurrencyArray.

105.1.6.4 TCurrencyArray Properties

The properties of the TCurrencyArray class are listed here.

Public Properties

	Name	Description
	Items (see page 17327)	This is Items, a member of class TCurrencyArray.

105.1.6.4.1 TCurrencyArray.Items Property

Pascal

```
property Items [Index: Integer]: Currency;
```

C++

```
__property Currency Items[int Index];
```

Description

This is Items, a member of class TCurrencyArray.

105.1.7 TCustomArray Class

Class Hierarchy

Mxarrays.TCustomArray

Pascal

```
TCustomArray = class;
```

C++

```
class TCustomArray;
```

File

Mxarrays

Description

This is class Mxarrays.TCustomArray.

105.1.7.1 TCustomArray Members

The following tables list the members exposed by TCustomArray.

Protected Methods

	Name	Description
	GetCompProc (see page 17330)	This is GetCompProc, a member of class TCustomArray.
	GetDups (see page 17331)	This is GetDups, a member of class TCustomArray.
	GetItem (see page 17332)	This is GetItem, a member of class TCustomArray.
	GetMemberCount (see page 17332)	This is GetMemberCount, a member of class TCustomArray.
	GetSort (see page 17332)	This is GetSort, a member of class TCustomArray.
	SetCompProc (see page 17333)	This is SetCompProc, a member of class TCustomArray.
	SetDups (see page 17333)	This is SetDups, a member of class TCustomArray.
	SetItem (see page 17333)	This is SetItem, a member of class TCustomArray.
	SetSort (see page 17334)	This is SetSort, a member of class TCustomArray.

Public Methods

	Name	Description
	Add (see page 17330)	This is Add, a member of class TCustomArray.
	Assign (see page 17330)	This is Assign, a member of class TCustomArray.
	ConvertVar (see page 17330)	This is ConvertVar, a member of class TCustomArray.
	Create (see page 17329)	This is Create, a member of class TCustomArray.
V	Destroy (see page 17329)	This is Destroy, a member of class TCustomArray.
	GetCurrency (see page 17331)	This is GetCurrency, a member of class TCustomArray.
	GetDouble (see page 17331)	This is GetDouble, a member of class TCustomArray.
	GetInteger (see page 17331)	This is GetInteger, a member of class TCustomArray.
	IndexOf (see page 17332)	This is IndexOf, a member of class TCustomArray.
	IsBlank (see page 17332)	This is IsBlank, a member of class TCustomArray.
V	MemoryUsage (see page 17333)	This is MemoryUsage, a member of class TCustomArray.
	SetSize (see page 17334)	This is SetSize, a member of class TCustomArray.

Public Properties

	Name	Description
	BlankBoolVal (see page 17334)	This is BlankBoolVal, a member of class TCustomArray.
R	BlankCount (see page 17335)	This is BlankCount, a member of class TCustomArray.
	BlankDateVal (see page 17335)	This is BlankDateVal, a member of class TCustomArray.
	BlankStringVal (see page 17335)	This is BlankStringVal, a member of class TCustomArray.
	CompareProc (see page 17335)	This is CompareProc, a member of class TCustomArray.
R	DataType (see page 17335)	This is DataType, a member of class TCustomArray.
	Duplicates (see page 17336)	This is Duplicates, a member of class TCustomArray.
	Items (see page 17336)	This is Items, a member of class TCustomArray.
R	List (see page 17336)	This is List, a member of class TCustomArray.
R	MemberCount (see page 17336)	This is MemberCount, a member of class TCustomArray.
	Sorted (see page 17337)	This is Sorted, a member of class TCustomArray.

105.1.7.2 TCustomArray.Create Constructor

Pascal

```
constructor Create(Items: Integer; VarType: Integer);
```

C++

```
__fastcall TCustomArray(int Items, int VarType);
```

Description

This is Create, a member of class TCustomArray.

105.1.7.3 TCustomArray.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomArray();
```

Description

This is Destroy, a member of class TCustomArray.

105.1.7.4 TCustomArray Methods

The methods of the TCustomArray class are listed here.

Protected Methods

	Name	Description
	GetCompProc (see page 17330)	This is GetCompProc, a member of class TCustomArray.
	GetDups (see page 17331)	This is GetDups, a member of class TCustomArray.
	GetItem (see page 17332)	This is GetItem, a member of class TCustomArray.
	GetMemberCount (see page 17332)	This is GetMemberCount, a member of class TCustomArray.
	GetSort (see page 17332)	This is GetSort, a member of class TCustomArray.
	SetCompProc (see page 17333)	This is SetCompProc, a member of class TCustomArray.
	SetDups (see page 17333)	This is SetDups, a member of class TCustomArray.
	SetItem (see page 17333)	This is SetItem, a member of class TCustomArray.

	SetSort (see page 17334)	This is SetSort, a member of class TCustomArray.

Public Methods

	Name	Description
	Add (see page 17330)	This is Add, a member of class TCustomArray.
	Assign (see page 17330)	This is Assign, a member of class TCustomArray.
	ConvertVar (see page 17330)	This is ConvertVar, a member of class TCustomArray.
	GetCurrency (see page 17331)	This is GetCurrency, a member of class TCustomArray.
	GetDouble (see page 17331)	This is GetDouble, a member of class TCustomArray.
	GetInteger (see page 17331)	This is GetInteger, a member of class TCustomArray.
	IndexOf (see page 17332)	This is IndexOf, a member of class TCustomArray.
	IsBlank (see page 17332)	This is IsBlank, a member of class TCustomArray.
	MemoryUsage (see page 17333)	This is MemoryUsage, a member of class TCustomArray.
	SetSize (see page 17334)	This is SetSize, a member of class TCustomArray.

105.1.7.4.1 TCustomArray.Add Method

Pascal

```
function Add(Value: Variant): Integer;
```

C++

```
__fastcall int Add(Variant Value);
```

Description

This is Add, a member of class TCustomArray.

105.1.7.4.2 TCustomArray.Assign Method

Pascal

```
procedure Assign(Value: TCustomArray; bSorted: Boolean; bUnique: Boolean);
```

C++

```
__fastcall Assign(TCustomArray Value, Boolean bSorted, Boolean bUnique);
```

Description

This is Assign, a member of class TCustomArray.

105.1.7.4.3 TCustomArray.ConvertVar Method

Pascal

```
function ConvertVar(Value: Variant): Variant;
```

C++

```
__fastcall Variant ConvertVar(Variant Value);
```

Description

This is ConvertVar, a member of class TCustomArray.

105.1.7.4.4 TCustomArray.GetCompProc Method

Pascal

```
function GetCompProc: TCompareProc;
```

C++

```
__fastcall TCompareProc GetCompProc();
```

Description

This is GetCompProc, a member of class TCustomArray.

105.1.7.4.5 TCustomArray.GetCurrency Method

Pascal

```
function GetCurrency(Index: Integer): Currency;
```

C++

```
__fastcall Currency GetCurrency(int Index);
```

Description

This is GetCurrency, a member of class TCustomArray.

105.1.7.4.6 TCustomArray.GetDouble Method

Pascal

```
function GetDouble(Index: Integer): Double;
```

C++

```
__fastcall Double GetDouble(int Index);
```

Description

This is GetDouble, a member of class TCustomArray.

105.1.7.4.7 TCustomArray.GetDups Method

Pascal

```
function GetDups: TDuplicates;
```

C++

```
__fastcall TDuplicates GetDups();
```

Description

This is GetDups, a member of class TCustomArray.

105.1.7.4.8 TCustomArray.GetInteger Method

Pascal

```
function GetInteger(Index: Integer): Integer;
```

C++

```
__fastcall int GetInteger(int Index);
```

Description

This is GetInteger, a member of class TCustomArray.

105.1.7.4.9 TCustomArray.GetItem Method

Pascal

```
function GetItem(Index: Integer): Variant;
```

C++

```
__fastcall Variant GetItem(int Index);
```

Description

This is GetItem, a member of class TCustomArray.

105.1.7.4.10 TCustomArray.GetMemberCount Method

Pascal

```
function GetMemberCount: Integer;
```

C++

```
__fastcall int GetMemberCount();
```

Description

This is GetMemberCount, a member of class TCustomArray.

105.1.7.4.11 TCustomArray.GetSort Method

Pascal

```
function GetSort: Boolean;
```

C++

```
__fastcall Boolean GetSort();
```

Description

This is GetSort, a member of class TCustomArray.

105.1.7.4.12 TCustomArray.IndexOf Method

Pascal

```
function IndexOf(Value: Variant): Integer;
```

C++

```
__fastcall int IndexOf(Variant Value);
```

Description

This is IndexOf, a member of class TCustomArray.

105.1.7.4.13 TCustomArray.IsBlank Method

Pascal

```
function IsBlank(Index: Integer): Boolean;
```

C++

```
__fastcall Boolean IsBlank(int Index);
```

Description

This is IsBlank, a member of class TCustomArray.

105.1.7.4.14 TCustomArray.MemoryUsage Method

Pascal

```
function MemoryUsage: Integer; virtual;
```

C++

```
virtual __fastcall int MemoryUsage();
```

Description

This is MemoryUsage, a member of class TCustomArray.

105.1.7.4.15 TCustomArray.SetCompProc Method

Pascal

```
procedure SetCompProc(Proc: TCompareProc);
```

C++

```
__fastcall SetCompProc(TCompareProc Proc);
```

Description

This is SetCompProc, a member of class TCustomArray.

105.1.7.4.16 TCustomArray.SetDups Method

Pascal

```
procedure SetDups(Value: TDuplicates);
```

C++

```
__fastcall SetDups(TDuplicates Value);
```

Description

This is SetDups, a member of class TCustomArray.

105.1.7.4.17 TCustomArray.SetItem Method

Pascal

```
procedure SetItem(Index: Integer; Value: Variant);
```

C++

```
__fastcall SetItem(int Index, Variant Value);
```

Description

This is SetItem, a member of class TCustomArray.

105.1.7.4.18 TCustomArray.SetSize Method

Pascal

```
procedure SetSize(size: Integer);
```

C++

```
__fastcall SetSize(int size);
```

Description

This is SetSize, a member of class TCustomArray.

105.1.7.4.19 TCustomArray.SetSort Method

Pascal

```
procedure SetSort(Value: Boolean);
```

C++

```
__fastcall SetSort(Boolean Value);
```

Description

This is SetSort, a member of class TCustomArray.

105.1.7.5 TCustomArray Properties

The properties of the TCustomArray class are listed here.

Public Properties

	Name	Description
	BlankBoolVal (see page 17334)	This is BlankBoolVal, a member of class TCustomArray.
R	BlankCount (see page 17335)	This is BlankCount, a member of class TCustomArray.
	BlankDateVal (see page 17335)	This is BlankDateVal, a member of class TCustomArray.
	BlankStringVal (see page 17335)	This is BlankStringVal, a member of class TCustomArray.
	CompareProc (see page 17335)	This is CompareProc, a member of class TCustomArray.
R	DataType (see page 17335)	This is DataType, a member of class TCustomArray.
	Duplicates (see page 17336)	This is Duplicates, a member of class TCustomArray.
	Items (see page 17336)	This is Items, a member of class TCustomArray.
R	List (see page 17336)	This is List, a member of class TCustomArray.
R	MemberCount (see page 17336)	This is MemberCount, a member of class TCustomArray.
	Sorted (see page 17337)	This is Sorted, a member of class TCustomArray.

105.1.7.5.1 TCustomArray.BlankBoolVal Property

Pascal

```
property BlankBoolVal: Word;
```

C++

```
__property Word BlankBoolVal;
```

Description

This is BlankBoolVal, a member of class TCustomArray.

105.1.7.5.2 TCustomArray.BlankCount Property

Pascal

```
property BlankCount: Integer;
```

C++

```
__property int BlankCount;
```

Description

This is BlankCount, a member of class TCustomArray.

105.1.7.5.3 TCustomArray.BlankDateVal Property

Pascal

```
property BlankDateVal: Variant;
```

C++

```
__property Variant BlankDateVal;
```

Description

This is BlankDateVal, a member of class TCustomArray.

105.1.7.5.4 TCustomArray.BlankStringVal Property

Pascal

```
property BlankStringVal: string;
```

C++

```
__property AnsiString BlankStringVal;
```

Description

This is BlankStringVal, a member of class TCustomArray.

105.1.7.5.5 TCustomArray.CompareProc Property

Pascal

```
property CompareProc: TCompareProc;
```

C++

```
__property TCompareProc CompareProc;
```

Description

This is CompareProc, a member of class TCustomArray.

105.1.7.5.6 TCustomArray.DataType Property

Pascal

```
property DataType: Integer;
```

C++

```
__property int DataType;
```

Description

This is DataType, a member of class TCustomArray.

105.1.7.5.7 TCustomArray.Duplicates Property

Pascal

```
property Duplicates: TDuplicates;
```

C++

```
__property TDuplicates Duplicates;
```

Description

This is Duplicates, a member of class TCustomArray.

105.1.7.5.8 TCustomArray.Items Property

Pascal

```
property Items [I: Integer]: Variant;
```

C++

```
__property Variant Items[int I];
```

Description

This is Items, a member of class TCustomArray.

105.1.7.5.9 TCustomArray.List Property

Pascal

```
property List: Pointer;
```

C++

```
__property void * List;
```

Description

This is List, a member of class TCustomArray.

105.1.7.5.10 TCustomArray.MemberCount Property

Pascal

```
property MemberCount: Integer;
```

C++

```
__property int MemberCount;
```

Description

This is MemberCount, a member of class TCustomArray.

105.1.7.5.11 TCustomArray.Sorted Property

Pascal

```
property Sorted: Boolean;
```

C++

```
__property Boolean Sorted;
```

Description

This is Sorted, a member of class TCustomArray.

105.1.8 TDoubleArray Class

Class Hierarchy

Pascal

```
TDoubleArray = class(TBaseArray);
```

C++

```
class TDoubleArray : public TBaseArray;
```

File

Mxarrays

Description

This is class Mxarrays.TDoubleArray.

105.1.8.1 TDoubleArray Members

The following tables list the members exposed by TDoubleArray.

Protected Methods

	Name	Description
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BlockCopy (see page 17311)	This is BlockCopy, a member of class TBaseArray.
	ClearFlag (see page 17311)	This is ClearFlag, a member of class TBaseArray.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetAutoSize (see page 17313)	This is GetAutoSize, a member of class TBaseArray.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Grow (see page 17313)	This is Grow, a member of class TBaseArray.
	HasFlag (see page 17314)	This is HasFlag, a member of class TBaseArray.
	InternalHandleException (see page 17315)	This is InternalHandleException, a member of class TBaseArray.
V	InvalidateItems (see page 17315)	This is InvalidateItems, a member of class TBaseArray.
	RemoveRange (see page 17316)	This is RemoveRange, a member of class TBaseArray.
	SetAutoSize (see page 17316)	This is SetAutoSize, a member of class TBaseArray.
V	SetCapacity (see page 17317)	This is SetCapacity, a member of class TBaseArray.
	SetFlag (see page 17317)	This is SetFlag, a member of class TBaseArray.

	ValidateBounds (see page 17317)	This is ValidateBounds, a member of class TBaseArray.
	ValidIndex (see page 17318)	This is ValidIndex, a member of class TBaseArray.

Public Methods

	Name	Description
	Add (see page 17340)	This is Add, a member of class TDoubleArray.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 17340)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 17311)	Clear removes all items from the array.
V	Create (see page 17339)	Creates an instance of TBaseArray for elements of a specific size.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Delete (see page 17312)	Removes an element from the array.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 17310)	Destroys an instance of TBaseArray (see page 17307).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Exchange (see page 17312)	Provides the interface for a method that swaps the values of two elements in the array.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Find (see page 17341)	This is Find, a member of class TDoubleArray.
	FindItem (see page 17312)	Locates a value in a sorted array and indicates whether an element with that value already exists.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItem (see page 17341)	This is GetItem, a member of class TDoubleArray.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	IndexOf (see page 17341)	Returns the position of the first element with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	Insert (see page 17314)	Inserts an element into the array and assigns it a value.
	InsertAt (see page 17315)	Adds an element to the array at the position specified by Index.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PutItem (see page 17341)	This is PutItem, a member of class TDoubleArray.
	RemoveItem (see page 17316)	Removes an element from the array.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Sort (see page 17317)	Provides the interface for a method that sorts the elements in the array.

Public Properties

	Name	Description
	AutoSize (see page 17318)	Indicates whether the array grows dynamically as items are added.
	Capacity (see page 17319)	Specifies the maximum number of items that can be added to the array.
	CompareProc (see page 17319)	Implements a sort order for the elements of the array.
	Count (see page 17320)	Specifies the number of items in the array.
	Duplicates (see page 17320)	Specifies whether duplicate items can be added to sorted arrays.
	Items (see page 17342)	This is Items, a member of class TDoubleArray.
R	ItemSize (see page 17321)	Indicates the number of bytes used to store each item in the array.
	Limit (see page 17321)	Specifies the size of the array.
R	List (see page 17321)	Points to the array of values maintained by TBaseArray (see page 17307).
	SortOrder (see page 17322)	Determines whether the array is sorted.

105.1.8.2 TDoubleArray.Create Constructor

Creates an instance of TBaseArray for elements of a specific size.

Pascal

```
constructor Create(itemcount: Integer; dummy: Integer); override;
```

C++

```
virtual __fastcall TDoubleArray(int itemcount, int dummy);
```

Description

Call Create to create an array containing elements with the size specified by the iSize parameter.Create sets the Capacity property to Itemcount and the ItemSize property to iSize. It also initializes the AutoSize property to true and the Count property to 0.

See Also

AutoSize (see page 17318)

Capacity (see page 17319)

Count (see page 17320)

ItemSize (see page 17321)

Create (see page 22287)

105.1.8.3 TDoubleArray Methods

The methods of the TDoubleArray class are listed here.

Public Methods

	Name	Description
	Add (see page 17340)	This is Add, a member of class TDoubleArray.
V	Assign (see page 17340)	Copies the contents of another, similar object.
	Find (see page 17341)	This is Find, a member of class TDoubleArray.
	GetItem (see page 17341)	This is GetItem, a member of class TDoubleArray.
V	IndexOf (see page 17341)	Returns the position of the first element with a specified value.
	PutItem (see page 17341)	This is PutItem, a member of class TDoubleArray.

105.1.8.3.1 TDoubleArray.Add Method

Pascal

```
function Add(Value: Double): Integer;
```

C++

```
__fastcall int Add(Double Value);
```

Description

This is Add, a member of class TDoubleArray.

105.1.8.3.2 TDoubleArray.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo (see page 2931)

EConvertError (see page 22724)

105.1.8.3.3 TDoubleArray.Find Method

Pascal

```
function Find(var Index: Integer; Value: Double): Boolean;
```

C++

```
__fastcall Boolean Find(int Index, Double Value);
```

Description

This is Find, a member of class TDoubleArray.

105.1.8.3.4 TDoubleArray.GetItem Method

Pascal

```
function GetItem(index: Integer): Double;
```

C++

```
__fastcall Double GetItem(int index);
```

Description

This is GetItem, a member of class TDoubleArray.

105.1.8.3.5 TDoubleArray.IndexOf Method

Returns the position of the first element with a specified value.

Pascal

```
function IndexOf(var Item): Integer; override;
```

C++

```
virtual __fastcall int IndexOf( Item);
```

Description

Call IndexOf to obtain the position of the first occurrence of the value Value. IndexOf returns the 0-based index of the element. Thus, if Value matches the first element in the array, IndexOf returns 0, if Value matches the second element, IndexOf returns 1, and so on. If the value is not in the array, IndexOf returns -1.

Note: IndexOf does not work for arrays sorted in descending order.

See Also

FindItem (see page 17312)

GetItem (see page 17313)

105.1.8.3.6 TDoubleArray.PutItem Method

Pascal

```
procedure PutItem(index: Integer; value: Double);
```

C++

```
__fastcall PutItem(int index, Double value);
```

Description

This is PutItem, a member of class TDoubleArray.

105.1.8.4 TDoubleArray Properties

The properties of the TDoubleArray class are listed here.

Public Properties

	Name	Description
	Items (see page 17342)	This is Items, a member of class TDoubleArray.

105.1.8.4.1 TDoubleArray.Items Property

Pascal

```
property Items [Index: Integer]: Double;
```

C++

```
__property Double Items[int Index];
```

Description

This is Items, a member of class TDoubleArray.

105.1.9 TIndexArray Class

Class Hierarchy

Mxarrays.TIndexArray

Pascal

```
TIndexArray = class;
```

C++

```
class TIndexArray;
```

File

Mxarrays

Description

This is class Mxarrays.TIndexArray.

105.1.9.1 TIndexArray Members

The following tables list the members exposed by TIndexArray.

Protected Fields

	Name	Description
	idxElements (see page 17344)	This is idxElements, a member of class TIndexArray.

Public Methods

	Name	Description
	Add (see page 17344)	This is Add, a member of class TIndexArray.
	Create (see page 17343)	This is Create, a member of class TIndexArray.
V	Destroy (see page 17343)	This is Destroy, a member of class TIndexArray.
	Expand (see page 17344)	This is Expand, a member of class TIndexArray.
	SetSize (see page 17344)	This is SetSize, a member of class TIndexArray.

Public Properties

	Name	Description
	Autosize (see page 17345)	This is Autosize, a member of class TIndexArray.
	Capacity (see page 17345)	This is Capacity, a member of class TIndexArray.
R	Count (see page 17345)	This is Count, a member of class TIndexArray.
	Items (see page 17346)	This is Items, a member of class TIndexArray.
R	MemoryUsage (see page 17346)	This is MemoryUsage, a member of class TIndexArray.

105.1.9.2 TIndexArray.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TIndexArray();
```

Description

This is Create, a member of class TIndexArray.

105.1.9.3 TIndexArray.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIndexArray();
```

Description

This is Destroy, a member of class TIndexArray.

105.1.9.4 TIndexArray Fields

The fields of the TIndexArray class are listed here.

Protected Fields

	Name	Description
	idxElements (see page 17344)	This is idxElements, a member of class TIndexArray.

105.1.9.4.1 TIndexArray.idxElements Field

Pascal

```
idxElements: PIndexElements;
```

C++

```
PIndexElements idxElements;
```

Description

This is idxElements, a member of class TIndexArray.

105.1.9.5 TIndexArray Methods

The methods of the TIndexArray class are listed here.

Public Methods

	Name	Description
	Add (see page 17344)	This is Add, a member of class TIndexArray.
	Expand (see page 17344)	This is Expand, a member of class TIndexArray.
	SetSize (see page 17344)	This is SetSize, a member of class TIndexArray.

105.1.9.5.1 TIndexArray.Add Method

Pascal

```
function Add(const NewValue: TSmallIntArray): Integer;
```

C++

```
__fastcall int Add(const TSmallIntArray NewValue);
```

Description

This is Add, a member of class TIndexArray.

105.1.9.5.2 TIndexArray.Expand Method

Pascal

```
procedure Expand;
```

C++

```
__fastcall Expand();
```

Description

This is Expand, a member of class TIndexArray.

105.1.9.5.3 TIndexArray.SetSize Method

Pascal

```
procedure SetSize(Elements: TIndexNDX);
```

C++

```
__fastcall SetSize(TIndexNDX Elements);
```

Description

This is SetSize, a member of class TIndexArray.

105.1.9.6 TIndexArray Properties

The properties of the TIndexArray class are listed here.

Public Properties

	Name	Description
	Autosize (see page 17345)	This is Autosize, a member of class TIndexArray.
	Capacity (see page 17345)	This is Capacity, a member of class TIndexArray.
R	Count (see page 17345)	This is Count, a member of class TIndexArray.
	Items (see page 17346)	This is Items, a member of class TIndexArray.
R	MemoryUsage (see page 17346)	This is MemoryUsage, a member of class TIndexArray.

105.1.9.6.1 TIndexArray.Autosize Property

Pascal

```
property Autosize: Boolean;
```

C++

```
__property Boolean Autosize;
```

Description

This is Autosize, a member of class TIndexArray.

105.1.9.6.2 TIndexArray.Capacity Property

Pascal

```
property Capacity: TIndexNDX;
```

C++

```
__property TIndexNDX Capacity;
```

Description

This is Capacity, a member of class TIndexArray.

105.1.9.6.3 TIndexArray.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TIndexArray.

105.1.9.6.4 TIndexArray.Items Property

Pascal

```
property Items [Element: TIndexNDX]: TSmallIntArray;
```

C++

```
__property TSmallIntArray Items[TIndexNDX Element];
```

Description

This is Items, a member of class TIndexArray.

105.1.9.6.5 TIndexArray.MemoryUsage Property

Pascal

```
property MemoryUsage: Integer;
```

C++

```
__property int MemoryUsage;
```

Description

This is MemoryUsage, a member of class TIndexArray.

105.1.10 TIntArray Class

Class Hierarchy

Pascal

```
TIntArray = class(TBaseArray);
```

C++

```
class TIntArray : public TBaseArray;
```

File

Mxarrays

Description

This is class Mxarrays.TIntArray.

105.1.10.1 TIntArray Members

The following tables list the members exposed by TIntArray.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BlockCopy (see page 17311)	This is BlockCopy, a member of class TBaseArray.
	ClearFlag (see page 17311)	This is ClearFlag, a member of class TBaseArray.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetAutoSize (see page 17313)	This is GetAutoSize, a member of class TBaseArray.
	GetOwner (see page 2932)	Returns the owner of an object.
	Grow (see page 17313)	This is Grow, a member of class TBaseArray.
	HasFlag (see page 17314)	This is HasFlag, a member of class TBaseArray.
	InternalHandleException (see page 17315)	This is InternalHandleException, a member of class TBaseArray.
	InvalidateItems (see page 17315)	This is InvalidateItems, a member of class TBaseArray.
	RemoveRange (see page 17316)	This is RemoveRange, a member of class TBaseArray.
	SetAutoSize (see page 17316)	This is SetAutoSize, a member of class TBaseArray.
	SetCapacity (see page 17317)	This is SetCapacity, a member of class TBaseArray.
	SetFlag (see page 17317)	This is SetFlag, a member of class TBaseArray.
	ValidateBounds (see page 17317)	This is ValidateBounds, a member of class TBaseArray.
	ValidIndex (see page 17318)	This is ValidIndex, a member of class TBaseArray.

Public Methods

	Name	Description
	Add (see page 17349)	This is Add, a member of class TIntArray.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 17349)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 17311)	Clear removes all items from the array.
	Create (see page 17348)	Creates an instance of TBaseArray for elements of a specific size.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 17312)	Removes an element from the array.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 17310)	Destroys an instance of TBaseArray (see page 17307).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Exchange (see page 17312)	Provides the interface for a method that swaps the values of two elements in the array.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Find (see page 17350)	This is Find, a member of class TIntArray.
	FindItem (see page 17312)	Locates a value in a sorted array and indicates whether an element with that value already exists.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItem (see page 17350)	This is GetItem, a member of class TIntArray.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	IndexOf (see page 17314)	Returns the position of the first element with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

V	Insert (see page 17314)	Inserts an element into the array and assigns it a value.
	InsertAt (see page 17315)	Adds an element to the array at the position specified by Index.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PutItem (see page 17350)	This is PutItem, a member of class TIntArray.
	RemoveItem (see page 17316)	Removes an element from the array.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Sort (see page 17317)	Provides the interface for a method that sorts the elements in the array.

Public Properties

	Name	Description
	AutoSize (see page 17318)	Indicates whether the array grows dynamically as items are added.
	Capacity (see page 17319)	Specifies the maximum number of items that can be added to the array.
	CompareProc (see page 17319)	Implements a sort order for the elements of the array.
	Count (see page 17320)	Specifies the number of items in the array.
	Duplicates (see page 17320)	Specifies whether duplicate items can be added to sorted arrays.
	Items (see page 17351)	This is Items, a member of class TIntArray.
R	ItemSize (see page 17321)	Indicates the number of bytes used to store each item in the array.
	Limit (see page 17321)	Specifies the size of the array.
R	List (see page 17321)	Points to the array of values maintained by TBaseArray (see page 17307).
	SortOrder (see page 17322)	Determines whether the array is sorted.

105.1.10.2 TIntArray.Create Constructor

Creates an instance of TBaseArray for elements of a specific size.

Pascal

```
constructor Create(itemcount: Integer; dummy: Integer); override;
```

C++

```
virtual __fastcall TIntArray(int itemcount, int dummy);
```

Description

Call Create to create an array containing elements with the size specified by the iSize parameter.Create sets the Capacity property to Itemcount and the ItemSize property to iSize. It also initializes the AutoSize property to true and the Count property to 0.

See Also

AutoSize (see page 17318)

Capacity (see page 17319)

Count (see page 17320)

ItemSize (see page 17321)

Create (see page 22287)

105.1.10.3 TIntArray Methods

The methods of the TIntArray class are listed here.

Public Methods

	Name	Description
	Add (see page 17349)	This is Add, a member of class TIntArray.
V	Assign (see page 17349)	Copies the contents of another, similar object.
	Find (see page 17350)	This is Find, a member of class TIntArray.
	GetItem (see page 17350)	This is GetItem, a member of class TIntArray.
	PutItem (see page 17350)	This is PutItem, a member of class TIntArray.

105.1.10.3.1 TIntArray.Add Method

Pascal

```
function Add(Value: Integer): Integer;
```

C++

```
__fastcall int Add(int Value);
```

Description

This is Add, a member of class TIntArray.

105.1.10.3.2 TIntArray.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of

the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo (see page 2931)

EConvertError (see page 22724)

105.1.10.3.3 TIntArray.Find Method

Pascal

```
function Find(var Index: Integer; Value: Integer): Boolean;
```

C++

```
__fastcall Boolean Find(int Index, int Value);
```

Description

This is Find, a member of class TIntArray.

105.1.10.3.4 TIntArray.GetItem Method

Pascal

```
function GetItem(index: Integer): Integer;
```

C++

```
__fastcall int GetItem(int index);
```

Description

This is GetItem, a member of class TIntArray.

105.1.10.3.5 TIntArray.PutItem Method

Pascal

```
procedure PutItem(index: Integer; value: Integer);
```

C++

```
__fastcall PutItem(int index, int value);
```

Description

This is PutItem, a member of class TIntArray.

105.1.10.4 TIntArray Properties

The properties of the TIntArray class are listed here.

Public Properties

	Name	Description
	Items (see page 17351)	This is Items, a member of class TIntArray.

105.1.10.4.1 TIntArray.Items Property

Pascal

```
property Items [Index: Integer]: Integer;
```

C++

```
__property int Items[int Index];
```

Description

This is Items, a member of class TIntArray.

105.1.11 TPointerArray Class

Class Hierarchy

Pascal

```
TPointerArray = class(TBaseArray);
```

C++

```
class TPointerArray : public TBaseArray;
```

File

Mxarrays

Description

This is class Mxarrays.TPointerArray.

105.1.11.1 TPointerArray Members

The following tables list the members exposed by TPointerArray.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BlockCopy (see page 17311)	This is BlockCopy, a member of class TBaseArray.
	ClearFlag (see page 17311)	This is ClearFlag, a member of class TBaseArray.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetAutoSize (see page 17313)	This is GetAutoSize, a member of class TBaseArray.
	GetOwner (see page 2932)	Returns the owner of an object.
	Grow (see page 17313)	This is Grow, a member of class TBaseArray.
	HasFlag (see page 17314)	This is HasFlag, a member of class TBaseArray.
	InternalHandleException (see page 17315)	This is InternalHandleException, a member of class TBaseArray.
	RemoveRange (see page 17316)	This is RemoveRange, a member of class TBaseArray.
	SetAutoSize (see page 17316)	This is SetAutoSize, a member of class TBaseArray.
	SetCapacity (see page 17317)	This is SetCapacity, a member of class TBaseArray.
	SetFlag (see page 17317)	This is SetFlag, a member of class TBaseArray.
	ValidateBounds (see page 17317)	This is ValidateBounds, a member of class TBaseArray.

	ValidIndex (see page 17318)	This is ValidIndex, a member of class TBaseArray.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 17311)	Clear removes all items from the array.
	CloneItem (see page 17354)	This is CloneItem, a member of class TPointerArray.
	CopyFrom (see page 17354)	This is CopyFrom, a member of class TPointerArray.
	CopyTo (see page 17354)	This is CopyTo, a member of class TPointerArray.
	Create (see page 17353)	Creates an instance of TBaseArray for elements of a specific size.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 17312)	Removes an element from the array.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 17310)	Destroys an instance of TBaseArray (see page 17307).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Exchange (see page 17312)	Provides the interface for a method that swaps the values of two elements in the array.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItem (see page 17312)	Locates a value in a sorted array and indicates whether an element with that value already exists.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeItem (see page 17354)	This is FreeItem, a member of class TPointerArray.
	GetData (see page 17355)	This is GetData, a member of class TPointerArray.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItem (see page 17313)	Returns the element in the array at the indicated position.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	IndexOf (see page 17314)	Returns the position of the first element with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 17314)	Inserts an element into the array and assigns it a value.
	InsertAt (see page 17315)	Adds an element to the array at the position specified by Index.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InvalidateItems (see page 17355)	This is InvalidateItems, a member of class TPointerArray.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PutData (see page 17355)	This is PutData, a member of class TPointerArray.
	PutItem (see page 17315)	Replaces the value of an element in the array.

	RemoveItem (see page 17316)	Removes an element from the array.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Sort (see page 17317)	Provides the interface for a method that sorts the elements in the array.

Public Properties

	Name	Description
	AsPtr (see page 17355)	This is AsPtr, a member of class TPointerArray.
	AutoSize (see page 17318)	Indicates whether the array grows dynamically as items are added.
	Capacity (see page 17319)	Specifies the maximum number of items that can be added to the array.
	CompareProc (see page 17319)	Implements a sort order for the elements of the array.
	Count (see page 17320)	Specifies the number of items in the array.
	Data (see page 17356)	This is Data, a member of class TPointerArray.
	Duplicates (see page 17320)	Specifies whether duplicate items can be added to sorted arrays.
R	ItemSize (see page 17321)	Indicates the number of bytes used to store each item in the array.
	Limit (see page 17321)	Specifies the size of the array.
R	List (see page 17321)	Points to the array of values maintained by TBaseArray (see page 17307).
	SortOrder (see page 17322)	Determines whether the array is sorted.

105.1.11.2 TPointerArray.Create Constructor

Creates an instance of TBaseArray for elements of a specific size.

Pascal

```
constructor Create(itemcount: Integer; dummy: Integer); override;
```

C++

```
virtual __fastcall TPointerArray(int itemcount, int dummy);
```

Description

Call Create to create an array containing elements with the size specified by the iSize parameter.Create sets the Capacity property to Itemcount and the ItemSize property to iSize. It also initializes the AutoSize property to true and the Count property to 0.

See Also

AutoSize (see page 17318)

Capacity (see page 17319)

Count (see page 17320)

ItemSize (see page 17321)

Create (see page 22287)

105.1.11.3 TPointerArray Methods

The methods of the TPointerArray class are listed here.

Public Methods

	Name	Description
V	CloneItem (see page 17354)	This is CloneItem, a member of class TPointerArray.
	CopyFrom (see page 17354)	This is CopyFrom, a member of class TPointerArray.
	CopyTo (see page 17354)	This is CopyTo, a member of class TPointerArray.
V	FreeItem (see page 17354)	This is FreeItem, a member of class TPointerArray.

	GetData (see page 17355)	This is GetData, a member of class TPointerArray.
	InvalidateItems (see page 17355)	This is InvalidateItems, a member of class TPointerArray.
	PutData (see page 17355)	This is PutData, a member of class TPointerArray.

105.1.11.3.1 TPointerArray.CloneItem Method

Pascal

```
function CloneItem(item: Pointer): Pointer; virtual;
```

C++

```
virtual __fastcall void * CloneItem(void * item);
```

Description

This is CloneItem, a member of class TPointerArray.

105.1.11.3.2 TPointerArray.CopyFrom Method

Pascal

```
procedure CopyFrom(var Source; toIndex: Integer; numItems: Integer);
```

C++

```
__fastcall CopyFrom( Source, int toIndex, int numItems);
```

Description

This is CopyFrom, a member of class TPointerArray.

105.1.11.3.3 TPointerArray.CopyTo Method

Pascal

```
procedure CopyTo(var Dest; fromIndex: Integer; numItems: Integer);
```

C++

```
__fastcall CopyTo( Dest, int fromIndex, int numItems);
```

Description

This is CopyTo, a member of class TPointerArray.

105.1.11.3.4 TPointerArray.FreeItem Method

Pascal

```
procedure FreeItem(item: Pointer); virtual;
```

C++

```
virtual __fastcall FreeItem(void * item);
```

Description

This is FreeItem, a member of class TPointerArray.

105.1.11.3.5 TPointerArray.GetData Method

Pascal

```
function GetData(index: Integer): Pointer;
```

C++

```
__fastcall void * GetData(int index);
```

Description

This is GetData, a member of class TPointerArray.

105.1.11.3.6 TPointerArray.InvalidateItems Method

Pascal

```
procedure InvalidateItems(atIndex: Integer; numItems: Integer); override;
```

C++

```
virtual __fastcall InvalidateItems(int atIndex, int numItems);
```

Description

This is InvalidateItems, a member of class TPointerArray.

105.1.11.3.7 TPointerArray.PutData Method

Pascal

```
procedure PutData(index: Integer; value: Pointer);
```

C++

```
__fastcall PutData(int index, void * value);
```

Description

This is PutData, a member of class TPointerArray.

105.1.11.4 TPointerArray Properties

The properties of the TPointerArray class are listed here.

Public Properties

	Name	Description
	AsPtr (see page 17355)	This is AsPtr, a member of class TPointerArray.
	Data (see page 17356)	This is Data, a member of class TPointerArray.

105.1.11.4.1 TPointerArray.AsPtr Property

Pascal

```
property AsPtr [Index: Integer]: Pointer;
```

C++

```
__property void * AsPtr[int Index];
```

Description

This is AsPtr, a member of class TPointerArray.

105.1.11.4.2 TPointerArray.Data Property

Pascal

```
property Data [Index: Integer]: Pointer;
```

C++

```
__property void * Data[int Index];
```

Description

This is Data, a member of class TPointerArray.

105.1.12 TSingleArray Class

Class Hierarchy

Pascal

```
TSingleArray = class(TBaseArray);
```

C++

```
class TSingleArray : public TBaseArray;
```

File

Mxarrays

Description

This is class Mxarrays.TSingleArray.

105.1.12.1 TSingleArray Members

The following tables list the members exposed by TSingleArray.

Protected Methods

	Name	Description
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BlockCopy (see page 17311)	This is BlockCopy, a member of class TBaseArray.
	ClearFlag (see page 17311)	This is ClearFlag, a member of class TBaseArray.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetAutoSize (see page 17313)	This is GetAutoSize, a member of class TBaseArray.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Grow (see page 17313)	This is Grow, a member of class TBaseArray.
	HasFlag (see page 17314)	This is HasFlag, a member of class TBaseArray.
	InternalHandleException (see page 17315)	This is InternalHandleException, a member of class TBaseArray.
V	InvalidateItems (see page 17315)	This is InvalidateItems, a member of class TBaseArray.
	RemoveRange (see page 17316)	This is RemoveRange, a member of class TBaseArray.

	SetAutoSize (see page 17316)	This is SetAutoSize, a member of class TBaseArray.
	SetCapacity (see page 17317)	This is SetCapacity, a member of class TBaseArray.
	SetFlag (see page 17317)	This is SetFlag, a member of class TBaseArray.
	ValidateBounds (see page 17317)	This is ValidateBounds, a member of class TBaseArray.
	ValidIndex (see page 17318)	This is ValidIndex, a member of class TBaseArray.

Public Methods

	Name	Description
	Add (see page 17359)	This is Add, a member of class TSingleArray.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 17359)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 17311)	Clear removes all items from the array.
	Create (see page 17358)	Creates an instance of TBaseArray for elements of a specific size.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 17312)	Removes an element from the array.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 17310)	Destroys an instance of TBaseArray (see page 17307).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Exchange (see page 17312)	Provides the interface for a method that swaps the values of two elements in the array.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Find (see page 17360)	This is Find, a member of class TSingleArray.
	FindItem (see page 17312)	Locates a value in a sorted array and indicates whether an element with that value already exists.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItem (see page 17360)	This is GetItem, a member of class TSingleArray.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	IndexOf (see page 17360)	Returns the position of the first element with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 17314)	Inserts an element into the array and assigns it a value.
	InsertAt (see page 17315)	Adds an element to the array at the position specified by Index.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PutItem (see page 17360)	This is PutItem, a member of class TSingleArray.
	RemoveItem (see page 17316)	Removes an element from the array.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Sort (see page 17317)	Provides the interface for a method that sorts the elements in the array.

Public Properties

	Name	Description
	AutoSize (see page 17318)	Indicates whether the array grows dynamically as items are added.
	Capacity (see page 17319)	Specifies the maximum number of items that can be added to the array.
	CompareProc (see page 17319)	Implements a sort order for the elements of the array.
	Count (see page 17320)	Specifies the number of items in the array.
	Duplicates (see page 17320)	Specifies whether duplicate items can be added to sorted arrays.
	Items (see page 17361)	This is Items, a member of class TSingleArray.
R	ItemSize (see page 17321)	Indicates the number of bytes used to store each item in the array.
	Limit (see page 17321)	Specifies the size of the array.
R	List (see page 17321)	Points to the array of values maintained by TBaseArray (see page 17307).
	SortOrder (see page 17322)	Determines whether the array is sorted.

105.1.12.2 TSingleArray.Create Constructor

Creates an instance of TBaseArray for elements of a specific size.

Pascal

```
constructor Create(itemcount: Integer; dummy: Integer); override;
```

C++

```
virtual __fastcall TSingleArray(int itemcount, int dummy);
```

Description

Call Create to create an array containing elements with the size specified by the iSize parameter.Create sets the Capacity property to Itemcount and the ItemSize property to iSize. It also initializes the AutoSize property to true and the Count property to 0.

See Also

AutoSize (see page 17318)

Capacity (see page 17319)

Count (see page 17320)

ItemSize (see page 17321)

Create (see page 22287)

105.1.12.3 TSingleArray Methods

The methods of the TSingleArray class are listed here.

Public Methods

	Name	Description
	Add (see page 17359)	This is Add, a member of class TSingleArray.
V	Assign (see page 17359)	Copies the contents of another, similar object.
	Find (see page 17360)	This is Find, a member of class TSingleArray.
	GetItem (see page 17360)	This is GetItem, a member of class TSingleArray.
V	IndexOf (see page 17360)	Returns the position of the first element with a specified value.
	PutItem (see page 17360)	This is PutItem, a member of class TSingleArray.

105.1.12.3.1 TSingleArray.Add Method

Pascal

```
function Add(Value: Single): Integer;
```

C++

```
__fastcall int Add(Single Value);
```

Description

This is Add, a member of class TSingleArray.

105.1.12.3.2 TSingleArray.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo (see page 2931)

EConvertError (see page 22724)

105.1.12.3.3 TSingleArray.Find Method

Pascal

```
function Find(var Index: Integer; Value: Single): Boolean;
```

C++

```
__fastcall Boolean Find(int Index, Single Value);
```

Description

This is Find, a member of class TSingleArray.

105.1.12.3.4 TSingleArray.GetItem Method

Pascal

```
function GetItem(index: Integer): Single;
```

C++

```
__fastcall Single GetItem(int index);
```

Description

This is GetItem, a member of class TSingleArray.

105.1.12.3.5 TSingleArray.IndexOf Method

Returns the position of the first element with a specified value.

Pascal

```
function IndexOf(var Item): Integer; override;
```

C++

```
virtual __fastcall int IndexOf( Item);
```

Description

Call IndexOf to obtain the position of the first occurrence of the value Value. IndexOf returns the 0-based index of the element. Thus, if Value matches the first element in the array, IndexOf returns 0, if Value matches the second element, IndexOf returns 1, and so on. If the value is not in the array, IndexOf returns -1.

Note: IndexOf does not work for arrays sorted in descending order.

See Also

FindItem (see page 17312)

GetItem (see page 17313)

105.1.12.3.6 TSingleArray.PutItem Method

Pascal

```
procedure PutItem(index: Integer; value: Single);
```

C++

```
__fastcall PutItem(int index, Single value);
```

Description

This is PutItem, a member of class TSingleArray.

105.1.12.4 TSingleArray Properties

The properties of the TSingleArray class are listed here.

Public Properties

	Name	Description
	Items (see page 17361)	This is Items, a member of class TSingleArray.

105.1.12.4.1 TSingleArray.Items Property

Pascal

```
property Items [Index: Integer]: Single;
```

C++

```
__property Single Items[int Index];
```

Description

This is Items, a member of class TSingleArray.

105.1.13 TSmallIntArray Class

TSmallIntArray is a dynamically resizable array of 16-bit integers.

Class Hierarchy

System::TObject → Classes.TPersistent → Mxarrays.TBaseArray → Mxarrays.TSmallIntArray

Pascal

```
TSmallIntArray = class(TBaseArray);
```

C++

```
class TSmallIntArray : public TBaseArray;
```

File

Mxarrays

Description

Use TSmallIntArray to represent an array of short integers when the number of elements in the array is unknown. For example, decision cubes use TSmallIntArray objects to represent the coordinates of a cell in the multidimensional cache of summary values.

See Also

TDecisionCube (see page 17442)

105.1.13.1 TSmallIntArray Members

The following tables list the members exposed by TSmallIntArray.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BlockCopy (see page 17311)	This is BlockCopy, a member of class TBaseArray.
	ClearFlag (see page 17311)	This is ClearFlag, a member of class TBaseArray.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetAutoSize (see page 17313)	This is GetAutoSize, a member of class TBaseArray.
	GetOwner (see page 2932)	Returns the owner of an object.
	Grow (see page 17313)	This is Grow, a member of class TBaseArray.
	HasFlag (see page 17314)	This is HasFlag, a member of class TBaseArray.
	InternalHandleException (see page 17315)	This is InternalHandleException, a member of class TBaseArray.
	InvalidateItems (see page 17315)	This is InvalidateItems, a member of class TBaseArray.
	RemoveRange (see page 17316)	This is RemoveRange, a member of class TBaseArray.
	SetAutoSize (see page 17316)	This is SetAutoSize, a member of class TBaseArray.
	SetCapacity (see page 17317)	This is SetCapacity, a member of class TBaseArray.
	SetFlag (see page 17317)	This is SetFlag, a member of class TBaseArray.
	ValidateBounds (see page 17317)	This is ValidateBounds, a member of class TBaseArray.
	ValidIndex (see page 17318)	This is ValidIndex, a member of class TBaseArray.

Public Methods

	Name	Description
	Add (see page 17364)	Adds a new element to the array.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 17365)	Copies the Items (see page 17366) property of another TSmallIntArray (see page 17361) object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 17311)	Clear removes all items from the array.
	Create (see page 17363)	Creates an instance of TSmallIntArray (see page 17361).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 17312)	Removes an element from the array.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 17310)	Destroys an instance of TBaseArray (see page 17307).
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Exchange (see page 17312)	Provides the interface for a method that swaps the values of two elements in the array.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItem (see page 17312)	Locates a value in a sorted array and indicates whether an element with that value already exists.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItem (see page 17365)	Returns the integer at the indicated position.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	IndexOf (see page 17314)	Returns the position of the first element with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	Insert (see page 17314)	Inserts an element into the array and assigns it a value.
	InsertAt (see page 17315)	Adds an element to the array at the position specified by Index.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PutItem (see page 17366)	Replaces the value of an element in the array.
	RemoveItem (see page 17316)	Removes an element from the array.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Sort (see page 17317)	Provides the interface for a method that sorts the elements in the array.

Public Properties

	Name	Description
	AutoSize (see page 17318)	Indicates whether the array grows dynamically as items are added.
	Capacity (see page 17319)	Specifies the maximum number of items that can be added to the array.
	CompareProc (see page 17319)	Implements a sort order for the elements of the array.
	Count (see page 17320)	Specifies the number of items in the array.
	Duplicates (see page 17320)	Specifies whether duplicate items can be added to sorted arrays.
	Items (see page 17366)	Lists the elements in the array.
R	ItemSize (see page 17321)	Indicates the number of bytes used to store each item in the array.
	Limit (see page 17321)	Specifies the size of the array.
R	List (see page 17321)	Points to the array of values maintained by TBaseArray (see page 17307).
	SortOrder (see page 17322)	Determines whether the array is sorted.

105.1.13.2 TSmallIntArray.Create Constructor

Creates an instance of TSmallIntArray (see page 17361).

Pascal

```
constructor Create(itemcount: Integer; dummy: Integer); override;
```

C++

```
virtual __fastcall TSmallIntArray(int itemcount, int dummy);
```

Description

Call Create to create and initialize a TSmallIntArray (see page 17361) object. Create sets the Capacity (see page 17319) property to Itemcount and ignores the iSize parameter.

Create also initializes the following properties:

ItemSize (see page 17321) is set to 2 (the size of a small integer).

CompareProc (see page 17319) is initialized to a function that returns the difference between two 16-bit integers.

AutoSize (see page 17318) is set to true.

Count (see page 17320) is set to 0.

See Also

AutoSize (see page 17318)

Capacity (see page 17319)

CompareProc (see page 17319)

Count (see page 17320)

ItemSize (see page 17321)

Create (see page 17309)

105.1.13.3 TSmallIntArray Methods

The methods of the TSmallIntArray class are listed here.

Public Methods

	Name	Description
	Add (see page 17364)	Adds a new element to the array.
	Assign (see page 17365)	Copies the Items (see page 17366) property of another TSmallIntArray (see page 17361) object.
	GetItem (see page 17365)	Returns the integer at the indicated position.
	PutItem (see page 17366)	Replaces the value of an element in the array.

105.1.13.3.1 TSmallIntArray.Add Method

Adds a new element to the array.

Pascal

```
function Add(Value: SmallInt): Integer;
```

C++

```
__fastcall int Add(SmallInt Value);
```

Description

Call Add to add an item to the end of an unsorted array, or to the appropriate position in a sorted array. To insert an element at a specified position within the array, use the Insert (see page 17314) method instead.

Note: Add assumes that sorted arrays are sorted in ascending order. To use Add on an array where SortOrder (see page 17322) is TS_DESCENDING, temporarily change the CompareProc (see page 17319) property to a function that multiplies the value returned by CompareProc (see page 17319) by -1.

See Also

CompareProc (see page 17319)

Insert (see page 17314)

SortOrder (see page 17322)

105.1.13.3.2 TSmallIntArray.Assign Method

Copies the Items (see page 17366) property of another TSmallIntArray (see page 17361) object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the array from another object. If the Source parameter is a TSmallIntArray (see page 17361) object, Assign replaces the Items (see page 17366) property with the array from the source array. Otherwise, Assign calls the inherited method which will assign values from any Source object that handles a TSmallIntArray (see page 17361) in its AssignTo method.

Note: Assign only changes the list of elements. It does not copy the AutoSize (see page 17318), Capacity (see page 17319), CompareProc (see page 17319), Duplicates (see page 17320), or SortOrder (see page 17322) properties. If the AutoSize (see page 17318) property is false, be sure that the value of Capacity (see page 17319) is at least as big as the Count (see page 17320) property of the source array. If the array is sorted, source items will appear in sorted order. If the Duplicates (see page 17320) property is not dupAccept, duplicate elements will not be copied from the source array.

See Also

AutoSize (see page 17318)

Capacity (see page 17319)

Count (see page 17320)

Items (see page 17366)

AssignTo (see page 2931)

105.1.13.3.3 TSmallIntArray.GetItem Method

Returns the integer at the indicated position.

Pascal

```
function GetItem(index: Integer): SmallInt;
```

C++

```
__fastcall SmallInt GetItem(int index);
```

Description

Call GetItem to obtain the value of an integer in the array. The Index parameter indicates the element of the array, where the first element has the index 0, the second element has the index 1, and so on.

See Also

FindItem (see page 17312)

IndexOf (see page 17314)

Items (see page 17366)

105.1.13.3.4 TSmallIntArray.PutItem Method

Replaces the value of an element in the array.

Pascal

```
procedure PutItem(index: Integer; value: SmallInt);
```

C++

```
__fastcall PutItem(int index, SmallInt value);
```

Description

Call PutItem to change the value of an integer to the value Value. Unlike the Insert (see page 17314) method, PutItem does not add a new item to the array, but replaces the value of an existing element. The Index parameter indicates which element to change, where 0 specifies the first element, 1 specifies the second element, and so on.

Note: Calling PutItem with Index set to the value of the Count (see page 17320) property will add a new element to the end of the array. This is the only case where PutItem adds a new element instead of replacing an existing one.

See Also

Count (see page 17320)

GetItem (see page 17365)

Insert (see page 17314)

Items (see page 17366)

105.1.13.4 TSmallIntArray Properties

The properties of the TSmallIntArray class are listed here.

Public Properties

	Name	Description
	Items (see page 17366)	Lists the elements in the array.

105.1.13.4.1 TSmallIntArray.Items Property

Lists the elements in the array.

Pascal

```
property Items [Index:Integer]: SmallInt;
```

C++

```
__property SmallInt Items[int Index];
```

Description

Use Items to read or set the value of the element indicated by the Index parameter, where 0 specifies the first element in the array, 1 specifies the second parameter, and so on.

Note: In Delphi code, Items is the default property for TSmallIntArray (see page 17361), which means the name of the Items property need not be included when using it. Thus, the line

```
FirstInt := SmallIntArray1.Items[0];
```

Note: can be written

```
FirstInt := SmallIntArray1[0].
```

See Also

GetItem (see page 17365)

List (see page 17321)

PutItem (see page 17366)

105.1.14 TStringArray Class

Class Hierarchy

Pascal

```
TStringArray = class(TBaseArray);
```

C++

```
class TStringArray : public TBaseArray;
```

File

Mxarrays

Description

This is class Mxarrays.TStringArray.

105.1.14.1 TStringArray Members

The following tables list the members exposed by TStringArray.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BlockCopy (see page 17311)	This is BlockCopy, a member of class TBaseArray.
	ClearFlag (see page 17311)	This is ClearFlag, a member of class TBaseArray.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetAutoSize (see page 17313)	This is GetAutoSize, a member of class TBaseArray.
	GetObject (see page 17371)	This is GetObject, a member of class TStringArray.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetString (see page 17372)	This is GetString, a member of class TStringArray.
	Grow (see page 17372)	This is Grow, a member of class TStringArray.
	HasFlag (see page 17314)	This is HasFlag, a member of class TBaseArray.
	InternalHandleException (see page 17315)	This is InternalHandleException, a member of class TBaseArray.
	InvalidateItems (see page 17373)	This is InvalidateItems, a member of class TStringArray.
	PutObject (see page 17373)	This is PutObject, a member of class TStringArray.
	PutString (see page 17373)	This is PutString, a member of class TStringArray.
	RemoveRange (see page 17316)	This is RemoveRange, a member of class TBaseArray.

	SetAutoSize (see page 17316)	This is SetAutoSize, a member of class TBaseArray.
V	SetCapacity (see page 17317)	This is SetCapacity, a member of class TBaseArray.
	SetFlag (see page 17317)	This is SetFlag, a member of class TBaseArray.
	ValidateBounds (see page 17317)	This is ValidateBounds, a member of class TBaseArray.
	ValidIndex (see page 17318)	This is ValidIndex, a member of class TBaseArray.

Public Methods

	Name	Description
	Add (see page 17370)	This is Add, a member of class TStringArray.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 17370)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 17311)	Clear removes all items from the array.
V	Create (see page 17369)	Creates an instance of TBaseArray for elements of a specific size.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Delete (see page 17312)	Removes an element from the array.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 17310)	Destroys an instance of TBaseArray (see page 17307).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Exchange (see page 17371)	Provides the interface for a method that swaps the values of two elements in the array.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Find (see page 17371)	This is Find, a member of class TStringArray.
	FindItem (see page 17312)	Locates a value in a sorted array and indicates whether an element with that value already exists.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItem (see page 17313)	Returns the element in the array at the indicated position.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	IndexOf (see page 17372)	Returns the position of the first element with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	Insert (see page 17372)	Inserts an element into the array and assigns it a value.
	InsertAt (see page 17315)	Adds an element to the array at the position specified by Index.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PutItem (see page 17315)	Replaces the value of an element in the array.
	RemoveItem (see page 17316)	Removes an element from the array.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Sort (see page 17373)	Provides the interface for a method that sorts the elements in the array.

Public Properties

	Name	Description
	AutoSize (see page 17318)	Indicates whether the array grows dynamically as items are added.
	Capacity (see page 17319)	Specifies the maximum number of items that can be added to the array.
	CompareProc (see page 17319)	Implements a sort order for the elements of the array.
	Count (see page 17320)	Specifies the number of items in the array.
	Duplicates (see page 17320)	Specifies whether duplicate items can be added to sorted arrays.
R	ItemSize (see page 17321)	Indicates the number of bytes used to store each item in the array.
	Limit (see page 17321)	Specifies the size of the array.
R	List (see page 17321)	Points to the array of values maintained by TBaseArray (see page 17307).
	SortOrder (see page 17322)	Determines whether the array is sorted.
	Strings (see page 17374)	This is Strings, a member of class TStringArray.

105.1.14.2 TStringArray.Create Constructor

Creates an instance of TBaseArray for elements of a specific size.

Pascal

```
constructor Create(itemcount: Integer; dummy: Integer); override;
```

C++

```
virtual __fastcall TStringArray(int itemcount, int dummy);
```

Description

Call Create to create an array containing elements with the size specified by the iSize parameter.Create sets the Capacity property to Itemcount and the ItemSize property to iSize. It also initializes the AutoSize property to true and the Count property to 0.

See Also

AutoSize (see page 17318)

Capacity (see page 17319)

Count (see page 17320)

ItemSize (see page 17321)

Create (see page 22287)

105.1.14.3 TStringArray Methods

The methods of the TStringArray class are listed here.

Protected Methods

	Name	Description
	GetObject (see page 17371)	This is GetObject, a member of class TStringArray.
	GetString (see page 17372)	This is GetString, a member of class TStringArray.
V	Grow (see page 17372)	This is Grow, a member of class TStringArray.
V	InvalidateItems (see page 17373)	This is InvalidateItems, a member of class TStringArray.
	PutObject (see page 17373)	This is PutObject, a member of class TStringArray.
	PutString (see page 17373)	This is PutString, a member of class TStringArray.

Public Methods

	Name	Description
	Add (see page 17370)	This is Add, a member of class TStringArray.
V	Assign (see page 17370)	Copies the contents of another, similar object.
V	Exchange (see page 17371)	Provides the interface for a method that swaps the values of two elements in the array.
	Find (see page 17371)	This is Find, a member of class TStringArray.
V	IndexOf (see page 17372)	Returns the position of the first element with a specified value.
V	Insert (see page 17372)	Inserts an element into the array and assigns it a value.
V	Sort (see page 17373)	Provides the interface for a method that sorts the elements in the array.

105.1.14.3.1 TStringArray.Add Method

Pascal

```
function Add(const S: String): Integer;
```

C++

```
__fastcall int Add(const AnsiString S);
```

Description

This is Add, a member of class TStringArray.

105.1.14.3.2 TStringArray.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the

contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo (see page 2931)

EConvertError (see page 22724)

105.1.14.3.3 TStringArray.Exchange Method

Provides the interface for a method that swaps the values of two elements in the array.

Pascal

```
procedure Exchange(Index1: Integer; Index2: Integer); override;
```

C++

```
virtual __fastcall Exchange(int Index1, int Index2);
```

Description

The Exchange method for TBaseArray does nothing other than provide an interface for a method that interchanges the values of two elements.

See Also

IndexOf (see page 17314)

GetItem (see page 17313)

105.1.14.3.4 TStringArray.Find Method

Pascal

```
function Find(S: string; var Index: Integer): Boolean;
```

C++

```
__fastcall Boolean Find(AnsiString S, int Index);
```

Description

This is Find, a member of class TStringArray.

105.1.14.3.5 TStringArray.GetObject Method

Pascal

```
function GetObject(Index: Integer): TObject;
```

C++

```
__fastcall TObject * GetObject(int Index);
```

Description

This is GetObject, a member of class TStringArray.

105.1.14.3.6 TStringArray.GetString Method

Pascal

```
function GetString(Index: Integer): string;
```

C++

```
__fastcall AnsiString GetString(int Index);
```

Description

This is GetString, a member of class TStringArray.

105.1.14.3.7 TStringArray.Grow Method

Pascal

```
procedure Grow; override;
```

C++

```
virtual __fastcall Grow();
```

Description

This is Grow, a member of class TStringArray.

105.1.14.3.8 TStringArray.IndexOf Method

Returns the position of the first element with a specified value.

Pascal

```
function IndexOf(var Item): Integer; override;
```

C++

```
virtual __fastcall int IndexOf( Item);
```

Description

Call IndexOf to obtain the position of the first occurrence of the value Value. IndexOf returns the 0-based index of the element. Thus, if Value matches the first element in the array, IndexOf returns 0, if Value matches the second element, IndexOf returns 1, and so on. If the value is not in the array, IndexOf returns -1.

Note: IndexOf does not work for arrays sorted in descending order.

See Also

FindItem (see page 17312)

GetItem (see page 17313)

105.1.14.3.9 TStringArray.Insert Method

Inserts an element into the array and assigns it a value.

Pascal

```
procedure Insert(Index: Integer; var Value); override;
```

C++

```
virtual __fastcall Insert(int Index,  Value);
```

Description

Call InsertAt to add an element to the array at the position specified by Index and assign it the value of Value. If Index is 0, the element is inserted at the beginning of the array. If Index is 1, the element is put in the second position of the array, and so on.

Note: Insert does not check the SortOrder property. If the array is sorted, be sure to insert the element in the proper sort order position.

See Also

Delete (see page 17312)

PutItem (see page 17315)

SortOrder (see page 17322)

105.1.14.3.10 TStringArray.InvalidateItems Method

Pascal

```
procedure InvalidateItems(atIndex: Integer; numItems: Integer); override;
```

C++

```
virtual __fastcall InvalidateItems(int atIndex, int numItems);
```

Description

This is InvalidateItems, a member of class TStringArray.

105.1.14.3.11 TStringArray.PutObject Method

Pascal

```
procedure PutObject(Index: Integer; AObject: TObject);
```

C++

```
__fastcall PutObject(int Index, TObject * AObject);
```

Description

This is PutObject, a member of class TStringArray.

105.1.14.3.12 TStringArray.PutString Method

Pascal

```
procedure PutString(Index: Integer; const S: string);
```

C++

```
__fastcall PutString(int Index, const AnsiString S);
```

Description

This is PutString, a member of class TStringArray.

105.1.14.3.13 TStringArray.Sort Method

Provides the interface for a method that sorts the elements in the array.

Pascal

```
procedure Sort(Compare: TCompareProc); override;
```

C++

```
virtual __fastcall Sort(TCompareProc Compare);
```

Description

The Sort method for TBaseArray does nothing. Descendants of TBaseArray override this method to sort the elements of the array using the ordering function provided in the Compare parameter.

See Also

CompareProc (see page 17319)

SortOrder (see page 17322)

105.1.14.4 TStringArray Properties

The properties of the TStringArray class are listed here.

Public Properties

	Name	Description
	Strings (see page 17374)	This is Strings, a member of class TStringArray.

105.1.14.4.1 TStringArray.Strings Property

Pascal

```
property Strings [Index: Integer]: String;
```

C++

```
__property AnsiString Strings[int Index];
```

Description

This is Strings, a member of class TStringArray.

105.1.15 TThreadCustomArray Class

Class Hierarchy

Pascal

```
TThreadCustomArray = class;
```

C++

```
class TThreadCustomArray;
```

File

Mxarrays

Description

This is class Mxarrays.TThreadCustomArray.

105.1.15.1 TThreadCustomArray Members

The following tables list the members exposed by TThreadCustomArray.

Public Methods

	Name	Description
	Add (see page 17376)	This is Add, a member of class TThreadCustomArray.
	Create (see page 17375)	This is Create, a member of class TThreadCustomArray.
V	Destroy (see page 17375)	This is Destroy, a member of class TThreadCustomArray.
	GetItem (see page 17376)	This is GetItem, a member of class TThreadCustomArray.
	LockArray (see page 17376)	This is LockArray, a member of class TThreadCustomArray.
	MemoryUsage (see page 17376)	This is MemoryUsage, a member of class TThreadCustomArray.
	UnlockArray (see page 17376)	This is UnlockArray, a member of class TThreadCustomArray.

105.1.15.2 TThreadCustomArray.Create Constructor

Pascal

```
constructor Create(Items: Integer; VarType: Integer);
```

C++

```
__fastcall TThreadCustomArray(int Items, int VarType);
```

Description

This is Create, a member of class TThreadCustomArray.

105.1.15.3 TThreadCustomArray.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TThreadCustomArray();
```

Description

This is Destroy, a member of class TThreadCustomArray.

105.1.15.4 TThreadCustomArray Methods

The methods of the TThreadCustomArray class are listed here.

Public Methods

	Name	Description
	Add (see page 17376)	This is Add, a member of class TThreadCustomArray.
	GetItem (see page 17376)	This is GetItem, a member of class TThreadCustomArray.
	LockArray (see page 17376)	This is LockArray, a member of class TThreadCustomArray.
	MemoryUsage (see page 17376)	This is MemoryUsage, a member of class TThreadCustomArray.
	UnlockArray (see page 17376)	This is UnlockArray, a member of class TThreadCustomArray.

105.1.15.4.1 TThreadCustomArray.Add Method

Pascal

```
function Add(Item: Variant): Integer;
```

C++

```
__fastcall int Add(Variant Item);
```

Description

This is Add, a member of class TThreadCustomArray.

105.1.15.4.2 TThreadCustomArray.GetItem Method

Pascal

```
function GetItem(Index: Integer): Variant;
```

C++

```
__fastcall Variant GetItem(int Index);
```

Description

This is GetItem, a member of class TThreadCustomArray.

105.1.15.4.3 TThreadCustomArray.LockArray Method

Pascal

```
function LockArray: TCustomArray;
```

C++

```
__fastcall TCustomArray LockArray();
```

Description

This is LockArray, a member of class TThreadCustomArray.

105.1.15.4.4 TThreadCustomArray.MemoryUsage Method

Pascal

```
function MemoryUsage: Integer;
```

C++

```
__fastcall int MemoryUsage();
```

Description

This is MemoryUsage, a member of class TThreadCustomArray.

105.1.15.4.5 TThreadCustomArray.UnlockArray Method

Pascal

```
procedure UnlockArray;
```

C++

```
__fastcall UnlockArray();
```

Description

This is UnlockArray, a member of class TThreadCustomArray.

105.1.16 TTwoDimArray Class

Class Hierarchy

Mxarrays.TTwoDimArray

Pascal

```
TTwoDimArray = class;
```

C++

```
class TTwoDimArray;
```

File

Mxarrays

Description

This is class Mxarrays.TTwoDimArray.

105.1.16.1 TTwoDimArray Members

The following tables list the members exposed by TTwoDimArray.

Protected Fields

	Name	Description
	mtxElements (see page 17378)	This is mtxElements, a member of class TTwoDimArray.

Public Methods

	Name	Description
	Create (see page 17377)	This is Create, a member of class TTwoDimArray.
V	Destroy (see page 17378)	This is Destroy, a member of class TTwoDimArray.
	SetSize (see page 17378)	This is SetSize, a member of class TTwoDimArray.

Public Properties

	Name	Description
R	columns (see page 17379)	This is columns, a member of class TTwoDimArray.
	Element (see page 17379)	This is Element, a member of class TTwoDimArray.
R	rows (see page 17379)	This is rows, a member of class TTwoDimArray.

105.1.16.2 TTwoDimArray.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TTwoDimArray();
```

Description

This is Create, a member of class TTwoDimArray.

105.1.16.3 TTwoDimArray.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TTwoDimArray();
```

Description

This is Destroy, a member of class TTwoDimArray.

105.1.16.4 TTwoDimArray Fields

The fields of the TTwoDimArray class are listed here.

Protected Fields

	Name	Description
	mtxElements (see page 17378)	This is mtxElements, a member of class TTwoDimArray.

105.1.16.4.1 TTwoDimArray.mtxElements Field

Pascal

```
mtxElements: PMatrixElements;
```

C++

```
PMatrixElements mtxElements;
```

Description

This is mtxElements, a member of class TTwoDimArray.

105.1.16.5 TTwoDimArray Methods

The methods of the TTwoDimArray class are listed here.

Public Methods

	Name	Description
	SetSize (see page 17378)	This is SetSize, a member of class TTwoDimArray.

105.1.16.5.1 TTwoDimArray.SetSize Method

Pascal

```
procedure SetSize(NumRows: TDynArrayNDX; NumColumns: TMatrixNDX);
```

C++

```
__fastcall SetSize(TDynArrayNDX NumRows, TMatrixNDX NumColumns);
```

Description

This is SetSize, a member of class TTwoDimArray.

105.1.16.6 TTwoDimArray Properties

The properties of the TTwoDimArray class are listed here.

Public Properties

	Name	Description
R	columns (see page 17379)	This is columns, a member of class TTwoDimArray.
	Element (see page 17379)	This is Element, a member of class TTwoDimArray.
R	rows (see page 17379)	This is rows, a member of class TTwoDimArray.

105.1.16.6.1 TTwoDimArray.columns Property

Pascal

```
property columns: TMatrixNDX;
```

C++

```
__property TMatrixNDX columns;
```

Description

This is columns, a member of class TTwoDimArray.

105.1.16.6.2 TTwoDimArray.Element Property

Pascal

```
property Element [row: TDynArrayNDX; column: TMatrixNDX]: SmallInt;
```

C++

```
__property SmallInt Element[TDynArrayNDX; column: TMatrixNDX row];
```

Description

This is Element, a member of class TTwoDimArray.

105.1.16.6.3 TTwoDimArray.rows Property

Pascal

```
property rows: TDynArrayNDX;
```

C++

```
__property TDynArrayNDX rows;
```

Description

This is rows, a member of class TTwoDimArray.

105.1.17 TWordArray Class

Class Hierarchy

Pascal

```
TWordArray = class(TBaseArray);
```

C++

```
class TWordArray : public TBaseArray;
```

File

Mxarrays

Description

This is class Mxarrays.TWordArray.

105.1.17.1 TWordArray Members

The following tables list the members exposed by TWordArray.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BlockCopy (see page 17311)	This is BlockCopy, a member of class TBaseArray.
	ClearFlag (see page 17311)	This is ClearFlag, a member of class TBaseArray.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetAutoSize (see page 17313)	This is GetAutoSize, a member of class TBaseArray.
	GetOwner (see page 2932)	Returns the owner of an object.
	Grow (see page 17313)	This is Grow, a member of class TBaseArray.
	HasFlag (see page 17314)	This is HasFlag, a member of class TBaseArray.
	InternalHandleException (see page 17315)	This is InternalHandleException, a member of class TBaseArray.
	InvalidateItems (see page 17315)	This is InvalidateItems, a member of class TBaseArray.
	RemoveRange (see page 17316)	This is RemoveRange, a member of class TBaseArray.
	SetAutoSize (see page 17316)	This is SetAutoSize, a member of class TBaseArray.
	SetCapacity (see page 17317)	This is SetCapacity, a member of class TBaseArray.
	SetFlag (see page 17317)	This is SetFlag, a member of class TBaseArray.
	ValidateBounds (see page 17317)	This is ValidateBounds, a member of class TBaseArray.
	ValidIndex (see page 17318)	This is ValidIndex, a member of class TBaseArray.

Public Methods

	Name	Description
	Add (see page 17382)	This is Add, a member of class TWordArray.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 17383)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 17311)	Clear removes all items from the array.
V	Create (see page 17382)	Creates an instance of TBaseArray for elements of a specific size.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Delete (see page 17312)	Removes an element from the array.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 17310)	Destroys an instance of TBaseArray (see page 17307).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Exchange (see page 17312)	Provides the interface for a method that swaps the values of two elements in the array.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Find (see page 17383)	This is Find, a member of class TWordArray.
	FindItem (see page 17312)	Locates a value in a sorted array and indicates whether an element with that value already exists.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItem (see page 17384)	This is GetItem, a member of class TWordArray.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	IndexOf (see page 17384)	Returns the position of the first element with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	Insert (see page 17314)	Inserts an element into the array and assigns it a value.
	InsertAt (see page 17315)	Adds an element to the array at the position specified by Index.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PutItem (see page 17384)	This is PutItem, a member of class TWordArray.
	RemoveItem (see page 17316)	Removes an element from the array.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Sort (see page 17317)	Provides the interface for a method that sorts the elements in the array.

Public Properties

	Name	Description
	AutoSize (see page 17318)	Indicates whether the array grows dynamically as items are added.
	Capacity (see page 17319)	Specifies the maximum number of items that can be added to the array.
	CompareProc (see page 17319)	Implements a sort order for the elements of the array.
	Count (see page 17320)	Specifies the number of items in the array.
	Duplicates (see page 17320)	Specifies whether duplicate items can be added to sorted arrays.
	Items (see page 17385)	This is Items, a member of class TWordArray.
R	ItemSize (see page 17321)	Indicates the number of bytes used to store each item in the array.
	Limit (see page 17321)	Specifies the size of the array.
R	List (see page 17321)	Points to the array of values maintained by TBaseArray (see page 17307).
	SortOrder (see page 17322)	Determines whether the array is sorted.

105.1.17.2 TWordArray.Create Constructor

Creates an instance of TBaseArray for elements of a specific size.

Pascal

```
constructor Create(itemcount: Integer; dummy: Integer); override;
```

C++

```
virtual __fastcall TWordArray(int itemcount, int dummy);
```

Description

Call Create to create an array containing elements with the size specified by the iSize parameter.Create sets the Capacity property to Itemcount and the ItemSize property to iSize. It also initializes the AutoSize property to true and the Count property to 0.

See Also

AutoSize (see page 17318)

Capacity (see page 17319)

Count (see page 17320)

ItemSize (see page 17321)

Create (see page 22287)

105.1.17.3 TWordArray Methods

The methods of the TWordArray class are listed here.

Public Methods

	Name	Description
	Add (see page 17382)	This is Add, a member of class TWordArray.
V	Assign (see page 17383)	Copies the contents of another, similar object.
	Find (see page 17383)	This is Find, a member of class TWordArray.
	GetItem (see page 17384)	This is GetItem, a member of class TWordArray.
V	IndexOf (see page 17384)	Returns the position of the first element with a specified value.
	PutItem (see page 17384)	This is PutItem, a member of class TWordArray.

105.1.17.3.1 TWordArray.Add Method

Pascal

```
function Add(Value: Word): Integer;
```

C++

```
__fastcall int Add(Word Value);
```

Description

This is Add, a member of class TWordArray.

105.1.17.3.2 TWordArray.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo (see page 2931)

EConvertError (see page 22724)

105.1.17.3.3 TWordArray.Find Method

Pascal

```
function Find(var Index: Integer; Value: Word): Boolean;
```

C++

```
__fastcall Boolean Find(int Index, Word Value);
```

Description

This is Find, a member of class TWordArray.

105.1.17.3.4 TWordArray.GetItem Method

Pascal

```
function GetItem(index: Integer): Word;
```

C++

```
__fastcall Word GetItem(int index);
```

Description

This is GetItem, a member of class TWordArray.

105.1.17.3.5 TWordArray.IndexOf Method

Returns the position of the first element with a specified value.

Pascal

```
function IndexOf(var Item): Integer; override;
```

C++

```
virtual __fastcall int IndexOf( Item);
```

Description

Call IndexOf to obtain the position of the first occurrence of the value Value. IndexOf returns the 0-based index of the element. Thus, if Value matches the first element in the array, IndexOf returns 0, if Value matches the second element, IndexOf returns 1, and so on. If the value is not in the array, IndexOf returns -1.

Note: IndexOf does not work for arrays sorted in descending order.

See Also

FindItem (see page 17312)

GetItem (see page 17313)

105.1.17.3.6 TWordArray.PutItem Method

Pascal

```
procedure PutItem(index: Integer; value: Word);
```

C++

```
__fastcall PutItem(int index, Word value);
```

Description

This is PutItem, a member of class TWordArray.

105.1.17.4 TWordArray Properties

The properties of the TWordArray class are listed here.

Public Properties

	Name	Description
	Items (see page 17385)	This is Items, a member of class TWordArray.

105.1.17.4.1 TWordArray.Items Property

Pascal

```
property Items [Index: Integer]: Word;
```

C++

```
__property Word Items[int Index];
```

Description

This is Items, a member of class TWordArray.

105.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetMemoryCapacity (see page 17386)	This is function Mxarrays.GetMemoryCapacity.
	SetMemoryCapacity (see page 17386)	This is function Mxarrays.SetMemoryCapacity.

105.2.1 Mxarrays.GetMemoryCapacity Function

Pascal

```
function GetMemoryCapacity: Integer;
```

C++

```
int GetMemoryCapacity();
```

File

Mxarrays

Description

This is function Mxarrays.GetMemoryCapacity.

105.2.2 Mxarrays.SetMemoryCapacity Function

Pascal

```
procedure SetMemoryCapacity(Value: Integer);
```

C++

```
SetMemoryCapacity(int Value);
```

File

Mxarrays

Description

This is function Mxarrays.SetMemoryCapacity.

105.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TArrayFlags (see page 17387)	This is record Mxarrays.TArrayFlags.
	TDuplicates (see page 17387)	This is record Mxarrays.TDuplicates.
	TSortOrder (see page 17388)	This is record Mxarrays.TSortOrder.

Records

	Name	Description
	TStringItem (see page 17388)	This is record Mxarrays.TStringItem.

105.3.1 Mxarrays.TArrayFlags Enumeration

Pascal

```
TArrayFlags = (
  afOwnsData,
  afAutoSize,
  afCanCompare,
  afSortUnique
);
```

C++

```
enum TArrayFlags {
  afOwnsData,
  afAutoSize,
  afCanCompare,
  afSortUnique
};
```

File

Mxarrays

Description

This is record Mxarrays.TArrayFlags.

105.3.2 Mxarrays.TDuplicates Enumeration

Pascal

```
TDuplicates = (
  dupIgnore,
  dupAccept,
  dupError
);
```

C++

```
enum TDuplicates {
  dupIgnore,
  dupAccept,
  dupError
};
```

File

Mxarrays

Description

This is record Mxarrays.TDuplicates.

105.3.3 Mxarrays.TSortOrder Enumeration

Pascal

```
TSortOrder = (
  tsNone,
  tsAscending,
  tsDescending
);
```

C++

```
enum TSortOrder {
  tsNone,
  tsAscending,
  tsDescending
};
```

File

Mxarrays

Description

This is record Mxarrays.TSortOrder.

105.3.4 Mxarrays.TStringItem Record

Pascal

```
TStringItem = record
  FString: string;
  FObject: TObject;
end;
```

C++

```
struct TStringItem {
  AnsiString FString;
  TObject * FObject;
};
```

File

Mxarrays

Description

This is record Mxarrays.TStringItem.

105.4 Types

The following table lists types in this documentation.

Types

Name	Description
PIndexElements (see page 17390)	This is type Mxarrays.PIndexElements.
PMatrixElements (see page 17390)	This is type Mxarrays.PMatrixElements.
TArrayFlagSet (see page 17391)	This is type Mxarrays.TArrayFlagSet.
TCompareProc (see page 17391)	This is type Mxarrays.TCompareProc.
TDynArrayNDX (see page 17391)	This is type Mxarrays.TDynArrayNDX.
TIndexElements (see page 17392)	This is type Mxarrays.TIndexElements.
TIndexNDX (see page 17392)	This is type Mxarrays.TIndexNDX.
TMatrixElements (see page 17392)	This is type Mxarrays.TMatrixElements.
TMatrixNDX (see page 17393)	This is type Mxarrays.TMatrixNDX.

105.4.1 Mxarrays.PIndexElements Type

Pascal

```
PIndexElements = ^TIndexElements;
```

C++

```
^TIndexElements PIndexElements;
```

File

Mxarrays

Description

This is type Mxarrays.PIndexElements.

105.4.2 Mxarrays.PMatrixElements Type

Pascal

```
PMatrixElements = ^TMatrixElements;
```

C++

```
^TMatrixElements PMatrixElements;
```

File

Mxarrays

Description

This is type Mxarrays.PMatrixElements.

105.4.3 Mxarrays.TArrayFlagSet Type

Pascal

```
TArrayFlagSet = set of TArrayFlags;
```

C++

```
TArrayFlags TArrayFlagSet;
```

File

Mxarrays

Description

This is type Mxarrays.TArrayFlagSet.

105.4.4 Mxarrays.TCompareProc Type

Pascal

```
TCompareProc = function (var item1, item2): Integer;
```

C++

```
(var item1, item2): Integer ( TCompareProc)();
```

File

Mxarrays

Description

This is type Mxarrays.TCompareProc.

105.4.5 Mxarrays.TDynArrayNDX Type

Pascal

```
TDynArrayNDX = 0..vMaxRow;
```

C++

```
0..vMaxRow TDynArrayNDX;
```

File

Mxarrays

Description

This is type Mxarrays.TDynArrayNDX.

105.4.6 Mxarrays.TIndexElements Type

Pascal

```
TIndexElements = array[TIndexNDX] of TSmallIntArray;
```

C++

```
array[TIndexNDX] of TSmallIntArray TIndexElements;
```

File

Mxarrays

Description

This is type Mxarrays.TIndexElements.

105.4.7 Mxarrays.TIndexNDX Type

Pascal

```
TIndexNDX = 0..vMaxCol;
```

C++

```
0..vMaxCol TIndexNDX;
```

File

Mxarrays

Description

This is type Mxarrays.TIndexNDX.

105.4.8 Mxarrays.TMatrixElements Type

Pascal

```
TMatrixElements = array[TMatrixNDX] of TSmallIntArray;
```

C++

```
array[TMatrixNDX] of TSmallIntArray TMatrixElements;
```

File

Mxarrays

Description

This is type Mxarrays.TMatrixElements.

105.4.9 Mxarrays.TMatrixNDX Type

Pascal

```
TMatrixNDX = 0..vMaxCol;
```

C++

```
0..vMaxCol TMatrixNDX;
```

File

Mxarrays

Description

This is type Mxarrays.TMatrixNDX.

105.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
vMaxCol (see page 17394)	This is constant Mxarrays.vMaxCol.
vMaxRow (see page 17394)	This is constant Mxarrays.vMaxRow.

105.5.1 Mxarrays.vMaxCol Constant

Pascal

```
vMaxCol = High(Integer) div Sizeof(TSmallIntArray)-1;
```

C++

```
vMaxCol = High(Integer) div Sizeof(TSmallIntArray)-1;
```

File

Mxarrays

Description

This is constant Mxarrays.vMaxCol.

105.5.2 Mxarrays.vMaxRow Constant

Pascal

```
vMaxRow = (High(Integer)-$f) div Sizeof(SmallInt);
```

C++

```
vMaxRow = (High(Integer)-$f) div Sizeof(SmallInt);
```

File

Mxarrays

Description

This is constant Mxarrays.vMaxRow.

106 MXCOMMON Namespace

This is namespace MXCOMMON.

Topics

Name	Description
Classes (see page 17397)	The following table lists classes in this documentation.
Functions (see page 17427)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 17432)	The following table lists structs, records, enums in this documentation.
Types (see page 17436)	The following table lists types in this documentation.

Classes

	Name	Description
	EDimensionMapError (see page 17397)	This is class MXCOMMON.EDimensionMapError.
	TBinData (see page 17397)	This is class MXCOMMON.TBinData.
	TDimensionItem (see page 17405)	TDimensionItem is the base class for objects that represent dimensions and summaries in a crosstabulated data store.
	TDimensionItems (see page 17415)	TDimensionItems is the base class for objects that represent dimension maps.
	TTicks (see page 17424)	This is class MXCOMMON.TTicks.

Functions

	Name	Description
	AddToQuerySelect (see page 17427)	This is function MXCOMMON.AddToQuerySelect.
	BuildDataSetMap (see page 17427)	This is function MXCOMMON.BuildDataSetMap.
	CheckIfEmptyQuery (see page 17428)	This is function MXCOMMON.CheckIfEmptyQuery.
	FieldTypeToVarType (see page 17428)	This is function MXCOMMON.FieldTypeToVarType.
	FormatVariant (see page 17428)	This is function MXCOMMON.FormatVariant.
	GetAggName (see page 17429)	This is function MXCOMMON.GetAggName.
	HookToDataBase (see page 17429)	This is function MXCOMMON.HookToDataBase.
	IsAggValid (see page 17429)	This is function MXCOMMON.IsAggValid.
	IsBDEAvailable (see page 17430)	This is function MXCOMMON.IsBDEAvailable.
	NextArg (see page 17430)	This is function MXCOMMON.NextArg.
	UpdateDesigner (see page 17430)	This is function MXCOMMON.UpdateDesigner.
	VerifyRTQuery (see page 17431)	This is function MXCOMMON.VerifyRTQuery.

Structs, Records, Enums

	Name	Description
	TActiveFlags (see page 17432)	This is record MXCOMMON.TActiveFlags.
	TBinType (see page 17432)	This is record MXCOMMON.TBinType.
	TCDNotifyType (see page 17433)	This is record MXCOMMON.TCDNotifyType.
	TDimFlags (see page 17433)	This is record MXCOMMON.TDimFlags.
	TQueryError (see page 17434)	This is record MXCOMMON.TQueryError.
	TTickInfoRec (see page 17434)	This is record MXCOMMON.TTickInfoRec.

Types

Name	Description
PTickInfoRec (see page 17436)	This is type MXCOMMON.PTickInfoRec.
TBinTypes (see page 17436)	This is type MXCOMMON.TBinTypes.
TDimensionItemClass (see page 17436)	This is type MXCOMMON.TDimensionItemClass.

106.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EDimensionMapError (see page 17397)	This is class MXCOMMON.EDimensionMapError.
	TBinData (see page 17397)	This is class MXCOMMON.TBinData.
	TDimensionItem (see page 17405)	TDimensionItem is the base class for objects that represent dimensions and summaries in a crosstabulated data store.
	TDimensionItems (see page 17415)	TDimensionItems is the base class for objects that represent dimension maps.
	TTicks (see page 17424)	This is class MXCOMMON.TTicks.

106.1.1 EDimensionMapError Class

Class Hierarchy

Pascal

```
EDimensionMapError = class(Exception);
```

C++

```
class EDimensionMapError : public Exception;
```

File

MXCOMMON

Description

This is class MXCOMMON.EDimensionMapError.

106.1.2 TBinData Class

Class Hierarchy

Pascal

```
TBinData = class(TPersistent);
```

C++

```
class TBinData : public TPersistent;
```

File

MXCOMMON

Description

This is class MXCOMMON.TBinData.

106.1.2.1 TBinData Members

The following tables list the members exposed by TBinData.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.

Public Methods

	Name	Description
	AddBin (see page 17400)	This is AddBin, a member of class TBinData.
	AddBinValue (see page 17400)	This is AddBinValue, a member of class TBinData.
	AddBinValues (see page 17400)	This is AddBinValues, a member of class TBinData.
	AddIBinValue (see page 17401)	This is AddIBinValue, a member of class TBinData.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 17401)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BinValueCount (see page 17402)	This is BinValueCount, a member of class TBinData.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 17402)	This is Clear, a member of class TBinData.
	create (see page 17399)	This is create, a member of class TBinData.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	destroy (see page 17399)	Destroys the TPersistent instance and frees its memory.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAllBinValueCount (see page 17402)	This is GetAllBinValueCount, a member of class TBinData.
	GetBinCount (see page 17402)	This is GetBinCount, a member of class TBinData.
	GetBinName (see page 17402)	This is GetBinName, a member of class TBinData.
	GetBinNameDataType (see page 17403)	This is GetBinNameDataType, a member of class TBinData.
	GetBinValue (see page 17403)	This is GetBinValue, a member of class TBinData.
	GetBinValues (see page 17403)	This is GetBinValues, a member of class TBinData.
	GetIBinValue (see page 17403)	This is GetIBinValue, a member of class TBinData.
	GetIBinValueCount (see page 17404)	This is GetIBinValueCount, a member of class TBinData.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	GetMaxBinNameSize (see page 17404)	This is GetMaxBinNameSize, a member of class TBinData.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	BinCount (see page 17404)	This is BinCount, a member of class TBinData.
R	BinName (see page 17404)	This is BinName, a member of class TBinData.
R	NameList (see page 17405)	This is NameList, a member of class TBinData.
	OtherBinName (see page 17405)	This is OtherBinName, a member of class TBinData.
R	ValueList (see page 17405)	This is ValueList, a member of class TBinData.

106.1.2.2 TBinData.create Constructor

Pascal

```
constructor create;
```

C++

```
__fastcall TBinData();
```

Description

This is create, a member of class TBinData.

106.1.2.3 TBinData.destroy Destructor

Destroys the TPersistent instance and frees its memory.

Pascal

```
destructor destroy; override;
```

C++

```
virtual __fastcall ~TBinData();
```

Description

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

Free (see page 22300)

Destroy (see page 22287)

106.1.2.4 TBinData Methods

The methods of the TBinData class are listed here.

Public Methods

	Name	Description
	AddBin (see page 17400)	This is AddBin, a member of class TBinData.
	AddBinValue (see page 17400)	This is AddBinValue, a member of class TBinData.
	AddBinValues (see page 17400)	This is AddBinValues, a member of class TBinData.
	AddIBinValue (see page 17401)	This is AddIBinValue, a member of class TBinData.
V	Assign (see page 17401)	Copies the contents of another, similar object.
	BinValueCount (see page 17402)	This is BinValueCount, a member of class TBinData.
	Clear (see page 17402)	This is Clear, a member of class TBinData.
	GetAllBinValueCount (see page 17402)	This is GetAllBinValueCount, a member of class TBinData.
	GetBinCount (see page 17402)	This is GetBinCount, a member of class TBinData.
	GetBinName (see page 17402)	This is GetBinName, a member of class TBinData.
	GetBinNameDataType (see page 17403)	This is GetBinNameDataType, a member of class TBinData.
	GetBinValue (see page 17403)	This is GetBinValue, a member of class TBinData.
	GetBinValues (see page 17403)	This is GetBinValues, a member of class TBinData.
	GetIBinValue (see page 17403)	This is GetIBinValue, a member of class TBinData.
	GetIBinValueCount (see page 17404)	This is GetIBinValueCount, a member of class TBinData.
	GetMaxBinNameSize (see page 17404)	This is GetMaxBinNameSize, a member of class TBinData.

106.1.2.4.1 TBinData.AddBin Method

Pascal

```
function AddBin(BinName: string; vType: Integer): Integer;
```

C++

```
__fastcall int AddBin(AnsiString BinName, int vType);
```

Description

This is AddBin, a member of class TBinData.

106.1.2.4.2 TBinData.AddBinValue Method

Pascal

```
function AddBinValue(BinName: string; Value: Variant): Integer;
```

C++

```
__fastcall int AddBinValue(AnsiString BinName, Variant Value);
```

Description

This is AddBinValue, a member of class TBinData.

106.1.2.4.3 TBinData.AddBinValues Method

Pascal

```
procedure AddBinValues(BinName: string; const Values: array of const);
```

C++

```
__fastcall AddBinValues(AnsiString BinName, const array of const Values);
```

Description

This is AddBinValues, a member of class TBinData.

106.1.2.4.4 TBinData.AddIBinValue Method

Pascal

```
function AddIBinValue(iBin: Integer; value: variant): Integer;
```

C++

```
__fastcall int AddIBinValue(int iBin, variant value);
```

Description

This is AddIBinValue, a member of class TBinData.

106.1.2.4.5 TBinData.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Value: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Value);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

AssignTo (see page 2931)

EConvertError (see page 22724)

106.1.2.4.6 TBinData.BinValueCount Method

Pascal

```
function BinValueCount(BinName: string): Integer;
```

C++

```
__fastcall int BinValueCount(AnsiString BinName);
```

Description

This is BinValueCount, a member of class TBinData.

106.1.2.4.7 TBinData.Clear Method

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

This is Clear, a member of class TBinData.

106.1.2.4.8 TBinData.GetAllBinValueCount Method

Pascal

```
function GetAllBinValueCount: Integer;
```

C++

```
__fastcall int GetAllBinValueCount();
```

Description

This is GetAllBinValueCount, a member of class TBinData.

106.1.2.4.9 TBinData.GetBinCount Method

Pascal

```
function GetBinCount: Integer;
```

C++

```
__fastcall int GetBinCount();
```

Description

This is GetBinCount, a member of class TBinData.

106.1.2.4.10 TBinData.GetBinName Method

Pascal

```
function GetBinName(Index: Integer): string;
```

C++

```
__fastcall AnsiString GetBinName(int Index);
```

Description

This is GetBinName, a member of class TBinData.

106.1.2.4.11 TBinData.GetBinNameDataType Method

Pascal

```
function GetBinNameDataType: TFieldType;
```

C++

```
__fastcall TFieldType GetBinNameDataType();
```

Description

This is GetBinNameDataType, a member of class TBinData.

106.1.2.4.12 TBinData.GetBinValue Method

Pascal

```
function GetBinValue(BinName: string; Index: Integer): Variant;
```

C++

```
__fastcall Variant GetBinValue(AnsiString BinName, int Index);
```

Description

This is GetBinValue, a member of class TBinData.

106.1.2.4.13 TBinData.GetBinValues Method

Pascal

```
function GetBinValues(BinName: string): Variant;
```

C++

```
__fastcall Variant GetBinValues(AnsiString BinName);
```

Description

This is GetBinValues, a member of class TBinData.

106.1.2.4.14 TBinData.GetIBinValue Method

Pascal

```
function GetIBinValue(iBin: Integer; ValueIndex: Integer): variant;
```

C++

```
__fastcall variant GetIBinValue(int iBin, int ValueIndex);
```

Description

This is GetIBinValue, a member of class TBinData.

106.1.2.4.15 TBinData.GetIBinValueCount Method

Pascal

```
function GetIBinValueCount(iBin: Integer): Integer;
```

C++

```
__fastcall int GetIBinValueCount(int iBin);
```

Description

This is GetIBinValueCount, a member of class TBinData.

106.1.2.4.16 TBinData.GetMaxBinNameSize Method

Pascal

```
function GetMaxBinNameSize: Integer;
```

C++

```
__fastcall int GetMaxBinNameSize();
```

Description

This is GetMaxBinNameSize, a member of class TBinData.

106.1.2.5 TBinData Properties

The properties of the TBinData class are listed here.

Public Properties

	Name	Description
R	BinCount (see page 17404)	This is BinCount, a member of class TBinData.
R	BinName (see page 17404)	This is BinName, a member of class TBinData.
R	NameList (see page 17405)	This is NameList, a member of class TBinData.
	OtherBinName (see page 17405)	This is OtherBinName, a member of class TBinData.
R	ValueList (see page 17405)	This is ValueList, a member of class TBinData.

106.1.2.5.1 TBinData.BinCount Property

Pascal

```
property BinCount: Integer;
```

C++

```
__property int BinCount;
```

Description

This is BinCount, a member of class TBinData.

106.1.2.5.2 TBinData.BinName Property

Pascal

```
property BinName [ Index:Integer ]: string;
```

C++

```
__property AnsiString BinName[int Index];
```

Description

This is BinName, a member of class TBinData.

106.1.2.5.3 TBinData.NameList Property

Pascal

```
property NameList: TStringList;
```

C++

```
__property TStringList NameList;
```

Description

This is NameList, a member of class TBinData.

106.1.2.5.4 TBinData.OtherBinName Property

Pascal

```
property OtherBinName: string;
```

C++

```
__property AnsiString OtherBinName;
```

Description

This is OtherBinName, a member of class TBinData.

106.1.2.5.5 TBinData.ValueList Property

Pascal

```
property ValueList: TList;
```

C++

```
__property TList ValueList;
```

Description

This is ValueList, a member of class TBinData.

106.1.3 TDimensionItem Class

TDimensionItem is the base class for objects that represent dimensions and summaries in a crosstabulated data store.

Class Hierarchy

Pascal

```
TDimensionItem = class(TCollectionItem);
```

C++

```
class TDimensionItem : public TCollectionItem;
```

File

MXCOMMON

Description

Use TDimensionItem as a base class when defining classes that represent the fields used by a crosstabulated data store. TDimensionItem describes a field from the data set used by a crosstabulated data store and the role that field plays in the data store. Crosstabulated data stores automatically create dimension items to represent the fields that make up their multidimensional arrays of summary values.

TDimensionItem has a single descendant, TCubeDim, that enhances the dimension item with the ability to represent date ranges.

See Also

TCubeDim (see page 17754)

TCustomDataStore (see page 17772)

TDimensionItems (see page 17415)

TDimensionItems (see page 17415)

106.1.3.1 TDimensionItem Members

The following tables list the members exposed by TDimensionItem.

Protected Methods

	Name	Description
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
V	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
V	InitializeRange (see page 17409)	This is InitializeRange, a member of class TDimensionItem.
V	NotifyCollection (see page 17410)	This is NotifyCollection, a member of class TDimensionItem.
V	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
V	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
V	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Protected Properties

	Name	Description
	Active (see page 17411)	This is Active, a member of class TDimensionItem.
R	Owner (see page 17414)	This is Owner, a member of class TDimensionItem.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 17408)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 17408)	Creates and initializes a TCollectionItem instance.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDimension (see page 17409)	Indicates whether the dimension item represents a dimension.
	IsSummary (see page 17410)	Indicates whether the dimension item represents a summary.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	ActiveFlag (see page 17411)	Indicates whether the dimension item is stored in the cache of a crosstabulated data store.
	BaseName (see page 17411)	Specifies the field name of the database field that is represented by or summarized in the dimension item.
	DerivedFrom (see page 17412)	Specifies the index of a dimension item from which a derived value is calculated.
	DimensionType (see page 17412)	Indicates the use of the dimension item.
	Fieldname (see page 17413)	This is Fieldname, a member of class TDimensionItem.
	FieldType (see page 17413)	Indicates the data type of the field that the dimension item represents.
	Format (see page 17414)	Indicates how field values are formatted on dimensions that represent numeric or temporal data.
	Name (see page 17414)	Denotes the name of a dimension or summary.

106.1.3.2 TDimensionItem.Create Constructor

Creates and initializes a TCollectionItem instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TDimensionItem(TCollection Collection);
```

Description

Do not call Create to instantiate a collection item. Instead, call the Add method of the collection to which the item should belong.

Collection identifies the TCollection instance to which the new item belongs.

See Also

Add (see page 2736)

Collection (see page 2761)

106.1.3.3 TDimensionItem Methods

The methods of the TDimensionItem class are listed here.

Protected Methods

	Name	Description
	InitializeRange (see page 17409)	This is InitializeRange, a member of class TDimensionItem.
	NotifyCollection (see page 17410)	This is NotifyCollection, a member of class TDimensionItem.

Public Methods

	Name	Description
	Assign (see page 17408)	Copies the contents of another, similar object.
	IsDimension (see page 17409)	Indicates whether the dimension item represents a dimension.
	IsSummary (see page 17410)	Indicates whether the dimension item represents a summary.

106.1.3.3.1 TDimensionItem.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Value: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Value);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the

inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo (see page 2931)

EConvertError (see page 22724)

106.1.3.3.2 TDimensionItem.InitializeRange Method

Pascal

```
procedure InitializeRange; virtual;
```

C++

```
virtual __fastcall InitializeRange();
```

Description

This is InitializeRange, a member of class TDimensionItem.

106.1.3.3.3 TDimensionItem.IsDimension Method

Indicates whether the dimension item represents a dimension.

Pascal

```
function IsDimension: Boolean;
```

C++

```
__fastcall Boolean IsDimension();
```

Description

Call IsDimension to determine the use of the dimension item. IsDimension returns true if the dimension item represents one of the dimensions of the multidimensional array maintained by a crosstabulated data store. IsDimension returns false if the dimension item represents a field that provides the summary values that fill the cells of the multidimensional array.

See Also

DimensionType (see page 17412)

IsSummary (see page 17410)

106.1.3.3.4 TDimensionItem.IsSummary Method

Indicates whether the dimension item represents a summary.

Pascal

```
function IsSummary: Boolean;
```

C++

```
__fastcall Boolean IsSummary();
```

Description

Call IsSummary to determine the use of the dimension item. IsSummary returns true if the dimension item represents a field that provides the summary values that fill the cells of the multidimensional array maintained by a crosstabulated data store. IsSummary returns false if the dimension item represents a one of the dimensions of the multidimensional array.

See Also

DimensionType (see page 17412)

IsDimension (see page 17409)

106.1.3.3.5 TDimensionItem.NotifyCollection Method

Pascal

```
procedure NotifyCollection(aType: TCDNotifyType); virtual;
```

C++

```
virtual __fastcall NotifyCollection(TCDNotifyType aType);
```

Description

This is NotifyCollection, a member of class TDimensionItem.

106.1.3.4 TDimensionItem Properties

The properties of the TDimensionItem class are listed here.

Protected Properties

	Name	Description
	Active (see page 17411)	This is Active, a member of class TDimensionItem.
R	Owner (see page 17414)	This is Owner, a member of class TDimensionItem.

Published Properties

	Name	Description
	ActiveFlag (see page 17411)	Indicates whether the dimension item is stored in the cache of a crosstabulated data store.
	BaseName (see page 17411)	Specifies the field name of the database field that is represented by or summarized in the dimension item.
	DerivedFrom (see page 17412)	Specifies the index of a dimension item from which a derived value is calculated.
	DimensionType (see page 17412)	Indicates the use of the dimension item.
	Fieldname (see page 17413)	This is Fieldname, a member of class TDimensionItem.
	FieldType (see page 17413)	Indicates the data type of the field that the dimension item represents.
	Format (see page 17414)	Indicates how field values are formatted on dimensions that represent numeric or temporal data.
	Name (see page 17414)	Denotes the name of a dimension or summary.

106.1.3.4.1 TDimensionItem.Active Property

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

This is Active, a member of class TDimensionItem.

106.1.3.4.2 TDimensionItem.ActiveFlag Property

Indicates whether the dimension item is stored in the cache of a crosstabulated data store.

Pascal

```
property ActiveFlag: TActiveFlags;
```

C++

```
__property TActiveFlags ActiveFlag;
```

Description

Set ActiveFlag to diActive when it is critical that the dimension item is available at all times. Set ActiveFlag to diAsNeeded instead if the dimension item is used less frequently. The decision cube swaps dimension items with Active (see page 17411) set to diAsNeeded in and out of the cache depending on when they are actually used, in order to conserve memory. Set ActiveFlag to diInactive to collapse the multidimensional array maintained by the data store so that it does not include the dimension item. When ActiveFlag is diInactive, the data store can not provide information about the dimension item to a decision source object.

The memory needs of a crosstabulated data store increase geometrically with each active dimension that is included. Memory needs increase linearly with each active summary that is included. Applications must find the best balance between the performance benefit of caching many dimensions and summaries so that they are immediately available to decision controls, and the need to keep the size of the cached multidimensional data array small enough so that it does not consume inordinate amounts of memory.

See Also

GetMemoryUsage (see page 17783)

MaxDimensions (see page 17793)

MaxSummaries (see page 17793)

106.1.3.4.3 TDimensionItem.BaseName Property

Specifies the field name of the database field that is represented by or summarized in the dimension item.

Pascal

```
property BaseName: string;
```

C++

```
__property AnsiString BaseName;
```

Description

Use BaseName to identify the field whose values underlie the dimension item. If the dimension item represents a dimension then

BaseName is the name of the field that corresponds to the dimension. Otherwise, BaseName is the field name of the field whose values are summarized by the dimension item.

Note: Basename is a fully qualified SQL selector. Table and field names must be correctly punctuated, including quotations.

See Also

DimensionType (see page 17412)

FieldName (see page 17413)

106.1.3.4.4 TDimensionItem.DerivedFrom Property

Specifies the index of a dimension item from which a derived value is calculated.

Pascal

```
property DerivedFrom: Integer;
```

C++

```
__property int DerivedFrom;
```

Description

Read DerivedFrom to determine whether the dimension item represents a field from the dataset of its decision cube. Dimension items that represent averages do not come directly from the dataset, but are derived from count and summary fields that appear in the dataset. When a derived average dimension item is created, DerivedFrom is set to the index of the count or summary dimension item. The corresponding summary or count dimension item is located by matching the BaseName (see page 17411) property when the derived values are calculated.

See Also

BaseName (see page 17411)

DataSet (see page 17789)

106.1.3.4.5 TDimensionItem.DimensionType Property

Indicates the use of the dimension item.

Pascal

```
property DimensionType: TDimFlags;
```

C++

```
__property TDimFlags DimensionType;
```

Description

Read DimensionType to determine whether the dimension item represents a dimension of the multidimensional array maintained by the crosstabulated data store or whether the dimension item represents a summary field that supplies the values to the cells of the multidimensional array. If the dimension item represents a summary, DimensionType also indicates the type of summary.

Do not set DimensionType if the dimension item represents a field from a query. The value of DimensionType is set automatically to reflect the semantics of the query if the crosstabulated data store that uses the dimension item is bound to a query. If the data store is bound to another type of data set, set DimensionType to a value that indicates the use of the dimension item in the multidimensional array.

DimensionType can have any of the following values:

Value	Meaning
dimDimension	The dimension item represents a dimension of the multidimensional array.
dimSum	The dimension item is a summary that represents the sum of a field value.
dimCount	The dimension item is a summary that represents the count of nonblank field values.
dimAverage	The dimension item is a summary that represents the average field value.
dimMin	The dimension item is a summary that represents the minimum field value. (not currently implemented)
dimMax	The dimension item is a summary that represents the maximum field value. (not currently implemented)
dimGenericAgg	The dimension item is some other type of summary.
dimUnknown	The use of the dimension item is not known. This occurs when the DataSet property of the data store is not based on a query. The value must be changed before the dimension item can be used.

See Also

IsDimension (see page 17409)

IsSummary (see page 17410)

106.1.3.4.6 TDimensionItem.Fieldname Property

Pascal

```
property Fieldname: string;
```

C++

```
__property AnsiString Fieldname;
```

Description

This is Fieldname, a member of class TDimensionItem.

106.1.3.4.7 TDimensionItem.FieldType Property

Indicates the data type of the field that the dimension item represents.

Pascal

```
property FieldType: TFieldType;
```

C++

```
__property TFieldType FieldType;
```

Description

Read FieldType to determine the type of data that makes up the values of the dimension item. FieldType is the same as the DataType property of the corresponding TField object from the dataset of the crosstabulated data store.

Do not set the FieldType property. The value of FieldType is set automatically to reflect the type of data provided by the dimension item.

See Also

DataSet (see page 17789)

DataType (see page 7159)

106.1.3.4.8 TDimensionItem.Format Property

Indicates how field values are formatted on dimensions that represent numeric or temporal data.

Pascal

```
property Format: String;
```

C++

```
__property AnsiString Format;
```

Description

Set Format on dimension items that represent numeric or temporal fields. The format specifiers that make up the Format string depend on the field type.

See the FormatFloat runtime library function for a description of the format specifiers for a numeric field. See the FormatDateTime runtime library function for a description of the format specifiers for a temporal field.

Decision controls that display value names read the value of Format, but can override it when formatting field values.

See Also

FormatDateTime (see page 22902)

FormatFloat (see page 22904)

106.1.3.4.9 TDimensionItem.Name Property

Denotes the name of a dimension or summary.

Pascal

```
property Name: string;
```

C++

```
__property AnsiString Name;
```

Description

Set Name to change the name provided by the GetDimensionName or GetSummaryName method of the crosstabulated data store. Decision controls that display dimension names read the value of Name, but can override it.

See Also

FieldName (see page 17413)

GetDimensionName (see page 17781)

GetSummaryName (see page 17784)

106.1.3.4.10 TDimensionItem.Owner Property

Pascal

```
property Owner: TCollection;
```

C++

```
__property TCollection Owner;
```

Description

This is Owner, a member of class TDimensionItem.

106.1.4 TDimensionItems Class

TDimensionItems is the base class for objects that represent dimension maps.

Class Hierarchy

Pascal

```
TDimensionItems = class(TCollection);
```

C++

```
class TDimensionItems : public TCollection;
```

File

MXCOMMON

Description

Use TDimensionItems as a base class when defining classes that represent the dimension map of a crosstabulated data store. TDimensionItems represents a collection of TDimensionItem (see page 17405) objects, where each TDimensionItem (see page 17405) corresponds to a field from the data set of the crosstabulated data store.

TDimensionItems has a single descendant, TCubeDims, that adds additional functionality to handle dimension maps that include date ranges.

See Also

TCubeDims (see page 17766)

TCustomDataStore (see page 17772)

TDimensionItem (see page 17405)

106.1.4.1 TDimensionItems Members

The following tables list the members exposed by TDimensionItems.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 17420)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	NotifyOwner (see page 17420)	This is NotifyOwner, a member of class TDimensionItems.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.

V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 17418)	Adds a dimension item to the end of the Items (see page 17422) array.
	AddDerivedField (see page 17418)	Adds a derived average summary to the end of the Items (see page 17422) array.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AlreadyExists (see page 17419)	Indicates whether a dimension item with specified properties already exists in the Items (see page 17422) property array.
V	Assign (see page 17419)	Copies the list of dimension items from another TDimensionItems (see page 17415) object.
	AverageFieldCheck (see page 17419)	Determines whether the necessary summary dimension items over a base dimension exist so that a dimension item of type dimAverage can be computed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 17417)	Creates an instance of TDimensionItems (see page 17415).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ActiveDimensionCount (see page 17421)	Indicates the number of dimension items that represent active dimensions in the crosstabulated data store.
R	ActiveSummaryCount (see page 17421)	Indicates the number of dimension items that represent active summaries in the crosstabulated data store.
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	DimensionCount (see page 17422)	Indicates the number of dimension items in the Items (see page 17422) array with DimensionType set to dimDimension.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 17422)	Lists all dimension items maintained by the TDimensionItems (see page 17415) object.
R	SummaryCount (see page 17423)	Indicates the number of dimension items in the Items (see page 17422) array with DimensionType set to a value other than dimDimension.

106.1.4.2 TDimensionItems.Create Constructor

Creates an instance of TDimensionItems (see page 17415).

Pascal

```
constructor Create(Owner: TPersistent; ItemClass: TDimensionItemClass);
```

C++

```
__fastcall TDimensionItems(TPersistent * Owner, TDimensionItemClass ItemClass);
```

Description

Applications should not need to call the constructor of TDimensionItems (see page 17415). TCustomDataStore objects create TDimensionItems (see page 17415) objects to implement their DimensionMap property.

See Also

Create (see page 2734)

DimensionMap (see page 17790)

Destroy (see page 2735)

106.1.4.3 TDimensionItems Methods

The methods of the TDimensionItems class are listed here.

Protected Methods

	Name	Description
V	GetOwner (see page 17420)	Returns the owner of an object.
	NotifyOwner (see page 17420)	This is NotifyOwner, a member of class TDimensionItems.

Public Methods

	Name	Description
	Add (see page 17418)	Adds a dimension item to the end of the Items (see page 17422) array.
	AddDerivedField (see page 17418)	Adds a derived average summary to the end of the Items (see page 17422) array.
	AlreadyExists (see page 17419)	Indicates whether a dimension item with specified properties already exists in the Items (see page 17422) property array.
	Assign (see page 17419)	Copies the list of dimension items from another TDimensionItems (see page 17415) object.
	AverageFieldCheck (see page 17419)	Determines whether the necessary summary dimension items over a base dimension exist so that a dimension item of type dimAverage can be computed.

106.1.4.3.1 TDimensionItems.Add Method

Adds a dimension item to the end of the Items (see page 17422) array.

Pascal

```
function Add: TDimensionItem;
```

C++

```
__fastcall TDimensionItem Add();
```

Description

Do not call the Add method to add dimension items to a TDimensionItems (see page 17415) object. The dimension items are added automatically to reflect the fields in the data set of the associated crosstabulated data store.

Add adds a new dimension item to the collection and returns the new dimension item.

See Also

Items (see page 17422)

DataSet (see page 17789)

106.1.4.3.2 TDimensionItems.AddDerivedField Method

Adds a derived average summary to the end of the Items (see page 17422) array.

Pascal

```
function AddDerivedField(Index: Integer; dimType: tDimFlags): Integer;
```

C++

```
__fastcall int AddDerivedField(int Index, tDimFlags dimType);
```

Description

Summaries that represent average values are not taken directly from the source dataset of a decision cube, but are derived from count summaries and summation summaries. AddDerivedField creates a dimension item for an average summary. The Index parameter specifies the index of an existing dimension item whose BaseName property specifies the field over which averages should be computed. AddDerivedField checks for the summary dimension items needed to derive the average. If both an average and a summation are available for the base field, AddDerivedField creates the average summary dimension item. AddDerivedField returns true if the dimension item is successfully created, false otherwise.

Note: The DimType (Delphi) or dimType (C++) parameter is currently ignored. Descendants of AddDerivedField can override this method to derive other types of dimension items. In this case, DimType/dimType should specify the type of derived dimension item that should be created. When overriding AddDerivedField, call the inherited method if DimType/dimType is dimAverage.

See Also

AverageFieldCheck (see page 17419)

DimensionType (see page 17412)

106.1.4.3.3 TDimensionItems.AlreadyExists Method

Indicates whether a dimension item with specified properties already exists in the Items (see page 17422) property array.

Pascal

```
function AlreadyExists(BaseName: String; sType: TDimFlags): Boolean;
```

C++

```
__fastcall Boolean AlreadyExists(AnsiString BaseName, TDimFlags sType);
```

Description

Call AlreadyExists to determine whether there is a dimension item in the Items (see page 17422) property array with the BaseName property equal to the BaseName parameter and the DimensionType property equal to the sType parameter.

See Also

Items (see page 17422)

BaseName (see page 17411)

DimensionType (see page 17412)

106.1.4.3.4 TDimensionItems.Assign Method

Copies the list of dimension items from another TDimensionItems (see page 17415) object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Assign calls the inherited method to copy the properties of the Source parameter. The inherited method will copy properties from any object that implements an AssignTo method that can copy to a TDimensionItems (see page 17415) object.

See Also

AssignTo (see page 2931)

106.1.4.3.5 TDimensionItems.AverageFieldCheck Method

Determines whether the necessary summary dimension items over a base dimension exist so that a dimension item of type dimAverage can be computed.

Pascal

```
function AverageFieldCheck(Index: Integer; var SumIndex: Integer; var CountIndex: Integer):
Boolean;
```

C++

```
__fastcall Boolean AverageFieldCheck(int Index, int SumIndex, int CountIndex);
```

Description

Call AverageFieldCheck to ensure that the necessary summary dimension items exist for creating an average summary. The Index parameter specifies an existing dimension item whose BaseName property specifies the field over which the average should be computed. The SumIndex and CountIndex parameters return the summation and count dimension items that can be used to compute average values.

See Also

AddDerivedField (see page 17418)

BaseName (see page 17411)

DimensionType (see page 17412)

106.1.4.3.6 TDimensionItems.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath (see page 2932)

TCollection (see page 2731)

TComponent (see page 2762)

Owner (see page 2807)

106.1.4.3.7 TDimensionItems.NotifyOwner Method

Pascal

```
procedure NotifyOwner(aType: TCDNotifyType);
```

C++

```
__fastcall NotifyOwner(TCDNotifyType aType);
```

Description

This is NotifyOwner, a member of class TDimensionItems.

106.1.4.4 TDimensionItems Properties

The properties of the TDimensionItems class are listed here.

Public Properties

	Name	Description
R	ActiveDimensionCount (see page 17421)	Indicates the number of dimension items that represent active dimensions in the crosstabulated data store.
R	ActiveSummaryCount (see page 17421)	Indicates the number of dimension items that represent active summaries in the crosstabulated data store.
R	DimensionCount (see page 17422)	Indicates the number of dimension items in the Items (see page 17422) array with DimensionType set to dimDimension.
	Items (see page 17422)	Lists all dimension items maintained by the TDimensionItems (see page 17415) object.
R	SummaryCount (see page 17423)	Indicates the number of dimension items in the Items (see page 17422) array with DimensionType set to a value other than dimDimension.

106.1.4.4.1 TDimensionItems.ActiveDimensionCount Property

Indicates the number of dimension items that represent active dimensions in the crosstabulated data store.

Pascal

```
property ActiveDimensionCount: Integer;
```

C++

```
__property int ActiveDimensionCount;
```

Description

Read ActiveDimensionCount to determine the number of dimensions in the multidimensional data array cached by the data store. The memory requirements of the cached array go up exponentially with each active dimension, so ActiveDimensionCount provides a rough sense of the size of the cached array.

ActiveDimensionCount is the number of dimension items in the Items (see page 17422) array that have their DimensionType property set to dimDimension and their Active property set to true. Change ActiveDimensionCount indirectly by changing the Active property on dimension items with DimensionType values of dimDimension.

The DimensionCount (see page 17422) property indicates the total number of dimension items with DimensionType set to dimDimension. It provides an upper limit to the ActiveDimensionCount property.

See Also

DimensionCount (see page 17422)

Items (see page 17422)

ActiveFlag (see page 17411)

DimensionType (see page 17412)

106.1.4.4.2 TDimensionItems.ActiveSummaryCount Property

Indicates the number of dimension items that represent active summaries in the crosstabulated data store.

Pascal

```
property ActiveSummaryCount: Integer;
```

C++

```
__property int ActiveSummaryCount;
```

Description

Read ActiveSummaryCount to determine the number of summaries in the cells of the multidimensional data array cached by the data store. The memory requirements of the cached array go up linearly with each active summary. ActiveSummaryCount is the number of different summaries that can be made available to decision controls.

ActiveSummaryCount is the number of dimension items in the Items (see page 17422) array that don't have their DimensionType property set to dimDimension and do have their Active property set to true. Change ActiveSummaryCount indirectly by changing the Active property on dimension items with DimensionType values other than dimDimension.

The SummaryCount (see page 17423) property indicates the total number of dimension items that do not have DimensionType set to dimDimension. It provides an upper limit to the ActiveSummaryCount property.

See Also

Items (see page 17422)

SummaryCount (see page 17423)

ActiveFlag (see page 17411)

DimensionType (see page 17412)

106.1.4.4.3 TDimensionItems.DimensionCount Property

Indicates the number of dimension items in the Items (see page 17422) array with DimensionType set to dimDimension.

Pascal

```
property DimensionCount: Integer;
```

C++

```
__property int DimensionCount;
```

Description

Read DimensionCount to determine the number of potential dimensions for the multidimensional data array cached by the data store. DimensionCount reflects the number of unsummarized fields in the data set of the crosstabulated data store. While the data store can make any of these dimensions available, usually only a subset are active at any time, in order to limit memory consumption. The ActiveDimensionCount (see page 17421) property gives the number of dimensions that are currently active.

See Also

ActiveDimensionCount (see page 17421)

DimensionType (see page 17412)

106.1.4.4.4 TDimensionItems.Items Property

Lists all dimension items maintained by the TDimensionItems (see page 17415) object.

Pascal

```
property Items [Index: Integer]: TDimensionItem;
```

C++

```
__property TDimensionItem Items[int Index];
```

Description

Use Items to access individual dimension items maintained by the TDimensionItems (see page 17415) object. The first dimension item has an Index of 0, the second dimension item has an Index of 1, and so on. For example, the following C++ code accesses an item to indicate that it can be swapped out of memory:

```
DecisionCube1->DimensionMap->Items[0]->ActiveFlag = diAsNeeded;
```

Each dimension item in the Items array represents a field from the data set of a crosstabulated data store. Each dimension item represents either a dimension (a field over which data is summarized), or a summary (a value summarized over the dimensions).

In Delphi Code, Items is the default property of TDimensionItems (see page 17415). This means that the name of the Items property can be eliminated from code that uses the Items property. Thus, the line

```
DecisionCube1.DimensionMap.Items[0].ActiveFlag := diAsNeeded;
```

could be written

```
DecisionCube1.DimensionMap[0].ActiveFlag := diAsNeeded;
```

Note: Do not change the Items property. The set of items in the Items array is set automatically to represent the fields from the data set. The properties of individual dimension items within the Items array may be changed to specify whether the dimension items should be cached by the data store, to change the name used when displaying the dimension items, and so on.

See Also

DataSet (see page 17789)

DimensionMap (see page 17790)

operator_[]

106.1.4.4.5 TDimensionItems.SummaryCount Property

Indicates the number of dimension items in the Items (see page 17422) array with DimensionType set to a value other than dimDimension.

Pascal

```
property SummaryCount: Integer;
```

C++

```
__property int SummaryCount;
```

Description

Read SummaryCount to determine the number of potential summaries that could be stored in the cells of the multidimensional data array cached by the data store. SummaryCount reflects the number of summarized fields in the data set of the crosstabulated data store. If memory is a serious concern, the data store can make any of these summaries inactive. The ActiveSummaryCount (see page 17421) property gives the number of summaries that are currently active.

See Also

ActiveSummaryCount (see page 17421)

DimensionType (see page 17412)

106.1.5 TTicks Class

Class Hierarchy

MXCOMMON.TTicks

Pascal

```
TTicks = class;
```

C++

```
class TTicks;
```

File

MXCOMMON

Description

This is class MXCOMMON.TTicks.

106.1.5.1 TTicks Members

The following tables list the members exposed by TTicks.

Public Methods

	Name	Description
	Clear (see page 17425)	This is Clear, a member of class TTicks.
	Create (see page 17424)	This is Create, a member of class TTicks.
	Destroy (see page 17425)	This is Destroy, a member of class TTicks.
	Dump (see page 17425)	This is Dump, a member of class TTicks.
	Ticks (see page 17425)	This is Ticks, a member of class TTicks.
	TicksIntArray (see page 17426)	This is TicksIntArray, a member of class TTicks.
	TicksSmallIntArray (see page 17426)	This is TicksSmallIntArray, a member of class TTicks.

Public Properties

	Name	Description
	NumberOfValues (see page 17426)	This is NumberOfValues, a member of class TTicks.

106.1.5.2 TTicks.Create Constructor

Pascal

```
constructor Create(FileName: string);
```

C++

```
__fastcall TTicks(AnsiString FileName);
```

Description

This is Create, a member of class TTicks.

106.1.5.3 TTicks.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TTicks();
```

Description

This is Destroy, a member of class TTicks.

106.1.5.4 TTicks Methods

The methods of the TTicks class are listed here.

Public Methods

	Name	Description
	Clear (see page 17425)	This is Clear, a member of class TTicks.
	Dump (see page 17425)	This is Dump, a member of class TTicks.
	Ticks (see page 17425)	This is Ticks, a member of class TTicks.
	TicksIntArray (see page 17426)	This is TicksIntArray, a member of class TTicks.
	TicksSmallIntArray (see page 17426)	This is TicksSmallIntArray, a member of class TTicks.

106.1.5.4.1 TTicks.Clear Method

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

This is Clear, a member of class TTicks.

106.1.5.4.2 TTicks.Dump Method

Pascal

```
procedure Dump(bDetail: Boolean);
```

C++

```
__fastcall Dump(Boolean bDetail);
```

Description

This is Dump, a member of class TTicks.

106.1.5.4.3 TTicks.Ticks Method

Pascal

```
procedure Ticks(SectionName: string);
```

C++

```
__fastcall Ticks(AnsiString SectionName);
```

Description

This is Ticks, a member of class TTicks.

106.1.5.4.4 TTicks.TicksIntArray Method

Pascal

```
procedure TicksIntArray(SectionName: string; IntArray: TIntArray);
```

C++

```
__fastcall TicksIntArray(AnsiString SectionName, TIntArray IntArray);
```

Description

This is TicksIntArray, a member of class TTicks.

106.1.5.4.5 TTicks.TicksSmallIntArray Method

Pascal

```
procedure TicksSmallIntArray(SectionName: string; IntArray: TSmallIntArray);
```

C++

```
__fastcall TicksSmallIntArray(AnsiString SectionName, TSmallIntArray IntArray);
```

Description

This is TicksSmallIntArray, a member of class TTicks.

106.1.5.5 TTicks Properties

The properties of the TTicks class are listed here.

Public Properties

	Name	Description
	NumberOfValues (see page 17426)	This is NumberOfValues, a member of class TTicks.

106.1.5.5.1 TTicks.NumberOfValues Property

Pascal

```
property NumberOfValues: Integer;
```

C++

```
__property int NumberOfValues;
```

Description

This is NumberOfValues, a member of class TTicks.

106.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AddToQuerySelect (see page 17427)	This is function MXCOMMON.AddToQuerySelect.
	BuildDataSetMap (see page 17427)	This is function MXCOMMON.BuildDataSetMap.
	CheckIfEmptyQuery (see page 17428)	This is function MXCOMMON.CheckIfEmptyQuery.
	FieldTypeToVarType (see page 17428)	This is function MXCOMMON.FieldTypeToVarType.
	FormatVariant (see page 17428)	This is function MXCOMMON.FormatVariant.
	GetAggName (see page 17429)	This is function MXCOMMON.GetAggName.
	HookToDataBase (see page 17429)	This is function MXCOMMON.HookToDataBase.
	IsAggValid (see page 17429)	This is function MXCOMMON.IsAggValid.
	IsBDEAvailable (see page 17430)	This is function MXCOMMON.IsBDEAvailable.
	NextArg (see page 17430)	This is function MXCOMMON.NextArg.
	UpdateDesigner (see page 17430)	This is function MXCOMMON.UpdateDesigner.
	VerifyRTQuery (see page 17431)	This is function MXCOMMON.VerifyRTQuery.

106.2.1 MXCOMMON.AddToQuerySelect Function

Pascal

```
procedure AddToQuerySelect(var SQLString: string; Select: string);
```

C++

```
AddToQuerySelect(AnsiString SQLString, AnsiString Select);
```

File

MXCOMMON

Description

This is function MXCOMMON.AddToQuerySelect.

106.2.2 MXCOMMON.BuildDataSetMap Function

Pascal

```
function BuildDataSetMap(aDataSet: TDataSet; Map: TDimensionItems; var bParsed: Boolean; var
bDataSetMatch: Boolean): TQueryError;
```

C++

```
TQueryError BuildDataSetMap(TDataSet aDataSet, TDimensionItems Map, Boolean bParsed, Boolean
bDataSetMatch);
```

File

MXCOMMON

Description

This is function MXCOMMON.BuildDataSetMap.

106.2.3 MXCOMMON.CheckIfEmptyQuery Function

Pascal

```
function CheckIfEmptyQuery(var SQLString: string): Boolean;
```

C++

```
Boolean CheckIfEmptyQuery(AnsiString SQLString);
```

File

MXCOMMON

Description

This is function MXCOMMON.CheckIfEmptyQuery.

106.2.4 MXCOMMON.FieldTypeToVarType Function

Pascal

```
function FieldTypeToVarType(DataType: TFieldType): Integer;
```

C++

```
int FieldTypeToVarType(TFieldType DataType);
```

File

MXCOMMON

Description

This is function MXCOMMON.FieldTypeToVarType.

106.2.5 MXCOMMON.FormatVariant Function

Pascal

```
function FormatVariant(Value: Variant; FFormat: String): string;
```

C++

```
AnsiString FormatVariant(Variant Value, AnsiString FFormat);
```

File

MXCOMMON

Description

This is function MXCOMMON.FormatVariant.

106.2.6 MXCOMMON.GetAggName Function

Pascal

```
function GetAggName(aType: TDimFlags; FieldName: string): string;
```

C++

```
AnsiString GetAggName(TDimFlags aType, AnsiString FieldName);
```

File

MXCOMMON

Description

This is function MXCOMMON.GetAggName.

106.2.7 MXCOMMON.HookToDataBase Function

Pascal

```
function HookToDataBase(aDataSet: TDataSet): TDataBase;
```

C++

```
TDataBase HookToDataBase(TDataSet aDataSet);
```

File

MXCOMMON

Description

This is function MXCOMMON.HookToDataBase.

106.2.8 MXCOMMON.IsAggValid Function

Pascal

```
function IsAggValid(AggType: TDimFlags; FieldType: TFieldType): Boolean;
```

C++

```
Boolean IsAggValid(TDimFlags AggType, TFieldType FieldType);
```

File

MXCOMMON

Description

This is function MXCOMMON.IsAggValid.

106.2.9 MXCOMMON.IsBDEAvailable Function

Pascal

```
function IsBDEAvailable: Boolean;
```

C++

```
Boolean IsBDEAvailable();
```

File

MXCOMMON

Description

This is function MXCOMMON.IsBDEAvailable.

106.2.10 MXCOMMON.NextArg Function

Pascal

```
function NextArg(var aPos: Integer; Source: string): string;
```

C++

```
AnsiString NextArg(int aPos, AnsiString Source);
```

File

MXCOMMON

Description

This is function MXCOMMON.NextArg.

106.2.11 MXCOMMON.UpdateDesigner Function

Pascal

```
procedure UpdateDesigner(Sender: TComponent);
```

C++

```
UpdateDesigner(TComponent * Sender);
```

File

MXCOMMON

Description

This is function MXCOMMON.UpdateDesigner.

106.2.12 MXCOMMON.VerifyRTQuery Function

Pascal

```
function VerifyRTQuery(aDataSet: TDataSet; Map: TDimensionItems; var bDataSetMatch: Boolean):
TQueryError;
```

C++

```
TQueryError VerifyRTQuery(TDataSet aDataSet, TDimensionItems Map, Boolean bDataSetMatch);
```

File

MXCOMMON

Description

This is function MXCOMMON.VerifyRTQuery.

106.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TActiveFlags (see page 17432)	This is record MXCOMMON.TActiveFlags.
	TBinType (see page 17432)	This is record MXCOMMON.TBinType.
	TCDNotifyType (see page 17433)	This is record MXCOMMON.TCDNotifyType.
	TDimFlags (see page 17433)	This is record MXCOMMON.TDimFlags.
	TQueryError (see page 17434)	This is record MXCOMMON.TQueryError.

Records

	Name	Description
	TTickInfoRec (see page 17434)	This is record MXCOMMON.TTickInfoRec.

106.3.1 MXCOMMON.TActiveFlags Enumeration

Pascal

```
TActiveFlags = (
  diActive,
  diAsNeeded,
  diInactive
);
```

C++

```
enum TActiveFlags {
  diActive,
  diAsNeeded,
  diInactive
};
```

File

MXCOMMON

Description

This is record MXCOMMON.TActiveFlags.

106.3.2 MXCOMMON.TBinType Enumeration

Pascal

```
TBinType = (
  binNone,
  binYear,
  binQuarter,
  binMonth,
  binSet,
```

```
    binCustom
  );
```

C++

```
  enum TBinType {
    binNone,
    binYear,
    binQuarter,
    binMonth,
    binSet,
    binCustom
  };
```

File

MXCOMMON

Description

This is record MXCOMMON.TBinType.

106.3.3 MXCOMMON.TCDNotifyType Enumeration

Pascal

```
  TCDNotifyType = (
    tdChanged
  );
```

C++

```
  enum TCDNotifyType {
    tdChanged
  };
```

File

MXCOMMON

Description

This is record MXCOMMON.TCDNotifyType.

106.3.4 MXCOMMON.TDimFlags Enumeration

Pascal

```
  TDimFlags = (
    dimDimension,
    dimSum,
    dimCount,
    dimAverage,
    dimMin,
    dimMax,
    dimGenericAgg,
    dimUnknown
  );
```

C++

```
  enum TDimFlags {
```

```
    dimDimension,
    dimSum,
    dimCount,
    dimAverage,
    dimMin,
    dimMax,
    dimGenericAgg,
    dimUnknown
  };
```

File

MXCOMMON

Description

This is record MXCOMMON.TDimFlags.

106.3.5 MXCOMMON.TQueryError Enumeration

Pascal

```
  TQueryError = (
    tqeOK,
    tqeNoDimensions,
    tqeNoAggs,
    tqeNotGrouped,
    tqeNotInitialized,
    tqeMapCorrupt,
    tqeUnKnownDims
  );
```

C++

```
  enum TQueryError {
    tqeOK,
    tqeNoDimensions,
    tqeNoAggs,
    tqeNotGrouped,
    tqeNotInitialized,
    tqeMapCorrupt,
    tqeUnKnownDims
  };
```

File

MXCOMMON

Description

This is record MXCOMMON.TQueryError.

106.3.6 MXCOMMON.TTickInfoRec Record

Pascal

```
  TTickInfoRec = record
    EndTicks: Integer;
    StartTicks: Integer;
    TotalTicks: Integer;
    SName: string;
```

```
end;
```

C++

```
struct TTickInfoRec {
  int EndTicks;
  int StartTicks;
  int TotalTicks;
  AnsiString SName;
};
```

File

MXCOMMON

Description

This is record MXCOMMON.TTickInfoRec.

106.4 Types

The following table lists types in this documentation.

Types

Name	Description
PTickInfoRec (see page 17436)	This is type MXCOMMON.PTickInfoRec.
TBinTypes (see page 17436)	This is type MXCOMMON.TBinTypes.
TDimensionItemClass (see page 17436)	This is type MXCOMMON.TDimensionItemClass.

106.4.1 MXCOMMON.PTickInfoRec Type

Pascal

```
PTickInfoRec = ^TTickInfoRec;
```

C++

```
^TTickInfoRec PTickInfoRec;
```

File

MXCOMMON

Description

This is type MXCOMMON.PTickInfoRec.

106.4.2 MXCOMMON.TBinTypes Type

Pascal

```
TBinTypes = set of TBinType;
```

C++

```
TBinType TBinTypes;
```

File

MXCOMMON

Description

This is type MXCOMMON.TBinTypes.

106.4.3 MXCOMMON.TDimensionItemClass Type

Pascal

```
TDimensionItemClass = class of TDimensionItem;
```

C++

```
TDimensionItem TDimensionItemClass;
```

File

MXCOMMON

Description

This is type MXCOMMON.TDimensionItemClass.

107 MXDB Namespace

This is namespace MXDB.

Topics

Name	Description
Classes (see page 17441)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 17510)	The following table lists structs, records, enums in this documentation.
Types (see page 17514)	The following table lists types in this documentation.

Classes

	Name	Description
	EArrayError (see page 17441)	This is class MXDB.EArrayError.
	EDimIndexError (see page 17441)	EDimIndexError is the exception class for when an invalid index is used to specify a dimension in a decision source.
	TDecisionCube (see page 17442)	TDecisionCube maintains crosstabulated data that it provides to a TDecisionSource (see page 17462) object.
	TDecisionDataLink (see page 17458)	This is class MXDB.TDecisionDataLink.
	TDecisionSource (see page 17462)	TDecisionSource links a decision control to a configuration (pivot state) of the data from a decision cube.
	TDimInfoArray (see page 17497)	This is class MXDB.TDimInfoArray.
	TIArray (see page 17501)	This is class MXDB.TIArray.
	TPivotState (see page 17504)	This is class MXDB.TPivotState.
	TQADecisionSource (see page 17508)	This is class MXDB.TQADecisionSource.

Structs, Records, Enums

	Name	Description
	TDecisionControlType (see page 17510)	This is record MXDB.TDecisionControlType.
	TDecisionDataEvent (see page 17510)	This is record MXDB.TDecisionDataEvent.
	TDimGroup (see page 17511)	This is record MXDB.TDimGroup.
	TDimInfo (see page 17511)	This is record MXDB.TDimInfo.
	TDimRange (see page 17512)	This is record MXDB.TDimRange.
	TDimState (see page 17512)	This is record MXDB.TDimState.
	TRowStates (see page 17513)	This is record MXDB.TRowStates.

Types

Name	Description
PArrayDimInfo (see page 17514)	This is type MXDB.PArrayDimInfo.

PArrayInt (see page 17514)	This is type MXDB.PArrayInt.
PDimInfo (see page 17515)	This is type MXDB.PDimInfo.
TArrayDimInfo (see page 17515)	This is type MXDB.TArrayDimInfo.
TArrayInt (see page 17515)	This is type MXDB.TArrayInt.
TBigStr (see page 17516)	This is type MXDB.TBigStr.
TRowState (see page 17516)	This is type MXDB.TRowState.

107.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EArrayError (see page 17441)	This is class MXDB.EArrayError.
	EDimIndexError (see page 17441)	EDimIndexError is the exception class for when an invalid index is used to specify a dimension in a decision source.
	TDecisionCube (see page 17442)	TDecisionCube maintains crosstabulated data that it provides to a TDecisionSource (see page 17462) object.
	TDecisionDataLink (see page 17458)	This is class MXDB.TDecisionDataLink.
	TDecisionSource (see page 17462)	TDecisionSource links a decision control to a configuration (pivot state) of the data from a decision cube.
	TDimInfoArray (see page 17497)	This is class MXDB.TDimInfoArray.
	TIArray (see page 17501)	This is class MXDB.TIArray.
	TPivotState (see page 17504)	This is class MXDB.TPivotState.
	TQADecisionSource (see page 17508)	This is class MXDB.TQADecisionSource.

107.1.1 EArrayError Class

Class Hierarchy

Pascal

```
EArrayError = class(Exception);
```

C++

```
class EArrayError : public Exception;
```

File

MXDB

Description

This is class MXDB.EArrayError.

107.1.2 EDimIndexError Class

EDimIndexError is the exception class for when an invalid index is used to specify a dimension in a decision source.

Class Hierarchy

Pascal

```
EDimIndexError = class(Exception);
```

C++

```
class EDimIndexError : public Exception;
```

File

MXDB

Description

EDimIndexError is raised when any of the methods of a decision source are called with a dimension index that does not correspond to a dimension.

See Also

TDecisionSource (see page 17462)

107.1.3 TDecisionCube Class

TDecisionCube maintains crosstabulated data that it provides to a TDecisionSource (see page 17462) object.

Class Hierarchy

Pascal

```
TDecisionCube = class(TCustomDataStore);
```

C++

```
class TDecisionCube : public TCustomDataStore;
```

File

MXDB

Description

Add a TDecisionCube object to a form or data module to allow an application to represent crosstabulated data. TDecisionCube analyzes the data from a source dataset into a multidimensional structure where each dimension corresponds to a field in the dataset over which information is summarized. Any dataset can be used as the source of a TDecisionCube object, but it is easiest to work with TDecisionQuery.

Usually, the summarized values are calculated by the dataset that is the source of the decision cubes. However, average values can be calculated internally by the Decision Cube instead. Internally calculated averages have the advantage that they can be pivoted, subtotaled, and drilled-in correctly by Decision grids that display the data from the Decision Cube.

TDecisionCube introduces properties and methods that allow a crosstabulated data store to provide its data to a TDecisionSource (see page 17462) object. Decision grids and Decision graphs do not retrieve data directly from the decision cube. They use a TDecisionSource (see page 17462) object, which represents a configuration of the dimensions from the TDecisionCube object.

107.1.3.1 TDecisionCube Members

The following tables list the members exposed by TDecisionCube.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActiveChanged (see page 17778)	This is ActiveChanged, a member of class TCustomDataStore.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BinMapHasBinData (see page 17778)	This is BinMapHasBinData, a member of class TCustomDataStore.
V	CanDimBeClosed (see page 17448)	This is CanDimBeClosed, a member of class TDecisionCube.
V	CanSumBeClosed (see page 17448)	This is CanSumBeClosed, a member of class TDecisionCube.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterClose (see page 17779)	This is DoAfterClose, a member of class TCustomDataStore.
V	DoAfterOpen (see page 17779)	This is DoAfterOpen, a member of class TCustomDataStore.
V	DoBeforeClose (see page 17779)	This is DoBeforeClose, a member of class TCustomDataStore.
V	DoBeforeOpen (see page 17780)	This is DoBeforeOpen, a member of class TCustomDataStore.
V	DoOnRefresh (see page 17780)	This is DoOnRefresh, a member of class TCustomDataStore.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetCurrentSummary (see page 17780)	This is GetCurrentSummary, a member of class TCustomDataStore.
	GetDataSet (see page 17780)	This is GetDataSet, a member of class TCustomDataStore.
	GetDomain (see page 17781)	This is GetDomain, a member of class TCustomDataStore.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

V	LayoutChanged (see page 17785)	This is LayoutChanged, a member of class TCustomDataStore.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 17785)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetCurrentSummary (see page 17786)	This is SetCurrentSummary, a member of class TCustomDataStore.
	SetDataSet (see page 17786)	This is SetDataSet, a member of class TCustomDataStore.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	DataCache (see page 17789)	This is DataCache, a member of class TCustomDataStore.
R	DataLink (see page 17789)	This is DataLink, a member of class TCustomDataStore.
	DataSource (see page 17790)	This is DataSource, a member of class TCustomDataStore.
R	InternalDataSource (see page 17792)	This is InternalDataSource, a member of class TCustomDataStore.
R	State (see page 17794)	This is State, a member of class TCustomDataStore.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CalcSubTotals (see page 17778)	Calculates dimension subtotals.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 17447)	Creates an instance of TDecisionCube (see page 17442).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

	Destroy (see page 17447)	Destroys an instance of TDecisionCube (see page 17442).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDetailSQL (see page 17448)	Returns an SQL statement that can be used to generate the described subset of the data in the decision cube.
	GetDimensionMemberCount (see page 17780)	Returns the number of distinct values for a dimension of the data store.
	GetDimensionName (see page 17781)	Returns the name of an active dimension.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMemberAsString (see page 17782)	Returns the specified value from a dimension of the data store, formatted as a string.
	GetMemberAsVariant (see page 17782)	Returns the specified value from a dimension of the crosstabulated data store.
	GetMemoryUsage (see page 17783)	Returns the number of bytes of memory used to cache the multidimensional array of summaries along all active dimensions.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetSQL (see page 17449)	Returns an SQL statement that can be used to generate the described subset of the data in the decision cube
	GetSummaryAsString (see page 17783)	Returns the value of the current summary for a set of values along all the active dimensions.
	GetSummaryAsVariant (see page 17784)	Returns the value of the current summary for a set of values along all the active dimensions.
	GetSummaryName (see page 17784)	Returns the name of an active summary.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 17785)	Updates the dimension map of the crosstabulated data store.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)

V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	ShowCubeDialog (see page 17450)	Displays the Decision Cube editor.
V	StateChanged (see page 17450)	Updates the dimension map when the pivot state changes.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Active (see page 17451)	Specifies whether the decision cube can provide data.
	BinData (see page 17787)	Indicates whether all the dimensions in the multidimensional array include a cell for every value along the dimension.
	Capacity (see page 17788)	Limits the memory that may be used by the cached array of summary values.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	CurrentSummary (see page 17788)	Specifies the index of the current summary from the set of active summaries maintained by the crosstabulated data store.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignState (see page 17452)	Specifies how much data is displayed by the decision cube at design time.
R	DimensionCount (see page 17790)	Specifies the number of dimensions cached by the crosstabulated data store.
R	DimensionMapCount (see page 17791)	Specifies the total number of fields from the dataset that make up the dimensions and summaries of the dimension map.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SummaryCount (see page 17794)	Specifies the number of summary fields cached by the crosstabulated data store.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterClose (see page 17456)	Occurs immediately after the crosstabulated data store has been deactivated.
	AfterOpen (see page 17456)	Occurs immediately after the crosstabulated data store has been activated.
	BeforeClose (see page 17456)	Occurs immediately before the crosstabulated data store is deactivated.
	BeforeOpen (see page 17457)	Occurs immediately before the crosstabulated data store is activated.
	OnLowCapacity (see page 17457)	Occurs when the multidimensional cache requires more memory than is allowed by the Capacity property.
	OnRefresh (see page 17458)	Occurs immediately before the dimension map is changed.

Published Properties

	Name	Description
	DataSet (see page 17451)	Specifies the dataset that provides the fields which make up the dimensions and summaries maintained by the crosstabulated data store.
	DimensionMap (see page 17453)	Describes the dimensions and summaries maintained by the crosstabulated data store.
	MaxCells (see page 17453)	Limits the number of cells that can be included in the cache at any one time.
	MaxDimensions (see page 17454)	Limits the number of dimensions that can be cached by the crosstabulated data store at any one time.
	MaxSummaries (see page 17454)	Limits the number of summaries that can be cached by the crosstabulated data store at one time.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ShowProgressDialog (see page 17455)	Determines whether a progress bar appears when the cache of crosstabulated values is built.
	Tag (see page 2808)	Stores an integer value as part of a component.

107.1.3.2 TDecisionCube.Create Constructor

Creates an instance of TDecisionCube (see page 17442).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDecisionCube(TComponent * AOwner);
```

Description

Call Create to instantiate a decision cube at runtime. Decision cubes placed on a form or data module at design time are created automatically.

Create allocates the memory for the decision cube and its helper objects and initializes the Active (see page 17451) property to false and the DesignState (see page 17452) property to dsAllData.

See Also

DesignState (see page 17452)

Create (see page 17776)

Active (see page 17451)

107.1.3.3 TDecisionCube.Destroy Destructor

Destroys an instance of TDecisionCube (see page 17442).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDecisionCube();
```

Description

Do not call the Destroy method directly. Instead call Free. Free checks that the decision cube is not nil, and only then calls Destroy.

See Also

Create (see page 17447)

Free (see page 22300)

107.1.3.4 TDecisionCube Methods

The methods of the TDecisionCube class are listed here.

Protected Methods

	Name	Description
	CanDimBeClosed (see page 17448)	This is CanDimBeClosed, a member of class TDecisionCube.
	CanSumBeClosed (see page 17448)	This is CanSumBeClosed, a member of class TDecisionCube.

Public Methods

	Name	Description
	GetDetailSQL (see page 17448)	Returns an SQL statement that can be used to generate the described subset of the data in the decision cube.
	GetSQL (see page 17449)	Returns an SQL statement that can be used to generate the described subset of the data in the decision cube
	ShowCubeDialog (see page 17450)	Displays the Decision Cube editor.
V	StateChanged (see page 17450)	Updates the dimension map when the pivot state changes.

107.1.3.4.1 TDecisionCube.CanDimBeClosed Method

Pascal

```
function CanDimBeClosed(iMapIndex: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanDimBeClosed(int iMapIndex);
```

Description

This is CanDimBeClosed, a member of class TDecisionCube.

107.1.3.4.2 TDecisionCube.CanSumBeClosed Method

Pascal

```
function CanSumBeClosed(iMapIndex: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanSumBeClosed(int iMapIndex);
```

Description

This is CanSumBeClosed, a member of class TDecisionCube.

107.1.3.4.3 TDecisionCube.GetDetailSQL Method

Returns an SQL statement that can be used to generate the described subset of the data in the decision cube.

Pascal

```
function GetDetailSQL(ValueArray: TSmallIntArray; SelectList: string; bActive: Boolean):
string;
```

C++

```
__fastcall AnsiString GetDetailSQL(TSmallIntArray ValueArray, AnsiString SelectList, Boolean
bActive);
```

Description

Use the SQL statement returned by GetDetailSQL to generate a dataset that represents the records that gave rise to a subset of the values in the decision cube. The resulting query produces the records represented in the projection described by the ValueArray parameter. The dataset will include all fields that make up the dimensions of the decision cube, plus any fields listed in the SelectList parameter. The query does not include any summary values or grouping, such as must be imposed by the dataset of the decision cube.

Each entry in the ValueArray parameter corresponds to a dimension of the decision cube, where the first entry corresponds to the first dimension, the second entry corresponds to the second dimension, and so on. If the value of an entry in the value array is less than 0, all field values over that dimension are included in the new dataset. If the value of an entry in the value array is

equal to or greater than 0, it is interpreted as the index of a value over the dimension field. When the ValueArray specifies a field value, the SQL statement restricts the dataset to records that match that value on the corresponding field of the original database table. Thus, ValueArray represents the dimension array with a set of drilled dimensions.

bActive specifies whether the ValueArray parameter includes inactive dimensions. Only active dimensions are included when bActive is true. Also when bActive is true, only the fields that correspond to active dimensions are included automatically in the SQL query.

The SelectList parameter is a list of comma delimited field names for the fields that are included in the result set of the SQL query. The query always includes the fields that correspond to the dimensions represented by the ValueArray parameter. If SelectList consists of a single asterisk (*), all the fields in the original dataset are included.

See Also

DataSet (see page 17789)

GetSQL (see page 17449)

SQL (see page 10089)

107.1.3.4.4 TDecisionCube.GetSQL Method

Returns an SQL statement that can be used to generate the described subset of the data in the decision cube

Pascal

```
function GetSQL(ValueArray: TSmallIntArray; bActive: Boolean): string;
```

C++

```
__fastcall AnsiString GetSQL(TSmallIntArray ValueArray, Boolean bActive);
```

Description

Use the SQL statement returned by GetSQL to view the data that gave rise to a subset of the information in the decision cube. The resulting query produces a dataset containing the projection described by the ValueArray parameter. All the summaries of the current dataset are included in the resulting query.

Each entry in the ValueArray parameter corresponds to a dimension of the decision cube, where the first entry corresponds to the first dimension, the second entry corresponds to the second dimension, and so on. If the value of an entry in the value array is less than 0, all field values over that dimension are included in the new dataset. If the value of an entry in the value array is equal to or greater than 0, it is interpreted as the index of a value over the dimension field. When the ValueArray specifies a field value, the SQL statement restricts the dataset to records that match that value on the corresponding field of the original database table. Thus, ValueArray represents the dimension array with a set of drilled dimensions.

bActive specifies whether the ValueArray parameter includes inactive dimensions. Only active dimensions are included when bActive is true.

To further restrict the dataset so that it includes only a subset of the dimensions in the decision cube, use the GetDetailSQL (see page 17448) method.

See Also

DataSet (see page 17789)

GetDetailSQL (see page 17448)

SQL (see page 10089)

107.1.3.4.5 TDecisionCube.ShowCubeDialog Method

Displays the Decision Cube editor.

Pascal

```
procedure ShowCubeDialog;
```

C++

```
__fastcall ShowCubeDialog();
```

Description

Call ShowCubeDialog to allow the user to change the active dimensions of the data cube using the Decision Cube editor. ShowCubeDialog brings up the same dialog that appears when Decision Cube editor is selected from the pop-up menu of the decision cube component at design time.

The Decision Cube editor allows the user to make dimensions active or inactive and to change the names of dimensions. It also controls how much information is shown in a decision control at design time.

See Also

DimensionCount (see page 17790)

DimensionMap (see page 17790)

SummaryCount (see page 17794)

GetDimensionName (see page 17781)

107.1.3.4.6 TDecisionCube.StateChanged Method

Updates the dimension map when the pivot state changes.

Pascal

```
procedure StateChanged; override;
```

C++

```
virtual __fastcall StateChanged();
```

Description

StateChanged is called automatically when dimensions are opened or closed, the current summary changes, or dimensions are pivoted. In response, the decision cube updates the dimension map to reflect the current state of its dimensions and summaries.

See Also

DimensionMap (see page 17790)

107.1.3.5 TDecisionCube Properties

The properties of the TDecisionCube class are listed here.

Public Properties

	Name	Description
	Active (see page 17451)	Specifies whether the decision cube can provide data.
	DesignState (see page 17452)	Specifies how much data is displayed by the decision cube at design time.

Published Properties

	Name	Description
	DataSet (see page 17451)	Specifies the dataset that provides the fields which make up the dimensions and summaries maintained by the crosstabulated data store.
	DimensionMap (see page 17453)	Describes the dimensions and summaries maintained by the crosstabulated data store.
	MaxCells (see page 17453)	Limits the number of cells that can be included in the cache at any one time.
	MaxDimensions (see page 17454)	Limits the number of dimensions that can be cached by the crosstabulated data store at any one time.
	MaxSummaries (see page 17454)	Limits the number of summaries that can be cached by the crosstabulated data store at one time.
	ShowProgressDialog (see page 17455)	Determines whether a progress bar appears when the cache of crosstabulated values is built.

107.1.3.5.1 TDecisionCube.Active Property

Specifies whether the decision cube can provide data.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Read Active to determine whether the decision cube is ready to provide data to a decision control. Set Active to true to cause the decision cube to fetch and analyze data from the dataset specified in the DataSet (see page 17451) property.

When Active is false, the decision cube is closed and the decision source cannot read data from the decision cube. When Active is true, data can be read from the decision cube.

Note: The Active property cannot be set to true unless the dataset specified by the DataSet (see page 17451) property is already active.

See Also

DataSet (see page 17789)

AfterClose (see page 17795)

AfterOpen (see page 17795)

BeforeClose (see page 17796)

BeforeOpen (see page 17796)

107.1.3.5.2 TDecisionCube.DataSet Property

Specifies the dataset that provides the fields which make up the dimensions and summaries maintained by the crosstabulated data store.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Set DataSet to the dataset that contains the crosstabulated data for the data store. Usually, DataSet is a TDecisionQuery object. TDecisionQuery objects are SQL queries that are grouped appropriately to calculate summaries for a crosstabulated data store.

The DataSet property can also be set to a TQuery object where the SQL has the same form as that of a TDecisionQuery or to any other dataset that contains summarized values in the same structure as the result of a TDecisionQuery query.

If the DataSet property is a TQuery or TDecisionQuery object, the crosstabulated data store automatically determines which fields are dimensions and which are summaries. If the DataSet property is not a query, the fields in the dimension map must be explicitly identified as dimensions or summaries, and, if they represent summaries, the type of summary must be indicated.

Note: The summary values for the crosstabulated data store must be calculated by the TDataSet object. The data store does not summarize raw data, but analyzes summarized data into dimensions.

See Also

DimensionMap (see page 17790)

TDecisionQuery (see page 17854)

TQuery (see page 10059)

107.1.3.5.3 TDecisionCube.DesignState Property

Specifies how much data is displayed by the decision cube at design time.

Pascal

```
property DesignState: TCubeDataState;
```

C++

```
__property TCubeDataState DesignState;
```

Description

Set DesignState to limit the amount of information that is provided when the decision cube is active at design time. Building the cache of the decision cube can be time and memory intensive. Limiting the information the decision cube can supply at design time can improve design time performance when the decision cube has many dimensions or when the dimensions have many values.

DesignState has one of the following values:

Value	Meaning
dsNoData	The decision cube can't be activated at design time.
dsMetaData	The decision cube provides the dimension captions, but no listing of values along the dimensions, and no summarized data.
dsDimensionData	The decision cube provides dimension captions, and the values of the dimension fields, but no summarized data.
dsAllData	The decision cube provides all possible data: dimension captions, the values of dimension fields, and summarized data.

Note: The Value of DesignState can be changed at design time using the Decision Cube editor.

See Also

ShowCubeDialog (see page 17450)

Active (see page 17451)

107.1.3.5.4 TDecisionCube.DimensionMap Property

Describes the dimensions and summaries maintained by the crosstabulated data store.

Pascal

```
property DimensionMap: TCubeDims;
```

C++

```
__property TCubeDims DimensionMap;
```

Description

Read DimensionMap to access the dimensions and summaries of the data store. The individual entries of the dimension map represent the fields of the dataset specified by the DataSet property or calculated fields derived from those fields, such as averages. DimensionMap provides information about these fields from the dataset that make up the crosstabulated data store, including the field names and the use of the fields within the multidimensional array.

When the data store is not active, use the properties of the TCubeDim objects to change the information cached by the data store. Use the ActiveFlag property of individual TCubeDim objects to specify whether those dimensions or summaries from the dataset are cached by the crosstabulated data store. Use the BinType property of the TCubeDim objects to allow cells along temporal dimensions to represent date ranges or to put the dimensions in a paged (permanently drilled) state.

If the dataset is not a query, use the DimensionType property of the TCubeDim objects to identify which fields are dimensions and which are summaries, and to identify the type of summary represented by the summary fields.

To change the properties of the entries in the dimension map when the data store is active, use the Refresh method.

Note: At design time, the DimensionType, Name, and ActiveFlag properties of the TCubeDim objects that make up the dimension map can be set using the Decision Cube Editor.

See Also

DataSet (see page 17789)

Refresh (see page 17785)

BinType (see page 17763)

ActiveFlag (see page 17411)

DimensionType (see page 17412)

Name (see page 17414)

Decision Cube Properties and Events

Using the Decision Cube Editor

107.1.3.5.5 TDecisionCube.MaxCells Property

Limits the number of cells that can be included in the cache at any one time.

Pascal

```
property MaxCells: Integer;
```

C++

```
__property int MaxCells;
```

Description

Use MaxCells to limit the memory usage of the crosstabulated data store. Memory consumption increases geometrically with

each dimension that is cached in the multidimensional array and linearly with each summary. MaxCells prevents too many dimensions or summaries from being cached at once.

When the ActiveFlag property of a dimension or summary is diActive, it is always added to the cache. When the ActiveFlag property of a dimension or summary is diAsNeeded, it can be added only if it does not cause the number of cells to exceed MaxCells. The data store swaps in as-needed dimensions and summaries when they are used by the decision source, making room, if necessary, by swapping out closed dimensions or summaries that are not current.

Note: Be sure to set MaxCells to a value big enough to accommodate all active dimensions and summaries plus the number of as-needed dimensions and summaries that can be open at one time.

See Also

MaxDimensions (see page 17793)

MaxSummaries (see page 17793)

ActiveFlag (see page 17411)

107.1.3.5.6 TDecisionCube.MaxDimensions Property

Limits the number of dimensions that can be cached by the crosstabulated data store at any one time.

Pascal

```
property MaxDimensions: Integer;
```

C++

```
__property int MaxDimensions;
```

Description

Use MaxDimensions to limit the memory usage of the data store. Memory consumption increases geometrically with each dimension that is cached in the multidimensional array. MaxDimensions prevents too many dimensions to be cached at once.

When the ActiveFlag property of a dimension is diActive, the dimension is always added to the cache. When the ActiveFlag property of a dimension is diAsNeeded, it can be added only if it does not cause the number of active dimensions to exceed MaxDimensions. The data store swaps in as-needed dimensions when they are open in the decision source, making room, if necessary, by swapping out closed dimensions.

Note: Be sure to set MaxDimensions to a value big enough to accommodate all active dimensions plus the number of as-needed dimensions that can be open at one time.

See Also

DimensionCount (see page 17790)

MaxCells (see page 17792)

MaxSummaries (see page 17793)

ActiveFlag (see page 17411)

107.1.3.5.7 TDecisionCube.MaxSummaries Property

Limits the number of summaries that can be cached by the crosstabulated data store at one time.

Pascal

```
property MaxSummaries: Integer;
```

C++

```
__property int MaxSummaries;
```

Description

Use MaxSummaries to limit the memory usage of the data store. Memory consumption increases linearly with each summary that is cached in the multidimensional array. MaxSummaries prevents too many summaries to be cached at once.

When the ActiveFlag property of a summary is diActive, the summary is always added to the cache. When the ActiveFlag property is diAsNeeded, it can be added only if it does not cause the number of active summaries to exceed MaxSummaries. The data store swaps in as-needed summaries when they are chosen as the current summary, making room, if necessary, by swapping out other as-needed summaries.

See Also

MaxCells (see page 17792)

MaxDimensions (see page 17793)

SummaryCount (see page 17794)

ActiveFlag (see page 17411)

107.1.3.5.8 TDecisionCube.ShowProgressDialog Property

Determines whether a progress bar appears when the cache of crosstabulated values is built.

Pascal

```
property ShowProgressDialog: Boolean;
```

C++

```
__property Boolean ShowProgressDialog;
```

Description

Set ShowProgressDialog to specify whether a progress bar should appear to provide users with a visual indication when the cache is being built. If the crosstabulated data store includes may dimensions, rebuilding the cache can take a noticeable amount of time. The progress bar provides users with feedback about how long this process will take.

See Also

DimensionCount (see page 17790)

TProgressBar (see page 4615)

107.1.3.6 TDecisionCube Events

The events of the TDecisionCube class are listed here.

Published Events

	Name	Description
	AfterClose (see page 17456)	Occurs immediately after the crosstabulated data store has been deactivated.
	AfterOpen (see page 17456)	Occurs immediately after the crosstabulated data store has been activated.
	BeforeClose (see page 17456)	Occurs immediately before the crosstabulated data store is deactivated.
	BeforeOpen (see page 17457)	Occurs immediately before the crosstabulated data store is activated.
	OnLowCapacity (see page 17457)	Occurs when the multidimensional cache requires more memory than is allowed by the Capacity property.
	OnRefresh (see page 17458)	Occurs immediately before the dimension map is changed.

107.1.3.6.1 TDecisionCube.AfterClose Event

Occurs immediately after the crosstabulated data store has been deactivated.

Pascal

```
property AfterClose: TCubeNotifyEvent;
```

C++

```
__property TCubeNotifyEvent AfterClose;
```

Description

Write an AfterClose event handler to take specific action when the crosstabulated data store has been shut down. For example, an application could provide feedback about the state of the data store, or update the dimension map for the next time the data store is activated.

See Also

BeforeClose (see page 17796)

DimensionMap (see page 17790)

107.1.3.6.2 TDecisionCube.AfterOpen Event

Occurs immediately after the crosstabulated data store has been activated.

Pascal

```
property AfterOpen: TCubeNotifyEvent;
```

C++

```
__property TCubeNotifyEvent AfterOpen;
```

Description

Write an AfterOpen event handler to take specific action when the crosstabulated data store is activated. This is the first opportunity to determine how much memory is consumed by the multidimensional cache maintained by the data store.

See Also

BeforeOpen (see page 17796)

GetMemoryUsage (see page 17783)

107.1.3.6.3 TDecisionCube.BeforeClose Event

Occurs immediately before the crosstabulated data store is deactivated.

Pascal

```
property BeforeClose: TCubeNotifyEvent;
```

C++

```
__property TCubeNotifyEvent BeforeClose;
```

Description

Write a BeforeClose event handler to take specific action before the data store shuts down. For example, an application can store information about the current state of the cache before it is cleared and all associated memory freed.

See Also

AfterClose (see page 17795)

107.1.3.6.4 TDecisionCube.BeforeOpen Event

Occurs immediately before the crosstabulated data store is activated.

Pascal

```
property BeforeOpen: TCubeNotifyEvent;
```

C++

```
__property TCubeNotifyEvent BeforeOpen;
```

Description

Write a BeforeOpen event handler to take specific action before the crosstabulated data store is activated. This is an appropriate time to adjust the value of Capacity, or set the ShowProgressDialog based on the number of active dimensions in the DimensionMap.

This is the last opportunity to adjust the entries in the DimensionMap before the cache is built. If the data store has never been active before this, the DimensionMap property will be nil (Delphi) or NULL (C++) at this point. A BeforeOpen event handler can build a dimension map programmatically if it is nil (Delphi) or NULL (C++). If the dimension map is not nil (Delphi) or NULL (C++), the properties of the dimension items can be changed, but the order and number of the dimension items themselves should not be changed.

See Also

AfterOpen (see page 17795)

Capacity (see page 17788)

DimensionMap (see page 17790)

ShowProgressDialog (see page 17794)

107.1.3.6.5 TDecisionCube.OnLowCapacity Event

Occurs when the multidimensional cache requires more memory than is allowed by the Capacity property.

Pascal

```
property OnLowCapacity: TCapacityErrorEvent;
```

C++

```
__property TCapacityErrorEvent OnLowCapacity;
```

Description

Write an OnLowCapacity event handler to respond to ELowCapacityError exceptions. An OnLowCapacity event handler can change the value of Capacity or deactivate some of the dimensions in the dimension map in order to allow the cache to fit in the available memory. If the memory problem is handled by the OnLowCapacity event handler, change the Action parameter to eaContinue to allow the data store to continue building the cache. Otherwise, an ELowCapacityError exception will be raised.

See Also

Capacity (see page 17788)

DimensionMap (see page 17790)

ELowCapacityError (see page 17306)

107.1.3.6.6 TDecisionCube.OnRefresh Event

Occurs immediately before the dimension map is changed.

Pascal

```
property OnRefresh: TCubeRefreshEvent;
```

C++

```
__property TCubeRefreshEvent OnRefresh;
```

Description

Write an OnRefresh event handler to take specific action when the dimension map changes. The DimMap parameter specifies the new value that is about to be set for the DimensionMap property. Use an OnRefresh event handler to change the properties of these dimension items before the DimensionMap property is set and the cache is rebuilt. This is also an opportunity to reset the MaxDimensions or MaxSummaries property to accommodate the dimension map that is about to be set.

See Also

DimensionMap (see page 17790)

MaxDimensions (see page 17793)

MaxSummaries (see page 17793)

Refresh (see page 17785)

Decision Cube Properties and Events

107.1.4 TDecisionDataLink Class

Class Hierarchy

Pascal

```
TDecisionDataLink = class(TPersistent);
```

C++

```
class TDecisionDataLink : public TPersistent;
```

File

MXDB

Description

This is class MXDB.TDecisionDataLink.

107.1.4.1 TDecisionDataLink Members

The following tables list the members exposed by TDecisionDataLink.

Protected Fields

	Name	Description
	FBlocked (see page 17460)	This is FBlocked, a member of class TDecisionDataLink.

	FDecisionSource (see page 17461)	This is FDecisionSource, a member of class TDecisionDataLink.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	DecisionDataEvent (see page 17461)	This is DecisionDataEvent, a member of class TDecisionDataLink.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetDecisionSource (see page 17461)	This is SetDecisionSource, a member of class TDecisionDataLink.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 17459)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 17460)	Destroys the TPersistent instance and frees its memory.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	DecisionSource (see page 17462)	This is DecisionSource, a member of class TDecisionDataLink.

107.1.4.2 TDecisionDataLink.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TDecisionDataLink();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

107.1.4.3 TDecisionDataLink.Destroy Destructor

Destroys the TPersistent instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDecisionDataLink();
```

Description

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

Free (see page 22300)

Destroy (see page 22287)

107.1.4.4 TDecisionDataLink Fields

The fields of the TDecisionDataLink class are listed here.

Protected Fields

	Name	Description
	FBlocked (see page 17460)	This is FBlocked, a member of class TDecisionDataLink.
	FDecisionSource (see page 17461)	This is FDecisionSource, a member of class TDecisionDataLink.

107.1.4.4.1 TDecisionDataLink.FBlocked Field

Pascal

```
FBlocked: Boolean;
```

C++

```
Boolean FBlocked;
```

Description

This is FBlocked, a member of class TDecisionDataLink.

107.1.4.4.2 TDecisionDataLink.FDecisionSource Field

Pascal

```
FDecisionSource: TDecisionSource;
```

C++

```
TDecisionSource FDecisionSource;
```

Description

This is FDecisionSource, a member of class TDecisionDataLink.

107.1.4.5 TDecisionDataLink Methods

The methods of the TDecisionDataLink class are listed here.

Protected Methods

	Name	Description
	DecisionDataEvent (see page 17461)	This is DecisionDataEvent, a member of class TDecisionDataLink.
	SetDecisionSource (see page 17461)	This is SetDecisionSource, a member of class TDecisionDataLink.

107.1.4.5.1 TDecisionDataLink.DecisionDataEvent Method

Pascal

```
procedure DecisionDataEvent(Event: TDecisionDataEvent); virtual;
```

C++

```
virtual __fastcall DecisionDataEvent(TDecisionDataEvent Event);
```

Description

This is DecisionDataEvent, a member of class TDecisionDataLink.

107.1.4.5.2 TDecisionDataLink.SetDecisionSource Method

Pascal

```
procedure SetDecisionSource(source: TDecisionSource);
```

C++

```
__fastcall SetDecisionSource(TDecisionSource source);
```

Description

This is SetDecisionSource, a member of class TDecisionDataLink.

107.1.4.6 TDecisionDataLink Properties

The properties of the TDecisionDataLink class are listed here.

Public Properties

	Name	Description
	DecisionSource (see page 17462)	This is DecisionSource, a member of class TDecisionDataLink.

107.1.4.6.1 TDecisionDataLink.DecisionSource Property

Pascal

```
property DecisionSource: TDecisionSource;
```

C++

```
__property TDecisionSource DecisionSource;
```

Description

This is DecisionSource, a member of class TDecisionDataLink.

107.1.5 TDecisionSource Class

TDecisionSource links a decision control to a configuration (pivot state) of the data from a decision cube.

Class Hierarchy

Pascal

```
TDecisionSource = class(TComponent);
```

C++

```
class TDecisionSource : public TComponent;
```

File

MXDB

Description

Use TDecisionSource to provide a decision grid or decision graph with cross-tabulated data from a decision cube. TDecisionSource represents a particular pivot state of dimensions from the decision cube into row and column dimensions. TDecisionSource also provides methods to drill down the display of a dimension to focus on summaries over a single value, or hide or show dimensions in the pivot state.

All decision controls that share a decision source display the same pivot state. For example, a form could contain a decision grid and a decision graph linked to the same decision source. Pivoting the dimensions of the decision grid would automatically update the image of the graph accordingly. To display two separate projections of the information from a decision cube in a single form, use two separate decision sources.

The pivot state of a decision source can be changed by manipulating a decision grid or by using a decision pivot.

107.1.5.1 TDecisionSource Members

The following tables list the members exposed by TDecisionSource.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDimGroup (see page 17483)	This is SetDimGroup, a member of class TDecisionSource.
	SetDimState (see page 17484)	This is SetDimState, a member of class TDecisionSource.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Fields

	Name	Description
	FOnAfterPivot (see page 17468)	This is FOnAfterPivot, a member of class TDecisionSource.
	FOnBeforePivot (see page 17468)	This is FOnBeforePivot, a member of class TDecisionSource.
	FOnLayoutChange (see page 17468)	This is FOnLayoutChange, a member of class TDecisionSource.
	FOnNewDimensions (see page 17468)	This is FOnNewDimensions, a member of class TDecisionSource.
	FOnStateChange (see page 17468)	This is FOnStateChange, a member of class TDecisionSource.
	FonSummaryChange (see page 17469)	This is FonSummaryChange, a member of class TDecisionSource.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CloseDimIndexRight (see page 17470)	Closes a dimension.
V	Create (see page 17467)	Creates and initializes an instance of TDecisionSource (see page 17462).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	DefineProperties (see page 17470)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	Destroy (see page 17467)	Destroys an instance of TDecisionSource (see page 17462).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DrillDimIndex (see page 17471)	Collapses a dimension to focus on a single value.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	Get2DDataAsVariant (see page 17472)	Returns the summary for a two dimensional projection of the current pivot state.
	GetActiveDim (see page 17472)	Converts a row-specific or column-specific dimension index into an absolute dimension index.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDataAsString (see page 17473)	Returns the data value that should appear in the cell of a decision grid, formatted as a string.
	GetDataAsVariant (see page 17473)	Returns the data value that should appear in the cell of a decision grid.
	GetDimensionMemberCount (see page 17474)	Returns the number of distinct values to be displayed for a given dimension.
	GetDimensionName (see page 17474)	Returns the display name for a dimension.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetGroup (see page 17475)	Indicates where a dimension appears in the current pivot state.
	GetGroupCount (see page 17475)	Returns the number of dimensions there are of a specified type.
	GetGroupExtent (see page 17476)	Returns the range of cell indexes for a single value of a dimension.
	GetIndex (see page 17477)	Returns the row-specific or column-specific index of a dimension.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMemberAsString (see page 17477)	Returns the label string for a dimension value.
	GetMemberAsVariant (see page 17478)	Returns a value along a dimension.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetRowState (see page 17478)	Indicates whether the adjacent dimensions are open or closed.
	GetState (see page 17479)	Returns the state of a dimension.
	GetSummaryName (see page 17479)	Returns the name of an active summary in the decision cube.
	GetValue (see page 17480)	Returns the drill value of a drilled or paged dimension.
	GetValueArray (see page 17480)	Returns the values of all dimension fields over which a data cell is summarized.
	GetValueIndex (see page 17481)	Returns the index of a single dimension value that corresponds to a cell in a decision grid.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveDimIndexes (see page 17481)	Changes the position of a dimension.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	OpenDimIndexLeft (see page 17482)	Opens the first closed dimension that appears before a specified dimension.
	OpenDimIndexRight (see page 17482)	Opens the first closed dimension that appears after a specified dimension.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

	SetCurrentSummary (see page 17483)	Specifies which summary is provided by the decision source.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SwapDimIndexes (see page 17484)	Interchanges the positions of two dimensions.
	ToggleDimIndex (see page 17484)	Changes whether a dimension is open, closed, or drilled.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CurrentSum (see page 17486)	Indicates the index of the current summary from the set of active summaries maintained by the decision cube.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	nColDims (see page 17489)	Indicates the number of column dimensions in the current pivot state of the decision source.
R	nDataCols (see page 17489)	Indicates the number of columns provided to the data region of a decision grid.
R	nDataRows (see page 17490)	Indicates the number of rows provided to the data region of a decision grid.
R	nDims (see page 17490)	Indicates the number of active dimensions in the decision cube.
R	nOpenColDims (see page 17491)	Indicates the number of column dimensions provided by the decision source.
R	nOpenRowDims (see page 17491)	Indicates the number of row dimensions provided by the decision source.
R	nRowDims (see page 17491)	Indicates the number of row dimensions in the current pivot state of the decision source.
R	nSums (see page 17492)	Indicates the number of active summaries in the decision cube.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Ready (see page 17492)	Indicates whether the decision source is linked to an active decision cube.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnAfterPivot (see page 17494)	Occurs immediately after the current pivot state changes.
	OnBeforePivot (see page 17494)	Occurs just before the current pivot state changes.
	OnLayoutChange (see page 17495)	Occurs immediately after decision controls are updated to reflect a change to the pivot state of the decision source.
	OnNewDimensions (see page 17495)	Occurs immediately after the data provided by the decision cube changes.
	OnStateChange (see page 17496)	Occurs when the DecisionCube (see page 17487) property changes.
	OnSummaryChange (see page 17496)	Occurs immediately after the CurrentSum (see page 17486) property changes.

Published Properties

	Name	Description
	ControlType (see page 17485)	Specifies how the decision source responds to messages from the decision pivot.
	DecisionCube (see page 17487)	Specifies the decision cube that provides the crosstabulated data for the decision source.
	Name (see page 17487)	Specifies the name of the component as referenced in code.
	SparseCols (see page 17493)	Indicates whether empty columns are removed from the current projection.
	SparseRows (see page 17493)	Indicates whether empty rows are removed from the current projection.
	Tag (see page 2808)	Stores an integer value as part of a component.

107.1.5.2 TDecisionSource.Create Constructor

Creates and initializes an instance of TDecisionSource (see page 17462).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDecisionSource(TComponent * AOwner);
```

Description

Call Create to instantiate a decision source at runtime. Decision source objects placed in forms or data modules at design time are created automatically.

See Also

Create (see page 2766)

107.1.5.3 TDecisionSource.Destroy Destructor

Destroys an instance of TDecisionSource (see page 17462).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDecisionSource();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the decision source reference is not nil and only then calls Destroy.

For all decision controls linked to the decision source, Destroy changes the DecisionSource property to nil (Delphi) or NULL (C++).

See Also

Free (see page 22300)

DecisionSource (see page 17521)

DecisionSource (see page 17578)

107.1.5.4 TDecisionSource Fields

The fields of the TDecisionSource class are listed here.

Public Fields

	Name	Description
	FOnAfterPivot (see page 17468)	This is FOnAfterPivot, a member of class TDecisionSource.
	FOnBeforePivot (see page 17468)	This is FOnBeforePivot, a member of class TDecisionSource.
	FOnLayoutChange (see page 17468)	This is FOnLayoutChange, a member of class TDecisionSource.
	FOnNewDimensions (see page 17468)	This is FOnNewDimensions, a member of class TDecisionSource.
	FOnStateChange (see page 17468)	This is FOnStateChange, a member of class TDecisionSource.

	FonSummaryChange (see page 17469)	This is FonSummaryChange, a member of class TDecisionSource.

107.1.5.4.1 TDecisionSource.FOnAfterPivot Field

Pascal

```
FOnAfterPivot: TNotifyEvent;
```

C++

```
TNotifyEvent FOnAfterPivot;
```

Description

This is FOnAfterPivot, a member of class TDecisionSource.

107.1.5.4.2 TDecisionSource.FOnBeforePivot Field

Pascal

```
FOnBeforePivot: TNotifyEvent;
```

C++

```
TNotifyEvent FOnBeforePivot;
```

Description

This is FOnBeforePivot, a member of class TDecisionSource.

107.1.5.4.3 TDecisionSource.FOnLayoutChange Field

Pascal

```
FOnLayoutChange: TNotifyEvent;
```

C++

```
TNotifyEvent FOnLayoutChange;
```

Description

This is FOnLayoutChange, a member of class TDecisionSource.

107.1.5.4.4 TDecisionSource.FOnNewDimensions Field

Pascal

```
FOnNewDimensions: TNotifyEvent;
```

C++

```
TNotifyEvent FOnNewDimensions;
```

Description

This is FOnNewDimensions, a member of class TDecisionSource.

107.1.5.4.5 TDecisionSource.FOnStateChange Field

Pascal

```
FOnStateChange: TNotifyEvent;
```

C++

```
TNotifyEvent FOnStateChange;
```

Description

This is FOnStateChange, a member of class TDecisionSource.

107.1.5.4.6 TDecisionSource.FonSummaryChange Field

Pascal

```
FonSummaryChange: TNotifyEvent;
```

C++

```
TNotifyEvent FonSummaryChange;
```

Description

This is FonSummaryChange, a member of class TDecisionSource.

107.1.5.5 TDecisionSource Methods

The methods of the TDecisionSource class are listed here.

Protected Methods

	Name	Description
	SetDimGroup (see page 17483)	This is SetDimGroup, a member of class TDecisionSource.
	SetDimState (see page 17484)	This is SetDimState, a member of class TDecisionSource.

Public Methods

	Name	Description
	CloseDimIndexRight (see page 17470)	Closes a dimension.
V	DefineProperties (see page 17470)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DrillDimIndex (see page 17471)	Collapses a dimension to focus on a single value.
	Get2DDataAsVariant (see page 17472)	Returns the summary for a two dimensional projection of the current pivot state.
	GetActiveDim (see page 17472)	Converts a row-specific or column-specific dimension index into an absolute dimension index.
	GetDataAsString (see page 17473)	Returns the data value that should appear in the cell of a decision grid, formatted as a string.
	GetDataAsVariant (see page 17473)	Returns the data value that should appear in the cell of a decision grid.
	GetDimensionMemberCount (see page 17474)	Returns the number of distinct values to be displayed for a given dimension.
	GetDimensionName (see page 17474)	Returns the display name for a dimension.
	GetGroup (see page 17475)	Indicates where a dimension appears in the current pivot state.
	GetGroupCount (see page 17475)	Returns the number of dimensions there are of a specified type.
	GetGroupExtent (see page 17476)	Returns the range of cell indexes for a single value of a dimension.
	GetIndex (see page 17477)	Returns the row-specific or column-specific index of a dimension.
	GetMemberAsString (see page 17477)	Returns the label string for a dimension value.
	GetMemberAsVariant (see page 17478)	Returns a value along a dimension.
	GetRowState (see page 17478)	Indicates whether the adjacent dimensions are open or closed.
	GetState (see page 17479)	Returns the state of a dimension.
	GetSummaryName (see page 17479)	Returns the name of an active summary in the decision cube.
	GetValue (see page 17480)	Returns the drill value of a drilled or paged dimension.
	GetValueArray (see page 17480)	Returns the values of all dimension fields over which a data cell is summarized.
	GetValueIndex (see page 17481)	Returns the index of a single dimension value that corresponds to a cell in a decision grid.

	MoveDimIndexes (see page 17481)	Changes the position of a dimension.
	OpenDimIndexLeft (see page 17482)	Opens the first closed dimension that appears before a specified dimension.
	OpenDimIndexRight (see page 17482)	Opens the first closed dimension that appears after a specified dimension.
	SetCurrentSummary (see page 17483)	Specifies which summary is provided by the decision source.
	SwapDimIndexes (see page 17484)	Interchanges the positions of two dimensions.
	ToggleDimIndex (see page 17484)	Changes whether a dimension is open, closed, or drilled.

107.1.5.5.1 TDecisionSource.CloseDimIndexRight Method

Closes a dimension.

Pascal

```
procedure CloseDimIndexRight(dimGroup: TDimGroup; Index: Integer; bOpen: Boolean);
```

C++

```
__fastcall CloseDimIndexRight(TDimGroup dimGroup, int Index, Boolean bOpen);
```

Description

Call CloseDimIndexRight to close a dimension so that it does not appear in the projection displayed by decision controls that use the decision source.

CloseDimIndexRight closes the first open dimension after the dimension identified by the Index parameter.

The dimGroup parameter indicates whether the dimension to be closed is a row dimension (dgRow) or a column dimension (dgCol). No other values for dimGroup should be used with the CloseDimIndexRight method.

If the dimGroup parameter is dgRow, Index identifies a row dimension, where 0 specifies the first row dimension, 1 specifies the second row dimension, and so on. If the dimGroup parameter is dgCol, Index identifies a column dimension, starting with an index of 0 for the first column dimension. No other values for dimGroup should be used with the CloseDimIndexRight method. To close the first open row or column dimension, set Index to -1.

The bOpen parameter specifies whether closed dimensions are counted when interpreting Index. Only open dimensions are counted when bOpen is true.

107.1.5.5.2 TDecisionSource.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are

defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

See Also

Ancestor (see page 2839)

DefineBinaryProperty (see page 2837)

DefineProperties (see page 2931)

DefineProperty (see page 2838)

107.1.5.5.3 TDecisionSource.DrillDimIndex Method

Collapses a dimension to focus on a single value.

Pascal

```
procedure DrillDimIndex(dimGroup: TDimGroup; Index: Integer; ValueIndex: Integer; bOpen:
Boolean);
```

C++

```
__fastcall DrillDimIndex(TDimGroup dimGroup, int Index, int ValueIndex, Boolean bOpen);
```

Description

Call DrillDimIndex to "drill down" on a dimension, so that only the summaries for a single value are displayed.

The dimGroup parameter specifies the type of dimension to be drilled. If dimGroup is dgRow, the Index parameter identifies a row dimension to be drilled. If dimGroup is dgCol, Index identifies a column dimension to be drilled. No other values for dimGroup should be used with the DrillDimIndex method. The first row or column dimension has an Index of 0, the second dimension has an Index of 1, and so on.

The ValueIndex parameter is the index of single value from all values over the dimension that should be displayed. To display only the summaries over the entire dimension, rather than for a single value along the dimension, set ValueIndex to -1.

The bOpen parameter specifies whether closed dimensions are counted when interpreting Index. Only open dimensions are counted when bOpen is true.

To restore the dimension from its drilled state so that it displays all values again, use the ToggleDimIndex (see page 17484) method.

Note: Do not drill a dimension of the Decision Source unless the CurrentSum (see page 17486) property specifies an additive summary. Additive Summaries are SUM and COUNT. AVERAGE (unless calculated internally by the Decision Cube), MAX, and MIN are not additive.

See Also

GetActiveDim (see page 17472)

CurrentSum (see page 17486)

107.1.5.5.4 TDecisionSource.Get2DDataAsVariant Method

Returns the summary for a two dimensional projection of the current pivot state.

Pascal

```
function Get2DDataAsVariant(iDimA: Integer; iDimB: Integer; aValueIndex: Integer; bValueIndex:
Integer): Variant;
```

C++

```
__fastcall Variant Get2DDataAsVariant(int iDimA, int iDimB, int aValueIndex, int bValueIndex);
```

Description

Call Get2DDataAsVariant to obtain the summary value from the decision cube that corresponds to the coordinates of aValueIndex on the iDimA dimension and bValueIndex on the iDimB dimension. The returned value is a variant that summarizes all values over the other active dimensions, unless they are drilled. For drilled dimensions, only the drilled value is included in the summary.

The iDimA and iDimB parameters specify the dimensions for the two dimensional projection, where 0 indicates the first active dimension, 1 indicates the second active dimension, and so on. The dimension indexes are expressed as absolute indexes. To obtain an absolute index from a row or column index, use the GetActiveDim (see page 17472) method. The aValueIndex and bValueIndex parameters are the indexes of the values on the two dimensions, where 0 indicates the first value, 1 indicates the second value, and so on. Use the GetMemberAsString (see page 17477) or GetMemberAsVariant (see page 17478) method to obtain the field values that correspond to the aValueIndex and bValueIndex parameters.

See Also

DrillDimIndex (see page 17471)

GetMemberAsString (see page 17477)

GetMemberAsVariant (see page 17478)

107.1.5.5.5 TDecisionSource.GetActiveDim Method

Converts a row-specific or column-specific dimension index into an absolute dimension index.

Pascal

```
function GetActiveDim(dimGroup: TDimGroup; index: Integer; bOpen: Boolean): Integer;
```

C++

```
__fastcall int GetActiveDim(TDimGroup dimGroup, int index, Boolean bOpen);
```

Description

Call GetActiveDim to obtain the index of a dimension in the decision cube from its position in a decision grid. The names and values of row dimensions appear in the label cells on the right of the decision grid. The first row dimension appears in the first column, the second row dimension appears in the second column, and so on. Similarly, column dimensions appear in the label cells on the top of the decision grid, with the first column dimension appearing in the first row of the grid.

The dimGroup parameter indicates whether the dimension of interest is a row dimension or column dimension. If dimGroup is dgRow, the dimension is a row dimension. If dimGroup is dgCol, the dimension is a column dimension. GetActiveDim is only implemented for dimGroup values of dgRow and dgCol.

The Index parameter indicates the position of the dimension in the set of row or column dimensions, where 0 specifies the first

row or column dimension, 1 specifies the second dimension, and so on.

The bOpen parameter specifies whether closed dimensions are counted when interpreting Index. Only open dimensions are counted when bOpen is true.

GetActiveDim returns the absolute index of the dimension. Absolute indexes are used by many methods of the decision source, such as GetDimensionName (see page 17474) or GetMemberAsString (see page 17477).

Note: To obtain a row-specific index or column-specific index from an absolute dimension index, use the GetIndex (see page 17477) method.

See Also

GetDimensionName (see page 17474)

GetGroup (see page 17475)

GetIndex (see page 17477)

GetMemberAsString (see page 17477)

107.1.5.5.6 TDecisionSource.GetDataAsString Method

Returns the data value that should appear in the cell of a decision grid, formatted as a string.

Pascal

```
function GetDataAsString(ARow: Integer; ACol: Integer; var SubLevel: Integer): String;
```

C++

```
__fastcall AnsiString GetDataAsString(int ARow, int ACol, int SubLevel);
```

Description

Call GetDataAsString to obtain the display string for a data cell in a decision grid. The ARow and ACol parameters indicate the row and column numbers of the cell in the decision grid, where (0,0) specifies the top left cell in the data region.

GetDataAsString computes the dimension coordinates in the decision cube that correspond to the row and column indexes, making note of all dimensions over which subtotals must be taken. It then obtains the summary value from the decision cube, combining values for each summarized dimension. GetDataAsString returns the final summary value, formatted as a string. It also returns the number of summarized dimensions in the SubLevel parameter.

See Also

GetDataAsVariant (see page 17473)

107.1.5.5.7 TDecisionSource.GetDataAsVariant Method

Returns the data value that should appear in the cell of a decision grid.

Pascal

```
function GetDataAsVariant(Arow: Integer; ACol: Integer; var SubLevel: Integer): Variant;
```

C++

```
__fastcall Variant GetDataAsVariant(int Arow, int ACol, int SubLevel);
```

Description

Call GetDataAsVariant to obtain the value of a data cell in a decision grid. The ARow and ACol parameters indicate the row and column numbers of the cell in the decision grid, where (0,0) specifies the top left cell in the data region.

GetDataAsVariant computes the dimension coordinates in the decision cube that correspond to the row and column indexes,

making note of all dimensions over which subtotals must be taken. It then obtains the summary value from the decision cube, combining values for each summarized dimension. GetDataAsVariant returns the final summary value. It also returns the number of summarized dimensions in the SubLevel parameter.

See Also

Get2DDataAsVariant (see page 17472)

GetDataAsString (see page 17473)

107.1.5.5.8 TDecisionSource.GetDimensionMemberCount Method

Returns the number of distinct values to be displayed for a given dimension.

Pascal

```
function GetDimensionMemberCount(iDim: Integer): Integer;
```

C++

```
__fastcall int GetDimensionMemberCount(int iDim);
```

Description

Call GetDimensionMemberCount to determine the number of values in the dimension identified by the iDim parameter. The iDim parameter is the absolute index of the dimension, where 0 indicates the first active dimension in the decision cube, 1 indicates the second active dimension, and so on. To convert from a row-specific or column-specific dimension index into an absolute dimension index, use the GetActiveDim (see page 17472) method.

GetDimensionMemberCount provides an upper limit to the ValueIndex parameter of the GetMemberAsString (see page 17477) or GetMemberAsVariant (see page 17478) method.

Note: The value returned by GetDimensionMemberCount may change depending on the pivot state.

See Also

GetActiveDim (see page 17472)

GetMemberAsString (see page 17477)

GetMemberAsVariant (see page 17478)

SparseCols (see page 17493)

SparseRows (see page 17493)

107.1.5.5.9 TDecisionSource.GetDimensionName Method

Returns the display name for a dimension.

Pascal

```
function GetDimensionName(iDim: Integer): String;
```

C++

```
__fastcall AnsiString GetDimensionName(int iDim);
```

Description

Call GetDimensionName to obtain a name to display as a label for the dimension. The iDim parameter is the absolute index of the dimension, where 0 indicates the first active dimension in the decision cube, 1 indicates the second active dimension, and so on. To convert from a row-specific or column-specific dimension index into an absolute dimension index, use the GetActiveDim (see page 17472) method.

The name of a dimension is often the name of the field the dimension represents. The dimension name can be changed in the Decision Cube Editor or by setting the Name (see page 17487) property of the dimension in the dimension map of the decision cube.

See Also

GetActiveDim (see page 17472)

DimensionMap (see page 17790)

Name (see page 17414)

107.1.5.5.10 TDecisionSource.GetGroup Method

Indicates where a dimension appears in the current pivot state.

Pascal

```
function GetGroup(iDim: Integer): TDimGroup;
```

C++

```
__fastcall TDimGroup GetGroup(int iDim);
```

Description

Call GetGroup to determine how the dimension specified by the iDim parameter is used in the current pivot state. The iDim parameter is the absolute index of the dimension, where 0 is the first active dimension, 1 is the second active dimension, and so on.

If the dimension is a row dimension (displayed to the left of a decision grid or on the y-axis of a decision graph), GetGroup returns dgRow. If it is a column dimension (displayed at the top of a decision grid or on the x-axis of a decision graph), GetGroup returns dgCol. If the dimension is a paged dimension (not appearing in the decision control but limiting the data to a single value along the dimension), GetGroup returns dgPage. GetGroup never returns dgSum or dgNone.

Note: To determine the position of the dimension within the row dimensions or column dimensions, use the GetIndex (see page 17477) method.

See Also

GetActiveDim (see page 17472)

GetIndex (see page 17477)

GetGroupCount (see page 17475)

107.1.5.5.11 TDecisionSource.GetGroupCount Method

Returns the number of dimensions there are of a specified type.

Pascal

```
function GetGroupCount(dimGroup: TDimGroup; bOpen: Boolean): Integer;
```

C++

```
__fastcall int GetGroupCount(TDimGroup dimGroup, Boolean bOpen);
```

Description

Call GetGroupCount to determine how many row, column, or paged dimensions exist in the current pivot state.

Specify the type of dimension to count as the value of dimGroup. This value can be dgRow, dgCol, or dgPage. Do not use other TDimGroup (see page 17511) values with GetGroupCount.

bOpen indicates whether to count all dimensions (including those currently closed), or only the open dimensions.

Note: You can get the same information about row and column dimensions using the nRowDims (see page 17491), nOpenRowDims (see page 17491), nColDims (see page 17489), or nOpenColDims (see page 17491) property.

See Also

GetGroup (see page 17475)

GetGroupExtent (see page 17476)

nRowDims (see page 17491)

nOpenRowDims (see page 17491)

nColDims (see page 17489)

nOpenColDims (see page 17491)

107.1.5.5.12 TDecisionSource.GetGroupExtent Method

Returns the range of cell indexes for a single value of a dimension.

Pascal

```
function GetGroupExtent(dimGroup: TDimGroup; Index: Integer; Cell: Integer): TDimRange;
```

C++

```
__fastcall TDimRange GetGroupExtent(TDimGroup dimGroup, int Index, int Cell);
```

Description

Call GetGroupExtent to find the range of cells in a decision grid that has the same value on a given dimension as the cell specified by the Cell parameter.

Cell is the index of the row or column containing the cell, where 0 specifies the first row or column in the data area of a decision grid.

If dimGroup is dgRow, Cell identifies a row of the grid. If dimGroup is dgCol, Cell identifies a column of the grid. Do not use other values for dimGroup.

Index specifies the row-specific or column-specific index of the dimension.

For example, if a decision grid has two row dimensions listed in the first two columns of the decision grid, the line

```
MyRange := GetGroupExtent(dgRow, 0, 3);
MyRange = DecisionSource1->GetGroupExtent(dgRow, 0, 3);
```

sets MyRange to the range of row indexes for cells that have the same value on the first row dimension as the third cell. The number of cells in this range is the same as the value returned by GetDimensionMemberCount (see page 17474) for the second open row dimension. The line

```
MyRange := GetGroupExtent(dgRow, 1, 3);
MyRange = DecisionSource1->GetGroupExtent(dgRow, 1, 3);
```

sets MyRange to the range from 3 to 3, because the second row dimension is the innermost row dimension, so each value is represented by a single row.

Note: If the dimension includes subtotals, the subtotal cell is included in the range returned by GetGroupExtent.

See Also

GetDimensionMemberCount (see page 17474)

107.1.5.5.13 TDecisionSource.GetIndex Method

Returns the row-specific or column-specific index of a dimension.

Pascal

```
function GetIndex(iDim: Integer; bOpen: Boolean): Integer;
```

C++

```
__fastcall int GetIndex(int iDim, Boolean bOpen);
```

Description

Call GetIndex to obtain the row-specific index or column-specific index of a dimension from its index in the decision cube. GetIndex returns 0 for the first row dimension or the first column dimension. GetIndex returns 1 for the second row dimension or the second column dimension, and so on. The iDim parameter is the absolute index of the dimension. If the bOpen parameter is true, GetIndex is the position of the dimension when only open dimensions are counted. If bOpen is false, all dimensions, including closed dimensions are counted.

Use the GetGroup (see page 17475) method to determine whether the index returned by GetIndex is a row-specific index (GetGroup (see page 17475) returns dgRow) or a column-specific index (GetGroup (see page 17475) returns dgCol).

To obtain the index of a dimension in the decision cube from its row-specific or column-specific index, use the GetActiveDim (see page 17472) method.

See Also

GetActiveDim (see page 17472)

GetGroup (see page 17475)

107.1.5.5.14 TDecisionSource.GetMemberAsString Method

Returns the label string for a dimension value.

Pascal

```
function GetMemberAsString(iDim: Integer; ValueIndex: Integer): String;
```

C++

```
__fastcall AnsiString GetMemberAsString(int iDim, int ValueIndex);
```

Description

Call GetMemberAsString to obtain the value indicated by the ValueIndex parameter along the dimension specified by the iDim parameter, formatted as a string.

The iDim parameter is the absolute index of the dimension, where 0 indicates the first active dimension in the decision cube, 1 indicates the second active dimension, and so on. To convert from a row-specific or column-specific dimension index into an absolute dimension index, use the GetActiveDim (see page 17472) method.

The ValueIndex parameter is the index of a value along the dimension, where 0 specifies the first value of the dimension and GetDimensionMemberCount (see page 17474) returns the number of values along the dimension.

See Also

GetActiveDim (see page 17472)

GetDimensionMemberCount (see page 17474)

GetDimensionName (see page 17474)

GetMemberAsVariant (see page 17478)

107.1.5.5.15 TDecisionSource.GetMemberAsVariant Method

Returns a value along a dimension.

Pascal

```
function GetMemberAsVariant(iDim: Integer; ValueIndex: Integer): Variant;
```

C++

```
__fastcall Variant GetMemberAsVariant(int iDim, int ValueIndex);
```

Description

Call GetMemberAsVariant to obtain the value indicated by the ValueIndex parameter along the dimension specified by the iDim parameter.

The iDim parameter is the absolute index of the dimension, where 0 indicates the first active dimension in the decision cube, 1 indicates the second active dimension, and so on. To convert from a row-specific or column-specific dimension index into an absolute dimension index, use the GetActiveDim (see page 17472) method.

The ValueIndex parameter is the index of a value along the dimension, where 0 specifies the first value of the dimension and GetDimensionMemberCount (see page 17474) returns the number of values along the dimension.

See Also

GetActiveDim (see page 17472)

GetDimensionMemberCount (see page 17474)

GetDimensionName (see page 17474)

GetMemberAsString (see page 17477)

107.1.5.5.16 TDecisionSource.GetRowState Method

Indicates whether the adjacent dimensions are open or closed.

Pascal

```
function GetRowState(iDim: Integer): TRowState;
```

C++

```
__fastcall TRowState GetRowState(int iDim);
```

Description

Call GetRowState to determine the state of the dimensions that are adjacent to a dimension in the current pivot state. The iDim parameter specifies the absolute index of the dimension whose neighbors are to be checked. When iDim is 0, the dimension is the first active dimension in the decision cube. When iDim is 1, it is the second active dimension, and so on.

The return value includes rcPrevOpen if the previous dimension is open or rcPrevClosed if the previous dimension is closed. The return value includes rcNextOpen if the following dimension is open or rcNextClosed if it is closed. The first row or column dimension does not include either rcPrevOpen or rcPrevClosed. The last row or column does not include either rcNextOpen or rcNextClosed.

Note: Do not be confused by the name of the GetRowState method. It provides information about the adjacent column dimensions if iDim specifies a column dimension, or information about the adjacent row dimensions if iDim specifies a row dimension.

See Also

GetState (see page 17479)

107.1.5.5.17 TDecisionSource.GetState Method

Returns the state of a dimension.

Pascal

```
function GetState(iDim: Integer): TDimState;
```

C++

```
__fastcall TDimState GetState(int iDim);
```

Description

Call GetState to determine whether a specified dimension is open, closed, or drilled. The iDim parameter is the absolute index of the dimension, where 0 specifies the first active dimension in the decision cube, 1 specifies the second active dimension, and so on. GetState returns one of the following values:

Value	Meaning
dmClosed	The dimension is closed. None of its values appear in the decision control.
dmOpen	The dimension is open. All of its values appear in the decision control.
dmDrilled	The dimension is drilled. Only a single value (or a summary over all values) along the dimension appears in the decision control.
dmPaged	The dimension can only display a single value or summarize all values together.
dmNone	The dimension is not active.

Note: The state dmDrilled appears the same as dmPaged in a decision control. However, drilled dimensions can be changed to open or closed, while paged dimensions cannot change their state. Paged dimensions use considerably less memory than other types.

See Also

GetRowState (see page 17478)

GetValue (see page 17480)

ToggleDimIndex (see page 17484)

107.1.5.5.18 TDecisionSource.GetSummaryName Method

Returns the name of an active summary in the decision cube.

Pascal

```
function GetSummaryName(iSum: Integer): String;
```

C++

```
__fastcall AnsiString GetSummaryName(int iSum);
```

Description

Call GetSummaryName to determine the name of a summary. The iSum parameter is the index of the summary from the list of active summaries available from the decision cube. Use GetSummaryName to determine the name of the possible summaries that can be set using the SetCurrentSummary (see page 17483) method.

See Also

SetCurrentSummary (see page 17483)

SummaryCount (see page 17794)

107.1.5.5.19 TDecisionSource.GetValue Method

Returns the drill value of a drilled or paged dimension.

Pascal

```
function GetValue(iDim: Integer): Integer;
```

C++

```
__fastcall int GetValue(int iDim);
```

Description

Call GetValue to determine the value focused on by a drilled or paged dimension. Drilled dimensions and paged dimensions display only the data for a single field value along the dimension. GetValue returns the index of that single value. The value itself can be obtained from this index by calling the GetMemberAsString (see page 17477) or GetMemberAsVariant (see page 17478) method.

The iDim parameter is the absolute index of the drilled or paged dimension, where 0 specifies the first active dimension in the decision cube, 1 specifies the second active dimension, and so on.

Note: If the dimension is drilled so that it displays only summaries over all the values in the dimension, GetValue returns -1. If the dimension specified by the iDim parameter is not drilled or paged, GetValue returns -1.

See Also

DrillDimIndex (see page 17471)

GetMemberAsString (see page 17477)

GetMemberAsVariant (see page 17478)

GetState (see page 17479)

107.1.5.5.20 TDecisionSource.GetValueArray Method

Returns the values of all dimension fields over which a data cell is summarized.

Pascal

```
function GetValueArray(ACol: Integer; ARow: Integer; var ValueArray: TSmallIntArray): Boolean;
```

C++

```
__fastcall Boolean GetValueArray(int ACol, int ARow, TSmallIntArray ValueArray);
```

Description

Call GetValueArray to obtain the coordinates of a data cell from a decision grid in the multidimensional array maintained by the decision cube. The ACol and ARow parameters represent the indexes of the column and row containing the cell, where (0,0) specifies the upper left data cell, not the top left cell in the grid. The ValueArray parameter returns the indexes of the field values along each active dimension. An index of -1 indicates that the cell represents a subtotal across all values in the corresponding dimension. Use the GetMemberAsString (see page 17477) or GetMemberAsVariant (see page 17478) method to convert the indexes in the ValueArray parameter into field values. GetValueArray returns a boolean indicating whether the function was successful.

See Also

GetMemberAsString (see page 17477)

GetMemberAsVariant (see page 17478)

GetValueIndex (see page 17481)

107.1.5.5.21 TDecisionSource.GetValueIndex Method

Returns the index of a single dimension value that corresponds to a cell in a decision grid.

Pascal

```
function GetValueIndex(dimGroup: TDimGroup; Index: Integer; Cell: Integer; var isBreak:
Boolean; var isSum: Boolean): Integer;
```

C++

```
__fastcall int GetValueIndex(TDimGroup dimGroup, int Index, int Cell, Boolean isBreak, Boolean
isSum);
```

Description

Call GetValueIndex to obtain the coordinate of a cell in a decision grid along the dimension specified by the Index parameter. The dimGroup parameter indicates whether the dimension is a row dimension (dgRow) or a column dimension (dgCol). Do not call GetValueIndex with dimGroup set to any other TDimGroup (see page 17511) value. The Index parameter is the row- or column-specific index of the dimension. The first row or column dimension has an Index of 0, the second dimension has an Index of 1, and so on. The Cell parameter is the index of the cell row or column, where 0 specifies the first row or column in the data region of the grid.

In addition to returning the index of the dimension value, GetValueIndex provides additional information about the position of Cell within the cells for the dimension. GetValueIndex sets isBreak to truewhen Cell is the first cell in the dimension group with the returned value on the specified dimension. GetValueIndex sets iSum to truewhen Cell represents a subtotal over the dimension.

See Also

GetActiveDim (see page 17472)

GetGroupExtent (see page 17476)

GetValueArray (see page 17480)

107.1.5.5.22 TDecisionSource.MoveDimIndexes Method

Changes the position of a dimension.

Pascal

```
procedure MoveDimIndexes(SdimGroup: TDimGroup; DdimGroup: TDimGroup; SIndex: Integer; DIndex:
Integer; bOpen: Boolean);
```

C++

```
__fastcall MoveDimIndexes(TDimGroup SdimGroup, TDimGroup DdimGroup, int SIndex, int DIndex,
Boolean bOpen);
```

Description

Call MoveDimIndexes to change the pivot state of the decision grid. MoveDimIndexes moves the dimension indicated by the SIndex and SdimGroup parameters to the position indicated by the DIndex and DdimGroup parameters.

The SdimGroup and DdimGroup parameters specify whether the dimension position is along the rows of a decision grid (SdimGroup or DdimGroup is dgRow), or across the columns of the decision grid (SdimGroup or DdimGroup is dgCol). The

SIndex and DIndex parameters indicate the index of the dimension position among the row dimensions or column dimensions, where 0 specifies the first position, 1 specifies the second position, and so on. The bOpen parameter specifies whether closed dimensions are counted when interpreting the SIndex and DIndex parameters. When bOpen is true, only open dimensions are counted.

Note: Do not move a dimension of the Decision Source unless the CurrentSum (see page 17486) property specifies an additive summary. Additive Summaries are SUM and COUNT. AVERAGE (unless calculated internally by the Decision Cube), MAX, and MIN are not additive.

See Also

GetActiveDim (see page 17472)

SwapDimIndexes (see page 17484)

CurrentSum (see page 17486)

107.1.5.5.23 TDecisionSource.OpenDimIndexLeft Method

Opens the first closed dimension that appears before a specified dimension.

Pascal

```
procedure OpenDimIndexLeft(dimGroup: TDimGroup; Index: Integer; bOpen: Boolean);
```

C++

```
__fastcall OpenDimIndexLeft(TDimGroup dimGroup, int Index, Boolean bOpen);
```

Description

Call OpenDimIndexLeft to reopen a closed dimension so that its values appear in the decision control.

OpenDimIndexLeft opens the first closed dimension before the dimension identified by the Index parameter. If the dimGroup parameter is dgRow, Index identifies a row dimension, where 0 specifies the first row dimension, 1 specifies the second row dimension, and so on. If the dimGroup parameter is dgCol, Index identifies a column dimension, starting with an index of 0 for the first column dimension. No other values for dimGroup should be used with the OpenDimIndexLeft method. To open the last closed row or column dimension, set Index to -1. The bOpen parameter specifies whether closed dimensions are counted when interpreting Index. Only open dimensions are counted when bOpen is true.

See Also

CloseDimIndexRight (see page 17470)

GetActiveDim (see page 17472)

GetRowState (see page 17478)

OpenDimIndexRight (see page 17482)

ToggleDimIndex (see page 17484)

107.1.5.5.24 TDecisionSource.OpenDimIndexRight Method

Opens the first closed dimension that appears after a specified dimension.

Pascal

```
procedure OpenDimIndexRight(dimGroup: TDimGroup; Index: Integer; bOpen: Boolean);
```

C++

```
__fastcall OpenDimIndexRight(TDimGroup dimGroup, int Index, Boolean bOpen);
```

Description

Call OpenDimIndexRight to reopen a closed dimension so that its values appear in the decision control.

OpenDimIndexRight opens the first closed dimension after the dimension identified by the Index parameter. If the dimGroup parameter is dgRow, Index identifies a row dimension, where 0 specifies the first row dimension, 1 specifies the second row dimension, and so on. If the dimGroup parameter is dgCol, Index identifies a column dimension, starting with an index of 0 for the first column dimension. No other values for dimGroup should be used with the OpenDimIndexRight method. To open the first closed row or column dimension, set Index to -1. The bOpen parameter specifies whether closed dimensions are counted when interpreting Index. Only open dimensions are counted when bOpen is true.

107.1.5.5.25 TDecisionSource.SetCurrentSummary Method

Specifies which summary is provided by the decision source.

Pascal

```
procedure SetCurrentSummary(Value: Integer);
```

C++

```
__fastcall SetCurrentSummary(int Value);
```

Description

The decision cube maintains a set of active summaries in its cache. The decision source can only present one of those summaries to decision controls. Call SetCurrentSummary to specify which of the active summaries is surfaced by the decision source. The Value parameter specifies the index of the summary in the list of active summaries maintained by the decision cube.

To obtain the names of the active summaries from which the current summary is chosen, use the GetSummaryName (see page 17479) method.

See Also

GetSummaryName (see page 17479)

CurrentSummary (see page 17788)

107.1.5.5.26 TDecisionSource.SetDimGroup Method

Pascal

```
procedure SetDimGroup(iDim: Integer; Group: TDimGroup; Index: Integer; bOpen: Boolean);
```

C++

```
__fastcall SetDimGroup(int iDim, TDimGroup Group, int Index, Boolean bOpen);
```

Description

This is SetDimGroup, a member of class TDecisionSource.

107.1.5.5.27 TDecisionSource.SetDimState Method

Pascal

```
procedure SetDimState(iDim: Integer; State: TDimState; ValueIndex: Integer);
```

C++

```
__fastcall SetDimState(int iDim, TDimState State, int ValueIndex);
```

Description

This is SetDimState, a member of class TDecisionSource.

107.1.5.5.28 TDecisionSource.SwapDimIndexes Method

Interchanges the positions of two dimensions.

Pascal

```
procedure SwapDimIndexes(SdimGroup: TDimGroup; DdimGroup: TDimGroup; SIndex: Integer; DIndex:
Integer; bOpen: Boolean);
```

C++

```
__fastcall SwapDimIndexes(TDimGroup SdimGroup, TDimGroup DdimGroup, int SIndex, int DIndex,
Boolean bOpen);
```

Description

Call SwapDimIndexes to change the pivot state of the decision grid. SwapDimIndexes interchanges the positions of the dimension indicated by the SIndex and SdimGroup parameters and the dimension indicated by the DIndex and DdimGroup parameters.

The SdimGroup and DdimGroup parameters specify whether the dimension position is along the rows of a decision grid (SdimGroup or DdimGroup is dgRow), or across the columns of the decision grid (SdimGroup or DdimGroup is false). The SIndex and DIndex parameters indicate the index of the dimension position among the row dimensions or column dimensions, where 0 specifies the first position, 1 specifies the second position, and so on. The bOpen parameter specifies whether closed dimensions are considered when interpreting the SIndex and DIndex parameters. When bOpen is true, only open dimensions are counted.

Note: Do not move a dimension of the Decision Source unless the CurrentSum (see page 17486) property specifies an additive summary. Additive Summaries are SUM and COUNT. AVERAGE (unless calculated internally by the Decision Cube), MAX, and MIN are not additive.

See Also

GetActiveDim (see page 17472)

MoveDimIndexes (see page 17481)

107.1.5.5.29 TDecisionSource.ToggleDimIndex Method

Changes whether a dimension is open, closed, or drilled.

Pascal

```
procedure ToggleDimIndex(dimGroup: TDimGroup; Index: Integer; bOpen: Boolean);
```

C++

```
__fastcall ToggleDimIndex(TDimGroup dimGroup, int Index, Boolean bOpen);
```

Description

Call ToggleDimIndex to open a closed dimension, close an open dimension, or expand a drilled dimension.

When dimGroup is dgRow, the Index parameter specifies the row-specific index of the dimension. When dimGroup is dgCol, Index specifies the column-specific index of the dimension. The first row or column dimension has an Index of 0, the second dimension has an Index of 1, and so on. The bOpen parameter specifies whether closed dimensions should be counted when interpreting the Index parameter. When bOpen is true, only open dimensions are counted.

107.1.5.6 TDecisionSource Properties

The properties of the TDecisionSource class are listed here.

Public Properties

	Name	Description
R	CurrentSum (see page 17486)	Indicates the index of the current summary from the set of active summaries maintained by the decision cube.
R	nColDims (see page 17489)	Indicates the number of column dimensions in the current pivot state of the decision source.
R	nDataCols (see page 17489)	Indicates the number of columns provided to the data region of a decision grid.
R	nDataRows (see page 17490)	Indicates the number of rows provided to the data region of a decision grid.
R	nDims (see page 17490)	Indicates the number of active dimensions in the decision cube.
R	nOpenColDims (see page 17491)	Indicates the number of column dimensions provided by the decision source.
R	nOpenRowDims (see page 17491)	Indicates the number of row dimensions provided by the decision source.
R	nRowDims (see page 17491)	Indicates the number of row dimensions in the current pivot state of the decision source.
R	nSums (see page 17492)	Indicates the number of active summaries in the decision cube.
R	Ready (see page 17492)	Indicates whether the decision source is linked to an active decision cube.

Published Properties

	Name	Description
	ControlType (see page 17485)	Specifies how the decision source responds to messages from the decision pivot.
	DecisionCube (see page 17487)	Specifies the decision cube that provides the crosstabulated data for the decision source.
	Name (see page 17487)	Specifies the name of the component as referenced in code.
	SparseCols (see page 17493)	Indicates whether empty columns are removed from the current projection.
	SparseRows (see page 17493)	Indicates whether empty rows are removed from the current projection.

107.1.5.6.1 TDecisionSource.ControlType Property

Specifies how the decision source responds to messages from the decision pivot.

Pascal

```
property ControlType: TDecisionControlType;
```

C++

```
__property TDecisionControlType ControlType;
```

Description

Use ControlType to specify what combination of row or column dimensions can be open at the same time. ControlType has one of the following values:

Value	Meaning
xtCheck	Pressing dimension buttons opens or closes an individual dimension, changing the number of open dimensions.
xtRadio	Pressing dimension buttons opens or closes the selected dimension and closes all other dimensions in that direction. When ControlType is xtRadio, at most one row dimension and one column dimension may be open at a time.
xtRadionEx	Pressing dimension buttons opens the selected dimension and closes all other dimensions in that direction or closes the selected dimension and opens another dimension in the same direction. When ControlType is xtRadioEx, exactly one row dimension and one column dimension must be open at any time.

See Also

TDecisionPivot (see page 17680)

Using Decision Sources

107.1.5.6.2 TDecisionSource.CurrentSum Property

Indicates the index of the current summary from the set of active summaries maintained by the decision cube.

Pascal

```
property CurrentSum: Integer;
```

C++

```
__property int CurrentSum;
```

Description

Read CurrentSum to determine which of the active summaries is used to provide values to clients of the decision source. CurrentSum returns 0 if the first active summary is the current summary. CurrentSum returns nSums (see page 17492)-1 if the last active summary is the current summary.

To change the current summary, use the SetCurrentSummary (see page 17483) method. Use the GetSummaryName (see page 17479) method to obtain the name of the current summary.

Note: Do not pivot, subtotal, or drill the information provided by the Decision source unless the CurrentSum property refers to an additive summary. Additive Summaries are SUM and COUNT. AVERAGE (unless calculated internally by the Decision Cube), MAX, and MIN are not additive.

See Also

GetSummaryName (see page 17479)

nSums (see page 17492)

OnSummaryChange (see page 17496)

SetCurrentSummary (see page 17483)

107.1.5.6.3 TDecisionSource.DecisionCube Property

Specifies the decision cube that provides the crosstabulated data for the decision source.

Pascal

```
property DecisionCube: TDecisionCube;
```

C++

```
__property TDecisionCube DecisionCube;
```

Description

Set DecisionCube to specify where the decision source should fetch its data. The decision cube maintains a multidimensional array of summaries in a cache. The decision source can provide decision controls with any projection of the data in that cache.

See Also

TDecisionCube (see page 17442)

107.1.5.6.4 TDecisionSource.Name Property

Specifies the name of the component as referenced in code.

Pascal

```
property Name: TComponentName;
```

C++

```
__property TComponentName Name;
```

Description

Use Name to change the name of a component to reflect its purpose in the current application. By default, the IDE assigns sequential names based on the type of the component, such as 'Button1', 'Button2', and so on.

Use Name to refer to the component in code.

Warning: Changing Name at runtime causes any references to the old name to become undefined. Any subsequent code that uses the old name will cause an exception.

C++ Examples:

```
/*
For the following example, add a button, a status bar, and a
list box to the form. Set the SimplePanel property of the
status bar to true, using the object inspector. Also, populate
the OnMouseUp event handler for the list box.  The following
code fills a list box with the names of all components on the
form when the user clicks the button. References to the
components themselves are inserted along with the names. The
components are all inserted at the front of the list, so that
the last component added to the form is the first component
in the list.  When the user right-clicks the name of an
object in the list, the component's coordinates are displayed
on the status bar. Note that because we are using the right-
click, the item need not be selected.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < ComponentCount; i++)
    ListBox1->Items->InsertObject(0,
```

```
                                    Components[i]->Name,
                                    (TObject *)Components[i]);
}

void __fastcall TForm1::ListBox1MouseUp(TObject *Sender, TMouseButton Button,
      TShiftState Shift, int X, int Y)
{
  if (Button == mbRight)
  {
    TClass ClassRef;
    int Index = ListBox1->ItemAtPos(Point(X,Y), true);
    // only components that are controls have a position
    // make sure the component is a control
    for (ClassRef = ListBox1->Items->Objects[Index]->ClassType();
         ClassRef != NULL;
         ClassRef = ClassRef->ClassParent())
      if (String(ClassRef->ClassName()) == "TControl")
      {
        TControl *TheObject = (TControl *)ListBox1->Items->Objects[Index];
        StatusBar1->SimpleText =
          TheObject->Name + " is at (" +
          IntToStr(TheObject->Left) + ", " +
          IntToStr(TheObject->Top) + ")";
         break;
      }
    if (ClassRef == NULL) // if it wasn't a control
      MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
For the following example, add a button, a status bar, and a
list box to the form. Set the SimplePanel property of the
status bar to true, using the object inspector. Also, populate
the OnMouseUp event handler for the list box.  The following
code fills a list box with the names of all components on the
form when the user clicks the button. References to the
components themselves are inserted along with the names. The
components are all inserted at the front of the list, so that
the last component added to the form is the first component
in the list.  When the user right-clicks the name of an
object in the list, the component’s coordinates are displayed
on the status bar. Note that because we are using the right-
click, the item need not be selected.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to Form1.ComponentCount-1 do
    ListBox1.Items.InsertObject(
      0, Form1.Components[I].Name,
      Form1.Components[I] as TObject);
end;

procedure TForm1.ListBox1MouseUp(
  Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X,Y: integer);
var
  APoint: TPoint;
  Index: integer;
  TheObject: TControl;
begin
  if Button = mbRight then
  begin
```

```
    APoint.X := X;
    APoint.Y := Y;
    Index := ListBox1.ItemAtPos(APoint, True);
    if (ListBox1.Items.Objects[Index] is TControl) then
    begin
      TheObject :=
        (ListBox1.Items.Objects[Index] as TControl);
      StatusBar1.SimpleText := TheObject.Name + ' is at (' +
                               IntToStr(TheObject.Left) + ', ' +
                               IntToStr(TheObject.Top) + ') ';
    end
    else
      Beep;
    end;
  end;
```

107.1.5.6.5 TDecisionSource.nColDims Property

Indicates the number of column dimensions in the current pivot state of the decision source.

Pascal

```
property nColDims: Integer;
```

C++

```
__property int nColDims;
```

Description

Read nColDims to determine the number of column dimensions the decision source can provide to a decision control. Column dimensions appear on the y axis of a decision graph or listed along the top of a decision grid. nColDims counts both the open and closed column dimensions. To determine the number of column dimensions actually provided to decision controls, use the nOpenColDims (see page 17491) property.

See Also

GetActiveDim (see page 17472)

nDims (see page 17490)

nOpenColDims (see page 17491)

nRowDims (see page 17491)

107.1.5.6.6 TDecisionSource.nDataCols Property

Indicates the number of columns provided to the data region of a decision grid.

Pascal

```
property nDataCols: Integer;
```

C++

```
__property int nDataCols;
```

Description

Read nDataCols to determine the number of summarized values the decision source provides for a row in a decision grid. Each of the columns counted by nDataCols represents a combination of values or dimension subtotals for each of the open column dimensions.

107.1.5.6.7 TDecisionSource.nDataRows Property

Indicates the number of rows provided to the data region of a decision grid.

Pascal

```
property nDataRows: Integer;
```

C++

```
__property int nDataRows;
```

Description

Read nDataRows to determine the number of summarized values the decision source provides for a column in a decision grid. Each of the rows counted by nDataRows represents a combination of values or dimension subtotals for each of the open row dimensions.

See Also

nOpenRowDims (see page 17491)

107.1.5.6.8 TDecisionSource.nDims Property

Indicates the number of active dimensions in the decision cube.

Pascal

```
property nDims: Integer;
```

C++

```
__property int nDims;
```

Description

Read nDims to determine the number of dimensions the decision source can provide to a decision control. The decision source does not necessarily provide decision controls with all the dimensions counted by the nDims property. Some of the dimensions may be closed.

The dimensions available through the decision source are divided into column dimensions and row dimensions. These are counted by the nColDims (see page 17489) and nRowDims (see page 17491) properties, respectively. nDims is equal to the sum of nColDims (see page 17489) and nRowDims (see page 17491).

See Also

nColDims (see page 17489)

nRowDims (see page 17491)

107.1.5.6.9 TDecisionSource.nOpenColDims Property

Indicates the number of column dimensions provided by the decision source.

Pascal

```
property nOpenColDims: Integer;
```

C++

```
__property int nOpenColDims;
```

Description

Read nOpenColDims to determine the number of open column dimensions the decision source provides to a decision control. Column dimensions appear on the y axis of a decision graph or listed along the top of a decision grid. nOpenColDims counts only the open column dimensions that appear in the decision control. To determine the number of column dimensions potentially available in the current pivot state, use the nColDims (see page 17489) property.

See Also

GetActiveDim (see page 17472)

nColDims (see page 17489)

nOpenRowDims (see page 17491)

107.1.5.6.10 TDecisionSource.nOpenRowDims Property

Indicates the number of row dimensions provided by the decision source.

Pascal

```
property nOpenRowDims: Integer;
```

C++

```
__property int nOpenRowDims;
```

Description

Read nOpenRowDims to determine the number of open row dimensions the decision source provides to a decision control. Row dimensions appear on the x axis of a decision graph or listed along the left side of a decision grid. nOpenRowDims counts only the open row dimensions that appear in the decision control. To determine the number of row dimensions potentially available in the current pivot state, use the nRowDims (see page 17491) property.

See Also

GetActiveDim (see page 17472)

nOpenColDims (see page 17491)

nRowDims (see page 17491)

107.1.5.6.11 TDecisionSource.nRowDims Property

Indicates the number of row dimensions in the current pivot state of the decision source.

Pascal

```
property nRowDims: Integer;
```

C++

```
__property int nRowDims;
```

Description

Read nRowDims to determine the number of row dimensions the decision source can provide to a decision control. Row dimensions appear on the x axis of a decision graph or listed along the left side of a decision grid. nRowDims counts both the open and closed row dimensions. To determine the number of row dimensions actually provided to decision controls, use the nOpenRowDims (see page 17491) property.

See Also

GetActiveDim (see page 17472)

nColDims (see page 17489)

nDims (see page 17490)

nOpenRowDims (see page 17491)

107.1.5.6.12 TDecisionSource.nSums Property

Indicates the number of active summaries in the decision cube.

Pascal

```
property nSums: Integer;
```

C++

```
__property int nSums;
```

Description

Read nSums to determine the number of summary types the decision source can provide to a decision control. The decision source can only provide decision controls with a single summary at a time. The CurrentSum (see page 17486) property indicates which of the nSums possibilities is currently provided by the decision source.

See Also

CurrentSum (see page 17486)

SetCurrentSummary (see page 17483)

107.1.5.6.13 TDecisionSource.Ready Property

Indicates whether the decision source is linked to an active decision cube.

Pascal

```
property Ready: Boolean;
```

C++

```
__property Boolean Ready;
```

Description

Read Ready to determine whether the decision source can provide data to a decision control.

See Also

DecisionCube (see page 17487)

Active (see page 17451)

107.1.5.6.14 TDecisionSource.SparseCols Property

Indicates whether empty columns are removed from the current projection.

Pascal

```
property SparseCols: Boolean;
```

C++

```
__property Boolean SparseCols;
```

Description

Set SparseCols to true to display columns that are empty in the current pivot state. Set SparseCols to false to show only those dimension values that have summarized data over one or more of the row dimensions.

Note: SparseCols does not change the value returned by GetDimensionMemberCount (see page 17474).

See Also

GetDimensionMemberCount (see page 17474)

SparseRows (see page 17493)

Using Decision Sources

107.1.5.6.15 TDecisionSource.SparseRows Property

Indicates whether empty rows are removed from the current projection.

Pascal

```
property SparseRows: Boolean;
```

C++

```
__property Boolean SparseRows;
```

Description

Set SparseRows to true to display rows that are empty in the current pivot state. Set SparseRows to false to show only those dimension values that have summarized data over one or more of the column dimensions.

Note: SparseRows doesn't change the value returned by GetDimensionMemberCount (see page 17474).

See Also

GetDimensionMemberCount (see page 17474)

SparseCols (see page 17493)

Using Decision Sources

107.1.5.7 TDecisionSource Events

The events of the TDecisionSource class are listed here.

Published Events

	Name	Description
	OnAfterPivot (see page 17494)	Occurs immediately after the current pivot state changes.
	OnBeforePivot (see page 17494)	Occurs just before the current pivot state changes.

	OnLayoutChange (see page 17495)	Occurs immediately after decision controls are updated to reflect a change to the pivot state of the decision source.
	OnNewDimensions (see page 17495)	Occurs immediately after the data provided by the decision cube changes.
	OnStateChange (see page 17496)	Occurs when the DecisionCube (see page 17487) property changes.
	OnSummaryChange (see page 17496)	Occurs immediately after the CurrentSum (see page 17486) property changes.

107.1.5.7.1 TDecisionSource.OnAfterPivot Event

Occurs immediately after the current pivot state changes.

Pascal

```
property OnAfterPivot: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAfterPivot;
```

Description

Write an OnAfterPivot event handler to take specific action after the information provided by the decision source changes but before any decision controls are updated to reflect the change. This is a good opportunity to save information about the pivot state.

When the pivot state of the decision source changes, an OnBeforePivot (see page 17494) occurs when the results of the change have been calculated, and OnAfterPivot occurs when the decision source has been updated to reflect the change. Once the decision controls that are linked to the decision pivot are updated to reflect the change, an OnLayoutChange (see page 17495) event occurs.

See Also

OnBeforePivot (see page 17494)

OnLayoutChange (see page 17495)

OnNewDimensions (see page 17495)

OnStateChange (see page 17496)

TDecisionPivot (see page 17680)

Using Decision Sources

107.1.5.7.2 TDecisionSource.OnBeforePivot Event

Occurs just before the current pivot state changes.

Pascal

```
property OnBeforePivot: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnBeforePivot;
```

Description

Write an OnBeforePivot event handler to take specific action just before the information provided by the decision source changes. When OnBeforePivot occurs, the results of the pivot have been computed but not implemented. Use the GetGroup (see page 17475), GetIndex (see page 17477), GetState (see page 17479), GetValue (see page 17480), and GetRowState (see page 17478) methods to get information about the pivot state that is about to be implemented. To get information about the pivot state that is ending, save the dimension information in an OnAfterPivot (see page 17494) event handler. The information about the new state can then be compared to information captured the last time the pivot state was

changed. The OnBeforePivot event handler can make additional alterations to the pivot state using the methods of the decision source.

See Also

OnAfterPivot (see page 17494)

GetGroup (see page 17475)

GetIndex (see page 17477)

GetRowState (see page 17478)

GetState (see page 17479)

GetValue (see page 17480)

TDecisionPivot (see page 17680)

Using Decision Sources

107.1.5.7.3 TDecisionSource.OnLayoutChange Event

Occurs immediately after decision controls are updated to reflect a change to the pivot state of the decision source.

Pascal

```
property OnLayoutChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnLayoutChange;
```

Description

Write an OnLayoutChange event handler to respond to changes in the configuration of the active dimensions. OnLayoutChange occurs when the pivot or drill state changes, but the information cached by the decision cube remains the same. When OnLayoutChange occurs, the information the decision source can potentially provide does not change, only the current configuration of that information. To respond to changes in the data cached by the decision cube, use the OnNewDimensions (see page 17495) event.

See Also

OnAfterPivot (see page 17494)

OnNewDimensions (see page 17495)

TDecisionPivot (see page 17680)

Using Decision Sources

107.1.5.7.4 TDecisionSource.OnNewDimensions Event

Occurs immediately after the data provided by the decision cube changes.

Pascal

```
property OnNewDimensions: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnNewDimensions;
```

Description

Write an OnNewDimensions event handler to respond to changes that alter the data array, such as when the active property of a

dimension in the data cube changes. When OnNewDimensions occurs, the information the decision source can provide changes. To respond to changes that reorganize the data but do not change the data cached by the data cube, use the OnEndPivot or OnLayoutChange (see page 17495) event. To respond to changes in the data cube itself, use the OnStateChange (see page 17496) event.

See Also

OnAfterPivot (see page 17494)

OnLayoutChange (see page 17495)

OnStateChange (see page 17496)

OnSummaryChange (see page 17496)

Using Decision Sources

107.1.5.7.5 TDecisionSource.OnStateChange Event

Occurs when the DecisionCube (see page 17487) property changes.

Pascal

```
property OnStateChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnStateChange;
```

Description

Write an OnStateChange event handler to respond when the DecisionCube (see page 17487) property changes or when the decision cube's Active property changes. To respond to less drastic changes, use the OnNewDimensions (see page 17495) event, the OnLayoutChange (see page 17495) event, or the OnEndPivot event.

See Also

DecisionCube (see page 17487)

OnAfterPivot (see page 17494)

OnLayoutChange (see page 17495)

OnNewDimensions (see page 17495)

Active (see page 17451)

Using Decision Sources

107.1.5.7.6 TDecisionSource.OnSummaryChange Event

Occurs immediately after the CurrentSum (see page 17486) property changes.

Pascal

```
property OnSummaryChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSummaryChange;
```

Description

Write an OnSummaryChange event handler to take specific action when the summary provided by the decision source changes. The value of the CurrentSum (see page 17486) property reflects the new current summary.

Using Decision Sources

107.1.6 TDimInfoArray Class

Class Hierarchy

MXDB.TDimInfoArray

Pascal

```
TDimInfoArray = class;
```

C++

```
class TDimInfoArray;
```

File

MXDB

Description

This is class MXDB.TDimInfoArray.

107.1.6.1 TDimInfoArray Members

The following tables list the members exposed by TDimInfoArray.

Protected Methods

	Name	Description
	Find (see page 17499)	This is Find, a member of class TDimInfoArray.
	GetItem (see page 17500)	This is GetItem, a member of class TDimInfoArray.

Public Methods

	Name	Description
	Assign (see page 17498)	This is Assign, a member of class TDimInfoArray.
	Create (see page 17498)	This is Create, a member of class TDimInfoArray.
V	Destroy (see page 17498)	This is Destroy, a member of class TDimInfoArray.
	GetGroupArray (see page 17499)	This is GetGroupArray, a member of class TDimInfoArray.
	GetGroupIndex (see page 17499)	This is GetGroupIndex, a member of class TDimInfoArray.
	GetGroupItem (see page 17499)	This is GetGroupItem, a member of class TDimInfoArray.
	GetGroupSize (see page 17499)	This is GetGroupSize, a member of class TDimInfoArray.
	IsEqual (see page 17500)	This is IsEqual, a member of class TDimInfoArray.

Public Properties

	Name	Description
R	Items (see page 17500)	This is Items, a member of class TDimInfoArray.
R	Limit (see page 17500)	This is Limit, a member of class TDimInfoArray.

107.1.6.2 TDimInfoArray.Create Constructor

Pascal

```
constructor Create(ALimit: Integer);
```

C++

```
__fastcall TDimInfoArray(int ALimit);
```

Description

This is Create, a member of class TDimInfoArray.

107.1.6.3 TDimInfoArray.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDimInfoArray();
```

Description

This is Destroy, a member of class TDimInfoArray.

107.1.6.4 TDimInfoArray Methods

The methods of the TDimInfoArray class are listed here.

Protected Methods

	Name	Description
	Find (see page 17499)	This is Find, a member of class TDimInfoArray.
	GetItem (see page 17500)	This is GetItem, a member of class TDimInfoArray.

Public Methods

	Name	Description
	Assign (see page 17498)	This is Assign, a member of class TDimInfoArray.
	GetGroupArray (see page 17499)	This is GetGroupArray, a member of class TDimInfoArray.
	GetGroupIndex (see page 17499)	This is GetGroupIndex, a member of class TDimInfoArray.
	GetGroupItem (see page 17499)	This is GetGroupItem, a member of class TDimInfoArray.
	GetGroupSize (see page 17499)	This is GetGroupSize, a member of class TDimInfoArray.
	IsEqual (see page 17500)	This is IsEqual, a member of class TDimInfoArray.

107.1.6.4.1 TDimInfoArray.Assign Method

Pascal

```
procedure Assign(Value: TDimInfoArray);
```

C++

```
__fastcall Assign(TDimInfoArray Value);
```

Description

This is Assign, a member of class TDimInfoArray.

107.1.6.4.2 TDimInfoArray.Find Method

Pascal

```
function Find(Name: string; var pos: Integer): Boolean;
```

C++

```
__fastcall Boolean Find(AnsiString Name, int pos);
```

Description

This is Find, a member of class TDimInfoArray.

107.1.6.4.3 TDimInfoArray.GetGroupArray Method

Pascal

```
function GetGroupArray(Group: TDimGroup; bOpen: Boolean): TIArray;
```

C++

```
__fastcall TIArray GetGroupArray(TDimGroup Group, Boolean bOpen);
```

Description

This is GetGroupArray, a member of class TDimInfoArray.

107.1.6.4.4 TDimInfoArray.GetGroupIndex Method

Pascal

```
function GetGroupIndex(Group: TDimGroup; Index: Integer; bOpen: Boolean): Integer;
```

C++

```
__fastcall int GetGroupIndex(TDimGroup Group, int Index, Boolean bOpen);
```

Description

This is GetGroupIndex, a member of class TDimInfoArray.

107.1.6.4.5 TDimInfoArray.GetGroupItem Method

Pascal

```
function GetGroupItem(Group: TDimGroup; Index: Integer; bOpen: Boolean): PDimInfo;
```

C++

```
__fastcall PDimInfo GetGroupItem(TDimGroup Group, int Index, Boolean bOpen);
```

Description

This is GetGroupItem, a member of class TDimInfoArray.

107.1.6.4.6 TDimInfoArray.GetGroupSize Method

Pascal

```
function GetGroupSize(Group: TDimGroup; bOpen: Boolean): Integer;
```

C++

```
__fastcall int GetGroupSize(TDimGroup Group, Boolean bOpen);
```

Description

This is GetGroupSize, a member of class TDimInfoArray.

107.1.6.4.7 TDimInfoArray.GetItem Method

Pascal

```
function GetItem(Index: Integer): PDimInfo;
```

C++

```
__fastcall PDimInfo GetItem(int Index);
```

Description

This is GetItem, a member of class TDimInfoArray.

107.1.6.4.8 TDimInfoArray.IsEqual Method

Pascal

```
function IsEqual(Value: TDimInfoArray): Boolean;
```

C++

```
__fastcall Boolean IsEqual(TDimInfoArray Value);
```

Description

This is IsEqual, a member of class TDimInfoArray.

107.1.6.5 TDimInfoArray Properties

The properties of the TDimInfoArray class are listed here.

Public Properties

	Name	Description
R	Items (see page 17500)	This is Items, a member of class TDimInfoArray.
R	Limit (see page 17500)	This is Limit, a member of class TDimInfoArray.

107.1.6.5.1 TDimInfoArray.Items Property

Pascal

```
property Items [Index: Integer]: PDimInfo;
```

C++

```
__property PDimInfo Items[int Index];
```

Description

This is Items, a member of class TDimInfoArray.

107.1.6.5.2 TDimInfoArray.Limit Property

Pascal

```
property Limit: Integer;
```

C++

```
__property int Limit;
```

Description

This is Limit, a member of class TDimInfoArray.

107.1.7 TIArray Class

Class Hierarchy

MXDB.TIArray

Pascal

```
TIArray = class;
```

C++

```
class TIArray;
```

File

MXDB

Description

This is class MXDB.TIArray.

107.1.7.1 TIArray Members

The following tables list the members exposed by TIArray.

Protected Methods

	Name	Description
	GetItem (see page 17503)	This is GetItem, a member of class TIArray.
	SetItem (see page 17503)	This is SetItem, a member of class TIArray.

Public Methods

	Name	Description
	Assign (see page 17502)	This is Assign, a member of class TIArray.
	Create (see page 17502)	This is Create, a member of class TIArray.
V	Destroy (see page 17502)	This is Destroy, a member of class TIArray.
	InsertAt (see page 17503)	This is InsertAt, a member of class TIArray.
	RemoveItem (see page 17503)	This is RemoveItem, a member of class TIArray.

Public Properties

	Name	Description
	AutoSize (see page 17504)	This is AutoSize, a member of class TIArray.
	Items (see page 17504)	This is Items, a member of class TIArray.
R	Limit (see page 17504)	This is Limit, a member of class TIArray.

107.1.7.2 TIArray.Create Constructor

Pascal

```
constructor Create(ALimit: Integer; ABlockSize: Integer);
```

C++

```
__fastcall TIArray(int ALimit, int ABlockSize);
```

Description

This is Create, a member of class TIArray.

107.1.7.3 TIArray.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIArray();
```

Description

This is Destroy, a member of class TIArray.

107.1.7.4 TIArray Methods

The methods of the TIArray class are listed here.

Protected Methods

	Name	Description
	GetItem (see page 17503)	This is GetItem, a member of class TIArray.
	SetItem (see page 17503)	This is SetItem, a member of class TIArray.

Public Methods

	Name	Description
	Assign (see page 17502)	This is Assign, a member of class TIArray.
	InsertAt (see page 17503)	This is InsertAt, a member of class TIArray.
	RemoveItem (see page 17503)	This is RemoveItem, a member of class TIArray.

107.1.7.4.1 TIArray.Assign Method

Pascal

```
procedure Assign(Value: TIArray);
```

C++

```
__fastcall Assign(TIArray Value);
```

Description

This is Assign, a member of class TIArray.

107.1.7.4.2 TIArray.GetItem Method

Pascal

```
function GetItem(Index: Integer): Integer;
```

C++

```
__fastcall int GetItem(int Index);
```

Description

This is GetItem, a member of class TIArray.

107.1.7.4.3 TIArray.InsertAt Method

Pascal

```
procedure InsertAt(Index: Integer; Value: Integer);
```

C++

```
__fastcall InsertAt(int Index, int Value);
```

Description

This is InsertAt, a member of class TIArray.

107.1.7.4.4 TIArray.RemoveItem Method

Pascal

```
function RemoveItem(Index: Integer): Integer;
```

C++

```
__fastcall int RemoveItem(int Index);
```

Description

This is RemoveItem, a member of class TIArray.

107.1.7.4.5 TIArray.SetItem Method

Pascal

```
procedure SetItem(Index: Integer; Value: Integer);
```

C++

```
__fastcall SetItem(int Index, int Value);
```

Description

This is SetItem, a member of class TIArray.

107.1.7.5 TIArray Properties

The properties of the TIArray class are listed here.

Public Properties

	Name	Description
	AutoSize (see page 17504)	This is AutoSize, a member of class TIArray.
	Items (see page 17504)	This is Items, a member of class TIArray.
R	Limit (see page 17504)	This is Limit, a member of class TIArray.

107.1.7.5.1 TIArray.AutoSize Property

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

This is AutoSize, a member of class TIArray.

107.1.7.5.2 TIArray.Items Property

Pascal

```
property Items [Index: Integer]: Integer;
```

C++

```
__property int Items[int Index];
```

Description

This is Items, a member of class TIArray.

107.1.7.5.3 TIArray.Limit Property

Pascal

```
property Limit: Integer;
```

C++

```
__property int Limit;
```

Description

This is Limit, a member of class TIArray.

107.1.8 TPivotState Class

Class Hierarchy

MXDB.TPivotState

Pascal

```
TPivotState = class;
```

C++

```
class TPivotState;
```

File

MXDB

Description

This is class MXDB.TPivotState.

107.1.8.1 TPivotState Members

The following tables list the members exposed by TPivotState.

Protected Methods

	Name	Description
	Assign (see page 17508)	This is Assign, a member of class TPivotState.
	IsEqual (see page 17508)	This is IsEqual, a member of class TPivotState.

Public Fields

	Name	Description
	DimInfo (see page 17506)	This is DimInfo, a member of class TPivotState.
	FColSparse (see page 17506)	This is FColSparse, a member of class TPivotState.
	FColSubs (see page 17506)	This is FColSubs, a member of class TPivotState.
	FCurrentSum (see page 17507)	This is FCurrentSum, a member of class TPivotState.
	FDims (see page 17507)	This is FDims, a member of class TPivotState.
	FRowSparse (see page 17507)	This is FRowSparse, a member of class TPivotState.
	FRowSubs (see page 17507)	This is FRowSubs, a member of class TPivotState.
	FSums (see page 17507)	This is FSums, a member of class TPivotState.

Public Methods

	Name	Description
	Create (see page 17505)	This is Create, a member of class TPivotState.
V	Destroy (see page 17505)	This is Destroy, a member of class TPivotState.

107.1.8.2 TPivotState.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TPivotState();
```

Description

This is Create, a member of class TPivotState.

107.1.8.3 TPivotState.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPivotState();
```

Description

This is Destroy, a member of class TPivotState.

107.1.8.4 TPivotState Fields

The fields of the TPivotState class are listed here.

Public Fields

	Name	Description
	DimInfo (see page 17506)	This is DimInfo, a member of class TPivotState.
	FColSparse (see page 17506)	This is FColSparse, a member of class TPivotState.
	FColSubs (see page 17506)	This is FColSubs, a member of class TPivotState.
	FCurrentSum (see page 17507)	This is FCurrentSum, a member of class TPivotState.
	FDims (see page 17507)	This is FDims, a member of class TPivotState.
	FRowSparse (see page 17507)	This is FRowSparse, a member of class TPivotState.
	FRowSubs (see page 17507)	This is FRowSubs, a member of class TPivotState.
	FSums (see page 17507)	This is FSums, a member of class TPivotState.

107.1.8.4.1 TPivotState.DimInfo Field

Pascal

```
DimInfo: TDimInfoArray;
```

C++

```
TDimInfoArray DimInfo;
```

Description

This is DimInfo, a member of class TPivotState.

107.1.8.4.2 TPivotState.FColSparse Field

Pascal

```
FColSparse: Boolean;
```

C++

```
Boolean FColSparse;
```

Description

This is FColSparse, a member of class TPivotState.

107.1.8.4.3 TPivotState.FColSubs Field

Pascal

```
FColSubs: Boolean;
```

C++

```
Boolean FColSubs;
```

Description

This is FColSubs, a member of class TPivotState.

107.1.8.4.4 TPivotState.FCurrentSum Field

Pascal

```
FCurrentSum: Integer;
```

C++

```
int FCurrentSum;
```

Description

This is FCurrentSum, a member of class TPivotState.

107.1.8.4.5 TPivotState.FDims Field

Pascal

```
FDims: Integer;
```

C++

```
int FDims;
```

Description

This is FDims, a member of class TPivotState.

107.1.8.4.6 TPivotState.FRowSparse Field

Pascal

```
FRowSparse: Boolean;
```

C++

```
Boolean FRowSparse;
```

Description

This is FRowSparse, a member of class TPivotState.

107.1.8.4.7 TPivotState.FRowSubs Field

Pascal

```
FRowSubs: Boolean;
```

C++

```
Boolean FRowSubs;
```

Description

This is FRowSubs, a member of class TPivotState.

107.1.8.4.8 TPivotState.FSums Field

Pascal

```
FSums: Integer;
```

C++

```
int FSums;
```

Description

This is FSums, a member of class TPivotState.

107.1.8.5 TPivotState Methods

The methods of the TPivotState class are listed here.

Protected Methods

	Name	Description
	Assign (see page 17508)	This is Assign, a member of class TPivotState.
	IsEqual (see page 17508)	This is IsEqual, a member of class TPivotState.

107.1.8.5.1 TPivotState.Assign Method

Pascal

```
procedure Assign(Value: TPivotState);
```

C++

```
__fastcall Assign(TPivotState Value);
```

Description

This is Assign, a member of class TPivotState.

107.1.8.5.2 TPivotState.IsEqual Method

Pascal

```
function IsEqual(Value: TPivotState): Boolean;
```

C++

```
__fastcall Boolean IsEqual(TPivotState Value);
```

Description

This is IsEqual, a member of class TPivotState.

107.1.9 TQADecisionSource Class

Class Hierarchy

Pascal

```
TQADecisionSource = class(TDecisionSource);
```

C++

```
class TQADecisionSource : public TDecisionSource;
```

File

MXDB

Description

This is class MXDB.TQADecisionSource.

107.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TDecisionControlType (see page 17510)	This is record MXDB.TDecisionControlType.
	TDecisionDataEvent (see page 17510)	This is record MXDB.TDecisionDataEvent.
	TDimGroup (see page 17511)	This is record MXDB.TDimGroup.
	TDimState (see page 17512)	This is record MXDB.TDimState.
	TRowStates (see page 17513)	This is record MXDB.TRowStates.

Records

	Name	Description
	TDimInfo (see page 17511)	This is record MXDB.TDimInfo.
	TDimRange (see page 17512)	This is record MXDB.TDimRange.

107.2.1 MXDB.TDecisionControlType Enumeration

Pascal

```
TDecisionControlType = (
  xtCheck,
  xtRadio,
  xtRadioEx
);
```

C++

```
enum TDecisionControlType {
  xtCheck,
  xtRadio,
  xtRadioEx
};
```

File

MXDB

Description

This is record MXDB.TDecisionControlType.

107.2.2 MXDB.TDecisionDataEvent Enumeration

Pascal

```
TDecisionDataEvent = (
  xeStateChanged,
  xeSummaryChanged,
  xePivot,
  xeNewMetaData,
```

```
    xeSourceChange
  );
```

C++

```
  enum TDecisionDataEvent {
    xeStateChanged,
    xeSummaryChanged,
    xePivot,
    xeNewMetaData,
    xeSourceChange
  };
```

File

MXDB

Description

This is record MXDB.TDecisionDataEvent.

107.2.3 MXDB.TDimGroup Enumeration

Pascal

```
  TDimGroup = (
    dgRow,
    dgCol,
    dgSum,
    dgPage,
    dgNone
  );
```

C++

```
  enum TDimGroup {
    dgRow,
    dgCol,
    dgSum,
    dgPage,
    dgNone
  };
```

File

MXDB

Description

This is record MXDB.TDimGroup.

107.2.4 MXDB.TDimInfo Record

Pascal

```
  TDimInfo = record
    iState: TDimState;
    iValue: Integer;
    iIndex: Integer;
    iActiveIndex: Integer;
    iRowState: TRowState;
    iGroup: TDimGroup;
```

```
end;
```

C++

```
struct TDimInfo {
  TDimState iState;
  int iValue;
  int iIndex;
  int iActiveIndex;
  TRowState iRowState;
  TDimGroup iGroup;
};
```

File

MXDB

Description

This is record MXDB.TDimInfo.

107.2.5 MXDB.TDimRange Record

Pascal

```
TDimRange = record
  First: Integer;
  Last: Integer;
end;
```

C++

```
struct TDimRange {
  int First;
  int Last;
};
```

File

MXDB

Description

This is record MXDB.TDimRange.

107.2.6 MXDB.TDimState Enumeration

Pascal

```
TDimState = (
  dmClosed,
  dmOpen,
  dmDrilled,
  dmPaged,
  dmNone
);
```

C++

```
enum TDimState {
  dmClosed,
  dmOpen,
```

```
    dmDrilled,
    dmPaged,
    dmNone
  };
```

File

MXDB

Description

This is record MXDB.TDimState.

107.2.7 MXDB.TRowStates Enumeration

Pascal

```
  TRowStates = (
    rcNextOpen,
    rcPrevOpen,
    rcNextClosed,
    rcPrevClosed
  );
```

C++

```
  enum TRowStates {
    rcNextOpen,
    rcPrevOpen,
    rcNextClosed,
    rcPrevClosed
  };
```

File

MXDB

Description

This is record MXDB.TRowStates.

107.3 Types

The following table lists types in this documentation.

Types

Name	Description
PArrayDimInfo (see page 17514)	This is type MXDB.PArrayDimInfo.
PArrayInt (see page 17514)	This is type MXDB.PArrayInt.
PDimInfo (see page 17515)	This is type MXDB.PDimInfo.
TArrayDimInfo (see page 17515)	This is type MXDB.TArrayDimInfo.
TArrayInt (see page 17515)	This is type MXDB.TArrayInt.
TBigStr (see page 17516)	This is type MXDB.TBigStr.
TRowState (see page 17516)	This is type MXDB.TRowState.

107.3.1 MXDB.PArrayDimInfo Type

Pascal

```
PArrayDimInfo = ^TArrayDimInfo;
```

C++

```
^TArrayDimInfo PArrayDimInfo;
```

File

MXDB

Description

This is type MXDB.PArrayDimInfo.

107.3.2 MXDB.PArrayInt Type

Pascal

```
PArrayInt = ^TArrayInt;
```

C++

```
^TArrayInt PArrayInt;
```

File

MXDB

Description

This is type MXDB.PArrayInt.

107.3.3 MXDB.PDimInfo Type

Pascal

```
PDimInfo = ^TDimInfo;
```

C++

```
^TDimInfo PDimInfo;
```

File

MXDB

Description

This is type MXDB.PDimInfo.

107.3.4 MXDB.TArrayDimInfo Type

Pascal

```
TArrayDimInfo = array[0..999] of TDimInfo;
```

C++

```
array[0..999] of TDimInfo TArrayDimInfo;
```

File

MXDB

Description

This is type MXDB.TArrayDimInfo.

107.3.5 MXDB.TArrayInt Type

Pascal

```
TArrayInt = array[0..MaxInt div 8] of Integer;
```

C++

```
array[0..MaxInt div 8] of Integer TArrayInt;
```

File

MXDB

Description

This is type MXDB.TArrayInt.

107.3.6 MXDB.TBigStr Type

Pascal

```
TBigStr = array[0..100000] of Char;
```

C++

```
array[0..100000] of Char TBigStr;
```

File

MXDB

Description

This is type MXDB.TBigStr.

107.3.7 MXDB.TRowState Type

Pascal

```
TRowState = set of TRowStates;
```

C++

```
TRowStates TRowState;
```

File

MXDB

Description

This is type MXDB.TRowState.

108 MXGRAPH Namespace

This is namespace MXGRAPH.

Topics

Name	Description
Classes (see page 17518)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 17549)	The following table lists structs, records, enums in this documentation.
Types (see page 17550)	The following table lists types in this documentation.

Classes

	Name	Description
	TCustomDecisionGraph (see page 17518)	TCustomDecisionGraph is the base class for controls that graph crosstabulated data.
	TDecisionGraph (see page 17521)	TDecisionGraph displays a graph of crosstabulated data.
	TDecisionGraphDataLink (see page 17546)	This is class MXGRAPH.TDecisionGraphDataLink.

Structs, Records, Enums

	Name	Description
	TSeriesType (see page 17549)	This is record MXGRAPH.TSeriesType.

Types

Name	Description
TDimEvent (see page 17550)	This is type MXGRAPH.TDimEvent.

108.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomDecisionGraph (see page 17518)	TCustomDecisionGraph is the base class for controls that graph crosstabulated data.
	TDecisionGraph (see page 17521)	TDecisionGraph displays a graph of crosstabulated data.
	TDecisionGraphDataLink (see page 17546)	This is class MXGRAPH.TDecisionGraphDataLink.

108.1.1 TCustomDecisionGraph Class

TCustomDecisionGraph is the base class for controls that graph crosstabulated data.

Class Hierarchy

Pascal

```
TCustomDecisionGraph = class(TCustomChart);
```

C++

```
class TCustomDecisionGraph : public TCustomChart;
```

File

MXGRAPH

Description

Use TCustomDecisionGraph as a base class when defining objects that graph the data from a decision source. Decision graphs chart a single summary that is calculated over a number of dimensions. The dimensions appear as axes of the graph.

The field that is summarized and the fields (dimensions) over which it is summarized can be changed dynamically at runtime to view any configuration of summary and dimensions chosen from the dimension map of a decision cube. Changes to the dimensions and summary can be initiated using a TDecisionPivot object.

Do not create instances of TCustomDecisionGraph. To put a decision graph on a form, use TDecisionGraph (see page 17521).

TDecisionCube (see page 17442)

TDecisionGraph (see page 17521)

TDecisionPivot (see page 17680)

TDecisionSource (see page 17462)

108.1.1.1 TCustomDecisionGraph Members

The following tables list the members exposed by TCustomDecisionGraph.

Protected Methods

	Name	Description
	Notification (see page 17520)	This is Notification, a member of class TCustomDecisionGraph.

Public Methods

	Name	Description
	Create (see page 17519)	Creates and initializes an instance of TCustomDecisionGraph (see page 17518).
	Destroy (see page 17519)	Destroys an instance of TCustomDecisionGraph (see page 17518).
	Updated (see page 17520)	Responds when the properties of the decision graph change.

Public Properties

	Name	Description
	DecisionSource (see page 17521)	Specifies the decision source object that supplies data values for the decision graph.

108.1.1.2 TCustomDecisionGraph.Create Constructor

Creates and initializes an instance of TCustomDecisionGraph (see page 17518).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomDecisionGraph(TComponent * AOwner);
```

Description

Call Create to create a decision graph at runtime. Do not create instances of TCustomDecisionGraph (see page 17518). Instead, create a descendant of TCustomDecisionGraph (see page 17518) such as TDecisionGraph (see page 17521). Decision graphs placed in forms at design time are created automatically.

Pass a single Component as a parameter to provide the decision graph with an Owner that is responsible for freeing it.

See Also

Destroy (see page 17519)

TDecisionGraph (see page 17521)

108.1.1.3 TCustomDecisionGraph.Destroy Destructor

Destroys an instance of TCustomDecisionGraph (see page 17518).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomDecisionGraph();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the decision grid is not nil and only then calls Destroy.

See Also

Free (see page 22300)

108.1.1.4 TCustomDecisionGraph Methods

The methods of the TCustomDecisionGraph class are listed here.

Protected Methods

	Name	Description
	Notification (see page 17520)	This is Notification, a member of class TCustomDecisionGraph.

Public Methods

	Name	Description
	Updated (see page 17520)	Responds when the properties of the decision graph change.

108.1.1.4.1 TCustomDecisionGraph.Notification Method

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

This is Notification, a member of class TCustomDecisionGraph.

108.1.1.4.2 TCustomDecisionGraph.Updated Method

Responds when the properties of the decision graph change.

Pascal

```
procedure Updated; override;
```

C++

```
virtual __fastcall Updated();
```

Description

Do not call the Updated method. It is called automatically when the properties of the decision graph change. TCustomDecisionGraph (see page 17518) uses this method to refresh the layout of the graph to reflect any changes that may have been made to the series.

108.1.1.5 TCustomDecisionGraph Properties

The properties of the TCustomDecisionGraph class are listed here.

Public Properties

	Name	Description
	DecisionSource (see page 17521)	Specifies the decision source object that supplies data values for the decision graph.

108.1.1.5.1 TCustomDecisionGraph.DecisionSource Property

Specifies the decision source object that supplies data values for the decision graph.

Pascal

```
property DecisionSource: TDecisionSource;
```

C++

```
__property TDecisionSource DecisionSource;
```

Description

Set DecisionSource to link the decision graph to the crosstabulated data from a decision cube. The DecisionSource object maintains information about the current pivot state of the data. Thus, any two decision controls that share the same decision source will display the data from the decision cube using the same configuration of dimensions, including any closed dimensions or drilled down values.

See Also

TDecisionSource (see page 17462)

TDecisionGraph (see page 17521)

108.1.2 TDecisionGraph Class

TDecisionGraph displays a graph of crosstabulated data.

Class Hierarchy

Pascal

```
TDecisionGraph = class(TCustomDecisionGraph);
```

C++

```
class TDecisionGraph : public TCustomDecisionGraph;
```

File

MXGRAPH

Description

Use TDecisionGraph to put a decision graph in a form. Decision graphs chart a single summary that is calculated over a number of dimensions. The axes of the graph correspond to these dimensions, which are provided by a decision source object. By default, the first row dimension appears as the x axis and the first column dimension appears as the y axis.

The field that is summarized and the fields (dimensions) over which it is summarized can be changed dynamically at runtime to view any configuration of summary and dimensions chosen from the dimension map of a decision cube. Changes to the dimensions and summary can be initiated using a TDecisionPivot object.

TDecisionGraph publishes many of the properties, events, and methods inherited from TCustomDecisionGraph (see page 17518), but introduces no new behavior.

To present the crosstabulated data in a grid, use TDecisionGrid instead.

108.1.2.1 TDecisionGraph Members

The following tables list the members exposed by TDecisionGraph.

Protected Methods

	Name	Description
	Notification (see page 17520)	This is Notification, a member of class TCustomDecisionGraph.

Public Methods

	Name	Description
	Create (see page 17519)	Creates and initializes an instance of TCustomDecisionGraph (see page 17518).
	Destroy (see page 17519)	Destroys an instance of TCustomDecisionGraph (see page 17518).
	Updated (see page 17520)	Responds when the properties of the decision graph change.

Published Properties

	Name	Description
	Align (see page 17526)	This is Align, a member of class TDecisionGraph.
	AllowPanning (see page 17526)	This is AllowPanning, a member of class TDecisionGraph.
	AllowZoom (see page 17526)	This is AllowZoom, a member of class TDecisionGraph.
	Anchors (see page 17526)	This is Anchors, a member of class TDecisionGraph.
	AnimatedZoom (see page 17527)	This is AnimatedZoom, a member of class TDecisionGraph.
	AnimatedZoomSteps (see page 17527)	This is AnimatedZoomSteps, a member of class TDecisionGraph.
	AutoSize (see page 17527)	This is AutoSize, a member of class TDecisionGraph.
	AxisVisible (see page 17527)	This is AxisVisible, a member of class TDecisionGraph.
	BackColor (see page 17528)	This is BackColor, a member of class TDecisionGraph.
	BackImage (see page 17528)	This is BackImage, a member of class TDecisionGraph.
	BackImageInside (see page 17528)	This is BackImageInside, a member of class TDecisionGraph.
	BackImageMode (see page 17528)	This is BackImageMode, a member of class TDecisionGraph.
	BevelInner (see page 17528)	This is BevelInner, a member of class TDecisionGraph.
	BevelOuter (see page 17529)	This is BevelOuter, a member of class TDecisionGraph.
	BevelWidth (see page 17529)	This is BevelWidth, a member of class TDecisionGraph.
	BorderStyle (see page 17529)	This is BorderStyle, a member of class TDecisionGraph.
	BorderWidth (see page 17529)	This is BorderWidth, a member of class TDecisionGraph.

	BottomAxis (see page 17530)	This is BottomAxis, a member of class TDecisionGraph.
	BottomWall (see page 17530)	This is BottomWall, a member of class TDecisionGraph.
	Chart3DPercent (see page 17530)	This is Chart3DPercent, a member of class TDecisionGraph.
	ClipPoints (see page 17530)	This is ClipPoints, a member of class TDecisionGraph.
	Color (see page 17530)	This is Color, a member of class TDecisionGraph.
	Constraints (see page 17531)	This is Constraints, a member of class TDecisionGraph.
	DecisionSource (see page 17531)	Specifies the decision source object that supplies data values for the decision graph.
	DragCursor (see page 17531)	This is DragCursor, a member of class TDecisionGraph.
	DragKind (see page 17531)	This is DragKind, a member of class TDecisionGraph.
	DragMode (see page 17532)	This is DragMode, a member of class TDecisionGraph.
	Enabled (see page 17532)	This is Enabled, a member of class TDecisionGraph.
	Foot (see page 17532)	This is Foot, a member of class TDecisionGraph.
	Frame (see page 17532)	This is Frame, a member of class TDecisionGraph.
	Gradient (see page 17533)	This is Gradient, a member of class TDecisionGraph.
	LeftAxis (see page 17533)	This is LeftAxis, a member of class TDecisionGraph.
	LeftWall (see page 17533)	This is LeftWall, a member of class TDecisionGraph.
	Legend (see page 17533)	This is Legend, a member of class TDecisionGraph.
	MarginBottom (see page 17533)	This is MarginBottom, a member of class TDecisionGraph.
	MarginLeft (see page 17534)	This is MarginLeft, a member of class TDecisionGraph.
	MarginRight (see page 17534)	This is MarginRight, a member of class TDecisionGraph.
	MarginTop (see page 17534)	This is MarginTop, a member of class TDecisionGraph.
	MaxPointsPerPage (see page 17534)	This is MaxPointsPerPage, a member of class TDecisionGraph.
	Monochrome (see page 17535)	This is Monochrome, a member of class TDecisionGraph.
	OnAfterDraw (see page 17535)	This is OnAfterDraw, a member of class TDecisionGraph.
	OnAllowScroll (see page 17535)	This is OnAllowScroll, a member of class TDecisionGraph.
	OnCanResize (see page 17535)	This is OnCanResize, a member of class TDecisionGraph.
	OnClick (see page 17535)	This is OnClick, a member of class TDecisionGraph.
	OnClickAxis (see page 17536)	This is OnClickAxis, a member of class TDecisionGraph.
	OnClickBackground (see page 17536)	This is OnClickBackground, a member of class TDecisionGraph.
	OnClickLegend (see page 17536)	This is OnClickLegend, a member of class TDecisionGraph.
	OnClickSeries (see page 17536)	This is OnClickSeries, a member of class TDecisionGraph.
	OnConstrainedResize (see page 17537)	This is OnConstrainedResize, a member of class TDecisionGraph.
	OnDblClick (see page 17537)	This is OnDblClick, a member of class TDecisionGraph.
	OnDockDrop (see page 17537)	This is OnDockDrop, a member of class TDecisionGraph.
	OnDockOver (see page 17537)	This is OnDockOver, a member of class TDecisionGraph.
	OnDragDrop (see page 17537)	This is OnDragDrop, a member of class TDecisionGraph.
	OnDragOver (see page 17538)	This is OnDragOver, a member of class TDecisionGraph.
	OnEndDock (see page 17538)	This is OnEndDock, a member of class TDecisionGraph.
	OnEndDrag (see page 17538)	This is OnEndDrag, a member of class TDecisionGraph.
	OnEnter (see page 17538)	This is OnEnter, a member of class TDecisionGraph.
	OnExit (see page 17539)	This is OnExit, a member of class TDecisionGraph.
	OnGetAxisLabel (see page 17539)	This is OnGetAxisLabel, a member of class TDecisionGraph.
	OnGetLegendPos (see page 17539)	This is OnGetLegendPos, a member of class TDecisionGraph.
	OnGetLegendRect (see page 17539)	This is OnGetLegendRect, a member of class TDecisionGraph.
	OnGetLegendText (see page 17539)	This is OnGetLegendText, a member of class TDecisionGraph.
	OnGetNextAxisLabel (see page 17540)	This is OnGetNextAxisLabel, a member of class TDecisionGraph.
	OnGetSiteInfo (see page 17540)	This is OnGetSiteInfo, a member of class TDecisionGraph.
	OnMouseDown (see page 17540)	This is OnMouseDown, a member of class TDecisionGraph.
	OnMouseMove (see page 17540)	This is OnMouseMove, a member of class TDecisionGraph.
	OnMouseUp (see page 17541)	This is OnMouseUp, a member of class TDecisionGraph.
	OnPageChange (see page 17541)	This is OnPageChange, a member of class TDecisionGraph.
	OnResize (see page 17541)	This is OnResize, a member of class TDecisionGraph.
	OnScroll (see page 17541)	This is OnScroll, a member of class TDecisionGraph.
	OnStartDock (see page 17541)	This is OnStartDock, a member of class TDecisionGraph.

	OnStartDrag (see page 17542)	This is OnStartDrag, a member of class TDecisionGraph.
	OnUnDock (see page 17542)	This is OnUnDock, a member of class TDecisionGraph.
	OnUndoZoom (see page 17542)	This is OnUndoZoom, a member of class TDecisionGraph.
	OnZoom (see page 17542)	This is OnZoom, a member of class TDecisionGraph.
	Page (see page 17543)	This is Page, a member of class TDecisionGraph.
	ParentColor (see page 17543)	This is ParentColor, a member of class TDecisionGraph.
	ParentShowHint (see page 17543)	This is ParentShowHint, a member of class TDecisionGraph.
	PopupMenu (see page 17543)	This is PopupMenu, a member of class TDecisionGraph.
	RightAxis (see page 17543)	This is RightAxis, a member of class TDecisionGraph.
	ScaleLastPage (see page 17544)	This is ScaleLastPage, a member of class TDecisionGraph.
	SeriesList (see page 17544)	This is SeriesList, a member of class TDecisionGraph.
	ShowHint (see page 17544)	This is ShowHint, a member of class TDecisionGraph.
	TabOrder (see page 17544)	This is TabOrder, a member of class TDecisionGraph.
	TabStop (see page 17545)	This is TabStop, a member of class TDecisionGraph.
	Title (see page 17545)	This is Title, a member of class TDecisionGraph.
	TopAxis (see page 17545)	This is TopAxis, a member of class TDecisionGraph.
	View3D (see page 17545)	This is View3D, a member of class TDecisionGraph.
	View3DWalls (see page 17545)	This is View3DWalls, a member of class TDecisionGraph.
	Visible (see page 17546)	This is Visible, a member of class TDecisionGraph.

108.1.2.2 TDecisionGraph Properties

The properties of the TDecisionGraph class are listed here.

Published Properties

	Name	Description
	Align (see page 17526)	This is Align, a member of class TDecisionGraph.
	AllowPanning (see page 17526)	This is AllowPanning, a member of class TDecisionGraph.
	AllowZoom (see page 17526)	This is AllowZoom, a member of class TDecisionGraph.
	Anchors (see page 17526)	This is Anchors, a member of class TDecisionGraph.
	AnimatedZoom (see page 17527)	This is AnimatedZoom, a member of class TDecisionGraph.
	AnimatedZoomSteps (see page 17527)	This is AnimatedZoomSteps, a member of class TDecisionGraph.
	AutoSize (see page 17527)	This is AutoSize, a member of class TDecisionGraph.
	AxisVisible (see page 17527)	This is AxisVisible, a member of class TDecisionGraph.
	BackColor (see page 17528)	This is BackColor, a member of class TDecisionGraph.
	BackImage (see page 17528)	This is BackImage, a member of class TDecisionGraph.
	BackImageInside (see page 17528)	This is BackImageInside, a member of class TDecisionGraph.
	BackImageMode (see page 17528)	This is BackImageMode, a member of class TDecisionGraph.
	BevelInner (see page 17528)	This is BevelInner, a member of class TDecisionGraph.
	BevelOuter (see page 17529)	This is BevelOuter, a member of class TDecisionGraph.
	BevelWidth (see page 17529)	This is BevelWidth, a member of class TDecisionGraph.
	BorderStyle (see page 17529)	This is BorderStyle, a member of class TDecisionGraph.
	BorderWidth (see page 17529)	This is BorderWidth, a member of class TDecisionGraph.
	BottomAxis (see page 17530)	This is BottomAxis, a member of class TDecisionGraph.
	BottomWall (see page 17530)	This is BottomWall, a member of class TDecisionGraph.
	Chart3DPercent (see page 17530)	This is Chart3DPercent, a member of class TDecisionGraph.
	ClipPoints (see page 17530)	This is ClipPoints, a member of class TDecisionGraph.
	Color (see page 17530)	This is Color, a member of class TDecisionGraph.
	Constraints (see page 17531)	This is Constraints, a member of class TDecisionGraph.
	DecisionSource (see page 17531)	Specifies the decision source object that supplies data values for the decision graph.
	DragCursor (see page 17531)	This is DragCursor, a member of class TDecisionGraph.
	DragKind (see page 17531)	This is DragKind, a member of class TDecisionGraph.
	DragMode (see page 17532)	This is DragMode, a member of class TDecisionGraph.

	Enabled (see page 17532)	This is Enabled, a member of class TDecisionGraph.
	Foot (see page 17532)	This is Foot, a member of class TDecisionGraph.
	Frame (see page 17532)	This is Frame, a member of class TDecisionGraph.
	Gradient (see page 17533)	This is Gradient, a member of class TDecisionGraph.
	LeftAxis (see page 17533)	This is LeftAxis, a member of class TDecisionGraph.
	LeftWall (see page 17533)	This is LeftWall, a member of class TDecisionGraph.
	Legend (see page 17533)	This is Legend, a member of class TDecisionGraph.
	MarginBottom (see page 17533)	This is MarginBottom, a member of class TDecisionGraph.
	MarginLeft (see page 17534)	This is MarginLeft, a member of class TDecisionGraph.
	MarginRight (see page 17534)	This is MarginRight, a member of class TDecisionGraph.
	MarginTop (see page 17534)	This is MarginTop, a member of class TDecisionGraph.
	MaxPointsPerPage (see page 17534)	This is MaxPointsPerPage, a member of class TDecisionGraph.
	Monochrome (see page 17535)	This is Monochrome, a member of class TDecisionGraph.
	OnAfterDraw (see page 17535)	This is OnAfterDraw, a member of class TDecisionGraph.
	OnAllowScroll (see page 17535)	This is OnAllowScroll, a member of class TDecisionGraph.
	OnCanResize (see page 17535)	This is OnCanResize, a member of class TDecisionGraph.
	OnClick (see page 17535)	This is OnClick, a member of class TDecisionGraph.
	OnClickAxis (see page 17536)	This is OnClickAxis, a member of class TDecisionGraph.
	OnClickBackground (see page 17536)	This is OnClickBackground, a member of class TDecisionGraph.
	OnClickLegend (see page 17536)	This is OnClickLegend, a member of class TDecisionGraph.
	OnClickSeries (see page 17536)	This is OnClickSeries, a member of class TDecisionGraph.
	OnConstrainedResize (see page 17537)	This is OnConstrainedResize, a member of class TDecisionGraph.
	OnDblClick (see page 17537)	This is OnDblClick, a member of class TDecisionGraph.
	OnDockDrop (see page 17537)	This is OnDockDrop, a member of class TDecisionGraph.
	OnDockOver (see page 17537)	This is OnDockOver, a member of class TDecisionGraph.
	OnDragDrop (see page 17537)	This is OnDragDrop, a member of class TDecisionGraph.
	OnDragOver (see page 17538)	This is OnDragOver, a member of class TDecisionGraph.
	OnEndDock (see page 17538)	This is OnEndDock, a member of class TDecisionGraph.
	OnEndDrag (see page 17538)	This is OnEndDrag, a member of class TDecisionGraph.
	OnEnter (see page 17538)	This is OnEnter, a member of class TDecisionGraph.
	OnExit (see page 17539)	This is OnExit, a member of class TDecisionGraph.
	OnGetAxisLabel (see page 17539)	This is OnGetAxisLabel, a member of class TDecisionGraph.
	OnGetLegendPos (see page 17539)	This is OnGetLegendPos, a member of class TDecisionGraph.
	OnGetLegendRect (see page 17539)	This is OnGetLegendRect, a member of class TDecisionGraph.
	OnGetLegendText (see page 17539)	This is OnGetLegendText, a member of class TDecisionGraph.
	OnGetNextAxisLabel (see page 17540)	This is OnGetNextAxisLabel, a member of class TDecisionGraph.
	OnGetSiteInfo (see page 17540)	This is OnGetSiteInfo, a member of class TDecisionGraph.
	OnMouseDown (see page 17540)	This is OnMouseDown, a member of class TDecisionGraph.
	OnMouseMove (see page 17540)	This is OnMouseMove, a member of class TDecisionGraph.
	OnMouseUp (see page 17541)	This is OnMouseUp, a member of class TDecisionGraph.
	OnPageChange (see page 17541)	This is OnPageChange, a member of class TDecisionGraph.
	OnResize (see page 17541)	This is OnResize, a member of class TDecisionGraph.
	OnScroll (see page 17541)	This is OnScroll, a member of class TDecisionGraph.
	OnStartDock (see page 17541)	This is OnStartDock, a member of class TDecisionGraph.
	OnStartDrag (see page 17542)	This is OnStartDrag, a member of class TDecisionGraph.
	OnUnDock (see page 17542)	This is OnUnDock, a member of class TDecisionGraph.
	OnUndoZoom (see page 17542)	This is OnUndoZoom, a member of class TDecisionGraph.
	OnZoom (see page 17542)	This is OnZoom, a member of class TDecisionGraph.
	Page (see page 17543)	This is Page, a member of class TDecisionGraph.
	ParentColor (see page 17543)	This is ParentColor, a member of class TDecisionGraph.
	ParentShowHint (see page 17543)	This is ParentShowHint, a member of class TDecisionGraph.
	PopupMenu (see page 17543)	This is PopupMenu, a member of class TDecisionGraph.
	RightAxis (see page 17543)	This is RightAxis, a member of class TDecisionGraph.
	ScaleLastPage (see page 17544)	This is ScaleLastPage, a member of class TDecisionGraph.

	SeriesList (see page 17544)	This is SeriesList, a member of class TDecisionGraph.
	ShowHint (see page 17544)	This is ShowHint, a member of class TDecisionGraph.
	TabOrder (see page 17544)	This is TabOrder, a member of class TDecisionGraph.
	TabStop (see page 17545)	This is TabStop, a member of class TDecisionGraph.
	Title (see page 17545)	This is Title, a member of class TDecisionGraph.
	TopAxis (see page 17545)	This is TopAxis, a member of class TDecisionGraph.
	View3D (see page 17545)	This is View3D, a member of class TDecisionGraph.
	View3DWalls (see page 17545)	This is View3DWalls, a member of class TDecisionGraph.
	Visible (see page 17546)	This is Visible, a member of class TDecisionGraph.

108.1.2.2.1 TDecisionGraph.Align Property

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

This is Align, a member of class TDecisionGraph.

108.1.2.2.2 TDecisionGraph.AllowPanning Property

Pascal

```
property AllowPanning;
```

C++

```
__property AllowPanning;
```

Description

This is AllowPanning, a member of class TDecisionGraph.

108.1.2.2.3 TDecisionGraph.AllowZoom Property

Pascal

```
property AllowZoom;
```

C++

```
__property AllowZoom;
```

Description

This is AllowZoom, a member of class TDecisionGraph.

108.1.2.2.4 TDecisionGraph.Anchors Property

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

This is Anchors, a member of class TDecisionGraph.

108.1.2.2.5 TDecisionGraph.AnimatedZoom Property

Pascal

```
property AnimatedZoom;
```

C++

```
__property AnimatedZoom;
```

Description

This is AnimatedZoom, a member of class TDecisionGraph.

108.1.2.2.6 TDecisionGraph.AnimatedZoomSteps Property

Pascal

```
property AnimatedZoomSteps;
```

C++

```
__property AnimatedZoomSteps;
```

Description

This is AnimatedZoomSteps, a member of class TDecisionGraph.

108.1.2.2.7 TDecisionGraph.AutoSize Property

Pascal

```
property AutoSize;
```

C++

```
__property AutoSize;
```

Description

This is AutoSize, a member of class TDecisionGraph.

108.1.2.2.8 TDecisionGraph.AxisVisible Property

Pascal

```
property AxisVisible;
```

C++

```
__property AxisVisible;
```

Description

This is AxisVisible, a member of class TDecisionGraph.

108.1.2.2.9 TDecisionGraph.BackColor Property

Pascal

```
property BackColor;
```

C++

```
__property BackColor;
```

Description

This is BackColor, a member of class TDecisionGraph.

108.1.2.2.10 TDecisionGraph.BackImage Property

Pascal

```
property BackImage;
```

C++

```
__property BackImage;
```

Description

This is BackImage, a member of class TDecisionGraph.

108.1.2.2.11 TDecisionGraph.BackImageInside Property

Pascal

```
property BackImageInside;
```

C++

```
__property BackImageInside;
```

Description

This is BackImageInside, a member of class TDecisionGraph.

108.1.2.2.12 TDecisionGraph.BackImageMode Property

Pascal

```
property BackImageMode;
```

C++

```
__property BackImageMode;
```

Description

This is BackImageMode, a member of class TDecisionGraph.

108.1.2.2.13 TDecisionGraph.BevelInner Property

Pascal

```
property BevelInner;
```

C++

```
__property BevelInner;
```

Description

This is BevelInner, a member of class TDecisionGraph.

108.1.2.2.14 TDecisionGraph.BevelOuter Property

Pascal

```
property BevelOuter;
```

C++

```
__property BevelOuter;
```

Description

This is BevelOuter, a member of class TDecisionGraph.

108.1.2.2.15 TDecisionGraph.BevelWidth Property

Pascal

```
property BevelWidth;
```

C++

```
__property BevelWidth;
```

Description

This is BevelWidth, a member of class TDecisionGraph.

108.1.2.2.16 TDecisionGraph.BorderStyle Property

Pascal

```
property BorderStyle;
```

C++

```
__property BorderStyle;
```

Description

This is BorderStyle, a member of class TDecisionGraph.

108.1.2.2.17 TDecisionGraph.BorderWidth Property

Pascal

```
property BorderWidth;
```

C++

```
__property BorderWidth;
```

Description

This is BorderWidth, a member of class TDecisionGraph.

108.1.2.2.18 TDecisionGraph.BottomAxis Property

Pascal

```
property BottomAxis;
```

C++

```
__property BottomAxis;
```

Description

This is BottomAxis, a member of class TDecisionGraph.

108.1.2.2.19 TDecisionGraph.BottomWall Property

Pascal

```
property BottomWall;
```

C++

```
__property BottomWall;
```

Description

This is BottomWall, a member of class TDecisionGraph.

108.1.2.2.20 TDecisionGraph.Chart3DPercent Property

Pascal

```
property Chart3DPercent;
```

C++

```
__property Chart3DPercent;
```

Description

This is Chart3DPercent, a member of class TDecisionGraph.

108.1.2.2.21 TDecisionGraph.ClipPoints Property

Pascal

```
property ClipPoints;
```

C++

```
__property ClipPoints;
```

Description

This is ClipPoints, a member of class TDecisionGraph.

108.1.2.2.22 TDecisionGraph.Color Property

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

This is Color, a member of class TDecisionGraph.

108.1.2.2.23 TDecisionGraph.Constraints Property

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

This is Constraints, a member of class TDecisionGraph.

108.1.2.2.24 TDecisionGraph.DecisionSource Property

Specifies the decision source object that supplies data values for the decision graph.

Pascal

```
property DecisionSource: TDecisionSource;
```

C++

```
__property TDecisionSource DecisionSource;
```

Description

Set DecisionSource to link the decision graph to the crosstabulated data from a decision cube. The DecisionSource object maintains information about the current pivot state of the data. Thus, any two decision controls that share the same decision source will display the data from the decision cube using the same configuration of dimensions, including any closed dimensions or drilled down values.

See Also

TDecisionSource (see page 17462)

TDecisionGraph (see page 17521)

108.1.2.2.25 TDecisionGraph.DragCursor Property

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

This is DragCursor, a member of class TDecisionGraph.

108.1.2.2.26 TDecisionGraph.DragKind Property

Pascal

```
property DragKind;
```

C++

```
__property DragKind;
```

Description

This is DragKind, a member of class TDecisionGraph.

108.1.2.2.27 TDecisionGraph.DragMode Property

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

This is DragMode, a member of class TDecisionGraph.

108.1.2.2.28 TDecisionGraph.Enabled Property

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

This is Enabled, a member of class TDecisionGraph.

108.1.2.2.29 TDecisionGraph.Foot Property

Pascal

```
property Foot;
```

C++

```
__property Foot;
```

Description

This is Foot, a member of class TDecisionGraph.

108.1.2.2.30 TDecisionGraph.Frame Property

Pascal

```
property Frame;
```

C++

```
__property Frame;
```

Description

This is Frame, a member of class TDecisionGraph.

108.1.2.2.31 TDecisionGraph.Gradient Property

Pascal

```
property Gradient;
```

C++

```
__property Gradient;
```

Description

This is Gradient, a member of class TDecisionGraph.

108.1.2.2.32 TDecisionGraph.LeftAxis Property

Pascal

```
property LeftAxis;
```

C++

```
__property LeftAxis;
```

Description

This is LeftAxis, a member of class TDecisionGraph.

108.1.2.2.33 TDecisionGraph.LeftWall Property

Pascal

```
property LeftWall;
```

C++

```
__property LeftWall;
```

Description

This is LeftWall, a member of class TDecisionGraph.

108.1.2.2.34 TDecisionGraph.Legend Property

Pascal

```
property Legend;
```

C++

```
__property Legend;
```

Description

This is Legend, a member of class TDecisionGraph.

108.1.2.2.35 TDecisionGraph.MarginBottom Property

Pascal

```
property MarginBottom;
```

C++

```
__property MarginBottom;
```

Description

This is MarginBottom, a member of class TDecisionGraph.

108.1.2.2.36 TDecisionGraph.MarginLeft Property

Pascal

```
property MarginLeft;
```

C++

```
__property MarginLeft;
```

Description

This is MarginLeft, a member of class TDecisionGraph.

108.1.2.2.37 TDecisionGraph.MarginRight Property

Pascal

```
property MarginRight;
```

C++

```
__property MarginRight;
```

Description

This is MarginRight, a member of class TDecisionGraph.

108.1.2.2.38 TDecisionGraph.MarginTop Property

Pascal

```
property MarginTop;
```

C++

```
__property MarginTop;
```

Description

This is MarginTop, a member of class TDecisionGraph.

108.1.2.2.39 TDecisionGraph.MaxPointsPerPage Property

Pascal

```
property MaxPointsPerPage;
```

C++

```
__property MaxPointsPerPage;
```

Description

This is MaxPointsPerPage, a member of class TDecisionGraph.

108.1.2.2.40 TDecisionGraph.Monochrome Property

Pascal

```
property Monochrome;
```

C++

```
__property Monochrome;
```

Description

This is Monochrome, a member of class TDecisionGraph.

108.1.2.2.41 TDecisionGraph.OnAfterDraw Property

Pascal

```
property OnAfterDraw;
```

C++

```
__property OnAfterDraw;
```

Description

This is OnAfterDraw, a member of class TDecisionGraph.

108.1.2.2.42 TDecisionGraph.OnAllowScroll Property

Pascal

```
property OnAllowScroll;
```

C++

```
__property OnAllowScroll;
```

Description

This is OnAllowScroll, a member of class TDecisionGraph.

108.1.2.2.43 TDecisionGraph.OnCanResize Property

Pascal

```
property OnCanResize;
```

C++

```
__property OnCanResize;
```

Description

This is OnCanResize, a member of class TDecisionGraph.

108.1.2.2.44 TDecisionGraph.OnClick Property

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

This is OnClick, a member of class TDecisionGraph.

108.1.2.2.45 TDecisionGraph.OnClickAxis Property

Pascal

```
property OnClickAxis;
```

C++

```
__property OnClickAxis;
```

Description

This is OnClickAxis, a member of class TDecisionGraph.

108.1.2.2.46 TDecisionGraph.OnClickBackground Property

Pascal

```
property OnClickBackground;
```

C++

```
__property OnClickBackground;
```

Description

This is OnClickBackground, a member of class TDecisionGraph.

108.1.2.2.47 TDecisionGraph.OnClickLegend Property

Pascal

```
property OnClickLegend;
```

C++

```
__property OnClickLegend;
```

Description

This is OnClickLegend, a member of class TDecisionGraph.

108.1.2.2.48 TDecisionGraph.OnClickSeries Property

Pascal

```
property OnClickSeries;
```

C++

```
__property OnClickSeries;
```

Description

This is OnClickSeries, a member of class TDecisionGraph.

108.1.2.2.49 TDecisionGraph.OnConstrainedResize Property

Pascal

```
property OnConstrainedResize;
```

C++

```
__property OnConstrainedResize;
```

Description

This is OnConstrainedResize, a member of class TDecisionGraph.

108.1.2.2.50 TDecisionGraph.OnDblClick Property

Pascal

```
property OnDblClick;
```

C++

```
__property OnDblClick;
```

Description

This is OnDblClick, a member of class TDecisionGraph.

108.1.2.2.51 TDecisionGraph.OnDockDrop Property

Pascal

```
property OnDockDrop;
```

C++

```
__property OnDockDrop;
```

Description

This is OnDockDrop, a member of class TDecisionGraph.

108.1.2.2.52 TDecisionGraph.OnDockOver Property

Pascal

```
property OnDockOver;
```

C++

```
__property OnDockOver;
```

Description

This is OnDockOver, a member of class TDecisionGraph.

108.1.2.2.53 TDecisionGraph.OnDragDrop Property

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

This is OnDragDrop, a member of class TDecisionGraph.

108.1.2.2.54 TDecisionGraph.OnDragOver Property

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

This is OnDragOver, a member of class TDecisionGraph.

108.1.2.2.55 TDecisionGraph.OnEndDock Property

Pascal

```
property OnEndDock;
```

C++

```
__property OnEndDock;
```

Description

This is OnEndDock, a member of class TDecisionGraph.

108.1.2.2.56 TDecisionGraph.OnEndDrag Property

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

This is OnEndDrag, a member of class TDecisionGraph.

108.1.2.2.57 TDecisionGraph.OnEnter Property

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

This is OnEnter, a member of class TDecisionGraph.

108.1.2.2.58 TDecisionGraph.OnExit Property

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

This is OnExit, a member of class TDecisionGraph.

108.1.2.2.59 TDecisionGraph.OnGetAxisLabel Property

Pascal

```
property OnGetAxisLabel;
```

C++

```
__property OnGetAxisLabel;
```

Description

This is OnGetAxisLabel, a member of class TDecisionGraph.

108.1.2.2.60 TDecisionGraph.OnGetLegendPos Property

Pascal

```
property OnGetLegendPos;
```

C++

```
__property OnGetLegendPos;
```

Description

This is OnGetLegendPos, a member of class TDecisionGraph.

108.1.2.2.61 TDecisionGraph.OnGetLegendRect Property

Pascal

```
property OnGetLegendRect;
```

C++

```
__property OnGetLegendRect;
```

Description

This is OnGetLegendRect, a member of class TDecisionGraph.

108.1.2.2.62 TDecisionGraph.OnGetLegendText Property

Pascal

```
property OnGetLegendText;
```

C++

```
__property OnGetLegendText;
```

Description

This is OnGetLegendText, a member of class TDecisionGraph.

108.1.2.2.63 TDecisionGraph.OnGetNextAxisLabel Property

Pascal

```
property OnGetNextAxisLabel;
```

C++

```
__property OnGetNextAxisLabel;
```

Description

This is OnGetNextAxisLabel, a member of class TDecisionGraph.

108.1.2.2.64 TDecisionGraph.OnGetSiteInfo Property

Pascal

```
property OnGetSiteInfo;
```

C++

```
__property OnGetSiteInfo;
```

Description

This is OnGetSiteInfo, a member of class TDecisionGraph.

108.1.2.2.65 TDecisionGraph.OnMouseDown Property

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

This is OnMouseDown, a member of class TDecisionGraph.

108.1.2.2.66 TDecisionGraph.OnMouseMove Property

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

This is OnMouseMove, a member of class TDecisionGraph.

108.1.2.2.67 TDecisionGraph.OnMouseUp Property

Pascal

```
property OnMouseUp;
```

C++

```
__property OnMouseUp;
```

Description

This is OnMouseUp, a member of class TDecisionGraph.

108.1.2.2.68 TDecisionGraph.OnPageChange Property

Pascal

```
property OnPageChange;
```

C++

```
__property OnPageChange;
```

Description

This is OnPageChange, a member of class TDecisionGraph.

108.1.2.2.69 TDecisionGraph.OnResize Property

Pascal

```
property OnResize;
```

C++

```
__property OnResize;
```

Description

This is OnResize, a member of class TDecisionGraph.

108.1.2.2.70 TDecisionGraph.OnScroll Property

Pascal

```
property OnScroll;
```

C++

```
__property OnScroll;
```

Description

This is OnScroll, a member of class TDecisionGraph.

108.1.2.2.71 TDecisionGraph.OnStartDock Property

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

This is OnStartDock, a member of class TDecisionGraph.

108.1.2.2.72 TDecisionGraph.OnStartDrag Property

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

This is OnStartDrag, a member of class TDecisionGraph.

108.1.2.2.73 TDecisionGraph.OnUnDock Property

Pascal

```
property OnUnDock;
```

C++

```
__property OnUnDock;
```

Description

This is OnUnDock, a member of class TDecisionGraph.

108.1.2.2.74 TDecisionGraph.OnUndoZoom Property

Pascal

```
property OnUndoZoom;
```

C++

```
__property OnUndoZoom;
```

Description

This is OnUndoZoom, a member of class TDecisionGraph.

108.1.2.2.75 TDecisionGraph.OnZoom Property

Pascal

```
property OnZoom;
```

C++

```
__property OnZoom;
```

Description

This is OnZoom, a member of class TDecisionGraph.

108.1.2.2.76 TDecisionGraph.Page Property

Pascal

```
property Page;
```

C++

```
__property Page;
```

Description

This is Page, a member of class TDecisionGraph.

108.1.2.2.77 TDecisionGraph.ParentColor Property

Pascal

```
property ParentColor;
```

C++

```
__property ParentColor;
```

Description

This is ParentColor, a member of class TDecisionGraph.

108.1.2.2.78 TDecisionGraph.ParentShowHint Property

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

This is ParentShowHint, a member of class TDecisionGraph.

108.1.2.2.79 TDecisionGraph.PopupMenu Property

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

This is PopupMenu, a member of class TDecisionGraph.

108.1.2.2.80 TDecisionGraph.RightAxis Property

Pascal

```
property RightAxis;
```

C++

```
__property RightAxis;
```

Description

This is RightAxis, a member of class TDecisionGraph.

108.1.2.2.81 TDecisionGraph.ScaleLastPage Property

Pascal

```
property ScaleLastPage;
```

C++

```
__property ScaleLastPage;
```

Description

This is ScaleLastPage, a member of class TDecisionGraph.

108.1.2.2.82 TDecisionGraph.SeriesList Property

Pascal

```
property SeriesList;
```

C++

```
__property SeriesList;
```

Description

This is SeriesList, a member of class TDecisionGraph.

108.1.2.2.83 TDecisionGraph.ShowHint Property

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

This is ShowHint, a member of class TDecisionGraph.

108.1.2.2.84 TDecisionGraph.TabOrder Property

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

This is TabOrder, a member of class TDecisionGraph.

108.1.2.2.85 TDecisionGraph.TabStop Property

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

This is TabStop, a member of class TDecisionGraph.

108.1.2.2.86 TDecisionGraph.Title Property

Pascal

```
property Title;
```

C++

```
__property Title;
```

Description

This is Title, a member of class TDecisionGraph.

108.1.2.2.87 TDecisionGraph.TopAxis Property

Pascal

```
property TopAxis;
```

C++

```
__property TopAxis;
```

Description

This is TopAxis, a member of class TDecisionGraph.

108.1.2.2.88 TDecisionGraph.View3D Property

Pascal

```
property View3D;
```

C++

```
__property View3D;
```

Description

This is View3D, a member of class TDecisionGraph.

108.1.2.2.89 TDecisionGraph.View3DWalls Property

Pascal

```
property View3DWalls;
```

C++

```
__property View3DWalls;
```

Description

This is View3DWalls, a member of class TDecisionGraph.

108.1.2.2.90 TDecisionGraph.Visible Property

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

This is Visible, a member of class TDecisionGraph.

108.1.3 TDecisionGraphDataLink Class

Class Hierarchy

System::TObject → Classes.TPersistent → MXDB.TDecisionDataLink → MXGRAPH.TDecisionGraphDataLink

Pascal

```
TDecisionGraphDataLink = class(TDecisionDataLink);
```

C++

```
class TDecisionGraphDataLink : public TDecisionDataLink;
```

File

MXGRAPH

Description

This is class MXGRAPH.TDecisionGraphDataLink.

108.1.3.1 TDecisionGraphDataLink Members

The following tables list the members exposed by TDecisionGraphDataLink.

Protected Fields

	Name	Description
	FBlocked (see page 17460)	This is FBlocked, a member of class TDecisionDataLink.
	FDecisionSource (see page 17461)	This is FDecisionSource, a member of class TDecisionDataLink.

Protected Methods

	Name	Description
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	DecisionDataEvent (see page 17548)	This is DecisionDataEvent, a member of class TDecisionGraphDataLink.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetDecisionSource (see page 17461)	This is SetDecisionSource, a member of class TDecisionDataLink.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 17547)	This is Create, a member of class TDecisionGraphDataLink.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 17548)	Destroys the TPersistent instance and frees its memory.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	DecisionSource (see page 17462)	This is DecisionSource, a member of class TDecisionDataLink.

108.1.3.2 TDecisionGraphDataLink.Create Constructor

Pascal

```
constructor Create(AGraph: TCustomDecisionGraph);
```

C++

```
__fastcall TDecisionGraphDataLink(TCustomDecisionGraph AGraph);
```

Description

This is Create, a member of class TDecisionGraphDataLink.

108.1.3.3 TDecisionGraphDataLink.Destroy Destructor

Destroys the TPersistent instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDecisionGraphDataLink();
```

Description

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

Free (see page 22300)

Destroy (see page 22287)

108.1.3.4 TDecisionGraphDataLink Methods

The methods of the TDecisionGraphDataLink class are listed here.

Protected Methods

	Name	Description
	DecisionDataEvent (see page 17548)	This is DecisionDataEvent, a member of class TDecisionGraphDataLink.

108.1.3.4.1 TDecisionGraphDataLink.DecisionDataEvent Method

Pascal

```
procedure DecisionDataEvent(Event: TDecisionDataEvent); override;
```

C++

```
virtual __fastcall DecisionDataEvent(TDecisionDataEvent Event);
```

Description

This is DecisionDataEvent, a member of class TDecisionGraphDataLink.

108.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TSeriesType (see page 17549)	This is record MXGRAPH.TSeriesType.

108.2.1 MXGRAPH.TSeriesType Enumeration

Pascal

```
TSeriesType = (
  stNormal,
  stTemplate,
  st1D
);
```

C++

```
enum TSeriesType {
  stNormal,
  stTemplate,
  st1D
};
```

File

MXGRAPH

Description

This is record MXGRAPH.TSeriesType.

108.3 Types

The following table lists types in this documentation.

Types

Name	Description
TDimEvent (see page 17550)	This is type MXGRAPH.TDimEvent.

108.3.1 MXGRAPH.TDimEvent Type

Pascal

```
TDimEvent = procedure (Sender: TObject; iDim: Integer) of object;
```

C++

```
(Sender: TObject; iDim: Integer) ( TDimEvent)();
```

File

MXGRAPH

Description

This is type MXGRAPH.TDimEvent.

109 MXGRID Namespace

This is namespace MXGRID.

Topics

Name	Description
Classes (see page 17553)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 17672)	The following table lists structs, records, enums in this documentation.
Types (see page 17676)	The following table lists types in this documentation.

Classes

	Name	Description
	TCustomDecisionGrid (see page 17553)	TCustomDecisonGrid is the base class for controls that present cross-tabulated data in a two-dimensional grid.
	TDecisionGrid (see page 17586)	TDecisionGrid presents crosstabulated data from a decision source in a grid format.
	TDecisionGridDataLink (see page 17658)	This is class MXGRID.TDecisionGridDataLink.
	TDisplayDim (see page 17661)	TDisplayDim represents a dimension in a decision grid.
	TDisplayDims (see page 17666)	TDisplayDims represents a collection of TDisplayDim (see page 17661) objects.
	TValueArray (see page 17671)	This is class MXGRID.TValueArray.

Structs, Records, Enums

	Name	Description
	TButtonPlace (see page 17672)	This is record MXGRID.TButtonPlace.
	TDDNotifyType (see page 17672)	This is record MXGRID.TDDNotifyType.
	TDecisionCellType (see page 17673)	This is record MXGRID.TDecisionCellType.
	TDecisionDrawStates (see page 17673)	This is record MXGRID.TDecisionDrawStates.
	TDecisionGridOption (see page 17674)	This is record MXGRID.TDecisionGridOption.
	TDecisionGridState (see page 17675)	This is record MXGRID.TDecisionGridState.
	TDecisionPivotState (see page 17675)	This is record MXGRID.TDecisionPivotState.

Types

Name	Description
TDecisionDrawCellEvent (see page 17676)	This is type MXGRID.TDecisionDrawCellEvent.
TDecisionDrawState (see page 17676)	This is type MXGRID.TDecisionDrawState.
TDecisionExamineCellEvent (see page 17677)	This is type MXGRID.TDecisionExamineCellEvent.
TDecisionGridOptions (see page 17677)	This is type MXGRID.TDecisionGridOptions.

TDisplayDimClass (see page 17677)	This is type MXGRID.TDisplayDimClass.

109.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomDecisionGrid (see page 17553)	TCustomDecisonGrid is the base class for controls that present cross-tabulated data in a two-dimensional grid.
	TDecisionGrid (see page 17586)	TDecisionGrid presents crosstabulated data from a decision source in a grid format.
	TDecisionGridDataLink (see page 17658)	This is class MXGRID.TDecisionGridDataLink.
	TDisplayDim (see page 17661)	TDisplayDim represents a dimension in a decision grid.
	TDisplayDims (see page 17666)	TDisplayDims represents a collection of TDisplayDim (see page 17661) objects.
	TValueArray (see page 17671)	This is class MXGRID.TValueArray.

109.1.1 TCustomDecisionGrid Class

TCustomDecisonGrid is the base class for controls that present cross-tabulated data in a two-dimensional grid.

Class Hierarchy

Pascal

```
TCustomDecisionGrid = class(TCustomGrid);
```

C++

```
class TCustomDecisionGrid : public TCustomGrid;
```

File

MXGRID

Description

Use TCustomDecisionGrid as a base class when defining a decision grid object. Decision grids can present a single summary that is calculated over an arbitrary number of dimensions.

The field that is summarized and the fields (dimensions) over which it is summarized can be changed dynamically at runtime to view any configuration of summary and dimensions chosen from the dimension map of a decision cube. Changes to the dimensions and summary can be initiated by direct manipulation of the decision grid, or by using a TDecisionPivot object.

Do not create instances of TCustomDecisionGrid. To add a decision grid to a form, use the TDecisionGrid (see page 17586) object.

See Also

TDecisionCube (see page 17442)

TDecisionGrid (see page 17586)

TDecisionPivot (see page 17680)

TDecisionSource (see page 17462)

109.1.1.1 TCustomDecisionGrid Members

The following tables list the members exposed by TCustomDecisionGrid.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	DesignOptionsBoost (see page 14814)	This is DesignOptionsBoost, a member of class TCustomGrid.

	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FGridState (see page 14814)	This is FGridState, a member of class TCustomGrid.
	FGridStateX (see page 17567)	This is FGridStateX, a member of class TCustomDecisionGrid.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSaveCellExtents (see page 14814)	This is FSaveCellExtents, a member of class TCustomGrid.
	VirtualView (see page 14814)	This is VirtualView, a member of class TCustomGrid.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AdjustSize (see page 14816)	Adds or deletes rows or columns from the grid.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	BeginColumnDrag (see page 14817)	Starts the dragging of a column in the grid.
	BeginRowDrag (see page 14817)	Starts the dragging of a row in the grid.
	BoxRect (see page 14818)	Returns the screen coordinates of a specified set of cells.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcDrawInfo (see page 14818)	Calculates the pixel locations of the grid boundaries.
	CalcFixedInfo (see page 14818)	Calculates the pixel locations of the fixed cells.
V	CalcSizingState (see page 14819)	Determines the appearance of the mouse cursor during resizing.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanEditAcceptKey (see page 14819)	Indicates whether the Key parameter can be entered into the current cell.
	CanEditModify (see page 14819)	Indicates whether the current cell in the grid can be edited.
V	CanEditShow (see page 14820)	Indicates whether the inplace edit control can be created to allow editing.
	CanGridAcceptKey (see page 14820)	Indicates whether the grid should respond to a given key combination.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.

	ChangeGridOrientation (see page 14821)	Prepares the grid's canvas for painting to reflect a right-to-left or left-to-right orientation.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CheckColumnDrag (see page 14821)	CheckColumnDrag validates whether the column currently selected for dragging can be dropped at the current location.
	CheckRowDrag (see page 14822)	CheckRowDrag validates whether the row currently selected for dragging can be dropped at the current location.
	Click (see page 5743)	Respond to user click.
	ColumnMoved (see page 14822)	Provides the interface for a method that responds when the position of a column changes.
V	ColWidthsChanged (see page 17569)	Responds when the column widths change.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateEditor (see page 14823)	Creates the inplace editor control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 14823)	Initializes the window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
V	DefineProperties (see page 14824)	Adds the ColWidths (see page 14845) and RowHeights (see page 14855) properties to the values saved with the grid.
V	DeleteColumn (see page 14824)	Deletes a specified column from the grid.
V	DeleteRow (see page 14825)	Deletes a specified from the grid.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
V	DoExit (see page 14825)	Hides the inplace editor when selection moves to another control in a form.

	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelDown (see page 14825)	Performs tasks when the mouse wheel is rotated downward.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoMouseWheelUp (see page 14826)	Performs tasks when the mouse wheel is rotated upward.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawCell (see page 17570)	Draws a cell in the grid.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EndColumnDrag (see page 14827)	Ends the dragging of a column in the grid.
	EndRowDrag (see page 14827)	Ends the dragging of a row in the grid.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	FocusCell (see page 14827)	Changes the current cell to a specified cell.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetCells (see page 17570)	Returns the value of a cell in the grid, formatted as a string.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEditLimit (see page 14828)	Provides the interface for a method that limits the number of characters the user can type into cells.
	GetEditMask (see page 14828)	Provides the interface for a method that returns an input mask for the specified cell.
	GetEditStyle (see page 14828)	Indicates whether a specified cell has an ellipsis button or drop-down arrow.
	GetEditText (see page 14829)	Returns the value of the indicated cell formatted for editing.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetGridHeight (see page 14829)	Returns the value of the GridHeight (see page 14850) property.
	GetGridWidth (see page 14830)	Returns the value of the GridWidth (see page 14851) property.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HideEdit (see page 14830)	Hides the inplace editor.
	HideEditor (see page 14830)	Hides the inplace editor when it is not in use.
	InvalidateCell (see page 14831)	Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.
	InvalidateCol (see page 14831)	Invalidates the region occupied by a column so that it will be repainted with the next Windows paint message.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	InvalidateEditor (see page 14832)	Causes the inplace editor to repaint itself, moving to a new location if necessary.
	InvalidateGrid (see page 14832)	Tells Windows to repaint the grid after other important Windows messages are handled.
	InvalidateRow (see page 14832)	Invalidates the region occupied by a row so that it will be repainted with the next Windows paint message.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
V	KeyDown (see page 14833)	Provides special processing when the user presses a key.
	KeyPress (see page 6163)	Respond to keyboard input.
V	KeyPress (see page 14833)	Provides special processing when the user presses a key.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
V	MouseDown (see page 17570)	Starts the drag of a dimension to a new location.
V	MouseMove (see page 17571)	Computes the drop site of a pivoting dimension.
V	MouseUp (see page 17571)	Rearranges the dimensions after a pivot and updates the decision source.
	MoveColRow (see page 14835)	Selects the cell indicated by the ACol and ARow parameters.
	MoveColumn (see page 14836)	Moves a column to a new position.
	MoveRow (see page 14836)	Moves a row to a new position.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 17572)	Renders the image of the decision grid.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.

	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	RowHeightsChanged (see page 17573)	Responds when the row heights change.
	RowMoved (see page 14837)	Provides the interface for a method that responds when the position of a row changes.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	ScrollData (see page 14838)	Scrolls the visual image of the cells in the grid.
	SelectCell (see page 17573)	Indicates whether the user can navigate to a specified cell.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEditText (see page 14839)	Provides the interface for a method that updates the text associated with a cell.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	ShowEditor (see page 14839)	Displays the inplace editor when the grid enters edit mode.
	ShowEditorChar (see page 14839)	Displays the inplace editor, with its text set to the specified character.

	SizeChanged (see page 14840)	Responds to changes in the size of the grid.
	Sizing (see page 14840)	Indicates whether the indicated coordinates are on one of the resize hot zones of the graph.
	TimedScroll (see page 14840)	Extends a move, resize, or selection out of the scrollable region when the user drags the mouse in a direction where the grid is scrolled.
V	TopLeftChanged (see page 17573)	Generates an OnTopLeftChanged (see page 17586) event.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateDesigner (see page 14841)	Notifies the designer when rows and columns of the grid are moved or resized.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 14843)	Determines whether a single line border is drawn around the grid.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	CaptionColor (see page 17574)	Specifies the background color of cells containing the names of the row and column dimensions.
	CaptionFont (see page 17575)	Specifies the font used to write the names of the row and column dimensions.
	Col (see page 14843)	Specifies the index of the column that contains the selected cell.
R	ColCount (see page 17576)	Indicates the total number of columns in the decision grid.
	Color (see page 5812)	Specifies the background color of the control.
	Color (see page 14844)	Specifies the background color of the control.
	ColWidths (see page 14845)	Indicates the width (in pixels) of all the columns in the grid.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DataColor (see page 17576)	Specifies the background color of the cells containing summarized values.
	DataFont (see page 17577)	Specifies the font used to write the summarized values in the scrollable region of the decision grid.

	DataSumColor (see page 17577)	Specifies the background color of cells that represent subtotals over entire dimensions.
	DefaultColWidth (see page 17578)	Specifies the width of all columns that are not explicitly resized.
	DefaultDrawing (see page 14847)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 17578)	Specifies the height of all rows that are not explicitly resized.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	Dimensions (see page 17579)	Provides access to the collection of TDisplayDim (see page 17661) objects that control the appearance of each dimension.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditorMode (see page 14848)	Determines whether the current cell can be edited.
	FixedColor (see page 14848)	Specifies the background color of the fixed rows and columns in the grid.
R	FixedCols (see page 17579)	Indicates the number of columns used for dimension captions and dimension value labels.
R	FixedRows (see page 17580)	Indicates the number of rows used for dimension captions and dimension value labels.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
R	GridHeight (see page 14850)	Specifies the height of the grid in pixels.
	GridLineColor (see page 17580)	Specifies the color of the lines that separate the cells in the decision grid.
	GridLineWidth (see page 17580)	Specifies the width, in pixels, of the lines that separate the cells of the grid.
R	GridWidth (see page 14851)	Specifies the width of the grid in pixels.
R	HitTest (see page 14851)	Indicates the current position of the mouse cursor.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
R	InplaceEditor (see page 14852)	Designates the edit control the grid uses to allow users to edit the contents of the selected cell.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	LabelColor (see page 17581)	Specifies the color of the individual row and column labels.
	LabelFont (see page 17581)	Specifies the font used to write the individual row and column labels.
	LabelSumColor (see page 17581)	Specifies the background color for the subtotal labels.
	LeftCol (see page 14852)	Specifies the index of the first visible scrollable column in the grid.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	Options (see page 17582)	Specifies settings that affect the entire grid display.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 14853)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	Row (see page 14854)	Specifies the index of the row that contains the selected cell.
R	RowCount (see page 17582)	Indicates the total number of rows in the decision grid.
	RowHeights (see page 14855)	Gives the height (in pixels) of all rows in the grid.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ScrollBars (see page 14856)	Specifies whether the grid includes horizontal and vertical scroll bars.
	Selection (see page 14856)	Indicates the boundaries of the current selection.
	TabStops (see page 14858)	Indicates whether the user can tab to specified columns in the grid.
	Text (see page 5842)	Contains a text string associated with the control.
	TopRow (see page 14858)	Specifies the index of the first visible scrollable row in the grid.
R	VisibleColCount (see page 14859)	Indicates the number of scrollable columns visible in the grid.

R	VisibleRowCount (see page 14859)	Indicates the number of scrollable rows visible in the grid.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnDecisionDrawCell (see page 17584)	Occurs just before a cell in the grid is drawn.
	OnDecisionExamineCell (see page 17585)	Occurs when the user right-clicks on a cell in the data region of the grid.
	OnTopLeftChanged (see page 17586)	Occurs when the data region of the grid scrolls.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	CellDrawState (see page 17568)	Retrieves information about a data cell in the grid.
	CellRect (see page 17569)	Returns the screen coordinates of a cell in the grid.
	CellValueArray (see page 17569)	Returns the values of all dimension fields over which a data cell is summarized.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 17566)	Creates and initializes an instance of TCustomDecisionGrid (see page 17553).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 17566)	Destroys an instance of TCustomDecisionGrid (see page 17553).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.

	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

	MouseCoord (see page 14834)	Returns the row and column indexes of the cell that contains a point specified in screen coordinates.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Notification (see page 17572)	Links the buttons in TDecisionPivot to the decision source.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.

R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Cells (see page 17575)	Provides indexed access to the values of all cells in the decision grid.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DecisionSource (see page 17578)	Specifies the decision source that supplies crosstabulated data to the decision grid.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowCubeEditor (see page 17583)	Determines whether the Cube Editor can be displayed.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.

	Totals (see page 17583)	Indicates whether the grid includes subtotals.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	TabStop (see page 14857)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

109.1.1.2 TCustomDecisionGrid.Create Constructor

Creates and initializes an instance of TCustomDecisionGrid (see page 17553).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomDecisionGrid(TComponent * AOwner);
```

Description

Call Create to instantiate a decision grid at runtime. Decision grids added to forms at design time are created automatically.

AOwner is the form that contains the decision grid. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

109.1.1.3 TCustomDecisionGrid.Destroy Destructor

Destroys an instance of TCustomDecisionGrid (see page 17553).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomDecisionGrid();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the decision grid is not nil, and only then calls Destroy. Destroy frees all helper objects used by TCustomDecisionGrid (see page 17553).

See Also

Free (see page 22300)

109.1.1.4 TCustomDecisionGrid Fields

The fields of the TCustomDecisionGrid class are listed here.

Protected Fields

	Name	Description
	FGridStateX (see page 17567)	This is FGridStateX, a member of class TCustomDecisionGrid.

109.1.1.4.1 TCustomDecisionGrid.FGridStateX Field

Pascal

```
FGridStateX: TDecisionGridState;
```

C++

```
TDecisionGridState FGridStateX;
```

Description

This is FGridStateX, a member of class TCustomDecisionGrid.

109.1.1.5 TCustomDecisionGrid Methods

The methods of the TCustomDecisionGrid class are listed here.

Protected Methods

	Name	Description
	ColWidthsChanged (see page 17569)	Responds when the column widths change.
	DrawCell (see page 17570)	Draws a cell in the grid.
	GetCells (see page 17570)	Returns the value of a cell in the grid, formatted as a string.
	MouseDown (see page 17570)	Starts the drag of a dimension to a new location.
	MouseMove (see page 17571)	Computes the drop site of a pivoting dimension.
	MouseUp (see page 17571)	Rearranges the dimensions after a pivot and updates the decision source.
	Paint (see page 17572)	Renders the image of the decision grid.
	RowHeightsChanged (see page 17573)	Responds when the row heights change.
	SelectCell (see page 17573)	Indicates whether the user can navigate to a specified cell.
	TopLeftChanged (see page 17573)	Generates an OnTopLeftChanged (see page 17586) event.

Public Methods

	Name	Description
	CellDrawState (see page 17568)	Retrieves information about a data cell in the grid.
	CellRect (see page 17569)	Returns the screen coordinates of a cell in the grid.
	CellValueArray (see page 17569)	Returns the values of all dimension fields over which a data cell is summarized.

	Notification (see page 17572)	Links the buttons in TDecisionPivot to the decision source.

109.1.1.5.1 TCustomDecisionGrid.CellDrawState Method

Retrieves information about a data cell in the grid.

Pascal

```
function CellDrawState(ACol: Integer; ARow: Integer; var Value: string; var DrawState:
TDecisionDrawState): boolean;
```

C++

```
__fastcall boolean CellDrawState(int ACol, int ARow, AnsiString Value, TDecisionDrawState
DrawState);
```

Description

Call CellDrawState to obtain information about a cell in the scrollable data region of the grid. The ACol and ARow parameters specify the index of the cell, where (0,0) is the upper left cell in the data region, not the upper left cell in the grid. The Value parameter returns the value of the summary in the cell, formatted for display. The DrawState parameter returns information about the type of information contained in the cell. For more information about the possible values of DrawState, see the entry for the OnDecisionDrawCell (see page 17584) event.

CellDrawState returns true if the Value and DrawState parameters are correctly filled in. CellDrawState returns false if the cell specified by ACol and ARow is not in the data region of the grid.

The ADrawState parameter indicates the type of cell that is about to be drawn. ADrawState includes one or more of the following values:

Value	Meaning
dsGroupStart	The cell is the first row or column label for a dimension. Always appears with dsRowValue or dsColValue.
dsRowCaption	The cell displays a row caption (the name of a dimension whose values are listed down a column on the left of the grid).
dsColCaption	The cell displays a column caption (the name of a dimension whose values are listed along the top of the grid).
dsSum	The cell displays a subtotal label or value. Always appears with dsRowValue, dsColValue, or dsData.
dsRowValue	The cell is a row label. It represents a value from a dimension listed down a column on the left of the grid or a summary label that appears at the end of each group of dimension values.
dsColValue	The cell is a column label. It represents a value from a dimension listed across the top of the grid or a summary label that appears at the end of the dimension.
dsData	The cell is in the scrollable data region of the grid.
dsOpenAfter	The cell has a plus sign (+) on the right that will open following dimension when clicked. Always appears with dsRowCaption, dsColCaption, dsRowPlus, or dsColPlus.
dsCloseAfter	The cell has a minus sign (-) on the right that will close the following dimension when clicked. Always appears with dsRowCaption, dsColCaption, dsRowPlus, or dsColPlus.
dsRowIndicator	The cell appears on the left grid margin that is used to display the open and close indicators (+ and -).
dsColIndicator	The cell appears on the upper grid margin that is used to display the open and close indicators (+ and -).
dsRowPlus	The cell appears in the left margin and contains a plus sign (+) indicating that the adjacent dimension is closed. Always appears with dsRowIndicator.
dsColPlus	The cell appears in the top margin and contains a plus sign (+) indicating that the adjacent dimension is closed. Always appears with dsColIndicator.
dsNone	The cell has no function.

See Also

Cells (see page 17575)

OnDecisionDrawCell (see page 17584)

109.1.1.5.2 TCustomDecisionGrid.CellRect Method

Returns the screen coordinates of a cell in the grid.

Pascal

```
function CellRect(ACol: Longint; ARow: Longint): TRect;
```

C++

```
__fastcall TRect CellRect(Longint ACol, Longint ARow);
```

Description

Call CellRect to obtain the boundaries, in pixels, of the cell in the column and row indicated by the ACol and ARow parameters. The top left cell that contains data is specified when ACol and ARow are set to zero.

If the indicated cell is not visible, CellRect returns an empty rectangle.

See Also

Cells (see page 17575)

109.1.1.5.3 TCustomDecisionGrid.CellValueArray Method

Returns the values of all dimension fields over which a data cell is summarized.

Pascal

```
function CellValueArray(ACol: Integer; ARow: Integer; var ValueArray: TValueArray): boolean;
```

C++

```
__fastcall boolean CellValueArray(int ACol, int ARow, TValueArray ValueArray);
```

Description

Call CellValueArray to obtain the coordinates of a data cell in the multidimensional array maintained by the decision cube. The ACol and ARow parameters represent the indexes of the column and row containing the cell, where (0,0) specifies the upper left data cell, not the top left cell in the grid. The ValueArray parameter returns the indexes of the field values for each dimension over which the cell summarizes data. Use the GetMemberAsString or GetMemberAsVariant method of the decision source to convert the indexes in the ValueArray parameter into field values. CellValueArray returns a boolean indicating whether the function was successful.

See Also

GetMemberAsString (see page 17477)

GetMemberAsVariant (see page 17478)

TValueArray

TSmallIntArray (see page 17361)

109.1.1.5.4 TCustomDecisionGrid.ColWidthsChanged Method

Responds when the column widths change.

Pascal

```
procedure ColWidthsChanged; override;
```

C++

```
virtual __fastcall ColWidthsChanged();
```

Description

ColWidthsChanged is called immediately after the column widths change.

ColWidthsChanged adjusts the scroll bar to accommodate the change. At design time, ColWidthsChanged forces all columns to have the same size when the columns are resized using the mouse.

See Also

ScrollBars (see page 14856)

109.1.1.5.5 TCustomDecisionGrid.DrawCell Method

Draws a cell in the grid.

Pascal

```
procedure DrawCell(ACol: Longint; ARow: Longint; ARect: TRect; AState: TGridDrawState);
override;
```

C++

```
virtual __fastcall DrawCell(Longint ACol, Longint ARow, TRect ARect, TGridDrawState AState);
```

Description

DrawCell is called automatically when the cell specified by the ACol and ARow parameters needs to be painted. DrawCell generates an OnDecisionDrawCell (see page 17584) event, and then draws the cell using the color, font, and value for the cell.

See Also

OnDecisionDrawCell (see page 17584)

109.1.1.5.6 TCustomDecisionGrid.GetCells Method

Returns the value of a cell in the grid, formatted as a string.

Pascal

```
function GetCells(ACol: Integer; ARow: Integer): String;
```

C++

```
__fastcall AnsiString GetCells(int ACol, int ARow);
```

Description

GetCells is the protected property access method for the Cells (see page 17575) property. Override GetCells to change the implementation of the Cells (see page 17575) property.

See Also

Cells (see page 17575)

109.1.1.5.7 TCustomDecisionGrid.MouseDown Method

Starts the drag of a dimension to a new location.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

MouseDown is called automatically when the user clicks the mouse in a cell of the grid. After calling the inherited method, MouseDown starts a pivot operation if the cell is a dimension label that can be dragged.

When overriding the MouseDown method, be sure to call the inherited method.

See Also

MouseMove (see page 17571)

MouseUp (see page 17571)

MouseDown (see page 14834)

109.1.1.5.8 TCustomDecisionGrid.MouseMove Method

Computes the drop site of a pivoting dimension.

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

MouseMove is called automatically when the user moves the mouse. After calling the inherited method, MouseMove calculates the new pivot state if a dimension is being dragged to a new location.

When overriding the MouseMove method, be sure to call the inherited method.

See Also

MouseDown (see page 17570)

MouseUp (see page 17571)

MouseMove (see page 14834)

109.1.1.5.9 TCustomDecisionGrid.MouseUp Method

Rearranges the dimensions after a pivot and updates the decision source.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

MouseUp is called automatically when the user releases the mouse. After calling the inherited method, MouseUp checks whether a dimension was just dragged to a new location. If a dimension was just moved, MouseUp changes the Dimensions (

see page 17579) property appropriately and updates the decision source to reflect the new configuration.

When overriding the MouseUp method, be sure to call the inherited method.

See Also

Dimensions (see page 17579)

MouseDown (see page 17570)

MouseMove (see page 17571)

MouseUp (see page 14835)

109.1.1.5.10 TCustomDecisionGrid.Notification Method

Links the buttons in TDecisionPivot to the decision source.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

After calling the inherited method, Notification performs the necessary internal adjustments when new elements are added to the decision grid. When overriding the Notification method, be sure to call the inherited method.

See Also

DecisionSource (see page 17578)

TDecisionPivot (see page 17680)

109.1.1.5.11 TCustomDecisionGrid.Paint Method

Renders the image of the decision grid.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

Paint is called when the grid receives a Windows paint message. Paint draws the grid, calling the DrawCell (see page 17570) method when it is time to paint the contents of each cell. After all the cells are drawn, Paint draws the grid lines.

If DefaultDrawing is false, Paint does not draw the background of the cells or draw the focus rectangle around the selected cell when it has focus.

See Also

DrawCell (see page 17570)

DefaultDrawing (see page 14847)

109.1.1.5.12 TCustomDecisionGrid.RowHeightsChanged Method

Responds when the row heights change.

Pascal

```
procedure RowHeightsChanged; override;
```

C++

```
virtual __fastcall RowHeightsChanged();
```

Description

RowHeightsChanged is called immediately after the row heights change.

RowHeightsChanged adjusts the scroll bar to accommodate the change. At design time, RowHeightsChanged forces all rows to have the same size when the rows are resized using the mouse.

See Also

ScrollBars (see page 14856)

109.1.1.5.13 TCustomDecisionGrid.SelectCell Method

Indicates whether the user can navigate to a specified cell.

Pascal

```
function SelectCell(Arow: LongInt; AColumn: LongInt): Boolean; override;
```

C++

```
virtual __fastcall Boolean SelectCell(LongInt Arow, LongInt AColumn);
```

Description

Decision grids call SelectCell internally before attempting to move selection to the cell identified by the ACol and ARow parameters. ACol and ARow are the column and row indexes for the cell, where the first column has index 0, and the top row has index 0.

As implemented in TCustomDecisionGrid (see page 17553), SelectCell always returns True, indicating that focus can move to the indicated cell.

See Also

Row (see page 14854)

Col (see page 14843)

OnDecisionExamineCell (see page 17585)

109.1.1.5.14 TCustomDecisionGrid.TopLeftChanged Method

Generates an OnTopLeftChanged (see page 17586) event.

Pascal

```
procedure TopLeftChanged; override;
```

C++

```
virtual __fastcall TopLeftChanged();
```

Description

Decision grids call TopLeftChanged internally, whenever the data region of the grid scrolls.

See Also

OnTopLeftChanged (see page 17586)

109.1.1.6 TCustomDecisionGrid Properties

The properties of the TCustomDecisionGrid class are listed here.

Protected Properties

	Name	Description
	CaptionColor (see page 17574)	Specifies the background color of cells containing the names of the row and column dimensions.
	CaptionFont (see page 17575)	Specifies the font used to write the names of the row and column dimensions.
R	ColCount (see page 17576)	Indicates the total number of columns in the decision grid.
	DataColor (see page 17576)	Specifies the background color of the cells containing summarized values.
	DataFont (see page 17577)	Specifies the font used to write the summarized values in the scrollable region of the decision grid.
	DataSumColor (see page 17577)	Specifies the background color of cells that represent subtotals over entire dimensions.
	DefaultColWidth (see page 17578)	Specifies the width of all columns that are not explicitly resized.
	DefaultRowHeight (see page 17578)	Specifies the height of all rows that are not explicitly resized.
	Dimensions (see page 17579)	Provides access to the collection of TDisplayDim (see page 17661) objects that control the appearance of each dimension.
R	FixedCols (see page 17579)	Indicates the number of columns used for dimension captions and dimension value labels.
R	FixedRows (see page 17580)	Indicates the number of rows used for dimension captions and dimension value labels.
	GridLineColor (see page 17580)	Specifies the color of the lines that separate the cells in the decision grid.
	GridLineWidth (see page 17580)	Specifies the width, in pixels, of the lines that separate the cells of the grid.
	LabelColor (see page 17581)	Specifies the color of the individual row and column labels.
	LabelFont (see page 17581)	Specifies the font used to write the individual row and column labels.
	LabelSumColor (see page 17581)	Specifies the background color for the subtotal labels.
	Options (see page 17582)	Specifies settings that affect the entire grid display.
R	RowCount (see page 17582)	Indicates the total number of rows in the decision grid.

Public Properties

	Name	Description
R	Cells (see page 17575)	Provides indexed access to the values of all cells in the decision grid.
	DecisionSource (see page 17578)	Specifies the decision source that supplies crosstabulated data to the decision grid.
	ShowCubeEditor (see page 17583)	Determines whether the Cube Editor can be displayed.
	Totals (see page 17583)	Indicates whether the grid includes subtotals.

109.1.1.6.1 TCustomDecisionGrid.CaptionColor Property

Specifies the background color of cells containing the names of the row and column dimensions.

Pascal

```
property CaptionColor: TColor;
```

C++

```
__property TColor CaptionColor;
```

Description

Set CaptionColor to the color that should be used to make the names of the row and column dimensions stand out. These are the names for the dimensions that are set in the Decision Cube Editor.

The actual values of the fields that make up the row and column dimensions are drawn using the LabelColor (see page 17581) property.

See Also

CaptionFont (see page 17575)

DataColor (see page 17576)

DataSumColor (see page 17577)

Dimensions (see page 17579)

LabelColor (see page 17581)

LabelSumColor (see page 17581)

109.1.1.6.2 TCustomDecisionGrid.CaptionFont Property

Specifies the font used to write the names of the row and column dimensions.

Pascal

```
property CaptionFont: TFont;
```

C++

```
__property TFont CaptionFont;
```

Description

Set CaptionFont to the font that should be used to make the names of the row and column dimensions stand out. These are the names for the dimensions that are set in the Decision Cube Editor.

The actual values of the fields that make up the row and column dimensions are written using the LabelFont (see page 17581) property.

See Also

CaptionColor (see page 17574)

DataFont (see page 17577)

Dimensions (see page 17579)

LabelFont (see page 17581)

TFont (see page 14497)

109.1.1.6.3 TCustomDecisionGrid.Cells Property

Provides indexed access to the values of all cells in the decision grid.

Pascal

```
property Cells [ACol, ARow: Integer]: String;
```

C++

```
__property AnsiString Cells[int ACol, ARow];
```

Description

Use Cells to obtain the value of a cell in the grid, formatted as a string. The ACol and ARow parameters indicate the column and row indexes of the cell, where (0,0) indicates the top left cell of the data region (not the top left cell of the grid). Cells that have been closed up using the Display Data or Display SubTotals menu items are still counted even though they are not visible.

If the cell is a row or column caption (negative value for ACol or ARow), Cells returns the name of the dimension. If the cell is a row or column label, Cells returns the field value of the dimension field. If the cell is a subtotal label, Cells returns the string Sum. If the cell is in the data region of the grid, Cells returns the summarized value.

See Also

CellDrawState (see page 17568)

CellValueArray (see page 17569)

109.1.1.6.4 TCustomDecisionGrid.ColCount Property

Indicates the total number of columns in the decision grid.

Pascal

```
property ColCount: integer;
```

C++

```
__property int ColCount;
```

Description

Read ColCount to determine the number of columns in the decision grid, including the columns containing dimension captions and label cells. Compute the number of columns in the data region of the decision grid by subtracting the value of FixedCols (see page 17579) from ColCount.

See Also

FixedCols (see page 17579)

109.1.1.6.5 TCustomDecisionGrid.DataColor Property

Specifies the background color of the cells containing summarized values.

Pascal

```
property DataColor: TColor;
```

C++

```
__property TColor DataColor;
```

Description

Set DataColor to the color that should be used for the scrollable data region of the decision grid. The data region contains the values of the current summary of the decision cube, where each cell represents the value of a field summarized over the values indicated by the row and column dimensions.

The subtotals that represent values summarized over all values within a given dimension (as well as the single value in other dimensions) are drawn using the DataSumColor (see page 17577) property.

See Also

CaptionColor (see page 17574)

DataFont (see page 17577)

DataSumColor (see page 17577)

LabelColor (see page 17581)

LabelSumColor (see page 17581)

109.1.1.6.6 TCustomDecisionGrid.DataFont Property

Specifies the font used to write the summarized values in the scrollable region of the decision grid.

Pascal

```
property DataFont: TFont;
```

C++

```
__property TFont DataFont;
```

Description

Set DataFont to the font that should be used for the data region of the decision grid. The data region contains the values of the current summary of the decision cube, where each cell represents the value of a field summarized over the values indicated by the row and column dimensions. It also includes the dimension subtotals over the summary field.

See Also

CaptionFont (see page 17575)

DataColor (see page 17576)

LabelFont (see page 17581)

109.1.1.6.7 TCustomDecisionGrid.DataSumColor Property

Specifies the background color of cells that represent subtotals over entire dimensions.

Pascal

```
property DataSumColor: TColor;
```

C++

```
__property TColor DataSumColor;
```

Description

Set DataSumColor to make the subtotals that represent an entire dimension stand out from the summary values that summarize information over a single value in each dimension. The subtotal cells are placed in the scrollable data region at the ends of the set of rows or columns that correspond to a given dimension.

See Also

CaptionColor (see page 17574)

DataColor (see page 17576)

DataFont (see page 17577)

LabelColor (see page 17581)

LabelSumColor (see page 17581)

Totals (see page 17583)

109.1.1.6.8 TCustomDecisionGrid.DecisionSource Property

Specifies the decision source that supplies crosstabulated data to the decision grid.

Pascal

```
property DecisionSource: TDecisionSource;
```

C++

```
__property TDecisionSource DecisionSource;
```

Description

Set DecisionSource to link the decision grid to the crosstabulated data from a decision cube. The DecisionSource object maintains information about the current pivot state of the data. Thus, any two decision controls that share the same decision source will display the data from the decision cube using the same configuration of row and column dimensions, including any closed dimensions or drilled down values.

See Also

TDecisionCube (see page 17442)

TDecisionSource (see page 17462)

109.1.1.6.9 TCustomDecisionGrid.DefaultColWidth Property

Specifies the width of all columns that are not explicitly resized.

Pascal

```
property DefaultColWidth: Integer;
```

C++

```
__property int DefaultColWidth;
```

Description

Set DefaultColWidth to the desired width of the columns in the decision grid that are not resized using the mouse. Setting DefaultColWidth changes the size of all columns in the grid, including columns that have been resized.

See Also

DefaultRowHeight (see page 17578)

109.1.1.6.10 TCustomDecisionGrid.DefaultRowHeight Property

Specifies the height of all rows that are not explicitly resized.

Pascal

```
property DefaultRowHeight: Integer;
```

C++

```
__property int DefaultRowHeight;
```

Description

Set DefaultRowHeight to the desired height of the rows in the decision grid that are not resized using the mouse. Setting DefaultRowHeight changes the size of all rows in the grid, including rows that have been resized.

See Also

DefaultColWidth (see page 17578)

109.1.1.6.11 TCustomDecisionGrid.Dimensions Property

Provides access to the collection of TDisplayDim (see page 17661) objects that control the appearance of each dimension.

Pascal

```
property Dimensions: TDisplayDims;
```

C++

```
__property TDisplayDims Dimensions;
```

Description

Set the properties of the individual TDisplayDim (see page 17661) objects to control the appearance of individual dimensions within the grid. The TDisplayDim (see page 17661) objects have properties that can override the various color and font properties of the grid to make individual dimensions stand out. They also allow the dimension names, alignments, and formats to be customized, and permit the dimension subtotals for a dimension to be turned on or off.

Note: Do not change the Dimensions property, only the properties of individual TDisplayDim (see page 17661) objects accessed through the Dimensions property. To programmatically change the configuration of dimensions that appears in the grid, use the decision source object.

See Also

CaptionColor (see page 17574)

CaptionFont (see page 17575)

DataColor (see page 17576)

DataFont (see page 17577)

DataSumColor (see page 17577)

LabelColor (see page 17581)

LabelFont (see page 17581)

LabelSumColor (see page 17581)

TDecisionSource (see page 17462)

TDisplayDim (see page 17661)

109.1.1.6.12 TCustomDecisionGrid.FixedCols Property

Indicates the number of columns used for dimension captions and dimension value labels.

Pascal

```
property FixedCols: integer;
```

C++

```
__property int FixedCols;
```

Description

Read FixedCols to determine the number of columns in the decision grid that are not part of the data region. Subtract FixedCols from the value of the ColCount (see page 17576) property to obtain the number of columns in the data region.

See Also

ColCount (see page 17576)

109.1.1.6.13 TCustomDecisionGrid.FixedRows Property

Indicates the number of rows used for dimension captions and dimension value labels.

Pascal

```
property FixedRows: integer;
```

C++

```
__property int FixedRows;
```

Description

Read FixedRows to determine the number of rows in the decision grid that are not part of the data region. Subtract FixedRows from the value of the RowCount (see page 17582) property to obtain the number of rows in the data region.

See Also

RowCount (see page 17582)

109.1.1.6.14 TCustomDecisionGrid.GridLineColor Property

Specifies the color of the lines that separate the cells in the decision grid.

Pascal

```
property GridLineColor: TColor;
```

C++

```
__property TColor GridLineColor;
```

Description

Set GridLineColor to specify the color of the lines drawn between the cells of the grid. The grid lines only appear when the Options (see page 17582) property includes cgGridLines.

See Also

GridLineWidth (see page 17580)

Options (see page 17582)

109.1.1.6.15 TCustomDecisionGrid.GridLineWidth Property

Specifies the width, in pixels, of the lines that separate the cells of the grid.

Pascal

```
property GridLineWidth: Integer;
```

C++

```
__property int GridLineWidth;
```

Description

Set GridLineWidth to make the lines that separate the cells in the decision grid heavier or lighter. The grid lines only appear when the Options (see page 17582) property includes cgGridLines.

See Also

GridLineColor (see page 17580)

Options (see page 17582)

109.1.1.6.16 TCustomDecisionGrid.LabelColor Property

Specifies the color of the individual row and column labels.

Pascal

```
property LabelColor: TColor;
```

C++

```
__property TColor LabelColor;
```

Description

Set LabelColor to the color that should be used to make the row and column labels stand out. The row and column labels of the decision grid contain the values of the fields that correspond to the dimensions of the decision cube. These are the values over which the data is summarized.

See Also

CaptionColor (see page 17574)

DataColor (see page 17576)

DataSumColor (see page 17577)

LabelFont (see page 17581)

LabelSumColor (see page 17581)

109.1.1.6.17 TCustomDecisionGrid.LabelFont Property

Specifies the font used to write the individual row and column labels.

Pascal

```
property LabelFont: TFont;
```

C++

```
__property TFont LabelFont;
```

Description

Set LabelFont to the font that should be used to write the labels that display the values of the dimensions over which data is summarized. The row and column labels of the decision grid contain the values of the fields that correspond to the dimensions of the decision cube. LabelFont is also used when writing the labels for rows or columns that represent dimension subtotals.

See Also

CaptionFont (see page 17575)

DataFont (see page 17577)

LabelColor (see page 17581)

LabelSumColor (see page 17581)

109.1.1.6.18 TCustomDecisionGrid.LabelSumColor Property

Specifies the background color for the subtotal labels.

Pascal

```
property LabelSumColor: TColor;
```

C++

```
__property TColor LabelSumColor;
```

Description

Set LabelSumColor make the subtotal labels stand out from the labels that represent individual field values along a dimension. The subtotal labels appear at the end of the set of field value labels for an individual dimension.

See Also

CaptionColor (see page 17574)

DataColor (see page 17576)

DataSumColor (see page 17577)

LabelColor (see page 17581)

LabelFont (see page 17581)

Totals (see page 17583)

109.1.1.6.19 TCustomDecisionGrid.Options Property

Specifies settings that affect the entire grid display.

Pascal

```
property Options: TDecisionGridOptions;
```

C++

```
__property TDecisionGridOptions Options;
```

Description

Set Options to include the desired properties for the grid. Options is a set drawn from the following values:

Value	Meaning
cgGridLines	Vertical and horizontal lines are drawn to separate the cells in the scrollable data region.
cgOutliner	The dimension caption cells contain plus (+) and minus (-) signs that open or close dimensions in the grid when clicked. The minus sign closes (hides) an adjacent dimension. The plus sign opens (shows) an adjacent dimension.
cgPivotable	Dimensions (see page 17579) can be rearranged by clicking on the dimension caption cells and dragging them to a new position.

Note: If Options does not include cgOutliner, individual dimensions can still be opened and closed using the decision pivot. Similarly, if Options does not include cgPivotable, individual dimensions can still be opened and closed with the decision pivot.

See Also

GridLineColor (see page 17580)

GridLineWidth (see page 17580)

TDecisionPivot (see page 17680)

109.1.1.6.20 TCustomDecisionGrid.RowCount Property

Indicates the total number of rows in the decision grid.

Pascal

```
property RowCount: integer;
```

C++

```
__property int RowCount;
```

Description

Read RowCount to determine the number of rows in the decision grid, including the rows containing dimension captions and label cells. Compute the number of rows in the data region of the decision grid by subtracting the value of FixedRows (see page 17580) from RowCount.

See Also

FixedRows (see page 17580)

109.1.1.6.21 TCustomDecisionGrid.ShowCubeEditor Property

Determines whether the Cube Editor can be displayed.

Pascal

```
property ShowCubeEditor: boolean;
```

C++

```
__property boolean ShowCubeEditor;
```

Description

ShowCubeEditor determines whether the Cube Editor for the associated TDecisionCube can be invoked. If set to true, a menu item to invoke the Cube Editor is added to the speed menu displayed on a right-click on the decision grid at runtime.

See Also

Dimensions (see page 17579)

ShowCubeDialog (see page 17450)

TDecisionCube (see page 17442)

109.1.1.6.22 TCustomDecisionGrid.Totals Property

Indicates whether the grid includes subtotals.

Pascal

```
property Totals: boolean;
```

C++

```
__property boolean Totals;
```

Description

Set Totals to turn row and column subtotals on or off for the whole grid. To turn subtotals on or off for individual dimensions, use the Dimensions (see page 17579) property.

See Also

Dimensions (see page 17579)

109.1.1.7 TCustomDecisionGrid Events

The events of the TCustomDecisionGrid class are listed here.

Public Events

	Name	Description
	OnDecisionDrawCell (see page 17584)	Occurs just before a cell in the grid is drawn.
	OnDecisionExamineCell (see page 17585)	Occurs when the user right-clicks on a cell in the data region of the grid.
	OnTopLeftChanged (see page 17586)	Occurs when the data region of the grid scrolls.

109.1.1.7.1 TCustomDecisionGrid.OnDecisionDrawCell Event

Occurs just before a cell in the grid is drawn.

Pascal

```
property OnDecisionDrawCell: TDecisionDrawCellEvent;
```

C++

```
__property TDecisionDrawCellEvent OnDecisionDrawCell;
```

Description

Write an OnDecisionDrawCell event handler to change the color, font, or text used to display an individual cell in the grid. Change the AColor, AFont, or Value parameter to change the color, font, or text respectively.

For example, to change the row and column labels from the values of the fields in the dataset to customized labels, change the Value parameter of the event handler when the Row and Column parameters represent a label cell.

The Row and Column parameters indicate the row and column of a cell within the grid, where (0,0) specifies the upper left summary value, not the upper left corner of the grid. Thus, the label cells contain negative row or column indexes. In addition, the AState parameter includes gdFixed when the cell is a label cell. AState also indicates whether the cell being drawn is selected.

The ADrawState parameter indicates the type of cell that is about to be drawn. ADrawState includes one or more of the following values:

Value	Meaning
dsGroupStart	The cell is the first row or column label for a dimension. Always appears with dsRowValue or dsColValue.
dsRowCaption	The cell displays a row caption (the name of a dimension whose values are listed down a column on the left of the grid).
dsColCaption	The cell displays a column caption (the name of a dimension whose values are listed along the top of the grid).
dsSum	The cell displays a subtotal label or value. Always appears with dsRowValue, dsColValue, or dsData.
dsRowValue	The cell is a row label. It represents a value from a dimension listed down a column on the left of the grid or a summary label that appears at the end of each group of dimension values.
dsColValue	The cell is a column label. It represents a value from a dimension listed across the top of the grid or a summary label that appears at the end of the dimension.
dsData	The cell is in the scrollable data region of the grid.
dsOpenAfter	The cell has a plus sign (+) on the right that will open following dimension when clicked. Always appears with dsRowCaption, dsColCaption, dsRowPlus, or dsColPlus.
dsCloseAfter	The cell has a minus sign (-) on the right that will close the following dimension when clicked. Always appears with dsRowCaption, dsColCaption, dsRowPlus, or dsColPlus.

dsRowIndicator	The cell appears on the left grid margin that is used to display the open and close indicators (+ and -).
dsColIndicator	The cell appears on the upper grid margin that is used to display the open and close indicators (+ and -).
dsRowPlus	The cell appears in the left margin and contains a plus sign (+) indicating that the adjacent dimension is closed. Always appears with dsRowIndicator.
dsColPlus	The cell appears in the top margin and contains a plus sign (+) indicating that the adjacent dimension is closed. Always appears with dsColIndicator.
dsNone	The cell has no function.

LabelColor (see page 17581)

LabelFont (see page 17581)

LabelSumColor (see page 17581)

109.1.1.7.2 TCustomDecisionGrid.OnDecisionExamineCell Event

Occurs when the user right-clicks on a cell in the data region of the grid.

Pascal

```
property OnDecisionExamineCell: TDecisionExamineCellEvent;
```

C++

```
__property TDecisionExamineCellEvent OnDecisionExamineCell;
```

Description

Write an OnDecisionExamineCell event handler to take specific action when the user right-clicks on one of the cells that contains summarized data. The ICol and IRow parameters indicate the column and row indexes of the cell. The column and row indexes specify the value 0 for the top or leftmost cell in the scrollable data region, not the top left cell of the decision grid. The ISum parameter is the index of the current summary in the decision cube, where the first active summary has an index of 0. The ValueArray parameter gives the coordinates of the cell in terms of the dimensions of the decision source. If the cell represents a subtotal value, the entry in the ValueArray for the dimension over which the subtotal is calculated is a negative number.

Use the Cells (see page 17575) property to obtain the value of the summary in the cell. Use the GetDimensionName method of the decision source to get the name of each dimension represented by an entry in the ValueArray parameter. Use the GetValueAsString or GetValueAsVariant method of the decision source to obtain the label values for each dimension represented in the ValueArray parameter.

See Also

GetDataAsVariant (see page 17473)

TSmallIntArray (see page 17361)

109.1.1.7.3 TCustomDecisionGrid.OnTopLeftChanged Event

Occurs when the data region of the grid scrolls.

Pascal

```
property OnTopLeftChanged: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTopLeftChanged;
```

Description

Write an OnTopLeftChanged event handler to take specific action when the summarized data in the grid scrolls. Use the Cells (see page 17575) property or the CellDrawState (see page 17568) method to obtain the new values of the data cells.

See Also

Cells (see page 17575)

CellDrawState (see page 17568)

CellValueArray (see page 17569)

109.1.2 TDecisionGrid Class

TDecisionGrid presents crosstabulated data from a decision source in a grid format.

Class Hierarchy

Pascal

```
TDecisionGrid = class(TCustomDecisionGrid);
```

C++

```
class TDecisionGrid : public TCustomDecisionGrid;
```

File

MXGRID

Description

Use TDecisionGrid to put a decision grid in a form. Decision grids present a single summary that is calculated over an arbitrary number of dimensions. The dimensions can appear as rows or columns in the grid, with the field values of the dimensions listed as labels along the top and left edges of the grid.

The field that is summarized and the fields (dimensions) over which it is summarized can be changed dynamically at runtime to view any configuration of summary and dimensions chosen from the dimension map of a decision cube. Changes to the dimensions and summary can be initiated by direct manipulation of the decision grid, or by using a TDecisionPivot object.

TDecisionGrid publishes many of the properties, events, and methods inherited from TCustomDecisionGrid (see page 17553), but introduces no new behavior.

To present the crosstabulated data in a chart, use TDecisionGraph instead.

Creating and Using Decision Grids

About Crosstabs

109.1.2.1 TDecisionGrid Members

The following tables list the members exposed by TDecisionGrid.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	DesignOptionsBoost (see page 14814)	This is DesignOptionsBoost, a member of class TCustomGrid.
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FGridState (see page 14814)	This is FGridState, a member of class TCustomGrid.
	FGridStateX (see page 17567)	This is FGridStateX, a member of class TCustomDecisionGrid.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSaveCellExtents (see page 14814)	This is FSaveCellExtents, a member of class TCustomGrid.
	VirtualView (see page 14814)	This is VirtualView, a member of class TCustomGrid.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AdjustSize (see page 14816)	Adds or deletes rows or columns from the grid.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	BeginColumnDrag (see page 14817)	Starts the dragging of a column in the grid.
	BeginRowDrag (see page 14817)	Starts the dragging of a row in the grid.
	BoxRect (see page 14818)	Returns the screen coordinates of a specified set of cells.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcDrawInfo (see page 14818)	Calculates the pixel locations of the grid boundaries.
	CalcFixedInfo (see page 14818)	Calculates the pixel locations of the fixed cells.
V	CalcSizingState (see page 14819)	Determines the appearance of the mouse cursor during resizing.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanEditAcceptKey (see page 14819)	Indicates whether the Key parameter can be entered into the current cell.
	CanEditModify (see page 14819)	Indicates whether the current cell in the grid can be edited.
V	CanEditShow (see page 14820)	Indicates whether the inplace edit control can be created to allow editing.
	CanGridAcceptKey (see page 14820)	Indicates whether the grid should respond to a given key combination.

	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	CellRect (see page 14821)	Returns the screen coordinates of a cell in the grid.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeGridOrientation (see page 14821)	Prepares the grid's canvas for painting to reflect a right-to-left or left-to-right orientation.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CheckColumnDrag (see page 14821)	CheckColumnDrag validates whether the column currently selected for dragging can be dropped at the current location.
	CheckRowDrag (see page 14822)	CheckRowDrag validates whether the row currently selected for dragging can be dropped at the current location.
	Click (see page 5743)	Respond to user click.
	ColumnMoved (see page 14822)	Provides the interface for a method that responds when the position of a column changes.
	ColWidthsChanged (see page 14822)	Responds when the column widths change.
	ColWidthsChanged (see page 17569)	Responds when the column widths change.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateEditor (see page 14823)	Creates the inplace editor control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 14823)	Initializes the window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DefineProperties (see page 14824)	Adds the ColWidths (see page 14845) and RowHeights (see page 14855) properties to the values saved with the grid.
	DeleteColumn (see page 14824)	Deletes a specified column from the grid.
	DeleteRow (see page 14825)	Deletes a specified from the grid.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.

	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
V	DoExit (see page 14825)	Hides the inplace editor when selection moves to another control in a form.
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
V	DoMouseWheelDown (see page 14825)	Performs tasks when the mouse wheel is rotated downward.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
V	DoMouseWheelUp (see page 14826)	Performs tasks when the mouse wheel is rotated upward.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
A	DrawCell (see page 14826)	Provides the prototype for a method that draws the contents of a cell in the grid.
V	DrawCell (see page 17570)	Draws a cell in the grid.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EndColumnDrag (see page 14827)	Ends the dragging of a column in the grid.
	EndRowDrag (see page 14827)	Ends the dragging of a row in the grid.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	FocusCell (see page 14827)	Changes the current cell to a specified cell.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetCells (see page 17570)	Returns the value of a cell in the grid, formatted as a string.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEditLimit (see page 14828)	Provides the interface for a method that limits the number of characters the user can type into cells.
	GetEditMask (see page 14828)	Provides the interface for a method that returns an input mask for the specified cell.
	GetEditStyle (see page 14828)	Indicates whether a specified cell has an ellipsis button or drop-down arrow.

	GetEditText (see page 14829)	Returns the value of the indicated cell formatted for editing.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetGridHeight (see page 14829)	Returns the value of the GridHeight (see page 14850) property.
	GetGridWidth (see page 14830)	Returns the value of the GridWidth (see page 14851) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HideEdit (see page 14830)	Hides the inplace editor.
	HideEditor (see page 14830)	Hides the inplace editor when it is not in use.
	InvalidateCell (see page 14831)	Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.
	InvalidateCol (see page 14831)	Invalidates the region occupied by a column so that it will be repainted with the next Windows paint message.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	InvalidateEditor (see page 14832)	Causes the inplace editor to repaint itself, moving to a new location if necessary.
	InvalidateGrid (see page 14832)	Tells Windows to repaint the grid after other important Windows messages are handled.
	InvalidateRow (see page 14832)	Invalidates the region occupied by a row so that it will be repainted with the next Windows paint message.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyDown (see page 14833)	Provides special processing when the user presses a key.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyPress (see page 14833)	Provides special processing when the user presses a key.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseDown (see page 14834)	Provides special processing when the user presses a mouse button.
	MouseDown (see page 17570)	Starts the drag of a dimension to a new location.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseMove (see page 14834)	Provides special processing when the user moves the mouse.
	MouseMove (see page 17571)	Computes the drop site of a pivoting dimension.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	MouseUp (see page 14835)	Provides special processing when the user releases the mouse button.
	MouseUp (see page 17571)	Rearranges the dimensions after a pivot and updates the decision source.
	MoveColRow (see page 14835)	Selects the cell indicated by the ACol and ARow parameters.
	MoveColumn (see page 14836)	Moves a column to a new position.

	MoveRow (see page 14836)	Moves a row to a new position.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 5920)	Renders the image of a custom control.
V	Paint (see page 14836)	Draws the image of the grid control on the screen.
V	Paint (see page 17572)	Renders the image of the decision grid.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	RowHeightsChanged (see page 14837)	Responds when the row heights change.
V	RowHeightsChanged (see page 17573)	Responds when the row heights change.
	RowMoved (see page 14837)	Provides the interface for a method that responds when the position of a row changes.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	ScrollData (see page 14838)	Scrolls the visual image of the cells in the grid.
V	SelectCell (see page 14838)	Determines whether a particular cell in the grid can be selected.
V	SelectCell (see page 17573)	Indicates whether the user can navigate to a specified cell.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEditText (see page 14839)	Provides the interface for a method that updates the text associated with a cell.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.

	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	ShowEditor (see page 14839)	Displays the inplace editor when the grid enters edit mode.
	ShowEditorChar (see page 14839)	Displays the inplace editor, with its text set to the specified character.
	SizeChanged (see page 14840)	Responds to changes in the size of the grid.
	Sizing (see page 14840)	Indicates whether the indicated coordinates are on one of the resize hot zones of the graph.
	TimedScroll (see page 14840)	Extends a move, resize, or selection out of the scrollable region when the user drags the mouse in a direction where the grid is scrolled.
	TopLeftChanged (see page 14841)	Updates the position of the inplace editor when the grid scrolls.
V	TopLeftChanged (see page 17573)	Generates an OnTopLeftChanged (see page 17586) event.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateDesigner (see page 14841)	Notifies the designer when rows and columns of the grid are moved or resized.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.

	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Col (see page 14843)	Specifies the index of the column that contains the selected cell.
	ColWidths (see page 14845)	Indicates the width (in pixels) of all the columns in the grid.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	EditorMode (see page 14848)	Determines whether the current cell can be edited.
	FixedColor (see page 14848)	Specifies the background color of the fixed rows and columns in the grid.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
R	GridHeight (see page 14850)	Specifies the height of the grid in pixels.
R	GridWidth (see page 14851)	Specifies the width of the grid in pixels.
R	HitTest (see page 14851)	Indicates the current position of the mouse cursor.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
R	InplaceEditor (see page 14852)	Designates the edit control the grid uses to allow users to edit the contents of the selected cell.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	LeftCol (see page 14852)	Specifies the index of the first visible scrollable column in the grid.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	Row (see page 14854)	Specifies the index of the row that contains the selected cell.
	RowHeights (see page 14855)	Gives the height (in pixels) of all rows in the grid.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Selection (see page 14856)	Indicates the boundaries of the current selection.
	TabStops (see page 14858)	Indicates whether the user can tab to specified columns in the grid.
	Text (see page 5842)	Contains a text string associated with the control.
	TopRow (see page 14858)	Specifies the index of the first visible scrollable row in the grid.
R	VisibleColCount (see page 14859)	Indicates the number of scrollable columns visible in the grid.
R	VisibleRowCount (see page 14859)	Indicates the number of scrollable rows visible in the grid.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.

	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	CellDrawState (see page 17568)	Retrieves information about a data cell in the grid.
	CellRect (see page 17569)	Returns the screen coordinates of a cell in the grid.
	CellValueArray (see page 17569)	Returns the values of all dimension fields over which a data cell is summarized.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 5918)	Creates an instance of TCustomControl (see page 5908).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 14813)	Creates an instance of TCustomGrid (see page 14800).
V	Create (see page 17566)	Creates and initializes an instance of TCustomDecisionGrid (see page 17553).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 5919)	Destroys an instance of TCustomControl (see page 5908).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 14813)	Destroys an instance of TCustomGrid (see page 14800).
V	Destroy (see page 17566)	Destroys an instance of TCustomDecisionGrid (see page 17553).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseCoord (see page 14834)	Returns the row and column indexes of the cell that contains a point specified in screen coordinates.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Notification (see page 17572)	Links the buttons in TDecisionPivot to the decision source.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Cells (see page 17575)	Provides indexed access to the values of all cells in the decision grid.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	ColCount (see page 17606)	Indicates the total number of columns in the decision grid.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	FixedCols (see page 17615)	Indicates the number of columns used for dimension captions and dimension value labels.
	FixedRows (see page 17615)	Indicates the number of rows used for dimension captions and dimension value labels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	RowCount (see page 17624)	Indicates the total number of rows in the decision grid.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnClick (see page 17630)	Occurs when the user clicks the control.
	OnDblClick (see page 17632)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDecisionDrawCell (see page 17632)	Occurs just before a cell in the grid is drawn.
	OnDecisionExamineCell (see page 17634)	Occurs when the user right-clicks on a cell in the data region of the grid.
	OnDragDrop (see page 17634)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 17637)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 17639)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

	OnEnter (see page 17640)	Occurs when a control receives the input focus.
	OnExit (see page 17642)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 17644)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 17647)	Occurs when a key is pressed.
	OnKeyUp (see page 17648)	Occurs when the user releases a key that has been pressed.
	OnMouseDown (see page 17650)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 17652)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 17654)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnResize (see page 17656)	Occurs immediately after the control is resized.
	OnStartDrag (see page 17657)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnTopLeftChanged (see page 17658)	Occurs when the data region of the grid scrolls.

Published Properties

	Name	Description
	Align (see page 17601)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 17605)	Specifies how the control is anchored to its parent.
	BorderStyle (see page 17605)	Determines whether a single line border is drawn around the grid.
	CaptionColor (see page 17605)	Specifies the background color of cells containing the names of the row and column dimensions.
	CaptionFont (see page 17606)	Specifies the font used to write the names of the row and column dimensions.
	Color (see page 17607)	Specifies the background color of the control.
	Constraints (see page 17608)	Specifies the size constraints for the control.
	Ctl3D (see page 17608)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DataColor (see page 17609)	Specifies the background color of the cells containing summarized values.
	DataFont (see page 17609)	Specifies the font used to write the summarized values in the scrollable region of the decision grid.
	DataSumColor (see page 17610)	Specifies the background color of cells that represent subtotals over entire dimensions.
	DecisionSource (see page 17610)	Specifies the decision source that supplies crosstabulated data to the decision grid.
	DefaultColWidth (see page 17610)	Specifies the width of all columns that are not explicitly resized.
	DefaultDrawing (see page 17611)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 17611)	Specifies the height of all rows that are not explicitly resized.
	Dimensions (see page 17612)	Provides access to the collection of TDisplayDim objects that control the appearance of each dimension.
	DragCursor (see page 17612)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 17613)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 17614)	Controls whether the control responds to mouse, keyboard, and timer events.
	GridLineColor (see page 17615)	Specifies the color of the lines that separate the cells in the decision grid.
	GridLineWidth (see page 17616)	Specifies the width, in pixels, of the lines that separate the cells of the grid.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	LabelColor (see page 17616)	Specifies the color of the individual row and column labels.
	LabelFont (see page 17616)	Specifies the font used to write the individual row and column labels.
	LabelSumColor (see page 17617)	Specifies the background color for the subtotal labels.

	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Options (see page 17617)	Specifies settings that affect the entire grid display.
	ParentColor (see page 17618)	Determines where a control looks for its color information.
	ParentCtl3D (see page 17618)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 17619)	Determines where a control looks for its font information.
	ParentShowHint (see page 17619)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 17620)	Identifies the pop-up menu associated with the control.
	ScrollBars (see page 17625)	Specifies whether the grid includes horizontal and vertical scroll bars.
	ShowCubeEditor (see page 17625)	Determines whether the Cube Editor can be displayed.
	ShowHint (see page 17625)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 17627)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 17627)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Totals (see page 17628)	Indicates whether the grid includes subtotals.
	Visible (see page 17628)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

109.1.2.2 TDecisionGrid Properties

The properties of the TDecisionGrid class are listed here.

Public Properties

	Name	Description
	ColCount (see page 17606)	Indicates the total number of columns in the decision grid.
	FixedCols (see page 17615)	Indicates the number of columns used for dimension captions and dimension value labels.
	FixedRows (see page 17615)	Indicates the number of rows used for dimension captions and dimension value labels.
	RowCount (see page 17624)	Indicates the total number of rows in the decision grid.

Published Properties

	Name	Description
	Align (see page 17601)	Determines how the control aligns within its container (parent control).
	Anchors (see page 17605)	Specifies how the control is anchored to its parent.
	BorderStyle (see page 17605)	Determines whether a single line border is drawn around the grid.
	CaptionColor (see page 17605)	Specifies the background color of cells containing the names of the row and column dimensions.
	CaptionFont (see page 17606)	Specifies the font used to write the names of the row and column dimensions.
	Color (see page 17607)	Specifies the background color of the control.
	Constraints (see page 17608)	Specifies the size constraints for the control.
	Ctl3D (see page 17608)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DataColor (see page 17609)	Specifies the background color of the cells containing summarized values.
	DataFont (see page 17609)	Specifies the font used to write the summarized values in the scrollable region of the decision grid.
	DataSumColor (see page 17610)	Specifies the background color of cells that represent subtotals over entire dimensions.
	DecisionSource (see page 17610)	Specifies the decision source that supplies crosstabulated data to the decision grid.
	DefaultColWidth (see page 17610)	Specifies the width of all columns that are not explicitly resized.

	DefaultDrawing (see page 17611)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 17611)	Specifies the height of all rows that are not explicitly resized.
	Dimensions (see page 17612)	Provides access to the collection of TDisplayDim objects that control the appearance of each dimension.
	DragCursor (see page 17612)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 17613)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 17614)	Controls whether the control responds to mouse, keyboard, and timer events.
	GridLineColor (see page 17615)	Specifies the color of the lines that separate the cells in the decision grid.
	GridLineWidth (see page 17616)	Specifies the width, in pixels, of the lines that separate the cells of the grid.
	LabelColor (see page 17616)	Specifies the color of the individual row and column labels.
	LabelFont (see page 17616)	Specifies the font used to write the individual row and column labels.
	LabelSumColor (see page 17617)	Specifies the background color for the subtotal labels.
	Options (see page 17617)	Specifies settings that affect the entire grid display.
	ParentColor (see page 17618)	Determines where a control looks for its color information.
	ParentCtl3D (see page 17618)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 17619)	Determines where a control looks for its font information.
	ParentShowHint (see page 17619)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 17620)	Identifies the pop-up menu associated with the control.
	ScrollBars (see page 17625)	Specifies whether the grid includes horizontal and vertical scroll bars.
	ShowCubeEditor (see page 17625)	Determines whether the Cube Editor can be displayed.
	ShowHint (see page 17625)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 17627)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 17627)	Determines if the user can tab to a control.
	Totals (see page 17628)	Indicates whether the grid includes subtotals.
	Visible (see page 17628)	Determines whether the component appears onscreen.

109.1.2.2.1 TDecisionGrid.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
```

```
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
```

```
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

Parent (see page 5832)

Anchors (see page 5802)

109.1.2.2.2 TDecisionGrid.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

109.1.2.2.3 TDecisionGrid.BorderStyle Property

Determines whether a single line border is drawn around the grid.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Set BorderStyle to bsSingle to add a single line border around the grid's image. Set BorderStyle to bsNone to omit the border.

109.1.2.2.4 TDecisionGrid.CaptionColor Property

Specifies the background color of cells containing the names of the row and column dimensions.

Pascal

```
property CaptionColor: TColor;
```

C++

```
__property TColor CaptionColor;
```

Description

Set CaptionColor to the color that should be used to make the names of the row and column dimensions stand out. These are the names for the dimensions that are set in the Decision Cube Editor.

The actual values of the fields that make up the row and column dimensions are drawn using the LabelColor property.

See Also

CaptionFont (see page 17575)

DataColor (see page 17576)

DataSumColor (see page 17577)

Dimensions (see page 17579)

LabelColor (see page 17581)

LabelSumColor (see page 17581)

109.1.2.2.5 TDecisionGrid.CaptionFont Property

Specifies the font used to write the names of the row and column dimensions.

Pascal

```
property CaptionFont: TFont;
```

C++

```
__property TFont CaptionFont;
```

Description

Set CaptionFont to the font that should be used to make the names of the row and column dimensions stand out. These are the names for the dimensions that are set in the Decision Cube Editor.

The actual values of the fields that make up the row and column dimensions are written using the LabelFont property.

See Also

CaptionColor (see page 17574)

DataFont (see page 17577)

Dimensions (see page 17579)

LabelFont (see page 17581)

TFont (see page 14497)

109.1.2.2.6 TDecisionGrid.ColCount Property

Indicates the total number of columns in the decision grid.

Pascal

```
property ColCount: Longint;
```

C++

```
__property int ColCount;__property Longint ColCount;
```

Description

Read ColCount to determine the number of columns in the decision grid, including the columns containing dimension captions

and label cells. Compute the number of columns in the data region of the decision grid by subtracting the value of FixedCols from ColCount.

See Also

FixedCols (see page 17579)

109.1.2.2.7 TDecisionGrid.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

109.1.2.2.8 TDecisionGrid.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

109.1.2.2.9 TDecisionGrid.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

109.1.2.2.10 TDecisionGrid.DataColor Property

Specifies the background color of the cells containing summarized values.

Pascal

```
property DataColor: TColor;
```

C++

```
__property TColor DataColor;
```

Description

Set DataColor to the color that should be used for the scrollable data region of the decision grid. The data region contains the values of the current summary of the decision cube, where each cell represents the value of a field summarized over the values indicated by the row and column dimensions.

The subtotals that represent values summarized over all values within a given dimension (as well as the single value in other dimensions) are drawn using the DataSumColor property.

See Also

CaptionColor (see page 17574)

DataFont (see page 17577)

DataSumColor (see page 17577)

LabelColor (see page 17581)

LabelSumColor (see page 17581)

109.1.2.2.11 TDecisionGrid.DataFont Property

Specifies the font used to write the summarized values in the scrollable region of the decision grid.

Pascal

```
property DataFont: TFont;
```

C++

```
__property TFont DataFont;
```

Description

Set DataFont to the font that should be used for the data region of the decision grid. The data region contains the values of the current summary of the decision cube, where each cell represents the value of a field summarized over the values indicated by the row and column dimensions. It also includes the dimension subtotals over the summary field.

See Also

CaptionFont (see page 17575)

DataColor (see page 17576)

LabelFont (see page 17581)

109.1.2.2.12 TDecisionGrid.DataSumColor Property

Specifies the background color of cells that represent subtotals over entire dimensions.

Pascal

```
property DataSumColor: TColor;
```

C++

```
__property TColor DataSumColor;
```

Description

Set DataSumColor to make the subtotals that represent an entire dimension stand out from the summary values that summarize information over a single value in each dimension. The subtotal cells are placed in the scrollable data region at the ends of the set of rows or columns that correspond to a given dimension.

See Also

CaptionColor (see page 17574)

DataColor (see page 17576)

DataFont (see page 17577)

LabelColor (see page 17581)

LabelSumColor (see page 17581)

Totals (see page 17583)

109.1.2.2.13 TDecisionGrid.DecisionSource Property

Specifies the decision source that supplies crosstabulated data to the decision grid.

Pascal

```
property DecisionSource: TDecisionSource;
```

C++

```
__property TDecisionSource DecisionSource;
```

Description

Set DecisionSource to link the decision grid to the crosstabulated data from a decision cube. The DecisionSource object maintains information about the current pivot state of the data. Thus, any two decision controls that share the same decision source will display the data from the decision cube using the same configuration of row and column dimensions, including any closed dimensions or drilled down values.

See Also

TDecisionCube (see page 17442)

TDecisionSource (see page 17462)

109.1.2.2.14 TDecisionGrid.DefaultColWidth Property

Specifies the width of all columns that are not explicitly resized.

Pascal

```
property DefaultColWidth: Integer;
```

C++

```
__property int DefaultColWidth;__property int DefaultColWidth;
```

Description

Set DefaultColWidth to the desired width of the columns in the decision grid that are not resized using the mouse. Setting DefaultColWidth changes the size of all columns in the grid, including columns that have been resized.

See Also

DefaultRowHeight (see page 17578)

109.1.2.2.15 TDecisionGrid.DefaultDrawing Property

Determines whether the Cells are painted when the grid is drawn.

Pascal

```
property DefaultDrawing: Boolean;
```

C++

```
__property Boolean DefaultDrawing;
```

Description

Set DefaultDrawing to true to have the grid automatically paint the cells in the grid, including adding the background color, the 3-D effects on the fixed cells, and the focus rectangle around the selected cell. Set DefaultDrawing to false to skip the painting of the cells when the grid is drawn.

When DefaultDrawing is false, the cells should be painted using the DrawCell method. For TCustomGrid, DrawCell is an abstract method. Descendants of TCustomGrid use DrawCell to provide their own customized drawing code, or to generate an OnDrawCell event.

See Also

DrawCell (see page 14826)

OnDrawCell (see page 14914)

109.1.2.2.16 TDecisionGrid.DefaultRowHeight Property

Specifies the height of all rows that are not explicitly resized.

Pascal

```
property DefaultRowHeight: Integer;
```

C++

```
__property int DefaultRowHeight;__property int DefaultRowHeight;
```

Description

Set DefaultRowHeight to the desired height of the rows in the decision grid that are not resized using the mouse. Setting DefaultRowHeight changes the size of all rows in the grid, including rows that have been resized.

See Also

DefaultColWidth (see page 17578)

109.1.2.2.17 TDecisionGrid.Dimensions Property

Provides access to the collection of TDisplayDim objects that control the appearance of each dimension.

Pascal

```
property Dimensions: TDisplayDims;
```

C++

```
__property TDisplayDims Dimensions;
```

Description

Set the properties of the individual TDisplayDim objects to control the appearance of individual dimensions within the grid. The TDisplayDim objects have properties that can override the various color and font properties of the grid to make individual dimensions stand out. They also allow the dimension names, alignments, and formats to be customized, and permit the dimension subtotals for a dimension to be turned on or off.

Note: Do not change the Dimensions property, only the properties of individual TDisplayDim objects accessed through the Dimensions property. To programmatically change the configuration of dimensions that appears in the grid, use the decision source object.

TDisplayDim (see page 17661)

109.1.2.2.18 TDecisionGrid.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

109.1.2.2.19 TDecisionGrid.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
```

```
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

109.1.2.2.20 TDecisionGrid.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

109.1.2.2.21 TDecisionGrid.FixedCols Property

Indicates the number of columns used for dimension captions and dimension value labels.

Pascal

```
property FixedCols: Integer;
```

C++

```
__property int FixedCols;__property int FixedCols;
```

Description

Read FixedCols to determine the number of columns in the decision grid that are not part of the data region. Subtract FixedCols from the value of the ColCount property to obtain the number of columns in the data region.

See Also

ColCount (see page 17576)

109.1.2.2.22 TDecisionGrid.FixedRows Property

Indicates the number of rows used for dimension captions and dimension value labels.

Pascal

```
property FixedRows: Integer;
```

C++

```
__property int FixedRows;__property int FixedRows;
```

Description

Read FixedRows to determine the number of rows in the decision grid that are not part of the data region. Subtract FixedRows from the value of the RowCount property to obtain the number of rows in the data region.

See Also

RowCount (see page 17582)

109.1.2.2.23 TDecisionGrid.GridLineColor Property

Specifies the color of the lines that separate the cells in the decision grid.

Pascal

```
property GridLineColor: TColor;
```

C++

```
__property TColor GridLineColor;
```

Description

Set GridLineColor to specify the color of the lines drawn between the cells of the grid. The grid lines only appear when the Options property includes cgGridLines.

See Also

GridLineWidth (see page 17580)

Options (see page 17582)

109.1.2.2.24 TDecisionGrid.GridLineWidth Property

Specifies the width, in pixels, of the lines that separate the cells of the grid.

Pascal

```
property GridLineWidth: Integer;
```

C++

```
__property int GridLineWidth;__property int GridLineWidth;
```

Description

Set GridLineWidth to make the lines that separate the cells in the decision grid heavier or lighter. The grid lines only appear when the Options property includes cgGridLines.

See Also

GridLineColor (see page 17580)

Options (see page 17582)

109.1.2.2.25 TDecisionGrid.LabelColor Property

Specifies the color of the individual row and column labels.

Pascal

```
property LabelColor: TColor;
```

C++

```
__property TColor LabelColor;
```

Description

Set LabelColor to the color that should be used to make the row and column labels stand out. The row and column labels of the decision grid contain the values of the fields that correspond to the dimensions of the decision cube. These are the values over which the data is summarized.

See Also

CaptionColor (see page 17574)

DataColor (see page 17576)

DataSumColor (see page 17577)

LabelFont (see page 17581)

LabelSumColor (see page 17581)

109.1.2.2.26 TDecisionGrid.LabelFont Property

Specifies the font used to write the individual row and column labels.

Pascal

```
property LabelFont: TFont;
```

C++

```
__property TFont LabelFont;
```

Description

Set LabelFont to the font that should be used to write the labels that display the values of the dimensions over which data is summarized. The row and column labels of the decision grid contain the values of the fields that correspond to the dimensions of the decision cube. LabelFont is also used when writing the labels for rows or columns that represent dimension subtotals.

See Also

CaptionFont (see page 17575)

DataFont (see page 17577)

LabelColor (see page 17581)

LabelSumColor (see page 17581)

109.1.2.2.27 TDecisionGrid.LabelSumColor Property

Specifies the background color for the subtotal labels.

Pascal

```
property LabelSumColor: TColor;
```

C++

```
__property TColor LabelSumColor;
```

Description

Set LabelSumColor make the subtotal labels stand out from the labels that represent individual field values along a dimension. The subtotal labels appear at the end of the set of field value labels for an individual dimension.

See Also

CaptionColor (see page 17574)

DataColor (see page 17576)

DataSumColor (see page 17577)

LabelColor (see page 17581)

LabelFont (see page 17581)

Totals (see page 17583)

109.1.2.2.28 TDecisionGrid.Options Property

Specifies settings that affect the entire grid display.

Pascal

```
property Options: TGridOptions;
```

C++

```
__property TDecisionGridOptions Options;__property TGridOptions Options;
```

Description

Set Options to include the desired properties for the grid. Options is a set drawn from the following values:

Value	Meaning
cgGridLines	Vertical and horizontal lines are drawn to separate the cells in the scrollable data region.

cgOutliner	The dimension caption cells contain plus (+) and minus (-) signs that open or close dimensions in the grid when clicked. The minus sign closes (hides) an adjacent dimension. The plus sign opens (shows) an adjacent dimension.
cgPivotable	Dimensions can be rearranged by clicking on the dimension caption cells and dragging them to a new position.

Note: If Options does not include cgOutliner, individual dimensions can still be opened and closed using the decision pivot. Similarly, if Options does not include cgPivotable, individual dimensions can still be opened and closed with the decision pivot.

See Also

GridLineColor (see page 17580)

GridLineWidth (see page 17580)

TDecisionPivot (see page 17680)

109.1.2.2.29 TDecisionGrid.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

109.1.2.2.30 TDecisionGrid.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

109.1.2.2.31 TDecisionGrid.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

109.1.2.2.32 TDecisionGrid.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

109.1.2.2.33 TDecisionGrid.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
```

```
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
```

```
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
```

```
    if PopupMenu1.PopupComponent = Edit1 then
      Edit1.CutToClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.CutToClipboard
    else
      Beep;
  end;

  procedure TForm1.Paste1Click(Sender: TObject);
  begin
    if PopupMenu1.PopupComponent = Edit1 then
      Edit1.PasteFromClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.PasteFromClipboard
    else
      Beep;
  end;
  {
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  }

  type
    TForm1 = class(TForm)

109.1.2.2.34 TDecisionGrid.RowCount Property

Indicates the total number of rows in the decision grid.

Pascal

```
property RowCount: Longint;
```

C++

```
__property int RowCount;__property Longint RowCount;
```

Description

Read RowCount to determine the number of rows in the decision grid, including the rows containing dimension captions and label cells. Compute the number of rows in the data region of the decision grid by subtracting the value of FixedRows from RowCount.

See Also

FixedRows (see page 17580)

109.1.2.2.35 TDecisionGrid.ScrollBars Property

Specifies whether the grid includes horizontal and vertical scroll bars.

Pascal

```
property ScrollBars: TScrollStyle;
```

C++

```
__property TScrollStyle ScrollBars;
```

Description

Use ScrollBars to give the grid horizontal or vertical scroll bars.

Note: If all the cells in the grid fit in the ClientWidth, no horizontal scroll bar appears, even if ScrollBars is ssHorizontal or ssBoth. If all the cells fit in the ClientHeight, no vertical scroll bar appears, even if ScrollBars is ssVertical or ssBoth.

See Also

ClientHeight (see page 5808)

ClientWidth (see page 5811)

109.1.2.2.36 TDecisionGrid.ShowCubeEditor Property

Determines whether the Cube Editor can be displayed.

Pascal

```
property ShowCubeEditor: boolean;
```

C++

```
__property boolean ShowCubeEditor;
```

Description

ShowCubeEditor determines whether the Cube Editor for the associated TDecisionCube can be invoked. If set to true, a menu item to invoke the Cube Editor is added to the speed menu displayed on a right-click on the decision grid at runtime.

See Also

Dimensions (see page 17579)

ShowCubeDialog (see page 17450)

TDecisionCube (see page 17442)

109.1.2.2.37 TDecisionGrid.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
```

```
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

Displaying Fly-over Help

109.1.2.2.38 TDecisionGrid.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

109.1.2.2.39 TDecisionGrid.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

109.1.2.2.40 TDecisionGrid.Totals Property

Indicates whether the grid includes subtotals.

Pascal

```
property Totals: boolean;
```

C++

```
__property boolean Totals;
```

Description

Set Totals to turn row and column subtotals on or off for the whole grid. To turn subtotals on or off for individual dimensions, use the Dimensions property.

See Also

Dimensions (see page 17579)

109.1.2.2.41 TDecisionGrid.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
```

```
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

109.1.2.3 TDecisionGrid Events

The events of the TDecisionGrid class are listed here.

Published Events

	Name	Description
	OnClick (see page 17630)	Occurs when the user clicks the control.
	OnDblClick (see page 17632)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDecisionDrawCell (see page 17632)	Occurs just before a cell in the grid is drawn.
	OnDecisionExamineCell (see page 17634)	Occurs when the user right-clicks on a cell in the data region of the grid.
	OnDragDrop (see page 17634)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 17637)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 17639)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 17640)	Occurs when a control receives the input focus.
	OnExit (see page 17642)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 17644)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 17647)	Occurs when a key is pressed.
	OnKeyUp (see page 17648)	Occurs when the user releases a key that has been pressed.
	OnMouseDown (see page 17650)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 17652)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 17654)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnResize (see page 17656)	Occurs immediately after the control is resized.
	OnStartDrag (see page 17657)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnTopLeftChanged (see page 17658)	Occurs when the data region of the grid scrolls.

109.1.2.3.1 TDecisionGrid.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.

- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;
```

```
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

109.1.2.3.2 TDecisionGrid.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

109.1.2.3.3 TDecisionGrid.OnDecisionDrawCell Event

Occurs just before a cell in the grid is drawn.

Pascal

```
property OnDecisionDrawCell: TDecisionDrawCellEvent;
```

C++

```
__property TDecisionDrawCellEvent OnDecisionDrawCell;
```

Description

Write an OnDecisionDrawCell event handler to change the color, font, or text used to display an individual cell in the grid. Change the AColor, AFont, or Value parameter to change the color, font, or text respectively.

For example, to change the row and column labels from the values of the fields in the dataset to customized labels, change the Value parameter of the event handler when the Row and Column parameters represent a label cell.

The Row and Column parameters indicate the row and column of a cell within the grid, where (0,0) specifies the upper left summary value, not the upper left corner of the grid. Thus, the label cells contain negative row or column indexes. In addition, the AState parameter includes gdFixed when the cell is a label cell. AState also indicates whether the cell being drawn is selected.

The ADrawState parameter indicates the type of cell that is about to be drawn. ADrawState includes one or more of the following values:

Value	Meaning
dsGroupStart	The cell is the first row or column label for a dimension. Always appears with dsRowValue or dsColValue.
dsRowCaption	The cell displays a row caption (the name of a dimension whose values are listed down a column on the left of the grid).
dsColCaption	The cell displays a column caption (the name of a dimension whose values are listed along the top of the grid).
dsSum	The cell displays a subtotal label or value. Always appears with dsRowValue, dsColValue, or dsData.
dsRowValue	The cell is a row label. It represents a value from a dimension listed down a column on the left of the grid or a summary label that appears at the end of each group of dimension values.
dsColValue	The cell is a column label. It represents a value from a dimension listed across the top of the grid or a summary label that appears at the end of the dimension.
dsData	The cell is in the scrollable data region of the grid.
dsOpenAfter	The cell has a plus sign (+) on the right that will open following dimension when clicked. Always appears with dsRowCaption, dsColCaption, dsRowPlus, or dsColPlus.
dsCloseAfter	The cell has a minus sign (-) on the right that will close the following dimension when clicked. Always appears with dsRowCaption, dsColCaption, dsRowPlus, or dsColPlus.
dsRowIndicator	The cell appears on the left grid margin that is used to display the open and close indicators (+ and -).
dsColIndicator	The cell appears on the upper grid margin that is used to display the open and close indicators (+ and -).
dsRowPlus	The cell appears in the left margin and contains a plus sign (+) indicating that the adjacent dimension is closed. Always appears with dsRowIndicator.
dsColPlus	The cell appears in the top margin and contains a plus sign (+) indicating that the adjacent dimension is closed. Always appears with dsColIndicator.
dsNone	The cell has no function.

109.1.2.3.4 TDecisionGrid.OnDecisionExamineCell Event

Occurs when the user right-clicks on a cell in the data region of the grid.

Pascal

```
property OnDecisionExamineCell: TDecisionExamineCellEvent;
```

C++

```
__property TDecisionExamineCellEvent OnDecisionExamineCell;
```

Description

Write an OnDecisionExamineCell event handler to take specific action when the user right-clicks on one of the cells that contains summarized data. The ICol and IRow parameters indicate the column and row indexes of the cell. The column and row indexes specify the value 0 for the top or leftmost cell in the scrollable data region, not the top left cell of the decision grid. The ISum parameter is the index of the current summary in the decision cube, where the first active summary has an index of 0. The ValueArray parameter gives the coordinates of the cell in terms of the dimensions of the decision source. If the cell represents a subtotal value, the entry in the ValueArray for the dimension over which the subtotal is calculated is a negative number.

Use the Cells property to obtain the value of the summary in the cell. Use the GetDimensionName method of the decision source to get the name of each dimension represented by an entry in the ValueArray parameter. Use the GetValueAsString or GetValueAsVariant method of the decision source to obtain the label values for each dimension represented in the ValueArray parameter.

109.1.2.3.5 TDecisionGrid.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the

OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;
```

```
procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

109.1.2.3.6 TDecisionGrid.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
```

```
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

109.1.2.3.7 TDecisionGrid.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

109.1.2.3.8 TDecisionGrid.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
```

```
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{

button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
```

```
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;

109.1.2.3.9 TDecisionGrid.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
```

```
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

109.1.2.3.10 TDecisionGrid.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not

generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;

109.1.2.3.11 TDecisionGrid.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

109.1.2.3.12 TDecisionGrid.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.

109.1.2.3.13 TDecisionGrid.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:

109.1.2.3.14 TDecisionGrid.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
      end
    else
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
      end;
  end;
end;
```

MouseCapture (see page 5831)

109.1.2.3.15 TDecisionGrid.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
```

```
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
```

```
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
      end
    else
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
      end;
  end;
end;
```

Responding to a Mouse-up Action

109.1.2.3.16 TDecisionGrid.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

AutoSize (see page 5803)

OnConstrainedResize (see page 5853)

109.1.2.3.17 TDecisionGrid.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

109.1.2.3.18 TDecisionGrid.OnTopLeftChanged Event

Occurs when the data region of the grid scrolls.

Pascal

```
property OnTopLeftChanged: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnTopLeftChanged;
```

Description

Write an OnTopLeftChanged event handler to take specific action when the summarized data in the grid scrolls. Use the Cells property or the CellDrawState method to obtain the new values of the data cells.

109.1.3 TDecisionGridDataLink Class

Class Hierarchy

Pascal

```
TDecisionGridDataLink = class(TDecisionDataLink);
```

C++

```
class TDecisionGridDataLink : public TDecisionDataLink;
```

File

MXGRID

Description

This is class MXGRID.TDecisionGridDataLink.

109.1.3.1 TDecisionGridDataLink Members

The following tables list the members exposed by TDecisionGridDataLink.

Protected Fields

	Name	Description
	FBlocked (see page 17460)	This is FBlocked, a member of class TDecisionDataLink.
	FDecisionSource (see page 17461)	This is FDecisionSource, a member of class TDecisionDataLink.

Protected Methods

	Name	Description
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	DecisionDataEvent (see page 17660)	This is DecisionDataEvent, a member of class TDecisionGridDataLink.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetDecisionSource (see page 17461)	This is SetDecisionSource, a member of class TDecisionDataLink.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 17660)	This is Create, a member of class TDecisionGridDataLink.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 17660)	Destroys the TPersistent instance and frees its memory.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	DecisionSource (see page 17462)	This is DecisionSource, a member of class TDecisionDataLink.

109.1.3.2 TDecisionGridDataLink.Create Constructor

Pascal

```
constructor Create(AGrid: TCustomDecisionGrid);
```

C++

```
__fastcall TDecisionGridDataLink(TCustomDecisionGrid AGrid);
```

Description

This is Create, a member of class TDecisionGridDataLink.

109.1.3.3 TDecisionGridDataLink.Destroy Destructor

Destroys the TPersistent instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDecisionGridDataLink();
```

Description

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

Free (see page 22300)

Destroy (see page 22287)

109.1.3.4 TDecisionGridDataLink Methods

The methods of the TDecisionGridDataLink class are listed here.

Protected Methods

	Name	Description
	DecisionDataEvent (see page 17660)	This is DecisionDataEvent, a member of class TDecisionGridDataLink.

109.1.3.4.1 TDecisionGridDataLink.DecisionDataEvent Method

Pascal

```
procedure DecisionDataEvent(Event: TDecisionDataEvent); override;
```

C++

```
virtual __fastcall DecisionDataEvent(TDecisionDataEvent Event);
```

Description

This is DecisionDataEvent, a member of class TDecisionGridDataLink.

109.1.4 TDisplayDim Class

TDisplayDim represents a dimension in a decision grid.

Class Hierarchy

Pascal

```
TDisplayDim = class(TCollectionItem);
```

C++

```
class TDisplayDim : public TCollectionItem;
```

File

MXGRID

Description

Use TDisplayDim to set the properties of a dimension in a decision grid. Decision grids maintain a collection of TDisplayDim objects that describe the dimension labels that run along their left and top edges. The properties of TDisplayDim can be used to make the labels for a single dimension stand out, or to turn on or off subtotals over the dimension.

See Also

TDecisionGrid (see page 17586)

TDisplayDims (see page 17666)

TDisplayDims (see page 17666)

109.1.4.1 TDisplayDim Members

The following tables list the members exposed by TDisplayDim.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	assign (see page 17663)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 17662)	Creates and initializes a TCollectionItem instance.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	Alignment (see page 17664)	Specifies the placement of values within the label cells.
	Color (see page 17664)	Specifies the background color of the label cells for the dimension.
	DisplayName (see page 17665)	Describes the dimension in the caption cell.
	FieldName (see page 17665)	Names the field in the underlying data set that the dimension represents.
	Format (see page 17665)	Specifies the format of the value labels along the dimension.
	Subtotals (see page 17666)	Indicates whether the grid should display subtotals over the dimension.

109.1.4.2 TDisplayDim.Create Constructor

Creates and initializes a TCollectionItem instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TDisplayDim(TCollection Collection);
```

Description

Do not call Create to instantiate a collection item. Instead, call the Add method of the collection to which the item should belong.

Collection identifies the TCollection instance to which the new item belongs.

See Also

Add (see page 2736)

Collection (see page 2761)

109.1.4.3 TDisplayDim Methods

The methods of the TDisplayDim class are listed here.

Public Methods

	Name	Description
	assign (see page 17663)	Copies the contents of another, similar object.

109.1.4.3.1 TDisplayDim.assign Method

Copies the contents of another, similar object.

Pascal

```
procedure assign(Value: TPersistent); override;
```

C++

```
virtual __fastcall assign(TPersistent * Value);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo (see page 2931)

EConvertError (see page 22724)

109.1.4.4 TDisplayDim Properties

The properties of the TDisplayDim class are listed here.

Published Properties

	Name	Description
	Alignment (see page 17664)	Specifies the placement of values within the label cells.
	Color (see page 17664)	Specifies the background color of the label cells for the dimension.
	DisplayName (see page 17665)	Describes the dimension in the caption cell.
	FieldName (see page 17665)	Names the field in the underlying data set that the dimension represents.
	Format (see page 17665)	Specifies the format of the value labels along the dimension.
	Subtotals (see page 17666)	Indicates whether the grid should display subtotals over the dimension.

109.1.4.4.1 TDisplayDim.Alignment Property

Specifies the placement of values within the label cells.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

Set Alignment to determine how the values of the dimension field are aligned in the label cells. Alignment can be one of the following values:

Value	Meaning
taLeftJustify	Values appear lined up along the left edge of the label cells.
taRightJustify	Values appear lined up along the right edge of the label cells.

See Also

GetMemberAsString (see page 17477)

109.1.4.4.2 TDisplayDim.Color Property

Specifies the background color of the label cells for the dimension.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Set Color to override the LabelColor property of the decision grid for the labels along a single dimension. Cells that display the field values along this dimension use Color for the background color.

See Also

LabelColor (see page 17581)

109.1.4.4.3 TDisplayDim.DisplayName Property

Describes the dimension in the caption cell.

Pascal

```
property DisplayName: string;
```

C++

```
__property AnsiString DisplayName;
```

Description

Set DisplayName to the name that appears in the caption cell that displays the name of this dimension. DisplayName overrides the name of the dimension returned by the decision source in its GetDimensionName method.

See Also

FieldName (see page 17665)

GetDimensionName (see page 17474)

109.1.4.4.4 TDisplayDim.FieldName Property

Names the field in the underlying data set that the dimension represents.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;
```

Description

Read FieldName to determine the name of the field on which the dimension item is based. FieldName is the same as the FieldName property of the TField object for the field in the dataset.

Note: Do not change the FieldName property. Changing the FieldName property loses the link to the underlying field in the data set.

See Also

DisplayName (see page 17665)

FieldName (see page 7164)

109.1.4.4.5 TDisplayDim.Format Property

Specifies the format of the value labels along the dimension.

Pascal

```
property Format: String;
```

C++

```
__property AnsiString Format;
```

Description

Set Format to specify how the values of the dimension field should be formatted into display labels. The format specifiers that make up the Format string depend on the field type.

See the FormatFloat runtime library function for a description of the format specifiers for a numeric field. See the FormatDateTime runtime library function for a description of the format specifiers for a temporal field. Format has no effect on other field types.

See Also

FormatDateTime (see page 22902)

FormatFloat (see page 22904)

109.1.4.4.6 TDisplayDim.Subtotals Property

Indicates whether the grid should display subtotals over the dimension.

Pascal

```
property Subtotals: Boolean;
```

C++

```
__property Boolean Subtotals;
```

Description

Set Subtotals to true to add a row or column of subtotals following the last value of the dimension. The subtotal row or column contains values of the summary field summarized over all values in the dimension. Set Subtotals to false to omit the subtotal row or column at the end of the dimension.

To turn subtotals on or off for all dimensions in the grid at once, use the Totals property of the decision grid.

Totals (see page 17583)

109.1.5 TDisplayDims Class

TDisplayDims represents a collection of TDisplayDim (see page 17661) objects.

Class Hierarchy

Pascal

```
TDisplayDims = class(TCollection);
```

C++

```
class TDisplayDims : public TCollection;
```

File

MXGRID

Description

Use TDisplayDims to describe the dimensions of a decision grid. Each TDisplayDim (see page 17661) object maintained by TDisplayDims corresponds to a field from the decision source. Decision grids use TDisplayDims to specify the appearance of the dimension labels that appear along the left and top edges of the grid.

See Also

TDecisionGraph (see page 17521)

TDecisionGrid (see page 17586)

TDecisionSource (see page 17462)

TDisplayDim (see page 17661)

109.1.5.1 TDisplayDims Members

The following tables list the members exposed by TDisplayDims.

Protected Fields

	Name	Description
	FGrid (see page 17669)	This is FGrid, a member of class TDisplayDims.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 17669)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	NotifyOwner (see page 17670)	This is NotifyOwner, a member of class TDisplayDims.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2736)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 2734)	Creates and initializes a collection.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
	Destroy (see page 2735)	Destroys the collection and each item in it.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 17670)	Lists the TDisplayDim (see page 17661) objects in the collection.

109.1.5.2 TDisplayDims Fields

The fields of the TDisplayDims class are listed here.

Protected Fields

	Name	Description
	FGrid (see page 17669)	This is FGrid, a member of class TDisplayDims.

109.1.5.2.1 TDisplayDims.FGrid Field

Pascal

```
FGrid: TCustomDecisionGrid;
```

C++

```
TCustomDecisionGrid FGrid;
```

Description

This is FGrid, a member of class TDisplayDims.

109.1.5.3 TDisplayDims Methods

The methods of the TDisplayDims class are listed here.

Protected Methods

	Name	Description
V	GetOwner (see page 17669)	Returns the owner of an object.
	NotifyOwner (see page 17670)	This is NotifyOwner, a member of class TDisplayDims.

109.1.5.3.1 TDisplayDims.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath (see page 2932)

TCollection (see page 2731)

TComponent (see page 2762)

Owner (see page 2807)

109.1.5.3.2 TDisplayDims.NotifyOwner Method

Pascal

```
procedure NotifyOwner(aType: TDDNotifyType);
```

C++

```
__fastcall NotifyOwner(TDDNotifyType aType);
```

Description

This is NotifyOwner, a member of class TDisplayDims.

109.1.5.4 TDisplayDims Properties

The properties of the TDisplayDims class are listed here.

Public Properties

	Name	Description
	Items (see page 17670)	Lists the TDisplayDim (see page 17661) objects in the collection.

109.1.5.4.1 TDisplayDims.Items Property

Lists the TDisplayDim (see page 17661) objects in the collection.

Pascal

```
property Items [Index: Integer]: TDisplayDim;
```

C++

```
__property TDisplayDim Items[int Index];
```

Description

Use Items to access the properties of the TDisplayDim (see page 17661) objects maintained by TDisplayDims (see page 17666).

Note: In Delphi code Items is the default property of TDisplayDims (see page 17666), so the name of the Items property can be left off when using this property. Thus the line

```
MyDim := DecisionGrid1.Dimensions.Items[0];
```

Note: can be written

```
MyDim := DecisionGrid1.Dimensions[0];
```

The TDisplayDim (see page 17661) objects in the Items array should correspond exactly to the dimensions of the decision source used by the decision control associated with the TDisplayDims (see page 17666) object. Do not directly change the elements of the Items array. To rearrange the display dimensions, use the SwapDimIndexes method of the decision source. To hide display dimensions, use the CloseDimIndexRight method of the decision source. To show hidden dimensions, use the OpenDimIndexLeft or OpenDimIndexRight method of the decision source.

See Also

TDecisionSource (see page 17462)

CloseDimIndexRight (see page 17470)

OpenDimIndexLeft (see page 17482)

OpenDimIndexRight (see page 17482)

SwapDimIndexes (see page 17484)

operator_[]

109.1.6 TValueArray Class

Class Hierarchy

Pascal

```
TValueArray = class(TSmallIntArray);
```

C++

```
class TValueArray : public TSmallIntArray;
```

File

MXGRID

Description

This is class MXGRID.TValueArray.

109.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TButtonPlace (see page 17672)	This is record MXGRID.TButtonPlace.
	TDDNotifyType (see page 17672)	This is record MXGRID.TDDNotifyType.
	TDecisionCellType (see page 17673)	This is record MXGRID.TDecisionCellType.
	TDecisionDrawStates (see page 17673)	This is record MXGRID.TDecisionDrawStates.
	TDecisionGridOption (see page 17674)	This is record MXGRID.TDecisionGridOption.
	TDecisionGridState (see page 17675)	This is record MXGRID.TDecisionGridState.
	TDecisionPivotState (see page 17675)	This is record MXGRID.TDecisionPivotState.

109.2.1 MXGRID.TButtonPlace Enumeration

Pascal

```
TButtonPlace = (
  bpLeft,
  bpMiddle,
  bpRight
);
```

C++

```
enum TButtonPlace {
  bpLeft,
  bpMiddle,
  bpRight
};
```

File

MXGRID

Description

This is record MXGRID.TButtonPlace.

109.2.2 MXGRID.TDDNotifyType Enumeration

Pascal

```
TDDNotifyType = (
  tdDisplay,
  tdSubTotals,
  tdMetaData
);
```

C++

```
enum TDDNotifyType {
```

```
    tdDisplay,
    tdSubTotals,
    tdMetaData
  };
```

File

MXGRID

Description

This is record MXGRID.TDDNotifyType.

109.2.3 MXGRID.TDecisionCellType Enumeration

Pascal

```
  TDecisionCellType = (
    ctNone,
    ctCaptionRow,
    ctCaptionCol,
    ctNewCaptionCol,
    ctRowLabel,
    ctColLabel,
    ctData,
    ctRowPlus,
    ctColPlus,
    ctRowIndicator,
    ctColIndicator
  );
```

C++

```
  enum TDecisionCellType {
    ctNone,
    ctCaptionRow,
    ctCaptionCol,
    ctNewCaptionCol,
    ctRowLabel,
    ctColLabel,
    ctData,
    ctRowPlus,
    ctColPlus,
    ctRowIndicator,
    ctColIndicator
  };
```

File

MXGRID

Description

This is record MXGRID.TDecisionCellType.

109.2.4 MXGRID.TDecisionDrawStates Enumeration

Pascal

```
  TDecisionDrawStates = (
    dsGroupStart,
```

```
    dsRowCaption,
    dsColCaption,
    dsSum,
    dsRowValue,
    dsColValue,
    dsData,
    dsOpenAfter,
    dsCloseAfter,
    dsCloseBefore,
    dsOpenBefore,
    dsRowIndicator,
    dsColIndicator,
    dsRowPlus,
    dsColPlus,
    dsNone
  );
```

C++

```
  enum TDecisionDrawStates {
    dsGroupStart,
    dsRowCaption,
    dsColCaption,
    dsSum,
    dsRowValue,
    dsColValue,
    dsData,
    dsOpenAfter,
    dsCloseAfter,
    dsCloseBefore,
    dsOpenBefore,
    dsRowIndicator,
    dsColIndicator,
    dsRowPlus,
    dsColPlus,
    dsNone
  };
```

File

MXGRID

Description

This is record MXGRID.TDecisionDrawStates.

109.2.5 MXGRID.TDecisionGridOption Enumeration

Pascal

```
  TDecisionGridOption = (
    cgGridLines,
    cgOutliner,
    cgPivotable
  );
```

C++

```
  enum TDecisionGridOption {
    cgGridLines,
    cgOutliner,
    cgPivotable
  };
```

File

MXGRID

Description

This is record MXGRID.TDecisionGridOption.

109.2.6 MXGRID.TDecisionGridState Enumeration

Pascal

```
TDecisionGridState = (
  csNormal,
  csPivoting
);
```

C++

```
enum TDecisionGridState {
  csNormal,
  csPivoting
};
```

File

MXGRID

Description

This is record MXGRID.TDecisionGridState.

109.2.7 MXGRID.TDecisionPivotState Enumeration

Pascal

```
TDecisionPivotState = (
  psNone,
  psLeftPivot,
  psMiddlePivot,
  psRightPivot,
  psTopPivot
);
```

C++

```
enum TDecisionPivotState {
  psNone,
  psLeftPivot,
  psMiddlePivot,
  psRightPivot,
  psTopPivot
};
```

File

MXGRID

Description

This is record MXGRID.TDecisionPivotState.

109.3 Types

The following table lists types in this documentation.

Types

Name	Description
TDecisionDrawCellEvent (see page 17676)	This is type MXGRID.TDecisionDrawCellEvent.
TDecisionDrawState (see page 17676)	This is type MXGRID.TDecisionDrawState.
TDecisionExamineCellEvent (see page 17677)	This is type MXGRID.TDecisionExamineCellEvent.
TDecisionGridOptions (see page 17677)	This is type MXGRID.TDecisionGridOptions.
TDisplayDimClass (see page 17677)	This is type MXGRID.TDisplayDimClass.

109.3.1 MXGRID.TDecisionDrawCellEvent Type

Pascal

```
TDecisionDrawCellEvent = procedure (Sender: TObject; Col, Row: Longint; var Value: string; var
aFont: TFont; var aColor: TColor; AState: TGridDrawState; aDrawState: TDecisionDrawState) of
object;
```

C++

```
(Sender: TObject; Col, Row: Longint; var Value: string; var aFont: TFont; var aColor: TColor;
AState: TGridDrawState; aDrawState: TDecisionDrawState) ( TDecisionDrawCellEvent)();
```

File

MXGRID

Description

This is type MXGRID.TDecisionDrawCellEvent.

109.3.2 MXGRID.TDecisionDrawState Type

Pascal

```
TDecisionDrawState = set of TDecisionDrawStates;
```

C++

```
TDecisionDrawStates TDecisionDrawState;
```

File

MXGRID

Description

This is type MXGRID.TDecisionDrawState.

109.3.3 MXGRID.TDecisionExamineCellEvent Type

Pascal

```
TDecisionExamineCellEvent = procedure (Sender: TObject; iCol, iRow: Longint; iSum: Integer;
const ValueArray: TValueArray) of object;
```

C++

```
(Sender: TObject; iCol, iRow: Longint; iSum: Integer; const ValueArray: TValueArray) (
TDecisionExamineCellEvent)();
```

File

MXGRID

Description

This is type MXGRID.TDecisionExamineCellEvent.

109.3.4 MXGRID.TDecisionGridOptions Type

Pascal

```
TDecisionGridOptions = set of TDecisionGridOption;
```

C++

```
TDecisionGridOption TDecisionGridOptions;
```

File

MXGRID

Description

This is type MXGRID.TDecisionGridOptions.

109.3.5 MXGRID.TDisplayDimClass Type

Pascal

```
TDisplayDimClass = class of TDisplayDim;
```

C++

```
TDisplayDim TDisplayDimClass;
```

File

MXGRID

Description

This is type MXGRID.TDisplayDimClass.

110 MXPIVSRC Namespace

This is namespace MXPIVSRC.

Topics

Name	Description
Classes (see page 17680)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 17741)	The following table lists structs, records, enums in this documentation.
Types (see page 17743)	The following table lists types in this documentation.

Classes

	Name	Description
	TDecisionPivot (see page 17680)	TDecisionPivot allows the user to control the pivot state of a decision source.
	TPivotDataLink (see page 17737)	This is class MXPIVSRC.TPivotDataLink.

Structs, Records, Enums

	Name	Description
	TDecisionButtonPosition (see page 17741)	This is record MXPIVSRC.TDecisionButtonPosition.
	TDecisionPivotOption (see page 17741)	This is record MXPIVSRC.TDecisionPivotOption.

Types

Name	Description
TDecisionPivotOptions (see page 17743)	This is type MXPIVSRC.TDecisionPivotOptions.

110.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TDecisionPivot (see page 17680)	TDecisionPivot allows the user to control the pivot state of a decision source.
	TPivotDataLink (see page 17737)	This is class MXPIVSRC.TPivotDataLink.

110.1.1 TDecisionPivot Class

TDecisionPivot allows the user to control the pivot state of a decision source.

Class Hierarchy

Pascal

```
TDecisionPivot = class(TCustomPanel);
```

C++

```
class TDecisionPivot : public TCustomPanel;
```

File

MXPIVSRC

Description

Add a decision pivot to a form to allow users to control the pivot state of decision graphs and decision grids. Decision pivots contain buttons that correspond to the active dimensions of a decision cube and a drop-down list box for choosing the current summary.

Pressing the dimension buttons opens or closes the dimensions, controlling whether the decision source provides detailed data values for those dimensions. Right-clicking the buttons of a decision pivot brings up a menu that allows users to control the drill state of a dimension. Drilled dimensions focus on a single value within the dimension. Dragging the buttons on a decision pivot rearranges the dimensions of the decision source into a new pivot configuration.

Note: Do not use the Decision pivot to pivot, subtotal, or drill in on summaries that are not additive. SUM and COUNT summaries are additive, AVERAGE (unless calculated by the Decision cube), MAX, and MIN are not.

About Crosstabs

110.1.1.1 TDecisionPivot Members

The following tables list the members exposed by TDecisionPivot.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.

	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 17692)	Adjusts the ClientRect property for the idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanAutoSize (see page 12537)	Adjusts the way the panel responds to resize attempts.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 12537)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DimStateChange (see page 17693)	This is DimStateChange, a member of class TDecisionPivot.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetBorderStyle (see page 17693)	This is GetBorderStyle, a member of class TDecisionPivot.
	GetBorderWidth (see page 17693)	This is GetBorderWidth, a member of class TDecisionPivot.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.

	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	NewDimLayout (see page 17694)	This is NewDimLayout, a member of class TDecisionPivot.
	NewPanelSetup (see page 17694)	This is NewPanelSetup, a member of class TDecisionPivot.
	Notification (see page 17694)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 5920)	Renders the image of a custom control.
	Paint (see page 12538)	Renders the image of the panel.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.

	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetBorderStyle (see page 17695)	This is SetBorderStyle, a member of class TDecisionPivot.
	SetBorderWidth (see page 17695)	This is SetBorderWidth, a member of class TDecisionPivot.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBackground (see page 12539)	This is SetParentBackground, a member of class TCustomPanel.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.

	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelKind (see page 6193)	Specifies the control's bevel style.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
R	Cols (see page 17707)	This is Cols, a member of class TDecisionPivot.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
R	Extras (see page 17710)	This is Extras, a member of class TDecisionPivot.
	FullRepaint (see page 12545)	Determines how the panel repaints itself when it is resized.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	Locked (see page 12545)	Determines whether a panel that is used as a toolbar is replaced by a toolbar supplied by an OLE server.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	Pages (see page 17713)	This is Pages, a member of class TDecisionPivot.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
R	Rows (see page 17719)	This is Rows, a member of class TDecisionPivot.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	VerticalAlignment (see page 12547)	Sets the vertical position of the caption.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.

	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 17691)	Creates and initializes an instance of TDecisionPivot (see page 17680).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 17692)	Destroys an instance of TDecisionPivot (see page 17680).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
V	GetControlsAlignment (see page 12538)	Returns the alignment of text in the panel.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.

V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 17695)	Resizes the decision pivot.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.

	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentBackground (see page 12546)	Determines whether control uses parent's theme background.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnClick (see page 17724)	Occurs when the user clicks the control.
	OnDblClick (see page 17726)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 17726)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 17728)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 17731)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 17732)	Occurs when a control receives the input focus.
	OnExit (see page 17734)	Occurs when the input focus shifts away from one control to another.
	OnResize (see page 17736)	Occurs immediately after the control is resized.
	OnStartDrag (see page 17737)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 17696)	Determines how the control aligns within its container (parent control).
	Alignment (see page 17700)	Determines how the caption is aligned within the panel.
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	BevelInner (see page 17700)	Determines the style of the inner bevel of a panel.
	BevelOuter (see page 17701)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 17702)	Determines the width, in pixels, of both the inner and outer bevels of a panel.
	BorderStyle (see page 17703)	Determines whether a line is drawn around the perimeter of the decision pivot.
	BorderWidth (see page 17704)	Specifies the distance, in pixels, between the outer and inner bevels.

	ButtonAutoSize (see page 17704)	Specifies whether the dimension buttons resize automatically when the decision pivot resizes.
	ButtonHeight (see page 17705)	Specifies the height, in pixels, of the dimension buttons.
	ButtonSpacing (see page 17705)	Specifies the number of pixels that appear between dimension buttons.
	ButtonWidth (see page 17705)	Specifies the width, in pixels, of the dimension buttons.
	Color (see page 17706)	Specifies the background color of the control.
	Ctl3D (see page 17707)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DecisionSource (see page 17707)	Specifies the decision source object that the decision pivot controls.
	DragCursor (see page 17708)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 17708)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 17710)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 17710)	Controls the attributes of text written on or in the control.
	GroupLayout (see page 17711)	Specifies how the dimension buttons and summary control are arranged on the decision pivot.
	Groups (see page 17712)	Specifies which controls appear in a decision pivot.
	GroupSpacing (see page 17712)	Determines the number of pixels that appear between control groups.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentColor (see page 17713)	Determines where a control looks for its color information.
	ParentCtl3D (see page 17713)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 17714)	Determines where a control looks for its font information.
	ParentShowHint (see page 17714)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 17715)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 17720)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 17721)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 17722)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 17722)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

110.1.1.2 TDecisionPivot.Create Constructor

Creates and initializes an instance of TDecisionPivot (see page 17680).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDecisionPivot(TComponent * AOwner);
```

Description

Call Create to instantiate a decision pivot at runtime. Decision pivots placed on forms at design time are created Pass a single Component as a parameter to provide the decision pivot with an Owner that is responsible for freeing it.

See Also

Owner (see page 2807)

Destroy (see page 17692)

110.1.1.3 TDecisionPivot.Destroy Destructor

Destroys an instance of TDecisionPivot (see page 17680).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDecisionPivot();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the decision pivot reference is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

110.1.1.4 TDecisionPivot Methods

The methods of the TDecisionPivot class are listed here.

Protected Methods

	Name	Description
V	AdjustClientRect (see page 17692)	Adjusts the ClientRect property for the idiosyncrasies of the window.
	DimStateChange (see page 17693)	This is DimStateChange, a member of class TDecisionPivot.
	GetBorderStyle (see page 17693)	This is GetBorderStyle, a member of class TDecisionPivot.
	GetBorderWidth (see page 17693)	This is GetBorderWidth, a member of class TDecisionPivot.
	NewDimLayout (see page 17694)	This is NewDimLayout, a member of class TDecisionPivot.
	NewPanelSetup (see page 17694)	This is NewPanelSetup, a member of class TDecisionPivot.
V	Notification (see page 17694)	Responds to notifications that components are being created or destroyed.
	SetBorderStyle (see page 17695)	This is SetBorderStyle, a member of class TDecisionPivot.
	SetBorderWidth (see page 17695)	This is SetBorderWidth, a member of class TDecisionPivot.

Public Methods

	Name	Description
V	SetBounds (see page 17695)	Resizes the decision pivot.

110.1.1.4.1 TDecisionPivot.AdjustClientRect Method

Adjusts the ClientRect property for the idiosyncrasies of the window.

Pascal

```
procedure AdjustClientRect(var Rect: TRect); override;
```

C++

```
virtual __fastcall AdjustClientRect(TRect Rect);
```

Description

AdjustClientRect is called internally when the panel needs accurate information on where to place child controls within the client area. AdjustClientRect reduces ClientRect by the width of the inner and outer bevels so that child objects are not placed on the beveled region.

See Also

ClientRect

Controls (see page 6197)

110.1.1.4.2 TDecisionPivot.DimStateChange Method

Pascal

```
procedure DimStateChange(iDim: Integer);
```

C++

```
__fastcall DimStateChange(int iDim);
```

Description

This is DimStateChange, a member of class TDecisionPivot.

110.1.1.4.3 TDecisionPivot.GetBorderStyle Method

Pascal

```
function GetBorderStyle: TBorderStyle;
```

C++

```
__fastcall TBorderStyle GetBorderStyle();
```

Description

This is GetBorderStyle, a member of class TDecisionPivot.

110.1.1.4.4 TDecisionPivot.GetBorderWidth Method

Pascal

```
function GetBorderWidth: TBorderWidth;
```

C++

```
__fastcall TBorderWidth GetBorderWidth();
```

Description

This is GetBorderWidth, a member of class TDecisionPivot.

110.1.1.4.5 TDecisionPivot.NewDimLayout Method

Pascal

```
procedure NewDimLayout;
```

C++

```
__fastcall NewDimLayout();
```

Description

This is NewDimLayout, a member of class TDecisionPivot.

110.1.1.4.6 TDecisionPivot.NewPanelSetup Method

Pascal

```
procedure NewPanelSetup;
```

C++

```
__fastcall NewPanelSetup();
```

Description

This is NewPanelSetup, a member of class TDecisionPivot.

110.1.1.4.7 TDecisionPivot.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu (see page 5835)

Notification (see page 2783)

110.1.1.4.8 TDecisionPivot.SetBorderStyle Method

Pascal

```
procedure SetBorderStyle(Value: TBorderStyle);
```

C++

```
__fastcall SetBorderStyle(TBorderStyle Value);
```

Description

This is SetBorderStyle, a member of class TDecisionPivot.

110.1.1.4.9 TDecisionPivot.SetBorderWidth Method

Pascal

```
procedure SetBorderWidth(Value: TBorderWidth);
```

C++

```
__fastcall SetBorderWidth(TBorderWidth Value);
```

Description

This is SetBorderWidth, a member of class TDecisionPivot.

110.1.1.4.10 TDecisionPivot.SetBounds Method

Resizes the decision pivot.

Pascal

```
procedure SetBounds(Left: Integer; Top: Integer; Height: Integer; Width: Integer); override;
```

C++

```
virtual __fastcall SetBounds(int Left, int Top, int Height, int Width);
```

Description

Use SetBounds to change all of the decision pivot's boundary properties at once. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately. By setting all four properties at once, SetBounds ensures that the control will not repaint between changes. Specify the values for the Left, Top, Width, and Height properties as the value of the Left, Top, Width, and Height parameters, respectively.

SetBounds overrides the inherited method to adjust the layout of the buttons in the decision pivot when the size changes.

See Also

ButtonAutoSize (see page 17704)

Height (see page 5825)

Left (see page 5830)

Top (see page 5844)

Width (see page 5849)

110.1.1.5 TDecisionPivot Properties

The properties of the TDecisionPivot class are listed here.

Protected Properties

	Name	Description
R	Cols (see page 17707)	This is Cols, a member of class TDecisionPivot.
R	Extras (see page 17710)	This is Extras, a member of class TDecisionPivot.
R	Pages (see page 17713)	This is Pages, a member of class TDecisionPivot.
R	Rows (see page 17719)	This is Rows, a member of class TDecisionPivot.

Published Properties

	Name	Description
	Align (see page 17696)	Determines how the control aligns within its container (parent control).
	Alignment (see page 17700)	Determines how the caption is aligned within the panel.
	BevelInner (see page 17700)	Determines the style of the inner bevel of a panel.
	BevelOuter (see page 17701)	Determines the style of the outer bevel of a panel.
	BevelWidth (see page 17702)	Determines the width, in pixels, of both the inner and outer bevels of a panel.
	BorderStyle (see page 17703)	Determines whether a line is drawn around the perimeter of the decision pivot.
	BorderWidth (see page 17704)	Specifies the distance, in pixels, between the outer and inner bevels.
	ButtonAutoSize (see page 17704)	Specifies whether the dimension buttons resize automatically when the decision pivot resizes.
	ButtonHeight (see page 17705)	Specifies the height, in pixels, of the dimension buttons.
	ButtonSpacing (see page 17705)	Specifies the number of pixels that appear between dimension buttons.
	ButtonWidth (see page 17705)	Specifies the width, in pixels, of the dimension buttons.
	Color (see page 17706)	Specifies the background color of the control.
	Ctl3D (see page 17707)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DecisionSource (see page 17707)	Specifies the decision source object that the decision pivot controls.
	DragCursor (see page 17708)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 17708)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 17710)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 17710)	Controls the attributes of text written on or in the control.
	GroupLayout (see page 17711)	Specifies how the dimension buttons and summary control are arranged on the decision pivot.
	Groups (see page 17712)	Specifies which controls appear in a decision pivot.
	GroupSpacing (see page 17712)	Determines the number of pixels that appear between control groups.
	ParentColor (see page 17713)	Determines where a control looks for its color information.
	ParentCtl3D (see page 17713)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 17714)	Determines where a control looks for its font information.
	ParentShowHint (see page 17714)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 17715)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 17720)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 17721)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 17722)	Determines if the user can tab to a control.
	Visible (see page 17722)	Determines whether the component appears onscreen.

110.1.1.5.1 TDecisionPivot.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
```

```
of the control it will resize.
}

Anchors (see page 5802)

110.1.1.5.2 TDecisionPivot.Alignment Property

Determines how the caption is aligned within the panel.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

Use the Alignment property to specify if the caption of a panel appears on the left, right, or center of the panel. For example, to use a panel as a status bar that displays the TApplication. ::Hint property as the panel's Caption property, set Alignment to taLeftJustify to place the hint text on the left side of the panel.

Note: Use the VerticalAlignment property to control the vertical position of the caption.

See Also

Hint (see page 13712)

Caption (see page 5806)

110.1.1.5.3 TDecisionPivot.BevelInner Property

Determines the style of the inner bevel of a panel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TPanelBevel BevelInner;__property TBevelCut BevelInner;
```

Description

Use BevelInner to provide the panel with a three-dimensional beveled look. A panel component has two bevels, an outer bevel drawn next to the border of the control, and an inner bevel drawn inside the outer bevel, separated by the number of pixels specified in the BorderWidth property. The width of the bevels, if they are drawn, is the BevelWidth property.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

BevelOuter (see page 12541)

BevelWidth (see page 12542)

BorderWidth (see page 12543)

110.1.1.5.4 TDecisionPivot.BevelOuter Property

Determines the style of the outer bevel of a panel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TPanelBevel BevelOuter;__property TBevelCut BevelOuter;
```

Description

Use BevelOuter to provide the panel with a three-dimensional beveled look. A panel component has two bevels, an outer bevel drawn next to the border of the control, and an inner bevel drawn inside the outer bevel, separated by the number of pixels specified in the BorderWidth property. The width of the outer bevel is specified in the BevelWidth property in pixels.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

BevelInner (see page 12540)

BevelWidth (see page 12542)

BorderWidth (see page 12543)

110.1.1.5.5 TDecisionPivot.BevelWidth Property

Determines the width, in pixels, of both the inner and outer bevels of a panel.

Pascal

```
property BevelWidth: TBevelWidth;
```

C++

```
__property TBevelWidth BevelWidth;__property TBevelWidth BevelWidth;
```

Description

Use BevelWidth to specify how wide the inner or outer bevel should be. Do not confuse BevelWidth, which is the width of the bevels, with BorderWidth, which is the space between the bevels.

If both the BevelInner and BevelOuter properties are bvNone, BevelWidth has no effect. To remove both bevels, set the BevelInner and BevelOuter properties to bvNone, rather than setting the BevelWidth to 0, as this involves less overhead when painting.

C++ Examples:

```
/*
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
*/
void __fastcall TForm1::CreateStatusLineClick(TObject *Sender)
{
  Panel1->Align = alBottom;
  Panel1->BevelInner = bvLowered;
  Panel1->BevelOuter = bvRaised;
  Panel1->BorderWidth = 1;
  Panel1->BevelWidth = 1;
}
```

Delphi Examples:

```
{
This example uses a panel component and a button named
CreateStatusLine on a form. The code moves the panel to the
bottom of the form when the user clicks the button and gives
the panel the appearance of a status line by changing the
value of the BevelInner, BevelOuter, BevelWidth, and
BorderWidth properties.
}
procedure TForm1.CreateStatusLineClick(Sender: TObject);
begin
  with Panel1 do
  begin
    Align := alBottom;
    BevelInner := bvLowered;
    BevelOuter := bvRaised;
    BorderWidth := 1;
    BevelWidth := 1;
  end;
end;
```

See Also

BevelInner (see page 12540)

BevelOuter (see page 12541)

BorderWidth (see page 12543)

110.1.1.5.6 TDecisionPivot.BorderStyle Property

Determines whether a line is drawn around the perimeter of the decision pivot.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Use BorderStyle to specify whether the decision pivot has a single line drawn around it. When BorderStyle is bsSingle, a single line is drawn around the panel outside of the outer bevel.

Note: Do not confuse the line drawn around the decision pivot with the BorderWidth (see page 17704) property. The BorderWidth (see page 17704) is the distance between the outer and inner bevels.

See Also

BorderWidth (see page 17704)

110.1.1.5.7 TDecisionPivot.BorderWidth Property

Specifies the distance, in pixels, between the outer and inner bevels.

Pascal

```
property BorderWidth: TBorderWidth;
```

C++

```
__property TBorderWidth BorderWidth;
```

Description

Use BorderWidth to specify how wide the border around the decision pivot should be. A value of 0 means no border should appear.

The border of the decision pivot is the area between the outer and inner bevels. It is visible only if the inner bevel is raised or lowered, but affects the inset of the controls in the pivot even if BevelInner (see page 17700) is bvNone.

Do not confuse the border of the pivot with line drawn around it. The line around the pivot is specified by the BorderStyle (see page 17703) property.

See Also

BorderStyle (see page 17703)

BevelInner (see page 12540)

BevelOuter (see page 12541)

110.1.1.5.8 TDecisionPivot.ButtonAutoSize Property

Specifies whether the dimension buttons resize automatically when the decision pivot resizes.

Pascal

```
property ButtonAutoSize: Boolean;
```

C++

```
__property Boolean ButtonAutoSize;
```

Description

Set ButtonAutoSize to true to cause the dimension buttons to expand and contract automatically when the size of the decision

pivot changes. Set ButtonAutoSize to false to specify fixed size buttons.

Note: The value of ButtonAutoSize is ignored when GroupLayout (see page 17711) is xtTopLeft.

See Also

ButtonHeight (see page 17705)

ButtonWidth (see page 17705)

GroupLayout (see page 17711)

110.1.1.5.9 TDecisionPivot.ButtonHeight Property

Specifies the height, in pixels, of the dimension buttons.

Pascal

```
property ButtonHeight: Integer;
```

C++

```
__property int ButtonHeight;
```

Description

Use ButtonHeight to determine the Height of the dimension buttons. Do not set ButtonHeight when the ButtonAutoSize (see page 17704) property is true. When ButtonAutoSize (see page 17704) is true, the height of the buttons is reset automatically whenever the layout of the decision pivot changes.

See Also

ButtonAutoSize (see page 17704)

ButtonWidth (see page 17705)

110.1.1.5.10 TDecisionPivot.ButtonSpacing Property

Specifies the number of pixels that appear between dimension buttons.

Pascal

```
property ButtonSpacing: Integer;
```

C++

```
__property int ButtonSpacing;
```

Description

Set ButtonSpacing to control the spacing between the buttons in a single group. Increase ButtonSpacing to make a decision pivot look less crowded. Decrease ButtonSpacing to make the row and column groups look more compact.

See Also

GroupSpacing (see page 17712)

110.1.1.5.11 TDecisionPivot.ButtonWidth Property

Specifies the width, in pixels, of the dimension buttons.

Pascal

```
property ButtonWidth: Integer;
```

C++

```
__property int ButtonWidth;
```

Description

Use ButtonWidth to determine the Width of the dimension buttons. Do not set ButtonWidth when the ButtonAutoSize (see page 17704) property is true. When ButtonAutoSize (see page 17704) is true, the width of the buttons is reset automatically whenever the layout of the decision pivot changes.

See Also

ButtonAutoSize (see page 17704)

ButtonHeight (see page 17705)

110.1.1.5.12 TDecisionPivot.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
```

```
end;
```

See Also

ParentColor (see page 5834)

110.1.1.5.13 TDecisionPivot.Cols Property

Pascal

```
property Cols: Integer;
```

C++

```
__property int Cols;
```

Description

This is Cols, a member of class TDecisionPivot.

110.1.1.5.14 TDecisionPivot.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

110.1.1.5.15 TDecisionPivot.DecisionSource Property

Specifies the decision source object that the decision pivot controls.

Pascal

```
property DecisionSource: TDecisionSource;
```

C++

```
__property TDecisionSource DecisionSource;
```

Description

Set DecisionSource to link the decision pivot to a decision source component. The controls in the decision pivot change the pivot state of the decision source.

The pivot state of the decision source can also change in response to another control, such as a decision grid. When the pivot state of the decision source changes, the decision pivot updates the layout of the dimension buttons and the selection in the summary combo box.

See Also

TDecisionGrid (see page 17586)

110.1.1.5.16 TDecisionPivot.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

110.1.1.5.17 TDecisionPivot.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
```

```
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}

Arranging the Order of Persistent Columns

110.1.1.5.18 TDecisionPivot.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

Enabling Mouse

110.1.1.5.19 TDecisionPivot.Extras Property

Pascal

```
property Extras: Integer;
```

C++

```
__property int Extras;
```

Description

This is Extras, a member of class TDecisionPivot.

110.1.1.5.20 TDecisionPivot.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

110.1.1.5.21 TDecisionPivot.GroupLayout Property

Specifies how the dimension buttons and summary control are arranged on the decision pivot.

Pascal

```
property GroupLayout: TDecisionButtonPosition;
```

C++

```
__property TDecisionButtonPosition GroupLayout;
```

Description

Set Layout to specify the organization of a decision pivot. Layout can have one of the following values:

Value	Meaning
xtHorizontal	The controls in the pivot are lined up side by side.
xtVertical	The controls in the pivot are lined up top to bottom.
xtLeftTop	The controls in the pivot are lined up along the edges of the pivot, with the row dimensions down the left side, the column dimensions along the top, and the summary control in the upper left corner.

When Layout is xtLeftTop, the center of the decision pivot is empty. A decision graph or decision grid can be placed in this empty spot so that the buttons line up with the dimensions they control.

When Layout is xtHorizontal or xtVertical, the summary control appears first, followed by a the row dimensions and then the column dimensions. The Groups (see page 17712) property can omit any of these from the layout.

See Also

Groups (see page 17712)

110.1.1.5.22 TDecisionPivot.Groups Property

Specifies which controls appear in a decision pivot.

Pascal

```
property Groups: TDecisionPivotOptions;
```

C++

```
__property TDecisionPivotOptions Groups;
```

Description

Set Groups to limit the types of controls that appear in the decision pivot. This allows greater flexibility over where the controls appear in a form. For example, a form can contain three decision pivots: one containing only row dimension buttons, one containing only column dimension buttons, and one containing only the summary selection combo box. These three pivots can then be arranged anywhere on the form.

Groups is a set containing one or more of the following values:

Value	Meaning
xtRows	The pivot contains row dimension buttons.
xtColumns	The pivot contains column dimension buttons.
xtSummaries	The pivot contains a summary selection combo box.

See Also

GroupLayout (see page 17711)

110.1.1.5.23 TDecisionPivot.GroupSpacing Property

Determines the number of pixels that appear between control groups.

Pascal

```
property GroupSpacing: Integer;
```

C++

```
__property int GroupSpacing;
```

Description

Set GroupSpacing to control the spaces that appear between the summary combo box, the group of row dimension buttons, and the group of column dimension buttons. Increase GroupSpacing to make the groups of controls appear more distinct. Decrease GroupSpacing to make the decision pivot look more compact.

See Also

ButtonSpacing (see page 17705)

Groups (see page 17712)

110.1.1.5.24 TDecisionPivot.Pages Property

Pascal

```
property Pages: Integer;
```

C++

```
__property int Pages;
```

Description

This is Pages, a member of class TDecisionPivot.

110.1.1.5.25 TDecisionPivot.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

110.1.1.5.26 TDecisionPivot.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

110.1.1.5.27 TDecisionPivot.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

110.1.1.5.28 TDecisionPivot.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

ParentFont (see page 5834)

ShowHint (see page 5840)

110.1.1.5.29 TDecisionPivot.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
```

```
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Cut1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->CutToClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Paste1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->PasteFromClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }
  /*
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  */
  void __fastcall TForm1::AddButtonClick(TObject *Sender)
  {
      const int num_items = 4;
      for (int index = 0; index < num_items; ++index)
      {
          TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
          PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
          NewItem->Caption = "Menu Item " + IntToStr(index);
          NewItem->Tag = index;
          NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
          TNotifyEvent();
      }
  }

  void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
  {
      TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
      if (ClickedItem)
      {
          switch (ClickedItem->Tag)
          {
```

```
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
```

```
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

110.1.1.5.30 TDecisionPivot.Rows Property

Pascal

```
property Rows: Integer;
```

C++

```
__property int Rows;
```

Description

This is Rows, a member of class TDecisionPivot.

110.1.1.5.31 TDecisionPivot.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

ShowHint (see page 13721)

Displaying Fly-over Help

110.1.1.5.32 TDecisionPivot.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

110.1.1.5.33 TDecisionPivot.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

110.1.1.5.34 TDecisionPivot.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
```

```
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

110.1.1.6 TDecisionPivot Events

The events of the TDecisionPivot class are listed here.

Published Events

	Name	Description
	OnClick (see page 17724)	Occurs when the user clicks the control.
	OnDblClick (see page 17726)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 17726)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 17728)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 17731)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 17732)	Occurs when a control receives the input focus.
	OnExit (see page 17734)	Occurs when the input focus shifts away from one control to another.
	OnResize (see page 17736)	Occurs immediately after the control is resized.
	OnStartDrag (see page 17737)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

110.1.1.6.1 TDecisionPivot.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
```

```
    PageControl1Change(Sender);
end;
```

110.1.1.6.2 TDecisionPivot.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

110.1.1.6.3 TDecisionPivot.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
```

```
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
```

```
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

110.1.1.6.4 TDecisionPivot.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
```

```
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

110.1.1.6.5 TDecisionPivot.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
```

```
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

110.1.1.6.6 TDecisionPivot.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;
```

```
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;
```

```
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

110.1.1.6.7 TDecisionPivot.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
```

```
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

See Also

OnEnter (see page 6219)

ActiveControl (see page 13896)

110.1.1.6.8 TDecisionPivot.OnResize Event

Occurs immediately after the control is resized.

Pascal

```
property OnResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnResize;
```

Description

Use OnResize to make any final adjustments after a control is resized.

To modify the way a control responds when an attempt is made to resize it, use OnCanResize or OnConstrainedResize.

Note: Some controls call this event handler when the control is first created.

Delphi Examples:

```
{
The following code keeps the right edge on Button1 against
the right edge of Form1 when Form1 is resized.
}
procedure TForm1.FormResize(Sender: TObject);
begin
  Button1.Left := Form1.ClientWidth-Button1.Width;
end;
```

AutoSize (see page 5803)

OnConstrainedResize (see page 5853)

110.1.1.6.9 TDecisionPivot.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

110.1.2 TPivotDataLink Class

Class Hierarchy

Pascal

```
TPivotDataLink = class(TDecisionDataLink);
```

C++

```
class TPivotDataLink : public TDecisionDataLink;
```

File

MXPIVSRC

Description

This is class MXPIVSRC.TPivotDataLink.

110.1.2.1 TPivotDataLink Members

The following tables list the members exposed by TPivotDataLink.

Protected Fields

	Name	Description
	FBlocked (see page 17460)	This is FBlocked, a member of class TDecisionDataLink.
	FDecisionSource (see page 17461)	This is FDecisionSource, a member of class TDecisionDataLink.

Protected Methods

	Name	Description
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	DecisionDataEvent (see page 17739)	This is DecisionDataEvent, a member of class TPivotDataLink.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetDecisionSource (see page 17461)	This is SetDecisionSource, a member of class TDecisionDataLink.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 17739)	This is Create, a member of class TPivotDataLink.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 17739)	Destroys the TPersistent instance and frees its memory.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	DecisionSource (see page 17462)	This is DecisionSource, a member of class TDecisionDataLink.

110.1.2.2 TPivotDataLink.Create Constructor

Pascal

```
constructor Create(aPivot: TDecisionPivot);
```

C++

```
__fastcall TPivotDataLink(TDecisionPivot aPivot);
```

Description

This is Create, a member of class TPivotDataLink.

110.1.2.3 TPivotDataLink.Destroy Destructor

Destroys the TPersistent instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPivotDataLink();
```

Description

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

Free (see page 22300)

Destroy (see page 22287)

110.1.2.4 TPivotDataLink Methods

The methods of the TPivotDataLink class are listed here.

Protected Methods

	Name	Description
	DecisionDataEvent (see page 17739)	This is DecisionDataEvent, a member of class TPivotDataLink.

110.1.2.4.1 TPivotDataLink.DecisionDataEvent Method

Pascal

```
procedure DecisionDataEvent(Event: TDecisionDataEvent); override;
```

C++

```
virtual __fastcall DecisionDataEvent(TDecisionDataEvent Event);
```

Description

This is DecisionDataEvent, a member of class TPivotDataLink.

110.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TDecisionButtonPosition (see page 17741)	This is record MXPIVSRC.TDecisionButtonPosition.
	TDecisionPivotOption (see page 17741)	This is record MXPIVSRC.TDecisionPivotOption.

110.2.1 MXPIVSRC.TDecisionButtonPosition Enumeration

Pascal

```
TDecisionButtonPosition = (
  xtHorizontal,
  xtVertical,
  xtLeftTop
);
```

C++

```
enum TDecisionButtonPosition {
  xtHorizontal,
  xtVertical,
  xtLeftTop
};
```

File

MXPIVSRC

Description

This is record MXPIVSRC.TDecisionButtonPosition.

110.2.2 MXPIVSRC.TDecisionPivotOption Enumeration

Pascal

```
TDecisionPivotOption = (
  xtRows,
  xtColumns,
  xtSummaries
);
```

C++

```
enum TDecisionPivotOption {
  xtRows,
  xtColumns,
  xtSummaries
};
```

File

MXPIVSRC

Description

This is record MXPIVSRC.TDecisionPivotOption.

110.3 Types

The following table lists types in this documentation.

Types

Name	Description
TDecisionPivotOptions (see page 17743)	This is type MXPIVSRC.TDecisionPivotOptions.

110.3.1 MXPIVSRC.TDecisionPivotOptions Type

Pascal

```
TDecisionPivotOptions = set of TDecisionPivotOption;
```

C++

```
TDecisionPivotOption TDecisionPivotOptions;
```

File

MXPIVSRC

Description

This is type MXPIVSRC.TDecisionPivotOptions.

111 Mxstore Namespace

This is namespace Mxstore.

Topics

Name	Description
Classes (see page 17747)	The following table lists classes in this documentation.
Functions (see page 17836)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 17837)	The following table lists structs, records, enums in this documentation.
Types (see page 17843)	The following table lists types in this documentation.
Constants (see page 17849)	The following table lists constants in this documentation.

Classes

	Name	Description
	ECacheError (see page 17747)	ECacheError is the exception class for failures that occur when building the cache of a decision cube.
	TAggDefinition (see page 17748)	This is class Mxstore.TAggDefinition.
	TBuilderDim (see page 17749)	This is class Mxstore.TBuilderDim.
	TCubeDim (see page 17754)	TCubeDim represents an entry in the dimension map of a decision cube.
	TCubeDims (see page 17766)	TCubeDims is a collection of TCubeDim (see page 17754) objects.
	TCustomDataStore (see page 17772)	TCustomDataStore is the base class for components that analyze and maintain crosstabulated data.
	TDataCache (see page 17797)	This is class Mxstore.TDataCache.
	TDimension (see page 17809)	This is class Mxstore.TDimension.
	TFieldDefinition (see page 17814)	This is class Mxstore.TFieldDefinition.
	TIndexInfo (see page 17818)	This is class Mxstore.TIndexInfo.
	TMultiDimDataLink (see page 17822)	This is class Mxstore.TMultiDimDataLink.
	TSummary (see page 17828)	This is class Mxstore.TSummary.

Constants

Name	Description
LargeValueCount (see page 17849)	This is constant Mxstore.LargeValueCount.
MaxBinDimensions (see page 17849)	This is constant Mxstore.MaxBinDimensions.
NonSparseAgg (see page 17850)	This is constant Mxstore.NonSparseAgg.
SparseAgg (see page 17850)	This is constant Mxstore.SparseAgg.
SparseSum (see page 17850)	This is constant Mxstore.SparseSum.
SparseUnknown (see page 17851)	This is constant Mxstore.SparseUnknown.

SubTotal (see page 17851)	This is constant Mxstore.SubTotal.

Functions

	Name	Description
	TestMatch (see page 17836)	This is function Mxstore.TestMatch.

Structs, Records, Enums

	Name	Description
	TBuildType (see page 17837)	This is record Mxstore.TBuildType.
	TCacheStateFlags (see page 17837)	This is record Mxstore.TCacheStateFlags.
	TCalcTotalsFlags (see page 17838)	This is record Mxstore.TCalcTotalsFlags.
	TCubeDataState (see page 17838)	This is record Mxstore.TCubeDataState.
	TCubeState (see page 17839)	This is record Mxstore.TCubeState.
	TErrorAction (see page 17839)	This is record Mxstore.TErrorAction.
	TFormatType (see page 17840)	This is record Mxstore.TFormatType.
	TIndexFlag (see page 17840)	This is record Mxstore.TIndexFlag.
	TIndexInfoRec (see page 17841)	This is record Mxstore.TIndexInfoRec.
	TLookupStateFlags (see page 17841)	This is record Mxstore.TLookupStateFlags.

Types

Name	Description
PIndexInfoRec (see page 17843)	This is type Mxstore.PIndexInfoRec.
TAggProc (see page 17843)	This is type Mxstore.TAggProc.
TCacheState (see page 17844)	This is type Mxstore.TCacheState.
TCalcTotals (see page 17844)	This is type Mxstore.TCalcTotals.
TCapacityErrorEvent (see page 17844)	This is type Mxstore.TCapacityErrorEvent.
TCubeDimClass (see page 17845)	This is type Mxstore.TCubeDimClass.
TCubeDimTransformEvent (see page 17845)	This is type Mxstore.TCubeDimTransformEvent.
TCubeNotifyEvent (see page 17845)	This is type Mxstore.TCubeNotifyEvent.
TCubeRefreshEvent (see page 17846)	This is type Mxstore.TCubeRefreshEvent.
TDerivedAggProc (see page 17846)	This is type Mxstore.TDerivedAggProc.
TDimFlagSet (see page 17846)	This is type Mxstore.TDimFlagSet.
TFieldArgs (see page 17847)	This is type Mxstore.TFieldArgs.
TIndexFlags (see page 17847)	This is type Mxstore.TIndexFlags.
TLookupState (see page 17847)	This is type Mxstore.TLookupState.
TSumMethod (see page 17848)	This is type Mxstore.TSumMethod.

111.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ECacheError (see page 17747)	ECacheError is the exception class for failures that occur when building the cache of a decision cube.
	TAggDefinition (see page 17748)	This is class Mxstore.TAggDefinition.
	TBuilderDim (see page 17749)	This is class Mxstore.TBuilderDim.
	TCubeDim (see page 17754)	TCubeDim represents an entry in the dimension map of a decision cube.
	TCubeDims (see page 17766)	TCubeDims is a collection of TCubeDim (see page 17754) objects.
	TCustomDataStore (see page 17772)	TCustomDataStore is the base class for components that analyze and maintain crosstabulated data.
	TDataCache (see page 17797)	This is class Mxstore.TDataCache.
	TDimension (see page 17809)	This is class Mxstore.TDimension.
	TFieldDefinition (see page 17814)	This is class Mxstore.TFieldDefinition.
	TIndexInfo (see page 17818)	This is class Mxstore.TIndexInfo.
	TMultiDimDataLink (see page 17822)	This is class Mxstore.TMultiDimDataLink.
	TSummary (see page 17828)	This is class Mxstore.TSummary.

111.1.1 ECacheError Class

ECacheError is the exception class for failures that occur when building the cache of a decision cube.

Class Hierarchy

Pascal

```
ECacheError = class(Exception);
```

C++

```
class ECacheError : public Exception;
```

File

Mxstore

Description

ECacheError is raised when

The dataset for a decision cube includes too many fields.

The dataset for a decision cube does not include the necessary summaries for computing a derived value such as an average.

A dimension item in the dimension map specifies a date range for dimension that does not represent a date or date-time field.

See Also

TDecisionCube (see page 17442)

111.1.2 TAggDefinition Class

Class Hierarchy

Mxstore.TAggDefinition

Pascal

```
TAggDefinition = class;
```

C++

```
class TAggDefinition;
```

File

Mxstore

Description

This is class Mxstore.TAggDefinition.

111.1.2.1 TAggDefinition Members

The following tables list the members exposed by TAggDefinition.

Public Properties

	Name	Description
	AggProc (see page 17748)	This is AggProc, a member of class TAggDefinition.

111.1.2.2 TAggDefinition Properties

The properties of the TAggDefinition class are listed here.

Public Properties

	Name	Description
	AggProc (see page 17748)	This is AggProc, a member of class TAggDefinition.

111.1.2.2.1 TAggDefinition.AggProc Property

Pascal

```
property AggProc: TDerivedAggProc;
```

C++

```
__property TDerivedAggProc AggProc;
```

Description

This is AggProc, a member of class TAggDefinition.

111.1.3 TBuilderDim Class

Class Hierarchy

Pascal

```
TBuilderDim = class(TDimension);
```

C++

```
class TBuilderDim : public TDimension;
```

File

Mxstore

Description

This is class Mxstore.TBuilderDim.

111.1.3.1 TBuilderDim Members

The following tables list the members exposed by TBuilderDim.

Protected Methods

	Name	Description
	GetCompProc (see page 17330)	This is GetCompProc, a member of class TCustomArray.
	GetDups (see page 17331)	This is GetDups, a member of class TCustomArray.
	GetItem (see page 17332)	This is GetItem, a member of class TCustomArray.
	GetLastVal (see page 17751)	This is GetLastVal, a member of class TBuilderDim.
	GetMemberCount (see page 17332)	This is GetMemberCount, a member of class TCustomArray.
	GetSort (see page 17332)	This is GetSort, a member of class TCustomArray.
	SetCompProc (see page 17333)	This is SetCompProc, a member of class TCustomArray.
	SetDups (see page 17333)	This is SetDups, a member of class TCustomArray.
	SetItem (see page 17333)	This is SetItem, a member of class TCustomArray.
	SetLastVal (see page 17753)	This is SetLastVal, a member of class TBuilderDim.
	SetSort (see page 17334)	This is SetSort, a member of class TCustomArray.

Public Methods

	Name	Description
	Add (see page 17751)	This is Add, a member of class TBuilderDim.
	AddSummary (see page 17751)	This is AddSummary, a member of class TBuilderDim.
	Assign (see page 17330)	This is Assign, a member of class TCustomArray.
	AssignSorted (see page 17811)	This is AssignSorted, a member of class TDimension.
	ClearFlag (see page 17811)	This is ClearFlag, a member of class TDimension.
	ConvertVar (see page 17330)	This is ConvertVar, a member of class TCustomArray.
	Create (see page 17750)	This is Create, a member of class TBuilderDim.
V	Destroy (see page 17750)	This is Destroy, a member of class TBuilderDim.
	GetCurrency (see page 17331)	This is GetCurrency, a member of class TCustomArray.
	GetDouble (see page 17331)	This is GetDouble, a member of class TCustomArray.
	GetInteger (see page 17331)	This is GetInteger, a member of class TCustomArray.
	GetSumCount (see page 17752)	This is GetSumCount, a member of class TBuilderDim.
	GetSummary (see page 17752)	This is GetSummary, a member of class TBuilderDim.

	HasFlag (see page 17812)	This is HasFlag, a member of class TDimension.
	IndexOf (see page 17332)	This is IndexOf, a member of class TCustomArray.
	InitSummary (see page 17752)	This is InitSummary, a member of class TBuilderDim.
	IsBlank (see page 17332)	This is IsBlank, a member of class TCustomArray.
	IsString (see page 17812)	This is IsString, a member of class TDimension.
	MatchLastVal (see page 17752)	This is MatchLastVal, a member of class TBuilderDim.
V	MemoryUsage (see page 17333)	This is MemoryUsage, a member of class TCustomArray.
	SetFlag (see page 17812)	This is SetFlag, a member of class TDimension.
	SetRangeCounting (see page 17812)	This is SetRangeCounting, a member of class TDimension.
	SetSize (see page 17334)	This is SetSize, a member of class TCustomArray.

Public Properties

	Name	Description
W	Attributes (see page 17813)	This is Attributes, a member of class TDimension.
	BlankBoolVal (see page 17334)	This is BlankBoolVal, a member of class TCustomArray.
R	BlankCount (see page 17335)	This is BlankCount, a member of class TCustomArray.
	BlankDateVal (see page 17335)	This is BlankDateVal, a member of class TCustomArray.
	BlankStringVal (see page 17335)	This is BlankStringVal, a member of class TCustomArray.
	CompareProc (see page 17335)	This is CompareProc, a member of class TCustomArray.
R	DataType (see page 17335)	This is DataType, a member of class TCustomArray.
	DimensionName (see page 17813)	This is DimensionName, a member of class TDimension.
	Duplicates (see page 17336)	This is Duplicates, a member of class TCustomArray.
R	FieldDefinition (see page 17813)	This is FieldDefinition, a member of class TDimension.
	FieldName (see page 17813)	This is FieldName, a member of class TDimension.
	FieldType (see page 17814)	This is FieldType, a member of class TDimension.
	GroupBreak (see page 17753)	This is GroupBreak, a member of class TBuilderDim.
	Items (see page 17336)	This is Items, a member of class TCustomArray.
	LastVal (see page 17753)	This is LastVal, a member of class TBuilderDim.
R	List (see page 17336)	This is List, a member of class TCustomArray.
R	MemberCount (see page 17336)	This is MemberCount, a member of class TCustomArray.
	Position (see page 17814)	This is Position, a member of class TDimension.
	Range (see page 17814)	This is Range, a member of class TDimension.
	Sorted (see page 17337)	This is Sorted, a member of class TCustomArray.
R	SumCount (see page 17753)	This is SumCount, a member of class TBuilderDim.

111.1.3.2 TBuilderDim.Create Constructor

Pascal

```
constructor Create(Items: Cardinal; DataType: TFieldType);
```

C++

```
__fastcall TBuilderDim(unsigned Items, TFieldType DataType);
```

Description

This is Create, a member of class TBuilderDim.

111.1.3.3 TBuilderDim.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBuilderDim();
```

Description

This is Destroy, a member of class TBuilderDim.

111.1.3.4 TBuilderDim Methods

The methods of the TBuilderDim class are listed here.

Protected Methods

	Name	Description
	GetLastVal (see page 17751)	This is GetLastVal, a member of class TBuilderDim.
	SetLastVal (see page 17753)	This is SetLastVal, a member of class TBuilderDim.

Public Methods

	Name	Description
	Add (see page 17751)	This is Add, a member of class TBuilderDim.
	AddSummary (see page 17751)	This is AddSummary, a member of class TBuilderDim.
	GetSumCount (see page 17752)	This is GetSumCount, a member of class TBuilderDim.
	GetSummary (see page 17752)	This is GetSummary, a member of class TBuilderDim.
	InitSummary (see page 17752)	This is InitSummary, a member of class TBuilderDim.
	MatchLastVal (see page 17752)	This is MatchLastVal, a member of class TBuilderDim.

111.1.3.4.1 TBuilderDim.Add Method

Pascal

```
procedure Add(Value: Variant);
```

C++

```
__fastcall Add(Variant Value);
```

Description

This is Add, a member of class TBuilderDim.

111.1.3.4.2 TBuilderDim.AddSummary Method

Pascal

```
procedure AddSummary(Value: Variant);
```

C++

```
__fastcall AddSummary(Variant Value);
```

Description

This is AddSummary, a member of class TBuilderDim.

111.1.3.4.3 TBuilderDim.GetLastVal Method

Pascal

```
function GetLastVal: Variant;
```

C++

```
__fastcall Variant GetLastVal();
```

Description

This is GetLastVal, a member of class TBuilderDim.

111.1.3.4.4 TBuilderDim.GetSumCount Method

Pascal

```
function GetSumCount: Integer;
```

C++

```
__fastcall int GetSumCount();
```

Description

This is GetSumCount, a member of class TBuilderDim.

111.1.3.4.5 TBuilderDim.GetSummary Method

Pascal

```
function GetSummary(Value: Variant): Variant;
```

C++

```
__fastcall Variant GetSummary(Variant Value);
```

Description

This is GetSummary, a member of class TBuilderDim.

111.1.3.4.6 TBuilderDim.InitSummary Method

Pascal

```
procedure InitSummary(DataType: Integer);
```

C++

```
__fastcall InitSummary(int DataType);
```

Description

This is InitSummary, a member of class TBuilderDim.

111.1.3.4.7 TBuilderDim.MatchLastVal Method

Pascal

```
function MatchLastVal(Value: Variant): Boolean;
```

C++

```
__fastcall Boolean MatchLastVal(Variant Value);
```

Description

This is MatchLastVal, a member of class TBuilderDim.

111.1.3.4.8 TBuilderDim.SetLastVal Method

Pascal

```
procedure SetLastVal(Value: Variant);
```

C++

```
__fastcall SetLastVal(Variant Value);
```

Description

This is SetLastVal, a member of class TBuilderDim.

111.1.3.5 TBuilderDim Properties

The properties of the TBuilderDim class are listed here.

Public Properties

	Name	Description
	GroupBreak (see page 17753)	This is GroupBreak, a member of class TBuilderDim.
	LastVal (see page 17753)	This is LastVal, a member of class TBuilderDim.
R	SumCount (see page 17753)	This is SumCount, a member of class TBuilderDim.

111.1.3.5.1 TBuilderDim.GroupBreak Property

Pascal

```
property GroupBreak: Boolean;
```

C++

```
__property Boolean GroupBreak;
```

Description

This is GroupBreak, a member of class TBuilderDim.

111.1.3.5.2 TBuilderDim.LastVal Property

Pascal

```
property LastVal: Variant;
```

C++

```
__property Variant LastVal;
```

Description

This is LastVal, a member of class TBuilderDim.

111.1.3.5.3 TBuilderDim.SumCount Property

Pascal

```
property SumCount: Integer;
```

C++

```
__property int SumCount;
```

Description

This is SumCount, a member of class TBuilderDim.

111.1.4 TCubeDim Class

TCubeDim represents an entry in the dimension map of a decision cube.

Class Hierarchy

System::TObject → Classes.TPersistent → Classes.TCollectionItem → MXCOMMON.TDimensionItem → Mxstore.TCubeDim

Pascal

```
TCubeDim = class(TDimensionItem);
```

C++

```
class TCubeDim : public TDimensionItem;
```

File

Mxstore

Description

Use TCubeDim to obtain information about the dimensions or summaries maintained by a decision cube. The decision cube maintains a collection of TCubeDim objects that describe the fields over which the information in the decision cube is summarized and the fields that supply those summarized values. The properties of TCubeDim can be used to change the display names of the dimensions of the decision cube, or to expand or collapse individual dimensions of the multidimensional array of values cached by the decision cube.

TCubeDim introduces properties and methods to allow a decision cube to include date ranges as the values along one of its dimensions.

See Also

TCubeDims (see page 17766)

TDecisionCube (see page 17442)

111.1.4.1 TCubeDim Members

The following tables list the members exposed by TCubeDim.

Protected Methods

	Name	Description
	AssignBinTypeFormat (see page 17758)	This is AssignBinTypeFormat, a member of class TCubeDim.
	AssignBinTypeTransform (see page 17758)	This is AssignBinTypeTransform, a member of class TCubeDim.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DataSetTransform (see page 17759)	This is DataSetTransform, a member of class TCubeDim.
V	DoTransform (see page 17759)	This is DoTransform, a member of class TCubeDim.
V	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetLoaded (see page 17760)	This is GetLoaded, a member of class TCubeDim.
V	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.

	InitializeRange (see page 17760)	This is InitializeRange, a member of class TCubeDim.
	MonthTransform (see page 17761)	This is MonthTransform, a member of class TCubeDim.
	NotifyCollection (see page 17761)	This is NotifyCollection, a member of class TCubeDim.
	QuarterTransform (see page 17761)	This is QuarterTransform, a member of class TCubeDim.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.
	SetLoaded (see page 17762)	This is SetLoaded, a member of class TCubeDim.
	YearTransform (see page 17762)	This is YearTransform, a member of class TCubeDim.

Protected Properties

	Name	Description
	Active (see page 17411)	This is Active, a member of class TDimensionItem.
	Dirty (see page 17764)	This is Dirty, a member of class TCubeDim.
R	Owner (see page 17414)	This is Owner, a member of class TDimensionItem.
	wasActive (see page 17766)	This is wasActive, a member of class TCubeDim.

Public Events

	Name	Description
	OnTransform (see page 17766)	This is OnTransform, a member of class TCubeDim.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 17757)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 17756)	Creates and initializes a TCollectionItem instance.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DefineProperties (see page 17759)	Designates methods for storing the dimension's unpublished data on a stream such as a form file.
	Destroy (see page 17757)	Destroys the TCollectionItem instance and frees its memory.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetBinValues (see page 17760)	Returns the set of values that are summarized by a single value along a dimension.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	IsBinData (see page 17761)	Indicates whether the dimension includes a member for every field value.
	IsDimension (see page 17409)	Indicates whether the dimension item represents a dimension.
	IsSummary (see page 17410)	Indicates whether the dimension item represents a summary.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	BinData (see page 17762)	Represents information about the implementation of paged dimensions.
	BinFormat (see page 17763)	Indicates how range values are formatted.
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
	Loaded (see page 17764)	Indicates whether the dimension item is currently cached by the decision cube.
	StartDate (see page 17765)	Determines how values are grouped along a dimension.
	StartValue (see page 17765)	Determines how values are grouped along a dimension.

Published Properties

	Name	Description
	ActiveFlag (see page 17411)	Indicates whether the dimension item is stored in the cache of a crosstabulated data store.
	BaseName (see page 17411)	Specifies the field name of the database field that is represented by or summarized in the dimension item.
	BinType (see page 17763)	Indicates how the values of the field represented by the dimension are grouped.
	DerivedFrom (see page 17412)	Specifies the index of a dimension item from which a derived value is calculated.
	DimensionType (see page 17412)	Indicates the use of the dimension item.
	Fieldname (see page 17413)	This is Fieldname, a member of class TDimensionItem.
	FieldType (see page 17413)	Indicates the data type of the field that the dimension item represents.
	Format (see page 17414)	Indicates how field values are formatted on dimensions that represent numeric or temporal data.
	Name (see page 17414)	Denotes the name of a dimension or summary.
	ValueCount (see page 17765)	Indicates the number of distinct values exist for the dimension.

111.1.4.2 TCubeDim.Create Constructor

Creates and initializes a TCollectionItem instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TCubeDim(TCollection Collection);
```

Description

Do not call Create to instantiate a collection item. Instead, call the Add method of the collection to which the item should belong.

Collection identifies the TCollection instance to which the new item belongs.

See Also

Add (see page 2736)

Collection (see page 2761)

111.1.4.3 TCubeDim.Destroy Destructor

Destroys the TCollectionItem instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCubeDim();
```

Description

Destroy is called indirectly by TCollection's Clear or Delete method.

See Also

Clear (see page 2741)

Delete (see page 2741)

Free (see page 22300)

111.1.4.4 TCubeDim Methods

The methods of the TCubeDim class are listed here.

Protected Methods

	Name	Description
	AssignBinTypeFormat (see page 17758)	This is AssignBinTypeFormat, a member of class TCubeDim.
	AssignBinTypeTransform (see page 17758)	This is AssignBinTypeTransform, a member of class TCubeDim.
	DataSetTransform (see page 17759)	This is DataSetTransform, a member of class TCubeDim.
V	DoTransform (see page 17759)	This is DoTransform, a member of class TCubeDim.
	GetLoaded (see page 17760)	This is GetLoaded, a member of class TCubeDim.
V	InitializeRange (see page 17760)	This is InitializeRange, a member of class TCubeDim.
	MonthTransform (see page 17761)	This is MonthTransform, a member of class TCubeDim.
V	NotifyCollection (see page 17761)	This is NotifyCollection, a member of class TCubeDim.
	QuarterTransform (see page 17761)	This is QuarterTransform, a member of class TCubeDim.
	SetLoaded (see page 17762)	This is SetLoaded, a member of class TCubeDim.
	YearTransform (see page 17762)	This is YearTransform, a member of class TCubeDim.

Public Methods

	Name	Description
V	Assign (see page 17757)	Copies the contents of another, similar object.
V	DefineProperties (see page 17759)	Designates methods for storing the dimension's unpublished data on a stream such as a form file.
	GetBinValues (see page 17760)	Returns the set of values that are summarized by a single value along a dimension.
	IsBinData (see page 17761)	Indicates whether the dimension includes a member for every field value.

111.1.4.4.1 TCubeDim.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Value: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Value);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo (see page 2931)

EConvertError (see page 22724)

111.1.4.4.2 TCubeDim.AssignBinTypeFormat Method

Pascal

```
function AssignBinTypeFormat(Bins: TBinType): string;
```

C++

```
__fastcall AnsiString AssignBinTypeFormat(TBinType Bins);
```

Description

This is AssignBinTypeFormat, a member of class TCubeDim.

111.1.4.4.3 TCubeDim.AssignBinTypeTransform Method

Pascal

```
function AssignBinTypeTransform(Bins: TBinType): TCubeDimTransformEvent;
```

C++

```
__fastcall TCubeDimTransformEvent AssignBinTypeTransform(TBinType Bins);
```

Description

This is AssignBinTypeTransform, a member of class TCubeDim.

111.1.4.4.4 TCubeDim.DataSetTransform Method

Pascal

```
procedure DataSetTransform(var Value: Variant; CubeDim: TCubeDim);
```

C++

```
__fastcall DataSetTransform(Variant Value, TCubeDim CubeDim);
```

Description

This is DataSetTransform, a member of class TCubeDim.

111.1.4.4.5 TCubeDim.DefineProperties Method

Designates methods for storing the dimension's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

Do not call DefineProperties. It is called automatically when forms or data modules containing the dimension's decision cube component are loaded or saved.

DefineProperties allows the dimension to load and save information as if it were a set of published property values. TCubeDim (see page 17754) uses this method to save some of its unpublished properties, including

an indication of whether the dimension is open or closed.

the public StartValue (see page 17765) property.

DefineProperties also allows the dimension to read information that was previously saved in other formats so as to preserve backward compatibility.

See Also

DefineProperties (see page 2931)

StartValue (see page 17765)

111.1.4.4.6 TCubeDim.DoTransform Method

Pascal

```
procedure DoTransform(var Value: Variant); virtual;
```

C++

```
virtual __fastcall DoTransform(Variant Value);
```

Description

This is DoTransform, a member of class TCubeDim.

111.1.4.4.7 TCubeDim.GetBinValues Method

Returns the set of values that are summarized by a single value along a dimension.

Pascal

```
function GetBinValues(Value: Variant): Variant;
```

C++

```
__fastcall Variant GetBinValues(Variant Value);
```

Description

Call GetBinValues to determine the actual values that underlie a single dimension member when the BinType (see page 17763) property is not binNone. The Value parameter is the single dimension member that represents a date range or the single value of a paged dimension. The value of Value can be obtained by calling the GetMemberAsVariant method of the decision cube or decision source.

If the BinType (see page 17763) property of the dimension is binYear, binQuarter, or binMonth, GetBinValues returns the starting and ending values of the range that includes the Value parameter. If the BinType (see page 17763) property is binSet, GetBinValues returns the single drilled value of the dimension.

See Also

BinType (see page 17763)

GetMemberAsVariant (see page 17782)

GetMemberAsVariant (see page 17478)

111.1.4.4.8 TCubeDim.GetLoaded Method

Pascal

```
function GetLoaded: Boolean;
```

C++

```
__fastcall Boolean GetLoaded();
```

Description

This is GetLoaded, a member of class TCubeDim.

111.1.4.4.9 TCubeDim.InitializeRange Method

Pascal

```
procedure InitializeRange; override;
```

C++

```
virtual __fastcall InitializeRange();
```

Description

This is InitializeRange, a member of class TCubeDim.

111.1.4.4.10 TCubeDim.IsBinData Method

Indicates whether the dimension includes a member for every field value.

Pascal

```
function IsBinData: Boolean;
```

C++

```
__fastcall Boolean IsBinData();
```

Description

Call IsBinData to determine if the dimension item represents a dimension of the decision cube that groups values into date ranges or represents a paged dimension. IsBinData returns true if the value of the BinType (see page 17763) property is not binNone.

See Also

BinType (see page 17763)

111.1.4.4.11 TCubeDim.MonthTransform Method

Pascal

```
procedure MonthTransform(var Value: Variant; CubeDim: TCubeDim);
```

C++

```
__fastcall MonthTransform(Variant Value, TCubeDim CubeDim);
```

Description

This is MonthTransform, a member of class TCubeDim.

111.1.4.4.12 TCubeDim.NotifyCollection Method

Pascal

```
procedure NotifyCollection(aType: TCDNotifyType); override;
```

C++

```
virtual __fastcall NotifyCollection(TCDNotifyType aType);
```

Description

This is NotifyCollection, a member of class TCubeDim.

111.1.4.4.13 TCubeDim.QuarterTransform Method

Pascal

```
procedure QuarterTransform(var Value: Variant; CubeDim: TCubeDim);
```

C++

```
__fastcall QuarterTransform(Variant Value, TCubeDim CubeDim);
```

Description

This is QuarterTransform, a member of class TCubeDim.

111.1.4.4.14 TCubeDim.SetLoaded Method

Pascal

```
procedure SetLoaded(Value: Boolean);
```

C++

```
__fastcall SetLoaded(Boolean Value);
```

Description

This is SetLoaded, a member of class TCubeDim.

111.1.4.4.15 TCubeDim.YearTransform Method

Pascal

```
procedure YearTransform(var Value: Variant; CubeDim: TCubeDim);
```

C++

```
__fastcall YearTransform(Variant Value, TCubeDim CubeDim);
```

Description

This is YearTransform, a member of class TCubeDim.

111.1.4.5 TCubeDim Properties

The properties of the TCubeDim class are listed here.

Protected Properties

	Name	Description
	Dirty (see page 17764)	This is Dirty, a member of class TCubeDim.
	wasActive (see page 17766)	This is wasActive, a member of class TCubeDim.

Public Properties

	Name	Description
R	BinData (see page 17762)	Represents information about the implementation of paged dimensions.
	BinFormat (see page 17763)	Indicates how range values are formatted.
	Loaded (see page 17764)	Indicates whether the dimension item is currently cached by the decision cube.
	StartDate (see page 17765)	Determines how values are grouped along a dimension.
	StartValue (see page 17765)	Determines how values are grouped along a dimension.

Published Properties

	Name	Description
	BinType (see page 17763)	Indicates how the values of the field represented by the dimension are grouped.
	ValueCount (see page 17765)	Indicates the number of distinct values exist for the dimension.

111.1.4.5.1 TCubeDim.BinData Property

Represents information about the implementation of paged dimensions.

Pascal

```
property BinData: TBinData;
```

C++

```
__property TBinData BinData;
```

Description

Do not use the BinData property. It is used internally to manage paged (permanently drilled) dimensions.

See Also

BinType (see page 17763)

111.1.4.5.2 TCubeDim.BinFormat Property

Indicates how range values are formatted.

Pascal

```
property BinFormat: string;
```

C++

```
__property AnsiString BinFormat;
```

Description

Set BinFormat to indicate how the labels for date ranges should appear. Use date and time formatting strings, such as those used with the FormatDateTime function.

See Also

BinType (see page 17763)

Format (see page 17414)

FormatDateTime (see page 22902)

111.1.4.5.3 TCubeDim.BinType Property

Indicates how the values of the field represented by the dimension are grouped.

Pascal

```
property BinType: TBinType;
```

C++

```
__property TBinType BinType;
```

Description

Set BinType to restrict the values that appear along the dimension. BinType can have one of the following values:

Value	Meaning
binNone	All values along the dimension appear.
binYear	Each cell along the dimension represents all field values that represent dates from the same year.
binQuarter	Each cell along the dimension represents all field values that represent dates from the same quarter.
binMonth	Each cell along the dimension represents all field values that represent dates from the same month.
binSet	The dimension is in a paged (permanently drilled) state. The drill-down value of the dimension can be changed, but the dimension can not be opened or closed.
binCustom	binCustom is not currently used but is provided to allow component writers to support other types of ranges.

If BinType is binYear, binQuarter, or binMonth, use the BinFormat (see page 17763) property to indicate how the values of the ranges along the dimension should be formatted.

If BinType is binSet, use the StartValue (see page 17765) property to specify which value along the dimension is used as the drill-down value. Unlike the drill-down value of a normal dimension, which is part of the pivot state stored by the decision source, the drill-down value of a paged dimension is the only value cached by the decision cube. Changing the drill-down value of paged dimensions causes the decision cube to rebuild its cache, which can be very time-consuming.

Note: When BinType is binSet, the dimension item consumes considerably less memory in the decision cube.

Note: Do not set BinType to binYear, binQuarter, or binMonth if the dimension does not represent a date or date-time field.

See Also

BinFormat (see page 17763)

FieldType (see page 17413)

StartValue (see page 17765)

111.1.4.5.4 TCubeDim.Dirty Property

Pascal

```
property Dirty: Boolean;
```

C++

```
__property Boolean Dirty;
```

Description

This is Dirty, a member of class TCubeDim.

111.1.4.5.5 TCubeDim.Loaded Property

Indicates whether the dimension item is currently cached by the decision cube.

Pascal

```
property Loaded: Boolean;
```

C++

```
__property Boolean Loaded;
```

Description

Read Loaded to determine whether the dimension item is currently available through the decision cube. When the ActiveFlag property is diActive, Loaded is always true. When the value of ActiveFlag is diInactive, Loaded is always false. When the value of ActiveFlag is diAsNeeded, use Loaded to determine whether the decision cube has cached the dimension item so that it is available to a decision source.

When Loaded is true, the dimension item consumes memory. When Loaded is false, the dimension item is unavailable.

See Also

ActiveFlag (see page 17411)

111.1.4.5.6 TCubeDim.StartDate Property

Determines how values are grouped along a dimension.

Pascal

```
property StartDate: TDate;
```

C++

```
__property TDate StartDate;
```

Description

When the BinType (see page 17763) property is binYear, binQuarter, or binMonth, set StartValue (see page 17765) to the first date in the first range of the dimension. If the BinType (see page 17763) property is binSet, set StartValue (see page 17765) to the drill-down value of the dimension.

See Also

BinType (see page 17763)

StartValue (see page 17765)

111.1.4.5.7 TCubeDim.StartValue Property

Determines how values are grouped along a dimension.

Pascal

```
property StartValue: String;
```

C++

```
__property AnsiString StartValue;
```

Description

When the BinType (see page 17763) property is binYear, binQuarter, or binMonth, set StartValue to the first date (expressed as a string) in the first range of the dimension. If the BinType (see page 17763) property is binSet, set StartValue to the drill-down value of the dimension.

See Also

BinType (see page 17763)

StartDate (see page 17765)

111.1.4.5.8 TCubeDim.ValueCount Property

Indicates the number of distinct values exist for the dimension.

Pascal

```
property ValueCount: Integer;
```

C++

```
__property int ValueCount;
```

Description

Read ValueCount to determine the number of distinct values for this dimension. The decision cube sets this value using its GetDimensionMemberCount method.

See Also

BinType (see page 17763)

StartValue (see page 17765)

GetDimensionMemberCount (see page 17780)

111.1.4.5.9 TCubeDim.wasActive Property

Pascal

```
property wasActive: Boolean;
```

C++

```
__property Boolean wasActive;
```

Description

This is wasActive, a member of class TCubeDim.

111.1.4.6 TCubeDim Events

The events of the TCubeDim class are listed here.

Public Events

	Name	Description
	OnTransform (see page 17766)	This is OnTransform, a member of class TCubeDim.

111.1.4.6.1 TCubeDim.OnTransform Event

Pascal

```
property OnTransform: TCubeDimTransformEvent;
```

C++

```
__property TCubeDimTransformEvent OnTransform;
```

Description

This is OnTransform, a member of class TCubeDim.

111.1.5 TCubeDims Class

TCubeDims is a collection of TCubeDim (see page 17754) objects.

Class Hierarchy

Pascal

```
TCubeDims = class(TDimensionItems);
```

C++

```
class TCubeDims : public TDimensionItems;
```

File

Mxstore

Description

Use TCubeDims as the dimension map of a crosstabulated data store. Each TCubeDim (see page 17754) object maintained by TCubeDims corresponds to a field from the data set of the crosstabulated data store. Each TCubeDim (see page 17754) object can be used as either a dimension (a field over which data is summarized), or a summary (a value summarized over the dimensions).

TCubeDims introduces new properties to handle dimension maps that include date ranges.

See Also

TCubeDim (see page 17754)

TDecisionCube (see page 17442)

111.1.5.1 TCubeDims Members

The following tables list the members exposed by TCubeDims.

Protected Methods

	Name	Description
	Add (see page 17769)	Adds a dimension item to the end of the Items array.
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetDirtyFlag (see page 17770)	This is GetDirtyFlag, a member of class TCubeDims.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 17770)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	NotifyOwner (see page 17420)	This is NotifyOwner, a member of class TDimensionItems.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	AddDerivedField (see page 17418)	Adds a derived average summary to the end of the Items (see page 17422) array.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	AlreadyExists (see page 17419)	Indicates whether a dimension item with specified properties already exists in the Items (see page 17422) property array.
V	Assign (see page 17770)	Copies the list of dimension items from another TDimensionItems object.
	AverageFieldCheck (see page 17419)	Determines whether the necessary summary dimension items over a base dimension exist so that a dimension item of type dimAverage can be computed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 17769)	This is Create, a member of class TCubeDims.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ActiveDimensionCount (see page 17421)	Indicates the number of dimension items that represent active dimensions in the crosstabulated data store.
R	ActiveSummaryCount (see page 17421)	Indicates the number of dimension items that represent active summaries in the crosstabulated data store.
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.

R	DimensionCount (see page 17422)	Indicates the number of dimension items in the Items (see page 17422) array with DimensionType set to dimDimension.
R	IsDirty (see page 17771)	Indicates that the fields that correspond to the TCubeDim (see page 17754) objects in the Items (see page 17771) array have changed.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 17771)	Lists all dimension items maintained by the TCubeDims (see page 17766) object.
R	SummaryCount (see page 17423)	Indicates the number of dimension items in the Items (see page 17422) array with DimensionType set to a value other than dimDimension.

111.1.5.2 TCubeDims.Create Constructor

Pascal

```
constructor Create(FOwner: TPersistent; ItemClass: TCubeDimClass);
```

C++

```
__fastcall TCubeDims(TPersistent * FOwner, TCubeDimClass ItemClass);
```

Description

This is Create, a member of class TCubeDims.

111.1.5.3 TCubeDims Methods

The methods of the TCubeDims class are listed here.

Protected Methods

	Name	Description
	Add (see page 17769)	Adds a dimension item to the end of the Items array.
	GetDirtyFlag (see page 17770)	This is GetDirtyFlag, a member of class TCubeDims.
V	GetOwner (see page 17770)	Returns the owner of an object.

Public Methods

	Name	Description
V	Assign (see page 17770)	Copies the list of dimension items from another TDimensionItems object.

111.1.5.3.1 TCubeDims.Add Method

Adds a dimension item to the end of the Items array.

Pascal

```
function Add: TCubeDim;
```

C++

```
__fastcall TCubeDim Add();
```

Description

Do not call the Add method to add dimension items to a TDimensionItems object. The dimension items are added automatically to reflect the fields in the data set of the associated crosstabulated data store.

Add adds a new dimension item to the collection and returns the new dimension item.

See Also

Items (see page 17422)

DataSet (see page 17789)

111.1.5.3.2 TCubeDims.Assign Method

Copies the list of dimension items from another TDimensionItems object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Assign calls the inherited method to copy the properties of the Source parameter. The inherited method will copy properties from any object that implements an AssignTo method that can copy to a TDimensionItems object.

See Also

AssignTo (see page 2931)

111.1.5.3.3 TCubeDims.GetDirtyFlag Method

Pascal

```
function GetDirtyFlag: Boolean;
```

C++

```
__fastcall Boolean GetDirtyFlag();
```

Description

This is GetDirtyFlag, a member of class TCubeDims.

111.1.5.3.4 TCubeDims.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath (see page 2932)

TCollection (see page 2731)

TComponent (see page 2762)

Owner (see page 2807)

111.1.5.4 TCubeDims Properties

The properties of the TCubeDims class are listed here.

Public Properties

	Name	Description
	IsDirty (see page 17771)	Indicates that the fields that correspond to the TCubeDim (see page 17754) objects in the Items (see page 17771) array have changed.
	Items (see page 17771)	Lists all dimension items maintained by the TCubeDims (see page 17766) object.

111.1.5.4.1 TCubeDims.IsDirty Property

Indicates that the fields that correspond to the TCubeDim (see page 17754) objects in the Items (see page 17771) array have changed.

Pascal

```
property IsDirty: Boolean;
```

C++

```
__property Boolean IsDirty;
```

Description

Read IsDirty to determine whether the information cached by the decision cube is valid. When any of the properties of the TCubeDim (see page 17754) objects in the Items (see page 17771) array change, IsDirty becomes true. When the value of IsDirty is read, IsDirty is reset to false.

See Also

Items (see page 17771)

TCubeDim (see page 17754)

111.1.5.4.2 TCubeDims.Items Property

Lists all dimension items maintained by the TCubeDims (see page 17766) object.

Pascal

```
property Items [Index: Integer]: TCubeDim;
```

C++

```
__property TCubeDim Items[int Index];
```

Description

Use Items to access individual dimensions or summaries maintained by the TCubeDims (see page 17766) object. The first TCubeDim (see page 17754) object has an Index of 0, the second has an Index of 1, and so on.

Each TCubeDim (see page 17754) object in the Items array represents a field from the data set of a decision cube. Each item represents either a dimension (a field over which data is summarized), or a summary (a value summarized over the dimensions).

In Delphi code, Items is the default property of TCubeDims (see page 17766). This means that the name of the Items property can be eliminated from code that uses the Items property. Thus, the line

```
DecisionCube1.DimensionMap.Items[0].ActiveFlag := diAsNeeded;
```

could be written

```
DecisionCube1.DimensionMap[0].ActiveFlag := diAsNeeded;
```

Note: Do not change the Items property. The set of items in the Items array is set automatically to represent the fields from the data set. The properties of individual TCubeDim (see page 17754) objects within the Items array may be changed to specify whether they should be cached by the data store, the name to use when displaying them, and so on.

DataSet (see page 17789)

DimensionMap (see page 17790)

operator_[]

111.1.6 TCustomDataStore Class

TCustomDataStore is the base class for components that analyze and maintain crosstabulated data.

Class Hierarchy

Pascal

```
TCustomDataStore = class(TComponent);
```

C++

```
class TCustomDataStore : public TComponent;
```

File

Mxstore

Description

Use TCustomDataStore as a base class when defining classes that fetch data from appropriately structured datasets and analyze it into a multidimensional array of summary values. Each dimension corresponds to a field in the dataset over which information is summarized. TCustomDataStore maintains a cached projection of this array over a set of active dimensions. The cache allows TCustomDataStore to quickly provide a projection of any subset of the active dimensions.

TCustomDataStore introduces properties and methods that describe the dimensions of the crosstabulated data array and the summary values that are computed over those dimensions.

Do not create instances of TCustomDataStore. To make the crosstabulated data from a TCustomDataStore object available to the objects in a form, use a TDecisionCube object.

See Also

TDecisionCube (see page 17442)

111.1.6.1 TCustomDataStore Members

The following tables list the members exposed by TCustomDataStore.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActiveChanged (see page 17778)	This is ActiveChanged, a member of class TCustomDataStore.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BinMapHasBinData (see page 17778)	This is BinMapHasBinData, a member of class TCustomDataStore.
V	CanDimBeClosed (see page 17778)	This is CanDimBeClosed, a member of class TCustomDataStore.
V	CanSumBeClosed (see page 17779)	This is CanSumBeClosed, a member of class TCustomDataStore.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterClose (see page 17779)	This is DoAfterClose, a member of class TCustomDataStore.
V	DoAfterOpen (see page 17779)	This is DoAfterOpen, a member of class TCustomDataStore.
V	DoBeforeClose (see page 17779)	This is DoBeforeClose, a member of class TCustomDataStore.
V	DoBeforeOpen (see page 17780)	This is DoBeforeOpen, a member of class TCustomDataStore.
V	DoOnRefresh (see page 17780)	This is DoOnRefresh, a member of class TCustomDataStore.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetCurrentSummary (see page 17780)	This is GetCurrentSummary, a member of class TCustomDataStore.
	GetDataSet (see page 17780)	This is GetDataSet, a member of class TCustomDataStore.
	GetDomain (see page 17781)	This is GetDomain, a member of class TCustomDataStore.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	LayoutChanged (see page 17785)	This is LayoutChanged, a member of class TCustomDataStore.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 17785)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetCurrentSummary (see page 17786)	This is SetCurrentSummary, a member of class TCustomDataStore.
	SetDataSet (see page 17786)	This is SetDataSet, a member of class TCustomDataStore.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.

V	StateChanged (see page 17786)	This is StateChanged, a member of class TCustomDataStore.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Active (see page 17787)	This is Active, a member of class TCustomDataStore.
R	DataCache (see page 17789)	This is DataCache, a member of class TCustomDataStore.
R	DataLink (see page 17789)	This is DataLink, a member of class TCustomDataStore.
	DataSource (see page 17790)	This is DataSource, a member of class TCustomDataStore.
	DesignState (see page 17790)	This is DesignState, a member of class TCustomDataStore.
R	InternalDataSource (see page 17792)	This is InternalDataSource, a member of class TCustomDataStore.
R	State (see page 17794)	This is State, a member of class TCustomDataStore.

Public Events

	Name	Description
	AfterClose (see page 17795)	Occurs immediately after the crosstabulated data store has been deactivated.
	AfterOpen (see page 17795)	Occurs immediately after the crosstabulated data store has been activated.
	BeforeClose (see page 17796)	Occurs immediately before the crosstabulated data store is deactivated.
	BeforeOpen (see page 17796)	Occurs immediately before the crosstabulated data store is activated.
	OnLowCapacity (see page 17796)	Occurs when the multidimensional cache requires more memory than is allowed by the Capacity (see page 17788) property.
	OnRefresh (see page 17797)	Occurs immediately before the dimension map is changed.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CalcSubTotals (see page 17778)	Calculates dimension subtotals.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 17776)	Creates an instance of TCustomDataStore (see page 17772).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 17777)	Destroys an instance of TCustomDataStore (see page 17772).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDimensionMemberCount (see page 17780)	Returns the number of distinct values for a dimension of the data store.
	GetDimensionName (see page 17781)	Returns the name of an active dimension.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMemberAsString (see page 17782)	Returns the specified value from a dimension of the data store, formatted as a string.
	GetMemberAsVariant (see page 17782)	Returns the specified value from a dimension of the crosstabulated data store.
	GetMemoryUsage (see page 17783)	Returns the number of bytes of memory used to cache the multidimensional array of summaries along all active dimensions.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetSummaryAsString (see page 17783)	Returns the value of the current summary for a set of values along all the active dimensions.
	GetSummaryAsVariant (see page 17784)	Returns the value of the current summary for a set of values along all the active dimensions.
	GetSummaryName (see page 17784)	Returns the name of an active summary.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 17785)	Updates the dimension map of the crosstabulated data store.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	BinData (see page 17787)	Indicates whether all the dimensions in the multidimensional array include a cell for every value along the dimension.
	Capacity (see page 17788)	Limits the memory that may be used by the cached array of summary values.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	CurrentSummary (see page 17788)	Specifies the index of the current summary from the set of active summaries maintained by the crosstabulated data store.
	DataSet (see page 17789)	Specifies the dataset that provides the fields which make up the dimensions and summaries maintained by the crosstabulated data store.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DimensionCount (see page 17790)	Specifies the number of dimensions cached by the crosstabulated data store.
	DimensionMap (see page 17790)	Describes the dimensions and summaries maintained by the crosstabulated data store.
R	DimensionMapCount (see page 17791)	Specifies the total number of fields from the dataset that make up the dimensions and summaries of the dimension map.
	MaxCells (see page 17792)	Limits the number of cells that can be included in the cache at any one time.
	MaxDimensions (see page 17793)	Limits the number of dimensions that can be cached by the crosstabulated data store at any one time.
	MaxSummaries (see page 17793)	Limits the number of summaries that can be cached by the crosstabulated data store at one time.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ShowProgressDialog (see page 17794)	Determines whether a progress bar appears when the cache of crosstabulated values is built.
R	SummaryCount (see page 17794)	Specifies the number of summary fields cached by the crosstabulated data store.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

111.1.6.2 TCustomDataStore.Create Constructor

Creates an instance of TCustomDataStore (see page 17772).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomDataStore(TComponent * AOwner);
```

Description

Create allocates the helper objects used by the crosstabulated data store to manage the dimension map and the crosstabulated data.

See Also

Create (see page 2766)

111.1.6.3 TCustomDataStore.Destroy Destructor

Destroys an instance of TCustomDataStore (see page 17772).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomDataStore();
```

Description

Do not call the Destroy method directly. Instead call Free. Free verifies that the decision cube is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

111.1.6.4 TCustomDataStore Methods

The methods of the TCustomDataStore class are listed here.

Protected Methods

	Name	Description
	ActiveChanged (see page 17778)	This is ActiveChanged, a member of class TCustomDataStore.
	BinMapHasBinData (see page 17778)	This is BinMapHasBinData, a member of class TCustomDataStore.
	CanDimBeClosed (see page 17778)	This is CanDimBeClosed, a member of class TCustomDataStore.
	CanSumBeClosed (see page 17779)	This is CanSumBeClosed, a member of class TCustomDataStore.
	DoAfterClose (see page 17779)	This is DoAfterClose, a member of class TCustomDataStore.
	DoAfterOpen (see page 17779)	This is DoAfterOpen, a member of class TCustomDataStore.
	DoBeforeClose (see page 17779)	This is DoBeforeClose, a member of class TCustomDataStore.
	DoBeforeOpen (see page 17780)	This is DoBeforeOpen, a member of class TCustomDataStore.
	DoOnRefresh (see page 17780)	This is DoOnRefresh, a member of class TCustomDataStore.
	GetCurrentSummary (see page 17780)	This is GetCurrentSummary, a member of class TCustomDataStore.
	GetDataSet (see page 17780)	This is GetDataSet, a member of class TCustomDataStore.
	GetDomain (see page 17781)	This is GetDomain, a member of class TCustomDataStore.
	LayoutChanged (see page 17785)	This is LayoutChanged, a member of class TCustomDataStore.
	Notification (see page 17785)	Forwards notification messages to all owned components.
	SetCurrentSummary (see page 17786)	This is SetCurrentSummary, a member of class TCustomDataStore.
	SetDataSet (see page 17786)	This is SetDataSet, a member of class TCustomDataStore.
	StateChanged (see page 17786)	This is StateChanged, a member of class TCustomDataStore.

Public Methods

	Name	Description
	CalcSubTotals (see page 17778)	Calculates dimension subtotals.
	GetDimensionMemberCount (see page 17780)	Returns the number of distinct values for a dimension of the data store.
	GetDimensionName (see page 17781)	Returns the name of an active dimension.
	GetMemberAsString (see page 17782)	Returns the specified value from a dimension of the data store, formatted as a string.
	GetMemberAsVariant (see page 17782)	Returns the specified value from a dimension of the crosstabulated data store.
	GetMemoryUsage (see page 17783)	Returns the number of bytes of memory used to cache the multidimensional array of summaries along all active dimensions.
	GetSummaryAsString (see page 17783)	Returns the value of the current summary for a set of values along all the active dimensions.

	GetSummaryAsVariant (see page 17784)	Returns the value of the current summary for a set of values along all the active dimensions.
	GetSummaryName (see page 17784)	Returns the name of an active summary.
	Refresh (see page 17785)	Updates the dimension map of the crosstabulated data store.

111.1.6.4.1 TCustomDataStore.ActiveChanged Method

Pascal

```
procedure ActiveChanged; virtual;
```

C++

```
virtual __fastcall ActiveChanged();
```

Description

This is ActiveChanged, a member of class TCustomDataStore.

111.1.6.4.2 TCustomDataStore.BinMapHasBinData Method

Pascal

```
function BinMapHasBinData: Boolean;
```

C++

```
__fastcall Boolean BinMapHasBinData();
```

Description

This is BinMapHasBinData, a member of class TCustomDataStore.

111.1.6.4.3 TCustomDataStore.CalcSubTotals Method

Calculates dimension subtotals.

Pascal

```
procedure CalcSubTotals;
```

C++

```
__fastcall CalcSubTotals();
```

Description

CalcSubTotals calculates dimension subtotals in cached data. CalcSubtotal is used internally by TCustomDataStore (see page 17772); an application should not call CalcSubTotals directly.

See Also

Create (see page 2766)

111.1.6.4.4 TCustomDataStore.CanDimBeClosed Method

Pascal

```
function CanDimBeClosed(iMapIndex: Integer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanDimBeClosed(int iMapIndex);
```

Description

This is CanDimBeClosed, a member of class TCustomDataStore.

111.1.6.4.5 TCustomDataStore.CanSumBeClosed Method

Pascal

```
function CanSumBeClosed(iMapIndex: Integer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanSumBeClosed(int iMapIndex);
```

Description

This is CanSumBeClosed, a member of class TCustomDataStore.

111.1.6.4.6 TCustomDataStore.DoAfterClose Method

Pascal

```
procedure DoAfterClose; virtual;
```

C++

```
virtual __fastcall DoAfterClose();
```

Description

This is DoAfterClose, a member of class TCustomDataStore.

111.1.6.4.7 TCustomDataStore.DoAfterOpen Method

Pascal

```
procedure DoAfterOpen; virtual;
```

C++

```
virtual __fastcall DoAfterOpen();
```

Description

This is DoAfterOpen, a member of class TCustomDataStore.

111.1.6.4.8 TCustomDataStore.DoBeforeClose Method

Pascal

```
procedure DoBeforeClose; virtual;
```

C++

```
virtual __fastcall DoBeforeClose();
```

Description

This is DoBeforeClose, a member of class TCustomDataStore.

111.1.6.4.9 TCustomDataStore.DoBeforeOpen Method

Pascal

```
procedure DoBeforeOpen; virtual;
```

C++

```
virtual __fastcall DoBeforeOpen();
```

Description

This is DoBeforeOpen, a member of class TCustomDataStore.

111.1.6.4.10 TCustomDataStore.DoOnRefresh Method

Pascal

```
procedure DoOnRefresh(DimMap: TCubeDims); virtual;
```

C++

```
virtual __fastcall DoOnRefresh(TCubeDims DimMap);
```

Description

This is DoOnRefresh, a member of class TCustomDataStore.

111.1.6.4.11 TCustomDataStore.GetCurrentSummary Method

Pascal

```
function GetCurrentSummary: Integer;
```

C++

```
__fastcall int GetCurrentSummary();
```

Description

This is GetCurrentSummary, a member of class TCustomDataStore.

111.1.6.4.12 TCustomDataStore.GetDataSet Method

Pascal

```
function GetDataSet: TDataSet;
```

C++

```
__fastcall TDataSet GetDataSet();
```

Description

This is GetDataSet, a member of class TCustomDataStore.

111.1.6.4.13 TCustomDataStore.GetDimensionMemberCount Method

Returns the number of distinct values for a dimension of the data store.

Pascal

```
function GetDimensionMemberCount(Dimension: Integer): Integer; virtual;
```

C++

```
virtual __fastcall int GetDimensionMemberCount(int Dimension);
```

Description

Call GetDimensionMemberCount to determine the number of distinct field values in the dimension specified by the Dimension parameter. Zero specifies the first active dimension, and DimensionCount (see page 17790)-1 specifies the last active dimension.

To obtain the individual values of the dimension, use the GetMemberAsString (see page 17782) or GetMemberAsVariant (see page 17782) method. GetDimensionMemberCount returns a value that provides an upper limit to the Index parameter of the GetMemberAsString (see page 17782) or GetMemberAsVariant (see page 17782) method.

To obtain the name of the dimension referred to by the Dimension parameter, use the GetDimensionName (see page 17781) method.

See Also

DimensionCount (see page 17790)

GetDimensionName (see page 17781)

GetMemberAsString (see page 17782)

GetMemberAsVariant (see page 17782)

111.1.6.4.14 TCustomDataStore.GetDimensionName Method

Returns the name of an active dimension.

Pascal

```
function GetDimensionName(Dimension: Integer): String; virtual;
```

C++

```
virtual __fastcall AnsiString GetDimensionName(int Dimension);
```

Description

Call GetDimensionName to obtain the name of the dimension indexed by the Dimension parameter. Zero specifies the first active dimension and DimensionCount (see page 17790)-1 specifies the last active dimension. The name of a dimension is the name of the database field the dimension represents, unless the Name property of the corresponding TDimensionItem object is changed.

See Also

DimensionCount (see page 17790)

Name (see page 17414)

111.1.6.4.15 TCustomDataStore.GetDomain Method

Pascal

```
function GetDomain(DimensionIDs: TIntArray; ATotals: Boolean; Domain: TTwoDimArray): Integer;
```

C++

```
__fastcall int GetDomain(TIntArray DimensionIDs, Boolean ATotals, TTwoDimArray Domain);
```

Description

This is GetDomain, a member of class TCustomDataStore.

111.1.6.4.16 TCustomDataStore.GetMemberAsString Method

Returns the specified value from a dimension of the data store, formatted as a string.

Pascal

```
function GetMemberAsString(Dimension: Integer; Index: Integer): String; virtual;
```

C++

```
virtual __fastcall AnsiString GetMemberAsString(int Dimension, int Index);
```

Description

Call GetMemberAsString to retrieve one of the values from the dimension specified by the Dimension parameter. Zero specifies the first dimension, and DimensionCount (see page 17790)-1 specifies the last dimension. The Index parameter indicates which value along the dimension is returned, where 0 is the first value. GetDimensionMemberCount (see page 17780) returns the number of values included in the dimension.

GetMemberAsString returns a field value formatted as a string. To obtain the field value as an unformatted variant, use the GetMemberAsVariant (see page 17782) method.

See Also

DimensionCount (see page 17790)

GetDimensionMemberCount (see page 17780)

GetDimensionName (see page 17781)

GetMemberAsVariant (see page 17782)

111.1.6.4.17 TCustomDataStore.GetMemberAsVariant Method

Returns the specified value from a dimension of the crosstabulated data store.

Pascal

```
function GetMemberAsVariant(Dimension: Integer; Index: Integer): Variant;
```

C++

```
__fastcall Variant GetMemberAsVariant(int Dimension, int Index);
```

Description

Call GetMemberAsVariant to retrieve one of the values from the dimension specified by the Dimension parameter. Zero specifies the first dimension, and DimensionCount (see page 17790)-1 specifies the last dimension. The Index parameter indicates which value along the dimension is returned, where 0 is the first value. GetDimensionMemberCount (see page 17780) returns the number of values included in the dimension.

See Also

DimensionCount (see page 17790)

GetDimensionMemberCount (see page 17780)

GetDimensionName (see page 17781)

GetMemberAsString (see page 17782)

111.1.6.4.18 TCustomDataStore.GetMemoryUsage Method

Returns the number of bytes of memory used to cache the multidimensional array of summaries along all active dimensions.

Pascal

```
function GetMemoryUsage: Integer;
```

C++

```
__fastcall int GetMemoryUsage();
```

Description

Call GetMemoryUsage to determine the size of the cache that stores the crosstabulated information for the data store. If the returned value is too large, consider making some of the active dimensions paged by setting their BinType property to binSet or allowing the data store to swap some dimensions out by setting their ActiveFlag property to diAsNeeded. The cube dimension can be accessed using the DimensionMap (see page 17790) property.

The storage needs of the crosstabulated data store increase geometrically with each active dimension that is added. Applications must find the best balance between the performance benefit of caching many dimensions so that they are immediately available to decision controls, and the need to keep the number of active dimensions small enough so that the cache does not consume inordinate amounts of memory.

See Also

DimensionMap (see page 17790)

BinType (see page 17763)

ActiveFlag (see page 17411)

111.1.6.4.19 TCustomDataStore.GetSummaryAsString Method

Returns the value of the current summary for a set of values along all the active dimensions.

Pascal

```
function GetSummaryAsString(Coord: TSmallIntArray): String; virtual;
```

C++

```
virtual __fastcall AnsiString GetSummaryAsString(TSmallIntArray Coord);
```

Description

Call GetSummaryAsString to obtain the value of a single cell from the multidimensional array of summary values. Set the Coord parameter to an array of indexes, where each index identifies a value along one of the dimensions of the array. The first value of Coord is the index of the desired value along the first active dimension, the second value of Coord is the index of the desired value along the second active dimension, and so on. Coord should contain DimensionCount (see page 17790) values.

To obtain the names of the active dimensions that correspond to the entries in the Coord parameter, use the GetDimensionName (see page 17781) method. To obtain the name of the specified value along any of the dimensions, use the GetMemberAsString (see page 17782) method.

GetSummaryAsString formats the summarized value as a string. To obtain the summary as a variant, use the GetSummaryAsVariant (see page 17784) method.

See Also

CurrentSummary (see page 17788)

DimensionCount (see page 17790)

GetDimensionName (see page 17781)

GetMemberAsString (see page 17782)

GetSummaryAsVariant (see page 17784)

111.1.6.4.20 TCustomDataStore.GetSummaryAsVariant Method

Returns the value of the current summary for a set of values along all the active dimensions.

Pascal

```
function GetSummaryAsVariant(Coord: TSmallIntArray): Variant; virtual;
```

C++

```
virtual __fastcall Variant GetSummaryAsVariant(TSmallIntArray Coord);
```

Description

Call GetSummaryAsVariant to obtain the value of a single cell from the multidimensional array of summary values. Set the Coord parameter to an array of indexes, where each index identifies a value along one of the dimensions of the array. The first value of Coord is the index of the desired value along the first active dimension, the second value of Coord is the index of the desired value along the second active dimension, and so on. Coord should contain DimensionCount (see page 17790) values.

To obtain the names of the active dimensions that correspond to the entries in the Coord parameter, use the GetDimensionName (see page 17781) method. To obtain the name of the specified value along any of the dimensions, use the GetMemberAsString (see page 17782) method.

To obtain the summary formatted as a string, use the GetSummaryAsString (see page 17783) method.

See Also

CurrentSummary (see page 17788)

DimensionCount (see page 17790)

GetDimensionName (see page 17781)

GetMemberAsString (see page 17782)

GetSummaryAsString (see page 17783)

111.1.6.4.21 TCustomDataStore.GetSummaryName Method

Returns the name of an active summary.

Pascal

```
function GetSummaryName(ISum: Integer): String; virtual;
```

C++

```
virtual __fastcall AnsiString GetSummaryName(int ISum);
```

Description

Call GetSummaryName to obtain the name of the summary specified by the ISum parameter. Zero specifies the first active summary and SummaryCount (see page 17794)-1 specifies the last active summary.

See Also

SummaryCount (see page 17794)

111.1.6.4.22 TCustomDataStore.LayoutChanged Method

Pascal

```
procedure LayoutChanged; virtual;
```

C++

```
virtual __fastcall LayoutChanged();
```

Description

This is LayoutChanged, a member of class TCustomDataStore.

111.1.6.4.23 TCustomDataStore.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

111.1.6.4.24 TCustomDataStore.Refresh Method

Updates the dimension map of the crosstabulated data store.

Pascal

```
procedure Refresh(DimMap: TCubeDims; bForce: Boolean);
```

C++

```
__fastcall Refresh(TCubeDims DimMap, Boolean bForce);
```

Description

To change the properties of the dimensions in the dimension map, make a copy of the DimensionMap (see page 17790) property, make any desired changes to the properties of the TCubeDim (see page 17754) objects, and call Refresh, passing in the altered dimension map. The bForce parameter specifies whether the cache should be rebuilt unconditionally. When bForce is

false, the cache will not be rebuilt unless the changes require it.

When the data store is active, call Refresh rather than directly altering the dimension map. Do not call Refresh while the data store is building the cache. Use the BeforeOpen (see page 17796) and AfterOpen (see page 17795) events to determine when the cache is being rebuilt.

See Also

AfterOpen (see page 17795)

BeforeOpen (see page 17796)

DimensionMap (see page 17790)

TCubeDim (see page 17754)

111.1.6.4.25 TCustomDataStore.SetCurrentSummary Method

Pascal

```
procedure SetCurrentSummary(Value: Integer);
```

C++

```
__fastcall SetCurrentSummary(int Value);
```

Description

This is SetCurrentSummary, a member of class TCustomDataStore.

111.1.6.4.26 TCustomDataStore.SetDataSet Method

Pascal

```
procedure SetDataSet(ADataSet: TDataSet);
```

C++

```
__fastcall SetDataSet(TDataSet ADataSet);
```

Description

This is SetDataSet, a member of class TCustomDataStore.

111.1.6.4.27 TCustomDataStore.StateChanged Method

Pascal

```
procedure StateChanged; virtual;
```

C++

```
virtual __fastcall StateChanged();
```

Description

This is StateChanged, a member of class TCustomDataStore.

111.1.6.5 TCustomDataStore Properties

The properties of the TCustomDataStore class are listed here.

Protected Properties

	Name	Description
	Active (see page 17787)	This is Active, a member of class TCustomDataStore.
R	DataCache (see page 17789)	This is DataCache, a member of class TCustomDataStore.
R	DataLink (see page 17789)	This is DataLink, a member of class TCustomDataStore.
	DataSource (see page 17790)	This is DataSource, a member of class TCustomDataStore.
	DesignState (see page 17790)	This is DesignState, a member of class TCustomDataStore.
R	InternalDataSource (see page 17792)	This is InternalDataSource, a member of class TCustomDataStore.
R	State (see page 17794)	This is State, a member of class TCustomDataStore.

Public Properties

	Name	Description
	BinData (see page 17787)	Indicates whether all the dimensions in the multidimensional array include a cell for every value along the dimension.
	Capacity (see page 17788)	Limits the memory that may be used by the cached array of summary values.
	CurrentSummary (see page 17788)	Specifies the index of the current summary from the set of active summaries maintained by the crosstabulated data store.
	DataSet (see page 17789)	Specifies the dataset that provides the fields which make up the dimensions and summaries maintained by the crosstabulated data store.
R	DimensionCount (see page 17790)	Specifies the number of dimensions cached by the crosstabulated data store.
	DimensionMap (see page 17790)	Describes the dimensions and summaries maintained by the crosstabulated data store.
R	DimensionMapCount (see page 17791)	Specifies the total number of fields from the dataset that make up the dimensions and summaries of the dimension map.
	MaxCells (see page 17792)	Limits the number of cells that can be included in the cache at any one time.
	MaxDimensions (see page 17793)	Limits the number of dimensions that can be cached by the crosstabulated data store at any one time.
	MaxSummaries (see page 17793)	Limits the number of summaries that can be cached by the crosstabulated data store at one time.
	ShowProgressDialog (see page 17794)	Determines whether a progress bar appears when the cache of crosstabulated values is built.
R	SummaryCount (see page 17794)	Specifies the number of summary fields cached by the crosstabulated data store.

111.1.6.5.1 TCustomDataStore.Active Property

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

This is Active, a member of class TCustomDataStore.

111.1.6.5.2 TCustomDataStore.BinData Property

Indicates whether all the dimensions in the multidimensional array include a cell for every value along the dimension.

Pascal

```
property BinData: Boolean;
```

C++

```
__property Boolean BinData;
```

Description

Read BinData to determine whether any of the active dimensions have been grouped into ranges or been put into a paged

(permanently drilled) state. When BinData is true, at least one dimension has been paged or has been collapsed into ranges of values. When BinData is false, all dimensions include entries for every value of the dimension field that appears in the dataset.

See Also

IsBinData (see page 17761)

111.1.6.5.3 TCustomDataStore.Capacity Property

Limits the memory that may be used by the cached array of summary values.

Pascal

```
property Capacity: Integer;
```

C++

```
__property int Capacity;
```

Description

Set Capacity to limit the number of bytes that may be used by the crosstabulated data store for storing the multidimensional array of summary values. If the number of active dimensions and summaries causes the cache to exceed this value, an ELowCapacityError is raised.

See Also

ELowCapacityError (see page 17306)

OnLowCapacity (see page 17796)

ActiveFlag (see page 17411)

111.1.6.5.4 TCustomDataStore.CurrentSummary Property

Specifies the index of the current summary from the set of active summaries maintained by the crosstabulated data store.

Pascal

```
property CurrentSummary: Integer;
```

C++

```
__property int CurrentSummary;
```

Description

Use CurrentSummary to determine which of the active summaries is used to provide values to clients of the data store. CurrentSummary returns 0 if the first active summary is the current summary. CurrentSummary returns SummaryCount (see page 17794)-1 if the last active summary is the current summary.

The dataset specified by the DataSet (see page 17789) property provides all the fields that make up the dimensions and summaries of the dimension map. At any time, a subset of all the dimensions and summaries provided by the dataset is cached by the crosstabulated data store and available to decision source objects. Of all the active (cached) summaries, only one can be provided to decision source objects at a time. That one summary is the current summary.

See Also

DataSet (see page 17789)

DimensionMap (see page 17790)

GetSummaryName (see page 17784)

SummaryCount (see page 17794)

111.1.6.5.5 TCustomDataStore.DataCache Property

Pascal

```
property DataCache: TDataCache;
```

C++

```
__property TDataCache DataCache;
```

Description

This is DataCache, a member of class TCustomDataStore.

111.1.6.5.6 TCustomDataStore.DataLink Property

Pascal

```
property DataLink: TMultiDimDataLink;
```

C++

```
__property TMultiDimDataLink DataLink;
```

Description

This is DataLink, a member of class TCustomDataStore.

111.1.6.5.7 TCustomDataStore.DataSet Property

Specifies the dataset that provides the fields which make up the dimensions and summaries maintained by the crosstabulated data store.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Set DataSet to the dataset that contains the crosstabulated data for the data store. Usually, DataSet is a TDecisionQuery object. TDecisionQuery objects are SQL queries that are grouped appropriately to calculate summaries for a crosstabulated data store.

The DataSet property can also be set to a TQuery object where the SQL has the same form as that of a TDecisionQuery or to any other dataset that contains summarized values in the same structure as the result of a TDecisionQuery query.

If the DataSet property is a TQuery or TDecisionQuery object, the crosstabulated data store automatically determines which fields are dimensions and which are summaries. If the DataSet property is not a query, the fields in the dimension map must be explicitly identified as dimensions or summaries, and, if they represent summaries, the type of summary must be indicated.

Note: The summary values for the crosstabulated data store must be calculated by the TDataSet object. The data store does not summarize raw data, but analyzes summarized data into dimensions.

See Also

DimensionMap (see page 17790)

TDecisionQuery (see page 17854)

TQuery (see page 10059)

111.1.6.5.8 TCustomDataStore.DataSource Property

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

This is DataSource, a member of class TCustomDataStore.

111.1.6.5.9 TCustomDataStore.DesignState Property

Pascal

```
property DesignState: TCubeDataState;
```

C++

```
__property TCubeDataState DesignState;
```

Description

This is DesignState, a member of class TCustomDataStore.

111.1.6.5.10 TCustomDataStore.DimensionCount Property

Specifies the number of dimensions cached by the crosstabulated data store.

Pascal

```
property DimensionCount: Integer;
```

C++

```
__property int DimensionCount;
```

Description

Read DimensionCount to determine the number of active dimensions. The dataset specified by the DataSet (see page 17789) property provides all the fields that make up the dimensions and summaries of the dimension map. At any time, a subset of all the dimensions and summaries provided by the dataset is cached by the crosstabulated data store and available to decision source objects. DimensionCount is the number of active (cached) dimensions that can be provided to decision source objects.

See Also

DataSet (see page 17789)

DimensionMap (see page 17790)

TDecisionSource (see page 17462)

111.1.6.5.11 TCustomDataStore.DimensionMap Property

Describes the dimensions and summaries maintained by the crosstabulated data store.

Pascal

```
property DimensionMap: TCubeDims;
```

C++

```
__property TCubeDims DimensionMap;
```

Description

Read DimensionMap to access the dimensions and summaries of the data store. The individual entries of the dimension map represent the fields of the dataset specified by the DataSet (see page 17789) property or calculated fields derived from those fields, such as averages. DimensionMap provides information about these fields from the dataset that make up the crosstabulated data store, including the field names and the use of the fields within the multidimensional array.

When the data store is not active, use the properties of the TCubeDim (see page 17754) objects to change the information cached by the data store. Use the ActiveFlag property of individual TCubeDim (see page 17754) objects to specify whether those dimensions or summaries from the dataset are cached by the crosstabulated data store. Use the BinType property of the TCubeDim (see page 17754) objects to allow cells along temporal dimensions to represent date ranges or to put the dimensions in a paged (permanently drilled) state.

If the dataset is not a query, use the DimensionType property of the TCubeDim (see page 17754) objects to identify which fields are dimensions and which are summaries, and to identify the type of summary represented by the summary fields.

To change the properties of the entries in the dimension map when the data store is active, use the Refresh (see page 17785) method.

Note: At design time, the DimensionType, Name, and ActiveFlag properties of the TCubeDim (see page 17754) objects that make up the dimension map can be set using the Decision Cube Editor.

See Also

DataSet (see page 17789)

Refresh (see page 17785)

BinType (see page 17763)

ActiveFlag (see page 17411)

DimensionType (see page 17412)

Name (see page 17414)

Decision Cube Properties and Events

Using the Decision Cube Editor

111.1.6.5.12 TCustomDataStore.DimensionMapCount Property

Specifies the total number of fields from the dataset that make up the dimensions and summaries of the dimension map.

Pascal

```
property DimensionMapCount: Integer;
```

C++

```
__property int DimensionMapCount;
```

Description

Read DimensionMapCount to determine the number of TCubeDim (see page 17754) objects that can be accessed through the DimensionMap (see page 17790) property. The value of DimensionMapCount is the number of fields in the dataset specified by the DataSet (see page 17789) property plus the number of derived fields based on those fields, such as fields for average values that are derived from count and summary fields.

The value of DimensionMapCount is not the same as DimensionCount (see page 17790) + SummaryCount (see page

17794). DimensionCount (see page 17790) and SummaryCount (see page 17794) count the number of dimensions and summaries that are cached by the crosstabulated data cube and available to the decision source. DimensionMapCount also counts any inactive dimensions or summaries that are not included in the cache.

See Also

DataSet (see page 17789)

DimensionCount (see page 17790)

DimensionMap (see page 17790)

SummaryCount (see page 17794)

TCubeDim (see page 17754)

111.1.6.5.13 TCustomDataStore.InternalDataSource Property

Pascal

```
property InternalDataSource: TDataSource;
```

C++

```
__property TDataSource InternalDataSource;
```

Description

This is InternalDataSource, a member of class TCustomDataStore.

111.1.6.5.14 TCustomDataStore.MaxCells Property

Limits the number of cells that can be included in the cache at any one time.

Pascal

```
property MaxCells: Integer;
```

C++

```
__property int MaxCells;
```

Description

Use MaxCells to limit the memory usage of the crosstabulated data store. Memory consumption increases geometrically with each dimension that is cached in the multidimensional array and linearly with each summary. MaxCells prevents too many dimensions or summaries from being cached at once.

When the ActiveFlag property of a dimension or summary is diActive, it is always added to the cache. When the ActiveFlag property of a dimension or summary is diAsNeeded, it can be added only if it does not cause the number of cells to exceed MaxCells. The data store swaps in as-needed dimensions and summaries when they are used by the decision source, making room, if necessary, by swapping out closed dimensions or summaries that are not current.

Note: Be sure to set MaxCells to a value big enough to accommodate all active dimensions and summaries plus the number of as-needed dimensions and summaries that can be open at one time.

See Also

MaxDimensions (see page 17793)

MaxSummaries (see page 17793)

ActiveFlag (see page 17411)

111.1.6.5.15 TCustomDataStore.MaxDimensions Property

Limits the number of dimensions that can be cached by the crosstabulated data store at any one time.

Pascal

```
property MaxDimensions: Integer;
```

C++

```
__property int MaxDimensions;
```

Description

Use MaxDimensions to limit the memory usage of the data store. Memory consumption increases geometrically with each dimension that is cached in the multidimensional array. MaxDimensions prevents too many dimensions to be cached at once.

When the ActiveFlag property of a dimension is diActive, the dimension is always added to the cache. When the ActiveFlag property of a dimension is diAsNeeded, it can be added only if it does not cause the number of active dimensions to exceed MaxDimensions. The data store swaps in as-needed dimensions when they are open in the decision source, making room, if necessary, by swapping out closed dimensions.

Note: Be sure to set MaxDimensions to a value big enough to accommodate all active dimensions plus the number of as-needed dimensions that can be open at one time.

See Also

DimensionCount (see page 17790)

MaxCells (see page 17792)

MaxSummaries (see page 17793)

ActiveFlag (see page 17411)

111.1.6.5.16 TCustomDataStore.MaxSummaries Property

Limits the number of summaries that can be cached by the crosstabulated data store at one time.

Pascal

```
property MaxSummaries: Integer;
```

C++

```
__property int MaxSummaries;
```

Description

Use MaxSummaries to limit the memory usage of the data store. Memory consumption increases linearly with each summary that is cached in the multidimensional array. MaxSummaries prevents too many summaries to be cached at once.

When the ActiveFlag property of a summary is diActive, the summary is always added to the cache. When the ActiveFlag property is diAsNeeded, it can be added only if it does not cause the number of active summaries to exceed MaxSummaries. The data store swaps in as-needed summaries when they are chosen as the current summary, making room, if necessary, by swapping out other as-needed summaries.

See Also

MaxCells (see page 17792)

MaxDimensions (see page 17793)

SummaryCount (see page 17794)

ActiveFlag (see page 17411)

111.1.6.5.17 TCustomDataStore.ShowProgressDialog Property

Determines whether a progress bar appears when the cache of crosstabulated values is built.

Pascal

```
property ShowProgressDialog: Boolean;
```

C++

```
__property Boolean ShowProgressDialog;
```

Description

Set ShowProgressDialog to specify whether a progress bar should appear to provide users with a visual indication when the cache is being built. If the crosstabulated data store includes may dimensions, rebuilding the cache can take a noticeable amount of time. The progress bar provides users with feedback about how long this process will take.

See Also

DimensionCount (see page 17790)

TProgressBar (see page 4615)

111.1.6.5.18 TCustomDataStore.State Property

Pascal

```
property State: TCubeState;
```

C++

```
__property TCubeState State;
```

Description

This is State, a member of class TCustomDataStore.

111.1.6.5.19 TCustomDataStore.SummaryCount Property

Specifies the number of summary fields cached by the crosstabulated data store.

Pascal

```
property SummaryCount: Integer;
```

C++

```
__property int SummaryCount;
```

Description

Read SummaryCount to determine the number of active summaries in the dimension map. The dataset specified by the DataSet (see page 17789) property provides all the fields that make up the dimensions and summaries of the dimension map. At any time, a subset of all the dimensions and summaries provided by the dataset is cached by the crosstabulated data store and available to decision source objects. SummaryCount is the number of active (cached) summaries that can provide data to decision source objects.

See Also

DataSet (see page 17789)

DimensionMap (see page 17790)

TDecisionSource (see page 17462)

111.1.6.6 TCustomDataStore Events

The events of the TCustomDataStore class are listed here.

Public Events

	Name	Description
	AfterClose (see page 17795)	Occurs immediately after the crosstabulated data store has been deactivated.
	AfterOpen (see page 17795)	Occurs immediately after the crosstabulated data store has been activated.
	BeforeClose (see page 17796)	Occurs immediately before the crosstabulated data store is deactivated.
	BeforeOpen (see page 17796)	Occurs immediately before the crosstabulated data store is activated.
	OnLowCapacity (see page 17796)	Occurs when the multidimensional cache requires more memory than is allowed by the Capacity (see page 17788) property.
	OnRefresh (see page 17797)	Occurs immediately before the dimension map is changed.

111.1.6.6.1 TCustomDataStore.AfterClose Event

Occurs immediately after the crosstabulated data store has been deactivated.

Pascal

```
property AfterClose: TCubeNotifyEvent;
```

C++

```
__property TCubeNotifyEvent AfterClose;
```

Description

Write an AfterClose event handler to take specific action when the crosstabulated data store has been shut down. For example, an application could provide feedback about the state of the data store, or update the dimension map for the next time the data store is activated.

See Also

BeforeClose (see page 17796)

DimensionMap (see page 17790)

111.1.6.6.2 TCustomDataStore.AfterOpen Event

Occurs immediately after the crosstabulated data store has been activated.

Pascal

```
property AfterOpen: TCubeNotifyEvent;
```

C++

```
__property TCubeNotifyEvent AfterOpen;
```

Description

Write an AfterOpen event handler to take specific action when the crosstabulated data store is activated. This is the first opportunity to determine how much memory is consumed by the multidimensional cache maintained by the data store.

See Also

BeforeOpen (see page 17796)

GetMemoryUsage (see page 17783)

111.1.6.6.3 TCustomDataStore.BeforeClose Event

Occurs immediately before the crosstabulated data store is deactivated.

Pascal

```
property BeforeClose: TCubeNotifyEvent;
```

C++

```
__property TCubeNotifyEvent BeforeClose;
```

Description

Write a BeforeClose event handler to take specific action before the data store shuts down. For example, an application can store information about the current state of the cache before it is cleared and all associated memory freed.

See Also

AfterClose (see page 17795)

111.1.6.6.4 TCustomDataStore.BeforeOpen Event

Occurs immediately before the crosstabulated data store is activated.

Pascal

```
property BeforeOpen: TCubeNotifyEvent;
```

C++

```
__property TCubeNotifyEvent BeforeOpen;
```

Description

Write a BeforeOpen event handler to take specific action before the crosstabulated data store is activated. This is an appropriate time to adjust the value of Capacity (see page 17788), or set the ShowProgressDialog (see page 17794) based on the number of active dimensions in the DimensionMap (see page 17790).

This is the last opportunity to adjust the entries in the DimensionMap (see page 17790) before the cache is built. If the data store has never been active before this, the DimensionMap (see page 17790) property will be nil (Delphi) or NULL (C++) at this point. A BeforeOpen event handler can build a dimension map programmatically if it is nil (Delphi) or NULL (C++). If the dimension map is not nil (Delphi) or NULL (C++), the properties of the dimension items can be changed, but the order and number of the dimension items themselves should not be changed.

See Also

AfterOpen (see page 17795)

Capacity (see page 17788)

DimensionMap (see page 17790)

ShowProgressDialog (see page 17794)

111.1.6.6.5 TCustomDataStore.OnLowCapacity Event

Occurs when the multidimensional cache requires more memory than is allowed by the Capacity (see page 17788) property.

Pascal

```
property OnLowCapacity: TCapacityErrorEvent;
```

C++

```
__property TCapacityErrorEvent OnLowCapacity;
```

Description

Write an OnLowCapacity event handler to respond to ELowCapacityError exceptions. An OnLowCapacity event handler can change the value of Capacity (see page 17788) or deactivate some of the dimensions in the dimension map in order to allow the cache to fit in the available memory. If the memory problem is handled by the OnLowCapacity event handler, change the Action parameter to eaContinue to allow the data store to continue building the cache. Otherwise, an ELowCapacityError exception will be raised.

See Also

Capacity (see page 17788)

DimensionMap (see page 17790)

ELowCapacityError (see page 17306)

111.1.6.6.6 TCustomDataStore.OnRefresh Event

Occurs immediately before the dimension map is changed.

Pascal

```
property OnRefresh: TCubeRefreshEvent;
```

C++

```
__property TCubeRefreshEvent OnRefresh;
```

Description

Write an OnRefresh event handler to take specific action when the dimension map changes. The DimMap parameter specifies the new value that is about to be set for the DimensionMap (see page 17790) property. Use an OnRefresh event handler to change the properties of these dimension items before the DimensionMap (see page 17790) property is set and the cache is rebuilt. This is also an opportunity to reset the MaxDimensions (see page 17793) or MaxSummaries (see page 17793) property to accommodate the dimension map that is about to be set.

See Also

DimensionMap (see page 17790)

MaxDimensions (see page 17793)

MaxSummaries (see page 17793)

Refresh (see page 17785)

Decision Cube Properties and Events

111.1.7 TDataCache Class

Class Hierarchy

Pascal

```
TDataCache = class;
```

C++

```
class TDataCache;
```

File

Mxstore

Description

This is class Mxstore.TDataCache.

111.1.7.1 TDataCache Members

The following tables list the members exposed by TDataCache.

Protected Methods

	Name	Description
	FreeCache (see page 17802)	This is FreeCache, a member of class TDataCache.

Public Methods

	Name	Description
	AddAggIndex (see page 17800)	This is AddAggIndex, a member of class TDataCache.
	AddIndex (see page 17800)	This is AddIndex, a member of class TDataCache.
	AppendDimension (see page 17800)	This is AppendDimension, a member of class TDataCache.
	AppendSummary (see page 17801)	This is AppendSummary, a member of class TDataCache.
	CalcSubTotals (see page 17801)	This is CalcSubTotals, a member of class TDataCache.
	ClearIndexInfo (see page 17801)	This is ClearIndexInfo, a member of class TDataCache.
	Create (see page 17799)	This is Create, a member of class TDataCache.
	CreateTable (see page 17801)	This is CreateTable, a member of class TDataCache.
V	Destroy (see page 17799)	This is Destroy, a member of class TDataCache.
	DimensionFromFieldName (see page 17801)	This is DimensionFromFieldName, a member of class TDataCache.
	GetDimensionMember (see page 17802)	This is GetDimensionMember, a member of class TDataCache.
	GetDimensionMemberAsVariant (see page 17802)	This is GetDimensionMemberAsVariant, a member of class TDataCache.
	GetDimensionMemberCount (see page 17802)	This is GetDimensionMemberCount, a member of class TDataCache.
	GetDimensionName (see page 17803)	This is GetDimensionName, a member of class TDataCache.
	GetDomain (see page 17803)	This is GetDomain, a member of class TDataCache.
	GetIndexCount (see page 17803)	This is GetIndexCount, a member of class TDataCache.
	GetMemoryUsage (see page 17803)	This is GetMemoryUsage, a member of class TDataCache.
	GetSummaryAsString (see page 17803)	This is GetSummaryAsString, a member of class TDataCache.
	GetSummaryAsVariant (see page 17804)	This is GetSummaryAsVariant, a member of class TDataCache.
	GetSummaryName (see page 17804)	This is GetSummaryName, a member of class TDataCache.
	HasSubTotals (see page 17804)	This is HasSubTotals, a member of class TDataCache.
	HasValidSubTotals (see page 17804)	This is HasValidSubTotals, a member of class TDataCache.
	IncSummaryIndex (see page 17805)	This is IncSummaryIndex, a member of class TDataCache.
	IsDimension (see page 17805)	This is IsDimension, a member of class TDataCache.
	IsSummary (see page 17805)	This is IsSummary, a member of class TDataCache.
	SummaryFromCubeDimIndex (see page 17805)	This is SummaryFromCubeDimIndex, a member of class TDataCache.
	SummaryFromFieldName (see page 17805)	This is SummaryFromFieldName, a member of class TDataCache.
	SummaryFromPosition (see page 17806)	This is SummaryFromPosition, a member of class TDataCache.

Public Properties

	Name	Description
	Active (see page 17806)	This is Active, a member of class TDataCache.
	CurrentSummary (see page 17807)	This is CurrentSummary, a member of class TDataCache.
R	DimensionCount (see page 17807)	This is DimensionCount, a member of class TDataCache.

	Dimensions (see page 17807)	This is Dimensions, a member of class TDataCache.
	ErrorCode (see page 17807)	This is ErrorCode, a member of class TDataCache.
	HasIndex (see page 17807)	This is HasIndex, a member of class TDataCache.
R	IndexCount (see page 17808)	This is IndexCount, a member of class TDataCache.
	PreCalculateTotals (see page 17808)	This is PreCalculateTotals, a member of class TDataCache.
	Sparsing (see page 17808)	This is Sparsing, a member of class TDataCache.
	Success (see page 17808)	This is Success, a member of class TDataCache.
R	Summaries (see page 17809)	This is Summaries, a member of class TDataCache.
R	SummaryCount (see page 17809)	This is SummaryCount, a member of class TDataCache.

111.1.7.2 TDataCache.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TDataCache();
```

Description

This is Create, a member of class TDataCache.

111.1.7.3 TDataCache.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataCache();
```

Description

This is Destroy, a member of class TDataCache.

111.1.7.4 TDataCache Methods

The methods of the TDataCache class are listed here.

Protected Methods

	Name	Description
	FreeCache (see page 17802)	This is FreeCache, a member of class TDataCache.

Public Methods

	Name	Description
	AddAggIndex (see page 17800)	This is AddAggIndex, a member of class TDataCache.
	AddIndex (see page 17800)	This is AddIndex, a member of class TDataCache.
	AppendDimension (see page 17800)	This is AppendDimension, a member of class TDataCache.
	AppendSummary (see page 17801)	This is AppendSummary, a member of class TDataCache.
	CalcSubTotals (see page 17801)	This is CalcSubTotals, a member of class TDataCache.
	ClearIndexInfo (see page 17801)	This is ClearIndexInfo, a member of class TDataCache.
	CreateTable (see page 17801)	This is CreateTable, a member of class TDataCache.
	DimensionFromFieldName (see page 17801)	This is DimensionFromFieldName, a member of class TDataCache.
	GetDimensionMember (see page 17802)	This is GetDimensionMember, a member of class TDataCache.

	GetDimensionMemberAsVariant (see page 17802)	This is GetDimensionMemberAsVariant, a member of class TDataCache.
	GetDimensionMemberCount (see page 17802)	This is GetDimensionMemberCount, a member of class TDataCache.
	GetDimensionName (see page 17803)	This is GetDimensionName, a member of class TDataCache.
	GetDomain (see page 17803)	This is GetDomain, a member of class TDataCache.
	GetIndexCount (see page 17803)	This is GetIndexCount, a member of class TDataCache.
	GetMemoryUsage (see page 17803)	This is GetMemoryUsage, a member of class TDataCache.
	GetSummaryAsString (see page 17803)	This is GetSummaryAsString, a member of class TDataCache.
	GetSummaryAsVariant (see page 17804)	This is GetSummaryAsVariant, a member of class TDataCache.
	GetSummaryName (see page 17804)	This is GetSummaryName, a member of class TDataCache.
	HasSubTotals (see page 17804)	This is HasSubTotals, a member of class TDataCache.
	HasValidSubTotals (see page 17804)	This is HasValidSubTotals, a member of class TDataCache.
	IncSummaryIndex (see page 17805)	This is IncSummaryIndex, a member of class TDataCache.
	IsDimension (see page 17805)	This is IsDimension, a member of class TDataCache.
	IsSummary (see page 17805)	This is IsSummary, a member of class TDataCache.
	SummaryFromCubeDimIndex (see page 17805)	This is SummaryFromCubeDimIndex, a member of class TDataCache.
	SummaryFromFieldName (see page 17805)	This is SummaryFromFieldName, a member of class TDataCache.
	SummaryFromPosition (see page 17806)	This is SummaryFromPosition, a member of class TDataCache.

111.1.7.4.1 TDataCache.AddAggIndex Method

Pascal

```
function AddAggIndex(SumIndex: TSmallIntArray; BuilderDims: TList): Integer;
```

C++

```
__fastcall int AddAggIndex(TSmallIntArray SumIndex, TList BuilderDims);
```

Description

This is AddAggIndex, a member of class TDataCache.

111.1.7.4.2 TDataCache.AddIndex Method

Pascal

```
function AddIndex(SumIndex: TSmallIntArray; bSparse: Boolean): Integer;
```

C++

```
__fastcall int AddIndex(TSmallIntArray SumIndex, Boolean bSparse);
```

Description

This is AddIndex, a member of class TDataCache.

111.1.7.4.3 TDataCache.AppendDimension Method

Pascal

```
function AppendDimension(Value: TDimension): Integer;
```

C++

```
__fastcall int AppendDimension(TDimension Value);
```

Description

This is AppendDimension, a member of class TDataCache.

111.1.7.4.4 TDataCache.AppendSummary Method

Pascal

```
function AppendSummary(Value: TSummary): Integer;
```

C++

```
__fastcall int AppendSummary(TSummary Value);
```

Description

This is AppendSummary, a member of class TDataCache.

111.1.7.4.5 TDataCache.CalcSubTotals Method

Pascal

```
procedure CalcSubTotals;
```

C++

```
__fastcall CalcSubTotals();
```

Description

This is CalcSubTotals, a member of class TDataCache.

111.1.7.4.6 TDataCache.ClearIndexInfo Method

Pascal

```
procedure ClearIndexInfo;
```

C++

```
__fastcall ClearIndexInfo();
```

Description

This is ClearIndexInfo, a member of class TDataCache.

111.1.7.4.7 TDataCache.CreateTable Method

Pascal

```
procedure CreateTable(Const Filename: String);
```

C++

```
__fastcall CreateTable(const AnsiString Filename);
```

Description

This is CreateTable, a member of class TDataCache.

111.1.7.4.8 TDataCache.DimensionFromFieldName Method

Pascal

```
function DimensionFromFieldName(FldName: string): TDimension;
```

C++

```
__fastcall TDimension DimensionFromFieldName(AnsiString FldName);
```

Description

This is DimensionFromFieldName, a member of class TDataCache.

111.1.7.4.9 TDataCache.FreeCache Method

Pascal

```
procedure FreeCache;
```

C++

```
__fastcall FreeCache();
```

Description

This is FreeCache, a member of class TDataCache.

111.1.7.4.10 TDataCache.GetDimensionMember Method

Pascal

```
function GetDimensionMember(DimIndex: Integer; MemberIndex: Integer): String;
```

C++

```
__fastcall AnsiString GetDimensionMember(int DimIndex, int MemberIndex);
```

Description

This is GetDimensionMember, a member of class TDataCache.

111.1.7.4.11 TDataCache.GetDimensionMemberAsVariant Method

Pascal

```
function GetDimensionMemberAsVariant(DimIndex: Integer; MemberIndex: Integer): Variant;
```

C++

```
__fastcall Variant GetDimensionMemberAsVariant(int DimIndex, int MemberIndex);
```

Description

This is GetDimensionMemberAsVariant, a member of class TDataCache.

111.1.7.4.12 TDataCache.GetDimensionMemberCount Method

Pascal

```
function GetDimensionMemberCount(DimIndex: Integer): Integer;
```

C++

```
__fastcall int GetDimensionMemberCount(int DimIndex);
```

Description

This is GetDimensionMemberCount, a member of class TDataCache.

111.1.7.4.13 TDataCache.GetDimensionName Method

Pascal

```
function GetDimensionName(DimIndex: Integer): String;
```

C++

```
__fastcall AnsiString GetDimensionName(int DimIndex);
```

Description

This is GetDimensionName, a member of class TDataCache.

111.1.7.4.14 TDataCache.GetDomain Method

Pascal

```
function GetDomain(DimensionIDs: TIntArray; nDims: Integer; ATotals: Boolean; Domain:
TTwoDimArray): Integer;
```

C++

```
__fastcall int GetDomain(TIntArray DimensionIDs, int nDims, Boolean ATotals, TTwoDimArray
Domain);
```

Description

This is GetDomain, a member of class TDataCache.

111.1.7.4.15 TDataCache.GetIndexCount Method

Pascal

```
function GetIndexCount: Integer;
```

C++

```
__fastcall int GetIndexCount();
```

Description

This is GetIndexCount, a member of class TDataCache.

111.1.7.4.16 TDataCache.GetMemoryUsage Method

Pascal

```
function GetMemoryUsage: Integer;
```

C++

```
__fastcall int GetMemoryUsage();
```

Description

This is GetMemoryUsage, a member of class TDataCache.

111.1.7.4.17 TDataCache.GetSummaryAsString Method

Pascal

```
function GetSummaryAsString(SumIndex: TSmallIntArray): String;
```

C++

```
__fastcall AnsiString GetSummaryAsString(TSmallIntArray SumIndex);
```

Description

This is GetSummaryAsString, a member of class TDataCache.

111.1.7.4.18 TDataCache.GetSummaryAsVariant Method

Pascal

```
function GetSummaryAsVariant(SumIndex: TSmallIntArray): Variant;
```

C++

```
__fastcall Variant GetSummaryAsVariant(TSmallIntArray SumIndex);
```

Description

This is GetSummaryAsVariant, a member of class TDataCache.

111.1.7.4.19 TDataCache.GetSummaryName Method

Pascal

```
function GetSummaryName(ISum: Integer): String;
```

C++

```
__fastcall AnsiString GetSummaryName(int ISum);
```

Description

This is GetSummaryName, a member of class TDataCache.

111.1.7.4.20 TDataCache.HasSubTotals Method

Pascal

```
function HasSubTotals(SumIndex: TSmallIntArray): Boolean;
```

C++

```
__fastcall Boolean HasSubTotals(TSmallIntArray SumIndex);
```

Description

This is HasSubTotals, a member of class TDataCache.

111.1.7.4.21 TDataCache.HasValidSubTotals Method

Pascal

```
function HasValidSubTotals(Summary: TSummary; SumIndex: TSmallIntArray): Boolean;
```

C++

```
__fastcall Boolean HasValidSubTotals(TSummary Summary, TSmallIntArray SumIndex);
```

Description

This is HasValidSubTotals, a member of class TDataCache.

111.1.7.4.22 TDataCache.IncSummaryIndex Method

Pascal

```
function IncSummaryIndex(Summary: TSummary; SumIndex: TSmallIntArray; rangeCount:
TSmallIntArray; var bGroupBreak: Boolean): Boolean;
```

C++

```
__fastcall Boolean IncSummaryIndex(TSummary Summary, TSmallIntArray SumIndex, TSmallIntArray
rangeCount, Boolean bGroupBreak);
```

Description

This is IncSummaryIndex, a member of class TDataCache.

111.1.7.4.23 TDataCache.IsDimension Method

Pascal

```
function IsDimension(Position: Integer): Boolean;
```

C++

```
__fastcall Boolean IsDimension(int Position);
```

Description

This is IsDimension, a member of class TDataCache.

111.1.7.4.24 TDataCache.IsSummary Method

Pascal

```
function IsSummary(Position: Integer): Boolean;
```

C++

```
__fastcall Boolean IsSummary(int Position);
```

Description

This is IsSummary, a member of class TDataCache.

111.1.7.4.25 TDataCache.SummaryFromCubeDimIndex Method

Pascal

```
function SummaryFromCubeDimIndex(Index: Integer): TSummary;
```

C++

```
__fastcall TSummary SummaryFromCubeDimIndex(int Index);
```

Description

This is SummaryFromCubeDimIndex, a member of class TDataCache.

111.1.7.4.26 TDataCache.SummaryFromFieldName Method

Pascal

```
function SummaryFromFieldName(FldName: string): TSummary;
```

C++

```
__fastcall TSummary SummaryFromFieldName(AnsiString FldName);
```

Description

This is SummaryFromFieldName, a member of class TDataCache.

111.1.7.4.27 TDataCache.SummaryFromPosition Method

Pascal

```
function SummaryFromPosition(Position: Integer): TSummary;
```

C++

```
__fastcall TSummary SummaryFromPosition(int Position);
```

Description

This is SummaryFromPosition, a member of class TDataCache.

111.1.7.5 TDataCache Properties

The properties of the TDataCache class are listed here.

Public Properties

	Name	Description
	Active (see page 17806)	This is Active, a member of class TDataCache.
	CurrentSummary (see page 17807)	This is CurrentSummary, a member of class TDataCache.
R	DimensionCount (see page 17807)	This is DimensionCount, a member of class TDataCache.
	Dimensions (see page 17807)	This is Dimensions, a member of class TDataCache.
	ErrorCode (see page 17807)	This is ErrorCode, a member of class TDataCache.
	HasIndex (see page 17807)	This is HasIndex, a member of class TDataCache.
R	IndexCount (see page 17808)	This is IndexCount, a member of class TDataCache.
	PreCalculateTotals (see page 17808)	This is PreCalculateTotals, a member of class TDataCache.
	Sparsing (see page 17808)	This is Sparsing, a member of class TDataCache.
	Success (see page 17808)	This is Success, a member of class TDataCache.
R	Summaries (see page 17809)	This is Summaries, a member of class TDataCache.
R	SummaryCount (see page 17809)	This is SummaryCount, a member of class TDataCache.

111.1.7.5.1 TDataCache.Active Property

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

This is Active, a member of class TDataCache.

111.1.7.5.2 TDataCache.CurrentSummary Property

Pascal

```
property CurrentSummary: Integer;
```

C++

```
__property int CurrentSummary;
```

Description

This is CurrentSummary, a member of class TDataCache.

111.1.7.5.3 TDataCache.DimensionCount Property

Pascal

```
property DimensionCount: Integer;
```

C++

```
__property int DimensionCount;
```

Description

This is DimensionCount, a member of class TDataCache.

111.1.7.5.4 TDataCache.Dimensions Property

Pascal

```
property Dimensions [Index: Integer]: TDimension;
```

C++

```
__property TDimension Dimensions[int Index];
```

Description

This is Dimensions, a member of class TDataCache.

111.1.7.5.5 TDataCache.ErrorCode Property

Pascal

```
property ErrorCode: Integer;
```

C++

```
__property int ErrorCode;
```

Description

This is ErrorCode, a member of class TDataCache.

111.1.7.5.6 TDataCache.HasIndex Property

Pascal

```
property HasIndex: Boolean;
```

C++

```
__property Boolean HasIndex;
```

Description

This is HasIndex, a member of class TDataCache.

111.1.7.5.7 TDataCache.IndexCount Property

Pascal

```
property IndexCount: Integer;
```

C++

```
__property int IndexCount;
```

Description

This is IndexCount, a member of class TDataCache.

111.1.7.5.8 TDataCache.PreCalculateTotals Property

Pascal

```
property PreCalculateTotals: Boolean;
```

C++

```
__property Boolean PreCalculateTotals;
```

Description

This is PreCalculateTotals, a member of class TDataCache.

111.1.7.5.9 TDataCache.Sparsing Property

Pascal

```
property Sparsing: Boolean;
```

C++

```
__property Boolean Sparsing;
```

Description

This is Sparsing, a member of class TDataCache.

111.1.7.5.10 TDataCache.Success Property

Pascal

```
property Success: Boolean;
```

C++

```
__property Boolean Success;
```

Description

This is Success, a member of class TDataCache.

111.1.7.5.11 TDataCache.Summaries Property

Pascal

```
property Summaries [Index: Integer]: TSummary;
```

C++

```
__property TSummary Summaries[int Index];
```

Description

This is Summaries, a member of class TDataCache.

111.1.7.5.12 TDataCache.SummaryCount Property

Pascal

```
property SummaryCount: Integer;
```

C++

```
__property int SummaryCount;
```

Description

This is SummaryCount, a member of class TDataCache.

111.1.8 TDimension Class

Class Hierarchy

Pascal

```
TDimension = class(TCustomArray);
```

C++

```
class TDimension : public TCustomArray;
```

File

Mxstore

Description

This is class Mxstore.TDimension.

111.1.8.1 TDimension Members

The following tables list the members exposed by TDimension.

Protected Methods

	Name	Description
	GetCompProc (see page 17330)	This is GetCompProc, a member of class TCustomArray.
	GetDups (see page 17331)	This is GetDups, a member of class TCustomArray.
	GetItem (see page 17332)	This is GetItem, a member of class TCustomArray.

	GetMemberCount (see page 17332)	This is GetMemberCount, a member of class TCustomArray.
	GetSort (see page 17332)	This is GetSort, a member of class TCustomArray.
	SetCompProc (see page 17333)	This is SetCompProc, a member of class TCustomArray.
	SetDups (see page 17333)	This is SetDups, a member of class TCustomArray.
	SetItem (see page 17333)	This is SetItem, a member of class TCustomArray.
	SetSort (see page 17334)	This is SetSort, a member of class TCustomArray.

Public Methods

	Name	Description
	Add (see page 17330)	This is Add, a member of class TCustomArray.
	Assign (see page 17330)	This is Assign, a member of class TCustomArray.
	AssignSorted (see page 17811)	This is AssignSorted, a member of class TDimension.
	ClearFlag (see page 17811)	This is ClearFlag, a member of class TDimension.
	ConvertVar (see page 17330)	This is ConvertVar, a member of class TCustomArray.
	Create (see page 17810)	This is Create, a member of class TDimension.
V	Destroy (see page 17811)	This is Destroy, a member of class TDimension.
	GetCurrency (see page 17331)	This is GetCurrency, a member of class TCustomArray.
	GetDouble (see page 17331)	This is GetDouble, a member of class TCustomArray.
	GetInteger (see page 17331)	This is GetInteger, a member of class TCustomArray.
	HasFlag (see page 17812)	This is HasFlag, a member of class TDimension.
	IndexOf (see page 17332)	This is IndexOf, a member of class TCustomArray.
	IsBlank (see page 17332)	This is IsBlank, a member of class TCustomArray.
	IsString (see page 17812)	This is IsString, a member of class TDimension.
V	MemoryUsage (see page 17333)	This is MemoryUsage, a member of class TCustomArray.
	SetFlag (see page 17812)	This is SetFlag, a member of class TDimension.
	SetRangeCounting (see page 17812)	This is SetRangeCounting, a member of class TDimension.
	SetSize (see page 17334)	This is SetSize, a member of class TCustomArray.

Public Properties

	Name	Description
W	Attributes (see page 17813)	This is Attributes, a member of class TDimension.
	BlankBoolVal (see page 17334)	This is BlankBoolVal, a member of class TCustomArray.
R	BlankCount (see page 17335)	This is BlankCount, a member of class TCustomArray.
	BlankDateVal (see page 17335)	This is BlankDateVal, a member of class TCustomArray.
	BlankStringVal (see page 17335)	This is BlankStringVal, a member of class TCustomArray.
	CompareProc (see page 17335)	This is CompareProc, a member of class TCustomArray.
R	DataType (see page 17335)	This is DataType, a member of class TCustomArray.
	DimensionName (see page 17813)	This is DimensionName, a member of class TDimension.
	Duplicates (see page 17336)	This is Duplicates, a member of class TCustomArray.
R	FieldDefinition (see page 17813)	This is FieldDefinition, a member of class TDimension.
	FieldName (see page 17813)	This is FieldName, a member of class TDimension.
	FieldType (see page 17814)	This is FieldType, a member of class TDimension.
	Items (see page 17336)	This is Items, a member of class TCustomArray.
R	List (see page 17336)	This is List, a member of class TCustomArray.
R	MemberCount (see page 17336)	This is MemberCount, a member of class TCustomArray.
	Position (see page 17814)	This is Position, a member of class TDimension.
	Range (see page 17814)	This is Range, a member of class TDimension.
	Sorted (see page 17337)	This is Sorted, a member of class TCustomArray.

111.1.8.2 TDimension.Create Constructor

Pascal

```
constructor Create(Items: Cardinal; DataType: TFieldType);
```

C++

```
__fastcall TDimension(unsigned Items, TFieldType DataType);
```

Description

This is Create, a member of class TDimension.

111.1.8.3 TDimension.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDimension();
```

Description

This is Destroy, a member of class TDimension.

111.1.8.4 TDimension Methods

The methods of the TDimension class are listed here.

Public Methods

	Name	Description
	AssignSorted (see page 17811)	This is AssignSorted, a member of class TDimension.
	ClearFlag (see page 17811)	This is ClearFlag, a member of class TDimension.
	HasFlag (see page 17812)	This is HasFlag, a member of class TDimension.
	IsString (see page 17812)	This is IsString, a member of class TDimension.
	SetFlag (see page 17812)	This is SetFlag, a member of class TDimension.
	SetRangeCounting (see page 17812)	This is SetRangeCounting, a member of class TDimension.

111.1.8.4.1 TDimension.AssignSorted Method

Pascal

```
procedure AssignSorted(Dim: TDimension; bUnique: Boolean);
```

C++

```
__fastcall AssignSorted(TDimension Dim, Boolean bUnique);
```

Description

This is AssignSorted, a member of class TDimension.

111.1.8.4.2 TDimension.ClearFlag Method

Pascal

```
procedure ClearFlag(aFlag: TDimFlags);
```

C++

```
__fastcall ClearFlag(TDimFlags aFlag);
```

Description

This is ClearFlag, a member of class TDimension.

111.1.8.4.3 TDimension.HasFlag Method

Pascal

```
function HasFlag(aFlag: TDimFlags): Boolean;
```

C++

```
__fastcall Boolean HasFlag(TDimFlags aFlag);
```

Description

This is HasFlag, a member of class TDimension.

111.1.8.4.4 TDimension.IsString Method

Pascal

```
function IsString: Boolean;
```

C++

```
__fastcall Boolean IsString();
```

Description

This is IsString, a member of class TDimension.

111.1.8.4.5 TDimension.SetFlag Method

Pascal

```
procedure SetFlag(aFlag: TDimFlags);
```

C++

```
__fastcall SetFlag(TDimFlags aFlag);
```

Description

This is SetFlag, a member of class TDimension.

111.1.8.4.6 TDimension.SetRangeCounting Method

Pascal

```
procedure SetRangeCounting(bRange: Boolean);
```

C++

```
__fastcall SetRangeCounting(Boolean bRange);
```

Description

This is SetRangeCounting, a member of class TDimension.

111.1.8.5 TDimension Properties

The properties of the TDimension class are listed here.

Public Properties

	Name	Description
W	Attributes (see page 17813)	This is Attributes, a member of class TDimension.
	DimensionName (see page 17813)	This is DimensionName, a member of class TDimension.
R	FieldDefinition (see page 17813)	This is FieldDefinition, a member of class TDimension.
	FieldName (see page 17813)	This is FieldName, a member of class TDimension.
	FieldType (see page 17814)	This is FieldType, a member of class TDimension.
	Position (see page 17814)	This is Position, a member of class TDimension.
	Range (see page 17814)	This is Range, a member of class TDimension.

111.1.8.5.1 TDimension.Attributes Property

Pascal

```
property Attributes: TDimFlags;
```

C++

```
__property TDimFlags Attributes;
```

Description

This is Attributes, a member of class TDimension.

111.1.8.5.2 TDimension.DimensionName Property

Pascal

```
property DimensionName: String;
```

C++

```
__property AnsiString DimensionName;
```

Description

This is DimensionName, a member of class TDimension.

111.1.8.5.3 TDimension.FieldDefinition Property

Pascal

```
property FieldDefinition: TFieldDefinition;
```

C++

```
__property TFieldDefinition FieldDefinition;
```

Description

This is FieldDefinition, a member of class TDimension.

111.1.8.5.4 TDimension.FieldName Property

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;
```

Description

This is FieldName, a member of class TDimension.

111.1.8.5.5 TDimension.FieldType Property

Pascal

```
property FieldType: TFieldType;
```

C++

```
__property TFieldType FieldType;
```

Description

This is FieldType, a member of class TDimension.

111.1.8.5.6 TDimension.Position Property

Pascal

```
property Position: Integer;
```

C++

```
__property int Position;
```

Description

This is Position, a member of class TDimension.

111.1.8.5.7 TDimension.Range Property

Pascal

```
property Range: Integer;
```

C++

```
__property int Range;
```

Description

This is Range, a member of class TDimension.

111.1.9 TFieldDefinition Class

Class Hierarchy

Mxstore.TFieldDefinition

Pascal

```
TFieldDefinition = class;
```

C++

```
class TFieldDefinition;
```

File

Mxstore

Description

This is class Mxstore.TFieldDefinition.

111.1.9.1 TFieldDefinition Members

The following tables list the members exposed by TFieldDefinition.

Public Methods

	Name	Description
	Create (see page 17815)	This is Create, a member of class TFieldDefinition.
	FormatVariantToStr (see page 17815)	This is FormatVariantToStr, a member of class TFieldDefinition.
	SetFieldType (see page 17816)	This is SetFieldType, a member of class TFieldDefinition.
	SetName (see page 17816)	This is SetName, a member of class TFieldDefinition.

Public Properties

	Name	Description
	DisplayName (see page 17816)	This is DisplayName, a member of class TFieldDefinition.
	FieldNo (see page 17817)	This is FieldNo, a member of class TFieldDefinition.
	FieldType (see page 17817)	This is FieldType, a member of class TFieldDefinition.
	FormatString (see page 17817)	This is FormatString, a member of class TFieldDefinition.
	Precision (see page 17817)	This is Precision, a member of class TFieldDefinition.
	Width (see page 17817)	This is Width, a member of class TFieldDefinition.

111.1.9.2 TFieldDefinition.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TFieldDefinition();
```

Description

This is Create, a member of class TFieldDefinition.

111.1.9.3 TFieldDefinition Methods

The methods of the TFieldDefinition class are listed here.

Public Methods

	Name	Description
	FormatVariantToStr (see page 17815)	This is FormatVariantToStr, a member of class TFieldDefinition.
	SetFieldType (see page 17816)	This is SetFieldType, a member of class TFieldDefinition.
	SetName (see page 17816)	This is SetName, a member of class TFieldDefinition.

111.1.9.3.1 TFieldDefinition.FormatVariantToStr Method

Pascal

```
function FormatVariantToStr(Value: Variant): string;
```

C++

```
__fastcall AnsiString FormatVariantToStr(Variant Value);
```

Description

This is FormatVariantToStr, a member of class TFieldDefinition.

111.1.9.3.2 TFieldDefinition.SetFieldType Method

Pascal

```
procedure SetFieldType(FType: TFieldType);
```

C++

```
__fastcall SetFieldType(TFieldType FType);
```

Description

This is SetFieldType, a member of class TFieldDefinition.

111.1.9.3.3 TFieldDefinition.SetName Method

Pascal

```
procedure SetName(Value: String);
```

C++

```
__fastcall SetName(AnsiString Value);
```

Description

This is SetName, a member of class TFieldDefinition.

111.1.9.4 TFieldDefinition Properties

The properties of the TFieldDefinition class are listed here.

Public Properties

	Name	Description
	DisplayName (see page 17816)	This is DisplayName, a member of class TFieldDefinition.
	FieldNo (see page 17817)	This is FieldNo, a member of class TFieldDefinition.
	FieldType (see page 17817)	This is FieldType, a member of class TFieldDefinition.
	FormatString (see page 17817)	This is FormatString, a member of class TFieldDefinition.
	Precision (see page 17817)	This is Precision, a member of class TFieldDefinition.
	Width (see page 17817)	This is Width, a member of class TFieldDefinition.

111.1.9.4.1 TFieldDefinition.DisplayName Property

Pascal

```
property DisplayName: String;
```

C++

```
__property AnsiString DisplayName;
```

Description

This is DisplayName, a member of class TFieldDefinition.

111.1.9.4.2 TFieldDefinition.FieldNo Property

Pascal

```
property FieldNo: Integer;
```

C++

```
__property int FieldNo;
```

Description

This is FieldNo, a member of class TFieldDefinition.

111.1.9.4.3 TFieldDefinition.FieldType Property

Pascal

```
property FieldType: TFieldType;
```

C++

```
__property TFieldType FieldType;
```

Description

This is FieldType, a member of class TFieldDefinition.

111.1.9.4.4 TFieldDefinition.FormatString Property

Pascal

```
property FormatString: string;
```

C++

```
__property AnsiString FormatString;
```

Description

This is FormatString, a member of class TFieldDefinition.

111.1.9.4.5 TFieldDefinition.Precision Property

Pascal

```
property Precision: Integer;
```

C++

```
__property int Precision;
```

Description

This is Precision, a member of class TFieldDefinition.

111.1.9.4.6 TFieldDefinition.Width Property

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

This is Width, a member of class TFieldDefinition.

111.1.10 TIndexInfo Class

Class Hierarchy

Mxstore.TIndexInfo

Pascal

```
TIndexInfo = class;
```

C++

```
class TIndexInfo;
```

File

Mxstore

Description

This is class Mxstore.TIndexInfo.

111.1.10.1 TIndexInfo Members

The following tables list the members exposed by TIndexInfo.

Public Methods

	Name	Description
	Add (see page 17819)	This is Add, a member of class TIndexInfo.
	AddOffset (see page 17819)	This is AddOffset, a member of class TIndexInfo.
	Create (see page 17818)	This is Create, a member of class TIndexInfo.
V	Destroy (see page 17819)	This is Destroy, a member of class TIndexInfo.
	GetCapacity (see page 17820)	This is GetCapacity, a member of class TIndexInfo.
	IsSparse (see page 17820)	This is IsSparse, a member of class TIndexInfo.
	IsSparseAgg (see page 17820)	This is IsSparseAgg, a member of class TIndexInfo.
	LockIndex (see page 17820)	This is LockIndex, a member of class TIndexInfo.
	SetCapacity (see page 17821)	This is SetCapacity, a member of class TIndexInfo.
	UnlockIndex (see page 17821)	This is UnlockIndex, a member of class TIndexInfo.

Public Properties

	Name	Description
	AddAggs (see page 17821)	This is AddAggs, a member of class TIndexInfo.
	Capacity (see page 17821)	This is Capacity, a member of class TIndexInfo.
R	Count (see page 17822)	This is Count, a member of class TIndexInfo.

111.1.10.2 TIndexInfo.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TIndexInfo();
```

Description

This is Create, a member of class TIndexInfo.

111.1.10.3 TIndexInfo.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TIndexInfo();
```

Description

This is Destroy, a member of class TIndexInfo.

111.1.10.4 TIndexInfo Methods

The methods of the TIndexInfo class are listed here.

Public Methods

	Name	Description
	Add (see page 17819)	This is Add, a member of class TIndexInfo.
	AddOffset (see page 17819)	This is AddOffset, a member of class TIndexInfo.
	GetCapacity (see page 17820)	This is GetCapacity, a member of class TIndexInfo.
	IsSparse (see page 17820)	This is IsSparse, a member of class TIndexInfo.
	IsSparseAgg (see page 17820)	This is IsSparseAgg, a member of class TIndexInfo.
	LockIndex (see page 17820)	This is LockIndex, a member of class TIndexInfo.
	SetCapacity (see page 17821)	This is SetCapacity, a member of class TIndexInfo.
	UnlockIndex (see page 17821)	This is UnlockIndex, a member of class TIndexInfo.

111.1.10.4.1 TIndexInfo.Add Method

Pascal

```
function Add(pIdxRec: PIndexInfoRec): Integer;
```

C++

```
__fastcall int Add(PIndexInfoRec pIdxRec);
```

Description

This is Add, a member of class TIndexInfo.

111.1.10.4.2 TIndexInfo.AddOffset Method

Pascal

```
procedure AddOffset(Index: Integer; IdxType: Integer);
```

C++

```
__fastcall AddOffset(int Index, int IdxType);
```

Description

This is AddOffset, a member of class TIndexInfo.

111.1.10.4.3 TIndexInfo.GetCapacity Method

Pascal

```
function GetCapacity: Integer;
```

C++

```
__fastcall int GetCapacity();
```

Description

This is GetCapacity, a member of class TIndexInfo.

111.1.10.4.4 TIndexInfo.IsSparse Method

Pascal

```
function IsSparse(Index: Integer): Boolean;
```

C++

```
__fastcall Boolean IsSparse(int Index);
```

Description

This is IsSparse, a member of class TIndexInfo.

111.1.10.4.5 TIndexInfo.IsSparseAgg Method

Pascal

```
function IsSparseAgg(Index: Integer): Boolean;
```

C++

```
__fastcall Boolean IsSparseAgg(int Index);
```

Description

This is IsSparseAgg, a member of class TIndexInfo.

111.1.10.4.6 TIndexInfo.LockIndex Method

Pascal

```
function LockIndex: TIntArray;
```

C++

```
__fastcall TIntArray LockIndex();
```

Description

This is LockIndex, a member of class TIndexInfo.

111.1.10.4.7 TIndexInfo.SetCapacity Method

Pascal

```
procedure SetCapacity(Value: Integer);
```

C++

```
__fastcall SetCapacity(int Value);
```

Description

This is SetCapacity, a member of class TIndexInfo.

111.1.10.4.8 TIndexInfo.UnlockIndex Method

Pascal

```
procedure UnlockIndex;
```

C++

```
__fastcall UnlockIndex();
```

Description

This is UnlockIndex, a member of class TIndexInfo.

111.1.10.5 TIndexInfo Properties

The properties of the TIndexInfo class are listed here.

Public Properties

	Name	Description
	AddAggs (see page 17821)	This is AddAggs, a member of class TIndexInfo.
	Capacity (see page 17821)	This is Capacity, a member of class TIndexInfo.
R	Count (see page 17822)	This is Count, a member of class TIndexInfo.

111.1.10.5.1 TIndexInfo.AddAggs Property

Pascal

```
property AddAggs: Boolean;
```

C++

```
__property Boolean AddAggs;
```

Description

This is AddAggs, a member of class TIndexInfo.

111.1.10.5.2 TIndexInfo.Capacity Property

Pascal

```
property Capacity: Integer;
```

C++

```
__property int Capacity;
```

Description

This is Capacity, a member of class TIndexInfo.

111.1.10.5.3 TIndexInfo.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TIndexInfo.

111.1.11 TMultiDimDataLink Class

Class Hierarchy

Pascal

```
TMultiDimDataLink = class(TDataLink);
```

C++

```
class TMultiDimDataLink : public TDataLink;
```

File

Mxstore

Description

This is class Mxstore.TMultiDimDataLink.

111.1.11.1 TMultiDimDataLink Members

The following tables list the members exposed by TMultiDimDataLink.

Protected Methods

	Name	Description
	ActiveChanged (see page 17825)	Responds to changes in the Active property.
	AddDimension (see page 17825)	This is AddDimension, a member of class TMultiDimDataLink.
	AddSummary (see page 17826)	This is AddSummary, a member of class TMultiDimDataLink.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CheckBrowseMode (see page 6880)	Allows the data-aware object to respond just before an event that changes the dataset state.
	CreateSummaryIndex (see page 17826)	This is CreateSummaryIndex, a member of class TMultiDimDataLink.
	DataEvent (see page 6881)	Responds to various events that occur while working with data.
	DataSetChanged (see page 6881)	Responds to changes in the dataset.
	DataSetScrolled (see page 6882)	Allows a response to scrolling the representation of the dataset within the data-aware object.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EditingChanged (see page 6883)	Responds to changes in the editing state of the data source.
	FetchAndBinValues (see page 17826)	This is FetchAndBinValues, a member of class TMultiDimDataLink.
	FetchValues (see page 17826)	This is FetchValues, a member of class TMultiDimDataLink.
	FocusControl (see page 6884)	Provides the interface for a method to force focus to the data-aware component associated with the TDataLink (see page 6876).
	GetActiveRecord (see page 6884)	This is GetActiveRecord, a member of class TDataLink.
	GetBOF (see page 6884)	This is GetBOF, a member of class TDataLink.
	GetBufferCount (see page 6884)	This is GetBufferCount, a member of class TDataLink.
	GetEOF (see page 6885)	This is GetEOF, a member of class TDataLink.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRecordCount (see page 6885)	This is GetRecordCount, a member of class TDataLink.
	LayoutChanged (see page 17827)	Responds to changes in the representation of the data by the data-aware object.
	MoveBy (see page 6885)	Repositions the dataset to another record relative to its active record.
	RecordChanged (see page 6886)	Responds to changes in the contents of the current record or field of the dataset.
	SetActiveRecord (see page 6886)	This is SetActiveRecord, a member of class TDataLink.
	SetBufferCount (see page 6887)	This is SetBufferCount, a member of class TDataLink.
	UpdateCache (see page 17827)	This is UpdateCache, a member of class TMultiDimDataLink.
	UpdateData (see page 6887)	Provides an interface for writing edits to a record in the dataset.
	UpdateDimensions (see page 17827)	This is UpdateDimensions, a member of class TMultiDimDataLink.
	UpdateFormatStrings (see page 17827)	This is UpdateFormatStrings, a member of class TMultiDimDataLink.

Protected Properties

	Name	Description
	VisualControl (see page 6894)	Indicates whether a visual control uses the datalink.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 17824)	This is Create, a member of class TMultiDimDataLink.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 17824)	Destroys an instance of TDataLink.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6882)	Attempts to drive the data source into an editing state if it is not already in one.
	ExecuteAction (see page 6883)	Invokes an action with the datasource as its target.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	UpdateAction (see page 6887)	Updates an action to reflect the current state of the TDataLink (see page 6876).
	UpdateRecord (see page 6888)	Responds to notifications that edits should be posted to the dataset.

Public Properties

	Name	Description
R	Active (see page 6888)	Specifies whether the dataset that TDataLink (see page 6876) manages is active.
	ActiveRecord (see page 6889)	Specifies the index of the current record within the internal record buffer maintained by the dataset for the Owner of the TDataLink (see page 6876) object.
R	BOF (see page 6889)	Indicates whether the first record in a dataset is active.
	BufferCount (see page 6890)	Specifies the number of records cached by the dataset for the Owner of the TDataLink (see page 6876) object.
R	DataSet (see page 6890)	Specifies the TDataSet (see page 6894) object that represents the data that this TDataLink (see page 6876) is tracking.
	DataSource (see page 6891)	Specifies the TDataSource (see page 7070) object that the Owner of the TDataLink (see page 6876) uses to connect to the dataset.
	DataSourceFixed (see page 6891)	Indicates whether the DataSource (see page 6891) property can be set.
R	Editing (see page 6892)	Indicates whether the DataSource (see page 6891) is in edit mode.
R	Eof (see page 6892)	Indicates whether the last record in a dataset is active.
	ReadOnly (see page 6893)	Indicates whether the dataset for this TDataLink (see page 6876) can be modified.
R	RecordCount (see page 6893)	Indicates the number of records in the internal record buffer maintained by the dataset.

111.1.11.2 TMultiDimDataLink.Create Constructor

Pascal

```
constructor Create(AStore: TCustomDataStore);
```

C++

```
__fastcall TMultiDimDataLink(TCustomDataStore AStore);
```

Description

This is Create, a member of class TMultiDimDataLink.

111.1.11.3 TMultiDimDataLink.Destroy Destructor

Destroys an instance of TDataLink.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMultiDimDataLink();
```

Description

The TDataLink object should be destroyed in the destructor of its Owner, where that Owner calls Create from its constructor.

Do not call Destroy directly in an application. Instead, call the Free method. Free checks that the TDataLink reference is not nil and only then calls Destroy.

Before calling the inherited destructor, Destroy removes any reference to the TDataLink from the data source object.

See Also

DataSource (see page 6891)

Free (see page 22300)

111.1.11.4 TMultiDimDataLink Methods

The methods of the TMultiDimDataLink class are listed here.

Protected Methods

	Name	Description
V	ActivateChanged (see page 17825)	Responds to changes in the Active property.
	AddDimension (see page 17825)	This is AddDimension, a member of class TMultiDimDataLink.
	AddSummary (see page 17826)	This is AddSummary, a member of class TMultiDimDataLink.
	CreateSummaryIndex (see page 17826)	This is CreateSummaryIndex, a member of class TMultiDimDataLink.
	FetchAndBinValues (see page 17826)	This is FetchAndBinValues, a member of class TMultiDimDataLink.
	FetchValues (see page 17826)	This is FetchValues, a member of class TMultiDimDataLink.
V	LayoutChanged (see page 17827)	Responds to changes in the representation of the data by the data-aware object.
	UpdateCache (see page 17827)	This is UpdateCache, a member of class TMultiDimDataLink.
	UpdateDimensions (see page 17827)	This is UpdateDimensions, a member of class TMultiDimDataLink.
	UpdateFormatStrings (see page 17827)	This is UpdateFormatStrings, a member of class TMultiDimDataLink.

111.1.11.4.1 TMultiDimDataLink.ActiveChanged Method

Responds to changes in the Active property.

Pascal

```
procedure ActiveChanged; override;
```

C++

```
virtual __fastcall ActiveChanged();
```

Description

The ActiveChanged method defined by TDataLink merely provides an interface for a method that can respond to changes in the Active property. Derived objects that do not need to respond to such changes can allow the inherited method to ignore them.

See Also

Active (see page 6888)

111.1.11.4.2 TMultiDimDataLink.AddDimension Method

Pascal

```
function AddDimension(DimMap: TCubeDim; Fld: TField): Integer;
```

C++

```
__fastcall int AddDimension(TCubeDim DimMap, TField Fld);
```

Description

This is AddDimension, a member of class TMultiDimDataLink.

111.1.11.4.3 TMultiDimDataLink.AddSummary Method

Pascal

```
procedure AddSummary(DimMap: TCubeDim; Fld: TField);
```

C++

```
__fastcall AddSummary(TCubeDim DimMap, TField Fld);
```

Description

This is AddSummary, a member of class TMultiDimDataLink.

111.1.11.4.4 TMultiDimDataLink.CreateSummaryIndex Method

Pascal

```
procedure CreateSummaryIndex(DimAllList: TList);
```

C++

```
__fastcall CreateSummaryIndex(TList DimAllList);
```

Description

This is CreateSummaryIndex, a member of class TMultiDimDataLink.

111.1.11.4.5 TMultiDimDataLink.FetchAndBinValues Method

Pascal

```
procedure FetchAndBinValues(DimAllList: TList);
```

C++

```
__fastcall FetchAndBinValues(TList DimAllList);
```

Description

This is FetchAndBinValues, a member of class TMultiDimDataLink.

111.1.11.4.6 TMultiDimDataLink.FetchValues Method

Pascal

```
procedure FetchValues(DimAllList: TList);
```

C++

```
__fastcall FetchValues(TList DimAllList);
```

Description

This is FetchValues, a member of class TMultiDimDataLink.

111.1.11.4.7 TMultiDimDataLink.LayoutChanged Method

Responds to changes in the representation of the data by the data-aware object.

Pascal

```
procedure LayoutChanged; override;
```

C++

```
virtual __fastcall LayoutChanged();
```

Description

The LayoutChanged method simply calls the DataSetChanged method. LayoutChanged is intended to provide an interface for a method that can respond after changes in the representation of the data by the data-aware object. An example of such a change would be changing the number or order of the columns in a TCustomDBGrid.

See Also

DataSetChanged (see page 6881)

111.1.11.4.8 TMultiDimDataLink.UpdateCache Method

Pascal

```
procedure UpdateCache(Sender: TObject);
```

C++

```
__fastcall UpdateCache(TObject * Sender);
```

Description

This is UpdateCache, a member of class TMultiDimDataLink.

111.1.11.4.9 TMultiDimDataLink.UpdateDimensions Method

Pascal

```
procedure UpdateDimensions(DimAllList: TList);
```

C++

```
__fastcall UpdateDimensions(TList DimAllList);
```

Description

This is UpdateDimensions, a member of class TMultiDimDataLink.

111.1.11.4.10 TMultiDimDataLink.UpdateFormatStrings Method

Pascal

```
procedure UpdateFormatStrings;
```

C++

```
__fastcall UpdateFormatStrings();
```

Description

This is UpdateFormatStrings, a member of class TMultiDimDataLink.

111.1.12 TSummary Class

Class Hierarchy

Pascal

```
TSummary = class(TCustomArray);
```

C++

```
class TSummary : public TCustomArray;
```

File

Mxstore

Description

This is class Mxstore.TSummary.

111.1.12.1 TSummary Members

The following tables list the members exposed by TSummary.

Protected Methods

	Name	Description
	GetCompProc (see page 17330)	This is GetCompProc, a member of class TCustomArray.
	GetDups (see page 17331)	This is GetDups, a member of class TCustomArray.
	GetItem (see page 17332)	This is GetItem, a member of class TCustomArray.
	GetMemberCount (see page 17332)	This is GetMemberCount, a member of class TCustomArray.
	GetSort (see page 17332)	This is GetSort, a member of class TCustomArray.
	HasFlag (see page 17831)	This is HasFlag, a member of class TSummary.
	SetAggregator (see page 17832)	This is SetAggregator, a member of class TSummary.
	SetCompProc (see page 17333)	This is SetCompProc, a member of class TCustomArray.
	SetDups (see page 17333)	This is SetDups, a member of class TCustomArray.
	SetItem (see page 17333)	This is SetItem, a member of class TCustomArray.
	SetSort (see page 17334)	This is SetSort, a member of class TCustomArray.

Public Events

	Name	Description
	SumMethod (see page 17834)	This is SumMethod, a member of class TSummary.

Public Methods

	Name	Description
	Add (see page 17330)	This is Add, a member of class TCustomArray.
	AddIndexInfo (see page 17830)	This is AddIndexInfo, a member of class TSummary.
	AddSubTotal (see page 17830)	This is AddSubTotal, a member of class TSummary.
	AddSum (see page 17830)	This is AddSum, a member of class TSummary.
	Assign (see page 17330)	This is Assign, a member of class TCustomArray.
	ClearTotals (see page 17831)	This is ClearTotals, a member of class TSummary.
	ConvertVar (see page 17330)	This is ConvertVar, a member of class TCustomArray.
	Create (see page 17829)	This is Create, a member of class TSummary.
	Destroy (see page 17829)	This is Destroy, a member of class TSummary.

	GetCurrency (see page 17331)	This is GetCurrency, a member of class TCustomArray.
	GetDouble (see page 17331)	This is GetDouble, a member of class TCustomArray.
	GetInteger (see page 17331)	This is GetInteger, a member of class TCustomArray.
	IndexOf (see page 17332)	This is IndexOf, a member of class TCustomArray.
	IsBlank (see page 17332)	This is IsBlank, a member of class TCustomArray.
	IsSparse (see page 17831)	This is IsSparse, a member of class TSummary.
V	MemoryUsage (see page 17831)	This is MemoryUsage, a member of class TSummary.
	SetSize (see page 17334)	This is SetSize, a member of class TCustomArray.
	UpdateIndexInfo (see page 17832)	This is UpdateIndexInfo, a member of class TSummary.

Public Properties

	Name	Description
	AggDefinition (see page 17832)	This is AggDefinition, a member of class TSummary.
W	Attributes (see page 17833)	This is Attributes, a member of class TSummary.
	BlankBoolVal (see page 17334)	This is BlankBoolVal, a member of class TCustomArray.
R	BlankCount (see page 17335)	This is BlankCount, a member of class TCustomArray.
	BlankDateVal (see page 17335)	This is BlankDateVal, a member of class TCustomArray.
	BlankStringVal (see page 17335)	This is BlankStringVal, a member of class TCustomArray.
	CompareProc (see page 17335)	This is CompareProc, a member of class TCustomArray.
	CubeDimIndex (see page 17833)	This is CubeDimIndex, a member of class TSummary.
R	DataType (see page 17335)	This is DataType, a member of class TCustomArray.
	Duplicates (see page 17336)	This is Duplicates, a member of class TCustomArray.
R	FieldDefinition (see page 17833)	This is FieldDefinition, a member of class TSummary.
	FieldName (see page 17833)	This is FieldName, a member of class TSummary.
	FieldType (see page 17833)	This is FieldType, a member of class TSummary.
R	IsDerived (see page 17834)	This is IsDerived, a member of class TSummary.
	Items (see page 17336)	This is Items, a member of class TCustomArray.
R	List (see page 17336)	This is List, a member of class TCustomArray.
R	MemberCount (see page 17336)	This is MemberCount, a member of class TCustomArray.
	Name (see page 17834)	This is Name, a member of class TSummary.
	Position (see page 17834)	This is Position, a member of class TSummary.
	Sorted (see page 17337)	This is Sorted, a member of class TCustomArray.

111.1.12.2 TSummary.Create Constructor

Pascal

```
constructor Create(Items: Cardinal; DataType: TFieldType);
```

C++

```
__fastcall TSummary(unsigned Items, TFieldType DataType);
```

Description

This is Create, a member of class TSummary.

111.1.12.3 TSummary.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSummary();
```

Description

This is Destroy, a member of class TSummary.

111.1.12.4 TSummary Methods

The methods of the TSummary class are listed here.

Protected Methods

	Name	Description
	HasFlag (see page 17831)	This is HasFlag, a member of class TSummary.
	SetAggregator (see page 17832)	This is SetAggregator, a member of class TSummary.

Public Methods

	Name	Description
	AddIndexInfo (see page 17830)	This is AddIndexInfo, a member of class TSummary.
	AddSubTotal (see page 17830)	This is AddSubTotal, a member of class TSummary.
	AddSum (see page 17830)	This is AddSum, a member of class TSummary.
	ClearTotals (see page 17831)	This is ClearTotals, a member of class TSummary.
	IsSparse (see page 17831)	This is IsSparse, a member of class TSummary.
	MemoryUsage (see page 17831)	This is MemoryUsage, a member of class TSummary.
	UpdateIndexInfo (see page 17832)	This is UpdateIndexInfo, a member of class TSummary.

111.1.12.4.1 TSummary.AddIndexInfo Method

Pascal

```
function AddIndexInfo(BTotal: Boolean; bSparse: Boolean; iAggOffset: Integer): Integer;
```

C++

```
__fastcall int AddIndexInfo(Boolean BTotal, Boolean bSparse, int iAggOffset);
```

Description

This is AddIndexInfo, a member of class TSummary.

111.1.12.4.2 TSummary.AddSubTotal Method

Pascal

```
function AddSubTotal(Value: Variant): Integer;
```

C++

```
__fastcall int AddSubTotal(Variant Value);
```

Description

This is AddSubTotal, a member of class TSummary.

111.1.12.4.3 TSummary.AddSum Method

Pascal

```
procedure AddSum(var SumIndex: TSmallIntArray; vNew: Variant);
```

C++

```
__fastcall AddSum(TSmallIntArray SumIndex, Variant vNew);
```

Description

This is AddSum, a member of class TSummary.

111.1.12.4.4 TSummary.ClearTotals Method

Pascal

```
procedure ClearTotals;
```

C++

```
__fastcall ClearTotals();
```

Description

This is ClearTotals, a member of class TSummary.

111.1.12.4.5 TSummary.HasFlag Method

Pascal

```
function HasFlag(aFlag: TDimFlags): Boolean;
```

C++

```
__fastcall Boolean HasFlag(TDimFlags aFlag);
```

Description

This is HasFlag, a member of class TSummary.

111.1.12.4.6 TSummary.IsSparse Method

Pascal

```
function IsSparse(Index: Integer): Boolean;
```

C++

```
__fastcall Boolean IsSparse(int Index);
```

Description

This is IsSparse, a member of class TSummary.

111.1.12.4.7 TSummary.MemoryUsage Method

Pascal

```
function MemoryUsage: Integer; override;
```

C++

```
virtual __fastcall int MemoryUsage();
```

Description

This is MemoryUsage, a member of class TSummary.

111.1.12.4.8 TSummary.SetAggregator Method

Pascal

```
function SetAggregator(aName: string; DimMap: TCubeDims; dimType: TDimFlags; var dIdx:
Integer): Boolean;
```

C++

```
__fastcall Boolean SetAggregator(AnsiString aName, TCubeDims DimMap, TDimFlags dimType, int
dIdx);
```

Description

This is SetAggregator, a member of class TSummary.

111.1.12.4.9 TSummary.UpdateIndexInfo Method

Pascal

```
procedure UpdateIndexInfo(Index: Integer; Value: Variant);
```

C++

```
__fastcall UpdateIndexInfo(int Index, Variant Value);
```

Description

This is UpdateIndexInfo, a member of class TSummary.

111.1.12.5 TSummary Properties

The properties of the TSummary class are listed here.

Public Properties

	Name	Description
	AggDefinition (see page 17832)	This is AggDefinition, a member of class TSummary.
W	Attributes (see page 17833)	This is Attributes, a member of class TSummary.
	CubeDimIndex (see page 17833)	This is CubeDimIndex, a member of class TSummary.
R	FieldDefinition (see page 17833)	This is FieldDefinition, a member of class TSummary.
	FieldName (see page 17833)	This is FieldName, a member of class TSummary.
	FieldType (see page 17833)	This is FieldType, a member of class TSummary.
R	IsDerived (see page 17834)	This is IsDerived, a member of class TSummary.
	Name (see page 17834)	This is Name, a member of class TSummary.
	Position (see page 17834)	This is Position, a member of class TSummary.

111.1.12.5.1 TSummary.AggDefinition Property

Pascal

```
property AggDefinition: TAggDefinition;
```

C++

```
__property TAggDefinition AggDefinition;
```

Description

This is AggDefinition, a member of class TSummary.

111.1.12.5.2 TSummary.Attributes Property

Pascal

```
property Attributes: TDimFlags;
```

C++

```
__property TDimFlags Attributes;
```

Description

This is Attributes, a member of class TSummary.

111.1.12.5.3 TSummary.CubeDimIndex Property

Pascal

```
property CubeDimIndex: Integer;
```

C++

```
__property int CubeDimIndex;
```

Description

This is CubeDimIndex, a member of class TSummary.

111.1.12.5.4 TSummary.FieldDefinition Property

Pascal

```
property FieldDefinition: TFieldDefinition;
```

C++

```
__property TFieldDefinition FieldDefinition;
```

Description

This is FieldDefinition, a member of class TSummary.

111.1.12.5.5 TSummary.FieldName Property

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;
```

Description

This is FieldName, a member of class TSummary.

111.1.12.5.6 TSummary.FieldType Property

Pascal

```
property FieldType: TFieldType;
```

C++

```
__property TFieldType FieldType;
```

Description

This is FieldType, a member of class TSummary.

111.1.12.5.7 TSummary.IsDerived Property

Pascal

```
property IsDerived: Boolean;
```

C++

```
__property Boolean IsDerived;
```

Description

This is IsDerived, a member of class TSummary.

111.1.12.5.8 TSummary.Name Property

Pascal

```
property Name: String;
```

C++

```
__property AnsiString Name;
```

Description

This is Name, a member of class TSummary.

111.1.12.5.9 TSummary.Position Property

Pascal

```
property Position: Integer;
```

C++

```
__property int Position;
```

Description

This is Position, a member of class TSummary.

111.1.12.6 TSummary Events

The events of the TSummary class are listed here.

Public Events

	Name	Description
	SumMethod (see page 17834)	This is SumMethod, a member of class TSummary.

111.1.12.6.1 TSummary.SumMethod Event

Pascal

```
property SumMethod: TSumMethod;
```

C++

```
__property TSumMethod SumMethod;
```

Description

This is SumMethod, a member of class TSummary.

111.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	TestMatch (see page 17836)	This is function Mxstore.TestMatch.

111.2.1 Mxstore.TestMatch Function

Pascal

```
function TestMatch(SumIdx: TSmallIntArray): Boolean;
```

C++

```
Boolean TestMatch(TSmallIntArray SumIdx);
```

File

Mxstore

Description

This is function Mxstore.TestMatch.

111.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TBuildType (see page 17837)	This is record Mxstore.TBuildType.
	TCacheStateFlags (see page 17837)	This is record Mxstore.TCacheStateFlags.
	TCalcTotalsFlags (see page 17838)	This is record Mxstore.TCalcTotalsFlags.
	TCubeDataState (see page 17838)	This is record Mxstore.TCubeDataState.
	TCubeState (see page 17839)	This is record Mxstore.TCubeState.
	TErrorAction (see page 17839)	This is record Mxstore.TErrorAction.
	TFormatType (see page 17840)	This is record Mxstore.TFormatType.
	TIndexFlag (see page 17840)	This is record Mxstore.TIndexFlag.
	TLookupStateFlags (see page 17841)	This is record Mxstore.TLookupStateFlags.

Records

	Name	Description
	TIndexInfoRec (see page 17841)	This is record Mxstore.TIndexInfoRec.

111.3.1 Mxstore.TBuildType Enumeration

Pascal

```
TBuildType = (
  btHardRebuild,
  btSoftRebuild,
  btNoRebuild
);
```

C++

```
enum TBuildType {
  btHardRebuild,
  btSoftRebuild,
  btNoRebuild
};
```

File

Mxstore

Description

This is record Mxstore.TBuildType.

111.3.2 Mxstore.TCacheStateFlags Enumeration

Pascal

```
TCacheStateFlags = (
```

```
    csHasIndex,
    csDirty,
    csSuccess,
    csShowProgress,
    csRefreshing
  );
```

C++

```
  enum TCacheStateFlags {
    csHasIndex,
    csDirty,
    csSuccess,
    csShowProgress,
    csRefreshing
  };
```

File

Mxstore

Description

This is record Mxstore.TCacheStateFlags.

111.3.3 Mxstore.TCalcTotalsFlags Enumeration

Pascal

```
  TCalcTotalsFlags = (
    ctPreCalc,
    ctRunning,
    ctNone
  );
```

C++

```
  enum TCalcTotalsFlags {
    ctPreCalc,
    ctRunning,
    ctNone
  };
```

File

Mxstore

Description

This is record Mxstore.TCalcTotalsFlags.

111.3.4 Mxstore.TCubeDataState Enumeration

Pascal

```
  TCubeDataState = (
    dsNoData,
    dsMetaData,
    dsDimensionData,
    dsAllData
  );
```

C++

```
enum TCubeDataState {
  dsNoData,
  dsMetaData,
  dsDimensionData,
  dsAllData
};
```

File

Mxstore

Description

This is record Mxstore.TCubeDataState.

111.3.5 Mxstore.TCubeState Enumeration

Pascal

```
TCubeState = (
  dcInactive,
  dcBrowseMetaData,
  dcBrowseMemberData,
  dcBrowseAllData
);
```

C++

```
enum TCubeState {
  dcInactive,
  dcBrowseMetaData,
  dcBrowseMemberData,
  dcBrowseAllData
};
```

File

Mxstore

Description

This is record Mxstore.TCubeState.

111.3.6 Mxstore.TErrorAction Enumeration

Pascal

```
TErrorAction = (
  eaFail,
  eaContinue
);
```

C++

```
enum TErrorAction {
  eaFail,
  eaContinue
};
```

File

Mxstore

Description

This is record Mxstore.TErrorAction.

111.3.7 Mxstore.TFormatType Enumeration

Pascal

```
TFormatType = (
  fxNone,
  fxFloat,
  fxCurrency,
  fxDateTime,
  fxTime,
  fxDate,
  fxString,
  fxInteger,
  fxBoolean
);
```

C++

```
enum TFormatType {
  fxNone,
  fxFloat,
  fxCurrency,
  fxDateTime,
  fxTime,
  fxDate,
  fxString,
  fxInteger,
  fxBoolean
};
```

File

Mxstore

Description

This is record Mxstore.TFormatType.

111.3.8 Mxstore.TIndexFlag Enumeration

Pascal

```
TIndexFlag = (
  idxNormal,
  idxSparsed,
  idxFiltered,
  idxSubTotals,
  idxDeleted
);
```

C++

```
enum TIndexFlag {
```

```
    idxNormal,
    idxSparsed,
    idxFiltered,
    idxSubTotals,
    idxDeleted
  };
```

File

Mxstore

Description

This is record Mxstore.TIndexFlag.

111.3.9 Mxstore.TIndexInfoRec Record

Pascal

```
  TIndexInfoRec = record
    AggOffset: Integer;
    SparseCnt: Integer;
    SubTotalCnt: Integer;
    Flags: TIndexFlags;
  end;
```

C++

```
  struct TIndexInfoRec {
    int AggOffset;
    int SparseCnt;
    int SubTotalCnt;
    TIndexFlags Flags;
  };
```

File

Mxstore

Description

This is record Mxstore.TIndexInfoRec.

111.3.10 Mxstore.TLookupStateFlags Enumeration

Pascal

```
  TLookupStateFlags = (
    lsSparsing,
    lsCursor,
    lsShowProgress
  );
```

C++

```
  enum TLookupStateFlags {
    lsSparsing,
    lsCursor,
    lsShowProgress
  };
```

File

Mxstore

Description

This is record Mxstore.TLookupStateFlags.

111.4 Types

The following table lists types in this documentation.

Types

Name	Description
PIndexInfoRec (see page 17843)	This is type Mxstore.PIndexInfoRec.
TAggProc (see page 17843)	This is type Mxstore.TAggProc.
TCacheState (see page 17844)	This is type Mxstore.TCacheState.
TCalcTotals (see page 17844)	This is type Mxstore.TCalcTotals.
TCapacityErrorEvent (see page 17844)	This is type Mxstore.TCapacityErrorEvent.
TCubeDimClass (see page 17845)	This is type Mxstore.TCubeDimClass.
TCubeDimTransformEvent (see page 17845)	This is type Mxstore.TCubeDimTransformEvent.
TCubeNotifyEvent (see page 17845)	This is type Mxstore.TCubeNotifyEvent.
TCubeRefreshEvent (see page 17846)	This is type Mxstore.TCubeRefreshEvent.
TDerivedAggProc (see page 17846)	This is type Mxstore.TDerivedAggProc.
TDimFlagSet (see page 17846)	This is type Mxstore.TDimFlagSet.
TFieldArgs (see page 17847)	This is type Mxstore.TFieldArgs.
TIndexFlags (see page 17847)	This is type Mxstore.TIndexFlags.
TLookupState (see page 17847)	This is type Mxstore.TLookupState.
TSumMethod (see page 17848)	This is type Mxstore.TSumMethod.

111.4.1 Mxstore.PIndexInfoRec Type

Pascal

```
PIndexInfoRec = ^TIndexInfoRec;
```

C++

```
^TIndexInfoRec PIndexInfoRec;
```

File

Mxstore

Description

This is type Mxstore.PIndexInfoRec.

111.4.2 Mxstore.TAggProc Type

Pascal

```
TAggProc = function (eCnt, Range: Integer; Summary: TSummary; SumIndex: TSmallIntArray; var
vNew: Variant): Boolean;
```

C++

```
(eCnt, Range: Integer; Summary: TSummary; SumIndex: TSmallIntArray; var vNew: Variant):
Boolean ( TAggProc)();
```

File

Mxstore

Description

This is type Mxstore.TAggProc.

111.4.3 Mxstore.TCacheState Type

Pascal

```
TCacheState = set of TCacheStateFlags;
```

C++

```
TCacheStateFlags TCacheState;
```

File

Mxstore

Description

This is type Mxstore.TCacheState.

111.4.4 Mxstore.TCalcTotals Type

Pascal

```
TCalcTotals = set of TCalcTotalsFlags;
```

C++

```
TCalcTotalsFlags TCalcTotals;
```

File

Mxstore

Description

This is type Mxstore.TCalcTotals.

111.4.5 Mxstore.TCapacityErrorEvent Type

Pascal

```
TCapacityErrorEvent = procedure (var EAction: TErrorAction) of object;
```

C++

```
(var EAction: TErrorAction) ( TCapacityErrorEvent)();
```

File

Mxstore

Description

This is type Mxstore.TCapacityErrorEvent.

111.4.6 Mxstore.TCubeDimClass Type

Pascal

```
TCubeDimClass = class of TCubeDim;
```

C++

```
TCubeDim TCubeDimClass;
```

File

Mxstore

Description

This is type Mxstore.TCubeDimClass.

111.4.7 Mxstore.TCubeDimTransformEvent Type

Pascal

```
TCubeDimTransformEvent = procedure (var Value: Variant; Data: TCubeDim) of object;
```

C++

```
(var Value: Variant; Data: TCubeDim) ( TCubeDimTransformEvent)();
```

File

Mxstore

Description

This is type Mxstore.TCubeDimTransformEvent.

111.4.8 Mxstore.TCubeNotifyEvent Type

Pascal

```
TCubeNotifyEvent = procedure (DataCube: TCustomDataStore) of object;
```

C++

```
(DataCube: TCustomDataStore) ( TCubeNotifyEvent)();
```

File

Mxstore

Description

This is type Mxstore.TCubeNotifyEvent.

111.4.9 Mxstore.TCubeRefreshEvent Type

Pascal

```
TCubeRefreshEvent = procedure (DataCube: TCustomDataStore; DimMap: TCubeDims) of object;
```

C++

```
(DataCube: TCustomDataStore; DimMap: TCubeDims) ( TCubeRefreshEvent)();
```

File

Mxstore

Description

This is type Mxstore.TCubeRefreshEvent.

111.4.10 Mxstore.TDerivedAggProc Type

Pascal

```
TDerivedAggProc = function (Val1, Val2: Variant): Variant;
```

C++

```
(Val1, Val2: Variant): Variant ( TDerivedAggProc)();
```

File

Mxstore

Description

This is type Mxstore.TDerivedAggProc.

111.4.11 Mxstore.TDimFlagSet Type

Pascal

```
TDimFlagSet = set of TDimFlags;
```

C++

```
TDimFlags TDimFlagSet;
```

File

Mxstore

Description

This is type Mxstore.TDimFlagSet.

111.4.12 Mxstore.TFieldArgs Type

Pascal

```
TFieldArgs = array[0..255] of Byte;
```

C++

```
array[0..255] of Byte TFieldArgs;
```

File

Mxstore

Description

This is type Mxstore.TFieldArgs.

111.4.13 Mxstore.TIndexFlags Type

Pascal

```
TIndexFlags = set of TIndexFlag;
```

C++

```
TIndexFlag TIndexFlags;
```

File

Mxstore

Description

This is type Mxstore.TIndexFlags.

111.4.14 Mxstore.TLookupState Type

Pascal

```
TLookupState = set of TLookupStateFlags;
```

C++

```
TLookupStateFlags TLookupState;
```

File

Mxstore

Description

This is type Mxstore.TLookupState.

111.4.15 Mxstore.TSumMethod Type

Pascal

```
TSumMethod = function (SumIndex: TSmallIntArray; Summary: TSummary; var Value: Variant):
Boolean of object;
```

C++

```
(SumIndex: TSmallIntArray; Summary: TSummary; var Value: Variant): Boolean ( TSumMethod)();
```

File

Mxstore

Description

This is type Mxstore.TSumMethod.

111.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
LargeValueCount (see page 17849)	This is constant Mxstore.LargeValueCount.
MaxBinDimensions (see page 17849)	This is constant Mxstore.MaxBinDimensions.
NonSparseAgg (see page 17850)	This is constant Mxstore.NonSparseAgg.
SparseAgg (see page 17850)	This is constant Mxstore.SparseAgg.
SparseSum (see page 17850)	This is constant Mxstore.SparseSum.
SparseUnknown (see page 17851)	This is constant Mxstore.SparseUnknown.
SubTotal (see page 17851)	This is constant Mxstore.SubTotal.

111.5.1 Mxstore.LargeValueCount Constant

Pascal

```
LargeValueCount = 50;
```

C++

```
LargeValueCount = 50;
```

File

Mxstore

Description

This is constant Mxstore.LargeValueCount.

111.5.2 Mxstore.MaxBinDimensions Constant

Pascal

```
MaxBinDimensions = 16;
```

C++

```
MaxBinDimensions = 16;
```

File

Mxstore

Description

This is constant Mxstore.MaxBinDimensions.

111.5.3 Mxstore.NonSparseAgg Constant

Pascal

```
NonSparseAgg = -4;
```

C++

```
NonSparseAgg = -4;
```

File

Mxstore

Description

This is constant Mxstore.NonSparseAgg.

111.5.4 Mxstore.SparseAgg Constant

Pascal

```
SparseAgg = -2;
```

C++

```
SparseAgg = -2;
```

File

Mxstore

Description

This is constant Mxstore.SparseAgg.

111.5.5 Mxstore.SparseSum Constant

Pascal

```
SparseSum = -1;
```

C++

```
SparseSum = -1;
```

File

Mxstore

Description

This is constant Mxstore.SparseSum.

111.5.6 Mxstore.SparseUnknown Constant

Pascal

```
SparseUnknown = -3;
```

C++

```
SparseUnknown = -3;
```

File

Mxstore

Description

This is constant Mxstore.SparseUnknown.

111.5.7 Mxstore.SubTotal Constant

Pascal

```
SubTotal = -1;
```

C++

```
SubTotal = -1;
```

File

Mxstore

Description

This is constant Mxstore.SubTotal.

112 MXTABLES Namespace

This is namespace MXTABLES.

Topics

Name	Description
Classes (see page 17854)	The following table lists classes in this documentation.
Functions (see page 17862)	The following table lists functions in this documentation.
Types (see page 17864)	The following table lists types in this documentation.

Classes

	Name	Description
	TDecisionQuery (see page 17854)	TDecisionQuery is a specialized query that prepares crosstabulated data for a decision cube.
	TQueryDim (see page 17855)	This is class MXTABLES.TQueryDim.
	TQueryDims (see page 17857)	This is class MXTABLES.TQueryDims.

Functions

	Name	Description
	AddDimensionItem (see page 17862)	This is function MXTABLES.AddDimensionItem.
	BuildDimensionMap (see page 17862)	This is function MXTABLES.BuildDimensionMap.
	BuildMasterDimensionMap (see page 17863)	This is function MXTABLES.BuildMasterDimensionMap.
	RemoveDimensionItem (see page 17863)	This is function MXTABLES.RemoveDimensionItem.

Types

Name	Description
TQueryDimClass (see page 17864)	This is type MXTABLES.TQueryDimClass.

112.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TDecisionQuery (see page 17854)	TDecisionQuery is a specialized query that prepares crosstabulated data for a decision cube.
	TQueryDim (see page 17855)	This is class MXTABLES.TQueryDim.
	TQueryDims (see page 17857)	This is class MXTABLES.TQueryDims.

112.1.1 TDecisionQuery Class

TDecisionQuery is a specialized query that prepares crosstabulated data for a decision cube.

Class Hierarchy

Pascal

```
TDecisionQuery = class(TQuery);
```

C++

```
class TDecisionQuery : public TQuery;
```

File

MXTABLES

Description

Use a TDecisionQuery as the dataset of a decision cube to ensure that the data is properly prepared. TDecisionQuery allows the dimensions and summaries to be defined directly on the dataset analyzed in a decision control. It then prepares an SQL query to provide the information from that dataset in a format that can be used by a decision cube.

Decision cubes can use other types of datasets, but the information must be structured in the same way as the output of a TDecisionQuery object.

Note: In the Decision Query editor that is displayed from the Decision query component, the query is initially handled in ANSI-92 SQL syntax, then translated (if necessary) into the dialect used by the data source of the query. Use only ANSI standard SQL in the Decision Query editor. Use the dialect of the data source in the SQL property of the Decision Query.

Using Datasets with Decision Support Components

Creating Decision Datasets with the Decision Query Editor

112.1.2 TQueryDim Class

Class Hierarchy

System::TObject → Classes.TPersistent → Classes.TCollectionItem → MXCOMMON.TDimensionItem → MXTABLES.TQueryDim

Pascal

```
TQueryDim = class(TDimensionItem);
```

C++

```
class TQueryDim : public TDimensionItem;
```

File

MXTABLES

Description

This is class MXTABLES.TQueryDim.

112.1.2.1 TQueryDim Members

The following tables list the members exposed by TQueryDim.

Protected Methods

	Name	Description
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
V	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
V	InitializeRange (see page 17409)	This is InitializeRange, a member of class TDimensionItem.
V	NotifyCollection (see page 17410)	This is NotifyCollection, a member of class TDimensionItem.
V	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
V	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
V	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Protected Properties

	Name	Description
R	Owner (see page 17414)	This is Owner, a member of class TDimensionItem.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	Assign (see page 17408)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2757)	Creates and initializes a TCollectionItem (see page 2755) instance.
V	Create (see page 17408)	Creates and initializes a TCollectionItem instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDimension (see page 17409)	Indicates whether the dimension item represents a dimension.
	IsSummary (see page 17410)	Indicates whether the dimension item represents a summary.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Active (see page 17857)	This is Active, a member of class TQueryDim.
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	ActiveFlag (see page 17411)	Indicates whether the dimension item is stored in the cache of a crosstabulated data store.
	BaseName (see page 17411)	Specifies the field name of the database field that is represented by or summarized in the dimension item.
	DerivedFrom (see page 17412)	Specifies the index of a dimension item from which a derived value is calculated.
	DimensionType (see page 17412)	Indicates the use of the dimension item.
	Fieldname (see page 17413)	This is Fieldname, a member of class TDimensionItem.
	FieldType (see page 17413)	Indicates the data type of the field that the dimension item represents.

	Format (see page 17414)	Indicates how field values are formatted on dimensions that represent numeric or temporal data.
	Name (see page 17414)	Denotes the name of a dimension or summary.

112.1.2.2 TQueryDim Properties

The properties of the TQueryDim class are listed here.

Public Properties

	Name	Description
	Active (see page 17857)	This is Active, a member of class TQueryDim.

112.1.2.2.1 TQueryDim.Active Property

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

This is Active, a member of class TQueryDim.

112.1.3 TQueryDims Class

Class Hierarchy

System::TObject → Classes.TPersistent → Classes.TCollection → MXCOMMON.TDimensionItems → MXTABLES.TQueryDims

Pascal

```
TQueryDims = class(TDimensionItems);
```

C++

```
class TQueryDims : public TDimensionItems;
```

File

MXTABLES

Description

This is class MXTABLES.TQueryDims.

112.1.3.1 TQueryDims Members

The following tables list the members exposed by TQueryDims.

Protected Methods

	Name	Description
	Added (see page 2736)	Responds when items are added to the collection.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.

	Create (see page 17859)	This is Create, a member of class TQueryDims.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetOwner (see page 17420)	Returns the owner of an object.
	GetQueryDim (see page 17860)	This is GetQueryDim, a member of class TQueryDims.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	NotifyOwner (see page 17420)	This is NotifyOwner, a member of class TDimensionItems.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
	SetQueryDim (see page 17860)	This is SetQueryDim, a member of class TQueryDims.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 17860)	Adds a dimension item to the end of the Items array.
	AddDerivedField (see page 17418)	Adds a derived average summary to the end of the Items (see page 17422) array.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AlreadyExists (see page 17419)	Indicates whether a dimension item with specified properties already exists in the Items (see page 17422) property array.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	Assign (see page 17419)	Copies the list of dimension items from another TDimensionItems (see page 17415) object.
	AverageFieldCheck (see page 17419)	Determines whether the necessary summary dimension items over a base dimension exist so that a dimension item of type dimAverage can be computed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.

V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ActiveDimensionCount (see page 17421)	Indicates the number of dimension items that represent active dimensions in the crosstabulated data store.
R	ActiveSummaryCount (see page 17421)	Indicates the number of dimension items that represent active summaries in the crosstabulated data store.
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	DimensionCount (see page 17422)	Indicates the number of dimension items in the Items (see page 17422) array with DimensionType set to dimDimension.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 17861)	Lists all dimension items maintained by the TDimensionItems object.
R	SummaryCount (see page 17423)	Indicates the number of dimension items in the Items (see page 17422) array with DimensionType set to a value other than dimDimension.

112.1.3.2 TQueryDims.Create Constructor

Pascal

```
constructor Create(Owner: TPersistent; ItemClass: TQueryDimClass);
```

C++

```
__fastcall TQueryDims(TPersistent * Owner, TQueryDimClass ItemClass);
```

Description

This is Create, a member of class TQueryDims.

112.1.3.3 TQueryDims Methods

The methods of the TQueryDims class are listed here.

Protected Methods

	Name	Description
	GetQueryDim (see page 17860)	This is GetQueryDim, a member of class TQueryDims.
	SetQueryDim (see page 17860)	This is SetQueryDim, a member of class TQueryDims.

Public Methods

	Name	Description
	Add (see page 17860)	Adds a dimension item to the end of the Items array.

112.1.3.3.1 TQueryDims.Add Method

Adds a dimension item to the end of the Items array.

Pascal

```
function Add: TQueryDim;
```

C++

```
__fastcall TQueryDim Add();
```

Description

Do not call the Add method to add dimension items to a TDimensionItems object. The dimension items are added automatically to reflect the fields in the data set of the associated crosstabulated data store.

Add adds a new dimension item to the collection and returns the new dimension item.

See Also

Items (see page 17422)

DataSet (see page 17789)

112.1.3.3.2 TQueryDims.GetQueryDim Method

Pascal

```
function GetQueryDim(Index: Integer): TQueryDim;
```

C++

```
__fastcall TQueryDim GetQueryDim(int Index);
```

Description

This is GetQueryDim, a member of class TQueryDims.

112.1.3.3.3 TQueryDims.SetQueryDim Method

Pascal

```
procedure SetQueryDim(Index: Integer; Value: TQueryDim);
```

C++

```
__fastcall SetQueryDim(int Index, TQueryDim Value);
```

Description

This is SetQueryDim, a member of class TQueryDims.

112.1.3.4 TQueryDims Properties

The properties of the TQueryDims class are listed here.

Public Properties

	Name	Description
	Items (see page 17861)	Lists all dimension items maintained by the TDimensionItems object.

112.1.3.4.1 TQueryDims.Items Property

Lists all dimension items maintained by the TDimensionItems object.

Pascal

```
property Items [Index: Integer]: TQueryDim;
```

C++

```
__property TQueryDim Items[int Index];
```

Description

Use Items to access individual dimension items maintained by the TDimensionItems object. The first dimension item has an Index of 0, the second dimension item has an Index of 1, and so on. For example, the following C++ code accesses an item to indicate that it can be swapped out of memory:

```
DecisionCube1->DimensionMap->Items[0]->ActiveFlag = diAsNeeded;
```

Each dimension item in the Items array represents a field from the data set of a crosstabulated data store. Each dimension item represents either a dimension (a field over which data is summarized), or a summary (a value summarized over the dimensions).

In Delphi Code, Items is the default property of TDimensionItems. This means that the name of the Items property can be eliminated from code that uses the Items property. Thus, the line

```
DecisionCube1.DimensionMap.Items[0].ActiveFlag := diAsNeeded;
```

could be written

```
DecisionCube1.DimensionMap[0].ActiveFlag := diAsNeeded;
```

Note: Do not change the Items property. The set of items in the Items array is set automatically to represent the fields from the data set. The properties of individual dimension items within the Items array may be changed to specify whether the dimension items should be cached by the data store, to change the name used when displaying the dimension items, and so on.

DimensionMap (see page 17790)

operator_[]

112.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AddDimensionItem (see page 17862)	This is function MXTABLES.AddDimensionItem.
	BuildDimensionMap (see page 17862)	This is function MXTABLES.BuildDimensionMap.
	BuildMasterDimensionMap (see page 17863)	This is function MXTABLES.BuildMasterDimensionMap.
	RemoveDimensionItem (see page 17863)	This is function MXTABLES.RemoveDimensionItem.

112.2.1 MXTABLES.AddDimensionItem Function

Pascal

```
function AddDimensionItem(myQuery: TXtabQuery; Map: TQueryDims; index: integer; Name: string):
TQueryError;
```

C++

```
TQueryError AddDimensionItem(TXtabQuery myQuery, TQueryDims Map, int index, AnsiString Name);
```

File

MXTABLES

Description

This is function MXTABLES.AddDimensionItem.

112.2.2 MXTABLES.BuildDimensionMap Function

Pascal

```
function BuildDimensionMap(myQuery: TXtabQuery; Map: TQueryDims; SQLString: string):
TQueryError;
```

C++

```
TQueryError BuildDimensionMap(TXtabQuery myQuery, TQueryDims Map, AnsiString SQLString);
```

File

MXTABLES

Description

This is function MXTABLES.BuildDimensionMap.

112.2.3 MXTABLES.BuildMasterDimensionMap Function

Pascal

```
function BuildMasterDimensionMap(myQuery: TXtabQuery; Map: TQueryDims): TQueryError;
```

C++

```
TQueryError BuildMasterDimensionMap(TXtabQuery myQuery, TQueryDims Map);
```

File

MXTABLES

Description

This is function MXTABLES.BuildMasterDimensionMap.

112.2.4 MXTABLES.RemoveDimensionItem Function

Pascal

```
function RemoveDimensionItem(myQuery: TXtabQuery; Map: TQueryDims; index: integer):
TQueryError;
```

C++

```
TQueryError RemoveDimensionItem(TXtabQuery myQuery, TQueryDims Map, int index);
```

File

MXTABLES

Description

This is function MXTABLES.RemoveDimensionItem.

112.3 Types

The following table lists types in this documentation.

Types

Name	Description
TQueryDimClass (see page 17864)	This is type MXTABLES.TQueryDimClass.

112.3.1 MXTABLES.TQueryDimClass Type

Pascal

```
TQueryDimClass = class of TQueryDim;
```

C++

```
TQueryDim TQueryDimClass;
```

File

MXTABLES

Description

This is type MXTABLES.TQueryDimClass.

113 ObjBrkr Namespace

This is namespace ObjBrkr.

Topics

Name	Description
Classes (see page 17866)	The following table lists classes in this documentation.

Classes

	Name	Description
	EBrokerException (see page 17866)	EBrokerException is the exception raised by simple object brokers when they can't locate an available server.
	TServerCollection (see page 17866)	TServerCollection is a collection of TServerItem (see page 17871) objects.
	TServerItem (see page 17871)	TServerItem describes an application server for a simple object broker.
	TSimpleObjectBroker (see page 17877)	TSimpleObjectBroker maintains a list of available application servers for a connection component.

113.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EBrokerException (see page 17866)	EBrokerException is the exception raised by simple object brokers when they can't locate an available server.
	TServerCollection (see page 17866)	TServerCollection is a collection of TServerItem (see page 17871) objects.
	TServerItem (see page 17871)	TServerItem describes an application server for a simple object broker.
	TSimpleObjectBroker (see page 17877)	TSimpleObjectBroker maintains a list of available application servers for a connection component.

113.1.1 EBrokerException Class

EBrokerException is the exception raised by simple object brokers when they can't locate an available server.

Class Hierarchy

System::TObject → SysUtils.Exception → ObjBrkr.EBrokerException

Pascal

```
EBrokerException = class(Exception);
```

C++

```
class EBrokerException : public Exception;
```

File

ObjBrkr

Description

EBrokerException is raised when a simple object broker can't locate an available server.

See Also

TSimpleObjectBroker (see page 17877)

TServerCollection (see page 17866)

113.1.2 TServerCollection Class

TServerCollection is a collection of TServerItem (see page 17871) objects.

Class Hierarchy

System::TObject → Classes.TPersistent → Classes.TCollection → Classes.TOwnedCollection → ObjBrkr.TServerCollection

Pascal

```
TServerCollection = class(TOwnedCollection);
```

C++

```
class TServerCollection : public TOwnedCollection;
```

File

ObjBrkr

Description

TSimpleObjectBroker (see page 17877) uses TServerCollection to represent the set of available application servers to which a client application can connect. Use the properties and methods of TServerCollection to manage the set of servers. For example, you can add items as new server systems come on line, disable server items when the corresponding system is temporarily out of commission, and so on.

See Also

TServerItem (see page 17871)

TSimpleObjectBroker (see page 17877)

113.1.2.1 TServerCollection Members

The following tables list the members exposed by TServerCollection.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 2915)	Returns the owner of an object.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2736)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 17869)	Creates and initializes a TServerCollection (see page 17866) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
	Destroy (see page 2735)	Destroys the collection and each item in it.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	FindServer (see page 17869)	Returns the server from the Items (see page 17871) property array that has a specified computer name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetBalancedName (see page 17870)	Returns the ComputerName property of a randomly chosen server from the Items (see page 17871) property array.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNextName (see page 17870)	This is GetNextName, a member of class TServerCollection.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.

	Items (see page 17871)	Lists the TServerItem (see page 17871) objects in the collection.

113.1.2.2 TServerCollection.Create Constructor

Creates and initializes a TServerCollection (see page 17866) object.

Pascal

```
constructor Create(AOwner: TComponent);
```

C++

```
__fastcall TServerCollection(TComponent * AOwner);
```

Description

Applications should not need to instantiate TServerCollection (see page 17866). The simple object broker that uses TServerCollection (see page 17866) to manage its list of available servers creates this object from its own constructor.

See Also

Servers (see page 17885)

113.1.2.3 TServerCollection Methods

The methods of the TServerCollection class are listed here.

Public Methods

	Name	Description
	FindServer (see page 17869)	Returns the server from the Items (see page 17871) property array that has a specified computer name.
	GetBalancedName (see page 17870)	Returns the ComputerName property of a randomly chosen server from the Items (see page 17871) property array.
	GetNextName (see page 17870)	This is GetNextName, a member of class TServerCollection.

113.1.2.3.1 TServerCollection.FindServer Method

Returns the server from the Items (see page 17871) property array that has a specified computer name.

Pascal

```
function FindServer(const ComputerName: string): TServerItem;
```

C++

```
__fastcall TServerItem FindServer(const AnsiString ComputerName);
```

Description

Call FindServer to locate a server in the items property array given its ComputerName property. The ComputerName parameter specifies this computer name. Usually, this value is obtained by a previous call to GetBalancedName (see page 17870) or GetNextName (see page 17870).

Note: FindServer returns the first item it finds with the given ComputerName property. Unlike the GetBalancedName (see page 17870) and GetNextName (see page 17870) methods, it does not ignore servers that have failed or been disabled (HasFailed is true, or Enabled is false).

See Also

GetBalancedName (see page 17870)

getnextname (see page 17870)

ComputerName (see page 17874)

Items (see page 17871)

Enabled (see page 17875)

HasFailed (see page 17876)

113.1.2.3.2 TServerCollection.GetBalancedName Method

Returns the ComputerName property of a randomly chosen server from the Items (see page 17871) property array.

Pascal

```
function GetBalancedName: string;
```

C++

```
__fastcall AnsiString GetBalancedName();
```

Description

Call GetBalancedName to get the name of an available server. Servers in the Items (see page 17871) property array are considered available when no connection attempts have failed (HasFailed is false) and their Enabled property has not been set to false. GetBalancedName selects an available TServerItem (see page 17871) at random from the Items (see page 17871) property array and returns its ComputerName property.

See Also

Items (see page 17871)

LoadBalanced (see page 17884)

ComputerName (see page 17874)

HasFailed (see page 17876)

Enabled (see page 17875)

getnextname (see page 17870)

113.1.2.3.3 TServerCollection.GetNextName Method

Pascal

```
function GetNextName: string;
```

C++

```
__fastcall AnsiString GetNextName();
```

Description

This is GetNextName, a member of class TServerCollection.

113.1.2.4 TServerCollection Properties

The properties of the TServerCollection class are listed here.

Public Properties

	Name	Description
	Items (see page 17871)	Lists the TServerItem (see page 17871) objects in the collection.

113.1.2.4.1 TServerCollection.Items Property

Lists the TServerItem (see page 17871) objects in the collection.

Pascal

```
property Items [Index: Integer]: TServerItem;
```

C++

```
__property TServerItem Items[int Index];
```

Description

Use Items to access individual TServerItem (see page 17871) objects maintained by TServerCollection (see page 17866).

Note: In Delphi, Items is the default property of TServerCollection (see page 17866), so the name of the Items property can be left off when using this property. Thus the line

```
TSimpleObjectBroker1.Servers.Items[I].Enabled := False;
```

can be written

```
TSimpleObjectBroker1.Servers[I].Enabled := False;
```

Note: In C++, Items can be accessed using the [] operator, to achieve an affect similar to the default property in Delphi.

See Also

Enabled (see page 17875)

GetBalancedName (see page 17870)

getnextname (see page 17870)

FindServer (see page 17869)

operator_[]

113.1.3 TServerItem Class

TServerItem describes an application server for a simple object broker.

Class Hierarchy

Pascal

```
TServerItem = class(TCollectionItem);
```

C++

```
class TServerItem : public TCollectionItem;
```

File

ObjBrkr

Description

Use TServerItem to describe an application server to which client applications can connect. TSimpleObjectBroker (see page 17877) maintains a list of these descriptions. Then, when a connection component needs to open a connection, it can use the information stored in a server item to identify an available application server.

See Also

TSimpleObjectBroker (see page 17877)

TRemoteDataModule (see page 6585)

TDispatchConnection (see page 16017)

113.1.3.1 TServerItem Members

The following tables list the members exposed by TServerItem.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 17874)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 17873)	Creates and initializes a TServerItem (see page 17871) instance.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2757)	Destroys the TCollectionItem (see page 2755) instance and frees its memory.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
	HasFailed (see page 17876)	Indicates whether a connection attempt to the associated server machine has failed.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	ComputerName (see page 17874)	Identifies the machine where the application server resides.
	Enabled (see page 17875)	Enables or disables the server item.
	Port (see page 17876)	Specifies the port number for the associated server application.

113.1.3.2 TServerItem.Create Constructor

Creates and initializes a TServerItem (see page 17871) instance.

Pascal

```
constructor Create(AOwner: TCollection); override;
```

C++

```
virtual __fastcall TServerItem(TCollection AOwner);
```

Description

Do not call Create directly to add a new server item to a server collection. Instead, use the Add or Insert method of the TServerCollection (see page 17866) object.

The AOwner parameter specifies the server collection that manages the newly created server item.

After calling the inherited constructor, Create initializes the Enabled (see page 17875) property to true, the HasFailed (see page 17876) property to false, and the Port (see page 17876) property to 211.

See Also

Add (see page 2736)

Insert (see page 2746)

Port (see page 17876)

HasFailed (see page 17876)

Enabled (see page 17875)

113.1.3.3 TServerItem Methods

The methods of the TServerItem class are listed here.

Protected Methods

	Name	Description
	GetDisplayName (see page 17874)	Returns the name of the collection item as it appears in the collection editor.

113.1.3.3.1 TServerItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName (see page 2761)

GetNamePath (see page 2759)

113.1.3.4 TServerItem Properties

The properties of the TServerItem class are listed here.

Public Properties

	Name	Description
	HasFailed (see page 17876)	Indicates whether a connection attempt to the associated server machine has failed.

Published Properties

	Name	Description
	ComputerName (see page 17874)	Identifies the machine where the application server resides.
	Enabled (see page 17875)	Enables or disables the server item.
	Port (see page 17876)	Specifies the port number for the associated server application.

113.1.3.4.1 TServerItem.ComputerName Property

Identifies the machine where the application server resides.

Pascal

```
property ComputerName: string;
```

C++

```
__property AnsiString ComputerName;
```

Description

Set ComputerName to a string that identifies the machine where the application server resides. The value of this string depends on the type of connection component that requests this value from its object broker.

If the connection component is a TDCOMConnection object, ComputerName is the Windows computer name. (This value can be found in the Control panel under network settings.)

If the connection component is a TSocketConnection object, ComputerName is either the host name or IP address of the system running the application server. Socket connection components parse this string to determine which it is.

If the connection component is a TWebConnection or TSoapConnection object, ComputerName is the URL of the dispatcher (httpsrvr.dll or soapsrvr.dll (running on the system with the application server.

GetBalancedName (see page 17870)

getnextname (see page 17870)

Port (see page 17876)

computername (see page 16014)

Address (see page 18935)

Host (see page 18936)

ObjectBroker (see page 16028)

113.1.3.4.2 TServerItem.Enabled Property

Enables or disables the server item.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Set Enabled to indicate whether the server should made available in the simple object broker. When Enabled is true, the ComputerName (see page 17874) property can be supplied to connection components by the object broker's GetComputerForGUID or GetComputerForProgID methods. When Enabled is false, the server item is not returned.

Note: Even when the server item is disabled, it is still returned by TServerCollection (see page 17866)'s FindServer method.

See Also

GetComputerForGUID (see page 17881)

GetComputerForProgID (see page 17882)

HasFailed (see page 17876)

FindServer (see page 17869)

113.1.3.4.3 TServerItem.HasFailed Property

Indicates whether a connection attempt to the associated server machine has failed.

Pascal

```
property HasFailed: Boolean;
```

C++

```
__property Boolean HasFailed;
```

Description

When connection components can't successfully open a connection to an application server, they inform the object broker by calling SetConnectStatus. The simple object broker, in turn, records this fact by setting the HasFailed property to true.

When HasFailed is false, the ComputerName (see page 17874) property can be supplied to connection components by the object broker's GetComputerForGUID or GetComputerForProgID methods. When HasFailed is true, the server item is not returned.

Once a server has failed it is presumed to be down until the application explicitly resets the HasFailed property to false.

Do not use HasFailed to disable server items. Instead, use the Enabled (see page 17875) property to disable servers for any reason other than a failed connection.

Note: Even when HasFailed is true, the server item is still returned by TServerCollection (see page 17866)'s FindServer method.

See Also

SetConnectStatus (see page 17884)

Enabled (see page 17875)

GetComputerForGUID (see page 17881)

GetComputerForProgID (see page 17882)

FindServer (see page 17869)

113.1.3.4.4 TServerItem.Port Property

Specifies the port number for the associated server application.

Pascal

```
property Port: Integer;
```

C++

```
__property int Port;
```

Description

Read Port to obtain a port number when using the server item to supply information for connecting using TCP/IP. This value is returned by the GetPortForComputer method of the simple object broker.

By default, the value of Port is 211, which is the default port number for the socket dispatcher application ScktSrvr.exe. If the server listens on a different port, change this property to indicate the listening port.

Note: Server items that supply a Port number should specify the server system's IP address or host name as the value of ComputerName (see page 17874).

See Also

ComputerName (see page 17874)

113.1.4 TSimpleObjectBroker Class

TSimpleObjectBroker maintains a list of available application servers for a connection component.

Class Hierarchy

Pascal

```
TSimpleObjectBroker = class(TCustomObjectBroker);
```

C++

```
class TSimpleObjectBroker : public TCustomObjectBroker;
```

File

ObjBrkr

Description

TSimpleObjectBroker maintains a list of servers, all of which run the application server for a multi-tiered application. When a connection component requests a server, the simple object broker passes the name of one of the available servers in the list. This process allows client applications to locate server systems dynamically at runtime. If there are redundant server systems, this allows client applications to continue functioning when a server goes down.

TSimpleObjectBroker can randomize the selection of servers from among the currently available servers in its list to provide a simple system of load balancing.

See Also

TDispatchConnection (see page 16017)

TServerCollection (see page 17866)

113.1.4.1 TSimpleObjectBroker Members

The following tables list the members exposed by TSimpleObjectBroker.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.

	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	Create (see page 17880)	Creates and initializes a simple object broker.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 17880)	Destroys an instance of TSimpleObjectBroker (see page 17877).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComputerForGUID (see page 17881)	Returns a string that identifies an available server machine.
	GetComputerForProgID (see page 17882)	Returns a string that identifies an available server machine.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetPortForComputer (see page 17882)	Returns a port number for connecting to a specified remote server.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LoadFromStream (see page 17883)	Sets the value of the Servers (see page 17885) property from a stream.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToStream (see page 17883)	Saves the value of the Servers (see page 17885) property to a stream.
	SetConnectStatus (see page 17884)	Records whether a connection was established to a specified server.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ServerData (see page 17885)	Encapsulates the list of servers as an OleVariant.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	LoadBalanced (see page 17884)	Specifies how the simple object broker picks a server from its list.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Servers (see page 17885)	Maintains the list of servers that can be provided to connection components.
	Tag (see page 2808)	Stores an integer value as part of a component.

113.1.4.2 TSimpleObjectBroker.Create Constructor

Creates and initializes a simple object broker.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSimpleObjectBroker(TComponent * AOwner);
```

Description

Call Create to instantiate a simple object broker at runtime.

After calling the inherited constructor, Create initializes the LoadBalanced (see page 17884) property to false and creates the TServerCollection (see page 17866) that implements the Servers (see page 17885) property.

See Also

Create (see page 2766)

Servers (see page 17885)

LoadBalanced (see page 17884)

113.1.4.3 TSimpleObjectBroker.Destroy Destructor

Destroys an instance of TSimpleObjectBroker (see page 17877).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSimpleObjectBroker();
```

Description

Do not call Destroy directly. Instead, call Free, which verifies that the simple object broker is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

113.1.4.4 TSimpleObjectBroker Methods

The methods of the TSimpleObjectBroker class are listed here.

Public Methods

	Name	Description
	GetComputerForGUID (see page 17881)	Returns a string that identifies an available server machine.
	GetComputerForProgID (see page 17882)	Returns a string that identifies an available server machine.
	GetPortForComputer (see page 17882)	Returns a port number for connecting to a specified remote server.
	LoadFromStream (see page 17883)	Sets the value of the Servers (see page 17885) property from a stream.
	SaveToStream (see page 17883)	Saves the value of the Servers (see page 17885) property to a stream.
	SetConnectStatus (see page 17884)	Records whether a connection was established to a specified server.

113.1.4.4.1 TSimpleObjectBroker.GetComputerForGUID Method

Returns a string that identifies an available server machine.

Pascal

```
function GetComputerForGUID(GUID: TGUID): string; override;
```

C++

```
virtual __fastcall AnsiString GetComputerForGUID(TGUID GUID);
```

Description

Call GetComputerForGUID to obtain the name of an available server machine. The GUID parameter (which specifies the global unique identifier of the desired server interface) is ignored.

GetComputerForGUID returns the ComputerName property of an available server from the Servers (see page 17885) property. If the LoadBalanced (see page 17884) property is true, this server is chosen at random from available servers. If the LoadBalanced (see page 17884) property is false, this server is the first available server listed in the Servers (see page 17885) property. If no servers are available, GetComputerForGUID raises an EBrokerException (see page 17866) exception.

A server is considered available if its Enabled property is true and its HasFailed property is false. The broker automatically sets HasFailed to false when it is notified of a connection failure for that server.

See Also

GetComputerForProgID (see page 17882)

ComputerName (see page 17874)

LoadBalanced (see page 17884)

EBrokerException (see page 17866)

Enabled (see page 17875)

HasFailed (see page 17876)

SetConnectStatus (see page 17884)

113.1.4.4.2 TSimpleObjectBroker.GetComputerForProgID Method

Returns a string that identifies an available server machine.

Pascal

```
function GetComputerForProgID(const ProgID): string; override;
```

C++

```
virtual __fastcall AnsiString GetComputerForProgID(const  ProgID);
```

Description

Call GetComputerForProgID to obtain the name of an available server machine. The ProgID parameter (which specifies the desired server interface) is ignored.

TSimpleObjectBroker (see page 17877) returns the ComputerName property of an available server from the Servers (see page 17885) property. If the LoadBalanced (see page 17884) property is true, this server is chosen at random from available servers. If the LoadBalanced (see page 17884) property is false, this server is the first available server listed in the Servers (see page 17885) property. If no servers are available, GetComputerForGUID (see page 17881) raises an EBrokerException (see page 17866) exception.

A server is considered available if its Enabled property is true and its HasFailed property is false. The broker automatically sets HasFailed to false when it is notified of a connection failure for that server.

See Also

GetComputerForGUID (see page 17881)

ComputerName (see page 17874)

LoadBalanced (see page 17884)

EBrokerException (see page 17866)

Enabled (see page 17875)

HasFailed (see page 17876)

SetConnectStatus (see page 17884)

113.1.4.4.3 TSimpleObjectBroker.GetPortForComputer Method

Returns a port number for connecting to a specified remote server.

Pascal

```
function GetPortForComputer(const ComputerName: string): Integer; override;
```

C++

```
virtual __fastcall int GetPortForComputer(const AnsiString ComputerName);
```

Description

Socket connection components call GetPortForComputer to get a value for their Port property. The ComputerName parameter specifies a Host name or IP address that was returned by GetComputerForGUID (see page 17881) or GetComputerForProgID (see page 17882). This value is used to identify a server in the list maintained by the Servers (see page 17885) property.

There are no connection components that explicitly use a Port number except on the Windows product. GetPortForComputer is

included in TCustomObjectBroker to allow for the possibility of connection components that use an explicit Port number. The ComputerName parameter is a Host name or IP address that is returned by the GetComputerForGUID (see page 17881) or GetComputerForProgID (see page 17882) method. This value is used to identify a server in the list maintained by the Servers (see page 17885) property.

See Also

GetComputerForProgID (see page 17882)

GetComputerForGUID (see page 17881)

Port (see page 18938)

ComputerName (see page 17874)

Port (see page 17876)

113.1.4.4.4 TSimpleObjectBroker.LoadFromStream Method

Sets the value of the Servers (see page 17885) property from a stream.

Pascal

```
procedure LoadFromStream(Stream: TStream);
```

C++

```
__fastcall LoadFromStream(TStream Stream);
```

Description

Call LoadFromStream to load a list of available servers that has been previously saved using the SaveToStream (see page 17883) method.

See Also

SaveToStream (see page 17883)

ServerData (see page 17885)

113.1.4.4.5 TSimpleObjectBroker.SaveToStream Method

Saves the value of the Servers (see page 17885) property to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream);
```

C++

```
__fastcall SaveToStream(TStream Stream);
```

Description

Call SaveToStream to save the list of available servers. The servers can be restored later by calling the LoadFromStream (see page 17883) method.

See Also

LoadFromStream (see page 17883)

ServerData (see page 17885)

113.1.4.4.6 TSimpleObjectBroker.SetConnectStatus Method

Records whether a connection was established to a specified server.

Pascal

```
procedure SetConnectStatus(ComputerName: string; Success: Boolean); override;
```

C++

```
virtual __fastcall SetConnectStatus(AnsiString ComputerName, Boolean Success);
```

Description

After calling GetComputerForGUID (see page 17881) or GetComputerForProgID (see page 17882), connection components use the returned value to open a connection to the identified server. They then call SetConnectStatus to inform the broker of whether the connection was successfully opened.

SetConnectStatus sets the HasFailed property of the corresponding server to true if the connection was unsuccessful. It sets the HasFailed property to false if the connection was successful.

When the HasFailed property of a server is true, that server is ignored when the GetComputerForGUID (see page 17881) or GetComputerForProgID (see page 17882) method looks for available connections.

See Also

GetComputerForGUID (see page 17881)

GetComputerForProgID (see page 17882)

113.1.4.5 TSimpleObjectBroker Properties

The properties of the TSimpleObjectBroker class are listed here.

Public Properties

	Name	Description
	ServerData (see page 17885)	Encapsulates the list of servers as an OleVariant.

Published Properties

	Name	Description
	LoadBalanced (see page 17884)	Specifies how the simple object broker picks a server from its list.
	Servers (see page 17885)	Maintains the list of servers that can be provided to connection components.

113.1.4.5.1 TSimpleObjectBroker.LoadBalanced Property

Specifies how the simple object broker picks a server from its list.

Pascal

```
property LoadBalanced: Boolean;
```

C++

```
__property Boolean LoadBalanced;
```

Description

Set LoadBalanced to true to indicate that the simple object broker should supply computer names randomly from the available servers listed in the Servers (see page 17885) property. When LoadBalanced is false, GetComputerForGUID (see page 17881) and GetComputerForProgID (see page 17882) always return the first available server.

If the simple object broker is used by multiple connection components in the client application, it is preferable to set LoadBalanced to true in order to distribute the work among available servers.

When there is only a single connection component, there is no need to randomize the selection of servers, because only one connection will be used at a time. However, when deploying client applications, you may want to reorder the Servers (see page 17885) list in the simple object broker for each client, so that different clients give preference to different servers.

See Also

Servers (see page 17885)

GetComputerForGUID (see page 17881)

GetComputerForProgID (see page 17882)

113.1.4.5.2 TSimpleObjectBroker.ServerData Property

Encapsulates the list of servers as an OleVariant.

Pascal

```
property ServerData: OleVariant;
```

C++

```
__property OleVariant ServerData;
```

Description

Reading ServerData returns the value of the Servers (see page 17885) property stored in the internal component format. Writing ServerData sets the value of the Servers (see page 17885) property from an OleVariant that was saved previously.

Use the ServerData property to provide a mechanism for loading and saving the list of servers represented by the Servers (see page 17885) property. For example, An application can write the value of ServerData to an .ini file or the system registry. Later, it can read the value it saved as an OleVariant, and set ServerData to restore the Servers (see page 17885) property to the value that was saved.

Note: The implementation of ServerData uses the SaveToStream (see page 17883) method to encode the Servers (see page 17885) property as an OleVariant and the LoadFromStream (see page 17883) method to decode that OleVariant and restore the Servers (see page 17885) property.

See Also

Servers (see page 17885)

LoadFromStream (see page 17883)

SaveToStream (see page 17883)

113.1.4.5.3 TSimpleObjectBroker.Servers Property

Maintains the list of servers that can be provided to connection components.

Pascal

```
property Servers: TServerCollection;
```

C++

```
__property TServerCollection Servers;
```

Description

Use Servers to specify the list of servers that the simple object broker can return from the GetComputerForProgID (see page

17882) and GetComputerForGUID (see page 17881) methods.

Each item in the collection keeps track of whether the last connection attempt to that server was successful, and if not, the simple object broker ignores that server. In addition, individual servers in the collection can be disabled so that the simple object broker ignores them until they are re-enabled.

See Also

ServerData (see page 17885)

GetComputerForProgID (see page 17882)

GetComputerForGUID (see page 17881)

TServerItem (see page 17871)

114 OleAuto Namespace

This is namespace OleAuto.

Topics

Name	Description
Classes (see page 17889)	The following table lists classes in this documentation.
Functions (see page 17907)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 17913)	The following table lists structs, records, enums in this documentation.
Types (see page 17915)	The following table lists types in this documentation.
Variables (see page 17916)	The following table lists variables in this documentation.
Constants (see page 17917)	The following table lists constants in this documentation.

Classes

	Name	Description
	EOleError (see page 17889)	This is class OleAuto.EOleError.
	EOleException (see page 17889)	This is class OleAuto.EOleException.
	EOleSysError (see page 17892)	This is class OleAuto.EOleSysError.
	TAutoDispatch (see page 17894)	This is class OleAuto.TAutoDispatch.
	TAutomation (see page 17897)	This is class OleAuto.TAutomation.
	TAutoObject (see page 17901)	This is class OleAuto.TAutoObject.
	TRegistryClass (see page 17905)	This is class OleAuto.TRegistryClass.

Constants

Name	Description
MaxDispArgs (see page 17917)	This is constant OleAuto.MaxDispArgs.

Functions

	Name	Description
	ClassIDToProgID (see page 17907)	This is function OleAuto.ClassIDToProgID.
	ClassIDToString (see page 17907)	This is function OleAuto.ClassIDToString.
	CreateOleObject (see page 17908)	This is function OleAuto.CreateOleObject.
	DispInvoke (see page 17908)	This is function OleAuto.DispInvoke.
	DispInvokeError (see page 17908)	This is function OleAuto.DispInvokeError.
	DllCanUnloadNow (see page 17909)	This is function OleAuto.DllCanUnloadNow.
	DllGetClassObject (see page 17909)	This is function OleAuto.DllGetClassObject.
	DllRegisterServer (see page 17909)	This is function OleAuto.DllRegisterServer.

	DllUnregisterServer (see page 17910)	This is function OleAuto.DllUnregisterServer.
	GetActiveOleObject (see page 17910)	This is function OleAuto.GetActiveOleObject.
	OleCheck (see page 17910)	This is function OleAuto.OleCheck.
	OleError (see page 17911)	This is function OleAuto.OleError.
	ProgIDToClassID (see page 17911)	This is function OleAuto.ProgIDToClassID.
	StringToClassID (see page 17911)	This is function OleAuto.StringToClassID.
	VarFromInterface (see page 17912)	This is function OleAuto.VarFromInterface.
	VarToAutoObject (see page 17912)	This is function OleAuto.VarToAutoObject.
	VarToInterface (see page 17912)	This is function OleAuto.VarToInterface.

Structs, Records, Enums

	Name	Description
	TAutoClassInfo (see page 17913)	This is record OleAuto.TAutoClassInfo.
	TAutoClassInstancing (see page 17913)	This is record OleAuto.TAutoClassInstancing.
	TStartMode (see page 17914)	This is record OleAuto.TStartMode.

Types

Name	Description
TAutoClass (see page 17915)	This is type OleAuto.TAutoClass.
TLastReleaseEvent (see page 17915)	This is type OleAuto.TLastReleaseEvent.

Variables

Name	Description
Automation (see page 17916)	This is variable OleAuto.Automation.

114.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EOleError (see page 17889)	This is class OleAuto.EOleError.
	EOleException (see page 17889)	This is class OleAuto.EOleException.
	EOleSysError (see page 17892)	This is class OleAuto.EOleSysError.
	TAutoDispatch (see page 17894)	This is class OleAuto.TAutoDispatch.
	TAutomation (see page 17897)	This is class OleAuto.TAutomation.
	TAutoObject (see page 17901)	This is class OleAuto.TAutoObject.
	TRegistryClass (see page 17905)	This is class OleAuto.TRegistryClass.

114.1.1 EOleError Class

Class Hierarchy

Pascal

```
EOleError = class(Exception);
```

C++

```
class EOleError : public Exception;
```

File

OleAuto

Description

This is class OleAuto.EOleError.

114.1.2 EOleException Class

Class Hierarchy

Pascal

```
EOleException = class(EOleError);
```

C++

```
class EOleException : public EOleError;
```

File

OleAuto

Description

This is class OleAuto.EOleException.

114.1.2.1 EOleException Members

The following tables list the members exposed by EOleException.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 17891)	This is Create, a member of class EOleException.
	CreateFmt (see page 22754)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 22755)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 22755)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateRes (see page 22756)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 22756)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 22757)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 22759)	This is the overview for the CreateResHelp constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ErrorCode (see page 17891)	This is ErrorCode, a member of class EOleException.

	HelpContext (see page 22760)	Indicates the context ID number for context-sensitive online help associated with the exception.
R	HelpFile (see page 17891)	This is HelpFile, a member of class EOleException.
	Message (see page 22760)	Message contains the text string to display in the exception dialog box when the exception is raised.
R	Source (see page 17892)	This is Source, a member of class EOleException.

114.1.2.2 EOleException.Create Constructor

Pascal

```
constructor Create(const ExcepInfo: TExcepInfo);
```

C++

```
__fastcall EOleException(const TExcepInfo ExcepInfo);
```

Description

This is Create, a member of class EOleException.

114.1.2.3 EOleException Properties

The properties of the EOleException class are listed here.

Public Properties

	Name	Description
R	ErrorCode (see page 17891)	This is ErrorCode, a member of class EOleException.
R	HelpFile (see page 17891)	This is HelpFile, a member of class EOleException.
R	Source (see page 17892)	This is Source, a member of class EOleException.

114.1.2.3.1 EOleException.ErrorCode Property

Pascal

```
property ErrorCode: Integer;
```

C++

```
__property int ErrorCode;
```

Description

This is ErrorCode, a member of class EOleException.

114.1.2.3.2 EOleException.HelpFile Property

Pascal

```
property HelpFile: string;
```

C++

```
__property AnsiString HelpFile;
```

Description

This is HelpFile, a member of class EOleException.

114.1.2.3.3 EOleException.Source Property

Pascal

```
property Source: string;
```

C++

```
__property AnsiString Source;
```

Description

This is Source, a member of class EOleException.

114.1.3 EOleSysError Class

Class Hierarchy

Pascal

```
EOleSysError = class(EOleError);
```

C++

```
class EOleSysError : public EOleError;
```

File

OleAuto

Description

This is class OleAuto.EOleSysError.

114.1.3.1 EOleSysError Members

The following tables list the members exposed by EOleSysError.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 17893)	This is Create, a member of class EOleSysError.
	CreateFmt (see page 22754)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 22755)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 22755)	Creates an instance of an exception with a simple message string and a help-context ID.

	CreateRes (see page 22756)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 22756)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 22757)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 22759)	This is the overview for the CreateResHelp constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ErrorCode (see page 17894)	This is ErrorCode, a member of class EOleSysError.
	HelpContext (see page 22760)	Indicates the context ID number for context-sensitive online help associated with the exception.
	Message (see page 22760)	Message contains the text string to display in the exception dialog box when the exception is raised.

114.1.3.2 EOleSysError.Create Constructor

Pascal

```
constructor Create(ErrorCode: Integer);
```

C++

```
__fastcall EOleSysError(int ErrorCode);
```

Description

This is Create, a member of class EOleSysError.

114.1.3.3 EOleSysError Properties

The properties of the EOleSysError class are listed here.

Public Properties

	Name	Description
R	ErrorCode (see page 17894)	This is ErrorCode, a member of class EOleSysError.

114.1.3.3.1 EOleSysError.ErrorCode Property

Pascal

```
property ErrorCode: Integer;
```

C++

```
__property int ErrorCode;
```

Description

This is ErrorCode, a member of class EOleSysError.

114.1.4 TAutoDispatch Class

Class Hierarchy

Pascal

```
TAutoDispatch = class(IDispatch);
```

C++

```
class TAutoDispatch : public IDispatch;
```

File

OleAuto

Description

This is class OleAuto.TAutoDispatch.

114.1.4.1 TAutoDispatch Members

The following tables list the members exposed by TAutoDispatch.

Public Methods

	Name	Description
V	AddRef (see page 17895)	This is AddRef, a member of class TAutoDispatch.
	Create (see page 17895)	This is Create, a member of class TAutoDispatch.
V	GetAutoObject (see page 17895)	This is GetAutoObject, a member of class TAutoDispatch.
V	GetIDsOfNames (see page 17896)	This is GetIDsOfNames, a member of class TAutoDispatch.
V	GetTypeInfo (see page 17896)	This is GetTypeInfo, a member of class TAutoDispatch.
V	GetTypeInfoCount (see page 17896)	This is GetTypeInfoCount, a member of class TAutoDispatch.
V	Invoke (see page 17896)	This is Invoke, a member of class TAutoDispatch.
V	QueryInterface (see page 17897)	This is QueryInterface, a member of class TAutoDispatch.
V	Release (see page 17897)	This is Release, a member of class TAutoDispatch.

Public Properties

	Name	Description
R	AutoObject (see page 17897)	This is AutoObject, a member of class TAutoDispatch.

114.1.4.2 TAutoDispatch.Create Constructor

Pascal

```
constructor Create(AutoObject: TAutoObject);
```

C++

```
__fastcall TAutoDispatch(TAutoObject AutoObject);
```

Description

This is Create, a member of class TAutoDispatch.

114.1.4.3 TAutoDispatch Methods

The methods of the TAutoDispatch class are listed here.

Public Methods

	Name	Description
	AddRef (see page 17895)	This is AddRef, a member of class TAutoDispatch.
	GetAutoObject (see page 17895)	This is GetAutoObject, a member of class TAutoDispatch.
	GetIDsOfNames (see page 17896)	This is GetIDsOfNames, a member of class TAutoDispatch.
	GetTypeInfo (see page 17896)	This is GetTypeInfo, a member of class TAutoDispatch.
	GetTypeInfoCount (see page 17896)	This is GetTypeInfoCount, a member of class TAutoDispatch.
	Invoke (see page 17896)	This is Invoke, a member of class TAutoDispatch.
	QueryInterface (see page 17897)	This is QueryInterface, a member of class TAutoDispatch.
	Release (see page 17897)	This is Release, a member of class TAutoDispatch.

114.1.4.3.1 TAutoDispatch.AddRef Method

Pascal

```
function AddRef: Longint; override;
```

C++

```
virtual __fastcall Longint AddRef();
```

Description

This is AddRef, a member of class TAutoDispatch.

114.1.4.3.2 TAutoDispatch.GetAutoObject Method

Pascal

```
function GetAutoObject: TAutoObject; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall TAutoObject GetAutoObject();
```

Description

This is GetAutoObject, a member of class TAutoDispatch.

114.1.4.3.3 TAutoDispatch.GetIDsOfNames Method

Pascal

```
function GetIDsOfNames(const iid: TIID; rgszNames: POleStrList; cNames: Integer; lcid: TLCID;
rgdispid: PDispIDList): HResult; override;
```

C++

```
virtual __fastcall HRESULT GetIDsOfNames(const TIID iid, POleStrList rgszNames, int cNames,
TLCID lcid, PDispIDList rgdispid);
```

Description

This is GetIDsOfNames, a member of class TAutoDispatch.

114.1.4.3.4 TAutoDispatch.GetTypeInfo Method

Pascal

```
function GetTypeInfo(itinfo: Integer; lcid: TLCID; var tinfo: ITypeInfo): HResult; override;
```

C++

```
virtual __fastcall HRESULT GetTypeInfo(int itinfo, TLCID lcid, ITypeInfo tinfo);
```

Description

This is GetTypeInfo, a member of class TAutoDispatch.

114.1.4.3.5 TAutoDispatch.GetTypeInfoCount Method

Pascal

```
function GetTypeInfoCount(var ctinfo: Integer): HResult; override;
```

C++

```
virtual __fastcall HRESULT GetTypeInfoCount(int ctinfo);
```

Description

This is GetTypeInfoCount, a member of class TAutoDispatch.

114.1.4.3.6 TAutoDispatch.Invoke Method

Pascal

```
function Invoke(dispIDMember: TDispID; const iid: TIID; lcid: TLCID; flags: Word; var
dispParams: TDispParams; varResult: PVariant; excepInfo: PExcepInfo; argErr: PInteger):
HResult; override;
```

C++

```
virtual __fastcall HRESULT Invoke(TDispID dispIDMember, const TIID iid, TLCID lcid, Word
flags, TDispParams dispParams, PVariant varResult, PExcepInfo excepInfo, PInteger argErr);
```

Description

This is Invoke, a member of class TAutoDispatch.

114.1.4.3.7 TAutoDispatch.QueryInterface Method

Pascal

```
function QueryInterface(const iid: TIID; var obj): HResult; override;
```

C++

```
virtual __fastcall HRESULT QueryInterface(const TIID iid,  obj);
```

Description

This is QueryInterface, a member of class TAutoDispatch.

114.1.4.3.8 TAutoDispatch.Release Method

Pascal

```
function Release: Longint; override;
```

C++

```
virtual __fastcall Longint Release();
```

Description

This is Release, a member of class TAutoDispatch.

114.1.4.4 TAutoDispatch Properties

The properties of the TAutoDispatch class are listed here.

Public Properties

	Name	Description
R	AutoObject (see page 17897)	This is AutoObject, a member of class TAutoDispatch.

114.1.4.4.1 TAutoDispatch.AutoObject Property

Pascal

```
property AutoObject: TAutoObject;
```

C++

```
__property TAutoObject AutoObject;
```

Description

This is AutoObject, a member of class TAutoDispatch.

114.1.5 TAutomation Class

Class Hierarchy

OleAuto.TAutomation

Pascal

```
TAutomation = class;
```

C++

```
class TAutomation;
```

File

OleAuto

Description

This is class OleAuto.TAutomation.

114.1.5.1 TAutomation Members

The following tables list the members exposed by TAutomation.

Public Events

	Name	Description
	OnLastRelease (see page 17900)	This is OnLastRelease, a member of class TAutomation.

Public Methods

	Name	Description
	Create (see page 17898)	This is Create, a member of class TAutomation.
V	Destroy (see page 17898)	This is Destroy, a member of class TAutomation.
	RegisterClass (see page 17899)	This is RegisterClass, a member of class TAutomation.
	UpdateRegistry (see page 17899)	This is UpdateRegistry, a member of class TAutomation.

Public Properties

	Name	Description
R	AutoObjectCount (see page 17899)	This is AutoObjectCount, a member of class TAutomation.
	IsInprocServer (see page 17900)	This is IsInprocServer, a member of class TAutomation.
R	StartMode (see page 17900)	This is StartMode, a member of class TAutomation.

114.1.5.2 TAutomation.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TAutomation();
```

Description

This is Create, a member of class TAutomation.

114.1.5.3 TAutomation.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAutomation();
```

Description

This is Destroy, a member of class TAutomation.

114.1.5.4 TAutomation Methods

The methods of the TAutomation class are listed here.

Public Methods

	Name	Description
	RegisterClass (see page 17899)	This is RegisterClass, a member of class TAutomation.
	UpdateRegistry (see page 17899)	This is UpdateRegistry, a member of class TAutomation.

114.1.5.4.1 TAutomation.RegisterClass Method

Pascal

```
procedure RegisterClass(const AutoClassInfo: TAutoClassInfo);
```

C++

```
__fastcall RegisterClass(const TAutoClassInfo AutoClassInfo);
```

Description

This is RegisterClass, a member of class TAutomation.

114.1.5.4.2 TAutomation.UpdateRegistry Method

Pascal

```
procedure UpdateRegistry(Register: Boolean);
```

C++

```
__fastcall UpdateRegistry(Boolean Register);
```

Description

This is UpdateRegistry, a member of class TAutomation.

114.1.5.5 TAutomation Properties

The properties of the TAutomation class are listed here.

Public Properties

	Name	Description
R	AutoObjectCount (see page 17899)	This is AutoObjectCount, a member of class TAutomation.
	IsInprocServer (see page 17900)	This is IsInprocServer, a member of class TAutomation.
R	StartMode (see page 17900)	This is StartMode, a member of class TAutomation.

114.1.5.5.1 TAutomation.AutoObjectCount Property

Pascal

```
property AutoObjectCount: Integer;
```

C++

```
__property int AutoObjectCount;
```

Description

This is AutoObjectCount, a member of class TAutomation.

114.1.5.5.2 TAutomation.IsInprocServer Property

Pascal

```
property IsInprocServer: Boolean;
```

C++

```
__property Boolean IsInprocServer;
```

Description

This is IsInprocServer, a member of class TAutomation.

114.1.5.5.3 TAutomation.StartMode Property

Pascal

```
property StartMode: TStartMode;
```

C++

```
__property TStartMode StartMode;
```

Description

This is StartMode, a member of class TAutomation.

114.1.5.6 TAutomation Events

The events of the TAutomation class are listed here.

Public Events

	Name	Description
	OnLastRelease (see page 17900)	This is OnLastRelease, a member of class TAutomation.

114.1.5.6.1 TAutomation.OnLastRelease Event

Pascal

```
property OnLastRelease: TLastReleaseEvent;
```

C++

```
__property TLastReleaseEvent OnLastRelease;
```

Description

This is OnLastRelease, a member of class TAutomation.

114.1.6 TAutoObject Class

Class Hierarchy

System::TObject → OleAuto.TAutoObject

Pascal

```
TAutoObject = class(TObject);
```

C++

```
class TAutoObject : public TObject;
```

File

OleAuto

Description

This is class OleAuto.TAutoObject.

114.1.6.1 TAutoObject Members

The following tables list the members exposed by TAutoObject.

Protected Methods

	Name	Description
V	CreateAutoDispatch (see page 17903)	This is CreateAutoDispatch, a member of class TAutoObject.
V	GetExceptionInfo (see page 17904)	This is GetExceptionInfo, a member of class TAutoObject.

Public Methods

	Name	Description
	AddRef (see page 17903)	This is AddRef, a member of class TAutoObject.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 17902)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 17902)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Release (see page 17904)	This is Release, a member of class TAutoObject.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	AutoDispatch (see page 17904)	This is AutoDispatch, a member of class TAutoObject.
R	OleObject (see page 17904)	This is OleObject, a member of class TAutoObject.
R	RefCount (see page 17905)	This is RefCount, a member of class TAutoObject.

114.1.6.2 TAutoObject.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TAutoObject();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

114.1.6.3 TAutoObject.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAutoObject();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

114.1.6.4 TAutoObject Methods

The methods of the TAutoObject class are listed here.

Protected Methods

	Name	Description
	CreateAutoDispatch (see page 17903)	This is CreateAutoDispatch, a member of class TAutoObject.
	GetExceptionInfo (see page 17904)	This is GetExceptionInfo, a member of class TAutoObject.

Public Methods

	Name	Description
	AddRef (see page 17903)	This is AddRef, a member of class TAutoObject.
	Release (see page 17904)	This is Release, a member of class TAutoObject.

114.1.6.4.1 TAutoObject.AddRef Method

Pascal

```
function AddRef: Integer;
```

C++

```
__fastcall int AddRef();
```

Description

This is AddRef, a member of class TAutoObject.

114.1.6.4.2 TAutoObject.CreateAutoDispatch Method

Pascal

```
function CreateAutoDispatch: TAutoDispatch; virtual;
```

C++

```
virtual __fastcall TAutoDispatch CreateAutoDispatch();
```

Description

This is CreateAutoDispatch, a member of class TAutoObject.

114.1.6.4.3 TAutoObject.GetExceptionInfo Method

Pascal

```
procedure GetExceptionInfo(ExceptObject: TObject; var ExcepInfo: TExcepInfo); virtual;
```

C++

```
virtual __fastcall GetExceptionInfo(TObject * ExceptObject, TExcepInfo ExcepInfo);
```

Description

This is GetExceptionInfo, a member of class TAutoObject.

114.1.6.4.4 TAutoObject.Release Method

Pascal

```
function Release: Integer;
```

C++

```
__fastcall int Release();
```

Description

This is Release, a member of class TAutoObject.

114.1.6.5 TAutoObject Properties

The properties of the TAutoObject class are listed here.

Public Properties

	Name	Description
R	AutoDispatch (see page 17904)	This is AutoDispatch, a member of class TAutoObject.
R	OleObject (see page 17904)	This is OleObject, a member of class TAutoObject.
R	RefCount (see page 17905)	This is RefCount, a member of class TAutoObject.

114.1.6.5.1 TAutoObject.AutoDispatch Property

Pascal

```
property AutoDispatch: TAutoDispatch;
```

C++

```
__property TAutoDispatch AutoDispatch;
```

Description

This is AutoDispatch, a member of class TAutoObject.

114.1.6.5.2 TAutoObject.OleObject Property

Pascal

```
property OleObject: Variant;
```

C++

```
__property Variant OleObject;
```

Description

This is OleObject, a member of class TAutoObject.

114.1.6.5.3 TAutoObject.RefCount Property

Pascal

```
property RefCount: Integer;
```

C++

```
__property int RefCount;
```

Description

This is RefCount, a member of class TAutoObject.

114.1.7 TRegistryClass Class

Class Hierarchy

OleAuto.TRegistryClass

Pascal

```
TRegistryClass = class;
```

C++

```
class TRegistryClass;
```

File

OleAuto

Description

This is class OleAuto.TRegistryClass.

114.1.7.1 TRegistryClass Members

The following tables list the members exposed by TRegistryClass.

Public Methods

	Name	Description
	Create (see page 17905)	This is Create, a member of class TRegistryClass.
V	Destroy (see page 17906)	This is Destroy, a member of class TRegistryClass.
	UpdateRegistry (see page 17906)	This is UpdateRegistry, a member of class TRegistryClass.

114.1.7.2 TRegistryClass.Create Constructor

Pascal

```
constructor Create(const AutoClassInfo: TAutoClassInfo);
```

C++

```
__fastcall TRegistryClass(const TAutoClassInfo AutoClassInfo);
```

Description

This is Create, a member of class TRegistryClass.

114.1.7.3 TRegistryClass.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRegistryClass();
```

Description

This is Destroy, a member of class TRegistryClass.

114.1.7.4 TRegistryClass Methods

The methods of the TRegistryClass class are listed here.

Public Methods

	Name	Description
	UpdateRegistry (see page 17906)	This is UpdateRegistry, a member of class TRegistryClass.

114.1.7.4.1 TRegistryClass.UpdateRegistry Method

Pascal

```
procedure UpdateRegistry(Register: Boolean);
```

C++

```
__fastcall UpdateRegistry(Boolean Register);
```

Description

This is UpdateRegistry, a member of class TRegistryClass.

114.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	ClassIDToProgID (see page 17907)	This is function OleAuto.ClassIDToProgID.
	ClassIDToString (see page 17907)	This is function OleAuto.ClassIDToString.
	CreateOleObject (see page 17908)	This is function OleAuto.CreateOleObject.
	DispInvoke (see page 17908)	This is function OleAuto.DispInvoke.
	DispInvokeError (see page 17908)	This is function OleAuto.DispInvokeError.
	DllCanUnloadNow (see page 17909)	This is function OleAuto.DllCanUnloadNow.
	DllGetClassObject (see page 17909)	This is function OleAuto.DllGetClassObject.
	DllRegisterServer (see page 17909)	This is function OleAuto.DllRegisterServer.
	DllUnregisterServer (see page 17910)	This is function OleAuto.DllUnregisterServer.
	GetActiveOleObject (see page 17910)	This is function OleAuto.GetActiveOleObject.
	OleCheck (see page 17910)	This is function OleAuto.OleCheck.
	OleError (see page 17911)	This is function OleAuto.OleError.
	ProgIDToClassID (see page 17911)	This is function OleAuto.ProgIDToClassID.
	StringToClassID (see page 17911)	This is function OleAuto.StringToClassID.
	VarFromInterface (see page 17912)	This is function OleAuto.VarFromInterface.
	VarToAutoObject (see page 17912)	This is function OleAuto.VarToAutoObject.
	VarToInterface (see page 17912)	This is function OleAuto.VarToInterface.

114.2.1 OleAuto.ClassIDToProgID Function

Pascal

```
function ClassIDToProgID(const ClassID: TCLSID): string;
```

C++

```
AnsiString ClassIDToProgID(const TCLSID ClassID);
```

File

OleAuto

Description

This is function OleAuto.ClassIDToProgID.

114.2.2 OleAuto.ClassIDToString Function

Pascal

```
function ClassIDToString(const ClassID: TCLSID): string;
```

C++

```
AnsiString ClassIDToString(const TCLSID ClassID);
```

File

OleAuto

Description

This is function OleAuto.ClassIDToString.

114.2.3 OleAuto.CreateOleObject Function

Pascal

```
function CreateOleObject(const ClassName: string): Variant;
```

C++

```
Variant CreateOleObject(const AnsiString ClassName);
```

File

OleAuto

Description

This is function OleAuto.CreateOleObject.

114.2.4 OleAuto.DispInvoke Function

Pascal

```
procedure DispInvoke(Dispatch: IDispatch; CallDesc: PCallDesc; DispIDs: PDispIDList; Params:
Pointer; Result: PVariant);
```

C++

```
DispInvoke(IDispatch Dispatch, PCallDesc CallDesc, PDispIDList DispIDs, void * Params,
PVariant Result);
```

File

OleAuto

Description

This is function OleAuto.DispInvoke.

114.2.5 OleAuto.DispInvokeError Function

Pascal

```
procedure DispInvokeError(Status: HResult; const ExcepInfo: TExcepInfo);
```

C++

```
DispInvokeError(HRESULT Status, const TExcepInfo ExcepInfo);
```

File

OleAuto

Description

This is function OleAuto.DispInvokeError.

114.2.6 OleAuto.DllCanUnloadNow Function

Pascal

```
function DllCanUnloadNow: HResult; stdcall;
```

C++

```
__stdcall HRESULT DllCanUnloadNow();
```

File

OleAuto

Description

This is function OleAuto.DllCanUnloadNow.

114.2.7 OleAuto.DllGetClassObject Function

Pascal

```
function DllGetClassObject(const CLSID: TCLSID; const IID: TIID; var Obj): HResult; stdcall;
```

C++

```
__stdcall HRESULT DllGetClassObject(const TCLSID CLSID, const TIID IID,  Obj);
```

File

OleAuto

Description

This is function OleAuto.DllGetClassObject.

114.2.8 OleAuto.DllRegisterServer Function

Pascal

```
function DllRegisterServer: HResult; stdcall;
```

C++

```
__stdcall HRESULT DllRegisterServer();
```

File

OleAuto

Description

This is function OleAuto.DllRegisterServer.

114.2.9 OleAuto.DllUnregisterServer Function

Pascal

```
function DllUnregisterServer: HResult; stdcall;
```

C++

```
__stdcall HRESULT DllUnregisterServer();
```

File

OleAuto

Description

This is function OleAuto.DllUnregisterServer.

114.2.10 OleAuto.GetActiveOleObject Function

Pascal

```
function GetActiveOleObject(const ClassName: string): Variant;
```

C++

```
Variant GetActiveOleObject(const AnsiString ClassName);
```

File

OleAuto

Description

This is function OleAuto.GetActiveOleObject.

114.2.11 OleAuto.OleCheck Function

Pascal

```
procedure OleCheck(Result: HResult);
```

C++

```
OleCheck(HRESULT Result);
```

File

OleAuto

Description

This is function OleAuto.OleCheck.

114.2.12 OleAuto.OleError Function

Pascal

```
procedure OleError(ErrorCode: HResult);
```

C++

```
OleError(HRESULT ErrorCode);
```

File

OleAuto

Description

This is function OleAuto.OleError.

114.2.13 OleAuto.ProgIDToClassID Function

Pascal

```
function ProgIDToClassID(const ProgID: string): TCLSID;
```

C++

```
TCLSID ProgIDToClassID(const AnsiString ProgID);
```

File

OleAuto

Description

This is function OleAuto.ProgIDToClassID.

114.2.14 OleAuto.StringToClassID Function

Pascal

```
function StringToClassID(const S: string): TCLSID;
```

C++

```
TCLSID StringToClassID(const AnsiString S);
```

File

OleAuto

Description

This is function OleAuto.StringToClassID.

114.2.15 OleAuto.VarFromInterface Function

Pascal

```
function VarFromInterface(Unknown: IUnknown): Variant;
```

C++

```
Variant VarFromInterface(IUnknown Unknown);
```

File

OleAuto

Description

This is function OleAuto.VarFromInterface.

114.2.16 OleAuto.VarToAutoObject Function

Pascal

```
function VarToAutoObject(const V: Variant): TAutoObject;
```

C++

```
TAutoObject VarToAutoObject(const Variant V);
```

File

OleAuto

Description

This is function OleAuto.VarToAutoObject.

114.2.17 OleAuto.VarToInterface Function

Pascal

```
function VarToInterface(const V: Variant): IDispatch;
```

C++

```
IDispatch VarToInterface(const Variant V);
```

File

OleAuto

Description

This is function OleAuto.VarToInterface.

114.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAutoClassInstancing (see page 17913)	This is record OleAuto.TAutoClassInstancing.
	TStartMode (see page 17914)	This is record OleAuto.TStartMode.

Records

	Name	Description
	TAutoClassInfo (see page 17913)	This is record OleAuto.TAutoClassInfo.

114.3.1 OleAuto.TAutoClassInfo Record

Pascal

```
TAutoClassInfo = record
  AutoClass: TAutoClass;
  ProgID: string;
  ClassID: string;
  Description: string;
  Instancing: TAutoClassInstancing;
end;
```

C++

```
struct TAutoClassInfo {
  TAutoClass AutoClass;
  AnsiString ProgID;
  AnsiString ClassID;
  AnsiString Description;
  TAutoClassInstancing Instancing;
};
```

File

OleAuto

Description

This is record OleAuto.TAutoClassInfo.

114.3.2 OleAuto.TAutoClassInstancing Enumeration

Pascal

```
TAutoClassInstancing = (
  acInternal,
  acSingleInstance,
  acMultiInstance
);
```

C++

```
enum TAutoClassInstancing {
  acInternal,
  acSingleInstance,
  acMultiInstance
};
```

File

OleAuto

Description

This is record OleAuto.TAutoClassInstancing.

114.3.3 OleAuto.TStartMode Enumeration

Pascal

```
TStartMode = (
  smStandalone,
  smAutomation,
  smRegServer,
  smUnregServer
);
```

C++

```
enum TStartMode {
  smStandalone,
  smAutomation,
  smRegServer,
  smUnregServer
};
```

File

OleAuto

Description

This is record OleAuto.TStartMode.

114.4 Types

The following table lists types in this documentation.

Types

Name	Description
TAutoClass (see page 17915)	This is type OleAuto.TAutoClass.
TLastReleaseEvent (see page 17915)	This is type OleAuto.TLastReleaseEvent.

114.4.1 OleAuto.TAutoClass Type

Pascal

```
TAutoClass = class of TAutoObject;
```

C++

```
TAutoObject TAutoClass;
```

File

OleAuto

Description

This is type OleAuto.TAutoClass.

114.4.2 OleAuto.TLastReleaseEvent Type

Pascal

```
TLastReleaseEvent = procedure (var Shutdown: Boolean) of object;
```

C++

```
(var Shutdown: Boolean) ( TLastReleaseEvent)();
```

File

OleAuto

Description

This is type OleAuto.TLastReleaseEvent.

114.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
Automation (see page 17916)	This is variable OleAuto.Automation.

114.5.1 OleAuto.Automation Variable

Pascal

```
Automation: TAutomation;
```

C++

```
TAutomation Automation;
```

File

OleAuto

Description

This is variable OleAuto.Automation.

114.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
MaxDispArgs (see page 17917)	This is constant OleAuto.MaxDispArgs.

114.6.1 OleAuto.MaxDispArgs Constant

Pascal

```
MaxDispArgs = 32;
```

C++

```
MaxDispArgs = 32;
```

File

OleAuto

Description

This is constant OleAuto.MaxDispArgs.

115 OleCtnrs Namespace

This is namespace OleCtnrs.

Topics

Name	Description
Classes (see page 17921)	The following table lists classes in this documentation.
Interfaces (see page 18009)	The following table lists interfaces in this documentation.
Functions (see page 18011)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 18012)	The following table lists structs, records, enums in this documentation.
Types (see page 18016)	The following table lists types in this documentation.
Constants (see page 18017)	The following table lists constants in this documentation.

Classes

	Name	Description
	TOleContainer (see page 17921)	TOleContainer embeds or links OLE objects.
	TOleForm (see page 18006)	TOleForm is an object that provides OLE support for a TForm object.

Constants

Name	Description
ovDiscardUndoState (see page 18017)	This is constant OleCtnrs.ovDiscardUndoState.
ovHide (see page 18017)	This is constant OleCtnrs.ovHide.
ovInPlaceActivate (see page 18018)	This is constant OleCtnrs.ovInPlaceActivate.
ovOpen (see page 18018)	This is constant OleCtnrs.ovOpen.
ovPrimary (see page 18018)	This is constant OleCtnrs.ovPrimary.
ovShow (see page 18019)	This is constant OleCtnrs.ovShow.
ovUIActivate (see page 18019)	This is constant OleCtnrs.ovUIActivate.

Functions

	Name	Description
	DestroyMetaPict (see page 18011)	Frees a metafile resource given its handle.

Interfaces

	Name	Description
	IVCLFrameForm (see page 18009)	This is class OleCtnrs.IVCLFrameForm.

Structs, Records, Enums

	Name	Description
	TAutoActivate (see page 18012)	This is record OleCtnrs.TAutoActivate.
	TCreateInfo (see page 18012)	This is record OleCtnrs.TCreateInfo.
	TCreateType (see page 18013)	This is record OleCtnrs.TCreateType.
	TObjectState (see page 18013)	This is record OleCtnrs.TObjectState.
	TSizeMode (see page 18014)	This is record OleCtnrs.TSizeMode.
	TVerbInfo (see page 18014)	This is record OleCtnrs.TVerbInfo.

Types

Name	Description
TObjectMoveEvent (see page 18016)	This is type OleCtnrs.TObjectMoveEvent.

115.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TOleContainer (see page 17921)	TOleContainer embeds or links OLE objects.
	TOleForm (see page 18006)	TOleForm is an object that provides OLE support for a TForm object.

115.1.1 TOleContainer Class

TOleContainer embeds or links OLE objects.

Class Hierarchy

Pascal

```
TOleContainer = class(TCustomControl, IUnknown, IOleClientSite, IOleInPlaceSite, IAdviseSink,
IOleDocumentSite, IOleUIObjInfo);
```

C++

```
class TOleContainer : public TCustomControl, public IUnknown, public IOleClientSite, public
IOleInPlaceSite, public IAdviseSink, public IOleDocumentSite, public IOleUIObjInfo;
```

File

OleCtnrs

Description

Use TOleContainer to handle many of the complexities of OLE 2.0. TOleContainer lets the user choose an OLE object to insert by simply calling the InsertObjectDialog (see page 17943) method. TOleContainer can create either an embedded OLE object or a linked OLE object.

TOleContainer automatically handles menu merging -- the process of combining the container form's menu with that of an in-place activated OLE object's server application. The menu items' GroupIndex property settings control how menus are merged. Those main menu items with GroupIndex values of 0, 2, and 4 remain; TOleContainer merges the server application's menus and replaces the main menu items with GroupIndex values of 1, 3, and 5 (if they exist).

OLE objects that are activated in-place add their server's toolbars directly into the container application's window. Normally, any

panels used for toolbars are replaced by the OLE object's server's toolbars. Prevent this by setting a panel's Locked property to true.

When using TOleContainer in an SDI application (the main form's FormStyle property is fsNormal rather than fsMDIForm), place the TOleContainer component inside a panel whose Align (see page 17951) property is set to alClient. TOleContainer replaces an SDI form's toolbars as described above, and using a panel automatically adjusts the amount of space available to the OLE container.

115.1.1.1 TOleContainer Members

The following tables list the members exposed by TOleContainer.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.

	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 17935)	Called when an application uses a component interface.
	_Release (see page 17935)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 17936)	Sends a CM_CHANGED message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 17939)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
V	DblClick (see page 17940)	OnDblClick event dispatcher.

	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 17940)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 17941)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.

	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 17942)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 17943)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 17945)	OnMouseDown event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 17945)	Renders the image of a custom control.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 17947)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.

	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.

	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ChangeIconDialog (see page 17936)	Displays the Change Icon OLE dialog box.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	Close (see page 17937)	Deactivates the OLE object.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Copy (see page 17937)	Copies the OLE object to the Windows clipboard.
V	Create (see page 17933)	Creates and initializes an instance of TOleContainer (see page 17921).
	CreateLinkToFile (see page 17937)	Creates a linked OLE object from the contents of a file.
	CreateObject (see page 17938)	Creates an embedded OLE object given its class name (also known as programmatic identifier).
	CreateObjectFromFile (see page 17938)	Creates an embedded OLE object from the contents of a file.
	CreateObjectFromInfo (see page 17939)	Creates an OLE object matching the specified TCreateInfo (see page 18012) record.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 17934)	Destroys an instance of TOleContainer (see page 17921).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DestroyObject (see page 17941)	Destroys the container's OLE object.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DoVerb (see page 17941)	Requests that the OLE object perform some action.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIconMetaPict (see page 17942)	Returns the global memory handle of a metafile containing the OLE object's icon.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InsertObjectDialog (see page 17943)	Displays the Insert Object OLE dialog box.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	LoadFromFile (see page 17944)	Loads an OLE object from the specified file.
	LoadFromStream (see page 17944)	Loads an OLE object from the specified stream.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ObjectPropertiesDialog (see page 17945)	Displays the OLE Object Properties property sheet.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Paste (see page 17946)	Pastes the contents of the Windows clipboard as an embedded object.
	PasteSpecialDialog (see page 17946)	Displays the Paste (see page 17946) Special OLE dialog box.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	Run (see page 17947)	Runs the OLE object's server application, but doesn't open or activate the OLE object itself.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveAsDocument (see page 17948)	Saves the OLE object to the specified file in native OLE Document format.
	SaveToFile (see page 17948)	Saves the OLE object to the specified file.
	SaveToStream (see page 17949)	Saves the OLE object to the specified stream.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UpdateObject (see page 17949)	Refreshes the OLE object.
	UpdateVerbs (see page 17949)	Refreshes the list of verbs the OLE object can respond to.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	CanPaste (see page 17957)	Indicates whether the Windows clipboard contains an OLE object that can be pasted into the OLE container.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.

R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
R	Linked (see page 17965)	Indicates whether the OLE object is linked or embedded.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Modified (see page 17965)	Indicates whether the OLE object has been modified.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	NewInserted (see page 17966)	Indicates whether the OLE object was created rather than pasted in or created as a link to a file.
R	ObjectVerbs (see page 17966)	Lists the verbs that the OLE object supports.
R	OleClassName (see page 17967)	Specifies the class name of the OLE object.
R	OleObject (see page 17967)	Represents the OLE object hosted by the OLE container.
R	OleObjectInterface (see page 17968)	Provides access to the IOleObject interface for the OLE object.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	PrimaryVerb (see page 17974)	Specifies the index of the primary (default) verb for the OLE object.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
R	SourceDoc (see page 17977)	Specifies the name of the source document for a linked OLE object.
R	State (see page 17977)	Describes the state of the OLE object.
R	StorageInterface (see page 17977)	Provides access to the IStorage interface for the OLE object.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnActivate (see page 17981)	Occurs immediately after the OLE object is activated.
	OnDeactivate (see page 17981)	Occurs immediately after the OLE object is deactivated.
	OnDragDrop (see page 17982)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 17984)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 17986)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 17987)	Occurs when a control receives the input focus.
	OnExit (see page 17990)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 17991)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 17994)	Occurs when a key is pressed.
	OnKeyUp (see page 17995)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 17997)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 17998)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 18000)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 18002)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnObjectMove (see page 18005)	Occurs when the OLE container is notified that the OLE object has moved or resized.
	OnResize (see page 18005)	Occurs immediately after the OLE container window is resized.
	OnStartDrag (see page 18005)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 17951)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	AllowActiveDoc (see page 17954)	Specifies whether the OLE container supports the IOleDocumentSite interface.
	AllowInPlace (see page 17955)	Determines whether the OLE container allows in-place activation.
	Anchors (see page 17955)	Specifies how the control is anchored to its parent.
	AutoActivate (see page 17956)	Determines how the object in an OLE container is activated.
	AutoVerbMenu (see page 17956)	Determines whether the OLE container automatically creates a pop-up menu containing the OLE object's verbs.
	BorderStyle (see page 17957)	Determines whether a single line is drawn around the OLE container.
	Caption (see page 17957)	Specifies a text string that identifies the control to the user.
	Color (see page 17960)	Specifies the background color of the control.
	Constraints (see page 17961)	Specifies the size constraints for the control.
	CopyOnSave (see page 17961)	Determines whether the SaveToFile (see page 17948) and SaveToStream (see page 17949) methods first create a copy of the OLE object.
	Ctl3D (see page 17962)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 17962)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 17963)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 17964)	Controls whether the control responds to mouse, keyboard, and timer events.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.

	Iconic (see page 17965)	Determines whether the OLE object is displayed as an icon.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldStreamFormat (see page 17966)	Indicates whether the OLE object is loaded and saved using the VCL format.
	ParentColor (see page 17968)	Determines where a control looks for its color information.
	ParentCtl3D (see page 17969)	Determines where a component looks to determine if it should appear three dimensional.
	ParentShowHint (see page 17969)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 17969)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 17974)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	SizeMode (see page 17976)	Determines how the OLE object is sized in the OLE container.
	TabOrder (see page 17978)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 17978)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 17979)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

115.1.1.2 TOleContainer.Create Constructor

Creates and initializes an instance of TOleContainer (see page 17921).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TOleContainer(TComponent * AOwner);
```

Description

Call Create to instantiate a TOleContainer (see page 17921) object at runtime. OLE containers placed on forms at design time are created automatically.

Pass a component to the constructor to supply the OLE container with an Owner that is responsible for freeing it.

After calling the inherited constructor, Create

Sets ControlStyle to [csClickEvents, csSetCaption, csOpaque, csDoubleClicks].

Sets TabStop (see page 17978) to true.

Sets ParentColor (see page 17968) to false and BorderStyle (see page 17957) to bsSingle.

Sets AllowActiveDoc (see page 17954) and AllowInPlace (see page 17955) to true.

Sets AutoActivate (see page 17956) to aaDoubleClick and AutoVerbMenu (see page 17956) to true.

Sets CopyOnSave (see page 17961) to true.

See Also

AllowActiveDoc (see page 17954)

AllowInPlace (see page 17955)

AutoActivate (see page 17956)

AutoVerbMenu (see page 17956)

BorderStyle (see page 17957)

ControlStyle (see page 5814)

ParentColor (see page 5834)

TabStop (see page 6211)

115.1.1.3 TOleContainer.Destroy Destructor

Destroys an instance of TOleContainer (see page 17921).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOleContainer();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TOleContainer (see page 17921) reference is not nil, and only then calls Destroy.Destroy frees the OLE object before calling the inherited destructor.

See Also

DestroyObject (see page 17941)

Free (see page 22300)

115.1.1.4 TOleContainer Methods

The methods of the TOleContainer class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 17935)	Called when an application uses a component interface.
	_Release (see page 17935)	Called when an application releases a component interface.
	Changed (see page 17936)	Sends a CM_CHANGED message to the control.
V	CreateParams (see page 17939)	Initializes a window-creation parameter data structure.
V	DblClick (see page 17940)	OnDblClick event dispatcher.
V	DefineProperties (see page 17940)	Provides methods to read and write the IsControl property to a stream such as a form file.
V	DoEnter (see page 17941)	Respond to receiving input focus.
V	GetPopupMenu (see page 17942)	Returns the pop-up menu associated with the control.
V	KeyDown (see page 17943)	Respond to key press events.
V	MouseDown (see page 17945)	OnMouseDown event dispatcher.
V	Paint (see page 17945)	Renders the image of a custom control.
V	QueryInterface (see page 17947)	Returns a reference to a specified interface if the object supports that interface.

Public Methods

	Name	Description
	ChangeIconDialog (see page 17936)	Displays the Change Icon OLE dialog box.
	Close (see page 17937)	Deactivates the OLE object.
	Copy (see page 17937)	Copies the OLE object to the Windows clipboard.
	CreateLinkToFile (see page 17937)	Creates a linked OLE object from the contents of a file.

	CreateObject (see page 17938)	Creates an embedded OLE object given its class name (also known as programmatic identifier).
	CreateObjectFromFile (see page 17938)	Creates an embedded OLE object from the contents of a file.
	CreateObjectFromInfo (see page 17939)	Creates an OLE object matching the specified TCreateInfo (see page 18012) record.
	DestroyObject (see page 17941)	Destroys the container's OLE object.
	DoVerb (see page 17941)	Requests that the OLE object perform some action.
	GetIconMetaPict (see page 17942)	Returns the global memory handle of a metafile containing the OLE object's icon.
	InsertObjectDialog (see page 17943)	Displays the Insert Object OLE dialog box.
	LoadFromFile (see page 17944)	Loads an OLE object from the specified file.
	LoadFromStream (see page 17944)	Loads an OLE object from the specified stream.
	ObjectPropertiesDialog (see page 17945)	Displays the OLE Object Properties property sheet.
	Paste (see page 17946)	Pastes the contents of the Windows clipboard as an embedded object.
	PasteSpecialDialog (see page 17946)	Displays the Paste (see page 17946) Special OLE dialog box.
	Run (see page 17947)	Runs the OLE object's server application, but doesn't open or activate the OLE object itself.
	SaveAsDocument (see page 17948)	Saves the OLE object to the specified file in native OLE Document format.
	SaveToFile (see page 17948)	Saves the OLE object to the specified file.
	SaveToStream (see page 17949)	Saves the OLE object to the specified stream.
	UpdateObject (see page 17949)	Refreshes the OLE object.
	UpdateVerbs (see page 17949)	Refreshes the list of verbs the OLE object can respond to.

115.1.1.4.1 TOleContainer._AddRef Method

Called when an application uses a component interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

__AddRef is a basic implementation of the IInterface method, _AddRef.

Note: If the component is a wrapper for a COM object, __AddRef calls the _AddRef method of that COM object, and returns the resulting reference count.

In all other cases, __AddRef simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __AddRef to implement reference counting.

See Also

Invoke (see page 2781)

QueryInterface (see page 2784)

_Release (see page 2769)

ComObject (see page 2793)

_AddRef (see page 22397)

115.1.1.4.2 TOleContainer._Release Method

Called when an application releases a component interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

__Release is a basic implementation of the IInterface method, _Release.

__Release returns the resulting value of the reference count for the component's interface.

Note:

In all other cases, __Release simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __Release to implement reference counting.

See Also

Invoke (see page 2781)

QueryInterface (see page 2784)

_AddRef (see page 2769)

ComObject (see page 2793)

115.1.1.4.3 TOleContainer.Changed Method

Sends a CM_CHANGED message to the control.

Pascal

```
procedure Changed; dynamic;
```

C++

```
__fastcall Changed();
```

Description

Call Changed after changing the properties of the control in a way that affects the properties of a parent object. Changed sends a CM_CHANGED message back to the control. If the control is a windowed control, this message is bubbled up to the parent so that it can make any necessary adjustments.

See Also

Parent (see page 5832)

115.1.1.4.4 TOleContainer.ChangeIconDialog Method

Displays the Change Icon OLE dialog box.

Pascal

```
function ChangeIconDialog: Boolean;
```

C++

```
__fastcall Boolean ChangeIconDialog();
```

Description

Call ChangeIconDialog to let the user choose a different icon (from .ICO, .DLL, and .EXE files) to use when displaying the OLE object as an icon. An OLE object must already be loaded before calling ChangeIconDialog. ChangeIconDialog returns true if the

dialog box was successfully displayed and the user chose the OK button. ChangeIconDialog returns false otherwise.

See Also

Iconic (see page 17965)

ObjectPropertiesDialog (see page 17945)

115.1.1.4.5 TOleContainer.Close Method

Deactivates the OLE object.

Pascal

```
procedure Close;
```

C++

```
__fastcall Close();
```

Description

Call Close to deactivate the OLE object and terminate its server application, without removing it from the container. Any changes the user made to the OLE object are automatically saved. After calling Close, the container's State (see page 17977) property is osLoaded.

Note: If Close is called when no OLE object is loaded, TOleContainer (see page 17921) raises an exception.

See Also

OnDeactivate (see page 17981)

State (see page 17977)

115.1.1.4.6 TOleContainer.Copy Method

Copies the OLE object to the Windows clipboard.

Pascal

```
procedure Copy;
```

C++

```
__fastcall Copy();
```

Description

Call Copy to write the OLE object to the clipboard. If there is no OLE object in the container, Copy raises an exception.

See Also

Paste (see page 17946)

PasteSpecialDialog (see page 17946)

SaveToFile (see page 17948)

SaveToStream (see page 17949)

115.1.1.4.7 TOleContainer.CreateLinkToFile Method

Creates a linked OLE object from the contents of a file.

Pascal

```
procedure CreateLinkToFile(const FileName: string; Iconic: Boolean);
```

C++

```
__fastcall CreateLinkToFile(const AnsiString FileName, Boolean Iconic);
```

Description

Call CreateLinkToFile to create a linked OLE object from the file specified by the FileName parameter. Iconic (see page 17965) specifies whether the object is shown as an icon (true) or displayed as it would be in the server application (false). If there is already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

CreateObject (see page 17938)

CreateObjectFromFile (see page 17938)

CreateObjectFromInfo (see page 17939)

Creating Clients for Servers That Do Not Have a Type Library

115.1.1.4.8 TOleContainer.CreateObject Method

Creates an embedded OLE object given its class name (also known as programmatic identifier).

Pascal

```
procedure CreateObject(const OleClassName: string; Iconic: Boolean);
```

C++

```
__fastcall CreateObject(const AnsiString OleClassName, Boolean Iconic);
```

Description

Call CreateObject to create an OLE object using the class name (also known as programmatic identifier) specified by the OleClassName (see page 17967) parameter. The Iconic (see page 17965) parameter indicates whether the object is shown as an icon (true) or displayed as it would be in the server application (false). If there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

CreateLinkToFile (see page 17937)

CreateObjectFromFile (see page 17938)

CreateObjectFromInfo (see page 17939)

OleClassName (see page 17967)

Creating Clients for Servers That Do Not Have a Type Library

115.1.1.4.9 TOleContainer.CreateObjectFromFile Method

Creates an embedded OLE object from the contents of a file.

Pascal

```
procedure CreateObjectFromFile(const FileName: string; Iconic: Boolean);
```

C++

```
__fastcall CreateObjectFromFile(const AnsiString FileName, Boolean Iconic);
```

Description

Call CreateObjectFromFile to create an OLE object from the file specified by the FileName parameter. The Iconic (see page 17965) parameter indicates whether the object is shown as an icon (true) or displayed as it would be in the server application (false). If there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

CreateLinkToFile (see page 17937)

CreateObject (see page 17938)

CreateObjectFromInfo (see page 17939)

Creating Clients for Servers That Do Not Have a Type Library

115.1.1.4.10 TOleContainer.CreateObjectFromInfo Method

Creates an OLE object matching the specified TCreateInfo (see page 18012) record.

Pascal

```
procedure CreateObjectFromInfo(const CreateInfo: TCreateInfo);
```

C++

```
__fastcall CreateObjectFromInfo(const TCreateInfo CreateInfo);
```

Description

Call CreateObjectFromInfo to create a linked or embedded OLE object based on the specifications in the CreateInfo parameter. CreateInfo specifies whether the object should be created from a file, from a data transfer object, or from a class identifier, and provides the necessary supporting information. CreateInfo also indicates whether the OLE object should be displayed as an Icon, and allows the icon to be specified. If there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

Note: The CreateLinkToFile (see page 17937), CreateObject (see page 17938), and CreateObjectFromFile (see page 17938) methods are one-line calls for the most common types of OLE objects. They can be used instead of filling out the TCreateInfo (see page 18012) record.

See Also

CreateLinkToFile (see page 17937)

CreateObject (see page 17938)

CreateObjectFromFile (see page 17938)

Creating Clients for Servers That Do Not Have a Type Library

115.1.1.4.11 TOleContainer.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override

CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

115.1.1.4.12 TOleContainer.DblClick Method

OnDblClick event dispatcher.

Pascal

```
procedure DblClick; override;
```

C++

```
virtual __fastcall DblClick();
```

Description

DblClick calls any event handler attached to the OnDblClick event. Override DblClick to provide other responses in addition to the inherited event-handler call when the user double-clicks the control.

The DblClick method is triggered by left mouse-button double-click message (WM_LBUTTONDBLCLK) from Windows.

See Also

Click (see page 5743)

OnDblClick (see page 5854)

115.1.1.4.13 TOleContainer.DefineProperties Method

Provides methods to read and write the IsControl property to a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

DefineProperties is called automatically by the streaming system that loads and saves VCL components. It allows persistent objects to read and write properties that are not published. Published properties are loaded and stored automatically.

DefineProperties uses the methods of the filer passed as the Filer parameter to assign methods that can load and save the IsControl property.

Override DefineProperties to persist unpublished properties. Call the DefineBinaryProperty or DefineProperty method of the Filer parameter to assign methods that load or save property values.

Note: When overriding this method, call the parent class's DefineProperties method first.

See Also

DefineBinaryProperty (see page 2837)

DefineProperty (see page 2838)

DefineProperties (see page 2771)

IsControl (see page 5829)

115.1.1.4.14 TOleContainer.DestroyObject Method

Destroys the container's OLE object.

Pascal

```
procedure DestroyObject;
```

C++

```
__fastcall DestroyObject();
```

Description

Call DestroyObject to destroy the OLE object, discarding any unsaved changes the user made to it.

See Also

Close (see page 17937)

OleObject (see page 17967)

Creating Clients for Servers That Do Not Have a Type Library

115.1.1.4.15 TOleContainer.DoEnter Method

Respond to receiving input focus.

Pascal

```
procedure DoEnter; override;
```

C++

```
virtual __fastcall DoEnter();
```

Description

DoEnter is called automatically when the control receives the input focus. As implemented in TWinControl, DoEnter calls the OnEnter event handler, if defined.

Descendant classes that override DoEnter should always call the inherited method.

See Also

DoExit (see page 6144)

OnEnter (see page 6219)

115.1.1.4.16 TOleContainer.DoVerb Method

Requests that the OLE object perform some action.

Pascal

```
procedure DoVerb(Verb: Integer);
```

C++

```
__fastcall DoVerb(int Verb);
```

Description

Call DoVerb to request that the OLE object perform one of the actions listed by the ObjectVerbs (see page 17966) property. OLE defines several verbs, such as ovShow (see page 18019) (to display the OLE object) and ovPrimary (see page 18018) (the default action, usually to activate the OLE object). OLE objects can also define their own custom verbs. Use the ObjectVerbs (see page 17966) property to get a list of those custom verbs.

See Also

ObjectVerbs (see page 17966)

Creating Clients for Servers That Do Not Have a Type Library

115.1.1.4.17 TOleContainer.GetIconMetaPict Method

Returns the global memory handle of a metafile containing the OLE object's icon.

Pascal

```
function GetIconMetaPict: HGlobal;
```

C++

```
__fastcall HGlobal GetIconMetaPict();
```

Description

Call GetIconMetaPict to obtain a metafile handle for drawing the OLE object's icon on another canvas. Use the global DestroyMetaPict (see page 18011) procedure to destroy the handle. If the OLE container is empty, GetIconMetaPict raises an exception.

See Also

DestroyMetaPict (see page 18011)

TMetafile (see page 14549)

TMetafileCanvas (see page 14564)

115.1.1.4.18 TOleContainer.GetPopupMenu Method

Returns the pop-up menu associated with the control.

Pascal

```
function GetPopupMenu: TPopupMenu; override;
```

C++

```
virtual __fastcall TPopupMenu GetPopupMenu();
```

Description

Call GetPopupMenu to find the popup menu associated with the control. Override GetPopupMenu to change which popup menu is associated with the control or to specify different popup menus depending on the state of the control.

GetPopupMenu returns the value of the Popup property.

See Also

PopupMenu (see page 5835)

115.1.1.4.19 TOleContainer.InsertObjectDialog Method

Displays the Insert Object OLE dialog box.

Pascal

```
function InsertObjectDialog: Boolean;
```

C++

```
__fastcall Boolean InsertObjectDialog();
```

Description

Call InsertObjectDialog to let the user create an OLE object. The OLE object can be embedded or linked. InsertObjectDialog returns true if the dialog box was successfully displayed and the user chose the OK button. InsertObjectDialog returns false otherwise. If the user chose OK and there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

CreateObjectFromInfo (see page 17939)

ObjectPropertiesDialog (see page 17945)

PasteSpecialDialog (see page 17946)

115.1.1.4.20 TOleContainer.KeyDown Method

Respond to key press events.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

When a windowed control receives a key-down message (WM_KEYDOWN) from Windows, its message handler calls the DoKeyDown method. If DoKeyDown determines that the control should, in fact, process the character, it calls KeyDown, passing the key code and shift-key state in the Key and Shift parameters, respectively.

KeyDown calls any event handler attached to the OnKeyDown event. Override KeyDown to provide other responses in addition to the event-handler call.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use WinAPI virtual key codes to determine the key pressed. For more information, search for virtual key codes in the Win32 Developer's Reference (WIN32.HLP).

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

Either KeyDown or the OnKeyDown event handler it calls can suppress further processing of a key by setting the Key parameter to zero.

See Also

KeyUp (see page 6164)

OnKeyDown (see page 6225)

DoKeyDown (see page 6145)

DoKeyPress (see page 6146)

DoKeyUp (see page 6146)

115.1.1.4.21 TOleContainer.LoadFromFile Method

Loads an OLE object from the specified file.

Pascal

```
procedure LoadFromFile(const FileName: string);
```

C++

```
__fastcall LoadFromFile(const AnsiString FileName);
```

Description

Call LoadFromFile to load an OLE object that was saved using the SaveToFile (see page 17948) method. If OldStreamFormat (see page 17966) is true, LoadFromFile loads files saved by an TOleContainer (see page 17921) object as well as files saved using the current format; if OldStreamFormat (see page 17966) is false, LoadFromFile will not load files saved by the library. If there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

LoadFromStream (see page 17944)

OldStreamFormat (see page 17966)

SaveToFile (see page 17948)

115.1.1.4.22 TOleContainer.LoadFromStream Method

Loads an OLE object from the specified stream.

Pascal

```
procedure LoadFromStream(Stream: TStream);
```

C++

```
__fastcall LoadFromStream(TStream Stream);
```

Description

Call LoadFromStream to load an OLE object from a stream. If OldStreamFormat (see page 17966) is true, LoadFromStream loads OLE objects saved by a TOleContainer (see page 17921) object as well as OLE objects saved using the current format; if OldStreamFormat (see page 17966) is false, LoadFromStream will not load OLE objects saved by the library. If there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

LoadFromFile (see page 17944)

OldStreamFormat (see page 17966)

SaveToStream (see page 17949)

TStream (see page 2973)

115.1.1.4.23 TOleContainer.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove (see page 5773)

MouseUp (see page 5774)

OnMouseDown (see page 5862)

115.1.1.4.24 TOleContainer.ObjectPropertiesDialog Method

Displays the OLE Object Properties property sheet.

Pascal

```
function ObjectPropertiesDialog: Boolean;
```

C++

```
__fastcall Boolean ObjectPropertiesDialog();
```

Description

Call ObjectPropertiesDialog to let the user see and edit the properties of the OLE object. Any changes the user makes in the property sheet are automatically made to the OLE object. ObjectPropertiesDialog returns true if the property sheet was successfully displayed and the user chose the OK button. It returns false otherwise.

If the OLE container is empty, ObjectPropertiesDialog raises an exception.

See Also

DoVerb (see page 17941)

115.1.1.4.25 TOleContainer.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

See Also

Canvas (see page 5921)

PaintWindow (see page 5920)

GetDeviceContext (see page 6155)

ClipRect (see page 14486)

115.1.1.4.26 TOleContainer.Paste Method

Pastes the contents of the Windows clipboard as an embedded object.

Pascal

```
procedure Paste;
```

C++

```
__fastcall Paste();
```

Description

Call Paste to embed the object on the clipboard in the OLE container. If there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

CanPaste (see page 17957)

CreateObjectFromInfo (see page 17939)

PasteSpecialDialog (see page 17946)

115.1.1.4.27 TOleContainer.PasteSpecialDialog Method

Displays the Paste (see page 17946) Special OLE dialog box.

Pascal

```
function PasteSpecialDialog: Boolean;
```

C++

```
__fastcall Boolean PasteSpecialDialog();
```

Description

Call PasteSpecialDialog to let the user control how the contents of the Windows clipboard are pasted into the container. The

Paste (see page 17946) Special dialog box lets the user select the format of the data, whether it should be embedded or linked, and whether the OLE object should be displayed as an icon (and if so, to choose a different icon). PasteSpecialDialog returns true if the dialog box was successfully displayed and the user chose the OK button. It returns false otherwise. If the user chose the OK button when there's already an OLE object in the container, it is destroyed and any changes the user made to it are discarded.

See Also

CanPaste (see page 17957)

InsertObjectDialog (see page 17943)

Paste (see page 17946)

115.1.1.4.28 TOleContainer.QueryInterface Method

Returns a reference to a specified interface if the object supports that interface.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface checks whether the component supports the interface specified by IID, and if so, returns a reference to that interface as the Obj parameter. If the component does not support the interface, the Obj parameter returns nil (Delphi) or NULL (C++).

Note: For components that act as COM object wrapper, QueryInterface calls the QueryInterface method of the internal COM object.

See Also

_AddRef (see page 2769)

_Release (see page 2769)

QueryInterface

QueryInterface (see page 22398)

Invoke (see page 2781)

ComObject (see page 2793)

115.1.1.4.29 TOleContainer.Run Method

Runs the OLE object's server application, but doesn't open or activate the OLE object itself.

Pascal

```
procedure Run;
```

C++

```
__fastcall Run();
```

Description

Call Run to ensure that the server application is running. Once the server application is running, opening and activating the OLE object happens much more quickly. An OLE object must already be loaded in the container before calling Run, Otherwise, Run

raises an exception.

See Also

State (see page 17977)

115.1.1.4.30 TOleContainer.SaveAsDocument Method

Saves the OLE object to the specified file in native OLE Document format.

Pascal

```
procedure SaveAsDocument(const FileName: string);
```

C++

```
__fastcall SaveAsDocument(const AnsiString FileName);
```

Description

Call SaveAsDocument to save the OLE object in its native OLE Document format. An OLE object must already be loaded in the container before calling SaveAsDocument. Otherwise, SaveAsDocument raises an exception.

Note: Saving an OLE object to a file or a stream limits the ability of another application, such as Word, to open the file, even if it is saved with the correct extension. Saving to a file or a stream loses information necessary to open such a file. Use SaveAsDocument when needing to save files in a native OLE Document format.

See Also

SaveToFile (see page 17948)

SaveToStream (see page 17949)

115.1.1.4.31 TOleContainer.SaveToFile Method

Saves the OLE object to the specified file.

Pascal

```
procedure SaveToFile(const FileName: string);
```

C++

```
__fastcall SaveToFile(const AnsiString FileName);
```

Description

Call SaveToFile to save the OLE object. If CopyOnSave (see page 17961) is true, SaveToFile first creates a temporary OLE object that compresses redundant data, saving space in the file that is saved. If OldStreamFormat (see page 17966) is true, SaveToFile writes a file that can be read by a TOleContainer (see page 17921) component.

An OLE object must already be loaded in the container before calling SaveToFile. Otherwise, SaveToFile raises an exception.

See Also

Copy (see page 17937)

CopyOnSave (see page 17961)

LoadFromFile (see page 17944)

OldStreamFormat (see page 17966)

SaveToStream (see page 17949)

115.1.1.4.32 TOleContainer.SaveToStream Method

Saves the OLE object to the specified stream.

Pascal

```
procedure SaveToStream(Stream: TStream);
```

C++

```
__fastcall SaveToStream(TStream Stream);
```

Description

Call SaveToStream to save the OLE object. If CopyOnSave (see page 17961) is true, SaveToStream first creates a temporary OLE object that compresses redundant data, reducing the information that must be saved. If OldStreamFormat (see page 17966) is true, SaveToStream writes the object in a format that can be read by a TOleContainer (see page 17921) component.

An OLE object must already be loaded in the container before calling SaveToStream. Otherwise, SaveToStream raises an exception.

Copy (see page 17937)

CopyOnSave (see page 17961)

LoadFromStream (see page 17944)

OldStreamFormat (see page 17966)

SaveToFile (see page 17948)

115.1.1.4.33 TOleContainer.UpdateObject Method

Refreshes the OLE object.

Pascal

```
procedure UpdateObject;
```

C++

```
__fastcall UpdateObject();
```

Description

Linked (see page 17965) OLE objects and embedded objects that contain linked OLE objects get out of date when the source of the link is updated. UpdateObject rereads the source to ensure that the OLE object has current data. If there is no OLE object loaded in the container, UpdateObject has no effect.

See Also

Linked (see page 17965)

UpdateVerbs (see page 17949)

115.1.1.4.34 TOleContainer.UpdateVerbs Method

Refreshes the list of verbs the OLE object can respond to.

Pascal

```
procedure UpdateVerbs;
```

C++

```
__fastcall UpdateVerbs();
```

Description

TOleContainer (see page 17921) automatically calls UpdateVerbs when the ObjectVerbs (see page 17966) property is first read, but some OLE objects change their verbs when they perform some actions. The Media Clip OLE object, for example, changes its Play verb to Stop while running. Call UpdateVerbs to ensure that the list of verbs is appropriate to the state of the OLE object.

An OLE object must already be loaded in the container before calling UpdateVerbs. Otherwise, UpdateVerbs raises an exception.

AutoVerbMenu (see page 17956)

ObjectVerbs (see page 17966)

115.1.1.5 TOleContainer Properties

The properties of the TOleContainer class are listed here.

Public Properties

	Name	Description
R	CanPaste (see page 17957)	Indicates whether the Windows clipboard contains an OLE object that can be pasted into the OLE container.
R	Linked (see page 17965)	Indicates whether the OLE object is linked or embedded.
	Modified (see page 17965)	Indicates whether the OLE object has been modified.
R	NewInserted (see page 17966)	Indicates whether the OLE object was created rather than pasted in or created as a link to a file.
R	ObjectVerbs (see page 17966)	Lists the verbs that the OLE object supports.
R	OleClassName (see page 17967)	Specifies the class name of the OLE object.
R	OleObject (see page 17967)	Represents the OLE object hosted by the OLE container.
R	OleObjectInterface (see page 17968)	Provides access to the IOleObject interface for the OLE object.
R	PrimaryVerb (see page 17974)	Specifies the index of the primary (default) verb for the OLE object.
R	SourceDoc (see page 17977)	Specifies the name of the source document for a linked OLE object.
R	State (see page 17977)	Describes the state of the OLE object.
R	StorageInterface (see page 17977)	Provides access to the IStorage interface for the OLE object.

Published Properties

	Name	Description
	Align (see page 17951)	Determines how the control aligns within its container (parent control).
	AllowActiveDoc (see page 17954)	Specifies whether the OLE container supports the IOleDocumentSite interface.
	AllowInPlace (see page 17955)	Determines whether the OLE container allows in-place activation.
	Anchors (see page 17955)	Specifies how the control is anchored to its parent.
	AutoActivate (see page 17956)	Determines how the object in an OLE container is activated.
	AutoVerbMenu (see page 17956)	Determines whether the OLE container automatically creates a pop-up menu containing the OLE object's verbs.
	BorderStyle (see page 17957)	Determines whether a single line is drawn around the OLE container.
	Caption (see page 17957)	Specifies a text string that identifies the control to the user.
	Color (see page 17960)	Specifies the background color of the control.
	Constraints (see page 17961)	Specifies the size constraints for the control.
	CopyOnSave (see page 17961)	Determines whether the SaveToFile (see page 17948) and SaveToStream (see page 17949) methods first create a copy of the OLE object.
	Ctl3D (see page 17962)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

	DragCursor (see page 17962)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 17963)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 17964)	Controls whether the control responds to mouse, keyboard, and timer events.
	Iconic (see page 17965)	Determines whether the OLE object is displayed as an icon.
	OldStreamFormat (see page 17966)	Indicates whether the OLE object is loaded and saved using the VCL format.
	ParentColor (see page 17968)	Determines where a control looks for its color information.
	ParentCtl3D (see page 17969)	Determines where a component looks to determine if it should appear three dimensional.
	ParentShowHint (see page 17969)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 17969)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 17974)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	SizeMode (see page 17976)	Determines how the OLE object is sized in the OLE container.
	TabOrder (see page 17978)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 17978)	Determines if the user can tab to a control.
	Visible (see page 17979)	Determines whether the component appears onscreen.

115.1.1.5.1 TOleContainer.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
```

```
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
```

```
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

procedure TForm1.Button1Click(Sender: TObject);
var
  ProgressBar: TProgressBar;
begin
  ProgressBar := TProgressBar.Create(Self);
```

```
    with ProgressBar do
    begin
      Parent := Self;
      Align := alBottom;
    end;
  end;
  {
  This example dynamically creates a Page Control, then a
  series of Tab Sheets on the Page Control.
  }
  var
    PageControl1: TPageControl;
    pts: array[0..3] of TTabSheet;
  const
    TabTitles: array[0..3] of ShortString = ('Customer', 'Orders', 'Items', 'Parts' );

  procedure TForm1.FormCreate(Sender: TObject);
  const
    colorpalette: Array[0..11] of TColor = (
      clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia, clTeal,
      clNavy, clMaroon, clLime, clOlive, clPurple);
  var
    i: Integer;
  begin

Parent (see page 5832)

Anchors (see page 5802)

115.1.1.5.2 TOleContainer.AllowActiveDoc Property

Specifies whether the OLE container supports the IOleDocumentSite interface.

Pascal

```
property AllowActiveDoc: Boolean;
```

C++

```
__property Boolean AllowActiveDoc;
```

Description

Set AllowActiveDoc to true to specify that the OLE container can house an ActiveDoc (DocObject). Set AllowActiveDoc to false to limit the OLE container to hosting OLE controls that use the more usual interfaces such as IOleClientSite. ActiveDoc-enabled controls have a slightly different border. Set AllowActiveDoc to false to maintain a consistent appearance in forms that do not need to support the IOleDocumentSite interface.

See Also

AllowInPlace (see page 17955)

115.1.1.5.3 TOleContainer.AllowInPlace Property

Determines whether the OLE container allows in-place activation.

Pascal

```
property AllowInPlace: Boolean;
```

C++

```
__property Boolean AllowInPlace;
```

Description

Set AllowInPlace to specify what happens when the user activates the OLE object. If AllowInPlace is true and Iconic (see page 17965) is false, the OLE object is activated in place. If AllowInPlace is false, the OLE object is activated in a separate window. The default value is true.

See Also

AllowActiveDoc (see page 17954)

AutoActivate (see page 17956)

Iconic (see page 17965)

115.1.1.5.4 TOleContainer.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

115.1.1.5.5 TOleContainer.AutoActivate Property

Determines how the object in an OLE container is activated.

Pascal

```
property AutoActivate: TAutoActivate;
```

C++

```
__property TAutoActivate AutoActivate;
```

Description

Set AutoActivate to specify what actions activate the OLE object. AutoActivate takes one of the values in the following table:

Values	Meaning
aaManual	The OLE object must be activated programmatically by calling DoVerb (see page 17941) (ovShow (see page 18019)).
aaGetFocus	The OLE object is activated when the OLE container gets focus (by clicking on it with the mouse or pressing Tab to move the focus to it).
aaDoubleClick	(Default) The OLE object is activated by double-clicking it or pressing Enter while the container has the focus.

See Also

AllowActiveDoc (see page 17954)

DoVerb (see page 17941)

115.1.1.5.6 TOleContainer.AutoVerbMenu Property

Determines whether the OLE container automatically creates a pop-up menu containing the OLE object's verbs.

Pascal

```
property AutoVerbMenu: Boolean;
```

C++

```
__property Boolean AutoVerbMenu;
```

Description

Use AutoVerbMenu to specify whether the OLE object can replace the OLE container's popup menu. If AutoVerbMenu is true (the default), the OLE object replaces any existing PopupMenu (see page 17969) property. If AutoVerbMenu is false, no popup menu is automatically created.

See Also

DoVerb (see page 17941)

ObjectVerbs (see page 17966)

PopupMenu (see page 5835)

115.1.1.5.7 TOleContainer.BorderStyle Property

Determines whether a single line is drawn around the OLE container.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Set BorderStyle to specify whether the OLE container should be framed by a single line. These are the possible values:

Value	Meaning
bsNone	No visible border
bsSingle	Single-line border

See Also

Ctl3D (see page 6198)

115.1.1.5.8 TOleContainer.CanPaste Property

Indicates whether the Windows clipboard contains an OLE object that can be pasted into the OLE container.

Pascal

```
property CanPaste: Boolean;
```

C++

```
__property Boolean CanPaste;
```

Description

Read CanPaste before trying to paste or paste link an OLE object from the clipboard.

See Also

Paste (see page 17946)

PasteSpecialDialog (see page 17946)

115.1.1.5.9 TOleContainer.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of

character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
```

```
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
```

```
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

115.1.1.5.10 TOleContainer.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
```

```
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

115.1.1.5.11 TOleContainer.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

115.1.1.5.12 TOleContainer.CopyOnSave Property

Determines whether the SaveToFile (see page 17948) and SaveToStream (see page 17949) methods first create a copy of the OLE object.

Pascal

```
property CopyOnSave: Boolean;
```

C++

```
__property Boolean CopyOnSave;
```

Description

When CopyOnSave is true, the SaveToFile (see page 17948) and SaveToStream (see page 17949) methods create a

temporary OLE object, compressing redundant data to save space. This compressed copy is then saved to the file or stream. When CopyOnSave is false, the OLE object is saved directly to the file or stream without using a temporary copy to compress redundant information.

Set CopyOnSave to false when the container holds very large embedded objects and there might not be enough memory to make the temporary copy. The default value is true.

See Also

OleObject (see page 17967)

SaveToFile (see page 17948)

SaveToStream (see page 17949)

115.1.1.5.13 TOleContainer.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

115.1.1.5.14 TOleContainer.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

115.1.1.5.15 TOleContainer.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
```

```
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

115.1.1.5.16 TOleContainer.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

115.1.1.5.17 TOleContainer.Iconic Property

Determines whether the OLE object is displayed as an icon.

Pascal

```
property Iconic: Boolean;
```

C++

```
__property Boolean Iconic;
```

Description

Set Iconic to specify whether the OLE container displays the icon for the server application instead of the image of the object. If Iconic is true, the OLE object is displayed as an icon; if false, it's displayed as it would be in the server application.

See Also

GetIconMetaPict (see page 17942)

115.1.1.5.18 TOleContainer.Linked Property

Indicates whether the OLE object is linked or embedded.

Pascal

```
property Linked: Boolean;
```

C++

```
__property Boolean Linked;
```

Description

Read Linked to determine whether the OLE object is linked to the OLE server. If Linked is true, the OLE object is linked; if false, it's embedded. An OLE object must already be loaded in the container before accessing the Linked property.

See Also

UpdateObject (see page 17949)

115.1.1.5.19 TOleContainer.Modified Property

Indicates whether the OLE object has been modified.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

Use Modified to determine when the OLE object has been modified (including being deleted or replaced by another OLE object). To keep track of incremental changes, set Modified to false and later check it to see if the OLE object has been modified after since Modified was set to false. If there is no OLE object loaded into the container, Modified returns false.

See Also

OleObject (see page 17967)

115.1.1.5.20 TOleContainer.NewInserted Property

Indicates whether the OLE object was created rather than pasted in or created as a link to a file.

Pascal

```
property NewInserted: Boolean;
```

C++

```
__property Boolean NewInserted;
```

Description

Read NewInserted to determine whether the OLE object was newly created via a call to InsertObjectDialog (see page 17943). If there is no OLE object loaded into the container, NewInserted returns false. If NewInserted is true after a call to InsertObjectDialog (see page 17943), call DoVerb (see page 17941)(ovShow (see page 18019)) to let the user edit the object.

See Also

DoVerb (see page 17941)

InsertObjectDialog (see page 17943)

OleObject (see page 17967)

115.1.1.5.21 TOleContainer.ObjectVerbs Property

Lists the verbs that the OLE object supports.

Pascal

```
property ObjectVerbs: TStrings;
```

C++

```
__property TStrings ObjectVerbs;
```

Description

Read ObjectVerbs to determine the verbs that can be used with the OLE object. The verb names can have embedded ampersand (&) characters to indicate shortcut keys. An OLE object must already be loaded in the container before accessing the ObjectVerbs property.

See Also

AutoVerbMenu (see page 17956)

DoVerb (see page 17941)

PrimaryVerb (see page 17974)

TStrings (see page 3029)

115.1.1.5.22 TOleContainer.OldStreamFormat Property

Indicates whether the OLE object is loaded and saved using the VCL format.

Pascal

```
property OldStreamFormat: Boolean;
```

C++

```
__property Boolean OldStreamFormat;
```

Description

Set OldStreamFormat to true to read OLE objects that were saved to file using VCL or to save OLE objects that will be used by VCL. If OldStreamFormat is false (the default), the LoadFromFile (see page 17944), LoadFromStream (see page 17944), SaveToFile (see page 17948), and SaveToStream (see page 17949) methods use the newer format that contains extra header information. The extra header information is used to validate a file or stream. This property is provided for backward compatibility only.

See Also

LoadFromFile (see page 17944)

LoadFromStream (see page 17944)

SaveToFile (see page 17948)

SaveToStream (see page 17949)

115.1.1.5.23 TOleContainer.OleClassName Property

Specifies the class name of the OLE object.

Pascal

```
property OleClassName: string;
```

C++

```
__property AnsiString OleClassName;
```

Description

Read OleClassName to obtain the class name (programmatic identifier) for the OLE object. The class name is a string describing the class of OLE object that is registered in the Windows registry. An OLE object must already be loaded in the container before accessing the OleClassName property.

See Also

OleObject (see page 17967)

115.1.1.5.24 TOleContainer.OleObject Property

Represents the OLE object hosted by the OLE container.

Pascal

```
property OleObject: Variant;
```

C++

```
__property Variant OleObject;
```

Description

Read OleObject to access the OLE object hosted by the OLE container as a variant. To interact with the OLE object using the IOleObject interface, use the OleObjectInterface (see page 17968) property instead. If the OLE object is not loaded in the container before reading OleObject, an EOleError exception is raised.

See Also

EOleError (see page 5528)

OleObjectInterface (see page 17968)

115.1.1.5.25 TOleContainer.OleObjectInterface Property

Provides access to the IOleObject interface for the OLE object.

Pascal

```
property OleObjectInterface: IOleObject;
```

C++

```
__property IOleObject OleObjectInterface;
```

Description

Use OleObjectInterface for low-level access to the OLE API. If there is no OLE object loaded into the container, OleObjectInterface returns nil (Delphi) or NULL (C++).

See Also

OleObject (see page 17967)

Creating Clients for Servers That Do Not Have a Type Library

115.1.1.5.26 TOleContainer.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

115.1.1.5.27 TOleContainer.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

115.1.1.5.28 TOleContainer.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

115.1.1.5.29 TOleContainer.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
```

```
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
```

```
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
```

```
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

115.1.1.5.30 TOleContainer.PrimaryVerb Property

Specifies the index of the primary (default) verb for the OLE object.

Pascal

```
property PrimaryVerb: Integer;
```

C++

```
__property int PrimaryVerb;
```

Description

Use PrimaryVerb to determine which verb in the ObjectVerbs (see page 17966) list specifies the default action for the OLE object. In a call to the DoVerb (see page 17941) method, DoVerb (see page 17941)(ovPrimary (see page 18018)) is the same as DoVerb (see page 17941)(PrimaryVerb). An OLE object must already be loaded in the container before accessing the PrimaryVerb property.

See Also

DoVerb (see page 17941)

ObjectVerbs (see page 17966)

115.1.1.5.31 TOleContainer.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
```

```
    Edit1.Hint := 'Enter your name';
    Edit1.ShowHint := True;
    with ListBox1 do
    begin
      for I := 1 to 10 do
        Items.Add('Item ' + IntToStr(I));
      Hint := 'Select an item';
      ShowHint := True;
    end;
    Application.ShowHint := True;
  end;
  {
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  }
```

Displaying Fly-over Help

115.1.1.5.32 TOleContainer.SizeMode Property

Determines how the OLE object is sized in the OLE container.

Pascal

```
property SizeMode: TSizeMode;
```

C++

```
__property TSizeMode SizeMode;
```

Description

Set SizeMode to specify how the OLE object is fit into the client area of the OLE container. The following table gives the possible values :

Value	Meaning
smClip	(Default)- Displays the OLE object at its normal size, clipping any parts that don't fit within the container.
smCenter	Displays the OLE object at its normal size, centering it within the container.
smScale	Scales or shrinks the view of the OLE object to fit within the container, by scaling width and height proportionally.
smStretch	Scales or shrinks the view of the OLE object to fill the OLE container, without regard to preserving the proportions of the OLE object.
smAutoSize	Displays the OLE object at its normal size and automatically resizes the container to fit the size of the OLE object.

See Also

AllowInPlace (see page 17955)

ClientRect

115.1.1.5.33 TOleContainer.SourceDoc Property

Specifies the name of the source document for a linked OLE object.

Pascal

```
property SourceDoc: string;
```

C++

```
__property AnsiString SourceDoc;
```

Description

Read SourceDoc to obtain the name of the OLE object when it is linked. An OLE object must already be loaded in the container before accessing the SourceDoc property. If the OLE object isn't linked, SourceDoc returns an empty string.

See Also

Linked (see page 17965)

OleClassName (see page 17967)

115.1.1.5.34 TOleContainer.State Property

Describes the state of the OLE object.

Pascal

```
property State: TObjectState;
```

C++

```
__property TObjectState State;
```

Description

Read State to determine the state of the OLE object and its server application. State has one of the following values:

Values	Meaning
osEmpty	There is no OLE object in the container.
osLoaded	There is an OLE object in the container, but its server application isn't currently running.
osRunning	The OLE object's server is running.
osOpen	The OLE object is open in a separate window.
osInPlaceActive	The OLE object is activated in place, but hasn't yet merged its menus or toolbars. This is an intermediate state; the State property will shift to osUIActive as soon as the menus and toolbars have been merged.
osUIActive	The OLE object is activated in place and menus and toolbars have been merged

See Also

AllowInPlace (see page 17955)

Iconic (see page 17965)

115.1.1.5.35 TOleContainer.StorageInterface Property

Provides access to the IStorage interface for the OLE object.

Pascal

```
property StorageInterface: IStorage;
```

C++

```
__property IStorage StorageInterface;
```

Description

Use StorageInterface for low-level access to the OLE API. If there is no OLE object loaded into the container, StorageInterface returns nil (Delphi) or NULL (C++).

See Also

OleObjectInterface (see page 17968)

115.1.1.5.36 TOleContainer.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

115.1.1.5.37 TOleContainer.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

115.1.1.5.38 TOleContainer.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
```

```
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

115.1.1.6 TOleContainer Events

The events of the TOleContainer class are listed here.

Published Events

	Name	Description
	OnActivate (see page 17981)	Occurs immediately after the OLE object is activated.
	OnDeactivate (see page 17981)	Occurs immediately after the OLE object is deactivated.
	OnDragDrop (see page 17982)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 17984)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 17986)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

	OnEnter (see page 17987)	Occurs when a control receives the input focus.
	OnExit (see page 17990)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 17991)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 17994)	Occurs when a key is pressed.
	OnKeyUp (see page 17995)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 17997)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 17998)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 18000)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 18002)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnObjectMove (see page 18005)	Occurs when the OLE container is notified that the OLE object has moved or resized.
	OnResize (see page 18005)	Occurs immediately after the OLE container window is resized.
	OnStartDrag (see page 18005)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

115.1.1.6.1 TOleContainer.OnActivate Event

Occurs immediately after the OLE object is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to take specific action when the OLE object becomes active.

See Also

AutoActivate (see page 17956)

DoVerb (see page 17941)

OnDeactivate (see page 17981)

State (see page 17977)

115.1.1.6.2 TOleContainer.OnDeactivate Event

Occurs immediately after the OLE object is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to respond when the OLE object is deactivated.

See Also

Close (see page 17937)

OnActivate (see page 17981)

State (see page 17977)

115.1.1.6.3 TOleContainer.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
```

```
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

115.1.1.6.4 TOleContainer.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}
```

```
/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
```

```
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

115.1.1.6.5 TOleContainer.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
```

```
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

115.1.1.6.6 TOleContainer.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
```

```
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
```

```
begin
  Memo1.Color := clWindow;
end;
```

115.1.1.6.7 TOleContainer.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
```

```
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also

115.1.1.6.8 TOleContainer.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
```

```
  event to FormKeyUp.  Set the KeyPreview on the form to True.
  }
  var
    FormColor: TColor;
  procedure TForm1.FormCreate(Sender: TObject);
  begin
    KeyPreview := True;
    FormColor := Form1.Color;
  end;

  procedure TForm1.FormKeyDown(
    Sender: TObject; var Key: Word; Shift: TShiftState);
  begin
    if Key = VK_F1 then
    begin
      Form1.Color := clAqua;
      if (ComboBox1.Text = 'KeyDown') then
        ComboBox1.Text := 'KeyDown2'
      else
        ComboBox1.Text := 'KeyDown';
      WriteLn(ComboBox1.Text);
    end;
  end;

  procedure TForm1.FormKeyUp(
    Sender: TObject; var Key: Word; Shift: TShiftState);
  begin
    if Key = VK_F1 then
    begin
      Form1.Color := FormColor;
      if (ComboBox1.Text = 'KeyUp') then
        ComboBox1.Text := 'KeyUp2'
      else
        ComboBox1.Text := 'KeyUp';
      WriteLn(ComboBox1.Text);
    end;
  end;
  {
  The following code aborts a print job if the user presses
  Esc. Note that you should set KeyPreview to true to ensure
  that the OnKeyDown event handler of Form1 is called.
  }

  uses Printers;

  procedure TForm1.Button1Click(Sender: TObject);
  var
    I, X, Y: Integer;
    Memo1 : TMemo;
    r: TRect;
  begin
    Memo1 := TMemo.Create(Form1);
    Memo1.Parent := Form1;
    Memo1.Visible := True;
    Memo1.Width := 700;
    if (OpenDialog1.Execute) then
    begin
      Memo1.Lines.LoadFromFile(OpenDialog1.FileName);

      Printer.BeginDoc;
      X := 200;
      Y := 200;
      for I := 0 to 140 do
        if (not Printer.Aborted) then
        begin
          Printer.Canvas.TextOut(X, Y, Memo1.Lines[I]);
```

```
          Y := Y + 80;
          if (Y > (Printer.PageHeight - 300)) then
          begin
            Y := 200;
            Printer.NewPage;
            Sleep(1000);  // to give you time to abort!
          end;
        end;
      if (not Printer.Aborted) then Printer.EndDoc;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
     KeyPreview := True;
  end;

  procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word; Shift: TShiftState);
  begin
  if (Key=VK_ESCAPE) and Printer.Printing then
    begin
    Printer.Abort;
    MessageDlg('Printing aborted', mtInformation, [mbOK],0);
    end;
  end;
```

115.1.1.6.9 TOleContainer.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not

generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

115.1.1.6.10 TOleContainer.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form’s color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
```

```
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/

115.1.1.6.11 TOleContainer.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate

event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

115.1.1.6.12 TOleContainer.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
```

```
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its

115.1.1.6.13 TOleContainer.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
```

```
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
```

```
    StartX := X;
    StartY := Y;
  end;

  procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
  Integer);
  begin
    Form1.Canvas.Rectangle(StartX, StartY, X, Y);
    StatusBar1.Panels[0].Text := '';
    StatusBar1.Panels[1].Text := '';
    StatusBar1.Panels[2].Text := '';
    StatusBar1.Panels[3].Text := '';
  end;

  procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
  begin
    if ssLeft in Shift then { make sure button is down }
    begin
      if Y > StartY then
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

115.1.1.6.14 TOleContainer.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area

of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:

Responding to a Mouse-up Action

115.1.1.6.15 TOleContainer.OnObjectMove Event

Occurs when the OLE container is notified that the OLE object has moved or resized.

Pascal

```
property OnObjectMove: TObjectMoveEvent;
```

C++

```
__property TObjectMoveEvent OnObjectMove;
```

Description

Write an OnObjectMove event handler to respond when the OLE object changes size or position. The Bounds parameter specifies the boundaries of the in-place object in the client coordinates of OLE container. OnObjectMove occurs before the OLE object's image is updated to reflect the change.

See Also

OnResize (see page 18005)

115.1.1.6.16 TOleContainer.OnResize Event

Occurs immediately after the OLE container window is resized.

Pascal

```
property OnResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnResize;
```

Description

Write an OnResize event handler to respond to changes in the size of the OLE container window. If SizeMode (see page 17976) is smAutoSize, the container window changes size whenever the OLE object resizes.

See Also

OnObjectMove (see page 18005)

SizeMode (see page 17976)

115.1.1.6.17 TOleContainer.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

115.1.2 TOleForm Class

TOleForm is an object that provides OLE support for a TForm object.

Class Hierarchy

Pascal

```
TOleForm = class(TInterfacedObject, IOleForm, IOleWindow, IOleInPlaceUIWindow,
IOleInPlaceFrame, IVCLFrameForm);
```

C++

```
class TOleForm : public TInterfacedObject, public IOleForm, public IOleWindow, public
IOleInPlaceUIWindow, public IOleInPlaceFrame, public IVCLFrameForm;
```

File

OleCtnrs

Description

TOleForm implements the IOleForm, IOleWindow, IOleInPlaceUIWindow, and IOleInPlaceFrame interfaces, as well as an interface for internal use. The implementation of the TOleForm object is used internally by the Visual Component Library.

115.1.2.1 TOleForm Members

The following tables list the members exposed by TOleForm.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddContainer (see page 18010)	This is AddContainer, a member of class IVCLFrameForm.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearBorderSpace (see page 18010)	This is ClearBorderSpace, a member of class IVCLFrameForm.
	Create (see page 18008)	Create creates a new instance of the TOleForm (see page 18006) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18008)	Destroy frees the memory associated with this instance of the TOleForm (see page 18006) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Form (see page 18010)	This is Form, a member of class IVCLFrameForm.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	OnDestroy (see page 14340)	This is OnDestroy, a member of class IOleForm.
	OnResize (see page 14341)	This is OnResize, a member of class IOleForm.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RemoveContainer (see page 18010)	This is RemoveContainer, a member of class IVCLFrameForm.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

115.1.2.2 TOleForm.Create Constructor

Create creates a new instance of the TOleForm (see page 18006) object.

Pascal

```
constructor Create(Form: TCustomForm);
```

C++

```
__fastcall TOleForm(TCustomForm Form);
```

Description

Create is used to create a new instance of the TOleForm (see page 18006) object. Form (see page 18010) is the form upon which to base the new TOleForm (see page 18006) object.

See Also

Destroy (see page 18008)

115.1.2.3 TOleForm.Destroy Destructor

Destroy frees the memory associated with this instance of the TOleForm (see page 18006) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOleForm();
```

Description

Do not call Destroy directly. Instead, call Free, which calls Destroy if this instance of the TOleForm (see page 18006) object is not nil.

Destroy frees private objects allocated and used by this instance of the TOleForm (see page 18006) object.

See Also

Create (see page 18008)

115.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IVCLFrameForm (see page 18009)	This is class OleCtnrs.IVCLFrameForm.

115.2.1 IVCLFrameForm Interface

Class Hierarchy

Pascal

```
IVCLFrameForm = interface(IOleInPlaceFrame);
```

C++

```
__interface IVCLFrameForm : public IOleInPlaceFrame;
```

File

OleCtnrs

Description

This is class OleCtnrs.IVCLFrameForm.

115.2.1.1 IVCLFrameForm Members

The following tables list the members exposed by IVCLFrameForm.

Public Methods

	Name	Description
	AddContainer (see page 18010)	This is AddContainer, a member of class IVCLFrameForm.
	ClearBorderSpace (see page 18010)	This is ClearBorderSpace, a member of class IVCLFrameForm.
	Form (see page 18010)	This is Form, a member of class IVCLFrameForm.
	RemoveContainer (see page 18010)	This is RemoveContainer, a member of class IVCLFrameForm.

115.2.1.2 IVCLFrameForm Methods

The methods of the IVCLFrameForm class are listed here.

Public Methods

	Name	Description
	AddContainer (see page 18010)	This is AddContainer, a member of class IVCLFrameForm.
	ClearBorderSpace (see page 18010)	This is ClearBorderSpace, a member of class IVCLFrameForm.
	Form (see page 18010)	This is Form, a member of class IVCLFrameForm.

	RemoveContainer (see page 18010)	This is RemoveContainer, a member of class IVCLFrameForm.

115.2.1.2.1 IVCLFrameForm.AddContainer Method

Pascal

```
procedure AddContainer(Instance: TOleContainer);
```

C++

```
__fastcall AddContainer(TOleContainer Instance);
```

Description

This is AddContainer, a member of class IVCLFrameForm.

115.2.1.2.2 IVCLFrameForm.ClearBorderSpace Method

Pascal

```
procedure ClearBorderSpace;
```

C++

```
__fastcall ClearBorderSpace();
```

Description

This is ClearBorderSpace, a member of class IVCLFrameForm.

115.2.1.2.3 IVCLFrameForm.Form Method

Pascal

```
function Form: TCustomForm;
```

C++

```
__fastcall TCustomForm Form();
```

Description

This is Form, a member of class IVCLFrameForm.

115.2.1.2.4 IVCLFrameForm.RemoveContainer Method

Pascal

```
procedure RemoveContainer(Instance: TOleContainer);
```

C++

```
__fastcall RemoveContainer(TOleContainer Instance);
```

Description

This is RemoveContainer, a member of class IVCLFrameForm.

115.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DestroyMetaPict (see page 18011)	Frees a metafile resource given its handle.

115.3.1 OleCtnrs.DestroyMetaPict Function

Frees a metafile resource given its handle.

Pascal

```
procedure DestroyMetaPict(MetaPict: HGlobal);
```

C++

```
DestroyMetaPict(HGlobal MetaPict);
```

File

OleCtnrs

Description

Call DestroyMetaPict to free a metafile obtained using the GetIconMetaPict method of TOleContainer (see page 17921).

You do not need to use DestroyMetaPict to free metafiles represented using TMetafile. These are freed automatically when the TMetafile instance is destroyed. However, if you assign a new value to the Handle property of TMetafile, thereby replacing its old metafile, you must free the old metafile by calling DestroyMetaPict.

See Also

TOleContainer (see page 17921)

TMetafile

115.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAutoActivate (see page 18012)	This is record OleCtnrs.TAutoActivate.
	TCreateType (see page 18013)	This is record OleCtnrs.TCreateType.
