	TObjectState (see page 18013)	This is record OleCtnrs.TObjectState.
	TSizeMode (see page 18014)	This is record OleCtnrs.TSizeMode.

Records

	Name	Description
	TCreateInfo (see page 18012)	This is record OleCtnrs.TCreateInfo.
	TVerbInfo (see page 18014)	This is record OleCtnrs.TVerbInfo.

115.4.1 OleCtnrs.TAutoActivate Enumeration

Pascal

```
TAutoActivate = (
  aaManual,
  aaGetFocus,
  aaDoubleClick
);
```

C++

```
enum TAutoActivate {
  aaManual,
  aaGetFocus,
  aaDoubleClick
};
```

File

OleCtnrs

Description

This is record OleCtnrs.TAutoActivate.

115.4.2 OleCtnrs.TCreateInfo Record

Pascal

```
TCreateInfo = record
  CreateType: TCreateType;
  ShowAsIcon: Boolean;
  IconMetaPict: HGlobal;
  ClassID: TCLSID;
  FileName: WideString;
```

```
    DataObject: IDataObject;
  end;
```

C++

```
  struct TCreateInfo {
    TCreateType CreateType;
    Boolean ShowAsIcon;
    HGlobal IconMetaPict;
    TCLSID ClassID;
    BSTR FileName;
    IDataObject DataObject;
  };
```

File

OleCtnrs

Description

This is record OleCtnrs.TCreateInfo.

115.4.3 OleCtnrs.TCreateType Enumeration

Pascal

```
  TCreateType = (
    ctNewObject,
    ctFromFile,
    ctLinkToFile,
    ctFromData,
    ctLinkFromData
  );
```

C++

```
  enum TCreateType {
    ctNewObject,
    ctFromFile,
    ctLinkToFile,
    ctFromData,
    ctLinkFromData
  };
```

File

OleCtnrs

Description

This is record OleCtnrs.TCreateType.

115.4.4 OleCtnrs.TObjectState Enumeration

Pascal

```
  TObjectState = (
    osEmpty,
    osLoaded,
    osRunning,
    osOpen,
    osInPlaceActive,
```

```
    osUIActive
  );
```

C++

```
  enum TObjectState {
    osEmpty,
    osLoaded,
    osRunning,
    osOpen,
    osInPlaceActive,
    osUIActive
  };
```

File

OleCtnrs

Description

This is record OleCtnrs.TObjectState.

115.4.5 OleCtnrs.TSizeMode Enumeration

Pascal

```
  TSizeMode = (
    smClip,
    smCenter,
    smScale,
    smStretch,
    smAutoSize
  );
```

C++

```
  enum TSizeMode {
    smClip,
    smCenter,
    smScale,
    smStretch,
    smAutoSize
  };
```

File

OleCtnrs

Description

This is record OleCtnrs.TSizeMode.

115.4.6 OleCtnrs.TVerbInfo Record

Pascal

```
  TVerbInfo = packed record
    Verb: Smallint;
    Flags: Word;
  end;
```

C++

```
struct TVerbInfo {
  Smallint Verb;
  Word Flags;
};
```

File

OleCtnrs

Description

This is record OleCtnrs.TVerbInfo.

115.5 Types

The following table lists types in this documentation.

Types

Name	Description
TObjectMoveEvent (see page 18016)	This is type OleCtnrs.TObjectMoveEvent.

115.5.1 OleCtnrs.TObjectMoveEvent Type

Pascal

```
TObjectMoveEvent = procedure (OleContainer: TOleContainer; const Bounds: TRect) of object;
```

C++

```
(OleContainer: TOleContainer; const Bounds: TRect) ( TObjectMoveEvent)();
```

File

OleCtnrs

Description

This is type OleCtnrs.TObjectMoveEvent.

115.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
ovDiscardUndoState (see page 18017)	This is constant OleCtnrs.ovDiscardUndoState.
ovHide (see page 18017)	This is constant OleCtnrs.ovHide.
ovInPlaceActivate (see page 18018)	This is constant OleCtnrs.ovInPlaceActivate.
ovOpen (see page 18018)	This is constant OleCtnrs.ovOpen.
ovPrimary (see page 18018)	This is constant OleCtnrs.ovPrimary.
ovShow (see page 18019)	This is constant OleCtnrs.ovShow.
ovUIActivate (see page 18019)	This is constant OleCtnrs.ovUIActivate.

115.6.1 OleCtnrs.ovDiscardUndoState Constant

Pascal

```
ovDiscardUndoState = -6;
```

C++

```
ovDiscardUndoState = -6;
```

File

OleCtnrs

Description

This is constant OleCtnrs.ovDiscardUndoState.

115.6.2 OleCtnrs.ovHide Constant

Pascal

```
ovHide = -3;
```

C++

```
ovHide = -3;
```

File

OleCtnrs

Description

This is constant OleCtnrs.ovHide.

115.6.3 OleCtnrs.ovInPlaceActivate Constant

Pascal

```
ovInPlaceActivate = -5;
```

C++

```
ovInPlaceActivate = -5;
```

File

OleCtnrs

Description

This is constant OleCtnrs.ovInPlaceActivate.

115.6.4 OleCtnrs.ovOpen Constant

Pascal

```
ovOpen = -2;
```

C++

```
ovOpen = -2;
```

File

OleCtnrs

Description

This is constant OleCtnrs.ovOpen.

115.6.5 OleCtnrs.ovPrimary Constant

Pascal

```
ovPrimary = -65536;
```

C++

```
ovPrimary = -65536;
```

File

OleCtnrs

Description

This is constant OleCtnrs.ovPrimary.

115.6.6 OleCtnrs.ovShow Constant

Pascal

```
ovShow = -1;
```

C++

```
ovShow = -1;
```

File

OleCtnrs

Description

This is constant OleCtnrs.ovShow.

115.6.7 OleCtnrs.ovUIActivate Constant

Pascal

```
ovUIActivate = -4;
```

C++

```
ovUIActivate = -4;
```

File

OleCtnrs

Description

This is constant OleCtnrs.ovUIActivate.

116 OleCtrls Namespace

This is namespace OleCtrls.

Topics

Name	Description
Classes (see page 18023)	The following table lists classes in this documentation.
Functions (see page 18088)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 18090)	The following table lists structs, records, enums in this documentation.
Types (see page 18093)	The following table lists types in this documentation.
Variables (see page 18096)	The following table lists variables in this documentation.

Classes

	Name	Description
	EOleCtrlError (see page 18023)	EOleCtrlError is the exception class for ActiveX controls.
	TEnumPropDesc (see page 18023)	TEnumPropDesc provides the mapping between strings used to name the values of a property in an OLE control object and the values themselves.
	TEventDispatch (see page 18026)	This is class OleCtrls.TEventDispatch.
	TOleControl (see page 18030)	TOleControl is the base class from which ActiveX controls are derived.

Functions

	Name	Description
	FontToOleFont (see page 18088)	Returns a Variant containing an IFontDispatch interface that represents a TFont object.
	OleFontToFont (see page 18088)	Fills in a TFont structure to represent an IFontDispatch.

Structs, Records, Enums

	Name	Description
	TControlData (see page 18090)	This is record OleCtrls.TControlData.
	TControlData2 (see page 18091)	This is record OleCtrls.TControlData2.
	TEnumValue (see page 18091)	This is record OleCtrls.TEnumValue.

Types

Name	Description
PControlData (see page 18093)	This is type OleCtrls.PControlData.
PControlData2 (see page 18093)	This is type OleCtrls.PControlData2.
PEnumValueList (see page 18094)	This is type OleCtrls.PEnumValueList.
TEnumValueList (see page 18094)	This is type OleCtrls.TEnumValueList.

TOleEnum (see page 18094)	This is type OleCtrls.TOleEnum.
TServiceQuery (see page 18095)	This is type OleCtrls.TServiceQuery.

Variables

Name	Description
EmptyParam (see page 18096)	This is variable OleCtrls.EmptyParam.

116.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EOleCtrlError (see page 18023)	EOleCtrlError is the exception class for ActiveX controls.
	TEnumPropDesc (see page 18023)	TEnumPropDesc provides the mapping between strings used to name the values of a property in an OLE control object and the values themselves.
	TEventDispatch (see page 18026)	This is class OleCtrls.TEventDispatch.
	TOleControl (see page 18030)	TOleControl is the base class from which ActiveX controls are derived.

116.1.1 EOleCtrlError Class

EOleCtrlError is the exception class for ActiveX controls.

Class Hierarchy

System::TObject → SysUtils.Exception → OleCtrls.EOleCtrlError

Pascal

```
EOleCtrlError = class(Exception);
```

C++

```
class EOleCtrlError : public Exception;
```

File

OleCtrls

Description

EOleCtrlError is raised when an application cannot link to an ActiveX control.

See Also

EOleError (see page 5528)

116.1.2 TEnumPropDesc Class

TEnumPropDesc provides the mapping between strings used to name the values of a property in an OLE control object and the values themselves.

Class Hierarchy

OleCtrls.TEnumPropDesc

Pascal

```
TEnumPropDesc = class;
```

C++

```
class TEnumPropDesc;
```

File

OleCtrls

Description

Use TEnumPropDesc to interpret the strings used by an OLE control object to represent the values of one of its properties. TEnumPropDesc can provide a list of possible value strings to a callback function, or map between the string names of property values and the values themselves. TEnumPropDesc objects are made available through the GetEnumPropDesc method of an OLE control object.

See Also

TOleControl (see page 18030)

116.1.2.1 TEnumPropDesc Members

The following tables list the members exposed by TEnumPropDesc.

Public Methods

	Name	Description
	Create (see page 18024)	Creates an instance of TEnumPropDesc (see page 18023).
	Destroy (see page 18025)	Destroys an instance of TEnumPropDesc (see page 18023).
	GetStrings (see page 18025)	Calls the callback Proc for each property value string.
	StringToValue (see page 18026)	Maps a string representation of the property value to the integer value.
	ValueToString (see page 18026)	Maps an integer that indicates the value of the property to the string representation of that value used by the OLE control object.

116.1.2.2 TEnumPropDesc.Create Constructor

Creates an instance of TEnumPropDesc (see page 18023).

Pascal

```
constructor Create(DispID: Integer; ValueCount: Integer; const TypeInfo: ITypeInfo);
```

C++

```
__fastcall TEnumPropDesc(int DispID, int ValueCount, const ITypeInfo TypeInfo);
```

Description

Create is called by an OLE control object to create an instance of TEnumPropDesc (see page 18023) to represent the values of one of its properties. Applications should not need to create instances of TEnumPropDesc (see page 18023). When working with OLE properties, get the TEnumPropDesc (see page 18023) objects from the OLE control object.

DispID identifies the property of the OLE object, ValueCount is the number of distinct values the property can take TypeInfo is an ITypeInfo object that the constructor can use to capture the values and their strings.

See Also

GetEnumPropDesc (see page 18054)

116.1.2.3 TEnumPropDesc.Destroy Destructor

Destroys an instance of TEnumPropDesc (see page 18023).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TEnumPropDesc();
```

Description

Do not call Destroy directly in an application. The TOleControl (see page 18030) object that owns the TEnumPropDesc (see page 18023) object will destroy it automatically.

Destroy frees the internal list used to map value strings to property values.

See Also

TOleControl (see page 18030)

Free (see page 22300)

116.1.2.4 TEnumPropDesc Methods

The methods of the TEnumPropDesc class are listed here.

Public Methods

	Name	Description
	GetStrings (see page 18025)	Calls the callback Proc for each property value string.
	StringToValue (see page 18026)	Maps a string representation of the property value to the integer value.
	ValueToString (see page 18026)	Maps an integer that indicates the value of the property to the string representation of that value used by the OLE control object.

116.1.2.4.1 TEnumPropDesc.GetStrings Method

Calls the callback Proc for each property value string.

Pascal

```
procedure GetStrings(Proc: TGetStrProc);
```

C++

```
__fastcall GetStrings(TGetStrProc Proc);
```

Description

Use GetStrings to execute code for every property value string represented in the TEnumPropDesc (see page 18023) object. The callback Proc is called for every value, with the S parameter set to a string that gives the integer value followed by the string representation of that value.

For example, consider a TEnumPropDesc (see page 18023) object that represents a color property, with values equal to TColor values. The callback Proc would be called for every built-in color name with strings of the form '255 - clRed'.

See Also

StringToValue (see page 18026)

ValueToString (see page 18026)

116.1.2.4.2 TEnumPropDesc.StringToValue Method

Maps a string representation of the property value to the integer value.

Pascal

```
function StringToValue(const S: string): Integer;
```

C++

```
__fastcall int StringToValue(const AnsiString S);
```

Description

Use StringToValue to map the string representation of a property value used by an OLE control object to an integer value that is a more accurate representation of the property value. If the property value is not an integer, the integer associated with the string can be a pointer to the value.

See Also

ValueToString (see page 18026)

116.1.2.4.3 TEnumPropDesc.ValueToString Method

Maps an integer that indicates the value of the property to the string representation of that value used by the OLE control object.

Pascal

```
function ValueToString(V: Integer): string;
```

C++

```
__fastcall AnsiString ValueToString(int V);
```

Description

Use ValueToString to map the integer value of a property value to the string representation used by an OLE control object. If the property value is not an integer, the integer associated with the string can be a pointer to the value.

See Also

StringToValue (see page 18026)

116.1.3 TEventDispatch Class

Class Hierarchy

Pascal

```
TEventDispatch = class(TObject, IUnknown, IDispatch);
```

C++

```
class TEventDispatch : public TObject, public IUnknown, public IDispatch;
```

File

OleCtrls

Description

This is class OleCtrls.TEventDispatch.

116.1.3.1 TEventDispatch Members

The following tables list the members exposed by TEventDispatch.

Protected Methods

	Name	Description
	_AddRef (see page 18028)	This is _AddRef, a member of class TEventDispatch.
	_Release (see page 18028)	This is _Release, a member of class TEventDispatch.
	GetIDsOfNames (see page 18029)	This is GetIDsOfNames, a member of class TEventDispatch.
	GetTypeInfo (see page 18029)	This is GetTypeInfo, a member of class TEventDispatch.
	GetTypeInfoCount (see page 18029)	This is GetTypeInfoCount, a member of class TEventDispatch.
V	Invoke (see page 18029)	This is Invoke, a member of class TEventDispatch.
	QueryInterface (see page 18030)	This is QueryInterface, a member of class TEventDispatch.

Protected Properties

	Name	Description
R	Control (see page 18030)	This is Control, a member of class TEventDispatch.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18028)	This is Create, a member of class TEventDispatch.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

116.1.3.2 TEventDispatch.Create Constructor

Pascal

```
constructor Create(Control: TOleControl);
```

C++

```
__fastcall TEventDispatch(TOleControl Control);
```

Description

This is Create, a member of class TEventDispatch.

116.1.3.3 TEventDispatch Methods

The methods of the TEventDispatch class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 18028)	This is _AddRef, a member of class TEventDispatch.
	_Release (see page 18028)	This is _Release, a member of class TEventDispatch.
	GetIDsOfNames (see page 18029)	This is GetIDsOfNames, a member of class TEventDispatch.
	GetTypeInfo (see page 18029)	This is GetTypeInfo, a member of class TEventDispatch.
	GetTypeInfoCount (see page 18029)	This is GetTypeInfoCount, a member of class TEventDispatch.
	Invoke (see page 18029)	This is Invoke, a member of class TEventDispatch.
	QueryInterface (see page 18030)	This is QueryInterface, a member of class TEventDispatch.

116.1.3.3.1 TEventDispatch._AddRef Method

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

This is _AddRef, a member of class TEventDispatch.

116.1.3.3.2 TEventDispatch._Release Method

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

This is _Release, a member of class TEventDispatch.

116.1.3.3.3 TEventDispatch.GetIDsOfNames Method

Pascal

```
function GetIDsOfNames(const IID: TGUID; Names: Pointer; NameCount: Integer; LocaleID:
Integer; DispIDs: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetIDsOfNames(const TGUID IID, void * Names, int NameCount, int
LocaleID, void * DispIDs);
```

Description

This is GetIDsOfNames, a member of class TEventDispatch.

116.1.3.3.4 TEventDispatch.GetTypeInfo Method

Pascal

```
function GetTypeInfo(Index: Integer; LocaleID: Integer; out TypeInfo): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfo(int Index, int LocaleID,  TypeInfo);
```

Description

This is GetTypeInfo, a member of class TEventDispatch.

116.1.3.3.5 TEventDispatch.GetTypeInfoCount Method

Pascal

```
function GetTypeInfoCount(out Count: Integer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfoCount(int Count);
```

Description

This is GetTypeInfoCount, a member of class TEventDispatch.

116.1.3.3.6 TEventDispatch.Invoke Method

Pascal

```
function Invoke(DispID: Integer; const IID: TGUID; LocaleID: Integer; Flags: Word; var Params;
VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT Invoke(int DispID, const TGUID IID, int LocaleID, Word
Flags,  Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

This is Invoke, a member of class TEventDispatch.

116.1.3.3.7 TEventDispatch.QueryInterface Method

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

This is QueryInterface, a member of class TEventDispatch.

116.1.3.4 TEventDispatch Properties

The properties of the TEventDispatch class are listed here.

Protected Properties

	Name	Description
	Control (see page 18030)	This is Control, a member of class TEventDispatch.

116.1.3.4.1 TEventDispatch.Control Property

Pascal

```
property Control: TOleControl;
```

C++

```
__property TOleControl Control;
```

Description

This is Control, a member of class TEventDispatch.

116.1.4 TOleControl Class

TOleControl is the base class from which ActiveX controls are derived.

Class Hierarchy

Pascal

```
TOleControl = class(TWinControl, IUnknown, IOleClientSite, IOleControlSite, IOleInPlaceSite,
IOleInPlaceFrame, IDispatch, IPropertyNotifySink, ISimpleFrameSite, IServiceProvider);
```

C++

```
class TOleControl : public TWinControl, public IUnknown, public IOleClientSite, public
IOleControlSite, public IOleInPlaceSite, public IOleInPlaceFrame, public IDispatch, public
IPropertyNotifySink, public ISimpleFrameSite, public IServiceProvider;
```

File

OleCtrls

Description

TOleControl is derived from TWinControl and handles the interactions with COM necessary for using ActiveX controls. Most application do not need to explicitly derive a component from this class.

See Also

TOleContainer (see page 17921)

Code Generated When You Import Type Library Information

Using Component Wrappers

116.1.4.1 TOleControl Members

The following tables list the members exposed by TOleControl.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.

	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 18046)	Called when an application uses a component interface.
	_Release (see page 18047)	Called when an application releases a component interface.
	_SetColorProp (see page 18047)	This is _SetColorProp, a member of class TOleControl.
	_SetTColorProp (see page 18048)	This is _SetTColorProp, a member of class TOleControl.
	_SetTFontProp (see page 18048)	This is _SetTFontProp, a member of class TOleControl.
	_SetTOleEnumProp (see page 18048)	This is _SetTOleEnumProp, a member of class TOleControl.
	_SetTPictureProp (see page 18048)	This is _SetTPictureProp, a member of class TOleControl.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.

	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanInPlaceActivate (see page 18049)	This is CanInPlaceActivate, a member of class TOleControl.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ContextSensitiveHelp (see page 18049)	This is ContextSensitiveHelp, a member of class TOleControl.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 18049)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DeactivateAndUndo (see page 18050)	This is DeactivateAndUndo, a member of class TOleControl.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 18050)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 18051)	Destroys the window created in the CreateWindowHandle method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DiscardUndoState (see page 18051)	This is DiscardUndoState, a member of class TOleControl.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.

	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EnableModeless (see page 18052)	This is EnableModeless, a member of class TOleControl.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetBorder (see page 18052)	This is GetBorder, a member of class TOleControl.
	GetByteProp (see page 18052)	This is GetByteProp, a member of class TOleControl.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetColorProp (see page 18053)	This is GetColorProp, a member of class TOleControl.
	GetCompProp (see page 18053)	This is GetCompProp, a member of class TOleControl.
	GetContainer (see page 18053)	This is GetContainer, a member of class TOleControl.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetCurrencyProp (see page 18053)	This is GetCurrencyProp, a member of class TOleControl.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDoubleProp (see page 18053)	This is GetDoubleProp, a member of class TOleControl.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetExtendedControl (see page 18054)	This is GetExtendedControl, a member of class TOleControl.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDispatchProp (see page 18055)	This is GetIDispatchProp, a member of class TOleControl.
	GetIDsOfNames (see page 18055)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIntegerProp (see page 18055)	This is GetIntegerProp, a member of class TOleControl.
	GetIUnknownProp (see page 18055)	This is GetIUnknownProp, a member of class TOleControl.
	GetMoniker (see page 18056)	This is GetMoniker, a member of class TOleControl.
	GetOleBoolProp (see page 18056)	This is GetOleBoolProp, a member of class TOleControl.
	GetOleDateProp (see page 18056)	This is GetOleDateProp, a member of class TOleControl.
	GetOleEnumProp (see page 18057)	This is GetOleEnumProp, a member of class TOleControl.
	GetOleVariantProp (see page 18057)	This is GetOleVariantProp, a member of class TOleControl.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.

	GetProperty (see page 18058)	This is GetProperty, a member of class TOleControl.
	GetShortIntProp (see page 18058)	This is GetShortIntProp, a member of class TOleControl.
	GetSingleProp (see page 18058)	This is GetSingleProp, a member of class TOleControl.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetSmallintProp (see page 18058)	This is GetSmallintProp, a member of class TOleControl.
	GetStringProp (see page 18059)	This is GetStringProp, a member of class TOleControl.
	GetTColorProp (see page 18059)	This is GetTColorProp, a member of class TOleControl.
	GetTDateTimeProp (see page 18059)	This is GetTDateTimeProp, a member of class TOleControl.
	GetTFontProp (see page 18059)	This is GetTFontProp, a member of class TOleControl.
	GetTOleEnumProp (see page 18059)	This is GetTOleEnumProp, a member of class TOleControl.
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTPictureProp (see page 18060)	This is GetTPictureProp, a member of class TOleControl.
	GetTypeInfo (see page 18060)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 18060)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariantProp (see page 18061)	This is GetVariantProp, a member of class TOleControl.
	GetWideStringProp (see page 18061)	This is GetWideStringProp, a member of class TOleControl.
	GetWindowContext (see page 18061)	This is GetWindowContext, a member of class TOleControl.
	GetWordBoolProp (see page 18061)	This is GetWordBoolProp, a member of class TOleControl.
	GetWordProp (see page 18062)	This is GetWordProp, a member of class TOleControl.
A	InitControlData (see page 18062)	This is InitControlData, a member of class TOleControl.
V	InitControlInterface (see page 18062)	This is InitControlInterface, a member of class TOleControl.
	InsertMenus (see page 18062)	This is InsertMenus, a member of class TOleControl.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 18062)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	InvokeEvent (see page 18063)	This is InvokeEvent, a member of class TOleControl.
	InvokeMethod (see page 18063)	This is InvokeMethod, a member of class TOleControl.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	LockInPlaceActive (see page 18064)	This is LockInPlaceActive, a member of class TOleControl.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	OleControlSite_TranslateAccelerator (see page 18064)	This is OleControlSite_TranslateAccelerator, a member of class TOleControl.
	OleInPlaceFrame_GetWindow (see page 18064)	This is OleInPlaceFrame_GetWindow, a member of class TOleControl.
	OleInPlaceFrame_TranslateAccelerator (see page 18065)	This is OleInPlaceFrame_TranslateAccelerator, a member of class TOleControl.
	OleInPlaceSite_GetWindow (see page 18065)	This is OleInPlaceSite_GetWindow, a member of class TOleControl.
V	OnChanged (see page 18065)	This is OnChanged, a member of class TOleControl.
	OnControlInfoChanged (see page 18065)	This is OnControlInfoChanged, a member of class TOleControl.
	OnFocus (see page 18066)	This is OnFocus, a member of class TOleControl.
	OnInPlaceActivate (see page 18066)	This is OnInPlaceActivate, a member of class TOleControl.

	OnInPlaceDeactivate (see page 18066)	This is OnInPlaceDeactivate, a member of class TOleControl.
	OnPosRectChange (see page 18066)	This is OnPosRectChange, a member of class TOleControl.
V	OnRequestEdit (see page 18066)	This is OnRequestEdit, a member of class TOleControl.
	OnShowWindow (see page 18067)	This is OnShowWindow, a member of class TOleControl.
	OnUIActivate (see page 18067)	This is OnUIActivate, a member of class TOleControl.
	OnUIDeactivate (see page 18067)	This is OnUIDeactivate, a member of class TOleControl.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
V	PaletteChanged (see page 18067)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PictureChanged (see page 18068)	This is PictureChanged, a member of class TOleControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	PostMessageFilter (see page 18068)	This is PostMessageFilter, a member of class TOleControl.
	PreMessageFilter (see page 18069)	This is PreMessageFilter, a member of class TOleControl.
V	QueryInterface (see page 18069)	Returns a reference to a specified interface if the object supports that interface.
	QueryService (see page 18069)	This is QueryService, a member of class TOleControl.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveMenus (see page 18070)	This is RemoveMenus, a member of class TOleControl.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	RequestBorderSpace (see page 18070)	This is RequestBorderSpace, a member of class TOleControl.
	RequestNewObjectLayout (see page 18070)	This is RequestNewObjectLayout, a member of class TOleControl.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	SaveObject (see page 18070)	This is SaveObject, a member of class TOleControl.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Scroll (see page 18070)	This is Scroll, a member of class TOleControl.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActiveObject (see page 18071)	This is SetActiveObject, a member of class TOleControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetBorderSpace (see page 18071)	This is SetBorderSpace, a member of class TOleControl.
	SetByteProp (see page 18071)	This is SetByteProp, a member of class TOleControl.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetColorProp (see page 18072)	This is SetColorProp, a member of class TOleControl.
	SetCompProp (see page 18072)	This is SetCompProp, a member of class TOleControl.
	SetCurrencyProp (see page 18072)	This is SetCurrencyProp, a member of class TOleControl.

	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDoubleProp (see page 18072)	This is SetDoubleProp, a member of class TOleControl.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIDispatchProp (see page 18073)	This is SetIDispatchProp, a member of class TOleControl.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetIntegerProp (see page 18073)	This is SetIntegerProp, a member of class TOleControl.
	SetIUnknownProp (see page 18073)	This is SetIUnknownProp, a member of class TOleControl.
	SetMenu (see page 18073)	This is SetMenu, a member of class TOleControl.
V	SetName (see page 18073)	Sets the name of the control.
	SetOleBoolProp (see page 18074)	This is SetOleBoolProp, a member of class TOleControl.
	SetOleDateProp (see page 18074)	This is SetOleDateProp, a member of class TOleControl.
	SetOleEnumProp (see page 18074)	This is SetOleEnumProp, a member of class TOleControl.
	SetOleVariantProp (see page 18075)	This is SetOleVariantProp, a member of class TOleControl.
V	SetParent (see page 18075)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetProperty (see page 18076)	This is SetProperty, a member of class TOleControl.
	SetShortIntProp (see page 18076)	This is SetShortIntProp, a member of class TOleControl.
	SetSingleProp (see page 18076)	This is SetSingleProp, a member of class TOleControl.
	SetSmallintProp (see page 18076)	This is SetSmallintProp, a member of class TOleControl.
	SetStatusText (see page 18077)	This is SetStatusText, a member of class TOleControl.
	SetStringProp (see page 18077)	This is SetStringProp, a member of class TOleControl.
	SetTColorProp (see page 18077)	This is SetTColorProp, a member of class TOleControl.
	SetTDateTimeProp (see page 18077)	This is SetTDateTimeProp, a member of class TOleControl.
	SetTFontProp (see page 18077)	This is SetTFontProp, a member of class TOleControl.
	SetTOleEnumProp (see page 18078)	This is SetTOleEnumProp, a member of class TOleControl.
	SetTPictureProp (see page 18078)	This is SetTPictureProp, a member of class TOleControl.
	SetVariantProp (see page 18078)	This is SetVariantProp, a member of class TOleControl.
	SetWideStringProp (see page 18078)	This is SetWideStringProp, a member of class TOleControl.
	SetWordBoolProp (see page 18079)	This is SetWordBoolProp, a member of class TOleControl.
	SetWordProp (see page 18079)	This is SetWordProp, a member of class TOleControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	ShowObject (see page 18079)	This is ShowObject, a member of class TOleControl.
	ShowPropertyFrame (see page 18079)	This is ShowPropertyFrame, a member of class TOleControl.
V	StandardEvent (see page 18080)	This is StandardEvent, a member of class TOleControl.
V	SuppressException (see page 18080)	This is SuppressException, a member of class TOleControl.
	TransformCoords (see page 18080)	This is TransformCoords, a member of class TOleControl.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 18080)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	ControlData (see page 18086)	This is ControlData, a member of class TOleControl.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.

	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	ServiceQuery (see page 18087)	This is ServiceQuery, a member of class TOleControl.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	BrowseProperties (see page 18048)	Notifies the ActiveX control to display its Properties dialog box.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 18043)	Creates a new instance of TOleControl (see page 18030).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 18050)	Handles all otherwise-unhandled messages.
	Destroy (see page 18043)	Frees the memory associated with this instance of TOleControl (see page 18030).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DoObjectVerb (see page 18051)	Notifies the ActiveX control to perform one of its actions.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.

	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetEnumPropDesc (see page 18054)	Returns descriptions of the ActiveX control's properties.
	GetHelpContext (see page 18054)	Retrieves the Help context of a member of the ActiveX control.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetObjectVerbs (see page 18056)	Retrieves the names of the verbs implemented by the ActiveX control.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetPropDisplayString (see page 18057)	Returns the display string for an interface for the ActiveX control.
	GetPropDisplayStrings (see page 18057)	Returns the display strings for an interface for the ActiveX control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsCustomProperty (see page 18063)	Indicates whether an interface for the ActiveX control is a custom property.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsPropPageProperty (see page 18064)	Indicates whether an interface for the OCX control is a property page property.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.

	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 18071)	Sets the boundaries of the ActiveX control.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetPropDisplayString (see page 18075)	Sets the display string for an interface for the ActiveX control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	ShowAboutBox (see page 18079)	Notifies the ActiveX control to display its About box.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 18085)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
R	DefaultDispatch (see page 18086)	The default dispatch interface.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	OleObject (see page 18086)	The ActiveX control associated with the TOleControl (see page 18030) object.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	PerPropBrowsing (see page 18086)	Provides access to information about the property page properties of the OleControl.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 18087)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

116.1.4.2 TOleControl.Create Constructor

Creates a new instance of TOleControl (see page 18030).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TOleControl(TComponent * AOwner);
```

Description

Use Create to create a new instance of the TOleControl (see page 18030) object. Create calls the inherited Create method and creates and initializes internal objects.

See Also

Destroy (see page 18043)

Create (see page 6123)

116.1.4.3 TOleControl.Destroy Destructor

Frees the memory associated with this instance of TOleControl (see page 18030).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOleControl();
```

Description

Do not call Destroy. Instead, call Free, which calls Destroy if this instance of TOleControl (see page 18030) is not nil.

See Also

Create (see page 18043)

Free (see page 22300)

116.1.4.4 TOleControl Methods

The methods of the TOleControl class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 18046)	Called when an application uses a component interface.
	_Release (see page 18047)	Called when an application releases a component interface.
	_SetColorProp (see page 18047)	This is _SetColorProp, a member of class TOleControl.
	_SetTColorProp (see page 18048)	This is _SetTColorProp, a member of class TOleControl.
	_SetTFontProp (see page 18048)	This is _SetTFontProp, a member of class TOleControl.
	_SetTOleEnumProp (see page 18048)	This is _SetTOleEnumProp, a member of class TOleControl.
	_SetTPictureProp (see page 18048)	This is _SetTPictureProp, a member of class TOleControl.
	CanInPlaceActivate (see page 18049)	This is CanInPlaceActivate, a member of class TOleControl.
	ContextSensitiveHelp (see page 18049)	This is ContextSensitiveHelp, a member of class TOleControl.
V	CreateWnd (see page 18049)	Creates the underlying window.
	DeactivateAndUndo (see page 18050)	This is DeactivateAndUndo, a member of class TOleControl.
V	DefineProperties (see page 18050)	Provides methods to read and write the IsControl property to a stream such as a form file.
V	DestroyWindowHandle (see page 18051)	Destroys the window created in the CreateWindowHandle method.
	DiscardUndoState (see page 18051)	This is DiscardUndoState, a member of class TOleControl.
	EnableModeless (see page 18052)	This is EnableModeless, a member of class TOleControl.
	GetBorder (see page 18052)	This is GetBorder, a member of class TOleControl.
	GetByteProp (see page 18052)	This is GetByteProp, a member of class TOleControl.
	GetColorProp (see page 18053)	This is GetColorProp, a member of class TOleControl.
	GetCompProp (see page 18053)	This is GetCompProp, a member of class TOleControl.
	GetContainer (see page 18053)	This is GetContainer, a member of class TOleControl.
	GetCurrencyProp (see page 18053)	This is GetCurrencyProp, a member of class TOleControl.
	GetDoubleProp (see page 18053)	This is GetDoubleProp, a member of class TOleControl.
	GetExtendedControl (see page 18054)	This is GetExtendedControl, a member of class TOleControl.
	GetIDispatchProp (see page 18055)	This is GetIDispatchProp, a member of class TOleControl.
	GetIDsOfNames (see page 18055)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIntegerProp (see page 18055)	This is GetIntegerProp, a member of class TOleControl.
	GetIUnknownProp (see page 18055)	This is GetIUnknownProp, a member of class TOleControl.
	GetMoniker (see page 18056)	This is GetMoniker, a member of class TOleControl.
	GetOleBoolProp (see page 18056)	This is GetOleBoolProp, a member of class TOleControl.
	GetOleDateProp (see page 18056)	This is GetOleDateProp, a member of class TOleControl.
	GetOleEnumProp (see page 18057)	This is GetOleEnumProp, a member of class TOleControl.
	GetOleVariantProp (see page 18057)	This is GetOleVariantProp, a member of class TOleControl.
	GetProperty (see page 18058)	This is GetProperty, a member of class TOleControl.
	GetShortIntProp (see page 18058)	This is GetShortIntProp, a member of class TOleControl.
	GetSingleProp (see page 18058)	This is GetSingleProp, a member of class TOleControl.
	GetSmallintProp (see page 18058)	This is GetSmallintProp, a member of class TOleControl.
	GetStringProp (see page 18059)	This is GetStringProp, a member of class TOleControl.
	GetTColorProp (see page 18059)	This is GetTColorProp, a member of class TOleControl.
	GetTDateTimeProp (see page 18059)	This is GetTDateTimeProp, a member of class TOleControl.
	GetTFontProp (see page 18059)	This is GetTFontProp, a member of class TOleControl.

	GetTOleEnumProp (see page 18059)	This is GetTOleEnumProp, a member of class TOleControl.
	GetTPictureProp (see page 18060)	This is GetTPictureProp, a member of class TOleControl.
	GetTypeInfo (see page 18060)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 18060)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariantProp (see page 18061)	This is GetVariantProp, a member of class TOleControl.
	GetWideStringProp (see page 18061)	This is GetWideStringProp, a member of class TOleControl.
	GetWindowContext (see page 18061)	This is GetWindowContext, a member of class TOleControl.
	GetWordBoolProp (see page 18061)	This is GetWordBoolProp, a member of class TOleControl.
	GetWordProp (see page 18062)	This is GetWordProp, a member of class TOleControl.
A	InitControlData (see page 18062)	This is InitControlData, a member of class TOleControl.
V	InitControlInterface (see page 18062)	This is InitControlInterface, a member of class TOleControl.
	InsertMenus (see page 18062)	This is InsertMenus, a member of class TOleControl.
	Invoke (see page 18062)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	InvokeEvent (see page 18063)	This is InvokeEvent, a member of class TOleControl.
	InvokeMethod (see page 18063)	This is InvokeMethod, a member of class TOleControl.
	LockInPlaceActive (see page 18064)	This is LockInPlaceActive, a member of class TOleControl.
	OleControlSite_TranslateAccelerator (see page 18064)	This is OleControlSite_TranslateAccelerator, a member of class TOleControl.
	OleInPlaceFrame_GetWindow (see page 18064)	This is OleInPlaceFrame_GetWindow, a member of class TOleControl.
	OleInPlaceFrame_TranslateAccelerator (see page 18065)	This is OleInPlaceFrame_TranslateAccelerator, a member of class TOleControl.
	OleInPlaceSite_GetWindow (see page 18065)	This is OleInPlaceSite_GetWindow, a member of class TOleControl.
V	OnChanged (see page 18065)	This is OnChanged, a member of class TOleControl.
	OnControlInfoChanged (see page 18065)	This is OnControlInfoChanged, a member of class TOleControl.
	OnFocus (see page 18066)	This is OnFocus, a member of class TOleControl.
	OnInPlaceActivate (see page 18066)	This is OnInPlaceActivate, a member of class TOleControl.
	OnInPlaceDeactivate (see page 18066)	This is OnInPlaceDeactivate, a member of class TOleControl.
	OnPosRectChange (see page 18066)	This is OnPosRectChange, a member of class TOleControl.
V	OnRequestEdit (see page 18066)	This is OnRequestEdit, a member of class TOleControl.
	OnShowWindow (see page 18067)	This is OnShowWindow, a member of class TOleControl.
	OnUIActivate (see page 18067)	This is OnUIActivate, a member of class TOleControl.
	OnUIDeactivate (see page 18067)	This is OnUIDeactivate, a member of class TOleControl.
V	PaletteChanged (see page 18067)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PictureChanged (see page 18068)	This is PictureChanged, a member of class TOleControl.
	PostMessageFilter (see page 18068)	This is PostMessageFilter, a member of class TOleControl.
	PreMessageFilter (see page 18069)	This is PreMessageFilter, a member of class TOleControl.
V	QueryInterface (see page 18069)	Returns a reference to a specified interface if the object supports that interface.
	QueryService (see page 18069)	This is QueryService, a member of class TOleControl.
	RemoveMenus (see page 18070)	This is RemoveMenus, a member of class TOleControl.
	RequestBorderSpace (see page 18070)	This is RequestBorderSpace, a member of class TOleControl.
	RequestNewObjectLayout (see page 18070)	This is RequestNewObjectLayout, a member of class TOleControl.
	SaveObject (see page 18070)	This is SaveObject, a member of class TOleControl.
	Scroll (see page 18070)	This is Scroll, a member of class TOleControl.
	SetActiveObject (see page 18071)	This is SetActiveObject, a member of class TOleControl.
	SetBorderSpace (see page 18071)	This is SetBorderSpace, a member of class TOleControl.
	SetByteProp (see page 18071)	This is SetByteProp, a member of class TOleControl.
	SetColorProp (see page 18072)	This is SetColorProp, a member of class TOleControl.
	SetCompProp (see page 18072)	This is SetCompProp, a member of class TOleControl.
	SetCurrencyProp (see page 18072)	This is SetCurrencyProp, a member of class TOleControl.
	SetDoubleProp (see page 18072)	This is SetDoubleProp, a member of class TOleControl.
	SetIDispatchProp (see page 18073)	This is SetIDispatchProp, a member of class TOleControl.
	SetIntegerProp (see page 18073)	This is SetIntegerProp, a member of class TOleControl.
	SetIUnknownProp (see page 18073)	This is SetIUnknownProp, a member of class TOleControl.
	SetMenu (see page 18073)	This is SetMenu, a member of class TOleControl.

	SetName (see page 18073)	Sets the name of the control.
	SetOleBoolProp (see page 18074)	This is SetOleBoolProp, a member of class TOleControl.
	SetOleDateProp (see page 18074)	This is SetOleDateProp, a member of class TOleControl.
	SetOleEnumProp (see page 18074)	This is SetOleEnumProp, a member of class TOleControl.
	SetOleVariantProp (see page 18075)	This is SetOleVariantProp, a member of class TOleControl.
	SetParent (see page 18075)	Sets the parent of the control.
	SetProperty (see page 18076)	This is SetProperty, a member of class TOleControl.
	SetShortIntProp (see page 18076)	This is SetShortIntProp, a member of class TOleControl.
	SetSingleProp (see page 18076)	This is SetSingleProp, a member of class TOleControl.
	SetSmallintProp (see page 18076)	This is SetSmallintProp, a member of class TOleControl.
	SetStatusText (see page 18077)	This is SetStatusText, a member of class TOleControl.
	SetStringProp (see page 18077)	This is SetStringProp, a member of class TOleControl.
	SetTColorProp (see page 18077)	This is SetTColorProp, a member of class TOleControl.
	SetTDateTimeProp (see page 18077)	This is SetTDateTimeProp, a member of class TOleControl.
	SetTFontProp (see page 18077)	This is SetTFontProp, a member of class TOleControl.
	SetTOleEnumProp (see page 18078)	This is SetTOleEnumProp, a member of class TOleControl.
	SetTPictureProp (see page 18078)	This is SetTPictureProp, a member of class TOleControl.
	SetVariantProp (see page 18078)	This is SetVariantProp, a member of class TOleControl.
	SetWideStringProp (see page 18078)	This is SetWideStringProp, a member of class TOleControl.
	SetWordBoolProp (see page 18079)	This is SetWordBoolProp, a member of class TOleControl.
	SetWordProp (see page 18079)	This is SetWordProp, a member of class TOleControl.
	ShowObject (see page 18079)	This is ShowObject, a member of class TOleControl.
	ShowPropertyFrame (see page 18079)	This is ShowPropertyFrame, a member of class TOleControl.
	StandardEvent (see page 18080)	This is StandardEvent, a member of class TOleControl.
	SuppressException (see page 18080)	This is SuppressException, a member of class TOleControl.
	TransformCoords (see page 18080)	This is TransformCoords, a member of class TOleControl.
	WndProc (see page 18080)	Provides specific message responses for the control.

Public Methods

	Name	Description
	BrowseProperties (see page 18048)	Notifies the ActiveX control to display its Properties dialog box.
	DefaultHandler (see page 18050)	Handles all otherwise-unhandled messages.
	DoObjectVerb (see page 18051)	Notifies the ActiveX control to perform one of its actions.
	GetEnumPropDesc (see page 18054)	Returns descriptions of the ActiveX control's properties.
	GetHelpContext (see page 18054)	Retrieves the Help context of a member of the ActiveX control.
	GetObjectVerbs (see page 18056)	Retrieves the names of the verbs implemented by the ActiveX control.
	GetPropDisplayString (see page 18057)	Returns the display string for an interface for the ActiveX control.
	GetPropDisplayStrings (see page 18057)	Returns the display strings for an interface for the ActiveX control.
	IsCustomProperty (see page 18063)	Indicates whether an interface for the ActiveX control is a custom property.
	IsPropPageProperty (see page 18064)	Indicates whether an interface for the OCX control is a property page property.
	SetBounds (see page 18071)	Sets the boundaries of the ActiveX control.
	SetPropDisplayString (see page 18075)	Sets the display string for an interface for the ActiveX control.
	ShowAboutBox (see page 18079)	Notifies the ActiveX control to display its About box.

116.1.4.4.1 TOleControl._AddRef Method

Called when an application uses a component interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

__AddRef is a basic implementation of the IInterface method, _AddRef.

Note: If the component is a wrapper for a COM object, __AddRef calls the _AddRef method of that COM object, and returns the resulting reference count.

In all other cases, __AddRef simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __AddRef to implement reference counting.

See Also

Invoke (see page 2781)

QueryInterface (see page 2784)

_Release (see page 2769)

ComObject (see page 2793)

_AddRef (see page 22397)

116.1.4.4.2 TOleControl._Release Method

Called when an application releases a component interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

__Release is a basic implementation of the IInterface method, _Release.

__Release returns the resulting value of the reference count for the component's interface.

Note:

In all other cases, __Release simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __Release to implement reference counting.

See Also

Invoke (see page 2781)

QueryInterface (see page 2784)

_AddRef (see page 2769)

ComObject (see page 2793)

116.1.4.4.3 TOleControl._SetColorProp Method

Pascal

```
procedure _SetColorProp(Index: Integer; Value: TColor);
```

C++

```
__fastcall _SetColorProp(int Index, TColor Value);
```

Description

This is _SetColorProp, a member of class TOleControl.

116.1.4.4.4 TOleControl._SetTColorProp Method

Pascal

```
procedure _SetTColorProp(Index: Integer; Value: TColor);
```

C++

```
__fastcall _SetTColorProp(int Index, TColor Value);
```

Description

This is _SetTColorProp, a member of class TOleControl.

116.1.4.4.5 TOleControl._SetTFontProp Method

Pascal

```
procedure _SetTFontProp(Index: Integer; Value: TFont);
```

C++

```
__fastcall _SetTFontProp(int Index, TFont Value);
```

Description

This is _SetTFontProp, a member of class TOleControl.

116.1.4.4.6 TOleControl._SetTOleEnumProp Method

Pascal

```
procedure _SetTOleEnumProp(Index: Integer; Value: TOleEnum);
```

C++

```
__fastcall _SetTOleEnumProp(int Index, TOleEnum Value);
```

Description

This is _SetTOleEnumProp, a member of class TOleControl.

116.1.4.4.7 TOleControl._SetTPictureProp Method

Pascal

```
procedure _SetTPictureProp(Index: Integer; Value: TPicture);
```

C++

```
__fastcall _SetTPictureProp(int Index, TPicture Value);
```

Description

This is _SetTPictureProp, a member of class TOleControl.

116.1.4.4.8 TOleControl.BrowseProperties Method

Notifies the ActiveX control to display its Properties dialog box.

Pascal

```
procedure BrowseProperties;
```

C++

```
__fastcall BrowseProperties();
```

Description

Use BrowseProperties to notify the ActiveX control to display its Properties dialog box. The Properties dialog box contains property pages for the ActiveX control.

116.1.4.4.9 TOleControl.CanInPlaceActivate Method

Pascal

```
function CanInPlaceActivate: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT CanInPlaceActivate();
```

Description

This is CanInPlaceActivate, a member of class TOleControl.

116.1.4.4.10 TOleControl.ContextSensitiveHelp Method

Pascal

```
function ContextSensitiveHelp(fEnterMode: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT ContextSensitiveHelp(BOOL fEnterMode);
```

Description

This is ContextSensitiveHelp, a member of class TOleControl.

116.1.4.4.11 TOleControl.CreateWnd Method

Creates the underlying window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the screen object when it is created.

See Also

CreateParams (see page 6135)

CreateWindowHandle (see page 6137)

Perform (see page 5776)

DestroyWnd (see page 6141)

116.1.4.4.12 TOleControl.DeactivateAndUndo Method

Pascal

```
function DeactivateAndUndo: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT DeactivateAndUndo();
```

Description

This is DeactivateAndUndo, a member of class TOleControl.

116.1.4.4.13 TOleControl.DefaultHandler Method

Handles all otherwise-unhandled messages.

Pascal

```
procedure DefaultHandler(var Message); override;
```

C++

```
virtual __fastcall DefaultHandler( Message);
```

Description

DefaultHandler handles all messages not already handled in a control's WndProc (see page 18080) or message handling methods. The inherited method should always be called for unhandled messages.

See Also

DefaultHandler (see page 5748)

116.1.4.4.14 TOleControl.DefineProperties Method

Provides methods to read and write the IsControl property to a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

DefineProperties is called automatically by the streaming system that loads and saves VCL components. It allows persistent objects to read and write properties that are not published. Published properties are loaded and stored automatically.

DefineProperties uses the methods of the filer passed as the Filer parameter to assign methods that can load and save the IsControl property.

Override DefineProperties to persist unpublished properties. Call the DefineBinaryProperty or DefineProperty method of the Filer parameter to assign methods that load or save property values.

Note: When overriding this method, call the parent class's DefineProperties method first.

See Also

DefineBinaryProperty (see page 2837)

DefineProperty (see page 2838)

DefineProperties (see page 2771)

IsControl (see page 5829)

116.1.4.4.15 TOleControl.DestroyWindowHandle Method

Destroys the window created in the CreateWindowHandle method.

Pascal

```
procedure DestroyWindowHandle; override;
```

C++

```
virtual __fastcall DestroyWindowHandle();
```

Description

Call DestroyWindowHandle to dispose of the window for the control.

TWinControl's Destroy method calls DestroyWindowHandle to destroy any window associated with a windowed control before destroying the object. The DestroyWnd method also calls DestroyWindowHandle.

See Also

CreateWindowHandle (see page 6137)

Destroy (see page 6124)

DestroyWnd (see page 6141)

116.1.4.4.16 TOleControl.DiscardUndoState Method

Pascal

```
function DiscardUndoState: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT DiscardUndoState();
```

Description

This is DiscardUndoState, a member of class TOleControl.

116.1.4.4.17 TOleControl.DoObjectVerb Method

Notifies the ActiveX control to perform one of its actions.

Pascal

```
procedure DoObjectVerb(Verb: Integer);
```

C++

```
__fastcall DoObjectVerb(int Verb);
```

Description

Use DoObjectVerb to notify the ActiveX control to perform one of its actions. Verb is an integer that corresponds to the action. Most application-defined verbs are small positive integers.

Verb Name	Verb
OLEIVERB_PRIMARY	0
OLEIVERB_SHOW	–1
OLEIVERB_OPEN	–2
OLEIVERB_HIDE	–3
OLEIVERB_UIACTIVATE	–4
OLEIVERB_INPLACEACTIVATE	–5
OLEIVERB_DISCARDUNDOSTATE	–6
OLEIVERB_PROPERTIES	–7

For more information about verbs, search the OLE.HLP file or the latest Microsoft Developer Network CD.

116.1.4.4.18 TOleControl.EnableModeless Method

Pascal

```
function EnableModeless(fEnable: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT EnableModeless(BOOL fEnable);
```

Description

This is EnableModeless, a member of class TOleControl.

116.1.4.4.19 TOleControl.GetBorder Method

Pascal

```
function GetBorder(out rectBorder: TRect): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetBorder(TRect rectBorder);
```

Description

This is GetBorder, a member of class TOleControl.

116.1.4.4.20 TOleControl.GetByteProp Method

Pascal

```
function GetByteProp(Index: Integer): Byte;
```

C++

```
__fastcall Byte GetByteProp(int Index);
```

Description

This is GetByteProp, a member of class TOleControl.

116.1.4.4.21 TOleControl.GetColorProp Method

Pascal

```
function GetColorProp(Index: Integer): TColor;
```

C++

```
__fastcall TColor GetColorProp(int Index);
```

Description

This is GetColorProp, a member of class TOleControl.

116.1.4.4.22 TOleControl.GetCompProp Method

Pascal

```
function GetCompProp(Index: Integer): Comp;
```

C++

```
__fastcall Comp GetCompProp(int Index);
```

Description

This is GetCompProp, a member of class TOleControl.

116.1.4.4.23 TOleControl.GetContainer Method

Pascal

```
function GetContainer(out container: IOleContainer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetContainer(IOleContainer container);
```

Description

This is GetContainer, a member of class TOleControl.

116.1.4.4.24 TOleControl.GetCurrencyProp Method

Pascal

```
function GetCurrencyProp(Index: Integer): Currency;
```

C++

```
__fastcall Currency GetCurrencyProp(int Index);
```

Description

This is GetCurrencyProp, a member of class TOleControl.

116.1.4.4.25 TOleControl.GetDoubleProp Method

Pascal

```
function GetDoubleProp(Index: Integer): Double;
```

C++

```
__fastcall Double GetDoubleProp(int Index);
```

Description

This is GetDoubleProp, a member of class TOleControl.

116.1.4.4.26 TOleControl.GetEnumPropDesc Method

Returns descriptions of the ActiveX control's properties.

Pascal

```
function GetEnumPropDesc(DispID: Integer): TEnumPropDesc;
```

C++

```
__fastcall TEnumPropDesc GetEnumPropDesc(int DispID);
```

Description

Use GetEnumPropDesc to return descriptions of the ActiveX control's properties. GetEnumPropDesc returns the descriptions in a TEnumPropDesc (see page 18023) object.

116.1.4.4.27 TOleControl.GetExtendedControl Method

Pascal

```
function GetExtendedControl(out disp: IDispatch): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetExtendedControl(IDispatch disp);
```

Description

This is GetExtendedControl, a member of class TOleControl.

116.1.4.4.28 TOleControl.GetHelpContext Method

Retrieves the Help context of a member of the ActiveX control.

Pascal

```
function GetHelpContext(Member: string; var HelpCtx: Integer; var HelpFile: string): Boolean;
```

C++

```
__fastcall Boolean GetHelpContext(AnsiString Member, int HelpCtx, AnsiString HelpFile);
```

Description

Use GetHelpContext to retrieve the Help context of a member of the ActiveX control.

Member is the name of a property, method, or event of the ActiveX control. To retrieve the help context of the ActiveX control itself, set Member to nil (Delphi) or NULL (C++).

HelpCtx is a variable in which the Help context identifier of Member is to be stored.

HelpFile is a variable in which the name of the Help file containing HelpCtx is to be stored.

The information about the ActiveX control is retrieved from its ITypeInfo interfaces. For more information, search the OLE.HLP file for ITypeInfo.

GetHelpContext returns false if Member is not found; otherwise, GetHelpContext returns true.

116.1.4.4.29 TOleControl.GetIDispatchProp Method

Pascal

```
function GetIDispatchProp(Index: Integer): IDispatch;
```

C++

```
__fastcall IDispatch GetIDispatchProp(int Index);
```

Description

This is GetIDispatchProp, a member of class TOleControl.

116.1.4.4.30 TOleControl.GetIDsOfNames Method

Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).

Pascal

```
function GetIDsOfNames(const IID: TGUID; Names: Pointer; NameCount: Integer; LocaleID:
Integer; DispIDs: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetIDsOfNames(const TGUID IID, void * Names, int NameCount, int
LocaleID, void * DispIDs);
```

Description

GetIDsOfNames implements the IDispatch interface GetIDsOfNames method. For components that support interfaces, GetIDsOfNames calls this method for the interface supported by the component, passing the specified parameters. The returned value can be used on subsequent calls to the Invoke method.

See Also

GetTypeInfo (see page 2779)

GetTypeInfoCount (see page 2779)

Invoke (see page 2781)

116.1.4.4.31 TOleControl.GetIntegerProp Method

Pascal

```
function GetIntegerProp(Index: Integer): Integer;
```

C++

```
__fastcall int GetIntegerProp(int Index);
```

Description

This is GetIntegerProp, a member of class TOleControl.

116.1.4.4.32 TOleControl.GetIUnknownProp Method

Pascal

```
function GetIUnknownProp(Index: Integer): IUnknown;
```

C++

```
__fastcall IUnknown GetIUnknownProp(int Index);
```

Description

This is GetIUnknownProp, a member of class TOleControl.

116.1.4.4.33 TOleControl.GetMoniker Method

Pascal

```
function GetMoniker(dwAssign: Longint; dwWhichMoniker: Longint; out mk: IMoniker): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetMoniker(Longint dwAssign, Longint dwWhichMoniker, IMoniker mk);
```

Description

This is GetMoniker, a member of class TOleControl.

116.1.4.4.34 TOleControl.GetObjectVerbs Method

Retrieves the names of the verbs implemented by the ActiveX control.

Pascal

```
procedure GetObjectVerbs(List: TStrings);
```

C++

```
__fastcall GetObjectVerbs(TStrings List);
```

Description

Use GetObjectVerbs to retrieve the names of the verbs implemented by the ActiveX control.

List is where the names of the verbs are to be stored.

116.1.4.4.35 TOleControl.GetOleBoolProp Method

Pascal

```
function GetOleBoolProp(Index: Integer): TOleBool;
```

C++

```
__fastcall TOleBool GetOleBoolProp(int Index);
```

Description

This is GetOleBoolProp, a member of class TOleControl.

116.1.4.4.36 TOleControl.GetOleDateProp Method

Pascal

```
function GetOleDateProp(Index: Integer): TOleDate;
```

C++

```
__fastcall TOleDate GetOleDateProp(int Index);
```

Description

This is GetOleDateProp, a member of class TOleControl.

116.1.4.4.37 TOleControl.GetOleEnumProp Method

Pascal

```
function GetOleEnumProp(Index: Integer): TOleEnum;
```

C++

```
__fastcall TOleEnum GetOleEnumProp(int Index);
```

Description

This is GetOleEnumProp, a member of class TOleControl.

116.1.4.4.38 TOleControl.GetOleVariantProp Method

Pascal

```
function GetOleVariantProp(Index: Integer): OleVariant;
```

C++

```
__fastcall OleVariant GetOleVariantProp(int Index);
```

Description

This is GetOleVariantProp, a member of class TOleControl.

116.1.4.4.39 TOleControl.GetPropDisplayString Method

Returns the display string for an interface for the ActiveX control.

Pascal

```
function GetPropDisplayString(DispID: Integer): string;
```

C++

```
__fastcall AnsiString GetPropDisplayString(int DispID);
```

Description

GetPropDisplayString returns the display string for an interface for the ActiveX control.

DispID is the identifier for the interface. For more information, search the OLE.HLP file for DISPID.

For more information about GetPropDisplayString, search the latest Microsoft Developer Network CD for GetDisplayStrings.

See Also

GetPropDisplayStrings (see page 18057)

SetPropDisplayString (see page 18075)

116.1.4.4.40 TOleControl.GetPropDisplayStrings Method

Returns the display strings for an interface for the ActiveX control.

Pascal

```
procedure GetPropDisplayStrings(DispID: Integer; List: TStrings);
```

C++

```
__fastcall GetPropDisplayStrings(int DispID, TStrings List);
```

Description

List is where the strings are to be stored.

For more information about GetPropDisplayStrings, search the latest Microsoft Developer Network CD for GetDisplayStrings.

See Also

GetPropDisplayString (see page 18057)

116.1.4.4.41 TOleControl.GetProperty Method

Pascal

```
procedure GetProperty(Index: Integer; var Value: TVarData);
```

C++

```
__fastcall GetProperty(int Index, TVarData Value);
```

Description

This is GetProperty, a member of class TOleControl.

116.1.4.4.42 TOleControl.GetShortIntProp Method

Pascal

```
function GetShortIntProp(Index: Integer): ShortInt;
```

C++

```
__fastcall ShortInt GetShortIntProp(int Index);
```

Description

This is GetShortIntProp, a member of class TOleControl.

116.1.4.4.43 TOleControl.GetSingleProp Method

Pascal

```
function GetSingleProp(Index: Integer): Single;
```

C++

```
__fastcall Single GetSingleProp(int Index);
```

Description

This is GetSingleProp, a member of class TOleControl.

116.1.4.4.44 TOleControl.GetSmallintProp Method

Pascal

```
function GetSmallintProp(Index: Integer): Smallint;
```

C++

```
__fastcall Smallint GetSmallintProp(int Index);
```

Description

This is GetSmallintProp, a member of class TOleControl.

116.1.4.4.45 TOleControl.GetStringProp Method

Pascal

```
function GetStringProp(Index: Integer): string;
```

C++

```
__fastcall AnsiString GetStringProp(int Index);
```

Description

This is GetStringProp, a member of class TOleControl.

116.1.4.4.46 TOleControl.GetTColorProp Method

Pascal

```
function GetTColorProp(Index: Integer): TColor;
```

C++

```
__fastcall TColor GetTColorProp(int Index);
```

Description

This is GetTColorProp, a member of class TOleControl.

116.1.4.4.47 TOleControl.GetTDateTimeProp Method

Pascal

```
function GetTDateTimeProp(Index: Integer): TDateTime;
```

C++

```
__fastcall TDateTime GetTDateTimeProp(int Index);
```

Description

This is GetTDateTimeProp, a member of class TOleControl.

116.1.4.4.48 TOleControl.GetTFontProp Method

Pascal

```
function GetTFontProp(Index: Integer): TFont;
```

C++

```
__fastcall TFont GetTFontProp(int Index);
```

Description

This is GetTFontProp, a member of class TOleControl.

116.1.4.4.49 TOleControl.GetTOleEnumProp Method

Pascal

```
function GetTOleEnumProp(Index: Integer): TOleEnum;
```

C++

```
__fastcall TOleEnum GetTOleEnumProp(int Index);
```

Description

This is GetTOleEnumProp, a member of class TOleControl.

116.1.4.4.50 TOleControl.GetTPictureProp Method

Pascal

```
function GetTPictureProp(Index: Integer): TPicture;
```

C++

```
__fastcall TPicture GetTPictureProp(int Index);
```

Description

This is GetTPictureProp, a member of class TOleControl.

116.1.4.4.51 TOleControl.GetTypeInfo Method

Retrieves the type information for an object.

Pascal

```
function GetTypeInfo(Index: Integer; LocaleID: Integer; out TypeInfo): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfo(int Index, int LocaleID,  TypeInfo);
```

Description

GetTypeInfo implements the IDispatch interface GetTypeInfo method. For components that support interfaces, GetTypeInfo calls the GetTypeInfo method for the interface supported by the component, passing it the specified parameters. Use the returned value to get the type information for an interface implemented by the component.

See Also

GetIDsOfNames (see page 2777)

GetTypeInfoCount (see page 2779)

Invoke (see page 2781)

116.1.4.4.52 TOleControl.GetTypeInfoCount Method

Returns the number of type information interfaces that an object provides (either 0 or 1).

Pascal

```
function GetTypeInfoCount(out Count: Integer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfoCount(int Count);
```

Description

GetTypeInfoCount implements the IDispatch interface GetTypeInfoCount method. For components that support interfaces, GetTypeInfoCount calls this method for the interface supported by the component. The Count parameter points to a location that receives the number of type information interfaces provided by the object. If the object provides type information, this number is 1; otherwise the number is 0.

See Also

GetIDsOfNames (see page 2777)

GetTypeInfo (see page 2779)

Invoke (see page 2781)

116.1.4.4.53 TOleControl.GetVariantProp Method

Pascal

```
function GetVariantProp(Index: Integer): Variant;
```

C++

```
__fastcall Variant GetVariantProp(int Index);
```

Description

This is GetVariantProp, a member of class TOleControl.

116.1.4.4.54 TOleControl.GetWideStringProp Method

Pascal

```
function GetWideStringProp(Index: Integer): WideString;
```

C++

```
__fastcall BSTR GetWideStringProp(int Index);
```

Description

This is GetWideStringProp, a member of class TOleControl.

116.1.4.4.55 TOleControl.GetWindowContext Method

Pascal

```
function GetWindowContext(out frame: IOleInPlaceFrame; out doc: IOleInPlaceUIWindow; out
rcPosRect: TRect; out rcClipRect: TRect; out frameInfo: TOleInPlaceFrameInfo): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetWindowContext(IOleInPlaceFrame frame, IOleInPlaceUIWindow doc,
TRect rcPosRect, TRect rcClipRect, TOleInPlaceFrameInfo frameInfo);
```

Description

This is GetWindowContext, a member of class TOleControl.

116.1.4.4.56 TOleControl.GetWordBoolProp Method

Pascal

```
function GetWordBoolProp(Index: Integer): WordBool;
```

C++

```
__fastcall WordBool GetWordBoolProp(int Index);
```

Description

This is GetWordBoolProp, a member of class TOleControl.

116.1.4.4.57 TOleControl.GetWordProp Method

Pascal

```
function GetWordProp(Index: Integer): Word;
```

C++

```
__fastcall Word GetWordProp(int Index);
```

Description

This is GetWordProp, a member of class TOleControl.

116.1.4.4.58 TOleControl.InitControlData Method

Pascal

```
procedure InitControlData; virtual; abstract;
```

C++

```
virtual __fastcall InitControlData() = 0;
```

Description

This is InitControlData, a member of class TOleControl.

116.1.4.4.59 TOleControl.InitControlInterface Method

Pascal

```
procedure InitControlInterface(const Obj: IUnknown); virtual;
```

C++

```
virtual __fastcall InitControlInterface(const IUnknown Obj);
```

Description

This is InitControlInterface, a member of class TOleControl.

116.1.4.4.60 TOleControl.InsertMenus Method

Pascal

```
function InsertMenus(hmenuShared: HMenu; var menuWidths: TOleMenuGroupWidths): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT InsertMenus(HMenu hmenuShared, TOleMenuGroupWidths menuWidths);
```

Description

This is InsertMenus, a member of class TOleControl.

116.1.4.4.61 TOleControl.Invoke Method

Provides access to Automation properties and methods when the component wraps an Automation object.

Pascal

```
function Invoke(DispID: Integer; const IID: TGUID; LocaleID: Integer; Flags: Word; var Params;
```

```
VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Invoke(int DispID, const TGUID IID, int LocaleID, Word Flags,
Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

Invoke is the standard mechanism for accessing the exposed properties and methods of an Automation object. For components that wrap the IDispatch interface of an Automation object, Invoke calls the Invoke method for the interface supported by the component, passing it the parameters specified by the function.

See Also

GetIDsOfNames (see page 2777)

GetTypeInfo (see page 2779)

GetTypeInfoCount (see page 2779)

ComObject (see page 2793)

116.1.4.4.62 TOleControl.InvokeEvent Method

Pascal

```
procedure InvokeEvent(DispID: TDispID; var Params: TDispParams); virtual;
```

C++

```
virtual __fastcall InvokeEvent(TDispID DispID, TDispParams Params);
```

Description

This is InvokeEvent, a member of class TOleControl.

116.1.4.4.63 TOleControl.InvokeMethod Method

Pascal

```
procedure InvokeMethod(const DispInfo; Result: Pointer);
```

C++

```
__fastcall InvokeMethod(const  DispInfo, void * Result);
```

Description

This is InvokeMethod, a member of class TOleControl.

116.1.4.4.64 TOleControl.IsCustomProperty Method

Indicates whether an interface for the ActiveX control is a custom property.

Pascal

```
function IsCustomProperty(DispID: Integer): Boolean;
```

C++

```
__fastcall Boolean IsCustomProperty(int DispID);
```

Description

Use IsCustomProperty to determine whether an interface for the ActiveX control is a custom property.

DispID is the identifier for the interface. For more information, search the OLE.HLP file for DISPID.

IsCustomProperty returns true if an interface is a custom property; otherwise, IsCustomProperty returns false.

116.1.4.4.65 TOleControl.IsPropPageProperty Method

Indicates whether an interface for the OCX control is a property page property.

Pascal

```
function IsPropPageProperty(DispID: Integer): Boolean;
```

C++

```
__fastcall Boolean IsPropPageProperty(int DispID);
```

Description

Use IsPropPageProperty to determine whether an interface for the OCX control is a property page property.

DispID is the identifier for the interface. For more information, search the OLE.HLP file for DISPID.

IsPropPageProperty returns true if an interface is a property page property; otherwise, IsPropPageProperty returns false.

116.1.4.4.66 TOleControl.LockInPlaceActive Method

Pascal

```
function LockInPlaceActive(fLock: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT LockInPlaceActive(BOOL fLock);
```

Description

This is LockInPlaceActive, a member of class TOleControl.

116.1.4.4.67 TOleControl.OleControlSite_TranslateAccelerator Method

Pascal

```
function OleControlSite_TranslateAccelerator(msg: PMsg; grfModifiers: Longint): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT OleControlSite_TranslateAccelerator(PMsg msg, Longint
grfModifiers);
```

Description

This is OleControlSite_TranslateAccelerator, a member of class TOleControl.

116.1.4.4.68 TOleControl.OleInPlaceFrame_GetWindow Method

Pascal

```
function OleInPlaceFrame_GetWindow(out wnd: HWnd): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OleInPlaceFrame_GetWindow(HWnd wnd);
```

Description

This is OleInPlaceFrame_GetWindow, a member of class TOleControl.

116.1.4.4.69 TOleControl.OleInPlaceFrame_TranslateAccelerator Method

Pascal

```
function OleInPlaceFrame_TranslateAccelerator(var msg: TMsg; wID: Word): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OleInPlaceFrame_TranslateAccelerator(TMsg msg, Word wID);
```

Description

This is OleInPlaceFrame_TranslateAccelerator, a member of class TOleControl.

116.1.4.4.70 TOleControl.OleInPlaceSite_GetWindow Method

Pascal

```
function OleInPlaceSite_GetWindow(out wnd: HWnd): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OleInPlaceSite_GetWindow(HWnd wnd);
```

Description

This is OleInPlaceSite_GetWindow, a member of class TOleControl.

116.1.4.4.71 TOleControl.OnChanged Method

Pascal

```
function OnChanged(dispid: TDispID): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT OnChanged(TDispID dispid);
```

Description

This is OnChanged, a member of class TOleControl.

116.1.4.4.72 TOleControl.OnControlInfoChanged Method

Pascal

```
function OnControlInfoChanged: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnControlInfoChanged();
```

Description

This is OnControlInfoChanged, a member of class TOleControl.

116.1.4.4.73 TOleControl.OnFocus Method

Pascal

```
function OnFocus(fGotFocus: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnFocus(BOOL fGotFocus);
```

Description

This is OnFocus, a member of class TOleControl.

116.1.4.4.74 TOleControl.OnInPlaceActivate Method

Pascal

```
function OnInPlaceActivate: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnInPlaceActivate();
```

Description

This is OnInPlaceActivate, a member of class TOleControl.

116.1.4.4.75 TOleControl.OnInPlaceDeactivate Method

Pascal

```
function OnInPlaceDeactivate: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnInPlaceDeactivate();
```

Description

This is OnInPlaceDeactivate, a member of class TOleControl.

116.1.4.4.76 TOleControl.OnPosRectChange Method

Pascal

```
function OnPosRectChange(const rcPosRect: TRect): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnPosRectChange(const TRect rcPosRect);
```

Description

This is OnPosRectChange, a member of class TOleControl.

116.1.4.4.77 TOleControl.OnRequestEdit Method

Pascal

```
function OnRequestEdit(dispid: TDispID): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT OnRequestEdit(TDispID dispid);
```

Description

This is OnRequestEdit, a member of class TOleControl.

116.1.4.4.78 TOleControl.OnShowWindow Method

Pascal

```
function OnShowWindow(fShow: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnShowWindow(BOOL fShow);
```

Description

This is OnShowWindow, a member of class TOleControl.

116.1.4.4.79 TOleControl.OnUIActivate Method

Pascal

```
function OnUIActivate: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnUIActivate();
```

Description

This is OnUIActivate, a member of class TOleControl.

116.1.4.4.80 TOleControl.OnUIDeactivate Method

Pascal

```
function OnUIDeactivate(fUndoable: BOOL): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT OnUIDeactivate(BOOL fUndoable);
```

Description

This is OnUIDeactivate, a member of class TOleControl.

116.1.4.4.81 TOleControl.PaletteChanged Method

Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.

Pascal

```
function PaletteChanged(Foreground: Boolean): Boolean; override;
```

C++

```
virtual __fastcall Boolean PaletteChanged(Boolean Foreground);
```

Description

PaletteChanged is called automatically when the Windows system palette changes. TWinControl responds to these notifications by trying to realize the windowed control's palette, if any, into the current device context, and then passing on the PaletteChanged notification to each of the child controls in turn. If the change in the system palette causes the actual value of the control's palette to change, PaletteChanged will invalidate the control so that it can repaint with the new palette.

Windows paints the active window with a foreground palette, while other windows are forced to use background palettes. Background palettes are approximate matches to the colors specified by the control's logical palette, given the limitations imposed by implementing the foreground palette. Windows only allows a single foreground palette.

PaletteChanged allows the control to obtain a new realization of its palette when the system palette changes. When Foreground is true, the form has been activated and the control is specifying the new foreground palette. When Foreground is false, another application or form has changed the foreground palette, and controls that are sensitive to the available palette should realize new background palettes to best match their logical palettes.

If the control does not have a logical palette to be realized into the current device context, GetPalette will return a handle of 0, and PaletteChanged will not try to realize a palette for the windowed control. Instead, it simply passes the notification on to the child controls. If the windowed control or any of its child controls realize a palette into the current device context in response to PaletteChanged, this method returns true.

Override PaletteChanged to change the way in which controls are given an opportunity to realize a new palette when the Windows system palette changes. For example, override PaletteChanged to change the order in which child controls realize their palettes, giving a particular control the foreground palette when the form is activated, or to pass palette change notification to custom controls implemented outside of the VCL, such as in DLLs.

Override GetPalette instead to affect whether the windowed control actually has a palette to realize, or to change the value of the control's logical palette.

Note: PaletteChanged is called only when the run-time video mode requires palette support, such as for 256 color mode, but not 16 million color mode.

See Also

GetDeviceContext (see page 6155)

GetPalette (see page 5765)

116.1.4.4.82 TOleControl.PictureChanged Method

Pascal

```
procedure PictureChanged(Sender: TObject);
```

C++

```
__fastcall PictureChanged(TObject * Sender);
```

Description

This is PictureChanged, a member of class TOleControl.

116.1.4.4.83 TOleControl.PostMessageFilter Method

Pascal

```
function PostMessageFilter(wnd: HWnd; msg: Integer; wp: Integer; lp: Integer; out res:
Integer; Cookie: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PostMessageFilter(HWnd wnd, int msg, int wp, int lp, int res,
Longint Cookie);
```

Description

This is PostMessageFilter, a member of class TOleControl.

116.1.4.4.84 TOleControl.PreMessageFilter Method

Pascal

```
function PreMessageFilter(wnd: HWnd; msg: Integer; wp: Integer; lp: Integer; out res: Integer;
out Cookie: Longint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT PreMessageFilter(HWnd wnd, int msg, int wp, int lp, int res,
Longint Cookie);
```

Description

This is PreMessageFilter, a member of class TOleControl.

116.1.4.4.85 TOleControl.QueryInterface Method

Returns a reference to a specified interface if the object supports that interface.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override;
```

C++

```
virtual __fastcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface checks whether the component supports the interface specified by IID, and if so, returns a reference to that interface as the Obj parameter. If the component does not support the interface, the Obj parameter returns nil (Delphi) or NULL (C++).

Note: For components that act as COM object wrapper, QueryInterface calls the QueryInterface method of the internal COM object.

116.1.4.4.86 TOleControl.QueryService Method

Pascal

```
function QueryService(const rsid: TGuid; const iid: TGuid; out obj): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT QueryService(const TGuid rsid, const TGuid iid,  obj);
```

Description

This is QueryService, a member of class TOleControl.

116.1.4.4.87 TOleControl.RemoveMenus Method

Pascal

```
function RemoveMenus(hmenuShared: HMenu): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT RemoveMenus(HMenu hmenuShared);
```

Description

This is RemoveMenus, a member of class TOleControl.

116.1.4.4.88 TOleControl.RequestBorderSpace Method

Pascal

```
function RequestBorderSpace(const borderwidths: TRect): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT RequestBorderSpace(const TRect borderwidths);
```

Description

This is RequestBorderSpace, a member of class TOleControl.

116.1.4.4.89 TOleControl.RequestNewObjectLayout Method

Pascal

```
function RequestNewObjectLayout: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT RequestNewObjectLayout();
```

Description

This is RequestNewObjectLayout, a member of class TOleControl.

116.1.4.4.90 TOleControl.SaveObject Method

Pascal

```
function SaveObject: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SaveObject();
```

Description

This is SaveObject, a member of class TOleControl.

116.1.4.4.91 TOleControl.Scroll Method

Pascal

```
function Scroll(scrollExtent: TPoint): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Scroll(TPoint scrollExtent);
```

Description

This is Scroll, a member of class TOleControl.

116.1.4.4.92 TOleControl.SetActiveObject Method

Pascal

```
function SetActiveObject(const activeObject: IOleInPlaceActiveObject; pszObjName: POleStr):
HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetActiveObject(const IOleInPlaceActiveObject activeObject,
POleStr pszObjName);
```

Description

This is SetActiveObject, a member of class TOleControl.

116.1.4.4.93 TOleControl.SetBorderSpace Method

Pascal

```
function SetBorderSpace(pborderwidths: PRect): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetBorderSpace(PRect pborderwidths);
```

Description

This is SetBorderSpace, a member of class TOleControl.

116.1.4.4.94 TOleControl.SetBounds Method

Sets the boundaries of the ActiveX control.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to set the boundaries of the ActiveX control.

ALeft, ATop, AWidth, and AHeight are the x-coordinate of the upper-left corner, the y-coordinate of the upper-left corner, the width and the height of the ActiveX control.

116.1.4.4.95 TOleControl.SetByteProp Method

Pascal

```
procedure SetByteProp(Index: Integer; Value: Byte);
```

C++

```
__fastcall SetByteProp(int Index, Byte Value);
```

Description

This is SetByteProp, a member of class TOleControl.

116.1.4.4.96 TOleControl.SetColorProp Method

Pascal

```
procedure SetColorProp(Index: Integer; Value: TColor);
```

C++

```
__fastcall SetColorProp(int Index, TColor Value);
```

Description

This is SetColorProp, a member of class TOleControl.

116.1.4.4.97 TOleControl.SetCompProp Method

Pascal

```
procedure SetCompProp(Index: Integer; const Value: Comp);
```

C++

```
__fastcall SetCompProp(int Index, const Comp Value);
```

Description

This is SetCompProp, a member of class TOleControl.

116.1.4.4.98 TOleControl.SetCurrencyProp Method

Pascal

```
procedure SetCurrencyProp(Index: Integer; const Value: Currency);
```

C++

```
__fastcall SetCurrencyProp(int Index, const Currency Value);
```

Description

This is SetCurrencyProp, a member of class TOleControl.

116.1.4.4.99 TOleControl.SetDoubleProp Method

Pascal

```
procedure SetDoubleProp(Index: Integer; const Value: Double);
```

C++

```
__fastcall SetDoubleProp(int Index, const Double Value);
```

Description

This is SetDoubleProp, a member of class TOleControl.

116.1.4.4.100 TOleControl.SetIDispatchProp Method

Pascal

```
procedure SetIDispatchProp(Index: Integer; const Value: IDispatch);
```

C++

```
__fastcall SetIDispatchProp(int Index, const IDispatch Value);
```

Description

This is SetIDispatchProp, a member of class TOleControl.

116.1.4.4.101 TOleControl.SetIntegerProp Method

Pascal

```
procedure SetIntegerProp(Index: Integer; Value: Integer);
```

C++

```
__fastcall SetIntegerProp(int Index, int Value);
```

Description

This is SetIntegerProp, a member of class TOleControl.

116.1.4.4.102 TOleControl.SetIUnknownProp Method

Pascal

```
procedure SetIUnknownProp(Index: Integer; const Value: IUnknown);
```

C++

```
__fastcall SetIUnknownProp(int Index, const IUnknown Value);
```

Description

This is SetIUnknownProp, a member of class TOleControl.

116.1.4.4.103 TOleControl.SetMenu Method

Pascal

```
function SetMenu(hmenuShared: HMenu; holemenu: HMenu; hwndActiveObject: HWnd): HResult;
stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetMenu(HMenu hmenuShared, HMenu holemenu, HWnd hwndActiveObject);
```

Description

This is SetMenu, a member of class TOleControl.

116.1.4.4.104 TOleControl.SetName Method

Sets the name of the control.

Pascal

```
procedure SetName(const Value: TComponentName); override;
```

C++

```
virtual __fastcall SetName(const TComponentName Value);
```

Description

SetName is the protected write implementation of the Name property. TControl updates the Text or Caption property, if appropriate, after changing the value of Name.

Override SetName to execute additional code when the value of the Name property changes.

See Also

Name

Caption (see page 5806)

Text (see page 5842)

116.1.4.4.105 TOleControl.SetOleBoolProp Method

Pascal

```
procedure SetOleBoolProp(Index: Integer; Value: TOleBool);
```

C++

```
__fastcall SetOleBoolProp(int Index, TOleBool Value);
```

Description

This is SetOleBoolProp, a member of class TOleControl.

116.1.4.4.106 TOleControl.SetOleDateProp Method

Pascal

```
procedure SetOleDateProp(Index: Integer; const Value: TOleDate);
```

C++

```
__fastcall SetOleDateProp(int Index, const TOleDate Value);
```

Description

This is SetOleDateProp, a member of class TOleControl.

116.1.4.4.107 TOleControl.SetOleEnumProp Method

Pascal

```
procedure SetOleEnumProp(Index: Integer; Value: TOleEnum);
```

C++

```
__fastcall SetOleEnumProp(int Index, TOleEnum Value);
```

Description

This is SetOleEnumProp, a member of class TOleControl.

116.1.4.4.108 TOleControl.SetOleVariantProp Method

Pascal

```
procedure SetOleVariantProp(Index: Integer; const Value: OleVariant);
```

C++

```
__fastcall SetOleVariantProp(int Index, const OleVariant Value);
```

Description

This is SetOleVariantProp, a member of class TOleControl.

116.1.4.4.109 TOleControl.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

See Also

Destroy (see page 5732)

InsertControl (see page 6160)

Parent (see page 5832)

RemoveControl (see page 6172)

116.1.4.4.110 TOleControl.SetPropDisplayString Method

Sets the display string for an interface for the ActiveX control.

Pascal

```
procedure SetPropDisplayString(DispID: Integer; const Value: string);
```

C++

```
__fastcall SetPropDisplayString(int DispID, const AnsiString Value);
```

Description

Use SetPropDisplayString to set the display string for an interface for the ActiveX control.

DispID is the identifier for the interface. For more information, search the OLE.HLP file for DISPID.

Value is the new display string for the interface.

See Also

GetPropDisplayStrings (see page 18057)

SetPropDisplayString

116.1.4.4.111 TOleControl.SetProperty Method

Pascal

```
procedure SetProperty(Index: Integer; const Value: TVarData);
```

C++

```
__fastcall SetProperty(int Index, const TVarData Value);
```

Description

This is SetProperty, a member of class TOleControl.

116.1.4.4.112 TOleControl.SetShortIntProp Method

Pascal

```
procedure SetShortIntProp(Index: Integer; Value: Shortint);
```

C++

```
__fastcall SetShortIntProp(int Index, Shortint Value);
```

Description

This is SetShortIntProp, a member of class TOleControl.

116.1.4.4.113 TOleControl.SetSingleProp Method

Pascal

```
procedure SetSingleProp(Index: Integer; const Value: Single);
```

C++

```
__fastcall SetSingleProp(int Index, const Single Value);
```

Description

This is SetSingleProp, a member of class TOleControl.

116.1.4.4.114 TOleControl.SetSmallintProp Method

Pascal

```
procedure SetSmallintProp(Index: Integer; Value: Smallint);
```

C++

```
__fastcall SetSmallintProp(int Index, Smallint Value);
```

Description

This is SetSmallintProp, a member of class TOleControl.

116.1.4.4.115 TOleControl.SetStatusText Method

Pascal

```
function SetStatusText(pszStatusText: POleStr): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT SetStatusText(POleStr pszStatusText);
```

Description

This is SetStatusText, a member of class TOleControl.

116.1.4.4.116 TOleControl.SetStringProp Method

Pascal

```
procedure SetStringProp(Index: Integer; const Value: string);
```

C++

```
__fastcall SetStringProp(int Index, const AnsiString Value);
```

Description

This is SetStringProp, a member of class TOleControl.

116.1.4.4.117 TOleControl.SetTColorProp Method

Pascal

```
procedure SetTColorProp(Index: Integer; Value: TColor);
```

C++

```
__fastcall SetTColorProp(int Index, TColor Value);
```

Description

This is SetTColorProp, a member of class TOleControl.

116.1.4.4.118 TOleControl.SetTDateTimeProp Method

Pascal

```
procedure SetTDateTimeProp(Index: Integer; const Value: TDateTime);
```

C++

```
__fastcall SetTDateTimeProp(int Index, const TDateTime Value);
```

Description

This is SetTDateTimeProp, a member of class TOleControl.

116.1.4.4.119 TOleControl.SetTFontProp Method

Pascal

```
procedure SetTFontProp(Index: Integer; Value: TFont);
```

C++

```
__fastcall SetTFontProp(int Index, TFont Value);
```

Description

This is SetTFontProp, a member of class TOleControl.

116.1.4.4.120 TOleControl.SetTOleEnumProp Method

Pascal

```
procedure SetTOleEnumProp(Index: Integer; Value: TOleEnum);
```

C++

```
__fastcall SetTOleEnumProp(int Index, TOleEnum Value);
```

Description

This is SetTOleEnumProp, a member of class TOleControl.

116.1.4.4.121 TOleControl.SetTPictureProp Method

Pascal

```
procedure SetTPictureProp(Index: Integer; Value: TPicture);
```

C++

```
__fastcall SetTPictureProp(int Index, TPicture Value);
```

Description

This is SetTPictureProp, a member of class TOleControl.

116.1.4.4.122 TOleControl.SetVariantProp Method

Pascal

```
procedure SetVariantProp(Index: Integer; const Value: Variant);
```

C++

```
__fastcall SetVariantProp(int Index, const Variant Value);
```

Description

This is SetVariantProp, a member of class TOleControl.

116.1.4.4.123 TOleControl.SetWideStringProp Method

Pascal

```
procedure SetWideStringProp(Index: Integer; const Value: WideString);
```

C++

```
__fastcall SetWideStringProp(int Index, const BSTR Value);
```

Description

This is SetWideStringProp, a member of class TOleControl.

116.1.4.4.124 TOleControl.SetWordBoolProp Method

Pascal

```
procedure SetWordBoolProp(Index: Integer; Value: WordBool);
```

C++

```
__fastcall SetWordBoolProp(int Index, WordBool Value);
```

Description

This is SetWordBoolProp, a member of class TOleControl.

116.1.4.4.125 TOleControl.SetWordProp Method

Pascal

```
procedure SetWordProp(Index: Integer; Value: Word);
```

C++

```
__fastcall SetWordProp(int Index, Word Value);
```

Description

This is SetWordProp, a member of class TOleControl.

116.1.4.4.126 TOleControl.ShowAboutBox Method

Notifies the ActiveX control to display its About box.

Pascal

```
procedure ShowAboutBox;
```

C++

```
__fastcall ShowAboutBox();
```

Description

Use ShowAboutBox to notify the ActiveX control to display its About box.

116.1.4.4.127 TOleControl.ShowObject Method

Pascal

```
function ShowObject: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT ShowObject();
```

Description

This is ShowObject, a member of class TOleControl.

116.1.4.4.128 TOleControl.ShowPropertyFrame Method

Pascal

```
function ShowPropertyFrame: HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT ShowPropertyFrame();
```

Description

This is ShowPropertyFrame, a member of class TOleControl.

116.1.4.4.129 TOleControl.StandardEvent Method

Pascal

```
procedure StandardEvent(DispID: TDispID; var Params: TDispParams); virtual;
```

C++

```
virtual __fastcall StandardEvent(TDispID DispID, TDispParams Params);
```

Description

This is StandardEvent, a member of class TOleControl.

116.1.4.4.130 TOleControl.SuppressException Method

Pascal

```
function SuppressException(E: Exception): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean SuppressException(Exception E);
```

Description

This is SuppressException, a member of class TOleControl.

116.1.4.4.131 TOleControl.TransformCoords Method

Pascal

```
function TransformCoords(var ptlHimetric: TPoint; var ptfContainer: TPointF; flags: Longint):
HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT TransformCoords(TPoint ptlHimetric, TPointF ptfContainer, Longint
flags);
```

Description

This is TransformCoords, a member of class TOleControl.

116.1.4.4.132 TOleControl.WndProc Method

Provides specific message responses for the control.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

Override WndProc to change the initial Windows message handler for the control. The WindowProc property is initialized to point to the WndProc method.

WndProc for TWinControl overrides the inherited method to define responses for focus, mouse, and keyboard messages. It sends all others to its inherited WndProc.

When overriding WndProc to provide specialized responses to messages, call the inherited WndProc at the end to dispatch any unhandled messages.

C++ Examples:

```
/*
This example shows how to use the WndProc method and the
WindowProc property to subclass a custom control's window
procedure.  This example subclasses the window procedure of
a TListBox descendant to respond to a user-defined message
called WM_STYLEMESSAGE. The subclassed window procedure can
be turned on or off by pressing a radio button.
*/
class TMyListBoxDescendant : public TListBox
{
__published:    // IDE-managed Components
    void __fastcall SubClassWndProc(Messages::TMessage &Message);
    void __fastcall ToggleSubClass(bool On);
    void __fastcall OnDrawItemProc(
      TWinControl *Control, int Index, const TRect &Rect,
      TOwnerDrawState State);
private:    // User declarations
public:     // User declarations
    __fastcall TMyListBoxDescendant(TComponent* Owner);
};

TForm1 *Form1;
TMyListBoxDescendant *MyListBoxDescendant1;
Graphics::TBitmap *bitmap0;

const WM_STYLEMESSAGE = WM_USER + 2000;

__fastcall TForm1::TForm1(TComponent* Owner)
    : TForm(Owner)
{
}

__fastcall TMyListBoxDescendant::TMyListBoxDescendant(TComponent* Owner)
    : TListBox(Owner)
{
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PostMessage(
    MyListBoxDescendant1->Handle,
    WM_STYLEMESSAGE,
    Integer(lbOwnerDrawFixed),
    0);
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  PostMessage(
    MyListBoxDescendant1->Handle,
    WM_STYLEMESSAGE,
    Integer(lbStandard),
```

```
    0);
}

116.1.4.5 TOleControl Properties

The properties of the TOleControl class are listed here.

Protected Properties

	Name	Description
	ControlData (see page 18086)	This is ControlData, a member of class TOleControl.

Public Properties

	Name	Description
	Anchors (see page 18085)	Specifies how the control is anchored to its parent.
R	DefaultDispatch (see page 18086)	The default dispatch interface.
R	OleObject (see page 18086)	The ActiveX control associated with the TOleControl (see page 18030) object.
R	PerPropBrowsing (see page 18086)	Provides access to information about the property page properties of the OleControl.
	TabStop (see page 18087)	Determines if the user can tab to a control.

116.1.4.5.1 TOleControl.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

116.1.4.5.2 TOleControl.ControlData Property

Pascal

```
property ControlData: PControlData;
```

C++

```
__property PControlData ControlData;
```

Description

This is ControlData, a member of class TOleControl.

116.1.4.5.3 TOleControl.DefaultDispatch Property

The default dispatch interface.

Pascal

```
property DefaultDispatch: IDispatch;
```

C++

```
__property IDispatch DefaultDispatch;
```

Description

DefaultDispatch default dispatch interface that the TOleControl (see page 18030) object encapsulates. For those ActiveX controls that have multiple dispatch interfaces, one is typically identified as the default.

116.1.4.5.4 TOleControl.OleObject Property

The ActiveX control associated with the TOleControl (see page 18030) object.

Pascal

```
property OleObject: Variant;
```

C++

```
__property Variant OleObject;
```

Description

OleObject is used to get the ActiveX control that is associated with the TOleControl (see page 18030)

116.1.4.5.5 TOleControl.PerPropBrowsing Property

Provides access to information about the property page properties of the OleControl.

Pascal

```
property PerPropBrowsing: IPerPropertyBrowsing;
```

C++

```
__property IPerPropertyBrowsing PerPropBrowsing;
```

Description

PerPropBrowsing is an interface to information about the properties of the OleControl as they appear on the associated property page.

116.1.4.5.6 TOleControl.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

116.1.4.6 TOleControl Events

The events of the TOleControl class are listed here.

Public Events

	Name	Description
	ServiceQuery (see page 18087)	This is ServiceQuery, a member of class TOleControl.

116.1.4.6.1 TOleControl.ServiceQuery Event

Pascal

```
property ServiceQuery: TServiceQuery;
```

C++

```
__property TServiceQuery ServiceQuery;
```

Description

This is ServiceQuery, a member of class TOleControl.

116.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	FontToOleFont (see page 18088)	Returns a Variant containing an IFontDispatch interface that represents a TFont object.
	OleFontToFont (see page 18088)	Fills in a TFont structure to represent an IFontDispatch.

116.2.1 OleCtrls.FontToOleFont Function

Returns a Variant containing an IFontDispatch interface that represents a TFont object.

Pascal

```
function FontToOleFont(Font: TFont): Variant;
```

C++

```
Variant FontToOleFont(TFont Font);
```

File

OleCtrls

Description

Use FontToOleFont to convert a font from TFont to IFontDispatch format. The interface uses the TFont object to implement the methods of the interface.

See Also

OleFontToFont (see page 18088)

OleStrToStrVar

StringToOleStr

OleStrToString

116.2.2 OleCtrls.OleFontToFont Function

Fills in a TFont structure to represent an IFontDispatch.

Pascal

```
procedure OleFontToFont(const OleFont: Variant; Font: TFont);
```

C++

```
OleFontToFont(const Variant OleFont, TFont Font);
```

File

OleCtrls

Description

Use OleFontToFont to convert a font from COM (IFontDispatch) to TFont format.

See Also

FontToOleFont (see page 18088)

OleStrToStrVar

StringToOleStr

OleStrToString

116.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TControlData (see page 18090)	This is record OleCtrls.TControlData.
	TControlData2 (see page 18091)	This is record OleCtrls.TControlData2.
	TEnumValue (see page 18091)	This is record OleCtrls.TEnumValue.

116.3.1 OleCtrls.TControlData Record

Pascal

```
TControlData = record
  ClassID: TGUID;
  EventIID: TGUID;
  EventCount: Longint;
  EventDispIDs: Pointer;
  LicenseKey: Pointer;
  Flags: DWORD;
  Version: Integer;
  FontCount: Integer;
  FontIDs: PDispIDList;
  PictureCount: Integer;
  PictureIDs: PDispIDList;
  Reserved: Integer;
  InstanceCount: Integer;
  EnumPropDescs: TList;
end;
```

C++

```
struct TControlData {
  TGUID ClassID;
  TGUID EventIID;
  Longint EventCount;
  void * EventDispIDs;
  void * LicenseKey;
  DWORD Flags;
  int Version;
  int FontCount;
  PDispIDList FontIDs;
  int PictureCount;
  PDispIDList PictureIDs;
  int Reserved;
  int InstanceCount;
  TList EnumPropDescs;
};
```

File

OleCtrls

Description

This is record OleCtrls.TControlData.

116.3.2 OleCtrls.TControlData2 Record

Pascal

```
TControlData2 = record
  ClassID: TGUID;
  EventIID: TGUID;
  EventCount: Longint;
  EventDispIDs: Pointer;
  LicenseKey: Pointer;
  Flags: DWORD;
  Version: Integer;
  FontCount: Integer;
  FontIDs: PDispIDList;
  PictureCount: Integer;
  PictureIDs: PDispIDList;
  Reserved: Integer;
  InstanceCount: Integer;
  EnumPropDescs: TList;
  FirstEventOfs: Cardinal;
end;
```

C++

```
struct TControlData2 {
  TGUID ClassID;
  TGUID EventIID;
  Longint EventCount;
  void * EventDispIDs;
  void * LicenseKey;
  DWORD Flags;
  int Version;
  int FontCount;
  PDispIDList FontIDs;
  int PictureCount;
  PDispIDList PictureIDs;
  int Reserved;
  int InstanceCount;
  TList EnumPropDescs;
  unsigned FirstEventOfs;
};
```

File

OleCtrls

Description

This is record OleCtrls.TControlData2.

116.3.3 OleCtrls.TEnumValue Record

Pascal

```
TEnumValue = record
  Value: Longint;
  Ident: string;
end;
```

C++

```
struct TEnumValue {
  Longint Value;
  AnsiString Ident;
};
```

File

OleCtrls

Description

This is record OleCtrls.TEnumValue.

116.4 Types

The following table lists types in this documentation.

Types

Name	Description
PControlData (see page 18093)	This is type OleCtrls.PControlData.
PControlData2 (see page 18093)	This is type OleCtrls.PControlData2.
PEnumValueList (see page 18094)	This is type OleCtrls.PEnumValueList.
TEnumValueList (see page 18094)	This is type OleCtrls.TEnumValueList.
TOleEnum (see page 18094)	This is type OleCtrls.TOleEnum.
TServiceQuery (see page 18095)	This is type OleCtrls.TServiceQuery.

116.4.1 OleCtrls.PControlData Type

Pascal

```
PControlData = ^TControlData;
```

C++

```
^TControlData PControlData;
```

File

OleCtrls

Description

This is type OleCtrls.PControlData.

116.4.2 OleCtrls.PControlData2 Type

Pascal

```
PControlData2 = ^TControlData2;
```

C++

```
^TControlData2 PControlData2;
```

File

OleCtrls

Description

This is type OleCtrls.PControlData2.

116.4.3 OleCtrls.PEnumValueList Type

Pascal

```
PEnumValueList = ^TEnumValueList;
```

C++

```
^TEnumValueList PEnumValueList;
```

File

OleCtrls

Description

This is type OleCtrls.PEnumValueList.

116.4.4 OleCtrls.TEnumValueList Type

Pascal

```
TEnumValueList = array[0..32767] of TEnumValue;
```

C++

```
array[0..32767] of TEnumValue TEnumValueList;
```

File

OleCtrls

Description

This is type OleCtrls.TEnumValueList.

116.4.5 OleCtrls.TOleEnum Type

Pascal

```
TOleEnum = ActiveX.TOleEnum;
```

C++

```
ActiveX.TOleEnum TOleEnum;
```

File

OleCtrls

Description

This is type OleCtrls.TOleEnum.

116.4.6 OleCtrls.TServiceQuery Type

Pascal

```
TServiceQuery = function (const rsid, iid: TGuid; out obj): HResult of object;
```

C++

```
(const rsid, iid: TGuid; out obj): HResult ( TServiceQuery)();
```

File

OleCtrls

Description

This is type OleCtrls.TServiceQuery.

116.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
EmptyParam (see page 18096)	This is variable OleCtrls.EmptyParam.

116.5.1 OleCtrls.EmptyParam Variable

Pascal

```
EmptyParam: OleVariant;
```

C++

```
OleVariant EmptyParam;
```

File

OleCtrls

Description

This is variable OleCtrls.EmptyParam.

117 OleServer Namespace

This is namespace OleServer.

Topics

Name	Description
Classes (see page 18098)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 18117)	The following table lists structs, records, enums in this documentation.
Types (see page 18119)	The following table lists types in this documentation.

Classes

	Name	Description
	TOleServer (see page 18098)	TOleServer is the base class for components that represent an imported COM server.
	TServerEventDispatch (see page 18112)	This is class OleServer.TServerEventDispatch.

Structs, Records, Enums

	Name	Description
	TConnectKind (see page 18117)	This is record OleServer.TConnectKind.
	TServerData (see page 18117)	This is record OleServer.TServerData.

Types

Name	Description
PServerData (see page 18119)	This is type OleServer.PServerData.
TVariantArray (see page 18119)	This is type OleServer.TVariantArray.

117.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TOleServer (see page 18098)	TOleServer is the base class for components that represent an imported COM server.
	TServerEventDispatch (see page 18112)	This is class OleServer.TServerEventDispatch.

117.1.1 TOleServer Class

TOleServer is the base class for components that represent an imported COM server.

Class Hierarchy

Pascal

```
TOleServer = class(TComponent, IUnknown);
```

C++

```
class TOleServer : public TComponent, public IUnknown;
```

File

OleServer

Description

TOleServer is the base class for COM servers that are imported by choosing Project|Import Type Library from the IDE. TOleServer introduces several properties and methods that manage the connection to a COM server and for invoking its default events.

Descendants of TOleServer expose the properties, methods, and events of the server CoClass. When an application calls one of the TOleServer descendant's methods or sets one of its properties, the component automatically establishes a connection to the COM server. You can also connect explicitly by calling the Connect (see page 18104) method.

Do not create instances of TOleServer. TOleServer relies on abstract pure virtual methods to establish and break a connection to the COM server. Instead, use a descendant of TOleServer that wraps the desired server. Numerous TOleServer descendants are provided on the Servers tab of the Component Palette. In addition, you can create your own descendants by importing a server's type library.

See Also

Code Generated When You Import Type Library Information

117.1.1.1 TOleServer Members

The following tables list the members exposed by TOleServer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 18104)	Increments the reference count for the number of interface references dependent on the OLE server.
	_Release (see page 18104)	Decrements the reference count for the calling interface on a object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ConnectEvents (see page 18105)	Establishes a connection using the EventDispatch (see page 18111) property as an event sink.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DisconnectEvents (see page 18106)	Terminates a connection that was established using the ConnectEvents (see page 18105) method.
	GetAutoConnect (see page 18106)	Returns the value of the AutoConnect (see page 18110) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetConnectKind (see page 18106)	Returns the value of the ConnectKind (see page 18110) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetServer (see page 18107)	Returns an interface for the COM server.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
A	InitServerData (see page 18107)	Initializes the ServerData (see page 18111) property to reflect the type library information of the COM server.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	InvokeEvent (see page 18107)	Dispatches an event from the COM server to the appropriate event handler.
V	Loaded (see page 18108)	Connects to the COM server when the Loaded object is first loaded into memory if AutoConnect (see page 18110) is True true.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 18108)	Returns a reference to a specified interface if the OLE server supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoConnect (see page 18109)	Sets the value of the AutoConnect (see page 18110) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnectKind (see page 18109)	Sets the value of the ConnectKind (see page 18110) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	EventDispatch (see page 18111)	This is EventDispatch, a member of class TOleServer.
	ServerData (see page 18111)	Encodes information about the COM server to which ServerData connects.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
A	Connect (see page 18104)	Establishes a connection to the COM server.
V	Create (see page 18101)	Allocates memory and constructs a safely initialized instance of a component.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18102)	Disposes of the component and its owned components.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
A	Disconnect (see page 18105)	Terminates the connection to the COM server.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	AutoConnect (see page 18110)	Specifies whether the component automatically connects to the server.
	ConnectKind (see page 18110)	Indicates the type of process to which the ConnectKind component establishes a connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RemoteMachineName (see page 18111)	Specifies the machine running the COM server when ConnectKind (see page 18110) is ckRemote.
	Tag (see page 2808)	Stores an integer value as part of a component.

117.1.1.2 TOleServer.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TOleServer(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

Components (see page 2799)

ComponentStyle (see page 2805)

Create (see page 22287)

Destroy (see page 2766)

Free (see page 22300)

Owner (see page 2807)

117.1.1.3 TOleServer.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOleServer();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

117.1.1.4 TOleServer Methods

The methods of the TOleServer class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 18104)	Increments the reference count for the number of interface references dependent on the OLE server.
	_Release (see page 18104)	Decrements the reference count for the calling interface on a object.
	ConnectEvents (see page 18105)	Establishes a connection using the EventDispatch (see page 18111) property as an event sink.
	DisconnectEvents (see page 18106)	Terminates a connection that was established using the ConnectEvents (see page 18105) method.
	GetAutoConnect (see page 18106)	Returns the value of the AutoConnect (see page 18110) property.
	GetConnectKind (see page 18106)	Returns the value of the ConnectKind (see page 18110) property.
V	GetServer (see page 18107)	Returns an interface for the COM server.
A	InitServerData (see page 18107)	Initializes the ServerData (see page 18111) property to reflect the type library information of the COM server.
V	InvokeEvent (see page 18107)	Dispatches an event from the COM server to the appropriate event handler.
V	Loaded (see page 18108)	Connects to the COM server when the Loaded object is first loaded into memory if AutoConnect (see page 18110) is True true.
V	QueryInterface (see page 18108)	Returns a reference to a specified interface if the OLE server supports that interface.
	SetAutoConnect (see page 18109)	Sets the value of the AutoConnect (see page 18110) property.
	SetConnectKind (see page 18109)	Sets the value of the ConnectKind (see page 18110) property.

Public Methods

	Name	Description
A	Connect (see page 18104)	Establishes a connection to the COM server.
A	Disconnect (see page 18105)	Terminates the connection to the COM server.

117.1.1.4.1 TOleServer._AddRef Method

Increments the reference count for the number of interface references dependent on the OLE server.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

_AddRef implements the IUnknown interface method, AddRef, which increments the reference count of objects using the OLE server's interface. _AddRef returns the resulting value of the reference count.

See Also

Invoke (see page 2781)

QueryInterface (see page 18108)

_Release (see page 18104)

117.1.1.4.2 TOleServer._Release Method

Decrements the reference count for the calling interface on a object.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

_Release implements the IUnknown interface method, Release, which decrements the reference count of objects using the OLE server's interface. If the reference count on the interface falls to 0, the server object is freed from memory.

_Release returns the resulting value of the reference count.

See Also

Invoke (see page 2781)

QueryInterface (see page 18108)

_AddRef (see page 18104)

117.1.1.4.3 TOleServer.Connect Method

Establishes a connection to the COM server.

Pascal

```
procedure Connect; virtual; abstract;
```

C++

```
virtual __fastcall Connect() = 0;
```

Description

Call Connect to connect the Connect component to the COM server it represents. If the AutoConnect (see page 18110)

property is True true, the Connect component automatically calls Connect when the application is first run.

Do not use Connect if the value of ConnectKind (see page 18110) is ckAttachToInterface. When attaching to an interface, use the ConnectTo method, which is introduced by descendant classes, instead.

If the value of ConnectKind (see page 18110) is ckRemote, the RemoteMachineName (see page 18111) property must be set before calling Connect.

Connect introduces Connect as an abstract a pure virtual method. Descendant classes must override this method to let the Connect component connect to a specific type of COM server.

See Also

AutoConnect (see page 18110)

ConnectKind (see page 18110)

RemoteMachineName (see page 18111)

Disconnect (see page 18105)

Using Component Wrappers

117.1.1.4.4 TOleServer.ConnectEvents Method

Establishes a connection using the EventDispatch (see page 18111) property as an event sink.

Pascal

```
procedure ConnectEvents(const Obj: IUnknown);
```

C++

```
__fastcall ConnectEvents(const IUnknown Obj);
```

Description

ConnectEvents descendants use ConnectEvents internally to implement their event handlers for events on the COM server. If the ConnectEvents descendant does not expose any server events, ConnectEvents is not used.

The Obj parameter is an interface for the COM server that generates events.

See Also

EventDispatch (see page 18111)

DisconnectEvents (see page 18106)

117.1.1.4.5 TOleServer.Disconnect Method

Terminates the connection to the COM server.

Pascal

```
procedure Disconnect; virtual; abstract;
```

C++

```
virtual __fastcall Disconnect() = 0;
```

Description

Call Disconnect to terminate a connection formed using the Connect (see page 18104) method.

Disconnect introduces Disconnect as an abstract a pure virtual method. Descendant classes must override this method to let the Disconnect component disconnect from a specific type of COM server.

See Also

Connect (see page 18104)

Using Component Wrappers

117.1.1.4.6 TOleServer.DisconnectEvents Method

Terminates a connection that was established using the ConnectEvents (see page 18105) method.

Pascal

```
procedure DisconnectEvents(const Obj: Iunknown);
```

C++

```
__fastcall DisconnectEvents(const Iunknown Obj);
```

Description

DisconnectEvents descendants use DisconnectEvents internally to terminate the connection established by ConnectEvents (see page 18105). If the DisconnectEvents descendant does not expose any server events, DisconnectEvents is not used.

The Obj parameter is an interface for the COM server that generates events.

See Also

ConnectEvents (see page 18105)

117.1.1.4.7 TOleServer.GetAutoConnect Method

Returns the value of the AutoConnect (see page 18110) property.

Pascal

```
function GetAutoConnect: Boolean;
```

C++

```
__fastcall Boolean GetAutoConnect();
```

Description

GetAutoConnect is the protected read implementation for the AutoConnect (see page 18110) property.

See Also

AutoConnect (see page 18110)

117.1.1.4.8 TOleServer.GetConnectKind Method

Returns the value of the ConnectKind (see page 18110) property.

Pascal

```
function GetConnectKind: TConnectKind;
```

C++

```
__fastcall TConnectKind GetConnectKind();
```

Description

GetConnectKind is the protected read implementation for the ConnectKind (see page 18110) property.

See Also

ConnectKind (see page 18110)

117.1.1.4.9 TOleServer.GetServer Method

Returns an interface for the COM server.

Pascal

```
function GetServer: IUnknown; virtual;
```

C++

```
virtual __fastcall IUnknown GetServer();
```

Description

GetServer descendants call GetServer from the implementation of their Connect (see page 18104) methods. GetServer obtains an interface for the COM server described by ServerData (see page 18111). The ConnectKind (see page 18110) property indicates how GetServer can obtain the interface.

See Also

Connect (see page 18104)

ConnectKind (see page 18110)

ServerData (see page 18111)

117.1.1.4.10 TOleServer.InitServerData Method

Initializes the ServerData (see page 18111) property to reflect the type library information of the COM server.

Pascal

```
procedure InitServerData; virtual; abstract;
```

C++

```
virtual __fastcall InitServerData() = 0;
```

Description

The InitServerData constructor calls InitServerData to initialize ServerData (see page 18111) with information from the COM server's type library.

InitServerData is an abstract a pure virtual method in InitServerData. Each InitServerData descendant implements this method so that the ServerData (see page 18111) property reflects its particular COM server.

See Also

ServerData (see page 18111)

Create (see page 18101)

117.1.1.4.11 TOleServer.InvokeEvent Method

Dispatches an event from the COM server to the appropriate event handler.

Pascal

```
procedure InvokeEvent(DispID: TDispID; var Params: TVariantArray); virtual;
```

C++

```
virtual __fastcall InvokeEvent(TDispID DispID, TVariantArray Params);
```

Description

InvokeEvent descendants use InvokeEvent internally to link their event handlers to events on the COM server.

DispID is the dispatch ID for the appropriate event handler.

Params passes the parameters of the event handler as an array of OleVariants.

As implemented in InvokeEvent, InvokeEvent does nothing, because InvokeEvent has no events. Descendants that surface events from a COM server override this method so that the event sink specified by EventDispatch (see page 18111) can pass events on to the appropriate event handlers.

See Also

EventDispatch (see page 18111)

117.1.1.4.12 TOleServer.Loaded Method

Connects to the COM server when the Loaded object is first loaded into memory if AutoConnect (see page 18110) is True true.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

The VCL streaming system automatically calls Loaded after the Loaded component is loaded into memory.

Loaded checks the AutoConnect (see page 18110) property, and if it is True true, calls the Connect (see page 18104) method to establish a connection.

See Also

AutoConnect (see page 18110)

Loaded (see page 2782)

117.1.1.4.13 TOleServer.QueryInterface Method

Returns a reference to a specified interface if the OLE server supports that interface.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override;
```

C++

```
virtual __fastcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface implements the IUnknown interface method QueryInterface. QueryInterface returns a reference to the interface specified by the IID parameter as the Obj parameter. If the OLE server does not support the interface, the Obj parameter returns nil NULL and QueryInterface returns a nonzero error code.

See Also

_AddRef (see page 18104)

_Release (see page 18104)

Invoke (see page 2781)

117.1.1.4.14 TOleServer.SetAutoConnect Method

Sets the value of the AutoConnect (see page 18110) property.

Pascal

```
procedure SetAutoConnect(flag: Boolean);
```

C++

```
__fastcall SetAutoConnect(Boolean flag);
```

Description

SetAutoConnect is the protected write implementation for the AutoConnect (see page 18110) property.

See Also

AutoConnect (see page 18110)

117.1.1.4.15 TOleServer.SetConnectKind Method

Sets the value of the ConnectKind (see page 18110) property.

Pascal

```
procedure SetConnectKind(ck: TConnectKind);
```

C++

```
__fastcall SetConnectKind(TConnectKind ck);
```

Description

SetConnectKind is the protected write implementation for the ConnectKind (see page 18110) property.

See Also

ConnectKind (see page 18110)

117.1.1.5 TOleServer Properties

The properties of the TOleServer class are listed here.

Protected Properties

	Name	Description
	EventDispatch (see page 18111)	This is EventDispatch, a member of class TOleServer.
	ServerData (see page 18111)	Encodes information about the COM server to which ServerData connects.

Published Properties

	Name	Description
	AutoConnect (see page 18110)	Specifies whether the component automatically connects to the server.
	ConnectKind (see page 18110)	Indicates the type of process to which the ConnectKind component establishes a connection.
	RemoteMachineName (see page 18111)	Specifies the machine running the COM server when ConnectKind (see page 18110) is ckRemote.

117.1.1.5.1 TOleServer.AutoConnect Property

Specifies whether the component automatically connects to the server.

Pascal

```
property AutoConnect: Boolean;
```

C++

```
__property Boolean AutoConnect;
```

Description

Set AutoConnect to True true to specify whether the server should be loaded automatically when the application first starts up. If AutoConnect is False false, the application establishes a connection when it calls one of the AutoConnect descendant's methods, sets a property, or calls the Connect (see page 18104) method.

Note: AutoConnect only establishes a connection when the application is first run. Changing the AutoConnect property at runtime has no effect.

See Also

Connect (see page 18104)

Using Component Wrappers

117.1.1.5.2 TOleServer.ConnectKind Property

Indicates the type of process to which the ConnectKind component establishes a connection.

Pascal

```
property ConnectKind: TConnectKind;
```

C++

```
__property TConnectKind ConnectKind;
```

Description

Set ConnectKind to indicate how the ConnectKind component establishes a connection. ConnectKind establishes the connection when the application is run (if AutoConnect (see page 18110) is True true) or when the application calls the Connect (see page 18104) (or ConnectTo) method.

The following table lists the possible values:

Value	Meaning
ckRunningOrNew	Attach to a running server or create a new instance of the server.
ckNewInstance	Always create a new instance of the server.
ckRunningInstance	Only attach to a running instance of the server.
ckRemote	Bind to a remote instance of the server. When using this option, you must supply a value for RemoteMachineName (see page 18111).
ckAttachToInterface	Don't bind to the server. Instead, the application supplies an interface using the ConnectTo method, which is introduced in descendant classes. This option can't be used with the AutoConnect (see page 18110) property.

See Also

Connect (see page 18104)

RemoteMachineName (see page 18111)

AutoConnect (see page 18110)

Using Component Wrappers

117.1.1.5.3 TOleServer.EventDispatch Property

Pascal

```
property EventDispatch: TServerEventDispatch;
```

C++

```
__property TServerEventDispatch EventDispatch;
```

Description

This is EventDispatch, a member of class TOleServer.

117.1.1.5.4 TOleServer.RemoteMachineName Property

Specifies the machine running the COM server when ConnectKind (see page 18110) is ckRemote.

Pascal

```
property RemoteMachineName: string;
```

C++

```
__property AnsiString RemoteMachineName;
```

Description

Use RemoteMachineName when the COM server instance is running remotely on another machine. Specify the name of the machine on which the COM server is running as the value of RemoteMachineName.

Note: RemoteMachineName is only used if ConnectKind (see page 18110) is ckRemote. Setting RemoteMachineName to a non-empty string sets ConnectKind (see page 18110) to ckRemote.

See Also

ConnectKind (see page 18110)

Connect (see page 18104)

Using Component Wrappers

117.1.1.5.5 TOleServer.ServerData Property

Encodes information about the COM server to which ServerData connects.

Pascal

```
property ServerData: PServerData;
```

C++

```
__property PServerData ServerData;
```

Description

ServerData uses ServerData internally to store type library information describing its COM server. Each ServerData descendant initializes this property in the constructor, specifying the information it needs to establish a connection.

See Also

InitServerData (see page 18107)

117.1.2 TServerEventDispatch Class

Class Hierarchy

Pascal

```
TServerEventDispatch = class(TObject, IUnknown, IDispatch);
```

C++

```
class TServerEventDispatch : public TObject, public IUnknown, public IDispatch;
```

File

OleServer

Description

This is class OleServer.TServerEventDispatch.

117.1.2.1 TServerEventDispatch Members

The following tables list the members exposed by TServerEventDispatch.

Protected Methods

	Name	Description
	_AddRef (see page 18114)	This is _AddRef, a member of class TServerEventDispatch.
	_Release (see page 18114)	This is _Release, a member of class TServerEventDispatch.
	GetIDsOfNames (see page 18114)	This is GetIDsOfNames, a member of class TServerEventDispatch.
	GetTypeInfo (see page 18114)	This is GetTypeInfo, a member of class TServerEventDispatch.
	GetTypeInfoCount (see page 18114)	This is GetTypeInfoCount, a member of class TServerEventDispatch.
	Invoke (see page 18115)	This is Invoke, a member of class TServerEventDispatch.
	QueryInterface (see page 18115)	This is QueryInterface, a member of class TServerEventDispatch.
	ServerDisconnect (see page 18115)	This is ServerDisconnect, a member of class TServerEventDispatch.

Protected Properties

	Name	Description
R	Server (see page 18116)	This is Server, a member of class TServerEventDispatch.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18113)	This is Create, a member of class TServerEventDispatch.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

117.1.2.2 TServerEventDispatch.Create Constructor

Pascal

```
constructor Create(Server: TOleServer);
```

C++

```
__fastcall TServerEventDispatch(TOleServer Server);
```

Description

This is Create, a member of class TServerEventDispatch.

117.1.2.3 TServerEventDispatch Methods

The methods of the TServerEventDispatch class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 18114)	This is _AddRef, a member of class TServerEventDispatch.
	_Release (see page 18114)	This is _Release, a member of class TServerEventDispatch.
	GetIDsOfNames (see page 18114)	This is GetIDsOfNames, a member of class TServerEventDispatch.
	GetTypeInfo (see page 18114)	This is GetTypeInfo, a member of class TServerEventDispatch.
	GetTypeInfoCount (see page 18114)	This is GetTypeInfoCount, a member of class TServerEventDispatch.
	Invoke (see page 18115)	This is Invoke, a member of class TServerEventDispatch.
	QueryInterface (see page 18115)	This is QueryInterface, a member of class TServerEventDispatch.
	ServerDisconnect (see page 18115)	This is ServerDisconnect, a member of class TServerEventDispatch.

117.1.2.3.1 TServerEventDispatch._AddRef Method

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

This is _AddRef, a member of class TServerEventDispatch.

117.1.2.3.2 TServerEventDispatch._Release Method

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

This is _Release, a member of class TServerEventDispatch.

117.1.2.3.3 TServerEventDispatch.GetIDsOfNames Method

Pascal

```
function GetIDsOfNames(const IID: TGUID; Names: Pointer; NameCount: Integer; LocaleID:
Integer; DispIDs: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetIDsOfNames(const TGUID IID, void * Names, int NameCount, int
LocaleID, void * DispIDs);
```

Description

This is GetIDsOfNames, a member of class TServerEventDispatch.

117.1.2.3.4 TServerEventDispatch.GetTypeInfo Method

Pascal

```
function GetTypeInfo(Index: Integer; LocaleID: Integer; out TypeInfo): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfo(int Index, int LocaleID,  TypeInfo);
```

Description

This is GetTypeInfo, a member of class TServerEventDispatch.

117.1.2.3.5 TServerEventDispatch.GetTypeInfoCount Method

Pascal

```
function GetTypeInfoCount(out Count: Integer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfoCount(int Count);
```

Description

This is GetTypeInfoCount, a member of class TServerEventDispatch.

117.1.2.3.6 TServerEventDispatch.Invoke Method

Pascal

```
function Invoke(DispID: Integer; const IID: TGUID; LocaleID: Integer; Flags: Word; var Params;
VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Invoke(int DispID, const TGUID IID, int LocaleID, Word Flags,
Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

This is Invoke, a member of class TServerEventDispatch.

117.1.2.3.7 TServerEventDispatch.QueryInterface Method

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

This is QueryInterface, a member of class TServerEventDispatch.

117.1.2.3.8 TServerEventDispatch.ServerDisconnect Method

Pascal

```
function ServerDisconnect: Boolean;
```

C++

```
__fastcall Boolean ServerDisconnect();
```

Description

This is ServerDisconnect, a member of class TServerEventDispatch.

117.1.2.4 TServerEventDispatch Properties

The properties of the TServerEventDispatch class are listed here.

Protected Properties

	Name	Description
R	Server (see page 18116)	This is Server, a member of class TServerEventDispatch.

117.1.2.4.1 TServerEventDispatch.Server Property

Pascal

```
property Server: TOleServer;
```

C++

```
__property TOleServer Server;
```

Description

This is Server, a member of class TServerEventDispatch.

117.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TConnectKind (see page 18117)	This is record OleServer.TConnectKind.

Records

	Name	Description
	TServerData (see page 18117)	This is record OleServer.TServerData.

117.2.1 OleServer.TConnectKind Enumeration

Pascal

```
TConnectKind = (
  ckRunningOrNew,
  ckNewInstance,
  ckRunningInstance,
  ckRemote,
  ckAttachToInterface
);
```

C++

```
enum TConnectKind {
  ckRunningOrNew,
  ckNewInstance,
  ckRunningInstance,
  ckRemote,
  ckAttachToInterface
};
```

File

OleServer

Description

This is record OleServer.TConnectKind.

117.2.2 OleServer.TServerData Record

Pascal

```
TServerData = record
  ClassID: TGUID;
  IntfIID: TGUID;
  EventIID: TGUID;
  LicenseKey: Pointer;
  Version: Integer;
  InstanceCount: Integer;
```

```
end;
```

C++

```
struct TServerData {
  TGUID ClassID;
  TGUID IntfIID;
  TGUID EventIID;
  void * LicenseKey;
  int Version;
  int InstanceCount;
};
```

File

OleServer

Description

This is record OleServer.TServerData.

117.3 Types

The following table lists types in this documentation.

Types

Name	Description
PServerData (see page 18119)	This is type OleServer.PServerData.
TVariantArray (see page 18119)	This is type OleServer.TVariantArray.

117.3.1 OleServer.PServerData Type

Pascal

```
PServerData = ^TServerData;
```

C++

```
^TServerData PServerData;
```

File

OleServer

Description

This is type OleServer.PServerData.

117.3.2 OleServer.TVariantArray Type

Pascal

```
TVariantArray = Array of OleVariant;
```

C++

```
Array of OleVariant TVariantArray;
```

File

OleServer

Description

This is type OleServer.TVariantArray.

118 OPConvert Namespace

This is namespace OPConvert.

Topics

Name	Description
Interfaces (see page 18122)	The following table lists interfaces in this documentation.
Structs, Records, Enums (see page 18132)	The following table lists structs, records, enums in this documentation.
Types (see page 18133)	The following table lists types in this documentation.

Interfaces

	Name	Description
	IOPConvert (see page 18122)	IOPConvert is the interface for marshaling and unmarshaling method calls on an invokable interface.

Structs, Records, Enums

	Name	Description
	TSOAPConvertOption (see page 18132)	This is record OPConvert.TSOAPConvertOption.

Types

Name	Description
TSOAPConvertOptions (see page 18133)	This is type OPConvert.TSOAPConvertOptions.

118.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IOPConvert (see page 18122)	IOPConvert is the interface for marshaling and unmarshaling method calls on an invokable interface.

118.1.1 IOPConvert Interface

IOPConvert is the interface for marshaling and unmarshaling method calls on an invokable interface.

Class Hierarchy

OPConvert.IOPConvert

Pascal

```
IOPConvert = interface;
```

C++

```
__interface IOPConvert;
```

File

OPConvert

Description

IOPConvert is implemented by classes that marshal and unmarshal method calls in Web Service applications. It defines methods for marshaling and unmarshaling method calls, as well as any exceptions that occur when attempting to execute those method calls.

The IOPConvert interface is used by remote interfaced objects on the client (TRIO descendants) and invoker components on the server (TSoapPascalInvoker descendants). Both the remote interfaced object and the invoker classes use the same IOPConvert implementation class, which represents a single encoding system (such as SOAP).

Classes (see page 2685) that implement IOPConvert use the runtime type information (RTTI) on an invokable interface to interpret or encode method calls. They do not execute these calls, but rather, convert between transportable strings that are the encoding of interface method calls and an invocation context (TInvContext object).

Note: C++ method declarations that use IOPConvert use the _di_IOPConvert type instead. This type is a DelphiInterface wrapper around the IOPConvert interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IOPConvert >  _di_IOPConvert;
```

See Also

TOPToSoapDomConvert (see page 18137)

TRio

TSoapPascalInvoker (see page 20020)

TInvContext (see page 15516)

118.1.1.1 IOPConvert Members

The following tables list the members exposed by IOPConvert.

Public Methods

	Name	Description
	GetAttachments (see page 18124)	Returns the value of the Attachments (see page 18130) property.
	GetEncoding (see page 18124)	Returns the value of the Encoding (see page 18130) property.
	GetOptions (see page 18124)	Returns the value of the Options (see page 18131) property.
	GetTempDir (see page 18124)	Returns the value of the TempDir (see page 18131) property.
	InvContextToMsg (see page 18125)	Marshals a method call from an invocation context to a transportable string.
	MakeFault (see page 18125)	Encodes an exception that was raised when trying to execute a method on an invokable interface.
	MakeResponse (see page 18126)	Encodes the results of successfully executing a method on an invokable interface.
	MsgToInvContext (see page 18126)	This is the overview for the MsgToInvContext method overload.
	ProcessResponse (see page 18127)	This is the overview for the ProcessResponse method overload.
	SetAttachments (see page 18128)	Sets the value of the Attachments (see page 18130) property.
	SetEncoding (see page 18129)	Sets the value of the Encoding (see page 18130) property.
	SetOptions (see page 18129)	Sets the value of the Options (see page 18131) property.
	SetTempDir (see page 18129)	Sets the value of the TempDir (see page 18131) property.

Public Properties

	Name	Description
	Attachments (see page 18130)	Lists the objects that encapsulate the attachments included with the SOAP request or its response.
	Encoding (see page 18130)	Indicates the character set to use for encoded method calls.
	Options (see page 18131)	Controls (see page 5711) how certain types of conversions are performed.
	TempDir (see page 18131)	Specifies the directory where temporary files for attachments are saved.

118.1.1.2 IOPConvert Methods

The methods of the IOPConvert class are listed here.

Public Methods

	Name	Description
	GetAttachments (see page 18124)	Returns the value of the Attachments (see page 18130) property.
	GetEncoding (see page 18124)	Returns the value of the Encoding (see page 18130) property.
	GetOptions (see page 18124)	Returns the value of the Options (see page 18131) property.
	GetTempDir (see page 18124)	Returns the value of the TempDir (see page 18131) property.
	InvContextToMsg (see page 18125)	Marshals a method call from an invocation context to a transportable string.
	MakeFault (see page 18125)	Encodes an exception that was raised when trying to execute a method on an invokable interface.
	MakeResponse (see page 18126)	Encodes the results of successfully executing a method on an invokable interface.
	MsgToInvContext (see page 18126)	This is the overview for the MsgToInvContext method overload.
	ProcessResponse (see page 18127)	This is the overview for the ProcessResponse method overload.
	SetAttachments (see page 18128)	Sets the value of the Attachments (see page 18130) property.
	SetEncoding (see page 18129)	Sets the value of the Encoding (see page 18130) property.
	SetOptions (see page 18129)	Sets the value of the Options (see page 18131) property.
	SetTempDir (see page 18129)	Sets the value of the TempDir (see page 18131) property.

118.1.1.2.1 IOPConvert.GetAttachments Method

Returns the value of the Attachments (see page 18130) property.

Pascal

```
function GetAttachments: TSoapDataList;
```

C++

```
__fastcall TSoapDataList GetAttachments();
```

Description

GetAttachments is the read implementation for the Attachments (see page 18130) property.

See Also

Attachments (see page 18130)

118.1.1.2.2 IOPConvert.GetEncoding Method

Returns the value of the Encoding (see page 18130) property.

Pascal

```
function GetEncoding: WideString;
```

C++

```
__fastcall BSTR GetEncoding();
```

Description

GetEncoding is the read implementation for the Encoding (see page 18130) property.

See Also

Encoding (see page 18130)

118.1.1.2.3 IOPConvert.GetOptions Method

Returns the value of the Options (see page 18131) property.

Pascal

```
function GetOptions: TSOAPConvertOptions;
```

C++

```
__fastcall TSOAPConvertOptions GetOptions();
```

Description

GetOptions is the read implementation for the Options (see page 18131) property.

See Also

Options (see page 18131)

118.1.1.2.4 IOPConvert.GetTempDir Method

Returns the value of the TempDir (see page 18131) property.

Pascal

```
function GetTempDir: string;
```

C++

```
__fastcall AnsiString GetTempDir();
```

Description

GetTempDir is the read implementation for the TempDir (see page 18131) property.

See Also

TempDir (see page 18131)

118.1.1.2.5 IOPConvert.InvContextToMsg Method

Marshals a method call from an invocation context to a transportable string.

Pascal

```
function InvContextToMsg(const IntfMD: TIntfMetaData; MethNum: Integer; Con: TInvContext;
Headers: THeaderList): TStream;
```

C++

```
__fastcall TStream InvContextToMsg(const TIntfMetaData IntfMD, int MethNum, TInvContext Con,
THeaderList Headers);
```

Description

InvContextToMsg looks up a specified method call, including the types and values of any arguments, from an invocation context, and returns an encoded version of that method call that can be transported to the application that executes it.

IntfMD represents the runtime type information (RTTI) from the interface whose method is called.

MethNum identifies the called method by its position in the interface's method table.

Con is the invocation context that contains details of the method call, including the parameter values passed in, the calling conventions, and any other temporary data used when making the call.

Headers is a list of TSOAPHeader descendants that represent the headers of the SOAP envelope that contained the method call.

InvContextToMsg returns a stream from which an application can read the encoded version of the method call. This encoded method call can then be passed to an IWebNode interface for execution.

See Also

MsgToInvContext (see page 18127)

Execute (see page 25432)

118.1.1.2.6 IOPConvert.MakeFault Method

Encodes an exception that was raised when trying to execute a method on an invokable interface.

Pascal

```
procedure MakeFault(const Ex: Exception; EStream: TStream);
```

C++

```
__fastcall MakeFault(const Exception Ex, TStream EStream);
```

Description

MakeFault encodes an exception that a Web Service application catches when trying to execute a method on an invokable interface. It generates an encoded exception packet, which the client can decode and use to raise the exception on the client application.

Ex is the exception object that represents the exception that occurred.

EStream is a stream to which MakeFault writes the encoded exception packet.

See Also

MakeResponse (see page 18126)

118.1.1.2.7 IOPConvert.MakeResponse Method

Encodes the results of successfully executing a method on an invokable interface.

Pascal

```
procedure MakeResponse(const IntfMD: TIntfMetaData; const MethNum: Integer; Context:
TInvContext; Response: TStream; Headers: THeaderList);
```

C++

```
__fastcall MakeResponse(const TIntfMetaData IntfMD, const int MethNum, TInvContext Context,
TStream Response, THeaderList Headers);
```

Description

MakeResponse retrieves the results of executing a method on an invokable interface from an invocation context and packages them into a transportable string, which it writes to a stream. This string is passed back to the client, which can unpack it using the ProcessResponse (see page 18128) method.

IntfMD represents the runtime type information (RTTI) from the interface whose method was executed.

MethNum identifies the called method by its position in the interface's method table.

Context is the invocation context that contains details of the method call.

Response is a stream to which MakeResponse writes the encoded version of the method result and any output parameters.

Headers is a list of TSOAPHeader descendants that represent the headers that should be added to the response message.

See Also

MakeFault (see page 18125)

ProcessResponse (see page 18128)

118.1.1.2.8 MsgToInvContext Method

This is the overview for the MsgToInvContext method overload.

Overload List

	Name	Description
	IOPConvert.MsgToInvContext (InvString, TIntfMetaData, Integer, TInvContext) (see page 18127)	Unpacks an encoded method call into an invocation context so that it can be executed.

	IOPConvert.MsgToInvContext (TStream, TIntfMetaData, Integer, TInvContext, THeaderList) (see page 18127)	Unpacks an encoded method call into an invocation context so that it can be executed.

118.1.1.2.8.1 IOPConvert.MsgToInvContext Method (InvString, TIntfMetaData, Integer, TInvContext)

Unpacks an encoded method call into an invocation context so that it can be executed.

Pascal

```
procedure MsgToInvContext(const Request: InvString; const IntfMD: TIntfMetaData; var MethNum:
Integer; Context: TInvContext); overload;
procedure MsgToInvContext(const Request: TStream; const IntfMD: TIntfMetaData; var MethNum:
Integer; Context: TInvContext; Headers: THeaderList); overload;
```

C++

```
__fastcall MsgToInvContext(const InvString Request, const TIntfMetaData IntfMD, int MethNum,
TInvContext Context);
__fastcall MsgToInvContext(const TStream Request, const TIntfMetaData IntfMD, int MethNum,
TInvContext Context, THeaderList Headers);
```

Description

MsgToInvContext takes an encoded message that a server application receives and uses it to fill out an invocation context, which can then be used to execute the method call.

Request is the encoded method call, or a stream from which to read that method call. It is generated on the client by a call to InvContextToMsg (see page 18125).

IntfMD represents the runtime type information (RTTI) from the interface whose method is called.

MethNum returns the position of the called method in the interface's method table.

Context is the invocation context to which this method adds the information encoded in Request.

Headers is an object list to which MsgToInvContext adds TSOAPHeader descendants to represent every header in the encoded message.

See Also

InvContextToMsg (see page 18125)

118.1.1.2.9 ProcessResponse Method

This is the overview for the ProcessResponse method overload.

Overload List

	Name	Description
	IOPConvert.ProcessResponse (InvString, TIntfMetaData, TIntfMethEntry, TInvContext) (see page 18128)	Unpacks the response packet from a method call into an invocation context.
	IOPConvert.ProcessResponse (TStream, TIntfMetaData, TIntfMethEntry, TInvContext, THeaderList) (see page 18128)	Unpacks the response packet from a method call into an invocation context.

118.1.1.2.9.1 IOPConvert.ProcessResponse Method (InvString, TIntfMetaData, TIntfMethEntry, TInvContext)

Unpacks the response packet from a method call into an invocation context.

Pascal

```
procedure ProcessResponse(const Resp: TStream; const IntfMD: TIntfMetaData; const MD:
TIntfMethEntry; Context: TInvContext; Headers: THeaderList); overload;
procedure ProcessResponse(const Resp: InvString; const IntfMD: TIntfMetaData; const MD:
TIntfMethEntry; Context: TInvContext); overload; deprecated;
```

C++

```
__fastcall ProcessResponse(const TStream Resp, const TIntfMetaData IntfMD, const
TIntfMethEntry MD, TInvContext Context, THeaderList Headers);
__fastcall ProcessResponse(const InvString Resp, const TIntfMetaData IntfMD, const
TIntfMethEntry MD, TInvContext Context);
```

Description

ProcessResponse takes the encoded results of executing a method on an invokable interface from an invocation context and unpacks them into an invocation context.

Response is the encoded results of executing a method on the invokable interface, or a stream from which those results can be read. It is generated on the server by the MakeResponse (see page 18126) method if the call was successful, or the MakeFault (see page 18125) method if the call was unsuccessful.

XMLDoc (see page 26095) is the interface to an XML document that represents the results of executing a method on the invokable interface. The values of its nodes come from the MakeResponse (see page 18126) method if the call was successful, or the MakeFault (see page 18125) method if the call was unsuccessful.

IntfMD describes the runtime type information (RTTI) of the interface whose method was called.

MD describes the runtime type information (RTTI) of the method that was called.

Context is the invocation context that ProcessResponse fills out based on the contents of Response.

Headers is a list that ProcessResponse fills with TSOAPHeader descendants that represent the headers of the encoded result message.

See Also

MakeFault (see page 18125)

MakeResponse (see page 18126)

118.1.1.2.10 IOPConvert.SetAttachments Method

Sets the value of the Attachments (see page 18130) property.

Pascal

```
procedure SetAttachments(Value: TSoapDataList);
```

C++

```
__fastcall SetAttachments(TSoapDataList Value);
```

Description

SetAttachments is the write implementation for the Attachments (see page 18130) property.

Value is a list of TSoapAttachment objects that encapsulate the current set of attachments.

See Also

Attachments (see page 18130)

118.1.1.2.11 IOPConvert.SetEncoding Method

Sets the value of the Encoding (see page 18130) property.

Pascal

```
procedure SetEncoding(const Encoding: WideString);
```

C++

```
__fastcall SetEncoding(const BSTR Encoding);
```

Description

SetEncoding is the write implementation for the Encoding (see page 18130) property.

Encoding (see page 18130) is the name of the new encoding to use for method calls.

See Also

Encoding (see page 18130)

118.1.1.2.12 IOPConvert.SetOptions Method

Sets the value of the Options (see page 18131) property.

Pascal

```
procedure SetOptions(const Value: TSOAPConvertOptions);
```

C++

```
__fastcall SetOptions(const TSOAPConvertOptions Value);
```

Description

SetOptions is the write implementation for the Options (see page 18131) property.

Value is the new set of options to use when marshaling and unmarshaling method calls.

See Also

Options (see page 18131)

118.1.1.2.13 IOPConvert.SetTempDir Method

Sets the value of the TempDir (see page 18131) property.

Pascal

```
procedure SetTempDir(const Value: string);
```

C++

```
__fastcall SetTempDir(const AnsiString Value);
```

Description

SetTempDir is the write implementation for the TempDir (see page 18131) property.

Value is the new temporary directory to use.

See Also

TempDir (see page 18131)

118.1.1.3 IOPConvert Properties

The properties of the IOPConvert class are listed here.

Public Properties

	Name	Description
	Attachments (see page 18130)	Lists the objects that encapsulate the attachments included with the SOAP request or its response.
	Encoding (see page 18130)	Indicates the character set to use for encoded method calls.
	Options (see page 18131)	Controls (see page 5711) how certain types of conversions are performed.
	TempDir (see page 18131)	Specifies the directory where temporary files for attachments are saved.

118.1.1.3.1 IOPConvert.Attachments Property

Lists the objects that encapsulate the attachments included with the SOAP request or its response.

Pascal

```
property Attachments: TSoapDataList;
```

C++

```
__property TSoapDataList Attachments;
```

Description

When a method on an invokable interface requires the user to send or receive attachments, these attachments are each represented by a TSoapAttachment object. Attachments lists the TSoapAttachment objects for each attachment of the current method.

Note: When the application that contains IOPConvert (see page 18122) receives attachments, it writes them to a temporary file rather than storing them in memory. The location for these temporary files is specified by the TempDir (see page 18131) property.

See Also

TempDir (see page 18131)

TSOAPAttachment (see page 15583)

118.1.1.3.2 IOPConvert.Encoding Property

Indicates the character set to use for encoded method calls.

Pascal

```
property Encoding: WideString;
```

C++

```
__property BSTR Encoding;
```

Description

Use Encoding to indicate the character set that is used for encoded method calls. If you do not specify an encoding (that is, if Encoding is an empty string), UTF-8 is assumed.

See Also

DefaultDOMVendor

Encoding (see page 26406)

118.1.1.3.3 IOPConvert.Options Property

Controls (see page 5711) how certain types of conversions are performed.

Pascal

```
property Options: TSOAPConvertOptions;
```

C++

```
__property TSOAPConvertOptions Options;
```

Description

Set Options to indicate how you want to handle various types of conversions. This set can include zero or more of the TSOAPConvertOption (see page 18132) flags.

See Also

MsgToInvContext (see page 18127)

ClassOptions (see page 15565)

InvContextToMsg (see page 18125)

118.1.1.3.4 IOPConvert.TempDir Property

Specifies the directory where temporary files for attachments are saved.

Pascal

```
property TempDir: string;
```

C++

```
__property AnsiString TempDir;
```

Description

When the application receives an attachment as the value of a parameter (or the return value) of the current method on the invokable interface, it writes the attachment to a temporary file. This temporary file becomes the value of the CacheFile property on the TSoapAttachment object that represents the attachment.

Use TempDir to specify the directory where temporary files for attachments are written.

Note: If TempDir is not set, the application uses the default temporary directory. On Windows, this is the directory that the Windows API GetTempPath returns. On Linux, this is obtained from the TMPDIR environment setting (or, if TMPDIR is not set, /tmp/)

See Also

Attachments (see page 18130)

CacheFile (see page 15592)

118.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TSOAPConvertOption (see page 18132)	This is record OPConvert.TSOAPConvertOption.

118.2.1 OPConvert.TSOAPConvertOption Enumeration

Pascal

```
TSOAPConvertOption = (
  soSendUntyped,
  soSendMultiRefObj,
  soSendMultiRefArray,
  soTryAllSchema,
  soRootRefNodesToBody,
  soDocument,
  soReturnSuccessForFault,
  soUTF8InHeader,
  soDontSendEmptyNodes,
  soCacheMimeResponse,
  soDontClearOutBoundHeaders,
  soCustomFaultAtDetailsNode,
  soLiteralParams,
  soUTF8EncodeXML,
  soXXXXHdr
);
```

C++

```
enum TSOAPConvertOption {
  soSendUntyped,
  soSendMultiRefObj,
  soSendMultiRefArray,
  soTryAllSchema,
  soRootRefNodesToBody,
  soDocument,
  soReturnSuccessForFault,
  soUTF8InHeader,
  soDontSendEmptyNodes,
  soCacheMimeResponse,
  soDontClearOutBoundHeaders,
  soCustomFaultAtDetailsNode,
  soLiteralParams,
  soUTF8EncodeXML,
  soXXXXHdr
};
```

File

OPConvert

Description

This is record OPConvert.TSOAPConvertOption.

118.3 Types

The following table lists types in this documentation.

Types

Name	Description
TSOAPConvertOptions (see page 18133)	This is type OPConvert.TSOAPConvertOptions.

118.3.1 OPConvert.TSOAPConvertOptions Type

Pascal

```
TSOAPConvertOptions = set of TSOAPConvertOption;
```

C++

```
TSOAPConvertOption TSOAPConvertOptions;
```

File

OPConvert

Description

This is type OPConvert.TSOAPConvertOptions.

119 OPToSOAPDomConv Namespace

This is namespace OPToSOAPDomConv.

Topics

Name	Description
Classes (see page 18137)	The following table lists classes in this documentation.
Functions (see page 18178)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 18179)	The following table lists structs, records, enums in this documentation.
Types (see page 18182)	The following table lists types in this documentation.
Variables (see page 18185)	The following table lists variables in this documentation.
Constants (see page 18186)	The following table lists constants in this documentation.

Classes

	Name	Description
	ESOAPDomConvertError (see page 18137)	ESOAPDomConvertError is the class for exceptions that occur when marshaling or unmarshaling a SOAP request.
	TOPToSoapDomConvert (see page 18137)	TOPToSoapDomConvert handles the marshaling and unmarshaling of SOAP method calls.
	TSOAPDomConv (see page 18150)	TSOAPDomConv is the base class for components that use a DOM to interpret and create SOAP method calls.

Constants

Name	Description
SVarArrayType (see page 18186)	This is constant OPToSOAPDomConv.SVarArrayType.

Functions

	Name	Description
	GetOrdPropEx (see page 18178)	This is function OPToSOAPDomConv.GetOrdPropEx.

Structs, Records, Enums

	Name	Description
	ConvNodeState (see page 18179)	This is record OPToSOAPDomConv.ConvNodeState.
	TMultiRefNodeElem (see page 18179)	This is record OPToSOAPDomConv.TMultiRefNodeElem.
	TMultiRefNodeMapElem (see page 18180)	This is record OPToSOAPDomConv.TMultiRefNodeMapElem.
	TSOAPArrayElemDesc (see page 18180)	This is record OPToSOAPDomConv.TSOAPArrayElemDesc.

Types

Name	Description
TMemberDataNotReceivedEvent (see page 18182)	This is type OPToSOAPDomConv.TMemberDataNotReceivedEvent.
TMultiRefNodeMap (see page 18182)	This is type OPToSOAPDomConv.TMultiRefNodeMap.
TMultiRefNodes (see page 18183)	This is type OPToSOAPDomConv.TMultiRefNodes.
TSOAPArrayDesc (see page 18183)	This is type OPToSOAPDomConv.TSOAPArrayDesc.
TUnhandledNodeEvent (see page 18183)	This is type OPToSOAPDomConv.TUnhandledNodeEvent.
TXMLNodeArray (see page 18184)	This is type OPToSOAPDomConv.TXMLNodeArray.

Variables

Name	Description
DefArrayElemName (see page 18185)	This is variable OPToSOAPDomConv.DefArrayElemName.

119.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ESOAPDomConvertError (see page 18137)	ESOAPDomConvertError is the class for exceptions that occur when marshaling or unmarshaling a SOAP request.
	TOPToSoapDomConvert (see page 18137)	TOPToSoapDomConvert handles the marshaling and unmarshaling of SOAP method calls.
	TSOAPDomConv (see page 18150)	TSOAPDomConv is the base class for components that use a DOM to interpret and create SOAP method calls.

119.1.1 ESOAPDomConvertError Class

ESOAPDomConvertError is the class for exceptions that occur when marshaling or unmarshaling a SOAP request.

Class Hierarchy

Pascal

```
ESOAPDomConvertError = class(Exception);
```

C++

```
class ESOAPDomConvertError : public Exception;
```

File

OPToSOAPDomConv

Description

TOPToSoapDomConvert (see page 18137) raises ESOAPDomConvertError exceptions when it can't marshal or unmarshal a SOAP packet that encodes a method call or its results.

See Also

TOPToSoapDOMConvert

119.1.2 TOPToSoapDomConvert Class

TOPToSoapDomConvert handles the marshaling and unmarshaling of SOAP method calls.

Class Hierarchy

Pascal

```
TOPToSoapDomConvert = class(TSOAPDomConv, IOPConvert);
```

C++

```
class TOPToSoapDomConvert : public TSOAPDomConv, public IOPConvert;
```

File

OPToSOAPDomConv

Description

TOPToSoapDomConvert is an implementation of the IOPConvert interface that handles the marshaling and unmarshaling of SOAP method calls. It uses a DOM parser to parse and edit the SOAP encoding of a method call and its results.

Typically, applications do not use TOPToSoapDomConvert directly. Rather, It is created and used by THTTPRio on client applications and THTTPSoapPascalInvoker or THTTPSoapCppInvoker on server applications.

TOPToSoapDomConvert converts between the SOAP encoding of a method call or its results and an invocation context. If the method call results in an exception, TOPToSoapDomConvert generates a SOAP error packet for that exception so that the client can raise the exception remotely.

See Also

THTTPRio

THTTPSoapPascalInvoker (see page 19951)

THTTPSoapCppInvoker (see page 19950)

IOPConvert (see page 18122)

TInvContext (see page 15516)

ESOAPDomConvertError (see page 18137)

119.1.2.1 TOPToSoapDomConvert Members

The following tables list the members exposed by TOPToSoapDomConvert.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FHeaderProcessors (see page 19915)	This is FHeaderProcessors, a member of class TSOAPDOMProcessor.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_AddRef (see page 19916)	Called when an application uses a component interface.

	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 19917)	Called when an application releases a component interface.
	AddAttachment (see page 18157)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	AddMultiRefNode (see page 18158)	This is AddMultiRefNode, a member of class TSOAPDomConv.
	AddNamespaceDecl (see page 18158)	This is AddNamespaceDecl, a member of class TSOAPDomConv.
	AddObjectAsWriting (see page 18158)	This is AddObjectAsWriting, a member of class TSOAPDomConv.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckEncodingStyle (see page 18158)	This is CheckEncodingStyle, a member of class TSOAPDomConv.
	ChildNodesAreNull (see page 18159)	This is ChildNodesAreNull, a member of class TSOAPDomConv.
	ConvertByteArrayToSoap (see page 18159)	This is ConvertByteArrayToSoap, a member of class TSOAPDomConv.
	ConvertEnumToSoap (see page 18159)	This is ConvertEnumToSoap, a member of class TSOAPDomConv.
	ConvertNativeArrayToSoap (see page 18159)	This is ConvertNativeArrayToSoap, a member of class TSOAPDomConv.
	ConvertObjectToSOAP (see page 18160)	This is ConvertObjectToSOAP, a member of class TSOAPDomConv.
	ConvertSoapToEnum (see page 18161)	This is ConvertSoapToEnum, a member of class TSOAPDomConv.
	ConvertSoapToNativeArray (see page 18161)	This is ConvertSoapToNativeArray, a member of class TSOAPDomConv.
	ConvertSoapToNativeArrayElem (see page 18161)	This is ConvertSoapToNativeArrayElem, a member of class TSOAPDomConv.
	ConvertSOAPToObject (see page 18162)	This is ConvertSOAPToObject, a member of class TSOAPDomConv.
	ConvertSoapToVariant (see page 18162)	This is ConvertSoapToVariant, a member of class TSOAPDomConv.
	ConvertVariantToSoap (see page 18162)	This is ConvertVariantToSoap, a member of class TSOAPDomConv.
	CreateMultiRefNode (see page 18163)	This is CreateMultiRefNode, a member of class TSOAPDomConv.
	CreateNULLNode (see page 18163)	This is CreateNULLNode, a member of class TSOAPDomConv.
	CreateObjectNode (see page 18163)	This is CreateObjectNode, a member of class TSOAPDomConv.
	CreateScalarNodeXS (see page 18163)	This is CreateScalarNodeXS, a member of class TSOAPDomConv.
	CreateTypedNode (see page 18164)	This is CreateTypedNode, a member of class TSOAPDomConv.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FinalizeMultiRefNodes (see page 18164)	This is FinalizeMultiRefNodes, a member of class TSOAPDomConv.
	FindAttachment (see page 18164)	Returns a TSOAPAttachment instance that represent the attachment with a specified ID.
V	FindHeaderProcessor (see page 19919)	Locates a processor to interpret or generate a specified SOAP header.
	FindMultiRefNodeByID (see page 18164)	This is FindMultiRefNodeByID, a member of class TSOAPDomConv.
	FindMultiRefNodeByInstance (see page 18165)	This is FindMultiRefNodeByInstance, a member of class TSOAPDomConv.
	FindNodeByHREF (see page 18165)	This is FindNodeByHREF, a member of class TSOAPDomConv.
	FindPrefixForURI (see page 18165)	This is FindPrefixForURI, a member of class TSOAPDomConv.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDataNode (see page 18165)	This is GetDataNode, a member of class TSOAPDomConv.
	GetElementType (see page 18166)	This is GetElementType, a member of class TSOAPDomConv.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetNewID (see page 18166)	This is GetNewID, a member of class TSOAPDomConv.
	GetNodeAsText (see page 18166)	This is GetNodeAsText, a member of class TSOAPDomConv.
	GetObjectPropAsText (see page 18166)	This is GetObjectPropAsText, a member of class TSOAPDomConv.
	GetOptions (see page 18166)	This is GetOptions, a member of class TSOAPDomConv.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeBySchemaNS (see page 18167)	This is GetTypeBySchemaNS, a member of class TSOAPDomConv.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).

	InitObjectFromSOAP (see page 18167)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsNodeAVarArray (see page 18167)	This is IsNodeAVarArray, a member of class TSOAPDomConv.
	IsObjectWriting (see page 18168)	This is IsObjectWriting, a member of class TSOAPDomConv.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LoadObject (see page 18168)	This is LoadObject, a member of class TSOAPDomConv.
	MakeArrayNode (see page 18168)	This is the overview for the MakeArrayNode method overload.
	MakeHeaderNodes (see page 19919)	Generates all the SOAP headers that this object knows how to create.
	MultiRefObject (see page 18169)	This is MultiRefObject, a member of class TSOAPDomConv.
	NewXMLDocument (see page 18147)	Creates a new empty XML document to hold the SOAP representation and returns its interface.
	NodeIsNULL (see page 18169)	This is NodeIsNULL, a member of class TSOAPDomConv.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	ObjectMemberNoShow (see page 18169)	This is ObjectMemberNoShow, a member of class TSOAPDomConv.
	ObjInstanceToSOAP (see page 18169)	Returns the SOAP representation of a remotable object.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadHeader (see page 18170)	This is ReadHeader, a member of class TSOAPDomConv.
	ReadRectDynArray (see page 18170)	This is ReadRectDynArray, a member of class TSOAPDomConv.
	ReadRectDynArrayElem (see page 18171)	This is ReadRectDynArrayElem, a member of class TSOAPDomConv.
	ReadRow (see page 18171)	This is ReadRow, a member of class TSOAPDomConv.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadVarArrayDim (see page 18171)	This is ReadVarArrayDim, a member of class TSOAPDomConv.
	ReadVariant (see page 18171)	This is ReadVariant, a member of class TSOAPDomConv.
	RemoveObjectAsWriting (see page 18172)	This is RemoveObjectAsWriting, a member of class TSOAPDomConv.
	ResetMultiRef (see page 18172)	This is ResetMultiRef, a member of class TSOAPDomConv.
	SerializationOptions (see page 18172)	This is the overview for the SerializationOptions method overload.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetNodeType (see page 18173)	This is SetNodeType, a member of class TSOAPDomConv.
	SetObjectPropFromText (see page 18173)	This is SetObjectPropFromText, a member of class TSOAPDomConv.
	SetOptions (see page 18173)	This is SetOptions, a member of class TSOAPDomConv.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	UnhandledNode (see page 18174)	This is UnhandledNode, a member of class TSOAPDomConv.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteHeader (see page 18174)	This is WriteHeader, a member of class TSOAPDomConv.
	WriteNonRectDynArray (see page 18174)	This is WriteNonRectDynArray, a member of class TSOAPDomConv.
	WriteNonRectDynArrayElem (see page 18174)	This is WriteNonRectDynArrayElem, a member of class TSOAPDomConv.
	WriteRectDynArray (see page 18175)	This is WriteRectDynArray, a member of class TSOAPDomConv.
	WriteRectDynArrayElem (see page 18175)	This is WriteRectDynArrayElem, a member of class TSOAPDomConv.

	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
	WriteVarArray (see page 18175)	This is WriteVarArray, a member of class TSOAPDomConv.
	WriteVarArrayAsB64 (see page 18175)	This is WriteVarArrayAsB64, a member of class TSOAPDomConv.
	WriteVariant (see page 18176)	This is WriteVariant, a member of class TSOAPDomConv.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddAttachment (see page 15611)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	AddHeaderProcessor (see page 19917)	Adds a processor to the internal list of interfaces to use for interpreting and creating SOAP headers.
	AfterConstruction (see page 19918)	Responds after the last constructor executes.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ConvertNativeDataToSoap (see page 18160)	Converts a native type to its SOAP representation.
	ConvertSoapToNativeData (see page 18161)	Converts the SOAP representation of a value to a pointer to the corresponding native representation.
	Create (see page 18143)	Creates a new TOPToSoapDomConvert (see page 18137) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DefaultProcessHeader (see page 19918)	Handles the interpretation of a SOAP header when no processor can be found.
	Destroy (see page 18143)	Frees the memory associated with the TOPToSoapDomConvert (see page 18137) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAttachment (see page 15612)	Returns a TSOAPAttachment (see page 15583) instance that represent the attachment with a specified ID.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAttachments (see page 18124)	Returns the value of the Attachments (see page 18130) property.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEncoding (see page 18124)	Returns the value of the Encoding (see page 18130) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetOptions (see page 18124)	Returns the value of the Options (see page 18131) property.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetTempDir (see page 18124)	Returns the value of the TempDir (see page 18131) property.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InitObjectFromSOAP (see page 15612)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InvContextToMsg (see page 18144)	Marshals a method call from an invocation context to a transportable string.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	MakeFault (see page 18145)	Encodes an exception that was raised when trying to execute a method on an invokable interface.
V	MakeResponse (see page 18145)	Encodes the results of successfully executing a method on an invokable interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MsgToInvContext (see page 18126)	This is the overview for the MsgToInvContext method overload.
V	MsgToInvContext (see page 18146)	This is the overview for the MsgToInvContext method overload.
V	NewInstance (see page 19919)	Allocates memory for each instance of TSOAPDOMProcessor (see page 19912).
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ObjInstanceToSOAP (see page 15612)	Returns the SOAP representation of a remotable object.
	ProcessResponse (see page 18127)	This is the overview for the ProcessResponse method overload.
V	ProcessResponse (see page 18147)	This is the overview for the ProcessResponse method overload.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttachments (see page 18128)	Sets the value of the Attachments (see page 18130) property.
	SetEncoding (see page 18129)	Sets the value of the Encoding (see page 18130) property.
	SetOptions (see page 18129)	Sets the value of the Options (see page 18131) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTempDir (see page 18129)	Sets the value of the TempDir (see page 18131) property.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Attachments (see page 18148)	Lists the objects that encapsulate the attachments included with the SOAP request or its response.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.

	Options (see page 18131)	Controls (see page 5711) how certain types of conversions are performed.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnMemberDataNotReceived (see page 18177)	Occurs when converting a SOAP representation to a remotable object and an expected class member was not found.
	OnUnhandledNode (see page 18177)	Occurs when a SOAP representation includes an XML node that the converter does not know how to handle.

Published Properties

	Name	Description
	Encoding (see page 18149)	Indicates the character set to use for encoded method calls.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Options (see page 18176)	Controls (see page 5711) how the TSOAPDomConv (see page 18150) object performs certain types of conversions.
	Tag (see page 2808)	Stores an integer value as part of a component.
	TempDir (see page 18149)	Specifies the directory where temporary files for attachments are saved.
	WSDLView (see page 18150)	Provides access to information in a WSDL document that represents the SOAP request.

119.1.2.2 TOPToSoapDomConvert.Create Constructor

Creates a new TOPToSoapDomConvert (see page 18137) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TOPToSoapDomConvert(TComponent * AOwner);
```

Description

Most applications do not create instances of TOPToSoapDomConvert (see page 18137). It is created by the THTTPRio and TSoapPascalInvoker objects to handle the marshaling and unmarshaling of SOAP method calls.

The AOwner parameter specifies the component that is responsible for freeing the TOPToSoapDomConvert (see page 18137) instance.

See Also

Owner (see page 2807)

THTTPRio

TSoapPascalInvoker (see page 20020)

119.1.2.3 TOPToSoapDomConvert.Destroy Destructor

Frees the memory associated with the TOPToSoapDomConvert (see page 18137) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOPToSoapDomConvert();
```

Description

Typically, TOPToSoapDomConvert (see page 18137) objects are freed by the objects that create them to handle the marshaling and unmarshaling of SOAP method calls.

Do not call Destroy directly in an application. Instead, use the Free method, that checks whether the reference is nil before calling Destroy.

See Also

Create (see page 18143)

Free (see page 22300)

119.1.2.4 TOPToSoapDomConvert Methods

The methods of the TOPToSoapDomConvert class are listed here.

Protected Methods

	Name	Description
	NewXMLDocument (see page 18147)	Creates a new empty XML document to hold the SOAP representation and returns its interface.

Public Methods

	Name	Description
	InvContextToMsg (see page 18144)	Marshals a method call from an invocation context to a transportable string.
V	MakeFault (see page 18145)	Encodes an exception that was raised when trying to execute a method on an invokable interface.
V	MakeResponse (see page 18145)	Encodes the results of successfully executing a method on an invokable interface.
V	MsgToInvContext (see page 18146)	This is the overview for the MsgToInvContext method overload.
V	ProcessResponse (see page 18147)	This is the overview for the ProcessResponse method overload.

119.1.2.4.1 TOPToSoapDomConvert.InvContextToMsg Method

Marshals a method call from an invocation context to a transportable string.

Pascal

```
function InvContextToMsg(const IntfMD: TIntfMetaData; MethNum: Integer; Con: TInvContext;
Headers: THeaderList): TStream;
```

C++

```
__fastcall TStream InvContextToMsg(const TIntfMetaData IntfMD, int MethNum, TInvContext Con,
THeaderList Headers);
```

Description

InvContextToMsg looks up a specified method call, including the types and values of any arguments, from an invocation context, and returns an encoded version of that method call that can be transported to the application that executes it.

IntfMD represents the runtime type information (RTTI) from the interface whose method is called.

MethNum identifies the called method by its position in the interface's method table.

Con is the invocation context that contains details of the method call, including the parameter values passed in, the calling conventions, and any other temporary data used when making the call.

Headers is a list of TSOAPHeader descendants that represent the headers of the SOAP envelope that contained the method call.

InvContextToMsg returns a stream from which an application can read the encoded version of the method call.

See Also

MsgToInvContext (see page 18146)

119.1.2.4.2 TOPToSoapDomConvert.MakeFault Method

Encodes an exception that was raised when trying to execute a method on an invokable interface.

Pascal

```
procedure MakeFault(const Ex: Exception; EStream: TStream); virtual;
```

C++

```
virtual __fastcall MakeFault(const Exception Ex, TStream EStream);
```

Description

MakeFault encodes an exception that a Web Service application catches when trying to execute a method on an invokable interface. It generates an encoded exception packet, which the client can decode and use to raise the exception on the client application.

Ex is the exception object that represents the exception that occurred.

EStream is a stream to which MakeFault writes the encoded exception packet.

See Also

MakeResponse (see page 18145)

119.1.2.4.3 TOPToSoapDomConvert.MakeResponse Method

Encodes the results of successfully executing a method on an invokable interface.

Pascal

```
procedure MakeResponse(const IntfMD: TIntfMetaData; const MethNum: Integer; Context:
TInvContext; Response: TStream; Headers: THeaderLIst); virtual;
```

C++

```
virtual __fastcall MakeResponse(const TIntfMetaData IntfMD, const int MethNum, TInvContext
Context, TStream Response, THeaderLIst Headers);
```

Description

MakeResponse retrieves the results of executing a method on an invokable interface from an invocation context and packages them into a transportable string, which it writes to a stream. This string is passed back to the client, which can unpack it using the ProcessResponse (see page 18147) method.

IntfMD represents the runtime type information (RTTI) from the interface whose method was executed.

MethNum identifies the called method by its position in the interface's method table.

Context is the invocation context that contains details of the method call.

Headers is a list of TSOAPHeader descendants that should be converted to headers on the encoded response.

Response is a stream to which MakeResponse writes the encoded version of the method result and any output parameters.

Headers is a list of TSOAPHeader descendants that represent the headers that should be added to the response message.

See Also

MakeFault (see page 18145)

ProcessResponse (see page 18147)

119.1.2.4.4 MsgToInvContext Method

This is the overview for the MsgToInvContext method overload.

Overload List

	Name	Description
	TOPToSoapDomConvert.MsgToInvContext (InvString, TIntfMetaData, Integer, TInvContext) (see page 18146)	Unpacks an encoded method call into an invocation context so that it can be executed.
	TOPToSoapDomConvert.MsgToInvContext (TStream, TIntfMetaData, Integer, TInvContext, THeaderList) (see page 18146)	Unpacks an encoded method call into an invocation context so that it can be executed.

119.1.2.4.4.1 TOPToSoapDomConvert.MsgToInvContext Method (InvString, TIntfMetaData, Integer, TInvContext)

Unpacks an encoded method call into an invocation context so that it can be executed.

Pascal

```
procedure MsgToInvContext(const Request: InvString; const IntfMD: TIntfMetaData; var MethNum:
Integer; Context: TInvContext); virtual; overload;
procedure MsgToInvContext(const Request: TStream; const IntfMD: TIntfMetaData; var MethNum:
Integer; Context: TInvContext; Headers: THeaderList); virtual; overload;
```

C++

```
virtual __fastcall MsgToInvContext(const InvString Request, const TIntfMetaData IntfMD, int
MethNum, TInvContext Context);
virtual __fastcall MsgToInvContext(const TStream Request, const TIntfMetaData IntfMD, int
MethNum, TInvContext Context, THeaderList Headers);
```

Description

MsgToInvContext takes an encoded message that a server application receives and uses it to fill out an invocation context, which can then be used to execute the method call.

Request is the encoded method call, or a stream from which to read that method call. It is generated on the client by a call to InvContextToMsg (see page 18144).

IntfMD represents the runtime type information (RTTI) from the interface whose method is called.

MethNum returns the position of the called method in the interface's method table.

Context is the invocation context to which this method adds the information encoded in Request.

Headers is an object list to which MsgToInvContext adds TSOAPHeader descendants to represent every header in the encoded message.

See Also

InvContextToMsg (see page 18144)

119.1.2.4.5 TOPToSoapDomConvert.NewXMLDocument Method

Creates a new empty XML document to hold the SOAP representation and returns its interface.

Pascal

```
function NewXMLDocument: IXMLDocument;
```

C++

```
__fastcall IXMLDocument NewXMLDocument();
```

Description

TOPToSoapDomConvert (see page 18137) uses NewXMLDocument internally to create the object that holds the SOAP representation of a message. It returns an interface for working with this representation. Note that the XML document that NewXMLDocument returns is empty. TOPToSoapDomConvert (see page 18137) subsequently uses the methods of the interface to fill out the body of this document.

119.1.2.4.6 ProcessResponse Method

This is the overview for the ProcessResponse method overload.

Overload List

	Name	Description
	TOPToSoapDomConvert.ProcessResponse (InvString, TIntfMetaData, TIntfMethEntry, TInvContext) (see page 18147)	Unpacks the response packet from a method call into an invocation context.
	TOPToSoapDomConvert.ProcessResponse (IXMLDocument, TIntfMetaData, TIntfMethEntry, TInvContext, THeaderList) (see page 18147)	Unpacks the response packet from a method call into an invocation context.
	TOPToSoapDomConvert.ProcessResponse (TStream, TIntfMetaData, TIntfMethEntry, TInvContext, THeaderList) (see page 18147)	Unpacks the response packet from a method call into an invocation context.

119.1.2.4.6.1 TOPToSoapDomConvert.ProcessResponse Method (IXMLDocument, TIntfMetaData, TIntfMethEntry, TInvContext, THeaderList)

Unpacks the response packet from a method call into an invocation context.

Pascal

```
procedure ProcessResponse(const Resp: InvString; const IntfMD: TIntfMetaData; const MD:
TIntfMethEntry; Context: TInvContext); virtual; overload;
procedure ProcessResponse(const Resp: TStream; const IntfMD: TIntfMetaData; const MD:
TIntfMethEntry; Context: TInvContext; Headers: THeaderList); virtual; overload;
procedure ProcessResponse(const XMLDoc: IXMLDocument; const IntfMD: TIntfMetaData; const MD:
TIntfMethEntry; Context: TInvContext; Headers: THeaderList); virtual; overload;
```

C++

```
virtual __fastcall ProcessResponse(const InvString Resp, const TIntfMetaData IntfMD, const
TIntfMethEntry MD, TInvContext Context);
virtual __fastcall ProcessResponse(const TStream Resp, const TIntfMetaData IntfMD, const
TIntfMethEntry MD, TInvContext Context, THeaderList Headers);
virtual __fastcall ProcessResponse(const IXMLDocument XMLDoc, const TIntfMetaData IntfMD,
const TIntfMethEntry MD, TInvContext Context, THeaderList Headers);
```

Description

ProcessResponse takes the encoded results of executing a method on an invokable interface from an invocation context and unpacks them into an invocation context.

Response is the encoded results of executing a method on the invokable interface, or a stream from which those results can be read. It is generated on the server by the MakeResponse (see page 18145) method if the call was successful, or the MakeFault (see page 18145) method if the call was unsuccessful.

XMLDoc (see page 26095) is the interface to an XML document that represents the results of executing a method on the invokable interface. The values of its nodes come from the MakeResponse (see page 18145) method if the call was successful, or the MakeFault (see page 18145) method if the call was unsuccessful.

IntfMD describes the runtime type information (RTTI) of the interface whose method was called.

MD describes the runtime type information (RTTI) of the method that was called.

Context is the invocation context that ProcessResponse fills out based on the contents of Response.

Headers is a list that ProcessResponse fills with TSOAPHeader descendants that represent the headers of the encoded result message.

MakeFault (see page 18145)

MakeResponse (see page 18145)

119.1.2.5 TOPToSoapDomConvert Properties

The properties of the TOPToSoapDomConvert class are listed here.

Public Properties

	Name	Description
	Attachments (see page 18148)	Lists the objects that encapsulate the attachments included with the SOAP request or its response.

Published Properties

	Name	Description
	Encoding (see page 18149)	Indicates the character set to use for encoded method calls.
	TempDir (see page 18149)	Specifies the directory where temporary files for attachments are saved.
	WSDLView (see page 18150)	Provides access to information in a WSDL document that represents the SOAP request.

119.1.2.5.1 TOPToSoapDomConvert.Attachments Property

Lists the objects that encapsulate the attachments included with the SOAP request or its response.

Pascal

```
property Attachments: TSOAPDataList;
```

C++

```
__property TSOAPDataList Attachments;
```

Description

When a method on an invokable interface requires the user to send or receive attachments, these attachments are each represented by a TSoapAttachment object. Attachments lists the TSoapAttachment objects for each attachment of the current

method.

Note: When the application that contains TOPToSoapDomConvert (see page 18137) receives attachments, it writes them to a temporary file rather than storing them in memory. The location for these temporary files is specified by the TempDir (see page 18149) property.

See Also

TempDir (see page 18149)

TSOAPAttachment (see page 15583)

119.1.2.5.2 TOPToSoapDomConvert.Encoding Property

Indicates the character set to use for encoded method calls.

Pascal

```
property Encoding: WideString;
```

C++

```
__property BSTR Encoding;
```

Description

Use Encoding to indicate the character set that is used for encoded method calls. Encoding causes the converter to make character set conversions using the DOM, rather than at the transport level. This approach is more efficient than transport-level encoding. If you set Encoding, the Options (see page 18176) property should not include soUTF8EncodeXML and soUTF8InHeader.

If you do not specify an encoding (that is, if Encoding is an empty string), TOPToSoapDomConvert (see page 18137) converts characters at the transport level assuming UTF-8.

TOPToSoapDomConvert (see page 18137) uses the DOM parser identified by the global DefaultDOMVendor variable to perform its conversions. Encoding must indicate an encoding that this default DOM parser supports.

Note: Some Web Services (such as Apache or .NET) require transport level encoding rather than DOM level encoding. In such cases, it is possible that setting Encoding can cause problems because the Web Service converts characters at the transport level and then converts a second time because of the encoding attribute that Encoding adds to the XML representation. If a Web Service requires transport-level encoding and assumes UTF8, Encoding should be an empty string and the Options (see page 18176) property should include soUTF8EncodeXML and soUTF8InHeader.

See Also

DefaultDOMVendor

Encoding (see page 26406)

Options (see page 18176)

119.1.2.5.3 TOPToSoapDomConvert.TempDir Property

Specifies the directory where temporary files for attachments are saved.

Pascal

```
property TempDir: string;
```

C++

```
__property AnsiString TempDir;
```

Description

When the application that includes this TOPToSoapDomConvert (see page 18137) instance receives an attachment as the value of a parameter (or the return value) of the current method, TOPToSoapDomConvert (see page 18137) writes the attachment to a temporary file. This temporary file becomes the value of the CacheFile property on the TSoapAttachment object that represents the attachment.

Use TempDir to specify the directory where TOPToSoapDomConvert (see page 18137) writes the temporary files for attachments.

Note: If TempDir is not set, the application uses the default temporary directory. On Windows, this is the directory that the Windows API GetTempPath returns. On Linux, this is obtained from the TMPDIR environment setting (or, if TMPDIR is not set, /tmp/)

See Also

Attachments (see page 18148)

CacheFile (see page 15592)

119.1.2.5.4 TOPToSoapDomConvert.WSDLView Property

Provides access to information in a WSDL document that represents the SOAP request.

Pascal

```
property WSDLView: TWSDLView;
```

C++

```
__property TWSDLView WSDLView;
```

Description

WSDLView represents information about the SOAP request when the application uses a WSDL document to define information about the interface. If the application does not use a WSDL document, WSDLView is nil (Delphi) or NULL (C++).

WSDL includes the parsed WSDL document, as well as properties to identify the target method call.

119.1.3 TSOAPDomConv Class

TSOAPDomConv is the base class for components that use a DOM to interpret and create SOAP method calls.

Class Hierarchy

Pascal

```
TSOAPDomConv = class(TSOAPDOMProcessor, IObjConverter);
```

C++

```
class TSOAPDomConv : public TSOAPDOMProcessor, public IObjConverter;
```

File

OPToSOAPDomConv

Description

TSOAPDomConv is the base class for DOM-based components that interpret and create SOAP method calls. It handles the logic of converting between the SOAP representation of a type and its native representation. TSOAPDomConv uses the remotable type registry (RemTypeRegistry) to look up the native type or class that corresponds to a type from a SOAP method call and to generate an instance of that type to represent an incoming value. It uses runtime type information (RTTI) to convert a native type or remotable class to its SOAP representation.

TSOAPDomConv implements the IObjConverter interface.

Do not create instances of TSOAPDomConv. It is intended only as a base class for components that interpret or create SOAP method calls.

TOPToSoapDomConvert (see page 18137)

RemTypeRegistry

IObjConverter (see page 15610)

119.1.3.1 TSOAPDomConv Members

The following tables list the members exposed by TSOAPDomConv.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FHeaderProcessors (see page 19915)	This is FHeaderProcessors, a member of class TSOAPDOMProcessor.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_AddRef (see page 19916)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 19917)	Called when an application releases a component interface.
	AddAttachment (see page 18157)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	AddMultiRefNode (see page 18158)	This is AddMultiRefNode, a member of class TSOAPDomConv.
	AddNamespaceDecl (see page 18158)	This is AddNamespaceDecl, a member of class TSOAPDomConv.
	AddObjectAsWriting (see page 18158)	This is AddObjectAsWriting, a member of class TSOAPDomConv.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckEncodingStyle (see page 18158)	This is CheckEncodingStyle, a member of class TSOAPDomConv.
	ChildNodesAreNull (see page 18159)	This is ChildNodesAreNull, a member of class TSOAPDomConv.
	ConvertByteArrayToSoap (see page 18159)	This is ConvertByteArrayToSoap, a member of class TSOAPDomConv.
	ConvertEnumToSoap (see page 18159)	This is ConvertEnumToSoap, a member of class TSOAPDomConv.
	ConvertNativeArrayToSoap (see page 18159)	This is ConvertNativeArrayToSoap, a member of class TSOAPDomConv.
	ConvertObjectToSOAP (see page 18160)	This is ConvertObjectToSOAP, a member of class TSOAPDomConv.

	ConvertSoapToEnum (see page 18161)	This is ConvertSoapToEnum, a member of class TSOAPDomConv.
	ConvertSoapToNativeArray (see page 18161)	This is ConvertSoapToNativeArray, a member of class TSOAPDomConv.
	ConvertSoapToNativeArrayElem (see page 18161)	This is ConvertSoapToNativeArrayElem, a member of class TSOAPDomConv.
	ConvertSOAPToObject (see page 18162)	This is ConvertSOAPToObject, a member of class TSOAPDomConv.
	ConvertSoapToVariant (see page 18162)	This is ConvertSoapToVariant, a member of class TSOAPDomConv.
	ConvertVariantToSoap (see page 18162)	This is ConvertVariantToSoap, a member of class TSOAPDomConv.
	CreateMultiRefNode (see page 18163)	This is CreateMultiRefNode, a member of class TSOAPDomConv.
	CreateNULLNode (see page 18163)	This is CreateNULLNode, a member of class TSOAPDomConv.
	CreateObjectNode (see page 18163)	This is CreateObjectNode, a member of class TSOAPDomConv.
	CreateScalarNodeXS (see page 18163)	This is CreateScalarNodeXS, a member of class TSOAPDomConv.
	CreateTypedNode (see page 18164)	This is CreateTypedNode, a member of class TSOAPDomConv.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FinalizeMultiRefNodes (see page 18164)	This is FinalizeMultiRefNodes, a member of class TSOAPDomConv.
	FindAttachment (see page 18164)	Returns a TSOAPAttachment instance that represent the attachment with a specified ID.
	FindHeaderProcessor (see page 19919)	Locates a processor to interpret or generate a specified SOAP header.
	FindMultiRefNodeByID (see page 18164)	This is FindMultiRefNodeByID, a member of class TSOAPDomConv.
	FindMultiRefNodeByInstance (see page 18165)	This is FindMultiRefNodeByInstance, a member of class TSOAPDomConv.
	FindNodeByHREF (see page 18165)	This is FindNodeByHREF, a member of class TSOAPDomConv.
	FindPrefixForURI (see page 18165)	This is FindPrefixForURI, a member of class TSOAPDomConv.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDataNode (see page 18165)	This is GetDataNode, a member of class TSOAPDomConv.
	GetElementType (see page 18166)	This is GetElementType, a member of class TSOAPDomConv.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetNewID (see page 18166)	This is GetNewID, a member of class TSOAPDomConv.
	GetNodeAsText (see page 18166)	This is GetNodeAsText, a member of class TSOAPDomConv.
	GetObjectPropAsText (see page 18166)	This is GetObjectPropAsText, a member of class TSOAPDomConv.
	GetOptions (see page 18166)	This is GetOptions, a member of class TSOAPDomConv.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeBySchemaNS (see page 18167)	This is GetTypeBySchemaNS, a member of class TSOAPDomConv.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InitObjectFromSOAP (see page 18167)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsNodeAVarArray (see page 18167)	This is IsNodeAVarArray, a member of class TSOAPDomConv.
	IsObjectWriting (see page 18168)	This is IsObjectWriting, a member of class TSOAPDomConv.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LoadObject (see page 18168)	This is LoadObject, a member of class TSOAPDomConv.
	MakeArrayNode (see page 18168)	This is the overview for the MakeArrayNode method overload.
	MakeHeaderNodes (see page 19919)	Generates all the SOAP headers that this object knows how to create.
	MultiRefObject (see page 18169)	This is MultiRefObject, a member of class TSOAPDomConv.
	NodeIsNULL (see page 18169)	This is NodeIsNULL, a member of class TSOAPDomConv.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	ObjectMemberNoShow (see page 18169)	This is ObjectMemberNoShow, a member of class TSOAPDomConv.
	ObjInstanceToSOAP (see page 18169)	Returns the SOAP representation of a remotable object.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.

	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadHeader (see page 18170)	This is ReadHeader, a member of class TSOAPDomConv.
	ReadRectDynArray (see page 18170)	This is ReadRectDynArray, a member of class TSOAPDomConv.
	ReadRectDynArrayElem (see page 18171)	This is ReadRectDynArrayElem, a member of class TSOAPDomConv.
	ReadRow (see page 18171)	This is ReadRow, a member of class TSOAPDomConv.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadVarArrayDim (see page 18171)	This is ReadVarArrayDim, a member of class TSOAPDomConv.
	ReadVariant (see page 18171)	This is ReadVariant, a member of class TSOAPDomConv.
	RemoveObjectAsWriting (see page 18172)	This is RemoveObjectAsWriting, a member of class TSOAPDomConv.
	ResetMultiRef (see page 18172)	This is ResetMultiRef, a member of class TSOAPDomConv.
	SerializationOptions (see page 18172)	This is the overview for the SerializationOptions method overload.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetNodeType (see page 18173)	This is SetNodeType, a member of class TSOAPDomConv.
	SetObjectPropFromText (see page 18173)	This is SetObjectPropFromText, a member of class TSOAPDomConv.
	SetOptions (see page 18173)	This is SetOptions, a member of class TSOAPDomConv.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	UnhandledNode (see page 18174)	This is UnhandledNode, a member of class TSOAPDomConv.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteHeader (see page 18174)	This is WriteHeader, a member of class TSOAPDomConv.
	WriteNonRectDynArray (see page 18174)	This is WriteNonRectDynArray, a member of class TSOAPDomConv.
	WriteNonRectDynArrayElem (see page 18174)	This is WriteNonRectDynArrayElem, a member of class TSOAPDomConv.
	WriteRectDynArray (see page 18175)	This is WriteRectDynArray, a member of class TSOAPDomConv.
	WriteRectDynArrayElem (see page 18175)	This is WriteRectDynArrayElem, a member of class TSOAPDomConv.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
	WriteVarArray (see page 18175)	This is WriteVarArray, a member of class TSOAPDomConv.
	WriteVarArrayAsB64 (see page 18175)	This is WriteVarArrayAsB64, a member of class TSOAPDomConv.
	WriteVariant (see page 18176)	This is WriteVariant, a member of class TSOAPDomConv.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddHeaderProcessor (see page 19917)	Adds a processor to the internal list of interfaces to use for interpreting and creating SOAP headers.
	AfterConstruction (see page 19918)	Responds after the last constructor executes.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ConvertNativeDataToSoap (see page 18160)	Converts a native type to its SOAP representation.
	ConvertSoapToNativeData (see page 18161)	Converts the SOAP representation of a value to a pointer to the corresponding native representation.
V	Create (see page 18155)	Creates a new TSOAPDomConv (see page 18150) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	DefaultProcessHeader (see page 19918)	Handles the interpretation of a SOAP header when no processor can be found.
V	Destroy (see page 18156)	Frees the memory associated with the TSOAPDomConv (see page 18150) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 19919)	Allocates memory for each instance of TSOAPDOMProcessor (see page 19912).
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnMemberDataNotReceived (see page 18177)	Occurs when converting a SOAP representation to a remotable object and an expected class member was not found.
	OnUnhandledNode (see page 18177)	Occurs when a SOAP representation includes an XML node that the converter does not know how to handle.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Options (see page 18176)	Controls (see page 5711) how the TSOAPDomConv (see page 18150) object performs certain types of conversions.
	Tag (see page 2808)	Stores an integer value as part of a component.

119.1.3.2 TSOAPDomConv.Create Constructor

Creates a new TSOAPDomConv (see page 18150) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSOAPDomConv(TComponent * AOwner);
```

Description

Typically, applications do not need to create instances of TSOAPDomConv (see page 18150). Instead, it is created and used by THTTPRio on client applications and THTTPSoapPascalInvoker or THTTPSoapCppInvoker on server applications.

The AOwner parameter specifies the component that is responsible for freeing the TSOAPDomConv (see page 18150) instance.

See Also

Owner (see page 2807)

THTTPRio

THTTPSoapPascalInvoker (see page 19951)

THTTPSoapCppInvoker (see page 19950)

119.1.3.3 TSOAPDomConv.Destroy Destructor

Frees the memory associated with the TSOAPDomConv (see page 18150) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSOAPDomConv();
```

Description

Do not call Destroy to free an instance of TSOAPDomConv (see page 18150). Instead, use the Free method, which first checks for a nil reference before calling Destroy.

Free (see page 22300)

119.1.3.4 TSOAPDomConv Methods

The methods of the TSOAPDomConv class are listed here.

Protected Methods

	Name	Description
	AddAttachment (see page 18157)	Stores information about a SOAP attachment so that it is included in the final message that is created.
	AddMultiRefNode (see page 18158)	This is AddMultiRefNode, a member of class TSOAPDomConv.
	AddNamespaceDecl (see page 18158)	This is AddNamespaceDecl, a member of class TSOAPDomConv.
	AddObjectAsWriting (see page 18158)	This is AddObjectAsWriting, a member of class TSOAPDomConv.
	CheckEncodingStyle (see page 18158)	This is CheckEncodingStyle, a member of class TSOAPDomConv.
	ChildNodesAreNull (see page 18159)	This is ChildNodesAreNull, a member of class TSOAPDomConv.
	ConvertByteArrayToSoap (see page 18159)	This is ConvertByteArrayToSoap, a member of class TSOAPDomConv.
	ConvertEnumToSoap (see page 18159)	This is ConvertEnumToSoap, a member of class TSOAPDomConv.
	ConvertNativeArrayToSoap (see page 18159)	This is ConvertNativeArrayToSoap, a member of class TSOAPDomConv.
	ConvertObjectToSOAP (see page 18160)	This is ConvertObjectToSOAP, a member of class TSOAPDomConv.
	ConvertSoapToEnum (see page 18161)	This is ConvertSoapToEnum, a member of class TSOAPDomConv.
	ConvertSoapToNativeArray (see page 18161)	This is ConvertSoapToNativeArray, a member of class TSOAPDomConv.
	ConvertSoapToNativeArrayElem (see page 18161)	This is ConvertSoapToNativeArrayElem, a member of class TSOAPDomConv.
	ConvertSOAPToObject (see page 18162)	This is ConvertSOAPToObject, a member of class TSOAPDomConv.
	ConvertSoapToVariant (see page 18162)	This is ConvertSoapToVariant, a member of class TSOAPDomConv.
	ConvertVariantToSoap (see page 18162)	This is ConvertVariantToSoap, a member of class TSOAPDomConv.
	CreateMultiRefNode (see page 18163)	This is CreateMultiRefNode, a member of class TSOAPDomConv.
	CreateNULLNode (see page 18163)	This is CreateNULLNode, a member of class TSOAPDomConv.
	CreateObjectNode (see page 18163)	This is CreateObjectNode, a member of class TSOAPDomConv.
	CreateScalarNodeXS (see page 18163)	This is CreateScalarNodeXS, a member of class TSOAPDomConv.
	CreateTypedNode (see page 18164)	This is CreateTypedNode, a member of class TSOAPDomConv.
	FinalizeMultiRefNodes (see page 18164)	This is FinalizeMultiRefNodes, a member of class TSOAPDomConv.
	FindAttachment (see page 18164)	Returns a TSOAPAttachment instance that represent the attachment with a specified ID.
	FindMultiRefNodeByID (see page 18164)	This is FindMultiRefNodeByID, a member of class TSOAPDomConv.
	FindMultiRefNodeByInstance (see page 18165)	This is FindMultiRefNodeByInstance, a member of class TSOAPDomConv.
	FindNodeByHREF (see page 18165)	This is FindNodeByHREF, a member of class TSOAPDomConv.

	FindPrefixForURI (see page 18165)	This is FindPrefixForURI, a member of class TSOAPDomConv.
	GetDataNode (see page 18165)	This is GetDataNode, a member of class TSOAPDomConv.
	GetElementType (see page 18166)	This is GetElementType, a member of class TSOAPDomConv.
	GetNewID (see page 18166)	This is GetNewID, a member of class TSOAPDomConv.
	GetNodeAsText (see page 18166)	This is GetNodeAsText, a member of class TSOAPDomConv.
	GetObjectPropAsText (see page 18166)	This is GetObjectPropAsText, a member of class TSOAPDomConv.
	GetOptions (see page 18166)	This is GetOptions, a member of class TSOAPDomConv.
	GetTypeBySchemaNS (see page 18167)	This is GetTypeBySchemaNS, a member of class TSOAPDomConv.
	InitObjectFromSOAP (see page 18167)	Initializes an instance of a remotable object to reflect the values in its SOAP representation.
	IsNodeAVarArray (see page 18167)	This is IsNodeAVarArray, a member of class TSOAPDomConv.
	IsObjectWriting (see page 18168)	This is IsObjectWriting, a member of class TSOAPDomConv.
	LoadObject (see page 18168)	This is LoadObject, a member of class TSOAPDomConv.
	MakeArrayNode (see page 18168)	This is the overview for the MakeArrayNode method overload.
	MultiRefObject (see page 18169)	This is MultiRefObject, a member of class TSOAPDomConv.
	NodeIsNULL (see page 18169)	This is NodeIsNULL, a member of class TSOAPDomConv.
	ObjectMemberNoShow (see page 18169)	This is ObjectMemberNoShow, a member of class TSOAPDomConv.
	ObjInstanceToSOAP (see page 18169)	Returns the SOAP representation of a remotable object.
	ReadHeader (see page 18170)	This is ReadHeader, a member of class TSOAPDomConv.
	ReadRectDynArray (see page 18170)	This is ReadRectDynArray, a member of class TSOAPDomConv.
	ReadRectDynArrayElem (see page 18171)	This is ReadRectDynArrayElem, a member of class TSOAPDomConv.
	ReadRow (see page 18171)	This is ReadRow, a member of class TSOAPDomConv.
	ReadVarArrayDim (see page 18171)	This is ReadVarArrayDim, a member of class TSOAPDomConv.
	ReadVariant (see page 18171)	This is ReadVariant, a member of class TSOAPDomConv.
	RemoveObjectAsWriting (see page 18172)	This is RemoveObjectAsWriting, a member of class TSOAPDomConv.
	ResetMultiRef (see page 18172)	This is ResetMultiRef, a member of class TSOAPDomConv.
	SerializationOptions (see page 18172)	This is the overview for the SerializationOptions method overload.
	SetNodeType (see page 18173)	This is SetNodeType, a member of class TSOAPDomConv.
	SetObjectPropFromText (see page 18173)	This is SetObjectPropFromText, a member of class TSOAPDomConv.
	SetOptions (see page 18173)	This is SetOptions, a member of class TSOAPDomConv.
	UnhandledNode (see page 18174)	This is UnhandledNode, a member of class TSOAPDomConv.
	WriteHeader (see page 18174)	This is WriteHeader, a member of class TSOAPDomConv.
	WriteNonRectDynArray (see page 18174)	This is WriteNonRectDynArray, a member of class TSOAPDomConv.
	WriteNonRectDynArrayElem (see page 18174)	This is WriteNonRectDynArrayElem, a member of class TSOAPDomConv.
	WriteRectDynArray (see page 18175)	This is WriteRectDynArray, a member of class TSOAPDomConv.
	WriteRectDynArrayElem (see page 18175)	This is WriteRectDynArrayElem, a member of class TSOAPDomConv.
	WriteVarArray (see page 18175)	This is WriteVarArray, a member of class TSOAPDomConv.
	WriteVarArrayAsB64 (see page 18175)	This is WriteVarArrayAsB64, a member of class TSOAPDomConv.
	WriteVariant (see page 18176)	This is WriteVariant, a member of class TSOAPDomConv.

Public Methods

	Name	Description
	ConvertNativeDataToSoap (see page 18160)	Converts a native type to its SOAP representation.
	ConvertSoapToNativeData (see page 18161)	Converts the SOAP representation of a value to a pointer to the corresponding native representation.

119.1.3.4.1 TSOAPDomConv.AddAttachment Method

Stores information about a SOAP attachment so that it is included in the final message that is created.

Pascal

```
procedure AddAttachment(Attachment: TSOAPAttachment; const AContentId: string);
```

C++

```
__fastcall AddAttachment(TSOAPAttachment Attachment, const AnsiString AContentId);
```

Description

AddAttachment stores a SOAP attachment so that it can be used to generate part of the multipart form that includes the SOAP envelope as another of its parts.

Attachment is the attachment that should be added to the multipart form.

AContentId is a string that uniquely identifies the attachment. It is added as a header to the part of the form that contains the attachment so that XML in the SOAP envelope can refer to the attachment. When interpreting the encoded SOAP envelope, this value is passed to the FindAttachment method so that the information in the attachment part can be used to recreate the TSOAPAttachment instance.

See Also

FindAttachment (see page 15612)

119.1.3.4.2 TSOAPDomConv.AddMultiRefNode Method

Pascal

```
procedure AddMultiRefNode(const ID: string; Instance: Pointer);
```

C++

```
__fastcall AddMultiRefNode(const AnsiString ID, void * Instance);
```

Description

This is AddMultiRefNode, a member of class TSOAPDomConv.

119.1.3.4.3 TSOAPDomConv.AddNamespaceDecl Method

Pascal

```
function AddNamespaceDecl(Node: IXMLNode; const URI: InvString): InvString;
```

C++

```
__fastcall InvString AddNamespaceDecl(IXMLNode Node, const InvString URI);
```

Description

This is AddNamespaceDecl, a member of class TSOAPDomConv.

119.1.3.4.4 TSOAPDomConv.AddObjectAsWriting Method

Pascal

```
procedure AddObjectAsWriting(Instance: TObject);
```

C++

```
__fastcall AddObjectAsWriting(TObject * Instance);
```

Description

This is AddObjectAsWriting, a member of class TSOAPDomConv.

119.1.3.4.5 TSOAPDomConv.CheckEncodingStyle Method

Pascal

```
procedure CheckEncodingStyle(Node: IXMLNode);
```

C++

```
__fastcall CheckEncodingStyle(IXMLNode Node);
```

Description

This is CheckEncodingStyle, a member of class TSOAPDomConv.

119.1.3.4.6 TSOAPDomConv.ChildNodesAreNull Method

Pascal

```
function ChildNodesAreNull(Node: IXMLNode): Boolean;
```

C++

```
__fastcall Boolean ChildNodesAreNull(IXMLNode Node);
```

Description

This is ChildNodesAreNull, a member of class TSOAPDomConv.

119.1.3.4.7 TSOAPDomConv.ConvertByteArrayToSoap Method

Pascal

```
procedure ConvertByteArrayToSoap(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString;
Info: PTypeInfo; P: Pointer);
```

C++

```
__fastcall ConvertByteArrayToSoap(IXMLNode RootNode, IXMLNode Node, const InvString Name,
PTypeInfo Info, void * P);
```

Description

This is ConvertByteArrayToSoap, a member of class TSOAPDomConv.

119.1.3.4.8 TSOAPDomConv.ConvertEnumToSoap Method

Pascal

```
function ConvertEnumToSoap(Info: PTypeInfo; P: Pointer; NumIndirect: Integer): InvString;
```

C++

```
__fastcall InvString ConvertEnumToSoap(PTypeInfo Info, void * P, int NumIndirect);
```

Description

This is ConvertEnumToSoap, a member of class TSOAPDomConv.

119.1.3.4.9 TSOAPDomConv.ConvertNativeArrayToSoap Method

Pascal

```
procedure ConvertNativeArrayToSoap(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString;
Info: PTypeInfo; P: Pointer; NumIndirect: Integer; InlineElements: Boolean = False);
```

C++

```
__fastcall ConvertNativeArrayToSoap(IXMLNode RootNode, IXMLNode Node, const InvString Name,
PTypeInfo Info, void * P, int NumIndirect, Boolean InlineElements = False);
```

Description

This is ConvertNativeArrayToSoap, a member of class TSOAPDomConv.

119.1.3.4.10 TSOAPDomConv.ConvertNativeDataToSoap Method

Converts a native type to its SOAP representation.

Pascal

```
procedure ConvertNativeDataToSoap(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString;
Info: PTypeInfo; P: Pointer; NumIndirect: Integer); dynamic;
```

C++

```
__fastcall ConvertNativeDataToSoap(IXMLNode RootNode, IXMLNode Node, const InvString Name,
PTypeInfo Info, void * P, int NumIndirect);
```

Description

ConvertNativeDataToSoap performs the conversion from a native type to its SOAP representation and adds that to the emerging DOM representation of a SOAP packet. It uses the options specified by the Options (see page 18176) property to determine whether to include type data and how to handle multiple references to the same remotable object.

RootNode is the node in the emerging SOAP representation that acts as a parent to any elements that represent an object that has multiple references.

Node is the parent node to which ConvertNativeDataToSoap adds a new child node that represents the native value.

Name is the type name of the SOAP encoding of the native type.

Info is a TypeInfo pointer that indicates the type in which the native data appears.

P is a pointer to the value to convert. It points (possibly with additional levels of indirection) to a value of the type indicated by Info.

NumIndirect indicates the number of levels of indirection by which P points to a value of the type indicated by Info.

See Also

ConvertSoapToNativeData (see page 18161)

Options (see page 18176)

119.1.3.4.11 TSOAPDomConv.ConvertObjectToSOAP Method

Pascal

```
procedure ConvertObjectToSOAP(const Name: InvString; ObjP: Pointer; RootNode: IXMLNOde; Node:
IXMLNOde; NumIndirect: Integer);
```

C++

```
__fastcall ConvertObjectToSOAP(const InvString Name, void * ObjP, IXMLNOde RootNode, IXMLNOde
Node, int NumIndirect);
```

Description

This is ConvertObjectToSOAP, a member of class TSOAPDomConv.

119.1.3.4.12 TSOAPDomConv.ConvertSoapToEnum Method

Pascal

```
function ConvertSoapToEnum(Info: PTypeInfo; S: InvString; IsNull: Boolean): Integer;
```

C++

```
__fastcall int ConvertSoapToEnum(PTypeInfo Info, InvString S, Boolean IsNull);
```

Description

This is ConvertSoapToEnum, a member of class TSOAPDomConv.

119.1.3.4.13 TSOAPDomConv.ConvertSoapToNativeArray Method

Pascal

```
function ConvertSoapToNativeArray(DataP: Pointer; TypeInfo: PTypeInfo; RootNode: IXMLNode;
Node: IXMLNode): Pointer;
```

C++

```
__fastcall void * ConvertSoapToNativeArray(void * DataP, PTypeInfo TypeInfo, IXMLNode
RootNode, IXMLNode Node);
```

Description

This is ConvertSoapToNativeArray, a member of class TSOAPDomConv.

119.1.3.4.14 TSOAPDomConv.ConvertSoapToNativeArrayElem Method

Pascal

```
function ConvertSoapToNativeArrayElem(ArrayInfo: PTypeInfo; ElemInfo: PTypeInfo; RootNode:
IXMLNode; Node: IXMLNode; ArrayDesc: TSOAPArrayDesc; Dims: Integer; CurDim: Integer; DataP:
Pointer): Pointer;
```

C++

```
__fastcall void * ConvertSoapToNativeArrayElem(PTypeInfo ArrayInfo, PTypeInfo ElemInfo,
IXMLNode RootNode, IXMLNode Node, TSOAPArrayDesc ArrayDesc, int Dims, int CurDim, void *
DataP);
```

Description

This is ConvertSoapToNativeArrayElem, a member of class TSOAPDomConv.

119.1.3.4.15 TSOAPDomConv.ConvertSoapToNativeData Method

Converts the SOAP representation of a value to a pointer to the corresponding native representation.

Pascal

```
procedure ConvertSoapToNativeData(DataP: Pointer; TypeInfo: PTypeInfo; Context: TDataContext;
RootNode: IXMLNode; Node: IXMLNode; Translate: Boolean; ByRef: Boolean; NumIndirect: Integer);
dynamic;
```

C++

```
__fastcall ConvertSoapToNativeData(void * DataP, PTypeInfo TypeInfo, TDataContext Context,
IXMLNode RootNode, IXMLNode Node, Boolean Translate, Boolean ByRef, int NumIndirect);
```

Description

ConvertSoapToNativeData performs the conversion from a DOM node that represents a SOAP encoding of a value to the

corresponding native representation.

DataP is a pointer to the memory allocated to hold the native representation of the value, and points to the results of the conversion.

TypeInfo is the typeinfo pointer that describes the native type that will represent the value.

Context is the TDataContext object that stores the value.

RootNode is the node in the SOAP packet that acts as a parent to any elements to which there are multiple references.

Node is the node in the SOAP packet whose value is to be translated.

Translate indicates whether Node represents a value to be translated, as opposed to a reference to value that is found elsewhere in the SOAP packet.

ByRef indicates whether the node corresponds to a parameter that is passed by reference.

NumIndirect indicates the number of levels of indirection by which DataP points to its value.

See Also

ConvertNativeDataToSoap (see page 18160)

Options (see page 18176)

119.1.3.4.16 TSOAPDomConv.ConvertSOAPToObject Method

Pascal

```
function ConvertSOAPToObject(RootNode: IXMLNode; Node: IXMLNode; AClass: TClass; const URI:
WideString; const TypeName: WideString; ObjP: Pointer; NumIndirect: Integer): TObject;
```

C++

```
__fastcall TObject * ConvertSOAPToObject(IXMLNode RootNode, IXMLNode Node, TClass AClass,
const BSTR URI, const BSTR TypeName, void * ObjP, int NumIndirect);
```

Description

This is ConvertSOAPToObject, a member of class TSOAPDomConv.

119.1.3.4.17 TSOAPDomConv.ConvertSoapToVariant Method

Pascal

```
procedure ConvertSoapToVariant(Node: IXMLNode; InvData: Pointer);
```

C++

```
__fastcall ConvertSoapToVariant(IXMLNode Node, void * InvData);
```

Description

This is ConvertSoapToVariant, a member of class TSOAPDomConv.

119.1.3.4.18 TSOAPDomConv.ConvertVariantToSoap Method

Pascal

```
procedure ConvertVariantToSoap(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString;
Info: PTypeInfo; P: PVarData; NumIndirect: Integer; V: Variant; UseVariant: Boolean);
```

C++

```
__fastcall ConvertVariantToSoap(IXMLNode RootNode, IXMLNode Node, const InvString Name,
```

```
PTypeInfo Info, PVarData P, int NumIndirect, Variant V, Boolean UseVariant);
```

Description

This is ConvertVariantToSoap, a member of class TSOAPDomConv.

119.1.3.4.19 TSOAPDomConv.CreateMultiRefNode Method

Pascal

```
function CreateMultiRefNode(RootNode: IXMLNode; const Name: InvString; const ID: InvString):
IXMLNode;
```

C++

```
__fastcall IXMLNode CreateMultiRefNode(IXMLNode RootNode, const InvString Name, const
InvString ID);
```

Description

This is CreateMultiRefNode, a member of class TSOAPDomConv.

119.1.3.4.20 TSOAPDomConv.CreateNULLNode Method

Pascal

```
function CreateNULLNode(RootNode: IXMLNode; ParentNode: IXMLNode; const Name: InvString;
UseParentNode: Boolean = False): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateNULLNode(IXMLNode RootNode, IXMLNode ParentNode, const InvString
Name, Boolean UseParentNode = False);
```

Description

This is CreateNULLNode, a member of class TSOAPDomConv.

119.1.3.4.21 TSOAPDomConv.CreateObjectNode Method

Pascal

```
function CreateObjectNode(Instance: TObject; RootNode: IXMLNode; ParentNode: IXMLNode; const
Name: InvString; const URI: InvString; ObjConvOpts: TObjectConvertOptions): InvString;
```

C++

```
__fastcall InvString CreateObjectNode(TObject * Instance, IXMLNode RootNode, IXMLNode
ParentNode, const InvString Name, const InvString URI, TObjectConvertOptions ObjConvOpts);
```

Description

This is CreateObjectNode, a member of class TSOAPDomConv.

119.1.3.4.22 TSOAPDomConv.CreateScalarNodeXS Method

Pascal

```
function CreateScalarNodeXS(RootNode: IXMLNode; ParentNode: IXMLNode; const NodeName:
WideString; const URI: WideString; const TypeName: WideString; const Value: WideString;
GenPre: Boolean = False): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateScalarNodeXS(IXMLNode RootNode, IXMLNode ParentNode, const BSTR
NodeName, const BSTR URI, const BSTR TypeName, const BSTR Value, Boolean GenPre = False);
```

Description

This is CreateScalarNodeXS, a member of class TSOAPDomConv.

119.1.3.4.23 TSOAPDomConv.CreateTypedNode Method

Pascal

```
function CreateTypedNode(RootNode: IXMLNode; ParentNode: IXMLNode; const NodeName: WideString;
const URI: WideString; TypeName: WideString; GenPre: Boolean = False): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateTypedNode(IXMLNode RootNode, IXMLNode ParentNode, const BSTR
NodeName, const BSTR URI, BSTR TypeName, Boolean GenPre = False);
```

Description

This is CreateTypedNode, a member of class TSOAPDomConv.

119.1.3.4.24 TSOAPDomConv.FinalizeMultiRefNodes Method

Pascal

```
procedure FinalizeMultiRefNodes;
```

C++

```
__fastcall FinalizeMultiRefNodes();
```

Description

This is FinalizeMultiRefNodes, a member of class TSOAPDomConv.

119.1.3.4.25 TSOAPDomConv.FindAttachment Method

Returns a TSOAPAttachment instance that represent the attachment with a specified ID.

Pascal

```
function FindAttachment(const AContentId: string): TSOAPAttachment;
```

C++

```
__fastcall TSOAPAttachment FindAttachment(const AnsiString AContentId);
```

Description

FindAttachment locates the attachment that is identified by a specified content ID (HREF).

AContentId is the unique identifier for the attachment that was supplied to the AddAttachment method when the attachment was first added to the multipart form.

FindAttachment returns a TSOAPAttachment instance that represents the attachment.

See Also

AddAttachment (see page 15611)

119.1.3.4.26 TSOAPDomConv.FindMultiRefNodeByID Method

Pascal

```
function FindMultiRefNodeByID(const ID: string): Pointer;
```

C++

```
__fastcall void * FindMultiRefNodeByID(const AnsiString ID);
```

Description

This is FindMultiRefNodeByID, a member of class TSOAPDomConv.

119.1.3.4.27 TSOAPDomConv.FindMultiRefNodeByInstance Method

Pascal

```
function FindMultiRefNodeByInstance(Instance: Pointer): string;
```

C++

```
__fastcall AnsiString FindMultiRefNodeByInstance(void * Instance);
```

Description

This is FindMultiRefNodeByInstance, a member of class TSOAPDomConv.

119.1.3.4.28 TSOAPDomConv.FindNodeByHREF Method

Pascal

```
function FindNodeByHREF(RootNode: IXMLNode; const HREF: InvString): IXMLNode;
```

C++

```
__fastcall IXMLNode FindNodeByHREF(IXMLNode RootNode, const InvString HREF);
```

Description

This is FindNodeByHREF, a member of class TSOAPDomConv.

119.1.3.4.29 TSOAPDomConv.FindPrefixForURI Method

Pascal

```
function FindPrefixForURI(RootNode: IXMLNode; Node: IXMLNode; const URI: InvString;
DeclIfNone: Boolean = False): InvString;
```

C++

```
__fastcall InvString FindPrefixForURI(IXMLNode RootNode, IXMLNode Node, const InvString URI,
Boolean DeclIfNone = False);
```

Description

This is FindPrefixForURI, a member of class TSOAPDomConv.

119.1.3.4.30 TSOAPDomConv.GetDataNode Method

Pascal

```
function GetDataNode(RootNode: IXMLNode; Node: IXMLNode; var ID: InvString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetDataNode(IXMLNode RootNode, IXMLNode Node, InvString ID);
```

Description

This is GetDataNode, a member of class TSOAPDomConv.

119.1.3.4.31 TSOAPDomConv.GetElementType Method

Pascal

```
function GetElementType(Node: IXMLNode; var TypeURI: InvString; var TypeName: InvString):
Boolean;
```

C++

```
__fastcall Boolean GetElementType(IXMLNode Node, InvString TypeURI, InvString TypeName);
```

Description

This is GetElementType, a member of class TSOAPDomConv.

119.1.3.4.32 TSOAPDomConv.GetNewID Method

Pascal

```
function GetNewID: string;
```

C++

```
__fastcall AnsiString GetNewID();
```

Description

This is GetNewID, a member of class TSOAPDomConv.

119.1.3.4.33 TSOAPDomConv.GetNodeAsText Method

Pascal

```
function GetNodeAsText(Node: IXMLNode): InvString;
```

C++

```
__fastcall InvString GetNodeAsText(IXMLNode Node);
```

Description

This is GetNodeAsText, a member of class TSOAPDomConv.

119.1.3.4.34 TSOAPDomConv.GetObjectPropAsText Method

Pascal

```
function GetObjectPropAsText(Instance: TObject; PropInfo: PPropInfo): WideString;
```

C++

```
__fastcall BSTR GetObjectPropAsText(TObject * Instance, PPropInfo PropInfo);
```

Description

This is GetObjectPropAsText, a member of class TSOAPDomConv.

119.1.3.4.35 TSOAPDomConv.GetOptions Method

Pascal

```
function GetOptions: TSOAPConvertOptions;
```

C++

```
__fastcall TSOAPConvertOptions GetOptions();
```

Description

This is GetOptions, a member of class TSOAPDomConv.

119.1.3.4.36 TSOAPDomConv.GetTypeBySchemaNS Method

Pascal

```
function GetTypeBySchemaNS(Node: IXMLNode; const URI: InvString): Variant;
```

C++

```
__fastcall Variant GetTypeBySchemaNS(IXMLNode Node, const InvString URI);
```

Description

This is GetTypeBySchemaNS, a member of class TSOAPDomConv.

119.1.3.4.37 TSOAPDomConv.InitObjectFromSOAP Method

Initializes an instance of a remotable object to reflect the values in its SOAP representation.

Pascal

```
procedure InitObjectFromSOAP(Instance: TObject; RootNode: IXMLNode; Node: IXMLNode);
```

C++

```
__fastcall InitObjectFromSOAP(TObject * Instance, IXMLNode RootNode, IXMLNode Node);
```

Description

InitObjectFromSOAP assigns values to the published properties of a remotable object that represents a node from the SOAP envelope.

Instance is the remotable object to initialize from its SOAP representation.

RootNode is an ancestor node of the node for the remotable object that can contain information needed for initializing the remotable object.

Node is the node in the SOAP envelope that represents the remotable object.

See Also

ObjInstanceToSOAP (see page 15612)

119.1.3.4.38 TSOAPDomConv.IsNodeAVarArray Method

Pascal

```
function IsNodeAVarArray(const Node: IXMLNode; var VT: TVarType): Boolean;
```

C++

```
__fastcall Boolean IsNodeAVarArray(const IXMLNode Node, TVarType VT);
```

Description

This is IsNodeAVarArray, a member of class TSOAPDomConv.

119.1.3.4.39 TSOAPDomConv.IsObjectWriting Method

Pascal

```
function IsObjectWriting(Instance: TObject): Boolean;
```

C++

```
__fastcall Boolean IsObjectWriting(TObject * Instance);
```

Description

This is IsObjectWriting, a member of class TSOAPDomConv.

119.1.3.4.40 TSOAPDomConv.LoadObject Method

Pascal

```
procedure LoadObject(Instance: TObject; RootNode: IXMLNode; Node: IXMLNode);
```

C++

```
__fastcall LoadObject(TObject * Instance, IXMLNode RootNode, IXMLNode Node);
```

Description

This is LoadObject, a member of class TSOAPDomConv.

119.1.3.4.41 MakeArrayNode Method

This is the overview for the MakeArrayNode method overload.

Overload List

	Name	Description
	TSOAPDomConv.MakeArrayNode (IXMLNode, IXMLNode, InvString, InvString, InvString, array of Integer) (see page 18169)	This is MakeArrayNode, a member of class TSOAPDomConv.
	TSOAPDomConv.MakeArrayNode (IXMLNode, IXMLNode, InvString, InvString, InvString, Integer, Integer) (see page 18168)	This is MakeArrayNode, a member of class TSOAPDomConv.

119.1.3.4.41.1 TSOAPDomConv.MakeArrayNode Method (IXMLNode, IXMLNode, InvString, InvString, InvString, Integer, Integer)

Pascal

```
function MakeArrayNode(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString; const URI:
InvString; const TypeName: InvString; Dim: Integer; Len: Integer): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode MakeArrayNode(IXMLNode RootNode, IXMLNode Node, const InvString Name,
const InvString URI, const InvString TypeName, int Dim, int Len);
```

Description

This is MakeArrayNode, a member of class TSOAPDomConv.

119.1.3.4.41.2 TSOAPDomConv.MakeArrayNode Method (IXMLNode, IXMLNode, InvString, InvString, InvString, array of Integer)

Pascal

```
function MakeArrayNode(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString; const URI:
InvString; const TypeName: InvString; Indices: array of Integer): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode MakeArrayNode(IXMLNode RootNode, IXMLNode Node, const InvString Name,
const InvString URI, const InvString TypeName, array of Integer Indices);
```

Description

This is MakeArrayNode, a member of class TSOAPDomConv.

119.1.3.4.42 TSOAPDomConv.MultiRefObject Method

Pascal

```
function MultiRefObject(Cls: TClass): Boolean;
```

C++

```
__fastcall Boolean MultiRefObject(TClass Cls);
```

Description

This is MultiRefObject, a member of class TSOAPDomConv.

119.1.3.4.43 TSOAPDomConv.NodeIsNULL Method

Pascal

```
function NodeIsNULL(Node: IXMLNode): Boolean;
```

C++

```
__fastcall Boolean NodeIsNULL(IXMLNode Node);
```

Description

This is NodeIsNULL, a member of class TSOAPDomConv.

119.1.3.4.44 TSOAPDomConv.ObjectMemberNoShow Method

Pascal

```
procedure ObjectMemberNoShow(const ClassName: string; const MemberName: string);
```

C++

```
__fastcall ObjectMemberNoShow(const AnsiString ClassName, const AnsiString MemberName);
```

Description

This is ObjectMemberNoShow, a member of class TSOAPDomConv.

119.1.3.4.45 TSOAPDomConv.ObjInstanceToSOAP Method

Returns the SOAP representation of a remotable object.

Pascal

```
function ObjInstanceToSOAP(Instance: TObject; RootNode: IXMLNode; ParentNode: IXMLNode; const
NodeName: InvString; const NodeNamespace: InvString; ObjConvOpts: TObjectConvertOptions; out
RefID: InvString): IXMLNode;
```

C++

```
__fastcall IXMLNode ObjInstanceToSOAP(TObject * Instance, IXMLNode RootNode, IXMLNode
ParentNode, const InvString NodeName, const InvString NodeNamespace, TObjectConvertOptions
ObjConvOpts, InvString RefID);
```

Description

ObjInstanceToSOAP adds a node to represent the value of a remotable object.

Instance is the remotable object to encode as its SOAP representation.

RootNode is an ancestor of the node to which information about the node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjInstanceToSOAP generates.

NodeName is the name of the node that is generated.

NodeNamespace is the URI for the namespace in which NodeName is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjInstanceToSOAP returns the XML for the newly generated node.

See Also

InitObjectFromSOAP (see page 15612)

119.1.3.4.46 TSOAPDomConv.ReadHeader Method

Pascal

```
procedure ReadHeader(const EnvNode: IXMLNode; const HdrNode: IXMLNode; Headers: THeaderList);
```

C++

```
__fastcall ReadHeader(const IXMLNode EnvNode, const IXMLNode HdrNode, THeaderList Headers);
```

Description

This is ReadHeader, a member of class TSOAPDomConv.

119.1.3.4.47 TSOAPDomConv.ReadRectDynArray Method

Pascal

```
procedure ReadRectDynArray(RootNode: IXMLNode; Node: IXMLNode; Info: PTypeInfo; Dims: Integer;
P: Pointer; CurElem: Integer);
```

C++

```
__fastcall ReadRectDynArray(IXMLNode RootNode, IXMLNode Node, PTypeInfo Info, int Dims, void *
P, int CurElem);
```

Description

This is ReadRectDynArray, a member of class TSOAPDomConv.

119.1.3.4.48 TSOAPDomConv.ReadRectDynArrayElem Method

Pascal

```
procedure ReadRectDynArrayElem(RootNode: IXMLNode; Node: IXMLNode; Info: PTypeInfo; Size:
Integer; Dim: Integer; P: Pointer; var CurElem: Integer);
```

C++

```
__fastcall ReadRectDynArrayElem(IXMLNode RootNode, IXMLNode Node, PTypeInfo Info, int Size,
int Dim, void * P, int CurElem);
```

Description

This is ReadRectDynArrayElem, a member of class TSOAPDomConv.

119.1.3.4.49 TSOAPDomConv.ReadRow Method

Pascal

```
procedure ReadRow(RootNode: IXMLNode; Node: IXMLNode; var CurElem: Integer; Size: Integer; P:
Pointer; Info: PTypeInfo);
```

C++

```
__fastcall ReadRow(IXMLNode RootNode, IXMLNode Node, int CurElem, int Size, void * P,
PTypeInfo Info);
```

Description

This is ReadRow, a member of class TSOAPDomConv.

119.1.3.4.50 TSOAPDomConv.ReadVarArrayDim Method

Pascal

```
function ReadVarArrayDim(Node: IXMLNode; IsVarVArray: Boolean = False; VT: TVarType = 0):
Variant;
```

C++

```
__fastcall Variant ReadVarArrayDim(IXMLNode Node, Boolean IsVarVArray = False, TVarType VT =
0);
```

Description

This is ReadVarArrayDim, a member of class TSOAPDomConv.

119.1.3.4.51 TSOAPDomConv.ReadVariant Method

Pascal

```
procedure ReadVariant(Node: IXMLNode; P: Pointer);
```

C++

```
__fastcall ReadVariant(IXMLNode Node, void * P);
```

Description

This is ReadVariant, a member of class TSOAPDomConv.

119.1.3.4.52 TSOAPDomConv.RemoveObjectAsWriting Method

Pascal

```
procedure RemoveObjectAsWriting(Instance: TObject);
```

C++

```
__fastcall RemoveObjectAsWriting(TObject * Instance);
```

Description

This is RemoveObjectAsWriting, a member of class TSOAPDomConv.

119.1.3.4.53 TSOAPDomConv.ResetMultiRef Method

Pascal

```
procedure ResetMultiRef;
```

C++

```
__fastcall ResetMultiRef();
```

Description

This is ResetMultiRef, a member of class TSOAPDomConv.

119.1.3.4.54 SerializationOptions Method

This is the overview for the SerializationOptions method overload.

Overload List

	Name	Description
	TSOAPDomConv.SerializationOptions (PTypeInfo) (see page 18172)	This is SerializationOptions, a member of class TSOAPDomConv.
	TSOAPDomConv.SerializationOptions (TClass) (see page 18172)	This is SerializationOptions, a member of class TSOAPDomConv.
	TSOAPDomConv.SerializationOptions (TObject) (see page 18173)	This is SerializationOptions, a member of class TSOAPDomConv.

119.1.3.4.54.1 TSOAPDomConv.SerializationOptions Method (PTypeInfo)

Pascal

```
function SerializationOptions(ATypeInfo: PTypeInfo): TSerializationOptions; overload;
```

C++

```
__fastcall TSerializationOptions SerializationOptions(PTypeInfo ATypeInfo);
```

Description

This is SerializationOptions, a member of class TSOAPDomConv.

119.1.3.4.54.2 TSOAPDomConv.SerializationOptions Method (TClass)

Pascal

```
function SerializationOptions(Cls: TClass): TSerializationOptions; overload;
```

C++

```
__fastcall TSerializationOptions SerializationOptions(TClass Cls);
```

Description

This is SerializationOptions, a member of class TSOAPDomConv.

119.1.3.4.54.3 TSOAPDomConv.SerializationOptions Method (TObject)

Pascal

```
function SerializationOptions(Obj: TObject): TSerializationOptions; overload;
```

C++

```
__fastcall TSerializationOptions SerializationOptions(TObject * Obj);
```

Description

This is SerializationOptions, a member of class TSOAPDomConv.

119.1.3.4.55 TSOAPDomConv.SetNodeType Method

Pascal

```
procedure SetNodeType(RootNode: IXMLNode; InstNode: IXMLNode; const ElemURI: InvString; const
TypeName: InvString);
```

C++

```
__fastcall SetNodeType(IXMLNode RootNode, IXMLNode InstNode, const InvString ElemURI, const
InvString TypeName);
```

Description

This is SetNodeType, a member of class TSOAPDomConv.

119.1.3.4.56 TSOAPDomConv.SetObjectPropFromText Method

Pascal

```
procedure SetObjectPropFromText(Instance: TObject; PropInfo: PPropInfo; const SoapData:
WideString);
```

C++

```
__fastcall SetObjectPropFromText(TObject * Instance, PPropInfo PropInfo, const BSTR SoapData);
```

Description

This is SetObjectPropFromText, a member of class TSOAPDomConv.

119.1.3.4.57 TSOAPDomConv.SetOptions Method

Pascal

```
procedure SetOptions(const Value: TSOAPConvertOptions);
```

C++

```
__fastcall SetOptions(const TSOAPConvertOptions Value);
```

Description

This is SetOptions, a member of class TSOAPDomConv.

119.1.3.4.58 TSOAPDomConv.UnhandledNode Method

Pascal

```
procedure UnhandledNode(const Name: string; NodeXML: WideString);
```

C++

```
__fastcall UnhandledNode(const AnsiString Name, BSTR NodeXML);
```

Description

This is UnhandledNode, a member of class TSOAPDomConv.

119.1.3.4.59 TSOAPDomConv.WriteHeader Method

Pascal

```
procedure WriteHeader(const Header: TObject; RootNode: IXMLNode; ParentNode: IXMLNode);
```

C++

```
__fastcall WriteHeader(const TObject * Header, IXMLNode RootNode, IXMLNode ParentNode);
```

Description

This is WriteHeader, a member of class TSOAPDomConv.

119.1.3.4.60 TSOAPDomConv.WriteNonRectDynArray Method

Pascal

```
procedure WriteNonRectDynArray(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString;
Info: PTypeInfo; const URI: InvString; const TypeName: InvString; P: Pointer; Dim: Integer);
```

C++

```
__fastcall WriteNonRectDynArray(IXMLNode RootNode, IXMLNode Node, const InvString Name,
PTypeInfo Info, const InvString URI, const InvString TypeName, void * P, int Dim);
```

Description

This is WriteNonRectDynArray, a member of class TSOAPDomConv.

119.1.3.4.61 TSOAPDomConv.WriteNonRectDynArrayElem Method

Pascal

```
function WriteNonRectDynArrayElem(RootNode: IXMLNode; Node: IXMLNode; Info: PTypeInfo; const
URI: InvString; const TypeName: InvString; P: Pointer; Dim: Integer): Integer;
```

C++

```
__fastcall int WriteNonRectDynArrayElem(IXMLNode RootNode, IXMLNode Node, PTypeInfo Info,
const InvString URI, const InvString TypeName, void * P, int Dim);
```

Description

This is WriteNonRectDynArrayElem, a member of class TSOAPDomConv.

119.1.3.4.62 TSOAPDomConv.WriteRectDynArray Method

Pascal

```
procedure WriteRectDynArray(RootNode: IXMLNode; Node: IXMLNode; Info: PTypeInfo; Dims:
Integer; P: Pointer; const TypeName: InvString);
```

C++

```
__fastcall WriteRectDynArray(IXMLNode RootNode, IXMLNode Node, PTypeInfo Info, int Dims, void
* P, const InvString TypeName);
```

Description

This is WriteRectDynArray, a member of class TSOAPDomConv.

119.1.3.4.63 TSOAPDomConv.WriteRectDynArrayElem Method

Pascal

```
procedure WriteRectDynArrayElem(RootNode: IXMLNode; Node: IXMLNode; Info: PTypeInfo; Size:
Integer; Dim: Integer; P: Pointer; const TypeName: InvString);
```

C++

```
__fastcall WriteRectDynArrayElem(IXMLNode RootNode, IXMLNode Node, PTypeInfo Info, int Size,
int Dim, void * P, const InvString TypeName);
```

Description

This is WriteRectDynArrayElem, a member of class TSOAPDomConv.

119.1.3.4.64 TSOAPDomConv.WriteVarArray Method

Pascal

```
procedure WriteVarArray(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString; V: Variant);
```

C++

```
__fastcall WriteVarArray(IXMLNode RootNode, IXMLNode Node, const InvString Name, Variant V);
```

Description

This is WriteVarArray, a member of class TSOAPDomConv.

119.1.3.4.65 TSOAPDomConv.WriteVarArrayAsB64 Method

Pascal

```
procedure WriteVarArrayAsB64(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString; V:
Variant);
```

C++

```
__fastcall WriteVarArrayAsB64(IXMLNode RootNode, IXMLNode Node, const InvString Name, Variant
V);
```

Description

This is WriteVarArrayAsB64, a member of class TSOAPDomConv.

119.1.3.4.66 TSOAPDomConv.WriteVariant Method

Pascal

```
procedure WriteVariant(RootNode: IXMLNode; Node: IXMLNode; const Name: InvString; V: Variant);
```

C++

```
__fastcall WriteVariant(IXMLNode RootNode, IXMLNode Node, const InvString Name, Variant V);
```

Description

This is WriteVariant, a member of class TSOAPDomConv.

119.1.3.5 TSOAPDomConv Properties

The properties of the TSOAPDomConv class are listed here.

Published Properties

	Name	Description
	Options (see page 18176)	Controls (see page 5711) how the TSOAPDomConv (see page 18150) object performs certain types of conversions.

119.1.3.5.1 TSOAPDomConv.Options Property

Controls (see page 5711) how the TSOAPDomConv (see page 18150) object performs certain types of conversions.

Pascal

```
property Options: TSOAPConvertOptions;
```

C++

```
__property TSOAPConvertOptions Options;
```

Description

Set Options to indicate how you want the TSOAPDomConv (see page 18150) object to handle various types of conversions. This set can include zero or more of the TSOAPConvertOption flags.

See Also

ConvertNativeDataToSoap (see page 18160)

ClassOptions (see page 15565)

ConvertSoapToNativeData (see page 18161)

119.1.3.6 TSOAPDomConv Events

The events of the TSOAPDomConv class are listed here.

Published Events

	Name	Description
	OnMemberDataNotReceived (see page 18177)	Occurs when converting a SOAP representation to a remotable object and an expected class member was not found.
	OnUnhandledNode (see page 18177)	Occurs when a SOAP representation includes an XML node that the converter does not know how to handle.

119.1.3.6.1 TSOAPDomConv.OnMemberDataNotReceived Event

Occurs when converting a SOAP representation to a remotable object and an expected class member was not found.

Pascal

```
property OnMemberDataNotReceived: TMemberDataNotReceivedEvent;
```

C++

```
__property TMemberDataNotReceivedEvent OnMemberDataNotReceived;
```

Description

Write an OnMemberDataNotReceived to detect cases where the converter does not receive the information it excepts When a method on an invokable interface requires the user to send or receive OnMemberDataNotReceived, these for deserializing a remotable type (a TRemotable descendant). This event is especially useful during debugging. Typically, after detecting a problem using OnMemberDataNotReceived, the problem is then handled by changing the code that declares or registers the remotable type.

See Also

TRemotable (see page 15556)

119.1.3.6.2 TSOAPDomConv.OnUnhandledNode Event

Occurs when a SOAP representation includes an XML node that the converter does not know how to handle.

Pascal

```
property OnUnhandledNode: TUnhandledNodeEvent;
```

C++

```
__property TUnhandledNodeEvent OnUnhandledNode;
```

Description

Write an OnUnhandledNode to detect and, possibly, fix cases where the converter can't correctly generate the native code corresponding to a node in a SOAP packet.

119.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetOrdPropEx (see page 18178)	This is function OPToSOAPDomConv.GetOrdPropEx.

119.2.1 OPToSOAPDomConv.GetOrdPropEx Function

Pascal

```
function GetOrdPropEx(Instance: TObject; PropInfo: PPropInfo): Longint;
```

C++

```
Longint GetOrdPropEx(TObject * Instance, PPropInfo PropInfo);
```

File

OPToSOAPDomConv

Description

This is function OPToSOAPDomConv.GetOrdPropEx.

119.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	ConvNodeState (see page 18179)	This is record OPToSOAPDomConv.ConvNodeState.

Records

	Name	Description
	TMultiRefNodeElem (see page 18179)	This is record OPToSOAPDomConv.TMultiRefNodeElem.
	TMultiRefNodeMapElem (see page 18180)	This is record OPToSOAPDomConv.TMultiRefNodeMapElem.
	TSOAPArrayElemDesc (see page 18180)	This is record OPToSOAPDomConv.TSOAPArrayElemDesc.

119.3.1 OPToSOAPDomConv.ConvNodeState Enumeration

Pascal

```
ConvNodeState = (
  nsClientSend,
  nsServerReceive,
  nsServerSend,
  nsClientReceive
);
```

C++

```
enum ConvNodeState {
  nsClientSend,
  nsServerReceive,
  nsServerSend,
  nsClientReceive
};
```

File

OPToSOAPDomConv

Description

This is record OPToSOAPDomConv.ConvNodeState.

119.3.2 OPToSOAPDomConv.TMultiRefNodeElem Record

Pascal

```
TMultiRefNodeElem = record
  Node: IXMLNode;
  MultiRefChildren: TXMLNodeArray;
end;
```

C++

```
struct TMultiRefNodeElem {
  IXMLNode Node;
  TXMLNodeArray MultiRefChildren;
};
```

File

OPToSOAPDomConv

Description

This is record OPToSOAPDomConv.TMultiRefNodeElem.

119.3.3 OPToSOAPDomConv.TMultiRefNodeMapElem Record

Pascal

```
TMultiRefNodeMapElem = record
  Instance: Pointer;
  ID: string;
end;
```

C++

```
struct TMultiRefNodeMapElem {
  void * Instance;
  AnsiString ID;
};
```

File

OPToSOAPDomConv

Description

This is record OPToSOAPDomConv.TMultiRefNodeMapElem.

119.3.4 OPToSOAPDomConv.TSOAPArrayElemDesc Record

Pascal

```
TSOAPArrayElemDesc = record
  MultiDim: Boolean;
  Dims: TIntegerDynArray;
end;
```

C++

```
struct TSOAPArrayElemDesc {
  Boolean MultiDim;
  TIntegerDynArray Dims;
};
```

File

OPToSOAPDomConv

Description

This is record OPToSOAPDomConv.TSOAPArrayElemDesc.

119.4 Types

The following table lists types in this documentation.

Types

Name	Description
TMemberDataNotReceivedEvent (see page 18182)	This is type OPToSOAPDomConv.TMemberDataNotReceivedEvent.
TMultiRefNodeMap (see page 18182)	This is type OPToSOAPDomConv.TMultiRefNodeMap.
TMultiRefNodes (see page 18183)	This is type OPToSOAPDomConv.TMultiRefNodes.
TSOAPArrayDesc (see page 18183)	This is type OPToSOAPDomConv.TSOAPArrayDesc.
TUnhandledNodeEvent (see page 18183)	This is type OPToSOAPDomConv.TUnhandledNodeEvent.
TXMLNodeArray (see page 18184)	This is type OPToSOAPDomConv.TXMLNodeArray.

119.4.1 OPToSOAPDomConv.TMemberDataNotReceivedEvent Type

Pascal

```
TMemberDataNotReceivedEvent = procedure (const ClassName: string; const Member: string) of
object;
```

C++

```
(const ClassName: string; const Member: string) ( TMemberDataNotReceivedEvent)();
```

File

OPToSOAPDomConv

Description

This is type OPToSOAPDomConv.TMemberDataNotReceivedEvent.

119.4.2 OPToSOAPDomConv.TMultiRefNodeMap Type

Pascal

```
TMultiRefNodeMap = array of TMultiRefNodeMapElem;
```

C++

```
array of TMultiRefNodeMapElem TMultiRefNodeMap;
```

File

OPToSOAPDomConv

Description

This is type OPToSOAPDomConv.TMultiRefNodeMap.

119.4.3 OPToSOAPDomConv.TMultiRefNodes Type

Pascal

```
TMultiRefNodes = array of TMultiRefNodeElem;
```

C++

```
array of TMultiRefNodeElem TMultiRefNodes;
```

File

OPToSOAPDomConv

Description

This is type OPToSOAPDomConv.TMultiRefNodes.

119.4.4 OPToSOAPDomConv.TSOAPArrayDesc Type

Pascal

```
TSOAPArrayDesc = array of TSOAPArrayElemDesc;
```

C++

```
array of TSOAPArrayElemDesc TSOAPArrayDesc;
```

File

OPToSOAPDomConv

Description

This is type OPToSOAPDomConv.TSOAPArrayDesc.

119.4.5 OPToSOAPDomConv.TUnhandledNodeEvent Type

Pascal

```
TUnhandledNodeEvent = procedure (const Name: string; NodeXML: WideString) of object;
```

C++

```
(const Name: string; NodeXML: WideString) ( TUnhandledNodeEvent)();
```

File

OPToSOAPDomConv

Description

This is type OPToSOAPDomConv.TUnhandledNodeEvent.

119.4.6 OPToSOAPDomConv.TXMLNodeArray Type

Pascal

```
TXMLNodeArray = array of IXMLNode;
```

C++

```
array of IXMLNode TXMLNodeArray;
```

File

OPToSOAPDomConv

Description

This is type OPToSOAPDomConv.TXMLNodeArray.

119.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DefArrayElemName (see page 18185)	This is variable OPToSOAPDomConv.DefArrayElemName.

119.5.1 OPToSOAPDomConv.DefArrayElemName Variable

Pascal

```
DefArrayElemName: string = 'item';
```

C++

```
AnsiString DefArrayElemName = 'item';
```

File

OPToSOAPDomConv

Description

This is variable OPToSOAPDomConv.DefArrayElemName.

119.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
SVarArrayType (see page 18186)	This is constant OPToSOAPDomConv.SVarArrayType.

119.6.1 OPToSOAPDomConv.SVarArrayType Constant

Pascal

```
SVarArrayType = 'VarArrayType';
```

C++

```
SVarArrayType = 'VarArrayType';
```

File

OPToSOAPDomConv

Description

This is constant OPToSOAPDomConv.SVarArrayType.

120 OrbPas Namespace

This is namespace OrbPas.

Topics

Name	Description
Interfaces (see page 18189)	The following table lists interfaces in this documentation.
Functions (see page 18217)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 18222)	The following table lists structs, records, enums in this documentation.
Types (see page 18224)	The following table lists types in this documentation.

Functions

	Name	Description
	AnyToVariant (see page 18217)	This is function OrbPas.AnyToVariant.
	BindStub (see page 18217)	This is function OrbPas.BindStub.
	CorbaAnyType (see page 18218)	This is function OrbPas.CorbaAnyType.
	CorbaDuplicateAny (see page 18218)	This is function OrbPas.CorbaDuplicateAny.
	CorbaReleaseAny (see page 18218)	This is function OrbPas.CorbaReleaseAny.
	CorbaStringFree (see page 18219)	This is function OrbPas.CorbaStringFree.
	CorbaWStringFree (see page 18219)	This is function OrbPas.CorbaWStringFree.
	CreateSkeleton (see page 18219)	This is function OrbPas.CreateSkeleton.
	CreateUserException (see page 18220)	This is function OrbPas.CreateUserException.
	InitORB (see page 18220)	This is function OrbPas.InitORB.
	RegisterUserException (see page 18220)	This is function OrbPas.RegisterUserException.
	SequenceToVariant (see page 18221)	This is function OrbPas.SequenceToVariant.
	UnRegisterUserException (see page 18221)	This is function OrbPas.UnRegisterUserException.
	VariantToAny (see page 18221)	This is function OrbPas.VariantToAny.

Interfaces

	Name	Description
	IBOA (see page 18189)	This is class OrbPas.IBOA.
	ICorbaObj (see page 18191)	This is class OrbPas.ICorbaObj.
	IMarshalInBuffer (see page 18192)	This is class OrbPas.IMarshalInBuffer.
	IMarshalOutBuffer (see page 18196)	This is class OrbPas.IMarshalOutBuffer.
	IORB (see page 18201)	This is class OrbPas.IORB.
	ISkeleton (see page 18205)	This is class OrbPas.ISkeleton.
	ISkeletonObject (see page 18206)	This is class OrbPas.ISkeletonObject.

	IStub (see page 18208)	This is class OrbPas.IStub.
	IStubObject (see page 18211)	This is class OrbPas.IStubObject.
	ITypeCode (see page 18212)	This is class OrbPas.ITypeCode.

Structs, Records, Enums

	Name	Description
	TCKind (see page 18222)	This is record OrbPas.TCKind.
	TStructMember (see page 18223)	This is record OrbPas.TStructMember.

Types

Name	Description
CorbaBoolean (see page 18224)	This is type OrbPas.CorbaBoolean.
CorbaULong (see page 18224)	This is type OrbPas.CorbaULong.
PCorbaAny (see page 18225)	This is type OrbPas.PCorbaAny.
PCorbaInterfaceDef (see page 18225)	This is type OrbPas.PCorbaInterfaceDef.
PCorbaObject (see page 18225)	This is type OrbPas.PCorbaObject.
PCorbaOrb (see page 18226)	This is type OrbPas.PCorbaOrb.
PExceptionDescription (see page 18226)	This is type OrbPas.PExceptionDescription.
PMarshalInbuffer (see page 18226)	This is type OrbPas.PMarshalInbuffer.
PMarshalOutbuffer (see page 18227)	This is type OrbPas.PMarshalOutbuffer.
PUserExceptionProxy (see page 18227)	This is type OrbPas.PUserExceptionProxy.
TArgv (see page 18227)	This is type OrbPas.TArgv.
TCopyUserExceptionProc (see page 18228)	This is type OrbPas.TCopyUserExceptionProc.
TStructMembers (see page 18228)	This is type OrbPas.TStructMembers.
TThrowUserExceptionProc (see page 18228)	This is type OrbPas.TThrowUserExceptionProc.
TUserExceptionFactoryProc (see page 18229)	This is type OrbPas.TUserExceptionFactoryProc.

120.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IBOA (see page 18189)	This is class OrbPas.IBOA.
	ICorbaObj (see page 18191)	This is class OrbPas.ICorbaObj.
	IMarshalInBuffer (see page 18192)	This is class OrbPas.IMarshalInBuffer.
	IMarshalOutBuffer (see page 18196)	This is class OrbPas.IMarshalOutBuffer.
	IORB (see page 18201)	This is class OrbPas.IORB.
	ISkeleton (see page 18205)	This is class OrbPas.ISkeleton.
	ISkeletonObject (see page 18206)	This is class OrbPas.ISkeletonObject.
	IStub (see page 18208)	This is class OrbPas.IStub.
	IStubObject (see page 18211)	This is class OrbPas.IStubObject.
	ITypeCode (see page 18212)	This is class OrbPas.ITypeCode.

120.1.1 IBOA Interface

Class Hierarchy

OrbPas.IBOA

Pascal

```
IBOA = interface;
```

C++

```
__interface IBOA;
```

File

OrbPas

Description

This is class OrbPas.IBOA.

120.1.1.1 IBOA Members

The following tables list the members exposed by IBOA.

Public Methods

	Name	Description
	Deactivate (see page 18190)	This is Deactivate, a member of class IBOA.
	GetPrincipal (see page 18190)	This is GetPrincipal, a member of class IBOA.
	GetPrincipalLength (see page 18190)	This is GetPrincipalLength, a member of class IBOA.
	ImplIsReady (see page 18190)	This is ImplIsReady, a member of class IBOA.
	ObjIsReady (see page 18191)	This is ObjIsReady, a member of class IBOA.

120.1.1.2 IBOA Methods

The methods of the IBOA class are listed here.

Public Methods

	Name	Description
	Deactivate (see page 18190)	This is Deactivate, a member of class IBOA.
	GetPrincipal (see page 18190)	This is GetPrincipal, a member of class IBOA.
	GetPrincipalLength (see page 18190)	This is GetPrincipalLength, a member of class IBOA.
	ImplIsReady (see page 18190)	This is ImplIsReady, a member of class IBOA.
	ObjIsReady (see page 18191)	This is ObjIsReady, a member of class IBOA.

120.1.1.2.1 IBOA.Deactivate Method

Pascal

```
procedure Deactivate(const Skeleton: ISkeleton); stdcall;
```

C++

```
__fastcall __stdcall Deactivate(const ISkeleton Skeleton);
```

Description

This is Deactivate, a member of class IBOA.

120.1.1.2.2 IBOA.GetPrincipal Method

Pascal

```
function GetPrincipal(Skeleton: ISkeleton; Bytes: Pointer): Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetPrincipal(ISkeleton Skeleton, void * Bytes);
```

Description

This is GetPrincipal, a member of class IBOA.

120.1.1.2.3 IBOA.GetPrincipalLength Method

Pascal

```
function GetPrincipalLength(Skeleton: ISkeleton): Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetPrincipalLength(ISkeleton Skeleton);
```

Description

This is GetPrincipalLength, a member of class IBOA.

120.1.1.2.4 IBOA.ImplIsReady Method

Pascal

```
procedure ImplIsReady; stdcall;
```

C++

```
__fastcall __stdcall ImplIsReady();
```

Description

This is ImplIsReady, a member of class IBOA.

120.1.1.2.5 IBOA.ObjIsReady Method

Pascal

```
procedure ObjIsReady(const Skeleton: ISkeleton); stdcall;
```

C++

```
__fastcall __stdcall ObjIsReady(const ISkeleton Skeleton);
```

Description

This is ObjIsReady, a member of class IBOA.

120.1.2 ICorbaObj Interface

Class Hierarchy

Pascal

```
ICorbaObj = interface;
```

C++

```
__interface ICorbaObj;
```

File

OrbPas

Description

This is class OrbPas.ICorbaObj.

120.1.2.1 ICorbaObj Members

The following tables list the members exposed by ICorbaObj.

Public Methods

	Name	Description
	CorbaObject (see page 18192)	This is CorbaObject, a member of class ICorbaObj.
	IsLocal (see page 18192)	This is IsLocal, a member of class ICorbaObj.

120.1.2.2 ICorbaObj Methods

The methods of the ICorbaObj class are listed here.

Public Methods

	Name	Description
	CorbaObject (see page 18192)	This is CorbaObject, a member of class ICorbaObj.
	IsLocal (see page 18192)	This is IsLocal, a member of class ICorbaObj.

120.1.2.2.1 ICorbaObj.CorbaObject Method

Pascal

```
function CorbaObject: PCorbaObject; stdcall;
```

C++

```
__fastcall __stdcall PCorbaObject CorbaObject();
```

Description

This is CorbaObject, a member of class ICorbaObj.

120.1.2.2.2 ICorbaObj.IsLocal Method

Pascal

```
function IsLocal: CorbaBoolean; stdcall;
```

C++

```
__fastcall __stdcall CorbaBoolean IsLocal();
```

Description

This is IsLocal, a member of class ICorbaObj.

120.1.3 IMarshalInBuffer Interface

Class Hierarchy

OrbPas.IMarshalInBuffer

Pascal

```
IMarshalInBuffer = interface;
```

C++

```
__interface IMarshalInBuffer;
```

File

OrbPas

Description

This is class OrbPas.IMarshalInBuffer.

120.1.3.1 IMarshalInBuffer Members

The following tables list the members exposed by IMarshalInBuffer.

Public Methods

	Name	Description
	Buffer (see page 18193)	This is Buffer, a member of class IMarshalInBuffer.
	GetAny (see page 18194)	This is GetAny, a member of class IMarshalInBuffer.
	GetChar (see page 18194)	This is GetChar, a member of class IMarshalInBuffer.
	GetDouble (see page 18194)	This is GetDouble, a member of class IMarshalInBuffer.
	GetFloat (see page 18194)	This is GetFloat, a member of class IMarshalInBuffer.
	GetLong (see page 18194)	This is GetLong, a member of class IMarshalInBuffer.
	GetObject (see page 18195)	This is GetObject, a member of class IMarshalInBuffer.
	GetShort (see page 18195)	This is GetShort, a member of class IMarshalInBuffer.
	GetText (see page 18195)	This is GetText, a member of class IMarshalInBuffer.
	GetUnsignedChar (see page 18195)	This is GetUnsignedChar, a member of class IMarshalInBuffer.
	GetUnsignedLong (see page 18196)	This is GetUnsignedLong, a member of class IMarshalInBuffer.
	GetUnsignedShort (see page 18196)	This is GetUnsignedShort, a member of class IMarshalInBuffer.
	GetWidechar (see page 18196)	This is GetWidechar, a member of class IMarshalInBuffer.
	GetWideText (see page 18196)	This is GetWideText, a member of class IMarshalInBuffer.

120.1.3.2 IMarshalInBuffer Methods

The methods of the IMarshalInBuffer class are listed here.

Public Methods

	Name	Description
	Buffer (see page 18193)	This is Buffer, a member of class IMarshalInBuffer.
	GetAny (see page 18194)	This is GetAny, a member of class IMarshalInBuffer.
	GetChar (see page 18194)	This is GetChar, a member of class IMarshalInBuffer.
	GetDouble (see page 18194)	This is GetDouble, a member of class IMarshalInBuffer.
	GetFloat (see page 18194)	This is GetFloat, a member of class IMarshalInBuffer.
	GetLong (see page 18194)	This is GetLong, a member of class IMarshalInBuffer.
	GetObject (see page 18195)	This is GetObject, a member of class IMarshalInBuffer.
	GetShort (see page 18195)	This is GetShort, a member of class IMarshalInBuffer.
	GetText (see page 18195)	This is GetText, a member of class IMarshalInBuffer.
	GetUnsignedChar (see page 18195)	This is GetUnsignedChar, a member of class IMarshalInBuffer.
	GetUnsignedLong (see page 18196)	This is GetUnsignedLong, a member of class IMarshalInBuffer.
	GetUnsignedShort (see page 18196)	This is GetUnsignedShort, a member of class IMarshalInBuffer.
	GetWidechar (see page 18196)	This is GetWidechar, a member of class IMarshalInBuffer.
	GetWideText (see page 18196)	This is GetWideText, a member of class IMarshalInBuffer.

120.1.3.2.1 IMarshalInBuffer.Buffer Method

Pascal

```
function Buffer: PMarshalInbuffer; stdcall;
```

C++

```
__fastcall __stdcall PMarshalInbuffer Buffer();
```

Description

This is Buffer, a member of class IMarshalInBuffer.

120.1.3.2.2 IMarshalInBuffer.GetAny Method

Pascal

```
function GetAny: PCorbaAny; stdcall;
```

C++

```
__fastcall __stdcall PCorbaAny GetAny();
```

Description

This is GetAny, a member of class IMarshalInBuffer.

120.1.3.2.3 IMarshalInBuffer.GetChar Method

Pascal

```
function GetChar: Shortint; stdcall;
```

C++

```
__fastcall __stdcall Shortint GetChar();
```

Description

This is GetChar, a member of class IMarshalInBuffer.

120.1.3.2.4 IMarshalInBuffer.GetDouble Method

Pascal

```
function GetDouble: Double; stdcall;
```

C++

```
__fastcall __stdcall Double GetDouble();
```

Description

This is GetDouble, a member of class IMarshalInBuffer.

120.1.3.2.5 IMarshalInBuffer.GetFloat Method

Pascal

```
function GetFloat: Single; stdcall;
```

C++

```
__fastcall __stdcall Single GetFloat();
```

Description

This is GetFloat, a member of class IMarshalInBuffer.

120.1.3.2.6 IMarshalInBuffer.GetLong Method

Pascal

```
function GetLong: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetLong();
```

Description

This is GetLong, a member of class IMarshalInBuffer.

120.1.3.2.7 IMarshalInBuffer.GetObject Method

Pascal

```
procedure GetObject(out Obj: ICorbaObj; ref_cnt: CorbaBoolean = True); stdcall;
```

C++

```
__fastcall __stdcall GetObject(ICorbaObj Obj, CorbaBoolean ref_cnt = True);
```

Description

This is GetObject, a member of class IMarshalInBuffer.

120.1.3.2.8 IMarshalInBuffer.GetShort Method

Pascal

```
function GetShort: Smallint; stdcall;
```

C++

```
__fastcall __stdcall Smallint GetShort();
```

Description

This is GetShort, a member of class IMarshalInBuffer.

120.1.3.2.9 IMarshalInBuffer.GetText Method

Pascal

```
function GetText: PChar; stdcall;
```

C++

```
__fastcall __stdcall const char * GetText();
```

Description

This is GetText, a member of class IMarshalInBuffer.

120.1.3.2.10 IMarshalInBuffer.GetUnsignedChar Method

Pascal

```
function GetUnsignedChar: Byte; stdcall;
```

C++

```
__fastcall __stdcall Byte GetUnsignedChar();
```

Description

This is GetUnsignedChar, a member of class IMarshalInBuffer.

120.1.3.2.11 IMarshalInBuffer.GetUnsignedLong Method

Pascal

```
function GetUnsignedLong: UINT; stdcall;
```

C++

```
__fastcall __stdcall UINT GetUnsignedLong();
```

Description

This is GetUnsignedLong, a member of class IMarshalInBuffer.

120.1.3.2.12 IMarshalInBuffer.GetUnsignedShort Method

Pascal

```
function GetUnsignedShort: Word; stdcall;
```

C++

```
__fastcall __stdcall Word GetUnsignedShort();
```

Description

This is GetUnsignedShort, a member of class IMarshalInBuffer.

120.1.3.2.13 IMarshalInBuffer.GetWidechar Method

Pascal

```
function GetWidechar: Word; stdcall;
```

C++

```
__fastcall __stdcall Word GetWidechar();
```

Description

This is GetWidechar, a member of class IMarshalInBuffer.

120.1.3.2.14 IMarshalInBuffer.GetWideText Method

Pascal

```
function GetWideText: PWideChar; stdcall;
```

C++

```
__fastcall __stdcall PWideChar GetWideText();
```

Description

This is GetWideText, a member of class IMarshalInBuffer.

120.1.4 IMarshalOutBuffer Interface

Class Hierarchy

Pascal

```
IMarshalOutBuffer = interface;
```

C++

```
__interface IMarshalOutBuffer;
```

File

OrbPas

Description

This is class OrbPas.IMarshalOutBuffer.

120.1.4.1 IMarshalOutBuffer Members

The following tables list the members exposed by IMarshalOutBuffer.

Public Methods

	Name	Description
	Buffer (see page 18198)	This is Buffer, a member of class IMarshalOutBuffer.
	PutAny (see page 18198)	This is PutAny, a member of class IMarshalOutBuffer.
	PutChar (see page 18198)	This is PutChar, a member of class IMarshalOutBuffer.
	PutDouble (see page 18198)	This is PutDouble, a member of class IMarshalOutBuffer.
	PutFloat (see page 18198)	This is PutFloat, a member of class IMarshalOutBuffer.
	PutLong (see page 18199)	This is PutLong, a member of class IMarshalOutBuffer.
	PutObject (see page 18199)	This is PutObject, a member of class IMarshalOutBuffer.
	PutShort (see page 18199)	This is PutShort, a member of class IMarshalOutBuffer.
	PutText (see page 18199)	This is PutText, a member of class IMarshalOutBuffer.
	PutUnsignedChar (see page 18200)	This is PutUnsignedChar, a member of class IMarshalOutBuffer.
	PutUnsignedLong (see page 18200)	This is PutUnsignedLong, a member of class IMarshalOutBuffer.
	PutUnsignedShort (see page 18200)	This is PutUnsignedShort, a member of class IMarshalOutBuffer.
	PutWidechar (see page 18200)	This is PutWidechar, a member of class IMarshalOutBuffer.
	PutWideText (see page 18200)	This is PutWideText, a member of class IMarshalOutBuffer.

120.1.4.2 IMarshalOutBuffer Methods

The methods of the IMarshalOutBuffer class are listed here.

Public Methods

	Name	Description
	Buffer (see page 18198)	This is Buffer, a member of class IMarshalOutBuffer.
	PutAny (see page 18198)	This is PutAny, a member of class IMarshalOutBuffer.
	PutChar (see page 18198)	This is PutChar, a member of class IMarshalOutBuffer.
	PutDouble (see page 18198)	This is PutDouble, a member of class IMarshalOutBuffer.
	PutFloat (see page 18198)	This is PutFloat, a member of class IMarshalOutBuffer.
	PutLong (see page 18199)	This is PutLong, a member of class IMarshalOutBuffer.
	PutObject (see page 18199)	This is PutObject, a member of class IMarshalOutBuffer.
	PutShort (see page 18199)	This is PutShort, a member of class IMarshalOutBuffer.
	PutText (see page 18199)	This is PutText, a member of class IMarshalOutBuffer.
	PutUnsignedChar (see page 18200)	This is PutUnsignedChar, a member of class IMarshalOutBuffer.
	PutUnsignedLong (see page 18200)	This is PutUnsignedLong, a member of class IMarshalOutBuffer.
	PutUnsignedShort (see page 18200)	This is PutUnsignedShort, a member of class IMarshalOutBuffer.
	PutWidechar (see page 18200)	This is PutWidechar, a member of class IMarshalOutBuffer.

	PutWideText (see page 18200)	This is PutWideText, a member of class IMarshalOutBuffer.

120.1.4.2.1 IMarshalOutBuffer.Buffer Method

Pascal

```
function Buffer: PMarshalOutbuffer; stdcall;
```

C++

```
__fastcall __stdcall PMarshalOutbuffer Buffer();
```

Description

This is Buffer, a member of class IMarshalOutBuffer.

120.1.4.2.2 IMarshalOutBuffer.PutAny Method

Pascal

```
procedure PutAny(Value: PCorbaAny); stdcall;
```

C++

```
__fastcall __stdcall PutAny(PCorbaAny Value);
```

Description

This is PutAny, a member of class IMarshalOutBuffer.

120.1.4.2.3 IMarshalOutBuffer.PutChar Method

Pascal

```
procedure PutChar(Value: Shortint); stdcall;
```

C++

```
__fastcall __stdcall PutChar(Shortint Value);
```

Description

This is PutChar, a member of class IMarshalOutBuffer.

120.1.4.2.4 IMarshalOutBuffer.PutDouble Method

Pascal

```
procedure PutDouble(Value: Double); stdcall;
```

C++

```
__fastcall __stdcall PutDouble(Double Value);
```

Description

This is PutDouble, a member of class IMarshalOutBuffer.

120.1.4.2.5 IMarshalOutBuffer.PutFloat Method

Pascal

```
procedure PutFloat(Value: Single); stdcall;
```

C++

```
__fastcall __stdcall PutFloat(Single Value);
```

Description

This is PutFloat, a member of class IMarshalOutBuffer.

120.1.4.2.6 IMarshalOutBuffer.PutLong Method

Pascal

```
procedure PutLong(Value: Integer); stdcall;
```

C++

```
__fastcall __stdcall PutLong(int Value);
```

Description

This is PutLong, a member of class IMarshalOutBuffer.

120.1.4.2.7 IMarshalOutBuffer.PutObject Method

Pascal

```
procedure PutObject(const Value: ICorbaObj); stdcall;
```

C++

```
__fastcall __stdcall PutObject(const ICorbaObj Value);
```

Description

This is PutObject, a member of class IMarshalOutBuffer.

120.1.4.2.8 IMarshalOutBuffer.PutShort Method

Pascal

```
procedure PutShort(Value: Smallint); stdcall;
```

C++

```
__fastcall __stdcall PutShort(Smallint Value);
```

Description

This is PutShort, a member of class IMarshalOutBuffer.

120.1.4.2.9 IMarshalOutBuffer.PutText Method

Pascal

```
procedure PutText(Value: PChar); stdcall;
```

C++

```
__fastcall __stdcall PutText(const char * Value);
```

Description

This is PutText, a member of class IMarshalOutBuffer.

120.1.4.2.10 IMarshalOutBuffer.PutUnsignedChar Method

Pascal

```
procedure PutUnsignedChar(Value: Byte); stdcall;
```

C++

```
__fastcall __stdcall PutUnsignedChar(Byte Value);
```

Description

This is PutUnsignedChar, a member of class IMarshalOutBuffer.

120.1.4.2.11 IMarshalOutBuffer.PutUnsignedLong Method

Pascal

```
procedure PutUnsignedLong(Value: UINT); stdcall;
```

C++

```
__fastcall __stdcall PutUnsignedLong(UINT Value);
```

Description

This is PutUnsignedLong, a member of class IMarshalOutBuffer.

120.1.4.2.12 IMarshalOutBuffer.PutUnsignedShort Method

Pascal

```
procedure PutUnsignedShort(Value: Word); stdcall;
```

C++

```
__fastcall __stdcall PutUnsignedShort(Word Value);
```

Description

This is PutUnsignedShort, a member of class IMarshalOutBuffer.

120.1.4.2.13 IMarshalOutBuffer.PutWidechar Method

Pascal

```
procedure PutWidechar(Value: Word); stdcall;
```

C++

```
__fastcall __stdcall PutWidechar(Word Value);
```

Description

This is PutWidechar, a member of class IMarshalOutBuffer.

120.1.4.2.14 IMarshalOutBuffer.PutWideText Method

Pascal

```
procedure PutWideText(Value: PWideChar); stdcall;
```

C++

```
__fastcall __stdcall PutWideText(PWideChar Value);
```

Description

This is PutWideText, a member of class IMarshalOutBuffer.

120.1.5 IORB Interface

Class Hierarchy

OrbPas.IORB

Pascal

```
IORB = interface;
```

C++

```
__interface IORB;
```

File

OrbPas

Description

This is class OrbPas.IORB.

120.1.5.1 IORB Members

The following tables list the members exposed by IORB.

Public Methods

	Name	Description
	BOAInit (see page 18202)	This is BOAInit, a member of class IORB.
	CreateAliasTC (see page 18202)	This is CreateAliasTC, a member of class IORB.
	CreateArrayTC (see page 18202)	This is CreateArrayTC, a member of class IORB.
	CreateObjRefTC (see page 18203)	This is CreateObjRefTC, a member of class IORB.
	CreateSequenceTC (see page 18203)	This is CreateSequenceTC, a member of class IORB.
	CreateStructTC (see page 18203)	This is CreateStructTC, a member of class IORB.
	CreateTC (see page 18203)	This is CreateTC, a member of class IORB.
	DispatchStruct (see page 18203)	This is DispatchStruct, a member of class IORB.
	FindRepositoryTC (see page 18204)	This is FindRepositoryTC, a member of class IORB.
	MakeAny (see page 18204)	This is MakeAny, a member of class IORB.
	ObjectToString (see page 18204)	This is ObjectToString, a member of class IORB.
	Orb (see page 18204)	This is Orb, a member of class IORB.
	Shutdown (see page 18205)	This is Shutdown, a member of class IORB.
	StringToObject (see page 18205)	This is StringToObject, a member of class IORB.

120.1.5.2 IORB Methods

The methods of the IORB class are listed here.

Public Methods

	Name	Description
	BOAInit (see page 18202)	This is BOAInit, a member of class IORB.

	CreateAliasTC (see page 18202)	This is CreateAliasTC, a member of class IORB.
	CreateArrayTC (see page 18202)	This is CreateArrayTC, a member of class IORB.
	CreateObjRefTC (see page 18203)	This is CreateObjRefTC, a member of class IORB.
	CreateSequenceTC (see page 18203)	This is CreateSequenceTC, a member of class IORB.
	CreateStructTC (see page 18203)	This is CreateStructTC, a member of class IORB.
	CreateTC (see page 18203)	This is CreateTC, a member of class IORB.
	DispatchStruct (see page 18203)	This is DispatchStruct, a member of class IORB.
	FindRepositoryTC (see page 18204)	This is FindRepositoryTC, a member of class IORB.
	MakeAny (see page 18204)	This is MakeAny, a member of class IORB.
	ObjectToString (see page 18204)	This is ObjectToString, a member of class IORB.
	Orb (see page 18204)	This is Orb, a member of class IORB.
	Shutdown (see page 18205)	This is Shutdown, a member of class IORB.
	StringToObject (see page 18205)	This is StringToObject, a member of class IORB.

120.1.5.2.1 IORB.BOAInit Method

Pascal

```
procedure BOAInit(Argc: Integer; const Argv: TArgv; out BOA: IBOA); stdcall;
```

C++

```
__fastcall __stdcall BOAInit(int Argc, const TArgv Argv, IBOA BOA);
```

Description

This is BOAInit, a member of class IORB.

120.1.5.2.2 IORB.CreateAliasTC Method

Pascal

```
procedure CreateAliasTC(RepID: PChar; TypeName: PChar; const TC: ITypeCode; out Result:
ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall CreateAliasTC(const char * RepID, const char * TypeName, const ITypeCode
TC, ITypeCode Result);
```

Description

This is CreateAliasTC, a member of class IORB.

120.1.5.2.3 IORB.CreateArrayTC Method

Pascal

```
procedure CreateArrayTC(Bound: CorbaULong; const TC: ITypeCode; out Result: ITypeCode);
stdcall;
```

C++

```
__fastcall __stdcall CreateArrayTC(CorbaULong Bound, const ITypeCode TC, ITypeCode Result);
```

Description

This is CreateArrayTC, a member of class IORB.

120.1.5.2.4 IORB.CreateObjRefTC Method

Pascal

```
procedure CreateObjRefTC(RepId: PChar; Name: PChar; out Result: ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall CreateObjRefTC(const char * RepId, const char * Name, ITypeCode Result);
```

Description

This is CreateObjRefTC, a member of class IORB.

120.1.5.2.5 IORB.CreateSequenceTC Method

Pascal

```
procedure CreateSequenceTC(Bound: CorbaULong; const TC: ITypeCode; out Result: ITypeCode);
stdcall;
```

C++

```
__fastcall __stdcall CreateSequenceTC(CorbaULong Bound, const ITypeCode TC, ITypeCode Result);
```

Description

This is CreateSequenceTC, a member of class IORB.

120.1.5.2.6 IORB.CreateStructTC Method

Pascal

```
procedure CreateStructTC(Kind: TCKind; RepId: PChar; Name: PChar; Members: TStructMembers;
nMember: Integer; out Result: ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall CreateStructTC(TCKind Kind, const char * RepId, const char * Name,
TStructMembers Members, int nMember, ITypeCode Result);
```

Description

This is CreateStructTC, a member of class IORB.

120.1.5.2.7 IORB.CreateTC Method

Pascal

```
procedure CreateTC(Kind: TCKind; out TC: ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall CreateTC(TCKind Kind, ITypeCode TC);
```

Description

This is CreateTC, a member of class IORB.

120.1.5.2.8 IORB.DispatchStruct Method

Pascal

```
function DispatchStruct(Any: PCorbaAny; CallDesc: PCallDesc; Params: Pointer; out Result:
```

```
Variant): Integer; stdcall;
```

C++

```
__fastcall __stdcall int DispatchStruct(PCorbaAny Any, PCallDesc CallDesc, void * Params,
Variant Result);
```

Description

This is DispatchStruct, a member of class IORB.

120.1.5.2.9 IORB.FindRepositoryTC Method

Pascal

```
procedure FindRepositoryTC(RepID: PChar; out TC: ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall FindRepositoryTC(const char * RepID, ITypeCode TC);
```

Description

This is FindRepositoryTC, a member of class IORB.

120.1.5.2.10 IORB.MakeAny Method

Pascal

```
function MakeAny(const TC: ITypeCode; VS: array of Variant): PCorbaAny; stdcall;
```

C++

```
__fastcall __stdcall PCorbaAny MakeAny(const ITypeCode TC, array of Variant VS);
```

Description

This is MakeAny, a member of class IORB.

120.1.5.2.11 IORB.ObjectToString Method

Pascal

```
function ObjectToString(const Obj: IStub): PChar; stdcall;
```

C++

```
__fastcall __stdcall const char * ObjectToString(const IStub Obj);
```

Description

This is ObjectToString, a member of class IORB.

120.1.5.2.12 IORB.Orb Method

Pascal

```
function Orb: PCorbaOrb;
```

C++

```
__fastcall PCorbaOrb Orb();
```

Description

This is Orb, a member of class IORB.

120.1.5.2.13 IORB.Shutdown Method

Pascal

```
procedure Shutdown; stdcall;
```

C++

```
__fastcall __stdcall Shutdown();
```

Description

This is Shutdown, a member of class IORB.

120.1.5.2.14 IORB.StringToObject Method

Pascal

```
procedure StringToObject(Str: PChar; out Obj: IStub); stdcall;
```

C++

```
__fastcall __stdcall StringToObject(const char * Str, IStub Obj);
```

Description

This is StringToObject, a member of class IORB.

120.1.6 ISkeleton Interface

Class Hierarchy

Pascal

```
ISkeleton = interface(ICorbaObj);
```

C++

```
__interface ISkeleton : public ICorbaObj;
```

File

OrbPas

Description

This is class OrbPas.ISkeleton.

120.1.6.1 ISkeleton Members

The following tables list the members exposed by ISkeleton.

Public Methods

	Name	Description
	CorbaObject (see page 18192)	This is CorbaObject, a member of class ICorbaObj.
	GetImplementation (see page 18206)	This is GetImplementation, a member of class ISkeleton.
	GetReplyBuffer (see page 18206)	This is GetReplyBuffer, a member of class ISkeleton.

	IsLocal (see page 18192)	This is IsLocal, a member of class ICorbaObj.

120.1.6.2 ISkeleton Methods

The methods of the ISkeleton class are listed here.

Public Methods

	Name	Description
	GetImplementation (see page 18206)	This is GetImplementation, a member of class ISkeleton.
	GetReplyBuffer (see page 18206)	This is GetReplyBuffer, a member of class ISkeleton.

120.1.6.2.1 ISkeleton.GetImplementation Method

Pascal

```
procedure GetImplementation(out Impl: IUnknown); stdcall;
```

C++

```
__fastcall __stdcall GetImplementation(IUnknown Impl);
```

Description

This is GetImplementation, a member of class ISkeleton.

120.1.6.2.2 ISkeleton.GetReplyBuffer Method

Pascal

```
procedure GetReplyBuffer(cookie: Pointer; out Outbuf: IMarshalOutBuffer); stdcall;
```

C++

```
__fastcall __stdcall GetReplyBuffer(void * cookie, IMarshalOutBuffer Outbuf);
```

Description

This is GetReplyBuffer, a member of class ISkeleton.

120.1.7 ISkeletonObject Interface

Class Hierarchy

Pascal

```
ISkeletonObject = interface;
```

C++

```
__interface ISkeletonObject;
```

File

OrbPas

Description

This is class OrbPas.ISkeletonObject.

120.1.7.1 ISkeletonObject Members

The following tables list the members exposed by ISkeletonObject.

Public Methods

	Name	Description
	Execute (see page 18207)	This is Execute, a member of class ISkeletonObject.
	GetImplementation (see page 18207)	This is GetImplementation, a member of class ISkeletonObject.
	GetSkeleton (see page 18207)	This is GetSkeleton, a member of class ISkeletonObject.

120.1.7.2 ISkeletonObject Methods

The methods of the ISkeletonObject class are listed here.

Public Methods

	Name	Description
	Execute (see page 18207)	This is Execute, a member of class ISkeletonObject.
	GetImplementation (see page 18207)	This is GetImplementation, a member of class ISkeletonObject.
	GetSkeleton (see page 18207)	This is GetSkeleton, a member of class ISkeletonObject.

120.1.7.2.1 ISkeletonObject.Execute Method

Pascal

```
function Execute(Operation: PChar; const Strm: IMarshalInBuffer; Cookie: Pointer):
CorbaBoolean; stdcall;
```

C++

```
__fastcall __stdcall CorbaBoolean Execute(const char * Operation, const IMarshalInBuffer Strm,
void * Cookie);
```

Description

This is Execute, a member of class ISkeletonObject.

120.1.7.2.2 ISkeletonObject.GetImplementation Method

Pascal

```
procedure GetImplementation(out Impl: IUnknown); stdcall;
```

C++

```
__fastcall __stdcall GetImplementation(IUnknown Impl);
```

Description

This is GetImplementation, a member of class ISkeletonObject.

120.1.7.2.3 ISkeletonObject.GetSkeleton Method

Pascal

```
procedure GetSkeleton(out Skeleton: ISkeleton); stdcall;
```

C++

```
__fastcall __stdcall GetSkeleton(ISkeleton Skeleton);
```

Description

This is GetSkeleton, a member of class ISkeletonObject.

120.1.8 IStub Interface

Class Hierarchy

Pascal

```
IStub = interface(ICorbaObj);
```

C++

```
__interface IStub : public ICorbaObj;
```

File

OrbPas

Description

This is class OrbPas.IStub.

120.1.8.1 IStub Members

The following tables list the members exposed by IStub.

Public Methods

	Name	Description
	CorbaObject (see page 18192)	This is CorbaObject, a member of class ICorbaObj.
	CreateRequest (see page 18209)	This is CreateRequest, a member of class IStub.
	Dispatch (see page 18209)	This is Dispatch, a member of class IStub.
	GetInterface (see page 18209)	This is GetInterface, a member of class IStub.
	Hash (see page 18209)	This is Hash, a member of class IStub.
	Invoke (see page 18210)	This is Invoke, a member of class IStub.
	IsA (see page 18210)	This is IsA, a member of class IStub.
	IsLocal (see page 18192)	This is IsLocal, a member of class ICorbaObj.
	NonExistent (see page 18210)	This is NonExistent, a member of class IStub.
	RepositoryID (see page 18210)	This is RepositoryID, a member of class IStub.
	SetPrincipal (see page 18211)	This is SetPrincipal, a member of class IStub.

120.1.8.2 IStub Methods

The methods of the IStub class are listed here.

Public Methods

	Name	Description
	CreateRequest (see page 18209)	This is CreateRequest, a member of class IStub.

	Dispatch (see page 18209)	This is Dispatch, a member of class IStub.
	GetInterface (see page 18209)	This is GetInterface, a member of class IStub.
	Hash (see page 18209)	This is Hash, a member of class IStub.
	Invoke (see page 18210)	This is Invoke, a member of class IStub.
	IsA (see page 18210)	This is IsA, a member of class IStub.
	NonExistent (see page 18210)	This is NonExistent, a member of class IStub.
	RepositoryID (see page 18210)	This is RepositoryID, a member of class IStub.
	SetPrincipal (see page 18211)	This is SetPrincipal, a member of class IStub.

120.1.8.2.1 IStub.CreateRequest Method

Pascal

```
procedure CreateRequest(Operation: PChar; ResponseExpected: CorbaBoolean; out Outbuf:
IMarshalOutBuffer); stdcall;
```

C++

```
__fastcall __stdcall CreateRequest(const char * Operation, CorbaBoolean ResponseExpected,
IMarshalOutBuffer Outbuf);
```

Description

This is CreateRequest, a member of class IStub.

120.1.8.2.2 IStub.Dispatch Method

Pascal

```
function Dispatch(CallDesc: PCallDesc; Params: Pointer; out Result: Variant): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Dispatch(PCallDesc CallDesc, void * Params, Variant Result);
```

Description

This is Dispatch, a member of class IStub.

120.1.8.2.3 IStub.GetInterface Method

Pascal

```
function GetInterface: PCorbaInterfaceDef; stdcall;
```

C++

```
__fastcall __stdcall PCorbaInterfaceDef GetInterface();
```

Description

This is GetInterface, a member of class IStub.

120.1.8.2.4 IStub.Hash Method

Pascal

```
function Hash(Maximum: CorbaULong): CorbaULong; stdcall;
```

C++

```
__fastcall __stdcall CorbaULong Hash(CorbaULong Maximum);
```

Description

This is Hash, a member of class IStub.

120.1.8.2.5 IStub.Invoke Method

Pascal

```
procedure Invoke(const Outbuf: IMarshalOutBuffer; out Inbuf: IMarshalInBuffer); stdcall;
```

C++

```
__fastcall __stdcall Invoke(const IMarshalOutBuffer Outbuf, IMarshalInBuffer Inbuf);
```

Description

This is Invoke, a member of class IStub.

120.1.8.2.6 IStub.IsA Method

Pascal

```
function IsA(LogicalTypeId: PChar): CorbaBoolean; stdcall;
```

C++

```
__fastcall __stdcall CorbaBoolean IsA(const char * LogicalTypeId);
```

Description

This is IsA, a member of class IStub.

120.1.8.2.7 IStub.NonExistent Method

Pascal

```
function NonExistent: CorbaBoolean; stdcall;
```

C++

```
__fastcall __stdcall CorbaBoolean NonExistent();
```

Description

This is NonExistent, a member of class IStub.

120.1.8.2.8 IStub.RepositoryID Method

Pascal

```
function RepositoryID: PChar; stdcall;
```

C++

```
__fastcall __stdcall const char * RepositoryID();
```

Description

This is RepositoryID, a member of class IStub.

120.1.8.2.9 IStub.SetPrincipal Method

Pascal

```
procedure SetPrincipal(Bytes: Pointer; Length: CorbaULong); stdcall;
```

C++

```
__fastcall __stdcall SetPrincipal(void * Bytes, CorbaULong Length);
```

Description

This is SetPrincipal, a member of class IStub.

120.1.9 IStubObject Interface

Class Hierarchy

OrbPas.IStubObject

Pascal

```
IStubObject = interface;
```

C++

```
__interface IStubObject;
```

File

OrbPas

Description

This is class OrbPas.IStubObject.

120.1.9.1 IStubObject Members

The following tables list the members exposed by IStubObject.

Public Methods

	Name	Description
	GetStub (see page 18212)	This is GetStub, a member of class IStubObject.

120.1.9.2 IStubObject Methods

The methods of the IStubObject class are listed here.

Public Methods

	Name	Description
	GetStub (see page 18212)	This is GetStub, a member of class IStubObject.

120.1.9.2.1 IStubObject.GetStub Method

Pascal

```
procedure GetStub(out stub: IStub); stdcall;
```

C++

```
__fastcall __stdcall GetStub(IStub stub);
```

Description

This is GetStub, a member of class IStubObject.

120.1.10 ITypeCode Interface

Class Hierarchy

OrbPas.ITypeCode

Pascal

```
ITypeCode = interface;
```

C++

```
__interface ITypeCode;
```

File

OrbPas

Description

This is class OrbPas.ITypeCode.

120.1.10.1 ITypeCode Members

The following tables list the members exposed by ITypeCode.

Public Methods

	Name	Description
	ContentType (see page 18213)	This is ContentType, a member of class ITypeCode.
	DefaultIndex (see page 18213)	This is DefaultIndex, a member of class ITypeCode.
	DiscriminatorType (see page 18213)	This is DiscriminatorType, a member of class ITypeCode.
	Equal (see page 18214)	This is Equal, a member of class ITypeCode.
	Id (see page 18214)	This is Id, a member of class ITypeCode.
	Kind (see page 18214)	This is Kind, a member of class ITypeCode.
	Length (see page 18214)	This is Length, a member of class ITypeCode.
	MemberCount (see page 18215)	This is MemberCount, a member of class ITypeCode.
	MemberLabel (see page 18215)	This is MemberLabel, a member of class ITypeCode.
	MemberName (see page 18215)	This is MemberName, a member of class ITypeCode.
	MemberType (see page 18215)	This is MemberType, a member of class ITypeCode.
	Name (see page 18215)	This is Name, a member of class ITypeCode.
	Parameter (see page 18216)	This is Parameter, a member of class ITypeCode.
	ParameterCount (see page 18216)	This is ParameterCount, a member of class ITypeCode.

120.1.10.2 ITypeCode Methods

The methods of the ITypeCode class are listed here.

Public Methods

	Name	Description
	ContentType (see page 18213)	This is ContentType, a member of class ITypeCode.
	DefaultIndex (see page 18213)	This is DefaultIndex, a member of class ITypeCode.
	DiscriminatorType (see page 18213)	This is DiscriminatorType, a member of class ITypeCode.
	Equal (see page 18214)	This is Equal, a member of class ITypeCode.
	Id (see page 18214)	This is Id, a member of class ITypeCode.
	Kind (see page 18214)	This is Kind, a member of class ITypeCode.
	Length (see page 18214)	This is Length, a member of class ITypeCode.
	MemberCount (see page 18215)	This is MemberCount, a member of class ITypeCode.
	MemberLabel (see page 18215)	This is MemberLabel, a member of class ITypeCode.
	MemberName (see page 18215)	This is MemberName, a member of class ITypeCode.
	MemberType (see page 18215)	This is MemberType, a member of class ITypeCode.
	Name (see page 18215)	This is Name, a member of class ITypeCode.
	Parameter (see page 18216)	This is Parameter, a member of class ITypeCode.
	ParameterCount (see page 18216)	This is ParameterCount, a member of class ITypeCode.

120.1.10.2.1 ITypeCode.ContentType Method

Pascal

```
procedure ContentType(out tc: ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall ContentType(ITypeCode tc);
```

Description

This is ContentType, a member of class ITypeCode.

120.1.10.2.2 ITypeCode.DefaultIndex Method

Pascal

```
function DefaultIndex: Integer; stdcall;
```

C++

```
__fastcall __stdcall int DefaultIndex();
```

Description

This is DefaultIndex, a member of class ITypeCode.

120.1.10.2.3 ITypeCode.DiscriminatorType Method

Pascal

```
procedure DiscriminatorType(out tc: ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall DiscriminatorType(ITypeCode tc);
```

Description

This is DiscriminatorType, a member of class ITypeCode.

120.1.10.2.4 ITypeCode.Equal Method

Pascal

```
function Equal(const tc: ITypeCode): CorbaBoolean; stdcall;
```

C++

```
__fastcall __stdcall CorbaBoolean Equal(const ITypeCode tc);
```

Description

This is Equal, a member of class ITypeCode.

120.1.10.2.5 ITypeCode.Id Method

Pascal

```
function Id: PChar; stdcall;
```

C++

```
__fastcall __stdcall const char * Id();
```

Description

This is Id, a member of class ITypeCode.

120.1.10.2.6 ITypeCode.Kind Method

Pascal

```
function Kind: TCKind; stdcall;
```

C++

```
__fastcall __stdcall TCKind Kind();
```

Description

This is Kind, a member of class ITypeCode.

120.1.10.2.7 ITypeCode.Length Method

Pascal

```
function Length: CorbaULong; stdcall;
```

C++

```
__fastcall __stdcall CorbaULong Length();
```

Description

This is Length, a member of class ITypeCode.

120.1.10.2.8 ITypeCode.MemberCount Method

Pascal

```
function MemberCount: CorbaULong; stdcall;
```

C++

```
__fastcall __stdcall CorbaULong MemberCount();
```

Description

This is MemberCount, a member of class ITypeCode.

120.1.10.2.9 ITypeCode.MemberLabel Method

Pascal

```
function MemberLabel(index: CorbaULong): PCorbaAny; stdcall;
```

C++

```
__fastcall __stdcall PCorbaAny MemberLabel(CorbaULong index);
```

Description

This is MemberLabel, a member of class ITypeCode.

120.1.10.2.10 ITypeCode.MemberName Method

Pascal

```
function MemberName(index: CorbaULong): PChar; stdcall;
```

C++

```
__fastcall __stdcall const char * MemberName(CorbaULong index);
```

Description

This is MemberName, a member of class ITypeCode.

120.1.10.2.11 ITypeCode.MemberType Method

Pascal

```
procedure MemberType(index: CorbaULong; out tc: ITypeCode); stdcall;
```

C++

```
__fastcall __stdcall MemberType(CorbaULong index, ITypeCode tc);
```

Description

This is MemberType, a member of class ITypeCode.

120.1.10.2.12 ITypeCode.Name Method

Pascal

```
function Name: PChar; stdcall;
```

C++

```
__fastcall __stdcall const char * Name();
```

Description

This is Name, a member of class ITypeCode.

120.1.10.2.13 ITypeCode.Parameter Method

Pascal

```
function Parameter(index: Integer): PCorbaAny; stdcall;
```

C++

```
__fastcall __stdcall PCorbaAny Parameter(int index);
```

Description

This is Parameter, a member of class ITypeCode.

120.1.10.2.14 ITypeCode.ParameterCount Method

Pascal

```
function ParameterCount: Integer; stdcall;
```

C++

```
__fastcall __stdcall int ParameterCount();
```

Description

This is ParameterCount, a member of class ITypeCode.

120.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AnyToVariant (see page 18217)	This is function OrbPas.AnyToVariant.
	BindStub (see page 18217)	This is function OrbPas.BindStub.
	CorbaAnyType (see page 18218)	This is function OrbPas.CorbaAnyType.
	CorbaDuplicateAny (see page 18218)	This is function OrbPas.CorbaDuplicateAny.
	CorbaReleaseAny (see page 18218)	This is function OrbPas.CorbaReleaseAny.
	CorbaStringFree (see page 18219)	This is function OrbPas.CorbaStringFree.
	CorbaWStringFree (see page 18219)	This is function OrbPas.CorbaWStringFree.
	CreateSkeleton (see page 18219)	This is function OrbPas.CreateSkeleton.
	CreateUserException (see page 18220)	This is function OrbPas.CreateUserException.
	InitORB (see page 18220)	This is function OrbPas.InitORB.
	RegisterUserException (see page 18220)	This is function OrbPas.RegisterUserException.
	SequenceToVariant (see page 18221)	This is function OrbPas.SequenceToVariant.
	UnRegisterUserException (see page 18221)	This is function OrbPas.UnRegisterUserException.
	VariantToAny (see page 18221)	This is function OrbPas.VariantToAny.

120.2.1 OrbPas.AnyToVariant Function

Pascal

```
function AnyToVariant(Value: PCorbaAny; OV: PVariant): Boolean;
```

C++

```
Boolean AnyToVariant(PCorbaAny Value, PVariant OV);
```

File

OrbPas

Description

This is function OrbPas.AnyToVariant.

120.2.2 OrbPas.BindStub Function

Pascal

```
procedure BindStub(RepositoryID: PChar; InstanceName: PChar; HostName: PChar; const Orb: IORB;
RefCountServer: CorbaBoolean; out Stub: IStub);
```

C++

```
BindStub(const char * RepositoryID, const char * InstanceName, const char * HostName, const
IORB Orb, CorbaBoolean RefCountServer, IStub Stub);
```

File

OrbPas

Description

This is function OrbPas.BindStub.

120.2.3 OrbPas.CorbaAnyType Function

Pascal

```
procedure CorbaAnyType(Any: PCorbaAny; out TypeCode: ITypeCode);
```

C++

```
CorbaAnyType(PCorbaAny Any, ITypeCode TypeCode);
```

File

OrbPas

Description

This is function OrbPas.CorbaAnyType.

120.2.4 OrbPas.CorbaDuplicateAny Function

Pascal

```
function CorbaDuplicateAny(Any: PCorbaAny): PCorbaAny;
```

C++

```
PCorbaAny CorbaDuplicateAny(PCorbaAny Any);
```

File

OrbPas

Description

This is function OrbPas.CorbaDuplicateAny.

120.2.5 OrbPas.CorbaReleaseAny Function

Pascal

```
procedure CorbaReleaseAny(Any: PCorbaAny);
```

C++

```
CorbaReleaseAny(PCorbaAny Any);
```

File

OrbPas

Description

This is function OrbPas.CorbaReleaseAny.

120.2.6 OrbPas.CorbaStringFree Function

Pascal

```
procedure CorbaStringFree(Str: PChar);
```

C++

```
CorbaStringFree(const char * Str);
```

File

OrbPas

Description

This is function OrbPas.CorbaStringFree.

120.2.7 OrbPas.CorbaWStringFree Function

Pascal

```
procedure CorbaWStringFree(Str: PWideChar);
```

C++

```
CorbaWStringFree(PWideChar Str);
```

File

OrbPas

Description

This is function OrbPas.CorbaWStringFree.

120.2.8 OrbPas.CreateSkeleton Function

Pascal

```
procedure CreateSkeleton(InterfaceName: PChar; const DelphiObject: ISkeletonObject; Serialize:
CorbaBoolean; InstanceName: PChar; RepositoryID: PChar; ClientRefCount: CorbaBoolean; out
Skeleton: ISkeleton);
```

C++

```
CreateSkeleton(const char * InterfaceName, const ISkeletonObject DelphiObject, CorbaBoolean
Serialize, const char * InstanceName, const char * RepositoryID, CorbaBoolean ClientRefCount,
ISkeleton Skeleton);
```

File

OrbPas

Description

This is function OrbPas.CreateSkeleton.

120.2.9 OrbPas.CreateUserException Function

Pascal

```
function CreateUserException(copy: TCopyUserExceptionProc; throwobj: TThrowUserExceptionProc):
PUserExceptionProxy;
```

C++

```
PUserExceptionProxy CreateUserException(TCopyUserExceptionProc copy, TThrowUserExceptionProc
throwobj);
```

File

OrbPas

Description

This is function OrbPas.CreateUserException.

120.2.10 OrbPas.InitORB Function

Pascal

```
procedure InitORB(const Argv: TArgv; out Orb: IORB);
```

C++

```
InitORB(const TArgv Argv, IORB Orb);
```

File

OrbPas

Description

This is function OrbPas.InitORB.

120.2.11 OrbPas.RegisterUserException Function

Pascal

```
function RegisterUserException(Name: PChar; RepositoryID: PChar; Factory:
TUserExceptionFactoryProc): PExceptionDescription;
```

C++

```
PExceptionDescription RegisterUserException(const char * Name, const char * RepositoryID,
TUserExceptionFactoryProc Factory);
```

File

OrbPas

Description

This is function OrbPas.RegisterUserException.

120.2.12 OrbPas.SequenceToVariant Function

Pascal

```
function SequenceToVariant(Value: PCorbaAny; OV: PVariant): Boolean;
```

C++

```
Boolean SequenceToVariant(PCorbaAny Value, PVariant OV);
```

File

OrbPas

Description

This is function OrbPas.SequenceToVariant.

120.2.13 OrbPas.UnRegisterUserException Function

Pascal

```
procedure UnRegisterUserException(Description: PExceptionDescription);
```

C++

```
UnRegisterUserException(PExceptionDescription Description);
```

File

OrbPas

Description

This is function OrbPas.UnRegisterUserException.

120.2.14 OrbPas.VariantToAny Function

Pascal

```
function VariantToAny(Value: PVariant): PCorbaAny;
```

C++

```
PCorbaAny VariantToAny(PVariant Value);
```

File

OrbPas

Description

This is function OrbPas.VariantToAny.

120.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCKind (see page 18222)	This is record OrbPas.TCKind.

Records

	Name	Description
	TStructMember (see page 18223)	This is record OrbPas.TStructMember.

120.3.1 OrbPas.TCKind Enumeration

Pascal

```
TCKind = (

File

OrbPas

Description

This is record OrbPas.TCKind.

120.3.2 OrbPas.TStructMember Record

Pascal

```
  TStructMember = record
    Name: string;
    TC: ITypeCode;
  end;
```

C++

```
  struct TStructMember {
    AnsiString Name;
    ITypeCode TC;
  };
```

File

OrbPas

Description

This is record OrbPas.TStructMember.

120.4 Types

The following table lists types in this documentation.

Types

Name	Description
CorbaBoolean (see page 18224)	This is type OrbPas.CorbaBoolean.
CorbaULong (see page 18224)	This is type OrbPas.CorbaULong.
PCorbaAny (see page 18225)	This is type OrbPas.PCorbaAny.
PCorbaInterfaceDef (see page 18225)	This is type OrbPas.PCorbaInterfaceDef.
PCorbaObject (see page 18225)	This is type OrbPas.PCorbaObject.
PCorbaOrb (see page 18226)	This is type OrbPas.PCorbaOrb.
PExceptionDescription (see page 18226)	This is type OrbPas.PExceptionDescription.
PMarshalInbuffer (see page 18226)	This is type OrbPas.PMarshalInbuffer.
PMarshalOutbuffer (see page 18227)	This is type OrbPas.PMarshalOutbuffer.
PUserExceptionProxy (see page 18227)	This is type OrbPas.PUserExceptionProxy.
TArgv (see page 18227)	This is type OrbPas.TArgv.
TCopyUserExceptionProc (see page 18228)	This is type OrbPas.TCopyUserExceptionProc.
TStructMembers (see page 18228)	This is type OrbPas.TStructMembers.
TThrowUserExceptionProc (see page 18228)	This is type OrbPas.TThrowUserExceptionProc.
TUserExceptionFactoryProc (see page 18229)	This is type OrbPas.TUserExceptionFactoryProc.

120.4.1 OrbPas.CorbaBoolean Type

Pascal

```
CorbaBoolean = ByteBool;
```

C++

```
ByteBool CorbaBoolean;
```

File

OrbPas

Description

This is type OrbPas.CorbaBoolean.

120.4.2 OrbPas.CorbaULong Type

Pascal

```
CorbaULong = Integer;
```

C++

```
int CorbaULong;
```

File

OrbPas

Description

This is type OrbPas.CorbaULong.

120.4.3 OrbPas.PCorbaAny Type

Pascal

```
PCorbaAny = type Pointer;
```

C++

```
type Pointer PCorbaAny;
```

File

OrbPas

Description

This is type OrbPas.PCorbaAny.

120.4.4 OrbPas.PCorbaInterfaceDef Type

Pascal

```
PCorbaInterfaceDef = type Pointer;
```

C++

```
type Pointer PCorbaInterfaceDef;
```

File

OrbPas

Description

This is type OrbPas.PCorbaInterfaceDef.

120.4.5 OrbPas.PCorbaObject Type

Pascal

```
PCorbaObject = type Pointer;
```

C++

```
type Pointer PCorbaObject;
```

File

OrbPas

Description

This is type OrbPas.PCorbaObject.

120.4.6 OrbPas.PCorbaOrb Type

Pascal

```
PCorbaOrb = type Pointer;
```

C++

```
type Pointer PCorbaOrb;
```

File

OrbPas

Description

This is type OrbPas.PCorbaOrb.

120.4.7 OrbPas.PExceptionDescription Type

Pascal

```
PExceptionDescription = type Pointer;
```

C++

```
type Pointer PExceptionDescription;
```

File

OrbPas

Description

This is type OrbPas.PExceptionDescription.

120.4.8 OrbPas.PMarshalInbuffer Type

Pascal

```
PMarshalInbuffer = type Pointer;
```

C++

```
type Pointer PMarshalInbuffer;
```

File

OrbPas

Description

This is type OrbPas.PMarshalInbuffer.

120.4.9 OrbPas.PMarshalOutbuffer Type

Pascal

```
PMarshalOutbuffer = type Pointer;
```

C++

```
type Pointer PMarshalOutbuffer;
```

File

OrbPas

Description

This is type OrbPas.PMarshalOutbuffer.

120.4.10 OrbPas.PUserExceptionProxy Type

Pascal

```
PUserExceptionProxy = type Pointer;
```

C++

```
type Pointer PUserExceptionProxy;
```

File

OrbPas

Description

This is type OrbPas.PUserExceptionProxy.

120.4.11 OrbPas.TArgv Type

Pascal

```
TArgv = array of string;
```

C++

```
array of string TArgv;
```

File

OrbPas

Description

This is type OrbPas.TArgv.

120.4.12 OrbPas.TCopyUserExceptionProc Type

Pascal

```
TCopyUserExceptionProc = procedure (const InBuf: IMarshalInBuffer) of object;
```

C++

```
(const InBuf: IMarshalInBuffer) ( TCopyUserExceptionProc)();
```

File

OrbPas

Description

This is type OrbPas.TCopyUserExceptionProc.

120.4.13 OrbPas.TStructMembers Type

Pascal

```
TStructMembers = array of TStructMember;
```

C++

```
array of TStructMember TStructMembers;
```

File

OrbPas

Description

This is type OrbPas.TStructMembers.

120.4.14 OrbPas.TThrowUserExceptionProc Type

Pascal

```
TThrowUserExceptionProc = procedure of object;
```

C++

```
( TThrowUserExceptionProc)();
```

File

OrbPas

Description

This is type OrbPas.TThrowUserExceptionProc.

120.4.15 OrbPas.TUserExceptionFactoryProc Type

Pascal

```
TUserExceptionFactoryProc = function : PUserExceptionProxy;
```

C++

```
: PUserExceptionProxy ( TUserExceptionFactoryProc)();
```

File

OrbPas

Description

This is type OrbPas.TUserExceptionFactoryProc.

121 Outline Namespace

This is namespace Outline.

Topics

Name	Description
Classes (see page 18233)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 18366)	The following table lists structs, records, enums in this documentation.
Types (see page 18371)	The following table lists types in this documentation.

Classes

	Name	Description
	EOutlineError (see page 18233)	EOutlineError is the exception class for outline components.
	OutlineError (see page 18234)	OutlineError is a special exception class for invalid outline-node indexes.
	TCustomOutline (see page 18234)	TCustomOutline is the base class for controls that display outline nodes (TOutlineNode (see page 18349) objects).
	TOutline (see page 18279)	TOutline is a multilevel outline that displays the values of TOutlineNode (see page 18349) objects.
	TOutlineNode (see page 18349)	TOutlineNode represents a node in a TCustomOutline (see page 18234) object.

Structs, Records, Enums

	Name	Description
	TAttachMode (see page 18366)	TAttachMode indicates how an outline node should be inserted into an outline.
	TOutlineBitmap (see page 18367)	This is record Outline.TOutlineBitmap.
	TOutlineNodeCompare (see page 18367)	This is record Outline.TOutlineNodeCompare.
	TOutlineOption (see page 18368)	TOutlineOptions (see page 18373) represents the style in which an outline is drawn.
	TOutlineStyle (see page 18368)	TOutlineStyle determines how the nodes of an outline are drawn.
	TOutlineType (see page 18369)	TOutlineType indicates whether an outline is owner-drawn.

Types

Name	Description
EOutlineChange (see page 18371)	EOutlineChange is the type of event handlers that respond when the nodes in an outline control change.
TBitmapArray (see page 18371)	This is type Outline.TBitmapArray.
TBitmapArrayRange (see page 18372)	This is type Outline.TBitmapArrayRange.
TChangeRange (see page 18372)	TChangeRange indicates the direction in which a node is moved.

TOutlineBitmaps (see page 18372)	This is type Outline.TOutlineBitmaps.
TOutlineOptions (see page 18373)	TOutlineOptions represents the style in which an outline is drawn.

121.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EOutlineError (see page 18233)	EOutlineError is the exception class for outline components.
	OutlineError (see page 18234)	OutlineError is a special exception class for invalid outline-node indexes.
	TCustomOutline (see page 18234)	TCustomOutline is the base class for controls that display outline nodes (TOutlineNode (see page 18349) objects).
	TOutline (see page 18279)	TOutline is a multilevel outline that displays the values of TOutlineNode (see page 18349) objects.
	TOutlineNode (see page 18349)	TOutlineNode represents a node in a TCustomOutline (see page 18234) object.

121.1.1 EOutlineError Class

EOutlineError is the exception class for outline components.

Class Hierarchy

Pascal

```
EOutlineError = class(Exception);
```

C++

```
class EOutlineError : public Exception;
```

File

Outline

Description

EOutlineError is raised when an error occurs as an application works with an outline component. For example, an EOutlineError exception occurs when an application

Attempts to access an outline using an invalid node index.

Attempts to expand a node whose parent isn't expanded.

Attempts to load items from a file using an invalid file extension.

Note: EOutlineError is raised by the TOutline (see page 18279) component, which is maintained for backward compatibility.

See Also

OutlineError (see page 18234)

121.1.2 OutlineError Class

OutlineError is a special exception class for invalid outline-node indexes.

Class Hierarchy

Pascal

```
OutlineError = class(TObject);
```

C++

```
class OutlineError : public TObject;
```

File

Outline

Description

OutlineError is raised when an application cannot access a specified outline node. In most cases, this occurs because the index used is invalid.

OutlineError is raised internally to abort look-ups of outline components. Because it does not descend from Exception, it never appears at runtime—even if the debugger is set to break on exceptions. Thus it is a useful tool for aborting deep recursions.

Note: OutlineError is raised by the TOutline (see page 18279) component, which is maintained for backward compatibility.

See Also

EOutlineError (see page 18233)

Exception (see page 22750)

121.1.3 TCustomOutline Class

TCustomOutline is the base class for controls that display outline nodes (TOutlineNode (see page 18349) objects).

Class Hierarchy

Pascal

```
TCustomOutline = class(TCustomGrid);
```

C++

```
class TCustomOutline : public TCustomGrid;
```

File

Outline

Description

Use TCustomOutline as a base class when defining a control that displays outline nodes in a two-dimensional layout. TCustomOutline introduces the ability to manage a hierarchy of outline nodes, including the ability to control the appearance and layout of those nodes and to expand or collapse branches of the outline tree.

Do not create instances of TCustomOutline. To add an outline control to a form, use the TOutline (see page 18279) object, which publishes many of the properties, events, and methods of TCustomOutline, or TTreeView, which wraps the Windows control that performs the same function.

See Also

TOutline (see page 18279)

TOutlineNode (see page 18349)

TTreeView (see page 5293)

121.1.3.1 TCustomOutline Members

The following tables list the members exposed by TCustomOutline.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnCollapse (see page 18278)	Occurs immediately after a node in the outline is collapsed.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 18278)	Occurs when a node must be drawn in an owner-draw outline.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnExpand (see page 18279)	Occurs immediately after a node in the outline is expanded.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.

	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	DesignOptionsBoost (see page 14814)	This is DesignOptionsBoost, a member of class TCustomGrid.
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FGridState (see page 14814)	This is FGridState, a member of class TCustomGrid.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSaveCellExtents (see page 14814)	This is FSaveCellExtents, a member of class TCustomGrid.
	VirtualView (see page 14814)	This is VirtualView, a member of class TCustomGrid.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AdjustSize (see page 14816)	Adds or deletes rows or columns from the grid.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BadIndex (see page 18253)	Indicates whether a node's index is up to date.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	BeginColumnDrag (see page 14817)	Starts the dragging of a column in the grid.

	BeginRowDrag (see page 14817)	Starts the dragging of a row in the grid.
	BoxRect (see page 14818)	Returns the screen coordinates of a specified set of cells.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcDrawInfo (see page 14818)	Calculates the pixel locations of the grid boundaries.
	CalcFixedInfo (see page 14818)	Calculates the pixel locations of the fixed cells.
	CalcSizingState (see page 14819)	Determines the appearance of the mouse cursor during resizing.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanEditAcceptKey (see page 14819)	Indicates whether the Key parameter can be entered into the current cell.
	CanEditModify (see page 14819)	Indicates whether the current cell in the grid can be edited.
	CanEditShow (see page 14820)	Indicates whether the inplace edit control can be created to allow editing.
	CanGridAcceptKey (see page 14820)	Indicates whether the grid should respond to a given key combination.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	CellRect (see page 14821)	Returns the screen coordinates of a cell in the grid.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeGridOrientation (see page 14821)	Prepares the grid's canvas for painting to reflect a right-to-left or left-to-right orientation.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CheckColumnDrag (see page 14821)	CheckColumnDrag validates whether the column currently selected for dragging can be dropped at the current location.
	CheckRowDrag (see page 14822)	CheckRowDrag validates whether the row currently selected for dragging can be dropped at the current location.
	Click (see page 18254)	Updates the SelectedItem (see page 18277) property.
	Collapse (see page 18254)	Generates an OnCollapse (see page 18278) event.
	ColumnMoved (see page 14822)	Provides the interface for a method that responds when the position of a column changes.
	ColWidthsChanged (see page 14822)	Responds when the column widths change.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateEditor (see page 14823)	Creates the inplace editor control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 14823)	Initializes the window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 18254)	Expands or collapses the selected node.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 18255)	Creates a binary property for customized bitmap values.
	DeleteColumn (see page 14824)	Deletes a specified column from the grid.
	DeleteNode (see page 18256)	Fixes up the outline after a node has been deleted.
	DeleteRow (see page 14825)	Deletes a specified from the grid.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.

	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoExit (see page 14825)	Hides the inplace editor when selection moves to another control in a form.
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelDown (see page 14825)	Performs tasks when the mouse wheel is rotated downward.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoMouseWheelUp (see page 14826)	Performs tasks when the mouse wheel is rotated upward.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawCell (see page 18256)	Draws a node in the outline.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EndColumnDrag (see page 14827)	Ends the dragging of a column in the grid.
	EndRowDrag (see page 14827)	Ends the dragging of a row in the grid.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	Expand (see page 18257)	Generates an OnExpand (see page 18279) event.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	FocusCell (see page 14827)	Changes the current cell to a specified cell.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.

	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEditLimit (see page 14828)	Provides the interface for a method that limits the number of characters the user can type into cells.
	GetEditMask (see page 14828)	Provides the interface for a method that returns an input mask for the specified cell.
	GetEditStyle (see page 14828)	Indicates whether a specified cell has an ellipsis button or drop-down arrow.
	GetEditText (see page 14829)	Returns the value of the indicated cell formatted for editing.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetGridHeight (see page 14829)	Returns the value of the GridHeight (see page 14850) property.
	GetGridWidth (see page 14830)	Returns the value of the GridWidth (see page 14851) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HideEdit (see page 14830)	Hides the inplace editor.
	HideEditor (see page 14830)	Hides the inplace editor when it is not in use.
	InvalidateCell (see page 14831)	Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.
	InvalidateCol (see page 14831)	Invalidates the region occupied by a column so that it will be repainted with the next Windows paint message.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	InvalidateEditor (see page 14832)	Causes the inplace editor to repaint itself, moving to a new location if necessary.
	InvalidateGrid (see page 14832)	Tells Windows to repaint the grid after other important Windows messages are handled.
	InvalidateRow (see page 14832)	Invalidates the region occupied by a row so that it will be repainted with the next Windows paint message.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 18262)	Provides special processing when the user presses a key.
	KeyPress (see page 18262)	Provides special processing when a key is pressed.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 18263)	Sets up the outline after it has been streamed in.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 18264)	Updates the SelectedItem (see page 18277) property.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseMove (see page 14834)	Provides special processing when the user moves the mouse.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	MouseUp (see page 14835)	Provides special processing when the user releases the mouse button.
	Move (see page 18265)	Repositions a node in the outline.
	MoveColRow (see page 14835)	Selects the cell indicated by the ACol and ARow parameters.
	MoveColumn (see page 14836)	Moves a column to a new position.

	MoveRow (see page 14836)	Moves a row to a new position.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 5920)	Renders the image of a custom control.
V	Paint (see page 14836)	Draws the image of the grid control on the screen.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	RowHeightsChanged (see page 14837)	Responds when the row heights change.
	RowMoved (see page 14837)	Provides the interface for a method that responds when the position of a row changes.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	ScrollData (see page 14838)	Scrolls the visual image of the cells in the grid.
V	SelectCell (see page 14838)	Determines whether a particular cell in the grid can be selected.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayWidth (see page 18266)	Sets the display width of the outline.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEditText (see page 14839)	Provides the interface for a method that updates the text associated with a cell.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetGoodIndex (see page 18266)	Returns the first node in the Items (see page 18271) array that must be reindexed to make the index of the Value parameter correct.

	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetLevel (see page 18267)	Sets the level of an outline node.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	ShowEditor (see page 14839)	Displays the inplace editor when the grid enters edit mode.
	ShowEditorChar (see page 14839)	Displays the inplace editor, with its text set to the specified character.
	SizeChanged (see page 14840)	Responds to changes in the size of the grid.
	Sizing (see page 14840)	Indicates whether the indicated coordinates are on one of the resize hot zones of the graph.
	TimedScroll (see page 14840)	Extends a move, resize, or selection out of the scrollable region when the user drags the mouse in a direction where the grid is scrolled.
	TopLeftChanged (see page 14841)	Updates the position of the inplace editor when the grid scrolls.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateDesigner (see page 14841)	Notifies the designer when rows and columns of the grid are moved or resized.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.

	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 14843)	Determines whether a single line border is drawn around the grid.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Col (see page 14843)	Specifies the index of the column that contains the selected cell.
	ColCount (see page 14844)	Specifies the number of columns in the grid.
	Color (see page 5812)	Specifies the background color of the control.
	Color (see page 14844)	Specifies the background color of the control.
	ColWidths (see page 14845)	Indicates the width (in pixels) of all the columns in the grid.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultColWidth (see page 14846)	Determines the width (in pixels) of all columns that have not been explicitly resized.
	DefaultDrawing (see page 14847)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 14847)	Specifies the height (in pixels) of all rows that have not been explicitly resized.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditorMode (see page 14848)	Determines whether the current cell can be edited.
	FixedColor (see page 14848)	Specifies the background color of the fixed rows and columns in the grid.
	FixedCols (see page 14848)	Specifies the number of columns on the left of the grid that cannot be scrolled.
	FixedRows (see page 14849)	Specifies the number of rows on the top of the grid that cannot be scrolled.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
R	GridHeight (see page 14850)	Specifies the height of the grid in pixels.
	GridLineWidth (see page 14850)	Specifies the width (in pixels) of the lines that separate the cells of the grid.
R	GridWidth (see page 14851)	Specifies the width of the grid in pixels.
R	HitTest (see page 14851)	Indicates the current position of the mouse cursor.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
R	InplaceEditor (see page 14852)	Designates the edit control the grid uses to allow users to edit the contents of the selected cell.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	ItemHeight (see page 18270)	Specifies the height of each node in the outline.
	ItemSeparator (see page 18271)	Specifies a delimiting string for outline nodes.
	LeftCol (see page 14852)	Specifies the index of the first visible scrollable column in the grid.
	Lines (see page 18272)	Lists the Text property values of all nodes in the outline.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	Options (see page 18272)	Determines how the nodes in the outline are drawn.
	OutlineStyle (see page 18273)	Specifies how the outline tree is displayed.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 14853)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PictureClosed (see page 18274)	Specifies the bitmap used to represent a collapsed node that has subitems.

	PictureLeaf (see page 18274)	Specifies the bitmap used to represent an item that does not have subitems.
	PictureMinus (see page 18275)	Specifies the bitmap used to represent an expanded item that has subitems.
	PictureOpen (see page 18275)	Specifies the bitmap used to represent an expanded item that has subitems.
	PicturePlus (see page 18276)	Specifies the bitmap used to represent a collapsed item that has subitems.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	RowCount (see page 14854)	Specifies the number of rows in the grid.
	RowHeights (see page 14855)	Gives the height (in pixels) of all rows in the grid.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ScrollBars (see page 14856)	Specifies whether the grid includes horizontal and vertical scroll bars.
	Selection (see page 14856)	Indicates the boundaries of the current selection.
	Style (see page 18277)	Determines whether the nodes and tree are drawn automatically.
	TabStops (see page 14858)	Indicates whether the user can tab to specified columns in the grid.
	Text (see page 5842)	Contains a text string associated with the control.
	TopRow (see page 14858)	Specifies the index of the first visible scrollable row in the grid.
R	VisibleColCount (see page 14859)	Indicates the number of scrollable columns visible in the grid.
R	VisibleRowCount (see page 14859)	Indicates the number of scrollable rows visible in the grid.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Add (see page 18250)	Adds a node to the outline.
	AddChild (see page 18250)	Adds a child node to a node in the outline.
	AddChildObject (see page 18251)	Adds a child node containing data to a node in the outline.
	AddObject (see page 18252)	Adds a node containing data to the outline.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BeginUpdate (see page 18253)	Prevents the updating of the outline until the EndUpdate (see page 18257) method is called.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 18253)	Removes all items from the outline.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.

	Create (see page 18248)	Creates an instance of TCustomOutline (see page 18234).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 18255)	Deletes a node from the outline.
	Destroy (see page 18248)	Destroys an instance of TCustomOutline (see page 18234).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	EndUpdate (see page 18257)	Performs the reindexing and repaints deferred by a call to BeginUpdate (see page 18253).
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	FullCollapse (see page 18257)	Causes all top-level nodes in the outline to collapse.
	FullExpand (see page 18258)	Expands every node in the outline.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetDataItem (see page 18258)	Returns the index of the first node in the outline that has the Value pointer as its Data property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItem (see page 18259)	Returns the index of the node at the position indicated by the X and Y parameters.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNodeDisplayWidth (see page 18259)	Returns the length of the row containing a specified node.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.

	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextItem (see page 18259)	Returns the index of the first node in the outline with the Value parameter as its Text property.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	GetVisibleNode (see page 18260)	Returns the TOutlineNode (see page 18349) object for the node indicated by a position in the image of the outline.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 18260)	Inserts a node at a specified position.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InsertObject (see page 18261)	Inserts a node containing data at a specified position.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	LoadFromFile (see page 18263)	Loads the outline from a text image stored in a file.
	LoadFromStream (see page 18264)	Loads the outline from a text image read from a stream.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseCoord (see page 14834)	Returns the row and column indexes of the cell that contains a point specified in screen coordinates.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

	SaveToFile (see page 18265)	Saves the Lines (see page 18272) property to a file.
	SaveToStream (see page 18265)	Writes the Lines (see page 18272) property to a stream.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	SetUpdateState (see page 18267)	Enables or disables the maintenance of the node indexes.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	Canvas (see page 18268)	Specifies the TCanvas object that presents a drawing surface for the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.

R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
R	ItemCount (see page 18270)	Indicates the number of nodes in the outline.
R	Items (see page 18271)	Lists the nodes in the outline.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	Row (see page 18276)	Specifies the index of the row that contains the selected cell.
	SelectedItem (see page 18277)	Specifies the index of the selected node.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.

	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	TabStop (see page 14857)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

121.1.3.2 TCustomOutline.Create Constructor

Creates an instance of TCustomOutline (see page 18234).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomOutline(TComponent * AOwner);
```

Description

Call Create to instantiate a TCustomOutline (see page 18234) object at runtime. Outlines placed on forms at design time are created automatically.

Create initializes the outline object, setting the values of some internal properties, as well as setting

Color to clWindow and ParentColor to false.

Height to 97 and Width to 121.

ItemSeparator (see page 18271) to '\'.

Options (see page 18272) to [ooDrawTreeRoot, ooDrawFocusRect].

OutlineStyle (see page 18273) to osTreePictureText.

See Also

Height (see page 5825)

ItemSeparator (see page 18271)

Options (see page 18272)

OutlineStyle (see page 18273)

Color (see page 5812)

ParentColor (see page 5834)

Create (see page 5918)

Width (see page 5849)

121.1.3.3 TCustomOutline.Destroy Destructor

Destroys an instance of TCustomOutline (see page 18234).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomOutline();
```

Description

Destroy frees all memory associated with the outline. While the destructor frees the TOutlineNode (see page 18349) objects that comprise the outline, any objects associated with those nodes are not freed.

121.1.3.4 TCustomOutline Methods

The methods of the TCustomOutline class are listed here.

Protected Methods

	Name	Description
	BadIndex (see page 18253)	Indicates whether a node's index is up to date.
V	Click (see page 18254)	Updates the SelectedItem (see page 18277) property.
	Collapse (see page 18254)	Generates an OnCollapse (see page 18278) event.
V	DblClick (see page 18254)	Expands or collapses the selected node.
V	DefineProperties (see page 18255)	Creates a binary property for customized bitmap values.
	DeleteNode (see page 18256)	Fixes up the outline after a node has been deleted.
V	DrawCell (see page 18256)	Draws a node in the outline.
	Expand (see page 18257)	Generates an OnExpand (see page 18279) event.
V	KeyDown (see page 18262)	Provides special processing when the user presses a key.
V	KeyPress (see page 18262)	Provides special processing when a key is pressed.
V	Loaded (see page 18263)	Sets up the outline after it has been streamed in.
V	MouseDown (see page 18264)	Updates the SelectedItem (see page 18277) property.
	Move (see page 18265)	Repositions a node in the outline.
	SetDisplayWidth (see page 18266)	Sets the display width of the outline.
	SetGoodIndex (see page 18266)	Returns the first node in the Items (see page 18271) array that must be reindexed to make the index of the Value parameter correct.
	SetLevel (see page 18267)	Sets the level of an outline node.

Public Methods

	Name	Description
	Add (see page 18250)	Adds a node to the outline.
	AddChild (see page 18250)	Adds a child node to a node in the outline.
	AddChildObject (see page 18251)	Adds a child node containing data to a node in the outline.
	AddObject (see page 18252)	Adds a node containing data to the outline.
	BeginUpdate (see page 18253)	Prevents the updating of the outline until the EndUpdate (see page 18257) method is called.
	Clear (see page 18253)	Removes all items from the outline.
	Delete (see page 18255)	Deletes a node from the outline.
	EndUpdate (see page 18257)	Performs the reindexing and repaints deferred by a call to BeginUpdate (see page 18253).
	FullCollapse (see page 18257)	Causes all top-level nodes in the outline to collapse.
	FullExpand (see page 18258)	Expands every node in the outline.
	GetDataItem (see page 18258)	Returns the index of the first node in the outline that has the Value pointer as its Data property.
	GetItem (see page 18259)	Returns the index of the node at the position indicated by the X and Y parameters.
	GetNodeDisplayWidth (see page 18259)	Returns the length of the row containing a specified node.
	GetTextItem (see page 18259)	Returns the index of the first node in the outline with the Value parameter as its Text property.
	GetVisibleNode (see page 18260)	Returns the TOutlineNode (see page 18349) object for the node indicated by a position in the image of the outline.
	Insert (see page 18260)	Inserts a node at a specified position.

	InsertObject (see page 18261)	Inserts a node containing data at a specified position.
	LoadFromFile (see page 18263)	Loads the outline from a text image stored in a file.
	LoadFromStream (see page 18264)	Loads the outline from a text image read from a stream.
	SaveToFile (see page 18265)	Saves the Lines (see page 18272) property to a file.
	SaveToStream (see page 18265)	Writes the Lines (see page 18272) property to a stream.
	SetUpdateState (see page 18267)	Enables or disables the maintenance of the node indexes.

121.1.3.4.1 TCustomOutline.Add Method

Adds a node to the outline.

Pascal

```
function Add(Index: LongInt; const Text: string): LongInt;
```

C++

```
__fastcall LongInt Add(LongInt Index, const AnsiString Text);
```

Description

Use Add to add a TOutlineNode (see page 18349) object to the outline. Text specifies the Text property value of the new node.

Index specifies where to add the new node. The new node is positioned in the outline as the last sibling of the node identified by Index. To add nodes to the beginning of the outline, specify zero (0) as the Index parameter.

Nodes that appear after the new node are moved down one row and reindexed in the Items (see page 18271) property array with valid Index values. If BeginUpdate (see page 18253) has been called, the Items (see page 18271) array is not reindexed until the EndUpdate (see page 18257) method is called.

Add returns the Index property of the new node.

AddChild (see page 18250)

AddObject (see page 18252)

BeginUpdate (see page 18253)

Delete (see page 18255)

EndUpdate (see page 18257)

Insert (see page 18260)

Items (see page 18271)

Index (see page 18362)

Text (see page 18364)

121.1.3.4.2 TCustomOutline.AddChild Method

Adds a child node to a node in the outline.

Pascal

```
function AddChild(Index: LongInt; const Text: string): LongInt;
```

C++

```
__fastcall LongInt AddChild(LongInt Index, const AnsiString Text);
```

Description

Use AddChild to add a TOutlineNode (see page 18349) object as the child of a node in the outline. Text specifies the Text property value of the new node.

Index specifies where to add the new node. The new node is positioned in the outline as the last child of the node identified by Index. To add nodes to the top level of the outline (off the root), specify zero (0) as the Index parameter.

Nodes that appear after the new node are moved down one row and reindexed in the Items (see page 18271) property array with valid Index values. If BeginUpdate (see page 18253) has been called, the Items (see page 18271) array is not reindexed until the EndUpdate (see page 18257) method is called.

AddChild returns the Index property of the new node.

See Also

Add (see page 18250)

AddChildObject (see page 18251)

BeginUpdate (see page 18253)

Delete (see page 18255)

EndUpdate (see page 18257)

Insert (see page 18260)

Items (see page 18271)

Index (see page 18362)

Text (see page 18364)

121.1.3.4.3 TCustomOutline.AddChildObject Method

Adds a child node containing data to a node in the outline.

Pascal

```
function AddChildObject(Index: LongInt; const Text: string; const Data: Pointer): LongInt;
```

C++

```
__fastcall LongInt AddChildObject(LongInt Index, const AnsiString Text, const void * Data);
```

Description

Use AddChildObject to add a TOutlineNode (see page 18349) object as the child of a node in the outline and assign it a data pointer. Text specifies the value of the Text property for the new node. Data specifies the value of the Data property for the new node.

Index specifies where to add the new node. The new node is positioned in the outline as the last child of the node identified by Index. To add nodes to the top level of the outline (off the root), specify zero (0) as the Index parameter.

Nodes that appear after the new node are moved down one row and reindexed in the Items (see page 18271) property array with valid Index values. If BeginUpdate (see page 18253) has been called, the Items (see page 18271) array is not reindexed until the EndUpdate (see page 18257) method is called.

AddChildObject returns the Index property of the new node.

See Also

AddChild (see page 18250)

AddObject (see page 18252)

BeginUpdate (see page 18253)

Delete (see page 18255)

EndUpdate (see page 18257)

InsertObject (see page 18261)

Items (see page 18271)

Data (see page 18360)

Index (see page 18362)

Text (see page 18364)

121.1.3.4.4 TCustomOutline.AddObject Method

Adds a node containing data to the outline.

Pascal

```
function AddObject(Index: LongInt; const Text: string; const Data: Pointer): LongInt;
```

C++

```
__fastcall LongInt AddObject(LongInt Index, const AnsiString Text, const void * Data);
```

Description

Use AddObject to add a TOutlineNode (see page 18349) object to the outline and assign it a data pointer. Text specifies the value of the Text property for the new node. Data specifies the value of the Data property for the new node.

Index specifies where to add the new node. The new node is positioned in the outline as the last sibling of the node identified by Index. To add nodes to the beginning of the outline, specify zero (0) as the Index parameter.

Nodes that appear after the new node are moved down one row and reindexed in the Items (see page 18271) property array with valid Index values. If BeginUpdate (see page 18253) has been called, the Items (see page 18271) array is not reindexed until the EndUpdate (see page 18257) method is called.

AddChild (see page 18250) returns the Index property of the new node.

See Also

Add (see page 18250)

AddChildObject (see page 18251)

BeginUpdate (see page 18253)

Delete (see page 18255)

EndUpdate (see page 18257)

InsertObject (see page 18261)

Items (see page 18271)

Data (see page 18360)

Index (see page 18362)

Text (see page 18364)

121.1.3.4.5 TCustomOutline.BadIndex Method

Indicates whether a node's index is up to date.

Pascal

```
function BadIndex(Value: TOutlineNode): Boolean;
```

C++

```
__fastcall Boolean BadIndex(TOutlineNode Value);
```

Description

Use BadIndex to determine whether the Index property of the TOutlineNode (see page 18349) object specified by the Value parameter accurately reflects the position of the node in the outline.

If nodes are added or removed after a call to BeginUpdate (see page 18253), the indexes may be out of date until the EndUpdate (see page 18257) method is called.

See Also

BeginUpdate (see page 18253)

EndUpdate (see page 18257)

Index (see page 18362)

121.1.3.4.6 TCustomOutline.BeginUpdate Method

Prevents the updating of the outline until the EndUpdate (see page 18257) method is called.

Pascal

```
procedure BeginUpdate;
```

C++

```
__fastcall BeginUpdate();
```

Description

Call BeginUpdate before adding, removing, or moving multiple outline items. BeginUpdate speeds processing time by deferring repaints and the adjustment of index values until EndUpdate (see page 18257) is called.

Note: Make sure that EndUpdate (see page 18257) is called after all changes have been made to the nodes in the Items (see page 18271) array.

See Also

BadIndex (see page 18253)

EndUpdate (see page 18257)

Items (see page 18271)

121.1.3.4.7 TCustomOutline.Clear Method

Removes all items from the outline.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the outline of all its nodes. Clear frees the memory for the removed items but not any memory for associated data.

121.1.3.4.8 TCustomOutline.Click Method

Updates the SelectedItem (see page 18277) property.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

Click is called automatically when the user clicks the mouse on a node in the outline. Click updates the SelectedItem (see page 18277) property before the OnClick event handler is called by the inherited method.

See Also

DblClick (see page 18254)

SelectedItem (see page 18277)

121.1.3.4.9 TCustomOutline.Collapse Method

Generates an OnCollapse (see page 18278) event.

Pascal

```
procedure Collapse(Index: LongInt); dynamic;
```

C++

```
__fastcall Collapse(LongInt Index);
```

Description

Collapse is called automatically after a node in the outline is collapsed. It calls the OnCollapse (see page 18278) event handler if it is assigned.

Override the Collapse method to provide additional processing after nodes in the outline have been collapsed, or to block the OnCollapse (see page 18278) event.

See Also

Expand (see page 18257)

OnCollapse (see page 18278)

121.1.3.4.10 TCustomOutline.DblClick Method

Expands or collapses the selected node.

Pascal

```
procedure DblClick; override;
```

C++

```
virtual __fastcall DblClick();
```

Description

DblClick is called automatically when the user double clicks the mouse on a node in the outline. After calling the OnDblClick event handler, DblClick updates the SelectedItem (see page 18277) property and expands the selected node if it is collapsed or collapses the selected node if it is expanded.

See Also

Click (see page 18254)

SelectedItem (see page 18277)

Expanded (see page 18361)

121.1.3.4.11 TCustomOutline.DefineProperties Method

Creates a binary property for customized bitmap values.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

The streaming system calls DefineProperties to allow the outline to define new properties that should be saved with the outline object. DefineProperties checks whether the outline uses any bitmaps other than the default values of PictureClosed (see page 18274), PictureLeaf (see page 18274), PictureMinus (see page 18275), PictureOpen (see page 18275), and PicturePlus (see page 18276). If the outline has customized any of these bitmaps, DefineProperties uses the DefineBinaryProperty method of the Filer parameter to create a binary property for the customized values.

See Also

PictureClosed (see page 18274)

PictureLeaf (see page 18274)

PictureMinus (see page 18275)

PictureOpen (see page 18275)

PicturePlus (see page 18276)

TWriter (see page 3175)

DefineBinaryProperty (see page 2837)

121.1.3.4.12 TCustomOutline.Delete Method

Deletes a node from the outline.

Pascal

```
procedure Delete(Index: LongInt);
```

C++

```
__fastcall Delete(LongInt Index);
```

Description

Call Delete to remove a node and all its descendants from the outline. Index is the index of the node to delete.

Delete removes the node and its children, frees all associated memory, and then calls DeleteNode (see page 18256) to update the indexes and make sure that SelectedItem (see page 18277) is valid.

See Also

Add (see page 18250)

DeleteNode (see page 18256)

SelectedItem (see page 18277)

121.1.3.4.13 TCustomOutline.DeleteNode Method

Fixes up the outline after a node has been deleted.

Pascal

```
procedure DeleteNode(Node: TOutlineNode; CurIndex: LongInt);
```

C++

```
__fastcall DeleteNode(TOutlineNode Node, LongInt CurIndex);
```

Description

DeleteNode is called automatically whenever a node in the outline is destroyed. It fixes up the index and makes sure that the SelectedItem (see page 18277) property is valid.

To Delete (see page 18255) a node from the outline, call the Delete (see page 18255) method of the outline or free the TOulineNode object.

See Also

Delete (see page 18255)

SelectedItem (see page 18277)

121.1.3.4.14 TCustomOutline.DrawCell Method

Draws a node in the outline.

Pascal

```
procedure DrawCell(ACol: Longint; ARow: Longint; ARect: TRect; AState: TGridDrawState);
override;
```

C++

```
virtual __fastcall DrawCell(Longint ACol, Longint ARow, TRect ARect, TGridDrawState AState);
```

Description

DrawCell is called automatically whenever the outline needs to draw a node. If the Style (see page 18277) property is otOwnerDraw and an OnDrawItem (see page 18278) event handler has been supplied, DrawCell generates an OnDrawItem (see page 18278) event. Otherwise, DrawCell draws the node in the manner indicated by the OutlineStyle (see page 18273) property.

See Also

OnDrawItem (see page 18278)

OutlineStyle (see page 18273)

121.1.3.4.15 TCustomOutline.EndUpdate Method

Performs the reindexing and repaints deferred by a call to BeginUpdate (see page 18253).

Pascal

```
procedure EndUpdate;
```

C++

```
__fastcall EndUpdate();
```

Description

Call EndUpdate at the end of a segment of code that began with a call to BeginUpdate (see page 18253). Every time BeginUpdate (see page 18253) is called, an internal counter is incremented. When EndUpdate is called, the counter is decremented. When every call to BeginUpdate (see page 18253) has been matched by a call to EndUpdate, EndUpdate fixes up the indexes and repaints the outline.

See Also

BeginUpdate (see page 18253)

Items (see page 18271)

121.1.3.4.16 TCustomOutline.Expand Method

Generates an OnExpand (see page 18279) event.

Pascal

```
procedure Expand(Index: LongInt); dynamic;
```

C++

```
__fastcall Expand(LongInt Index);
```

Description

Expand is called automatically after a node in the outline is expanded. It calls the OnExpand (see page 18279) event handler if it is assigned.

Override the Expand method to provide additional processing after nodes in the outline have been expanded, or to block the OnExpand (see page 18279) event.

See Also

Collapse (see page 18254)

OnExpand (see page 18279)

121.1.3.4.17 TCustomOutline.FullCollapse Method

Causes all top-level nodes in the outline to collapse.

Pascal

```
procedure FullCollapse;
```

C++

```
__fastcall FullCollapse();
```

Description

Call FullCollapse to shrink the outline as much as possible. FullCollapse sets the Expanded property of each TOutlineNode (see page 18349) that is a direct descendant of the root of the outline to false. This causes all the descendants of these top-level nodes to be hidden. Depending on the value of OutlineStyle (see page 18273), each collapsed top-level node is then represented with the PictureClosed (see page 18274) bitmap and/or the PicturePlus (see page 18276) bitmap.

See Also

OutlineStyle (see page 18273)

PictureClosed (see page 18274)

PicturePlus (see page 18276)

Expanded (see page 18361)

121.1.3.4.18 TCustomOutline.FullExpand Method

Expands every node in the outline.

Pascal

```
procedure FullExpand;
```

C++

```
__fastcall FullExpand();
```

Description

Call FullExpand to show all nodes in the outline. FullExpand calls the FullExpand method of the root node. This causes the Expanded property of all nodes in the outline to be set to true. Every node in the Items (see page 18271) array appears fully expanded in the outline. Depending on the value of OutlineStyle (see page 18273), each node that has descendants is then represented with the PictureOpen (see page 18275) bitmap and/or the PictureMinus (see page 18275) bitmap. The appearance of leaf nodes is unaffected.

See Also

OutlineStyle (see page 18273)

PictureMinus (see page 18275)

PictureOpen (see page 18275)

FullExpand (see page 18355)

121.1.3.4.19 TCustomOutline.GetDataItem Method

Returns the index of the first node in the outline that has the Value pointer as its Data property.

Pascal

```
function GetDataItem(Value: Pointer): Longint;
```

C++

```
__fastcall Longint GetDataItem(void * Value);
```

Description

Call GetDataItem to locate the node that corresponds to the Value parameter. GetDataItem returns an index into the Items (see page 18271) property array.

See Also

Items (see page 18271)

Data (see page 18360)

121.1.3.4.20 TCustomOutline.GetItem Method

Returns the index of the node at the position indicated by the X and Y parameters.

Pascal

```
function GetItem(X: Integer; Y: Integer): LongInt;
```

C++

```
__fastcall LongInt GetItem(int X, int Y);
```

Description

Call GetItem to locate the node at the specified screen pixel coordinates. GetItem returns an index into the Items (see page 18271) property array.

See Also

Items (see page 18271)

121.1.3.4.21 TCustomOutline.GetNodeDisplayWidth Method

Returns the length of the row containing a specified node.

Pascal

```
function GetNodeDisplayWidth(Node: TOutlineNode): Integer;
```

C++

```
__fastcall int GetNodeDisplayWidth(TOutlineNode Node);
```

Description

Call GetNodeDisplayWidth to determine the length, in pixels, of the line in the outline that contains the node specified by the Node parameter. GetNodeDisplayWidth adjusts for the lines and bitmaps specified by the OutlineStyle (see page 18273) property.

See Also

ItemHeight (see page 18270)

OutlineStyle (see page 18273)

121.1.3.4.22 TCustomOutline.GetTextItem Method

Returns the index of the first node in the outline with the Value parameter as its Text property.

Pascal

```
function GetTextItem(const Value: string): Longint;
```

C++

```
__fastcall Longint GetTextItem(const AnsiString Value);
```

Description

Call GetTextItem to locate the node that corresponds to the Value parameter. GetTextItem returns an index into the Items (see

page 18271) property array.

See Also

Items (see page 18271)

Text (see page 18364)

121.1.3.4.23 TCustomOutline.GetVisibleNode Method

Returns the TOutlineNode (see page 18349) object for the node indicated by a position in the image of the outline.

Pascal

```
function GetVisibleNode(Index: LongInt): TOutlineNode;
```

C++

```
__fastcall TOutlineNode GetVisibleNode(LongInt Index);
```

Description

Call GetVisibleNode to locate a node with the position given by the Index parameter, where all nodes that are hidden because their parent node is collapsed are ignored. An Index of 0 indicates the first visible node, an Index of 1 indicates the second visible node, and so on. If the outline is fully expanded, GetVisibleNode returns the value of Items (see page 18271)[Index+1].

See Also

Items (see page 18271)

121.1.3.4.24 TCustomOutline.Insert Method

Inserts a node at a specified position.

Pascal

```
function Insert(Index: LongInt; const Text: string): LongInt;
```

C++

```
__fastcall LongInt Insert(LongInt Index, const AnsiString Text);
```

Description

Use Insert to add a TOutlineNode (see page 18349) object to the outline. Text specifies the Text property value of the new node.

Index specifies where to add the new node. The new node is positioned in the outline in the position currently occupied by the node identified by Index. The new node is inserted at the same level as the node currently identified by Index, so that the original node and the new node are siblings and share the same parent. To add nodes to the beginning of the outline, specify zero (0) as the Index parameter.

Nodes that appear after the new node, including the one specified by Index before Insert is called, are moved down one row and reindexed in the Items (see page 18271) property array with valid Index values. If BeginUpdate (see page 18253) has been called, the Items (see page 18271) array is not reindexed until the EndUpdate (see page 18257) method is called.

Insert returns the Index property of the new node.

See Also

Add (see page 18250)

AddChild (see page 18250)

BeginUpdate (see page 18253)

Delete (see page 18255)

EndUpdate (see page 18257)

InsertObject (see page 18261)

Items (see page 18271)

Index (see page 18362)

Text (see page 18364)

121.1.3.4.25 TCustomOutline.InsertObject Method

Inserts a node containing data at a specified position.

Pascal

```
function InsertObject(Index: LongInt; const Text: string; const Data: Pointer): LongInt;
```

C++

```
__fastcall LongInt InsertObject(LongInt Index, const AnsiString Text, const void * Data);
```

Description

Use InsertObject to add a TOutlineNode (see page 18349) object to the outline and assign it a data pointer. Text specifies the value of the Text property for the new node. Data specifies the value of the Data property for the new node.

Index specifies where to add the new node. The new node is positioned in the outline in the position currently occupied by the node identified by Index. The new node is inserted at the same level as the node currently identified by Index, so that the original node and the new node are siblings and share the same parent. To add nodes to the beginning of the outline, specify zero (0) as the Index parameter.

Nodes that appear after the new node, including the one specified by Index before Insert (see page 18260) is called, are moved down one row and reindexed in the Items (see page 18271) property array with valid Index values. If BeginUpdate (see page 18253) has been called, the Items (see page 18271) array is not reindexed until the EndUpdate (see page 18257) method is called.

Insert (see page 18260) returns the Index property of the new node.

See Also

AddObject (see page 18252)

AddChildObject (see page 18251)

BeginUpdate (see page 18253)

Delete (see page 18255)

EndUpdate (see page 18257)

Insert (see page 18260)

Items (see page 18271)

Data (see page 18360)

Index (see page 18362)

Text (see page 18364)

121.1.3.4.26 TCustomOutline.KeyDown Method

Provides special processing when the user presses a key.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

KeyDown is called automatically when the user presses a key. After calling the inherited method, which generates an OnKeyDown event, KeyDown processes the following keystrokes:

Key	Behavior
Home	Selects the first node in the outline.
End	Selects the last node in the outline.
Return	Toggles the selected node between its collapsed and expanded states.
Ctrl+*	Fully expands the outline.
Right arrow	Selects the first child of the selected node.
Left arrow	Selects the parent of the selected node.
Ctrl+Up arrow	Selects the node following the selected node.
Ctrl+Down arrow	Selects the node preceding the selected node.

See Also

KeyPress (see page 18262)

SelectedItem (see page 18277)

KeyDown (see page 14833)

121.1.3.4.27 TCustomOutline.KeyPress Method

Provides special processing when a key is pressed.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

KeyPress is called automatically after the user presses a key but before it is released. After calling the inherited method, which generates an OnKeyPress event, KeyPress processes the following characters :

Key	Behavior
+	Expands the selected node.
-	Collapses the selected node.
*	Fully expands the outline.

See Also

KeyDown (see page 18262)

KeyPress (see page 14833)

121.1.3.4.28 TCustomOutline.Loaded Method

Sets up the outline after it has been streamed in.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

The streaming system calls Loaded after the outline has been fully loaded into memory. Loaded makes sure that all indexes are correct, loads any custom bitmaps that replaced the default values, and selects the first node in the outline.

See Also

DefineProperties (see page 18255)

SelectedItem (see page 18277)

SetGoodIndex (see page 18266)

121.1.3.4.29 TCustomOutline.LoadFromFile Method

Loads the outline from a text image stored in a file.

Pascal

```
procedure LoadFromFile(const FileName: string);
```

C++

```
__fastcall LoadFromFile(const AnsiString FileName);
```

Description

Call LoadFromFile to fill an outline from the file specified by the FileName parameter. Each line in the file represents a node in the outline. The file does not include the root node.

Leading tabs and spaces are converted into levels of the outline. Text without any leading tabs or spaces becomes level 1 items. For example, the following set of strings represents an outline with three first level children descended from the root, and an additional, second level child on the first and third nodes:

```
ChildA
 ChildA1
ChildB
ChildC
 ChildC1
```

To fill the outline from a text image read from a stream, use the LoadFromStream (see page 18264) method. To fill the outline from a text image represented as a TStrings object, use the Lines (see page 18272) property.

See Also

Lines (see page 18272)

LoadFromStream (see page 18264)

SaveToFile (see page 18265)

121.1.3.4.30 TCustomOutline.LoadFromStream Method

Loads the outline from a text image read from a stream.

Pascal

```
procedure LoadFromStream(Stream: TStream);
```

C++

```
__fastcall LoadFromStream(TStream Stream);
```

Description

Call LoadFromStream to fill an outline from the stream specified by the Stream parameter. For example, use LoadFromStream to load an outline from an image stored in a database table, using a TBlobStream object. Each node in the outline is separated by a newline character. The stream does not provide the root node.

Leading tabs and spaces are converted into levels of the outline. Text without any leading tabs or spaces becomes level 1 items. For example, the following set of strings represents an outline with three first level children descended from the root, and an additional, second level child on the first and third nodes:

```
ChildA
 ChildA1
ChildB
ChildC
 ChildC1
```

To fill the outline from a text image read from a file, use the LoadFromFile (see page 18263) method. To fill the outline from a text image represented as a TStrings object, use the Lines (see page 18272) property.

See Also

Lines (see page 18272)

LoadFromFile (see page 18263)

SaveToStream (see page 18265)

121.1.3.4.31 TCustomOutline.MouseDown Method

Updates the SelectedItem (see page 18277) property.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

After calling the inherited method to generate an OnMouseDown event and locate the line under the mouse, MouseDown sets the SelectedItem (see page 18277) property to the node in the line under the mouse.

See Also

SelectedItem (see page 18277)

121.1.3.4.32 TCustomOutline.Move Method

Repositions a node in the outline.

Pascal

```
procedure Move(Destination: LongInt; Source: LongInt; AttachMode: TAttachMode);
```

C++

```
__fastcall Move(LongInt Destination, LongInt Source, TAttachMode AttachMode);
```

Description

Call Move to reposition the node with the index specified by the Source parameter to the position indicated by the Destination parameter. The meaning of the Destination parameter depends on the value of the AttachMode parameter.

See Also

Add (see page 18250)

AddChild (see page 18250)

Insert (see page 18260)

Items (see page 18271)

121.1.3.4.33 TCustomOutline.SaveToFile Method

Saves the Lines (see page 18272) property to a file.

Pascal

```
procedure SaveToFile(const FileName: string);
```

C++

```
__fastcall SaveToFile(const AnsiString FileName);
```

Description

Call SaveToFile to save a text image of the outline to the file specified by the FileName parameter. The image saved is the value of the Lines (see page 18272) property, where each line of the file represents a node, and each level of the outline is represented by a tab character.

To write the outline to an arbitrary stream, use the SaveToStream (see page 18265) method.

See Also

Lines (see page 18272)

LoadFromFile (see page 18263)

SaveToStream (see page 18265)

121.1.3.4.34 TCustomOutline.SaveToStream Method

Writes the Lines (see page 18272) property to a stream.

Pascal

```
procedure SaveToStream(Stream: TStream);
```

C++

```
__fastcall SaveToStream(TStream Stream);
```

Description

Call SaveToStream to write a text image of the outline to the stream specified by the Stream parameter. The image saved is the value of the Lines (see page 18272) property, where each line of text represents a node, and each level of the outline is represented by a tab character.

To write the outline to a file, use the SaveToFile (see page 18265) method.

See Also

Lines (see page 18272)

LoadFromStream (see page 18264)

SaveToFile (see page 18265)

121.1.3.4.35 TCustomOutline.SetDisplayWidth Method

Sets the display width of the outline.

Pascal

```
procedure SetDisplayWidth(Value: Integer);
```

C++

```
__fastcall SetDisplayWidth(int Value);
```

Description

Call SetDisplayWidth to set the width of the image of the outline to the number of pixels specified by the Value parameter. Value should large enough to display the most deeply nested node. Use the GetNodeDisplayWidth (see page 18259) method to determine the size needed to display the visible nodes.

If the display width is greater than the client width of the control, users can scroll the image to view the entire width.

See Also

ClientWidth (see page 5811)

GetNodeDisplayWidth (see page 18259)

GetVisibleNode (see page 18260)

121.1.3.4.36 TCustomOutline.SetGoodIndex Method

Returns the first node in the Items (see page 18271) array that must be reindexed to make the index of the Value parameter correct.

Pascal

```
function SetGoodIndex(Value: TOutlineNode): TOutlineNode;
```

C++

```
__fastcall TOutlineNode SetGoodIndex(TOutlineNode Value);
```

Description

Call SetGoodIndex to determine how much of the Items (see page 18271) array must be reindexed after changing the nodes in the outline. All nodes from the root to the value returned by SetGoodIndex do not need to be reindexed.

See Also

BadIndex (see page 18253)

121.1.3.4.37 TCustomOutline.SetLevel Method

Sets the level of an outline node.

Pascal

```
procedure SetLevel(Node: TOutlineNode; CurLevel: Cardinal; NewLevel: Cardinal);
```

C++

```
__fastcall SetLevel(TOutlineNode Node, unsigned CurLevel, unsigned NewLevel);
```

Description

Call SetLevel to change the nesting depth of the node specified by the Node parameter. CurLevel is the node's current level and NewLevel is the node's new level.

For example, consider the outline specified by the following value of Lines (see page 18272):

```
NodeA
 NodeB
  NodeC
 NodeD
```

Calling SetLevel for NodeD with CurLevel set to 2 and NewLevel set to 4 results in the outline with the following value of Lines (see page 18272):

```
NodeA
 NodeB
  NodeC
   NodeD
```

That is, the parent of NodeD was changed from NodeA to NodeC.

See Also

Lines (see page 18272)

121.1.3.4.38 TCustomOutline.SetUpdateState Method

Enables or disables the maintenance of the node indexes.

Pascal

```
procedure SetUpdateState(Value: Boolean);
```

C++

```
__fastcall SetUpdateState(Boolean Value);
```

Description

Call SetUpdateState with Value set to true to block the recomputation of indexes. Call SetUpdateState with Value set to false to recompute all indexes in the outline and enable the maintenance of indexes with every change to the nodes in the outline.

Unlike calls to BeginUpdate (see page 18253) and EndUpdate (see page 18257), calls to SetUpdateState do not nest: Calling SetUpdateState with Value set to false always recomputes the indexes regardless of the number of previous calls to SetUpdateState with Value set to true.

Note: Calling SetUpdateState takes precedence over any enabling or disabling of index maintenance provided by BeginUpdate (see page 18253) or EndUpdate (see page 18257).

See Also

BeginUpdate (see page 18253)

EndUpdate (see page 18257)

121.1.3.5 TCustomOutline Properties

The properties of the TCustomOutline class are listed here.

Protected Properties

	Name	Description
	ItemHeight (see page 18270)	Specifies the height of each node in the outline.
	ItemSeparator (see page 18271)	Specifies a delimiting string for outline nodes.
	Lines (see page 18272)	Lists the Text property values of all nodes in the outline.
	Options (see page 18272)	Determines how the nodes in the outline are drawn.
	OutlineStyle (see page 18273)	Specifies how the outline tree is displayed.
	PictureClosed (see page 18274)	Specifies the bitmap used to represent a collapsed node that has subitems.
	PictureLeaf (see page 18274)	Specifies the bitmap used to represent an item that does not have subitems.
	PictureMinus (see page 18275)	Specifies the bitmap used to represent an expanded item that has subitems.
	PictureOpen (see page 18275)	Specifies the bitmap used to represent an expanded item that has subitems.
	PicturePlus (see page 18276)	Specifies the bitmap used to represent a collapsed item that has subitems.
	Style (see page 18277)	Determines whether the nodes and tree are drawn automatically.

Public Properties

	Name	Description
	Canvas (see page 18268)	Specifies the TCanvas object that presents a drawing surface for the control.
R	ItemCount (see page 18270)	Indicates the number of nodes in the outline.
R	Items (see page 18271)	Lists the nodes in the outline.
	Row (see page 18276)	Specifies the index of the row that contains the selected cell.
	SelectedItem (see page 18277)	Specifies the index of the selected node.

121.1.3.5.1 TCustomOutline.Canvas Property

Specifies the TCanvas object that presents a drawing surface for the control.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Use the properties of the TCanvas object to draw or paint on the surface of the control. Canvas encapsulates a Windows device context, providing all the tools and methods needed for drawing and painting.

Canvas is a protected property that is usually redeclared as public in descendants of TCustomControl.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
```

```
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  ImageList1->Draw(DrawGrid1->Canvas,Rect.Left,Rect.Top,index);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(index) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}
//---------------------------------------------------------------------------
void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TStringGrid *myStringGrid;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TStringGrid")
  {
    myStringGrid = (TStringGrid *)ListBox1->Items->Objects[Index];
    // make sure we are using the TControls canvas and not the from's!
    myStringGrid->Canvas->MoveTo(myStringGrid->ClientRect.Left, myStringGrid->ClientRect.Top);
    myStringGrid->Canvas->LineTo(myStringGrid->ClientRect.Right,
myStringGrid->ClientRect.Bottom);
    myStringGrid = NULL;
  }
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clWhite;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
  end;
```

```
    ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
  end;

  procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
    var CanSelect: Boolean);
  begin
    CanSelect:= True;
  end;
  {
  The following code uses ClientRect to find and draw a line
  from the top left to the bottom right of the current
  control.  Select a TControl in the ListBox list.  This
  example assumes that the current object is a descendent of
  TControl and has a public Canvas property.
  }
    if (ListBox1.Items.Objects[Index] is TStringGrid) then
    begin
      myStringGrid:= (ListBox1.Items.Objects[Index] as TStringGrid);
      with myStringGrid.ClientRect do
      begin // make sure we are using the TControl's canvas and not the form's!
        myStringGrid.Canvas.MoveTo(Left, Top);
        myStringGrid.Canvas.LineTo(Right, Bottom);
      end;
    myStringGrid:= nil;
    end;
```

See Also

Paint (see page 5920)

121.1.3.5.2 TCustomOutline.ItemCount Property

Indicates the number of nodes in the outline.

Pascal

```
property ItemCount: LongInt;
```

C++

```
__property LongInt ItemCount;
```

Description

Read ItemCount to determine the number of nodes in the outline. Use ItemCount with the Items (see page 18271) property array to iterate over all nodes in the outline.

Note: Reading ItemCount can be computationally expensive, as it causes all the indexes used by the outline to be updated.

See Also

Items (see page 18271)

121.1.3.5.3 TCustomOutline.ItemHeight Property

Specifies the height of each node in the outline.

Pascal

```
property ItemHeight: Integer;
```

C++

```
__property int ItemHeight;
```

Description

Set ItemHeight to the height, in pixels, of each node in the outline. Changing the ItemHeight property also changes the font used to display the nodes.

See Also

ItemCount (see page 18270)

Items (see page 18271)

121.1.3.5.4 TCustomOutline.Items Property

Lists the nodes in the outline.

Pascal

```
property Items [Index: LongInt]: TOutlineNode;
```

C++

```
__property TOutlineNode Items[LongInt Index];
```

Description

Use Items to access a node in the outline. Each item is a TOutlineNode (see page 18349) object.

Index is a number specifying the node to return, where Items[0] refers to the root, Items[1] is the first (topmost) node, and so on.

Note: Items is the default property of TCustomOutline (see page 18234). This means that the name of the property may be omitted in code. Thus the line

Note: Outline1.Items[1].Text := Edit1.Text;

Note: can also be written

Note: Outline1[1].Text := Edit1.Text;

Note: In C++, Items can be accessed using the [] operator, to achieve an affect similar to the default property in Delphi.

See Also

ItemCount (see page 18270)

ItemHeight (see page 18270)

ItemSeparator (see page 18271)

Lines (see page 18272)

operator_[]

121.1.3.5.5 TCustomOutline.ItemSeparator Property

Specifies a delimiting string for outline nodes.

Pascal

```
property ItemSeparator: string;
```

C++

```
__property AnsiString ItemSeparator;
```

Description

Set ItemSeparator to the string that should appear between node names in the path description of any individual node in the outline. ItemSeparator is used to implement the FullPath read method of TOutlineNode (see page 18349).

ItemSeparator is initialized to the backslash (\) character when the TCustomOutline (see page 18234) object is created.

See Also

Items (see page 18271)

FullPath (see page 18361)

121.1.3.5.6 TCustomOutline.Lines Property

Lists the Text property values of all nodes in the outline.

Pascal

```
property Lines: TStrings;
```

C++

```
__property TStrings Lines;
```

Description

Read Lines to obtain a text representation of the outline. Set Lines to fill the outline from a set of text strings. Each string in the Lines property represents a node in the outline. Lines does not include the root node.

Leading tabs and spaces are converted into levels of the outline. Text without any leading tabs or spaces becomes level 1 items. For example, the following set of strings represents an outline with three first level children descended from the root, and an additional, second level child on the first and third nodes:

```
ChildA
 ChildA1
ChildB
ChildC
 ChildC1
```

The Lines property is primarily useful for filling an outline with items at design time. While Lines can be used to access the individual nodes at run time, it is much quicker to access an item with the Items (see page 18271) property.

See Also

Items (see page 18271)

Text (see page 18364)

121.1.3.5.7 TCustomOutline.Options Property

Determines how the nodes in the outline are drawn.

Pascal

```
property Options: TOutlineOptions;
```

C++

```
__property TOutlineOptions Options;
```

Description

Set Options to any combination of the following values:

Value	Meaning
ooDrawTreeRoot	The first item (Index value of 1) is connected to the root item by the outline tree. This means that the tree will extend from the top of the outline to all the first level items. Without ooDrawTreeRoot, all first level items appear leftmost in the outline, not connected by the tree.
ooDrawFocusRect	The outline draws a focus rectangle around the selected item.
ooStretchBitmaps	The outline stretches the standard bitmaps (PictureLeaf (see page 18274), PictureOpen (see page 18275), PictureClosed (see page 18274), PicturePlus (see page 18276), PictureMinus (see page 18275)) to fit in the size of the item, determined by the size of the Font of the Text. Without ooStretchBitmaps, the bitmaps will be cropped if larger than the height of the item text, or won't fill up the entire item space if smaller than the text.

See Also

Items (see page 18271)

OutlineStyle (see page 18273)

PictureClosed (see page 18274)

PictureLeaf (see page 18274)

PictureMinus (see page 18275)

PictureOpen (see page 18275)

PicturePlus (see page 18276)

SelectedItem (see page 18277)

121.1.3.5.8 TCustomOutline.OutlineStyle Property

Specifies how the outline tree is displayed.

Pascal

```
property OutlineStyle: TOutlineStyle;
```

C++

```
__property TOutlineStyle OutlineStyle;
```

Description

Set OutlineStyle to one of the following values:

Value	Meaning
osText	Displays node text (specified in Text) only.
osPlusMinusText	Displays plus picture (specified in PicturePlus (see page 18276)), minus picture (specified in PictureMinus (see page 18275)), and node text (specified in Text).
osPictureText	Displays open picture (specified in PictureOpen (see page 18275)), closed picture (specified in PictureClosed (see page 18274)), leaf picture (specified in PictureLeaf (see page 18274)) and node text (specified in Text).

osPlusMinusPictureText	Displays plus picture (specified in PicturePlus (see page 18276)), minus picture (specified in PictureMinus (see page 18275)), open picture (specified in PictureOpen (see page 18275)), closed picture (specified in PictureClosed (see page 18274)), leaf picture (specified in PictureLeaf (see page 18274)), and node text (specified in Text).
osTreeText	Displays lines connecting outline nodes and node text (specified in Text).
osTreePictureText	Displays lines connecting outline nodes, open picture (specified in PictureOpen (see page 18275)), closed picture (specified in PictureClosed (see page 18274)), leaf picture (specified in PictureLeaf (see page 18274)), and node text (specified in Text).

Note: If the Style (see page 18277) property is otOwnerDraw, the value of OutlineStyle is ignored. The connecting lines, node bitmaps, and node text must all be drawn in an OnDrawItem (see page 18278) event handler.

See Also

Options (see page 18272)

PictureClosed (see page 18274)

PictureLeaf (see page 18274)

PicturePlus (see page 18276)

Style (see page 18277)

Text (see page 18364)

121.1.3.5.9 TCustomOutline.PictureClosed Property

Specifies the bitmap used to represent a collapsed node that has subitems.

Pascal

```
property PictureClosed: TBitmap;
```

C++

```
__property TBitmap PictureClosed;
```

Description

By default, PictureClosed is a closed file folder bitmap. Set PictureClosed to change the bitmap used for collapsed nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle (see page 18273) property is set to osPictureText, osPlusMinusPictureText, or osTreePictureText.

See Also

OutlineStyle (see page 18273)

PictureLeaf (see page 18274)

PictureMinus (see page 18275)

PictureOpen (see page 18275)

121.1.3.5.10 TCustomOutline.PictureLeaf Property

Specifies the bitmap used to represent an item that does not have subitems.

Pascal

```
property PictureLeaf: TBitmap;
```

C++

```
__property TBitmap PictureLeaf;
```

Description

By default, PictureLeaf is a document bitmap. Set PictureLeaf to change the bitmap used for leaf nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle (see page 18273) property is set to osPictureText, osPlusMinusPictureText, or osTreePictureText.

See Also

OutlineStyle (see page 18273)

PictureClosed (see page 18274)

PictureOpen (see page 18275)

121.1.3.5.11 TCustomOutline.PictureMinus Property

Specifies the bitmap used to represent an expanded item that has subitems.

Pascal

```
property PictureMinus: TBitmap;
```

C++

```
__property TBitmap PictureMinus;
```

Description

By default, PictureMinus is a minus sign (-). Set PictureMinus to change the bitmap used for collapsible nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle (see page 18273) property is set to osPlusMinusPictureText or osPlusMinusText.

See Also

OutlineStyle (see page 18273)

PictureOpen (see page 18275)

PicturePlus (see page 18276)

121.1.3.5.12 TCustomOutline.PictureOpen Property

Specifies the bitmap used to represent an expanded item that has subitems.

Pascal

```
property PictureOpen: TBitmap;
```

C++

```
__property TBitmap PictureOpen;
```

Description

By default, the PictureOpen property is an open file folder. Set PictureOpen to change the bitmap used for expanded nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle (see page 18273) property is set to osPictureText,

osPlusMinusPictureText, or osTreePictureText.

See Also

OutlineStyle (see page 18273)

PictureClosed (see page 18274)

PictureLeaf (see page 18274)

PicturePlus (see page 18276)

121.1.3.5.13 TCustomOutline.PicturePlus Property

Specifies the bitmap used to represent a collapsed item that has subitems.

Pascal

```
property PicturePlus: TBitmap;
```

C++

```
__property TBitmap PicturePlus;
```

Description

By default, the PicturePlus property is a plus sign (+). Set PicturePlus to change the bitmap used for collapsed nodes.

Note: The bitmap will not be displayed in the outline unless the OutlineStyle (see page 18273) property is set to osPlusMinusPictureText or osPlusMinusText.

See Also

OutlineStyle (see page 18273)

PictureClosed (see page 18274)

PictureMinus (see page 18275)

121.1.3.5.14 TCustomOutline.Row Property

Specifies the index of the row that contains the selected cell.

Pascal

```
property Row: Longint;
```

C++

```
__property Longint Row;
```

Description

Use Row at runtime to determine the current row in the grid. Setting Row moves focus to the cell in the current column that is in the new row. The first row has an index of 0, the second row an index of 1, and so on.

The selected cell in the grid can be located by reading the Row property and the Col property to obtain the indexes of its row and column. When focus moves to the grid, the selected cell gets input focus.

Delphi Examples:

```
{
This example displays a string grid, a list box, and a
button on a form. When the application runs, strings are put
in the cells of row 1 of the string grid. When the user
clicks the button, The strings in the current row of the
grid are displayed in the list box.
```

```
  Note that when the grid contains an empty cell, the list box
  has a corresponding empty string.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    ListBox1.Items := StringGrid1.Rows[StringGrid1.Row];
  end;
  procedure TForm1.FormCreate(Sender: TObject);
  begin
    with StringGrid1 do
    begin
      Cells[1,0] := 'Column 1';
      Cells[2,0] := 'Column 2';
      Cells[3,0] := 'Column 3';
      Cells[4,0] := 'Column 4';
      Cells[0,1] := 'Row 1';
      Cells[1,1] := 'Object';
      Cells[2,1] := 'Pascal';
      Cells[3,1] := 'is';
      Cells[4,1] := 'excellent';
      Cells[0,2] := 'Row 2';
      Cells[1,2] := 'Delphi';
      Cells[2,2] := 'is';
      Cells[4,2] := 'RAD';
    end;
  end;
```

See Also

Col (see page 14843)

121.1.3.5.15 TCustomOutline.SelectedItem Property

Specifies the index of the selected node.

Pascal

```
property SelectedItem: Longint;
```

C++

```
__property Longint SelectedItem;
```

Description

Read SelectedItem to determine the Index of the selected node. If no node is selected, SelectedItem is 0. Set SelectedItem to set focus to a particular node in the outline.

See Also

Items (see page 18271)

121.1.3.5.16 TCustomOutline.Style Property

Determines whether the nodes and tree are drawn automatically.

Pascal

```
property Style: TOutlineType;
```

C++

```
__property TOutlineType Style;
```

Description

By default, Style is osStandard, meaning that the outline displays items in the style determined by the OutlineStyle (see page

18273) property. Set Style to otOwnerDraw to create owner-draw outlines, meaning that items must be drawn on the canvas of the outline by code in an OnDrawItem (see page 18278) event handler.

Owner-draw outlines can display items other than the Text of a node and the standard bitmaps specified in the PictureClosed (see page 18274), PictureOpen (see page 18275), PictureMinus (see page 18275), PicturePlus (see page 18276), and PictureLeaf (see page 18274) properties. Owner-draw outlines require more programming, however, as the application must specify how to render the image for each node in an OnDrawItem (see page 18278) event handler.

See Also

Canvas (see page 5921)

OnDrawItem (see page 18278)

OutlineStyle (see page 18273)

121.1.3.6 TCustomOutline Events

The events of the TCustomOutline class are listed here.

Protected Events

	Name	Description
	OnCollapse (see page 18278)	Occurs immediately after a node in the outline is collapsed.
	OnDrawItem (see page 18278)	Occurs when a node must be drawn in an owner-draw outline.
	OnExpand (see page 18279)	Occurs immediately after a node in the outline is expanded.

121.1.3.6.1 TCustomOutline.OnCollapse Event

Occurs immediately after a node in the outline is collapsed.

Pascal

```
property OnCollapse: EOutlineChange;
```

C++

```
__property EOutlineChange OnCollapse;
```

Description

Write an OnCollapse event handler to perform special processing when a node in the outline is collapsed. The event handler supplies the index of the node that collapsed.

See Also

OnExpand (see page 18279)

121.1.3.6.2 TCustomOutline.OnDrawItem Event

Occurs when a node must be drawn in an owner-draw outline.

Pascal

```
property OnDrawItem: TDrawItemEvent;
```

C++

```
__property TDrawItemEvent OnDrawItem;
```

Description

When the Style (see page 18277) property is set to otOwnerDraw, specify an OnDrawItem event handler to render the image

of each node in the outline. An OnDrawItem event handler can display items other than the Text of a node and the standard bitmaps specified in the PictureClosed (see page 18274), PictureOpen (see page 18275), PictureMinus (see page 18275), PicturePlus (see page 18276), and PictureLeaf (see page 18274) properties.

Draw the image of the node specified by the Index parameter onto the canvas of the outline.

See Also

Canvas (see page 5921)

PictureClosed (see page 18274)

PictureLeaf (see page 18274)

PictureMinus (see page 18275)

PictureOpen (see page 18275)

PicturePlus (see page 18276)

Style (see page 18277)

Text (see page 18364)

121.1.3.6.3 TCustomOutline.OnExpand Event

Occurs immediately after a node in the outline is expanded.

Pascal

```
property OnExpand: EOutlineChange;
```

C++

```
__property EOutlineChange OnExpand;
```

Description

Write an OnExpand event handler to perform special processing when a node in the outline is expanded. The event handler identifies the node that was just expanded.

See Also

OnCollapse (see page 18278)

121.1.4 TOutline Class

TOutline is a multilevel outline that displays the values of TOutlineNode (see page 18349) objects.

Class Hierarchy

Pascal

```
TOutline = class(TCustomOutline);
```

C++

```
class TOutline : public TCustomOutline;
```

File

Outline

Description

Use an outline to visually organize information in a hierarchical tree. Each item in an outline is contained in a TOutlineNode (see page 18349) object. Outline (see page 18231) controls allow an application to manage a hierarchy of outline nodes, including the ability to control the appearance and layout of those nodes and the ability to expand or collapse branches of the outline tree.

TOutline is provided primarily for backward compatibility. New applications should use TTreeView instead.

See Also

TOutlineNode (see page 18349)

TTreeView (see page 5293)

121.1.4.1 TOutline Members

The following tables list the members exposed by TOutline.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	DesignOptionsBoost (see page 14814)	This is DesignOptionsBoost, a member of class TCustomGrid.
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FGridState (see page 14814)	This is FGridState, a member of class TCustomGrid.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSaveCellExtents (see page 14814)	This is FSaveCellExtents, a member of class TCustomGrid.

	VirtualView (see page 14814)	This is VirtualView, a member of class TCustomGrid.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AdjustSize (see page 14816)	Adds or deletes rows or columns from the grid.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BadIndex (see page 18253)	Indicates whether a node's index is up to date.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	BeginColumnDrag (see page 14817)	Starts the dragging of a column in the grid.
	BeginRowDrag (see page 14817)	Starts the dragging of a row in the grid.
	BoxRect (see page 14818)	Returns the screen coordinates of a specified set of cells.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcDrawInfo (see page 14818)	Calculates the pixel locations of the grid boundaries.
	CalcFixedInfo (see page 14818)	Calculates the pixel locations of the fixed cells.
V	CalcSizingState (see page 14819)	Determines the appearance of the mouse cursor during resizing.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanEditAcceptKey (see page 14819)	Indicates whether the Key parameter can be entered into the current cell.
	CanEditModify (see page 14819)	Indicates whether the current cell in the grid can be edited.
V	CanEditShow (see page 14820)	Indicates whether the inplace edit control can be created to allow editing.
	CanGridAcceptKey (see page 14820)	Indicates whether the grid should respond to a given key combination.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	CellRect (see page 14821)	Returns the screen coordinates of a cell in the grid.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeGridOrientation (see page 14821)	Prepares the grid's canvas for painting to reflect a right-to-left or left-to-right orientation.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CheckColumnDrag (see page 14821)	CheckColumnDrag validates whether the column currently selected for dragging can be dropped at the current location.
	CheckRowDrag (see page 14822)	CheckRowDrag validates whether the row currently selected for dragging can be dropped at the current location.
	Click (see page 5743)	Respond to user click.
V	Click (see page 18254)	Updates the SelectedItem (see page 18277) property.
	Collapse (see page 18254)	Generates an OnCollapse (see page 18278) event.
	ColumnMoved (see page 14822)	Provides the interface for a method that responds when the position of a column changes.

	ColWidthsChanged (see page 14822)	Responds when the column widths change.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateEditor (see page 14823)	Creates the inplace editor control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 14823)	Initializes the window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
V	DblClick (see page 18254)	Expands or collapses the selected node.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
V	DefineProperties (see page 14824)	Adds the ColWidths (see page 14845) and RowHeights (see page 14855) properties to the values saved with the grid.
V	DefineProperties (see page 18255)	Creates a binary property for customized bitmap values.
V	DeleteColumn (see page 14824)	Deletes a specified column from the grid.
	DeleteNode (see page 18256)	Fixes up the outline after a node has been deleted.
V	DeleteRow (see page 14825)	Deletes a specified from the grid.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
V	DoExit (see page 14825)	Hides the inplace editor when selection moves to another control in a form.
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.

	DoMouseWheelDown (see page 14825)	Performs tasks when the mouse wheel is rotated downward.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoMouseWheelUp (see page 14826)	Performs tasks when the mouse wheel is rotated upward.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawCell (see page 14826)	Provides the prototype for a method that draws the contents of a cell in the grid.
	DrawCell (see page 18256)	Draws a node in the outline.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EndColumnDrag (see page 14827)	Ends the dragging of a column in the grid.
	EndRowDrag (see page 14827)	Ends the dragging of a row in the grid.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	Expand (see page 18257)	Generates an OnExpand (see page 18279) event.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	FocusCell (see page 14827)	Changes the current cell to a specified cell.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEditLimit (see page 14828)	Provides the interface for a method that limits the number of characters the user can type into cells.
	GetEditMask (see page 14828)	Provides the interface for a method that returns an input mask for the specified cell.
	GetEditStyle (see page 14828)	Indicates whether a specified cell has an ellipsis button or drop-down arrow.
	GetEditText (see page 14829)	Returns the value of the indicated cell formatted for editing.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetGridHeight (see page 14829)	Returns the value of the GridHeight (see page 14850) property.
	GetGridWidth (see page 14830)	Returns the value of the GridWidth (see page 14851) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.

	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HideEdit (see page 14830)	Hides the inplace editor.
	HideEditor (see page 14830)	Hides the inplace editor when it is not in use.
	InvalidateCell (see page 14831)	Invalidates the region occupied by a cell so that it will be repainted with the next Windows paint message.
	InvalidateCol (see page 14831)	Invalidates the region occupied by a column so that it will be repainted with the next Windows paint message.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	InvalidateEditor (see page 14832)	Causes the inplace editor to repaint itself, moving to a new location if necessary.
	InvalidateGrid (see page 14832)	Tells Windows to repaint the grid after other important Windows messages are handled.
	InvalidateRow (see page 14832)	Invalidates the region occupied by a row so that it will be repainted with the next Windows paint message.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
V	KeyDown (see page 14833)	Provides special processing when the user presses a key.
V	KeyDown (see page 18262)	Provides special processing when the user presses a key.
	KeyPress (see page 6163)	Respond to keyboard input.
V	KeyPress (see page 14833)	Provides special processing when the user presses a key.
V	KeyPress (see page 18262)	Provides special processing when a key is pressed.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 18263)	Sets up the outline after it has been streamed in.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
V	MouseDown (see page 14834)	Provides special processing when the user presses a mouse button.
V	MouseDown (see page 18264)	Updates the SelectedItem (see page 18277) property.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
V	MouseMove (see page 14834)	Provides special processing when the user moves the mouse.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	MouseUp (see page 14835)	Provides special processing when the user releases the mouse button.
	Move (see page 18265)	Repositions a node in the outline.
	MoveColRow (see page 14835)	Selects the cell indicated by the ACol and ARow parameters.
	MoveColumn (see page 14836)	Moves a column to a new position.
	MoveRow (see page 14836)	Moves a row to a new position.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 5920)	Renders the image of a custom control.
V	Paint (see page 14836)	Draws the image of the grid control on the screen.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.

	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	RowHeightsChanged (see page 14837)	Responds when the row heights change.
	RowMoved (see page 14837)	Provides the interface for a method that responds when the position of a row changes.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	ScrollData (see page 14838)	Scrolls the visual image of the cells in the grid.
	SelectCell (see page 14838)	Determines whether a particular cell in the grid can be selected.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayWidth (see page 18266)	Sets the display width of the outline.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEditText (see page 14839)	Provides the interface for a method that updates the text associated with a cell.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetGoodIndex (see page 18266)	Returns the first node in the Items (see page 18271) array that must be reindexed to make the index of the Value parameter correct.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetLevel (see page 18267)	Sets the level of an outline node.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.

V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	ShowEditor (see page 14839)	Displays the inplace editor when the grid enters edit mode.
	ShowEditorChar (see page 14839)	Displays the inplace editor, with its text set to the specified character.
	SizeChanged (see page 14840)	Responds to changes in the size of the grid.
	Sizing (see page 14840)	Indicates whether the indicated coordinates are on one of the resize hot zones of the graph.
	TimedScroll (see page 14840)	Extends a move, resize, or selection out of the scrollable region when the user drags the mouse in a direction where the grid is scrolled.
	TopLeftChanged (see page 14841)	Updates the position of the inplace editor when the grid scrolls.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateDesigner (see page 14841)	Notifies the designer when rows and columns of the grid are moved or resized.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Col (see page 14843)	Specifies the index of the column that contains the selected cell.
	ColCount (see page 14844)	Specifies the number of columns in the grid.
	ColWidths (see page 14845)	Indicates the width (in pixels) of all the columns in the grid.

	DefaultColWidth (see page 14846)	Determines the width (in pixels) of all columns that have not been explicitly resized.
	DefaultDrawing (see page 14847)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 14847)	Specifies the height (in pixels) of all rows that have not been explicitly resized.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	EditorMode (see page 14848)	Determines whether the current cell can be edited.
	FixedColor (see page 14848)	Specifies the background color of the fixed rows and columns in the grid.
	FixedCols (see page 14848)	Specifies the number of columns on the left of the grid that cannot be scrolled.
	FixedRows (see page 14849)	Specifies the number of rows on the top of the grid that cannot be scrolled.
R	GridHeight (see page 14850)	Specifies the height of the grid in pixels.
	GridLineWidth (see page 14850)	Specifies the width (in pixels) of the lines that separate the cells of the grid.
R	GridWidth (see page 14851)	Specifies the width of the grid in pixels.
R	HitTest (see page 14851)	Indicates the current position of the mouse cursor.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
R	InplaceEditor (see page 14852)	Designates the edit control the grid uses to allow users to edit the contents of the selected cell.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	LeftCol (see page 14852)	Specifies the index of the first visible scrollable column in the grid.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	Row (see page 14854)	Specifies the index of the row that contains the selected cell.
	RowCount (see page 14854)	Specifies the number of rows in the grid.
	RowHeights (see page 14855)	Gives the height (in pixels) of all rows in the grid.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Selection (see page 14856)	Indicates the boundaries of the current selection.
	TabStops (see page 14858)	Indicates whether the user can tab to specified columns in the grid.
	Text (see page 5842)	Contains a text string associated with the control.
	TopRow (see page 14858)	Specifies the index of the first visible scrollable row in the grid.
R	VisibleColCount (see page 14859)	Indicates the number of scrollable columns visible in the grid.
R	VisibleRowCount (see page 14859)	Indicates the number of scrollable rows visible in the grid.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Add (see page 18250)	Adds a node to the outline.
	AddChild (see page 18250)	Adds a child node to a node in the outline.
	AddChildObject (see page 18251)	Adds a child node containing data to a node in the outline.
	AddObject (see page 18252)	Adds a node containing data to the outline.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.

	BeginUpdate (see page 18253)	Prevents the updating of the outline until the EndUpdate (see page 18257) method is called.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 18253)	Removes all items from the outline.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 5918)	Creates an instance of TCustomControl (see page 5908).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 14813)	Creates an instance of TCustomGrid (see page 14800).
V	Create (see page 18248)	Creates an instance of TCustomOutline (see page 18234).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 18255)	Deletes a node from the outline.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 5919)	Destroys an instance of TCustomControl (see page 5908).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 14813)	Destroys an instance of TCustomGrid (see page 14800).
V	Destroy (see page 18248)	Destroys an instance of TCustomOutline (see page 18234).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.

	EndUpdate (see page 18257)	Performs the reindexing and repaints deferred by a call to BeginUpdate (see page 18253).
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	FullCollapse (see page 18257)	Causes all top-level nodes in the outline to collapse.
	FullExpand (see page 18258)	Expands every node in the outline.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetDataItem (see page 18258)	Returns the index of the first node in the outline that has the Value pointer as its Data property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItem (see page 18259)	Returns the index of the node at the position indicated by the X and Y parameters.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNodeDisplayWidth (see page 18259)	Returns the length of the row containing a specified node.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextItem (see page 18259)	Returns the index of the first node in the outline with the Value parameter as its Text property.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	GetVisibleNode (see page 18260)	Returns the TOutlineNode (see page 18349) object for the node indicated by a position in the image of the outline.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 18260)	Inserts a node at a specified position.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InsertObject (see page 18261)	Inserts a node containing data at a specified position.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.

	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	LoadFromFile (see page 18263)	Loads the outline from a text image stored in a file.
	LoadFromStream (see page 18264)	Loads the outline from a text image read from a stream.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseCoord (see page 14834)	Returns the row and column indexes of the cell that contains a point specified in screen coordinates.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 18265)	Saves the Lines (see page 18272) property to a file.
	SaveToStream (see page 18265)	Writes the Lines (see page 18272) property to a stream.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	SetUpdateState (see page 18267)	Enables or disables the maintenance of the node indexes.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	Canvas (see page 18268)	Specifies the TCanvas object that presents a drawing surface for the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
R	ItemCount (see page 18270)	Indicates the number of nodes in the outline.
R	Items (see page 18271)	Lists the nodes in the outline.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.

	Row (see page 18276)	Specifies the index of the row that contains the selected cell.
	SelectedItem (see page 18277)	Specifies the index of the selected node.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnClick (see page 18320)	Occurs when the user clicks the control.
	OnCollapse (see page 18322)	Occurs immediately after a node in the outline is collapsed.
	OnContextPopup (see page 18322)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 18323)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 18323)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 18325)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 18328)	Occurs when a node must be drawn in an owner-draw outline.
	OnEndDock (see page 18328)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 18329)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 18330)	Occurs when a control receives the input focus.
	OnExit (see page 18332)	Occurs when the input focus shifts away from one control to another.
	OnExpand (see page 18334)	Occurs immediately after a node in the outline is expanded.
	OnKeyDown (see page 18334)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 18337)	Occurs when a key is pressed.
	OnKeyUp (see page 18338)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 18339)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 18340)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 18343)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 18343)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 18343)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 18346)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 18348)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 18348)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 18294)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	BorderStyle (see page 18298)	Determines whether a single line border is drawn around the grid.
	Color (see page 18298)	Specifies the background color of the control.
	Ctl3D (see page 18299)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 18299)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 18299)	Specifies whether the control is being dragged normally or for docking.

	DragMode (see page 18300)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 18301)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 18302)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	ItemHeight (see page 18303)	Specifies the height of each node in the outline.
	ItemSeparator (see page 18303)	Specifies a delimiting string for outline nodes.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Lines (see page 18304)	Lists the Text property values of all nodes in the outline.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Options (see page 18304)	Determines how the nodes in the outline are drawn.
	OutlineStyle (see page 18305)	Specifies how the outline tree is displayed.
	ParentColor (see page 18306)	Determines where a control looks for its color information.
	ParentCtl3D (see page 18306)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 18307)	Determines where a control looks for its font information.
	ParentShowHint (see page 18307)	Determines where a control looks to find out if its Help Hint should be shown.
	PictureClosed (see page 18308)	Specifies the bitmap used to represent a collapsed node that has subitems.
	PictureLeaf (see page 18308)	Specifies the bitmap used to represent an item that does not have subitems.
	PictureMinus (see page 18308)	Specifies the bitmap used to represent an expanded item that has subitems.
	PictureOpen (see page 18309)	Specifies the bitmap used to represent an expanded item that has subitems.
	PicturePlus (see page 18309)	Specifies the bitmap used to represent a collapsed item that has subitems.
	PopupMenu (see page 18310)	Identifies the pop-up menu associated with the control.
	ScrollBars (see page 18314)	Specifies whether the grid includes horizontal and vertical scroll bars.
	ShowHint (see page 18315)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 18316)	Determines whether the nodes and tree are drawn automatically.
	TabOrder (see page 18317)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 18317)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 18318)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

121.1.4.2 TOutline Properties

The properties of the TOutline class are listed here.

Published Properties

	Name	Description
	Align (see page 18294)	Determines how the control aligns within its container (parent control).
	BorderStyle (see page 18298)	Determines whether a single line border is drawn around the grid.
	Color (see page 18298)	Specifies the background color of the control.
	Ctl3D (see page 18299)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 18299)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 18299)	Specifies whether the control is being dragged normally or for docking.

	DragMode (see page 18300)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 18301)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 18302)	Controls the attributes of text written on or in the control.
	ItemHeight (see page 18303)	Specifies the height of each node in the outline.
	ItemSeparator (see page 18303)	Specifies a delimiting string for outline nodes.
	Lines (see page 18304)	Lists the Text property values of all nodes in the outline.
	Options (see page 18304)	Determines how the nodes in the outline are drawn.
	OutlineStyle (see page 18305)	Specifies how the outline tree is displayed.
	ParentColor (see page 18306)	Determines where a control looks for its color information.
	ParentCtl3D (see page 18306)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 18307)	Determines where a control looks for its font information.
	ParentShowHint (see page 18307)	Determines where a control looks to find out if its Help Hint should be shown.
	PictureClosed (see page 18308)	Specifies the bitmap used to represent a collapsed node that has subitems.
	PictureLeaf (see page 18308)	Specifies the bitmap used to represent an item that does not have subitems.
	PictureMinus (see page 18308)	Specifies the bitmap used to represent an expanded item that has subitems.
	PictureOpen (see page 18309)	Specifies the bitmap used to represent an expanded item that has subitems.
	PicturePlus (see page 18309)	Specifies the bitmap used to represent a collapsed item that has subitems.
	PopupMenu (see page 18310)	Identifies the pop-up menu associated with the control.
	ScrollBars (see page 18314)	Specifies whether the grid includes horizontal and vertical scroll bars.
	ShowHint (see page 18315)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Style (see page 18316)	Determines whether the nodes and tree are drawn automatically.
	TabOrder (see page 18317)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 18317)	Determines if the user can tab to a control.
	Visible (see page 18318)	Determines whether the component appears onscreen.

121.1.4.2.1 TOutline.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>

Parent (see page 5832)

Anchors (see page 5802)

121.1.4.2.2 TOutline.BorderStyle Property

Determines whether a single line border is drawn around the grid.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Set BorderStyle to bsSingle to add a single line border around the grid's image. Set BorderStyle to bsNone to omit the border.

121.1.4.2.3 TOutline.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
```

```
end;
```

See Also

ParentColor (see page 5834)

121.1.4.2.4 TOutline.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

121.1.4.2.5 TOutline.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

121.1.4.2.6 TOutline.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

121.1.4.2.7 TOutline.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
```

```
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

Arranging the Order of Persistent Columns

121.1.4.2.8 TOutline.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

121.1.4.2.9 TOutline.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
```

```
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

121.1.4.2.10 TOutline.ItemHeight Property

Specifies the height of each node in the outline.

Pascal

```
property ItemHeight: Integer;
```

C++

```
__property int ItemHeight;
```

Description

Set ItemHeight to the height, in pixels, of each node in the outline. Changing the ItemHeight property also changes the font used to display the nodes.

See Also

ItemCount (see page 18270)

Items (see page 18271)

121.1.4.2.11 TOutline.ItemSeparator Property

Specifies a delimiting string for outline nodes.

Pascal

```
property ItemSeparator: string;
```

C++

```
__property AnsiString ItemSeparator;
```

Description

Set ItemSeparator to the string that should appear between node names in the path description of any individual node in the outline. ItemSeparator is used to implement the FullPath read method of TOutlineNode.

ItemSeparator is initialized to the backslash (\) character when the TCustomOutline object is created.

See Also

Items (see page 18271)

FullPath (see page 18361)

121.1.4.2.12 TOutline.Lines Property

Lists the Text property values of all nodes in the outline.

Pascal

```
property Lines: TStrings;
```

C++

```
__property TStrings Lines;
```

Description

Read Lines to obtain a text representation of the outline. Set Lines to fill the outline from a set of text strings. Each string in the Lines property represents a node in the outline. Lines does not include the root node.

Leading tabs and spaces are converted into levels of the outline. Text without any leading tabs or spaces becomes level 1 items. For example, the following set of strings represents an outline with three first level children descended from the root, and an additional, second level child on the first and third nodes:

```
ChildA
 ChildA1
ChildB
ChildC
 ChildC1
```

The Lines property is primarily useful for filling an outline with items at design time. While Lines can be used to access the individual nodes at run time, it is much quicker to access an item with the Items property.

See Also

Items (see page 18271)

Text (see page 18364)

121.1.4.2.13 TOutline.Options Property

Determines how the nodes in the outline are drawn.

Pascal

```
property Options: TGridOptions;
```

C++

```
__property TOutlineOptions Options;__property TGridOptions Options;
```

Description

Set Options to any combination of the following values:

Value	Meaning
ooDrawTreeRoot	The first item (Index value of 1) is connected to the root item by the outline tree. This means that the tree will extend from the top of the outline to all the first level items. Without ooDrawTreeRoot, all first level items appear leftmost in the outline, not connected by the tree.
ooDrawFocusRect	The outline draws a focus rectangle around the selected item.

ooStretchBitmaps	The outline stretches the standard bitmaps (PictureLeaf, PictureOpen, PictureClosed, PicturePlus, PictureMinus) to fit in the size of the item, determined by the size of the Font of the Text. Without ooStretchBitmaps, the bitmaps will be cropped if larger than the height of the item text, or won't fill up the entire item space if smaller than the text.

See Also

Items (see page 18271)

OutlineStyle (see page 18273)

PictureClosed (see page 18274)

PictureLeaf (see page 18274)

PictureMinus (see page 18275)

PictureOpen (see page 18275)

PicturePlus (see page 18276)

SelectedItem (see page 18277)

121.1.4.2.14 TOutline.OutlineStyle Property

Specifies how the outline tree is displayed.

Pascal

```
property OutlineStyle: TOutlineStyle;
```

C++

```
__property TOutlineStyle OutlineStyle;
```

Description

Set OutlineStyle to one of the following values:

Value	Meaning
osText	Displays node text (specified in Text) only.
osPlusMinusText	Displays plus picture (specified in PicturePlus), minus picture (specified in PictureMinus), and node text (specified in Text).
osPictureText	Displays open picture (specified in PictureOpen), closed picture (specified in PictureClosed), leaf picture (specified in PictureLeaf) and node text (specified in Text).
osPlusMinusPictureText	Displays plus picture (specified in PicturePlus), minus picture (specified in PictureMinus), open picture (specified in PictureOpen), closed picture (specified in PictureClosed), leaf picture (specified in PictureLeaf), and node text (specified in Text).
osTreeText	Displays lines connecting outline nodes and node text (specified in Text).
osTreePictureText	Displays lines connecting outline nodes, open picture (specified in PictureOpen), closed picture (specified in PictureClosed), leaf picture (specified in PictureLeaf), and node text (specified in Text).

Note: If the Style property is otOwnerDraw, the value of OutlineStyle is ignored. The connecting lines, node bitmaps, and node text must all be drawn in an OnDrawItem event handler.

121.1.4.2.15 TOutline.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

121.1.4.2.16 TOutline.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

121.1.4.2.17 TOutline.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

121.1.4.2.18 TOutline.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

121.1.4.2.19 TOutline.PictureClosed Property

Specifies the bitmap used to represent a collapsed node that has subitems.

Pascal

```
property PictureClosed: TBitmap;
```

C++

```
__property TBitmap PictureClosed;
```

Description

By default, PictureClosed is a closed file folder bitmap. Set PictureClosed to change the bitmap used for collapsed nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle property is set to osPictureText, osPlusMinusPictureText, or osTreePictureText.

See Also

OutlineStyle (see page 18273)

PictureLeaf (see page 18274)

PictureMinus (see page 18275)

PictureOpen (see page 18275)

121.1.4.2.20 TOutline.PictureLeaf Property

Specifies the bitmap used to represent an item that does not have subitems.

Pascal

```
property PictureLeaf: TBitmap;
```

C++

```
__property TBitmap PictureLeaf;
```

Description

By default, PictureLeaf is a document bitmap. Set PictureLeaf to change the bitmap used for leaf nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle property is set to osPictureText, osPlusMinusPictureText, or osTreePictureText.

See Also

OutlineStyle (see page 18273)

PictureClosed (see page 18274)

PictureOpen (see page 18275)

121.1.4.2.21 TOutline.PictureMinus Property

Specifies the bitmap used to represent an expanded item that has subitems.

Pascal

```
property PictureMinus: TBitmap;
```

C++

```
__property TBitmap PictureMinus;
```

Description

By default, PictureMinus is a minus sign (-). Set PictureMinus to change the bitmap used for collapsible nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle property is set to osPlusMinusPictureText or osPlusMinusText.

See Also

OutlineStyle (see page 18273)

PictureOpen (see page 18275)

PicturePlus (see page 18276)

121.1.4.2.22 TOutline.PictureOpen Property

Specifies the bitmap used to represent an expanded item that has subitems.

Pascal

```
property PictureOpen: TBitmap;
```

C++

```
__property TBitmap PictureOpen;
```

Description

By default, the PictureOpen property is an open file folder. Set PictureOpen to change the bitmap used for expanded nodes.

Note: The bitmap is not displayed in the outline unless the OutlineStyle property is set to osPictureText, osPlusMinusPictureText, or osTreePictureText.

See Also

OutlineStyle (see page 18273)

PictureClosed (see page 18274)

PictureLeaf (see page 18274)

PicturePlus (see page 18276)

121.1.4.2.23 TOutline.PicturePlus Property

Specifies the bitmap used to represent a collapsed item that has subitems.

Pascal

```
property PicturePlus: TBitmap;
```

C++

```
__property TBitmap PicturePlus;
```

Description

By default, the PicturePlus property is a plus sign (+). Set PicturePlus to change the bitmap used for collapsed nodes.

Note: The bitmap will not be displayed in the outline unless the OutlineStyle property is set to osPlusMinusPictureText or osPlusMinusText.

See Also

OutlineStyle (see page 18273)

PictureClosed (see page 18274)

PictureMinus (see page 18275)

121.1.4.2.24 TOutline.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
```

```
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
```

```
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;
```

```
procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

121.1.4.2.25 TOutline.ScrollBars Property

Specifies whether the grid includes horizontal and vertical scroll bars.

Pascal

```
property ScrollBars: TScrollStyle;
```

C++

```
__property TScrollStyle ScrollBars;
```

Description

Use ScrollBars to give the grid horizontal or vertical scroll bars.

Note: If all the cells in the grid fit in the ClientWidth, no horizontal scroll bar appears, even if ScrollBars is ssHorizontal or ssBoth. If all the cells fit in the ClientHeight, no vertical scroll bar appears, even if ScrollBars is ssVertical or ssBoth.

See Also

ClientHeight (see page 5808)

ClientWidth (see page 5811)

121.1.4.2.26 TOutline.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

121.1.4.2.27 TOutline.Style Property

Determines whether the nodes and tree are drawn automatically.

Pascal

```
property Style: TOutlineType;
```

C++

```
__property TOutlineType Style;
```

Description

By default, Style is osStandard, meaning that the outline displays items in the style determined by the OutlineStyle property. Set Style to otOwnerDraw to create owner-draw outlines, meaning that items must be drawn on the canvas of the outline by code in an OnDrawItem event handler.

Owner-draw outlines can display items other than the Text of a node and the standard bitmaps specified in the PictureClosed, PictureOpen, PictureMinus, PicturePlus, and PictureLeaf properties. Owner-draw outlines require more programming, however, as the application must specify how to render the image for each node in an OnDrawItem event handler.

See Also

Canvas (see page 5921)

OnDrawItem (see page 18278)

OutlineStyle (see page 18273)

121.1.4.2.28 TOutline.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

121.1.4.2.29 TOutline.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

121.1.4.2.30 TOutline.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
```

```
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

121.1.4.3 TOutline Events

The events of the TOutline class are listed here.

Published Events

	Name	Description
	OnClick (see page 18320)	Occurs when the user clicks the control.
	OnCollapse (see page 18322)	Occurs immediately after a node in the outline is collapsed.
	OnContextPopup (see page 18322)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 18323)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 18323)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 18325)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 18328)	Occurs when a node must be drawn in an owner-draw outline.
	OnEndDock (see page 18328)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 18329)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 18330)	Occurs when a control receives the input focus.
	OnExit (see page 18332)	Occurs when the input focus shifts away from one control to another.
	OnExpand (see page 18334)	Occurs immediately after a node in the outline is expanded.
	OnKeyDown (see page 18334)	Occurs when a user presses any key while the control has focus.

	OnKeyPress (see page 18337)	Occurs when a key is pressed.
	OnKeyUp (see page 18338)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 18339)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 18340)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 18343)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 18343)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 18343)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 18346)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 18348)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 18348)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

121.1.4.3.1 TOutline.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
```

```
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

121.1.4.3.2 TOutline.OnCollapse Event

Occurs immediately after a node in the outline is collapsed.

Pascal

```
property OnCollapse: EOutlineChange;
```

C++

```
__property EOutlineChange OnCollapse;
```

Description

Write an OnCollapse event handler to perform special processing when a node in the outline is collapsed. The event handler supplies the index of the node that collapsed.

See Also

OnExpand (see page 18279)

121.1.4.3.3 TOutline.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

TPopupMenu (see page 16169)

PopupMenu (see page 5835)

AutoPopup (see page 16178)

121.1.4.3.4 TOutline.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

121.1.4.3.5 TOutline.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}
```

```
/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
```

```
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

121.1.4.3.6 TOutline.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;
```

```
procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

121.1.4.3.7 TOutline.OnDrawItem Event

Occurs when a node must be drawn in an owner-draw outline.

Pascal

```
property OnDrawItem: TDrawItemEvent;
```

C++

```
__property TDrawItemEvent OnDrawItem;
```

Description

When the Style property is set to otOwnerDraw, specify an OnDrawItem event handler to render the image of each node in the outline. An OnDrawItem event handler can display items other than the Text of a node and the standard bitmaps specified in the PictureClosed, PictureOpen, PictureMinus, PicturePlus, and PictureLeaf properties.

Draw the image of the node specified by the Index parameter onto the canvas of the outline.

See Also

Canvas (see page 5921)

PictureClosed (see page 18274)

PictureLeaf (see page 18274)

PictureMinus (see page 18275)

PictureOpen (see page 18275)

PicturePlus (see page 18276)

Style (see page 18277)

Text (see page 18364)

121.1.4.3.8 TOutline.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

OnStartDock (see page 5871)

121.1.4.3.9 TOutline.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

121.1.4.3.10 TOutline.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}
```

```
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
```

```
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;

121.1.4.3.11 TOutline.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also

121.1.4.3.12 TOutline.OnExpand Event

Occurs immediately after a node in the outline is expanded.

Pascal

```
property OnExpand: EOutlineChange;
```

C++

```
__property EOutlineChange OnExpand;
```

Description

Write an OnExpand event handler to perform special processing when a node in the outline is expanded. The event handler identifies the node that was just expanded.

See Also

OnCollapse (see page 18278)

121.1.4.3.13 TOutline.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
```

```
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form’s color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

121.1.4.3.14 TOutline.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
```

```
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

121.1.4.3.15 TOutline.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.

121.1.4.3.16 TOutline.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

121.1.4.3.17 TOutline.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
```

```
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its

121.1.4.3.18 TOutline.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

121.1.4.3.19 TOutline.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

121.1.4.3.20 TOutline.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form’s unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
```

```
  status bar.  (Set the Width of the status panels to 150
  before running this example).  When the user presses a mouse
  button, moves the mouse, and releases the mouse button, a
  rectangle is drawn on the form. When the mouse button is
  released, the rectangle appears on the form's canvas. Its
  top-left and bottom-right corners are defined by the
  location of the mouse pointer when the user pressed and
  released the mouse button.  While the user drags the mouse,
  the location of the top, left, bottom, and right sides of
  the rectangle are displayed in the status bar.
  }
  procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
  Y: Integer);
  begin
    StartX := X;
    StartY := Y;
  end;

121.1.4.3.21 TOutline.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit

121.1.4.3.22 TOutline.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

121.1.4.3.23 TOutline.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

121.1.5 TOutlineNode Class

TOutlineNode represents a node in a TCustomOutline (see page 18234) object.

Class Hierarchy

Pascal

```
TOutlineNode = class(TPersistent);
```

C++

```
class TOutlineNode : public TPersistent;
```

File

Outline

Description

Use TOutlineNode to describe a node in a Win 3.1 outline. Each outline node appears as a line, or row, of the outline. An outline node can have from 0 to 16368 subnodes, which are subordinate to the parent node in the outline structure.

See Also

TOutline (see page 18279)

121.1.5.1 TOutlineNode Members

The following tables list the members exposed by TOutlineNode.

Protected Methods

	Name	Description
	AddNode (see page 18353)	This is AddNode, a member of class TOutlineNode.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDataItem (see page 18355)	This is GetDataItem, a member of class TOutlineNode.
	GetNodeAtIndex (see page 18357)	This is GetNodeAtIndex, a member of class TOutlineNode.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRowOfNode (see page 18357)	This is GetRowOfNode, a member of class TOutlineNode.
	GetTextItem (see page 18358)	This is GetTextItem, a member of class TOutlineNode.
	GetVisibleNode (see page 18358)	This is GetVisibleNode, a member of class TOutlineNode.
	HasAsParent (see page 18358)	This is HasAsParent, a member of class TOutlineNode.
	InsertNode (see page 18358)	This is InsertNode, a member of class TOutlineNode.
	InternalRemove (see page 18359)	This is InternalRemove, a member of class TOutlineNode.
	Remove (see page 18359)	This is Remove, a member of class TOutlineNode.
	WriteNode (see page 18359)	This is WriteNode, a member of class TOutlineNode.

Protected Properties

	Name	Description
R	ExpandCount (see page 18361)	This is ExpandCount, a member of class TOutlineNode.
R	Items (see page 18363)	This is Items, a member of class TOutlineNode.
R	List (see page 18364)	This is List, a member of class TOutlineNode.
R	Outline (see page 18364)	This is Outline, a member of class TOutlineNode.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ChangeLevelBy (see page 18353)	Changes the level of an outline node.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Collapse (see page 18354)	Collapses an outline item.
	Create (see page 18351)	Creates a new TOutlineNode (see page 18349) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18352)	Frees the memory associated with the TOutlineNode (see page 18349) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Expand (see page 18354)	Expands an outline item.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	FullExpand (see page 18355)	Expands an outline node and all its descendants.
	GetDisplayWidth (see page 18355)	Returns the distance, in pixels, from the left edge of the outline to the right edge of the outline node.
	getFirstChild (see page 18356)	This is getFirstChild, a member of class TOutlineNode.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetLastChild (see page 18356)	Returns the Index (see page 18362) value of the last subnode.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNextChild (see page 18356)	Returns the Index (see page 18362) value of the next child of an outline node.
	GetPrevChild (see page 18357)	Returns the Index (see page 18362) value of the previous child of an outline node.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveTo (see page 18359)	Moves an outline node from one location within the outline to another.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Data (see page 18360)	Points to application-specific data associated with the node.
	Expanded (see page 18361)	Determines whether descendants of the outline node are displayed.
R	FullPath (see page 18361)	Describes an outline node, using its text and the text of all ancestor nodes in the outline.
R	HasItems (see page 18362)	Indicates whether the outline node has any subnodes.
R	Index (see page 18362)	Identifies the node in the Items (see page 18363) array maintained by the outline.
R	IsVisible (see page 18363)	Indicates whether the outline node is visible in the outline.
	Level (see page 18363)	Indicates the level of indentation of a node within the outline.
R	Parent (see page 18364)	Identifies the immediate ancestor of the node.
	Text (see page 18364)	Specifies the string that identifies the outline node.
R	TopItem (see page 18365)	Indicates which outline node is the topmost ancestor of a node.

121.1.5.2 TOutlineNode.Create Constructor

Creates a new TOutlineNode (see page 18349) object.

Pascal

```
constructor Create(AOwner: TCustomOutline);
```

C++

```
__fastcall TOutlineNode(TCustomOutline AOwner);
```

Description

Do not call the constructor for TOutlineNode (see page 18349) directly. Instead, use one of the methods of the outline component in which the node should appear. These methods are as follows:

Method	Action
Add	Creates the node as the last sibling of a specified node.

AddObject	Same as Add, but also initializing the node's Data (see page 18360) property.
AddChild	Creates the node as the last child of a specified node.
AddChildObject	Same as AddChild, but also initializing the node's Data (see page 18360) property.
Insert	Creates the node in the current position of an existing node.
InsertObject	Same as Insert, but also initializing the node's Data (see page 18360) property.

See Also

Data (see page 18360)

Add (see page 18250)

AddObject (see page 18252)

AddChild (see page 18250)

Insert (see page 18260)

AddChildObject (see page 18251)

InsertObject (see page 18261)

121.1.5.3 TOutlineNode.Destroy Destructor

Frees the memory associated with the TOutlineNode (see page 18349) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOutlineNode();
```

Description

Do not call Destroy directly. The preferred method of deleting nodes is to use the Delete method of the containing outline component.

See Also

Free (see page 22300)

Delete (see page 18255)

121.1.5.4 TOutlineNode Methods

The methods of the TOutlineNode class are listed here.

Protected Methods

	Name	Description
	AddNode (see page 18353)	This is AddNode, a member of class TOutlineNode.
	GetDataItem (see page 18355)	This is GetDataItem, a member of class TOutlineNode.
	GetNodeAtIndex (see page 18357)	This is GetNodeAtIndex, a member of class TOutlineNode.
	GetRowOfNode (see page 18357)	This is GetRowOfNode, a member of class TOutlineNode.
	GetTextItem (see page 18358)	This is GetTextItem, a member of class TOutlineNode.
	GetVisibleNode (see page 18358)	This is GetVisibleNode, a member of class TOutlineNode.

	HasAsParent (see page 18358)	This is HasAsParent, a member of class TOutlineNode.
	InsertNode (see page 18358)	This is InsertNode, a member of class TOutlineNode.
	InternalRemove (see page 18359)	This is InternalRemove, a member of class TOutlineNode.
	Remove (see page 18359)	This is Remove, a member of class TOutlineNode.
	WriteNode (see page 18359)	This is WriteNode, a member of class TOutlineNode.

Public Methods

	Name	Description
	ChangeLevelBy (see page 18353)	Changes the level of an outline node.
	Collapse (see page 18354)	Collapses an outline item.
	Expand (see page 18354)	Expands an outline item.
	FullExpand (see page 18355)	Expands an outline node and all its descendants.
	GetDisplayWidth (see page 18355)	Returns the distance, in pixels, from the left edge of the outline to the right edge of the outline node.
	getFirstChild (see page 18356)	This is getFirstChild, a member of class TOutlineNode.
	GetLastChild (see page 18356)	Returns the Index (see page 18362) value of the last subnode.
	GetNextChild (see page 18356)	Returns the Index (see page 18362) value of the next child of an outline node.
	GetPrevChild (see page 18357)	Returns the Index (see page 18362) value of the previous child of an outline node.
	MoveTo (see page 18359)	Moves an outline node from one location within the outline to another.

121.1.5.4.1 TOutlineNode.AddNode Method

Pascal

```
function AddNode(Value: TOutlineNode): LongInt;
```

C++

```
__fastcall LongInt AddNode(TOutlineNode Value);
```

Description

This is AddNode, a member of class TOutlineNode.

121.1.5.4.2 TOutlineNode.ChangeLevelBy Method

Changes the level of an outline node.

Pascal

```
procedure ChangeLevelBy(Value: TChangeRange);
```

C++

```
__fastcall ChangeLevelBy(TChangeRange Value);
```

Description

Call ChangeLevelBy to move a node up or down a branch in the outline. Specify a Value parameter value of -1 to move up (toward the root) one level. Specify a Value parameter value of 1 to move down (away from the root) one level.

When moving up one level, an item becomes the next sibling of its former parent. When moving down one level, an item becomes the last child of its former prior sibling.

Nodes at the first level can not be moved up, as they have no parent. The first node in the outline can not be moved down either, as it has no prior sibling.

Note: Before calling ChangeLevelBy, be sure that the node has the appropriate number of parents or that the appropriate prior siblings exist.

See Also

Level (see page 18363)

MoveTo (see page 18359)

Parent (see page 18364)

121.1.5.4.3 TOutlineNode.Collapse Method

Collapses an outline item.

Pascal

```
procedure Collapse;
```

C++

```
__fastcall Collapse();
```

Description

Collapse sets the Expanded (see page 18361) property to false. When an outline node is collapsed, its descendants are hidden and, depending on the OutlineStyle property of the outline in which the node is contained, the plus picture or closed picture is displayed.

Collapse does nothing to nodes that have no descendants.

See Also

Expand (see page 18354)

Expanded (see page 18361)

OutlineStyle (see page 18273)

121.1.5.4.4 TOutlineNode.Expand Method

Expands an outline item.

Pascal

```
procedure Expand;
```

C++

```
__fastcall Expand();
```

Description

Expand sets the Expanded (see page 18361) property to true. When an outline node is expanded, its descendants are displayed and, depending on the OutlineStyle property of the outline in which the node is contained, the minus picture or open picture is displayed.

Expand does nothing to nodes that have no descendants.

Note: Expand only ensures that the immediate children of a node are visible. To expand all descendants of a node, use the FullExpand (see page 18355) method.

See Also

Collapse (see page 18354)

Expanded (see page 18361)

FullExpand (see page 18355)

OutlineStyle (see page 18273)

121.1.5.4.5 TOutlineNode.FullExpand Method

Expands an outline node and all its descendants.

Pascal

```
procedure FullExpand;
```

C++

```
__fastcall FullExpand();
```

Description

Use FullExpand to expand all the nodes in the subtree of the outline rooted at the outline node. FullExpand sets the Expanded (see page 18361) property of the node and all its descendants to true.

See Also

Collapse (see page 18354)

Expand (see page 18354)

Expanded (see page 18361)

121.1.5.4.6 TOutlineNode.GetDataItem Method

Pascal

```
function GetDataItem(Value: Pointer): LongInt;
```

C++

```
__fastcall LongInt GetDataItem(void * Value);
```

Description

This is GetDataItem, a member of class TOutlineNode.

121.1.5.4.7 TOutlineNode.GetDisplayWidth Method

Returns the distance, in pixels, from the left edge of the outline to the right edge of the outline node.

Pascal

```
function GetDisplayWidth: Integer;
```

C++

```
__fastcall int GetDisplayWidth();
```

Description

Call GetDisplayWidth to determine the length of the line in the outline that contains the outline node. GetDisplayWidth adjusts for the lines and bitmaps specified by the OutlineStyle property of the outline.

See Also

GetNodeDisplayWidth (see page 18259)

OutlineStyle (see page 18273)

121.1.5.4.8 TOutlineNode.getFirstChild Method

Pascal

```
function getFirstChild: LongInt;
```

C++

```
__fastcall LongInt getFirstChild();
```

Description

This is getFirstChild, a member of class TOutlineNode.

121.1.5.4.9 TOutlineNode.GetLastChild Method

Returns the Index (see page 18362) value of the last subnode.

Pascal

```
function GetLastChild: LongInt;
```

C++

```
__fastcall LongInt GetLastChild();
```

Description

Call GetLastChild to locate the last subnode of a node. If the node has no descendants, GetLastChild returns -1.

See Also

GetFirstChild (see page 18356)

GetNextChild (see page 18356)

GetPrevChild (see page 18357)

HasItems (see page 18362)

Index (see page 18362)

121.1.5.4.10 TOutlineNode.GetNextChild Method

Returns the Index (see page 18362) value of the next child of an outline node.

Pascal

```
function GetNextChild(Value: LongInt): LongInt;
```

C++

```
__fastcall LongInt GetNextChild(LongInt Value);
```

Description

Call GetNextChild to obtain the index of the next immediate descendant of a node, following the child node with the index given by the Value parameter. If the child node indicated by Value has no next sibling, or if the child node indicated by Value is not an immediate descendant of the outline node, GetNextChild returns -1.

Index (see page 18362) values reflect a depth-first traversal of the outline. Thus, the node returned by GetNextChild is not simply the node with an index of Value+1, unless the node with index Value has no descendants. GetNextChild allows a breadth-first traversal of the outline.

See Also

GetFirstChild (see page 18356)

GetLastChild (see page 18356)

GetPrevChild (see page 18357)

Index (see page 18362)

121.1.5.4.11 TOutlineNode.GetNodeAtIndex Method

Pascal

```
function GetNodeAtIndex(TargetIndex: LongInt): TOutlineNode;
```

C++

```
__fastcall TOutlineNode GetNodeAtIndex(LongInt TargetIndex);
```

Description

This is GetNodeAtIndex, a member of class TOutlineNode.

121.1.5.4.12 TOutlineNode.GetPrevChild Method

Returns the Index (see page 18362) value of the previous child of an outline node.

Pascal

```
function GetPrevChild(Value: LongInt): LongInt;
```

C++

```
__fastcall LongInt GetPrevChild(LongInt Value);
```

Description

Call GetPrevChild to obtain the index of the previous immediate descendant of a node, preceding the child node with the index given by the Value parameter. If the child node indicated by Value has no prior sibling, or if the child node indicated by Value is not an immediate descendant of the outline node, GetPrevChild returns -1.

Index (see page 18362) values reflect a depth-first traversal of the outline. Thus, the previous sibling of the child node indicated by Value is not simply one less than Value, unless that previous sibling has no descendants.

See Also

GetFirstChild (see page 18356)

GetLastChild (see page 18356)

GetNextChild (see page 18356)

Index (see page 18362)

121.1.5.4.13 TOutlineNode.GetRowOfNode Method

Pascal

```
function GetRowOfNode(TargetNode: TOutlineNode; var RowCount: Longint): Boolean;
```

C++

```
__fastcall Boolean GetRowOfNode(TOutlineNode TargetNode, Longint RowCount);
```

Description

This is GetRowOfNode, a member of class TOutlineNode.

121.1.5.4.14 TOutlineNode.GetTextItem Method

Pascal

```
function GetTextItem(const Value: string): LongInt;
```

C++

```
__fastcall LongInt GetTextItem(const AnsiString Value);
```

Description

This is GetTextItem, a member of class TOutlineNode.

121.1.5.4.15 TOutlineNode.GetVisibleNode Method

Pascal

```
function GetVisibleNode(TargetCount: LongInt): TOutlineNode;
```

C++

```
__fastcall TOutlineNode GetVisibleNode(LongInt TargetCount);
```

Description

This is GetVisibleNode, a member of class TOutlineNode.

121.1.5.4.16 TOutlineNode.HasAsParent Method

Pascal

```
function HasAsParent(Value: TOutlineNode): Boolean;
```

C++

```
__fastcall Boolean HasAsParent(TOutlineNode Value);
```

Description

This is HasAsParent, a member of class TOutlineNode.

121.1.5.4.17 TOutlineNode.InsertNode Method

Pascal

```
function InsertNode(Index: LongInt; Value: TOutlineNode): LongInt;
```

C++

```
__fastcall LongInt InsertNode(LongInt Index, TOutlineNode Value);
```

Description

This is InsertNode, a member of class TOutlineNode.

121.1.5.4.18 TOutlineNode.InternalRemove Method

Pascal

```
procedure InternalRemove(Value: TOutlineNode; Index: Integer);
```

C++

```
__fastcall InternalRemove(TOutlineNode Value, int Index);
```

Description

This is InternalRemove, a member of class TOutlineNode.

121.1.5.4.19 TOutlineNode.MoveTo Method

Moves an outline node from one location within the outline to another.

Pascal

```
procedure MoveTo(Destination: LongInt; AttachMode: TAttachMode);
```

C++

```
__fastcall MoveTo(LongInt Destination, TAttachMode AttachMode);
```

Description

Call MoveTo to reposition the node to the position indicated by the Destination parameter. Destination is the Index (see page 18362) value of another outline node. The AttachMode parameter specifies how to attach the moved node to the destination position.

Note: To change only the level of a node, use the ChangeLevelBy (see page 18353) method.

See Also

ChangeLevelBy (see page 18353)

Index (see page 18362)

Add (see page 18250)

AddChild (see page 18250)

Insert (see page 18260)

121.1.5.4.20 TOutlineNode.Remove Method

Pascal

```
procedure Remove(Value: TOutlineNode);
```

C++

```
__fastcall Remove(TOutlineNode Value);
```

Description

This is Remove, a member of class TOutlineNode.

121.1.5.4.21 TOutlineNode.WriteNode Method

Pascal

```
procedure WriteNode(Buffer: PChar; Stream: TStream);
```

C++

```
__fastcall WriteNode(const char * Buffer, TStream Stream);
```

Description

This is WriteNode, a member of class TOutlineNode.

121.1.5.5 TOutlineNode Properties

The properties of the TOutlineNode class are listed here.

Protected Properties

	Name	Description
R	ExpandCount (see page 18361)	This is ExpandCount, a member of class TOutlineNode.
R	Items (see page 18363)	This is Items, a member of class TOutlineNode.
R	List (see page 18364)	This is List, a member of class TOutlineNode.
R	Outline (see page 18364)	This is Outline, a member of class TOutlineNode.

Public Properties

	Name	Description
	Data (see page 18360)	Points to application-specific data associated with the node.
	Expanded (see page 18361)	Determines whether descendants of the outline node are displayed.
R	FullPath (see page 18361)	Describes an outline node, using its text and the text of all ancestor nodes in the outline.
R	HasItems (see page 18362)	Indicates whether the outline node has any subnodes.
R	Index (see page 18362)	Identifies the node in the Items (see page 18363) array maintained by the outline.
R	IsVisible (see page 18363)	Indicates whether the outline node is visible in the outline.
	Level (see page 18363)	Indicates the level of indentation of a node within the outline.
R	Parent (see page 18364)	Identifies the immediate ancestor of the node.
	Text (see page 18364)	Specifies the string that identifies the outline node.
R	TopItem (see page 18365)	Indicates which outline node is the topmost ancestor of a node.

121.1.5.5.1 TOutlineNode.Data Property

Points to application-specific data associated with the node.

Pascal

```
property Data: Pointer;
```

C++

```
__property void * Data;
```

Description

Use Data to associate an arbitrary value with a node in an outline. For example, if the outline represents the table of contents to an electronic document, Data could point to an object that provides jump information for accessing the section of the document named by the node.

The Data property is usually described by the Text (see page 18364) property, which is displayed in the rendered image of the node.

See Also

Text (see page 18364)

121.1.5.5.2 TOutlineNode.ExpandCount Property

Pascal

```
property ExpandCount: LongInt;
```

C++

```
__property LongInt ExpandCount;
```

Description

This is ExpandCount, a member of class TOutlineNode.

121.1.5.5.3 TOutlineNode.Expanded Property

Determines whether descendants of the outline node are displayed.

Pascal

```
property Expanded: Boolean;
```

C++

```
__property Boolean Expanded;
```

Description

Set Expanded to true to display all subnodes of a node. When an outline node is expanded, its descendants are displayed and, depending on the OutlineStyle property of the outline in which the node is contained, the minus picture or open picture is displayed.

Set Expanded to false to collapse the node. When an outline node is collapsed, its descendants are hidden and, depending on the OutlineStyle property of the outline in which the node is contained, the plus picture or closed picture is displayed.

Expanded is not meaningful for nodes that have no descendants.

See Also

HasItems (see page 18362)

OutlineStyle (see page 18273)

121.1.5.5.4 TOutlineNode.FullPath Property

Describes an outline node, using its text and the text of all ancestor nodes in the outline.

Pascal

```
property FullPath: string;
```

C++

```
__property AnsiString FullPath;
```

Description

Read FullPath to obtain a description of the entire branch of the outline leading to the outline node. FullPath consists of the values of the Text (see page 18364) properties of all outline items, starting with the text of the node at the first level and traversing the outline down to the outline node. The string specified as the ItemSeparator property of the outline separates the text for each node in the path.

See Also

Level (see page 18363)

Parent (see page 18364)

ItemSeparator (see page 18271)

Text (see page 18364)

TopItem (see page 18365)

121.1.5.5.5 TOutlineNode.HasItems Property

Indicates whether the outline node has any subnodes.

Pascal

```
property HasItems: Boolean;
```

C++

```
__property Boolean HasItems;
```

Description

Read HasItem to determine whether the outline node is a leaf node. Depending on the OutlineStyle property of the outline that contains the node, leaf nodes may appear with the leaf bitmap. If the node is not a leaf, subnodes appear below and indented from the node when it is expanded.

HasItem returns true if the node has any descendants, even if the node is collapsed and the descendants are not visible. HasItem returns false if the node is a leaf node.

See Also

Expanded (see page 18361)

Parent (see page 18364)

OutlineStyle (see page 18273)

121.1.5.5.6 TOutlineNode.Index Property

Identifies the node in the Items (see page 18363) array maintained by the outline.

Pascal

```
property Index: LongInt;
```

C++

```
__property LongInt Index;
```

Description

Read Index to determine the row of the outline where the node appears. The first node has an Index value of 1, and subsequent nodes are indexed sequentially. If a node has subnodes, the Index value of the parent node is one less than the Index value of its first descendant.

When nodes in the outline are added, moved, or deleted, the values of the Index properties of all subsequent nodes must be recalculated to be valid. Sometimes, the recalculation of indexes is deferred until all changes to the nodes are complete. To ensure that the value of Index is valid, call the SetUpdateState method of the outline that contains the node.

See Also

Items (see page 18271)

SetUpdateState (see page 18267)

121.1.5.5.7 TOutlineNode.IsVisible Property

Indicates whether the outline node is visible in the outline.

Pascal

```
property IsVisible: Boolean;
```

C++

```
__property Boolean IsVisible;
```

Description

Read IsVisible to determine whether the node is part of the current image of the outline. A node is visible if it is on level 1 or if all its parents are expanded.

Note: Do not confuse IsVisible with the Visible property of TControl objects. Outline (see page 18364) nodes are not controls, but merely helper objects that describe nodes for an outline control. IsVisible indicates whether a node is visible because its parents are expanded or collapsed. It does not provide information about whether the node has been scrolled out of view, or even if the outline is not visible.

See Also

Expanded (see page 18361)

Visible (see page 5847)

121.1.5.5.8 TOutlineNode.Items Property

Pascal

```
property Items [Index: LongInt]: TOutlineNode;
```

C++

```
__property TOutlineNode Items[LongInt Index];
```

Description

This is Items, a member of class TOutlineNode.

121.1.5.5.9 TOutlineNode.Level Property

Indicates the level of indentation of a node within the outline.

Pascal

```
property Level: Cardinal;
```

C++

```
__property unsigned Level;
```

Description

The value of Level is 1 for nodes that directly descend from the root of the outline (the top level). The value of Level is 2 for their children, and so on.

See Also

ChangeLevelBy (see page 18353)

Parent (see page 18364)

TopItem (see page 18365)

121.1.5.5.10 TOutlineNode.List Property

Pascal

```
property List: TList;
```

C++

```
__property TList List;
```

Description

This is List, a member of class TOutlineNode.

121.1.5.5.11 TOutlineNode.Outline Property

Pascal

```
property Outline: TCustomOutline;
```

C++

```
__property TCustomOutline Outline;
```

Description

This is Outline, a member of class TOutlineNode.

121.1.5.5.12 TOutlineNode.Parent Property

Identifies the immediate ancestor of the node.

Pascal

```
property Parent: TOutlineNode;
```

C++

```
__property TOutlineNode Parent;
```

Description

Read Parent to find the parent of an outline node. A parent node is one level higher and contains the child node as a subnode.

See Also

Level (see page 18363)

TopItem (see page 18365)

121.1.5.5.13 TOutlineNode.Text Property

Specifies the string that identifies the outline node.

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

Use Text to determine the string that is displayed in the outline to represent the node.

See Also

FullPath (see page 18361)

121.1.5.5.14 TOutlineNode.TopItem Property

Indicates which outline node is the topmost ancestor of a node.

Pascal

```
property TopItem: Longint;
```

C++

```
__property Longint TopItem;
```

Description

Read TopItem to determine the first node in the branch of the outline tree that contains the outline node. The TopItem property specifies the Index (see page 18362) value of the level 1 ancestor of the outline node. For a node on level 1, TopItem has the same value as the Index (see page 18362) property.

See Also

Index (see page 18362)

Level (see page 18363)

Parent (see page 18364)

121.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAttachMode (see page 18366)	TAttachMode indicates how an outline node should be inserted into an outline.
	TOutlineBitmap (see page 18367)	This is record Outline.TOutlineBitmap.
	TOutlineNodeCompare (see page 18367)	This is record Outline.TOutlineNodeCompare.
	TOutlineOption (see page 18368)	TOutlineOptions (see page 18373) represents the style in which an outline is drawn.
	TOutlineStyle (see page 18368)	TOutlineStyle determines how the nodes of an outline are drawn.
	TOutlineType (see page 18369)	TOutlineType indicates whether an outline is owner-drawn.

121.2.1 Outline.TAttachMode Enumeration

TAttachMode indicates how an outline node should be inserted into an outline.

Pascal

```
TAttachMode = (
  oaAdd,
  oaAddChild,
  oaInsert
);
```

C++

```
enum TAttachMode {
  oaAdd,
  oaAddChild,
  oaInsert
};
```

File

Outline

Description

TAttachMode is used by methods that move outline nodes within an outline. It includes the following values:

Value	Description
oaAdd	The item is attached as if added with the Add method. The moved item becomes the last sibling of the item specified by the Destination parameter, sharing the same parent as the Destination item.
oaAddChild	The item is attached as if added with the AddChild method. The moved item becomes the last child of the item specified by the Destination parameter. The Destination item becomes the parent of the moved item.
oaInsert	The item is attached as if inserted with the Insert method. The moved item replaces the Destination item in the outline, while the Destination item and all other following items are moved down one row.

See Also

TCustomOutline

TOutlineNode

121.2.2 Outline.TOutlineBitmap Enumeration

Pascal

```
TOutlineBitmap = (
  obPlus,
  obMinus,
  obOpen,
  obClose,
  obLeaf
);
```

C++

```
enum TOutlineBitmap {
  obPlus,
  obMinus,
  obOpen,
  obClose,
  obLeaf
};
```

File

Outline

Description

This is record Outline.TOutlineBitmap.

121.2.3 Outline.TOutlineNodeCompare Enumeration

Pascal

```
TOutlineNodeCompare = (
  ocLess,
  ocSame,
  ocGreater,
  ocInvalid
);
```

C++

```
enum TOutlineNodeCompare {
  ocLess,
  ocSame,
  ocGreater,
  ocInvalid
};
```

File

Outline

Description

This is record Outline.TOutlineNodeCompare.

121.2.4 Outline.TOutlineOption Enumeration

TOutlineOptions (see page 18373) represents the style in which an outline is drawn.

Pascal

```
TOutlineOption = (
  ooDrawTreeRoot,
  ooDrawFocusRect,
  ooStretchBitmaps
);
```

C++

```
enum TOutlineOption {
  ooDrawTreeRoot,
  ooDrawFocusRect,
  ooStretchBitmaps
};
```

File

Outline

Description

TOutlineOptions (see page 18373) is a set of TOutlineOption values. Together they influence the way an outline is drawn. Each TOutlineOption value is described below:

Value	Meaning
ooDrawTreeRoot	The first item (Index value of 1) is connected to the root item by the outline tree. This means that the tree will extend from the top of the outline to all the first level items. Without ooDrawTreeRoot, all first level items appear leftmost in the outline, not connected by the tree.
ooDrawFocusRect	The outline draws a focus rectangle around the selected item.
ooStretchBitmaps	The outline stretches the standard bitmaps (PictureLeaf, PictureOpen, PictureClosed, PicturePlus, PictureMinus) to fit in the size of the item, determined by the size of the Font of the Text. Without ooStretchBitmaps, the bitmaps will be cropped if larger than the height of the item text, or won't fill up the entire item space if smaller than the text.

See Also

TCustomOutline (see page 18234)

121.2.5 Outline.TOutlineStyle Enumeration

TOutlineStyle determines how the nodes of an outline are drawn.

Pascal

```
TOutlineStyle = (
  osText,
  osPlusMinusText,
  osPictureText,
  osPlusMinusPictureText,
  osTreeText,
  osTreePictureText
);
```

C++

```
enum TOutlineStyle {
  osText,
  osPlusMinusText,
  osPictureText,
  osPlusMinusPictureText,
  osTreeText,
  osTreePictureText
};
```

File

Outline

Description

TOutlineStyle is the type of TCustomOutline (see page 18234).::OutlineStyle. It includes the following values:

Value	Meaning
osText	Only the text of nodes is drawn.
osPlusMinusText	In addition to the text, each node displays plus picture (when it can be expanded) or minus picture (when it can be collapsed).
osPictureText	In addition to the text, each node displays the open picture (when it is expanded), closed picture (when it is collapsed), or leaf picture (when it has no subnodes).
osPlusMinusPictureText	In addition to the text, each node displays the plus picture or minus picture (as in osPlusMinusText), and the open, closed or leaf picture (as in osPictureText).
osTreeText	Visible lines connect the outline nodes.
osTreePictureText	In addition to the text, each node displays the open picture (when it is expanded), closed picture (when it is collapsed), or leaf picture (when it has no subnodes). Visible lines connect the outline nodes.

See Also

TCustomOutline

121.2.6 Outline.TOutlineType Enumeration

TOutlineType indicates whether an outline is owner-drawn.

Pascal

```
TOutlineType = (
  otStandard,
  otOwnerDraw
);
```

C++

```
enum TOutlineType {
  otStandard,
  otOwnerDraw
};
```

File

Outline

Description

TOutlineType determines whether an outline is drawn automatically or by user code in an OnDrawItem event.

Value	Meaning
otStandardItems	Items are drawn automatically.
otOwnerDraw	Items are drawn on the Canvas by application code.

TCustomOutline

TCustomOutline

121.3 Types

The following table lists types in this documentation.

Types

Name	Description
EOutlineChange (see page 18371)	EOutlineChange is the type of event handlers that respond when the nodes in an outline control change.
TBitmapArray (see page 18371)	This is type Outline.TBitmapArray.
TBitmapArrayRange (see page 18372)	This is type Outline.TBitmapArrayRange.
TChangeRange (see page 18372)	TChangeRange indicates the direction in which a node is moved.
TOutlineBitmaps (see page 18372)	This is type Outline.TOutlineBitmaps.
TOutlineOptions (see page 18373)	TOutlineOptions represents the style in which an outline is drawn.

121.3.1 Outline.EOutlineChange Type

EOutlineChange is the type of event handlers that respond when the nodes in an outline control change.

Pascal

```
EOutlineChange = procedure (Sender: TObject; Index: LongInt) of object;
```

C++

```
(Sender: TObject; Index: LongInt) ( EOutlineChange)();
```

File

Outline

Description

Sender is the outline control whose node just changed.

Index is the index of the node that just changed.

121.3.2 Outline.TBitmapArray Type

Pascal

```
TBitmapArray = array[TBitmapArrayRange] of TBitmap;
```

C++

```
array[TBitmapArrayRange] of TBitmap TBitmapArray;
```

File

Outline

Description

This is type Outline.TBitmapArray.

121.3.3 Outline.TBitmapArrayRange Type

Pascal

```
TBitmapArrayRange = 0..4;
```

C++

```
0..4 TBitmapArrayRange;
```

File

Outline

Description

This is type Outline.TBitmapArrayRange.

121.3.4 Outline.TChangeRange Type

TChangeRange indicates the direction in which a node is moved.

Pascal

```
TChangeRange = -1..1;
```

C++

```
-1..1 TChangeRange;
```

File

Outline

Description

TChangeRange is the type of the Value parameter of an outline node's ChangeLevelBy method. It can take one of the following values:

Value	Meaning
-1	Move the node toward the root by one level.
1	Move the node toward the leaf by one level.

See Also

TOutlineNode (see page 18349)

121.3.5 Outline.TOutlineBitmaps Type

Pascal

```
TOutlineBitmaps = set of TOutlineBitmap;
```

C++

```
TOutlineBitmap TOutlineBitmaps;
```

File

Outline

Description

This is type Outline.TOutlineBitmaps.

121.3.6 Outline.TOutlineOptions Type

TOutlineOptions represents the style in which an outline is drawn.

Pascal

```
TOutlineOptions = set of TOutlineOption;
```

C++

```
TOutlineOption TOutlineOptions;
```

File

Outline

Description

TOutlineOptions is a set of TOutlineOption (see page 18368) values. Together they influence the way an outline is drawn. Each TOutlineOption (see page 18368) value is described below:

Value	Meaning
ooDrawTreeRoot	The first item (Index value of 1) is connected to the root item by the outline tree. This means that the tree will extend from the top of the outline to all the first level items. Without ooDrawTreeRoot, all first level items appear leftmost in the outline, not connected by the tree.
ooDrawFocusRect	The outline draws a focus rectangle around the selected item.
ooStretchBitmaps	The outline stretches the standard bitmaps (PictureLeaf, PictureOpen, PictureClosed, PicturePlus, PictureMinus) to fit in the size of the item, determined by the size of the Font of the Text. Without ooStretchBitmaps, the bitmaps will be cropped if larger than the height of the item text, or won't fill up the entire item space if smaller than the text.

122 PagItems Namespace

This is namespace PagItems.

Topics

Name	Description
Classes (see page 18376)	The following table lists classes in this documentation.

Classes

	Name	Description
	TBasePageItemsProducer (see page 18376)	TBasePageItemsProducer produces a string of HTML commands based on an input template.
	TPageItemsProducer (see page 18383)	TPageItemsProducer maintains a list of Web item components for producing a string of HTML commands based on an input template.

122.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TBasePageItemsProducer (see page 18376)	TBasePageItemsProducer produces a string of HTML commands based on an input template.
	TPageItemsProducer (see page 18383)	TPageItemsProducer maintains a list of Web item components for producing a string of HTML commands based on an input template.

122.1.1 TBasePageItemsProducer Class

TBasePageItemsProducer produces a string of HTML commands based on an input template.

Class Hierarchy

Pascal

```
TBasePageItemsProducer = class(TComponentsPageProducer, IGetWebComponentList,
ITopLevelWebComponent);
```

C++

```
class TBasePageItemsProducer : public TComponentsPageProducer, public IGetWebComponentList,
public ITopLevelWebComponent;
```

File

PagItems

Description

Use TBasePageItemsProducer to convert an HTML template that includes content generated by other components into a string of HTML commands that can be interpreted by a client application such as a Web browser. HTML templates include HTML commands and HTML-transparent tags that are replaced with customized content by the components page producer in an OnHTMLTag event handler.

TBasePageItemsProducer differs from other page producer components in that it replaces special HTML-transparent tags of the format

```
<#COMPONENT Name=WebContentComponent>
```

with the HTML produced by the components named WebContentComponent. In addition, TBasePageItemsProducer stores a default value for WebContentComponent as the value of its WebPageItems (see page 18382) property.

See Also

IWebContent (see page 24792)

TPageItemsProducer (see page 18383)

TInetXPageProducer (see page 17145)

TAdapterPageProducer (see page 19802)

122.1.1.1 TBasePageItemsProducer Members

The following tables list the members exposed by TBasePageItemsProducer.

Protected Events

	Name	Description
	OnHTMLTag (see page 15280)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoTagEvent (see page 5618)	This is DoTagEvent, a member of class TComponentsPageProducer.
	DoTagEvent (see page 15276)	This is DoTagEvent, a member of class TBasePageProducer.
V	FindComponent (see page 5619)	This is FindComponent, a member of class TComponentsPageProducer.
	FindComponentName (see page 5619)	This is FindComponentName, a member of class TComponentsPageProducer.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
V	GetChildren (see page 18381)	This is GetChildren, a member of class TBasePageItemsProducer.
V	GetComponentContent (see page 5619)	This is GetComponentContent, a member of class TComponentsPageProducer.
	GetComponentList (see page 18382)	This is GetComponentList, a member of class TBasePageItemsProducer.
V	GetContentOptions (see page 5619)	This is GetContentOptions, a member of class TComponentsPageProducer.
	GetDefaultComponentList (see page 18382)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.

	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
	GetTemplateFileName (see page 15277)	This is GetTemplateFileName, a member of class TBasePageProducer.
	GetTemplateStream (see page 15277)	This is GetTemplateStream, a member of class TBasePageProducer.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleScriptTag (see page 15277)	This is HandleScriptTag, a member of class TBasePageProducer.
	HandleTag (see page 5620)	This is HandleTag, a member of class TComponentsPageProducer.
	HandleTag (see page 15278)	This is HandleTag, a member of class TBasePageProducer.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 18382)	This is SetChildOrder, a member of class TBasePageItemsProducer.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Content (see page 15106)	Returns the content produced by the content producer.
V	Content (see page 15274)	Returns the content produced by the content producer.
V	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
V	ContentFromStream (see page 15275)	Returns the content produced in response to input read from a stream.
V	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
V	ContentFromString (see page 15275)	Returns the content produced in response to an input string.
V	Create (see page 18380)	Creates an instance of a TBasePageItemsProducer (see page 18376).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18381)	Destroys the instance of the TBasePageItemsProducer (see page 18376).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ScriptEngine (see page 15279)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 15279)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.
R	WebPageItems (see page 18382)	Maintains a list of components that generate HTML content for the producer.

Published Events

	Name	Description
	OnHTMLTag (see page 5620)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

122.1.1.2 TBasePageItemsProducer.Create Constructor

Creates an instance of a TBasePageItemsProducer (see page 18376).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBasePageItemsProducer(TComponent * AOwner);
```

Description

Call Create to instantiate a TBasePageItemsProducer (see page 18376) component at runtime if it was not created at design time.

AOwner is the component, typically the Web module, that becomes the value of this page producer's Owner property. The Owner is responsible for freeing the TBasePageItemsProducer (see page 18376) instance.

See Also

Owner (see page 2807)

122.1.1.3 TBasePageItemsProducer.Destroy Destructor

Destroys the instance of the TBasePageItemsProducer (see page 18376).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBasePageItemsProducer();
```

Description

Do not call Destroy directly. Instead call Free, which checks that the TBasePageItemsProducer (see page 18376) reference is not nil before calling Destroy.

See Also

Create (see page 18380)

Free (see page 22300)

122.1.1.4 TBasePageItemsProducer Methods

The methods of the TBasePageItemsProducer class are listed here.

Protected Methods

	Name	Description
	GetChildren (see page 18381)	This is GetChildren, a member of class TBasePageItemsProducer.
	GetComponentList (see page 18382)	This is GetComponentList, a member of class TBasePageItemsProducer.
	GetDefaultComponentList (see page 18382)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
	SetChildOrder (see page 18382)	This is SetChildOrder, a member of class TBasePageItemsProducer.

122.1.1.4.1 TBasePageItemsProducer.GetChildren Method

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

This is GetChildren, a member of class TBasePageItemsProducer.

122.1.1.4.2 TBasePageItemsProducer.GetComponentList Method

Pascal

```
function GetComponentList: TObject;
```

C++

```
__fastcall TObject * GetComponentList();
```

Description

This is GetComponentList, a member of class TBasePageItemsProducer.

122.1.1.4.3 TBasePageItemsProducer.GetDefaultComponentList Method

Pascal

```
function GetDefaultComponentList: TObject;
```

C++

```
__fastcall TObject * GetDefaultComponentList();
```

Description

This is GetDefaultComponentList, a member of class TBasePageItemsProducer.

122.1.1.4.4 TBasePageItemsProducer.SetChildOrder Method

Pascal

```
procedure SetChildOrder(Component: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Component, int Order);
```

Description

This is SetChildOrder, a member of class TBasePageItemsProducer.

122.1.1.5 TBasePageItemsProducer Properties

The properties of the TBasePageItemsProducer class are listed here.

Public Properties

	Name	Description
R	WebPageItems (see page 18382)	Maintains a list of components that generate HTML content for the producer.

122.1.1.5.1 TBasePageItemsProducer.WebPageItems Property

Maintains a list of components that generate HTML content for the producer.

Pascal

```
property WebPageItems: TWebComponentList;
```

C++

```
__property TWebComponentList WebPageItems;
```

Description

WebPageItems lists the components that generate content for the page items producer. Each of these components supports the IWebContent interface, and can contain its own list of Web items that help it generate its content.

The type of items that can be added to the WebPageItems list are restricted by a protected method that is abstract or, in C++ terminology, pure virtual in TBasePageItemsProducer (see page 18376). Descendant classes implement this protected method to indicate what types of items can be added to the list.

At design time, use the Web page editor to add components to the WebPageItems property.

Note: Typically, WebPageItems lists all the components that generate content for the page items producer, in the order that the generated content appears in the final HTML document. However, the page items producer can transform COMPONENT tags in its template using components that are not in this list, as long as they have the same owner as the page items producer..

IWebContent (see page 24792)

Creating Web Pages with an InternetExpress Page Producer

122.1.2 TPageItemsProducer Class

TPageItemsProducer maintains a list of Web item components for producing a string of HTML commands based on an input template.

Class Hierarchy

Pascal

```
TPageItemsProducer = class(TBasePageItemsProducer);
```

C++

```
class TPageItemsProducer : public TBasePageItemsProducer;
```

File

PagItems

Description

Use TPageItemsProducer as the base class for components that convert an HTML template that includes content generated by other components into a string of HTML commands that can be interpreted by a client application such as a Web browser. HTML templates include HTML commands and HTML-transparent tags that are replaced with customized content by the page items

producer in an OnHTMLTag event handler.

Page item producers differ from other page producer components in that they replace special HTML-transparent tags of the format

```
<#COMPONENT Name=WebContentComponent>
```

with the HTML produced by the component named WebContentComponent. WebContentComponent must have the same Owner as the page item producer and support the IWebContent interface, which the page item producer uses to obtain the replacement HTML for the COMPONENT tag.

TPageItemsProducer introduces the WebPageItems (see page 18382) property to maintain a hierarchical list of these Web content components, where each component produces content for its parent component.

IWebContent (see page 24792)

TInetXPageProducer (see page 17145)

122.1.2.1 TPageItemsProducer Members

The following tables list the members exposed by TPageItemsProducer.

Protected Events

	Name	Description
	OnHTMLTag (see page 15280)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoTagEvent (see page 5618)	This is DoTagEvent, a member of class TComponentsPageProducer.
	DoTagEvent (see page 15276)	This is DoTagEvent, a member of class TBasePageProducer.
V	FindComponent (see page 5619)	This is FindComponent, a member of class TComponentsPageProducer.
	FindComponentName (see page 5619)	This is FindComponentName, a member of class TComponentsPageProducer.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 18381)	This is GetChildren, a member of class TBasePageItemsProducer.
V	GetComponentContent (see page 5619)	This is GetComponentContent, a member of class TComponentsPageProducer.
	GetComponentList (see page 18382)	This is GetComponentList, a member of class TBasePageItemsProducer.
V	GetContentOptions (see page 5619)	This is GetContentOptions, a member of class TComponentsPageProducer.
	GetDefaultComponentList (see page 18382)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
V	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 15277)	This is GetTemplateFileName, a member of class TBasePageProducer.
V	GetTemplateStream (see page 18388)	This is GetTemplateStream, a member of class TPageItemsProducer.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleScriptTag (see page 15277)	This is HandleScriptTag, a member of class TBasePageProducer.
V	HandleTag (see page 5620)	This is HandleTag, a member of class TComponentsPageProducer.
V	HandleTag (see page 15278)	This is HandleTag, a member of class TBasePageProducer.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 18382)	This is SetChildOrder, a member of class TBasePageItemsProducer.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
V	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.

	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Content (see page 15106)	Returns the content produced by the content producer.
V	Content (see page 15274)	Returns the content produced by the content producer.
V	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
V	ContentFromStream (see page 15275)	Returns the content produced in response to input read from a stream.
V	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
V	ContentFromString (see page 15275)	Returns the content produced in response to an input string.
V	Create (see page 18388)	Creates and initializes an instance of TPageItemsProducer (see page 18383).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18388)	Frees an instance of TPageItemsProducer (see page 18383).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
	HTMLDoc (see page 18389)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 18389)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ScriptEngine (see page 15279)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 15279)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.
R	WebPageItems (see page 18382)	Maintains a list of components that generate HTML content for the producer.

Published Events

	Name	Description
	OnHTMLTag (see page 5620)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

122.1.2.2 TPageItemsProducer.Create Constructor

Creates and initializes an instance of TPageItemsProducer (see page 18383).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPageItemsProducer(TComponent * AOwner);
```

Description

Call Create to instantiate a page items producer at runtime.

122.1.2.3 TPageItemsProducer.Destroy Destructor

Frees an instance of TPageItemsProducer (see page 18383).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPageItemsProducer();
```

Description

Do not call Destroy directly. Instead, call the Free method, which checks whether the TPageItemsProducer (see page 18383) reference is not nil before calling Destroy.

See Also

Free (see page 22300)

122.1.2.4 TPageItemsProducer Methods

The methods of the TPageItemsProducer class are listed here.

Protected Methods

	Name	Description
	GetTemplateStream (see page 18388)	This is GetTemplateStream, a member of class TPageItemsProducer.

122.1.2.4.1 TPageItemsProducer.GetTemplateStream Method

Pascal

```
function GetTemplateStream(out AOwned: Boolean): TStream; override;
```

C++

```
virtual __fastcall TStream GetTemplateStream(Boolean AOwned);
```

Description

This is GetTemplateStream, a member of class TPageItemsProducer.

122.1.2.5 TPageItemsProducer Properties

The properties of the TPageItemsProducer class are listed here.

Public Properties

	Name	Description
	HTMLDoc (see page 18389)	Specifies the HTML template used to generate the value returned by the Content method.
	HTMLFile (see page 18389)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.

122.1.2.5.1 TPageItemsProducer.HTMLDoc Property

Specifies the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLDoc: TStrings;
```

C++

```
__property TStrings HTMLDoc;
```

Description

Set HTMLDoc to a set of strings that make up the HTML template. Each string is a sequence of one or more HTML commands or HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLDoc clears the HTMLFile (see page 18389) property.

See Also

Content (see page 15274)

HTMLFile (see page 18389)

122.1.2.5.2 TPageItemsProducer.HTMLFile Property

Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLFile: TFileName;
```

C++

```
__property TFileName HTMLFile;
```

Description

Set HTMLFile to the name of the file that contains an HTML template. The HTML template is a sequence of HTML commands and HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLFile clears the HTMLDoc (see page 18389) property.

Note: When distributing applications that contain page producers which use the HTMLFile property, be sure to distribute the file along with the application. Also, be sure that the value of HTMLFile does not include a hard-coded path name that will not be available on the user's disk.

HTMLDoc (see page 18389)

123 Printers Namespace

This is namespace Printers.

Topics

Name	Description
Classes (see page 18392)	The following table lists classes in this documentation.
Functions (see page 18412)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 18416)	The following table lists structs, records, enums in this documentation.
Types (see page 18418)	The following table lists types in this documentation.

Classes

	Name	Description
	EPrinter (see page 18392)	EPrinter is the exception class for printing errors.
	TPrinter (see page 18392)	TPrinter encapsulates the Windows printer interface.

Functions

	Name	Description
	AssignPrn (see page 18412)	Assigns a text file variable to the printer.
	Printer (see page 18412)	Returns a global instance of TPrinter (see page 18392) to manage interaction with the printer.
	SetPrinter (see page 18414)	Replaces the global instance of TPrinter (see page 18392) that manages interaction with the printer.

Structs, Records, Enums

	Name	Description
	TPrinterCapability (see page 18416)	TPrinterCapability and TPrinterCapabilities (see page 18418) specify the capabilities of a printer device driver.
	TPrinterOrientation (see page 18416)	TPrinterOrientation indicates the orientation of pages when printing.
	TPrinterState (see page 18417)	This is record Printers.TPrinterState.

Types

Name	Description
TPrinterCapabilities (see page 18418)	This is type Printers.TPrinterCapabilities.

123.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EPrinter (see page 18392)	EPrinter is the exception class for printing errors.
	TPrinter (see page 18392)	TPrinter encapsulates the Windows printer interface.

123.1.1 EPrinter Class

EPrinter is the exception class for printing errors.

Class Hierarchy

Pascal

```
EPrinter = class(Exception);
```

C++

```
class EPrinter : public Exception;
```

File

Printers

Description

EPrinter is raised when a printing error occurs. For example, if an application attempts to use a printer that doesn't exist, or if a job can't be sent to the printer for some other reason, an EPrinter exception is raised.

See Also

TPrinter (see page 18392)

123.1.2 TPrinter Class

TPrinter encapsulates the Windows printer interface.

Class Hierarchy

Pascal

```
TPrinter = class(TObject);
```

C++

```
class TPrinter : public TObject;
```

File

Printers

Description

Use TPrinter to manage any printing performed by an application. Obtain an instance of TPrinter by calling the Printer (see page 18412) function in the Printers (see page 18409) unit.

To determine how the printed image of the form appears, use the PrintScale property of a TForm component.

A print job is started by a call to BeginDoc (see page 18397). The application sends commands by rendering through a Text variable or the printer's canvas. You can move to a new page by calling the NewPage (see page 18400) method. The job stays open until the application calls EndDoc (see page 18399). If a problem occurs and you need to terminate a print job that was not sent to the printer successfully, call the Abort (see page 18395) method.

Use the TPrinter properties to configure the print job. For example, the title displayed in the Print Manager (and on network header pages) is determined by the Title (see page 18411) property. Copies (see page 18405) determines the number of copies to print, and Orientation (see page 18406) lets you specify whether to print in portrait or landscape mode.

TPrinter includes several read-only properties as well, that let you determine which page is currently being printed, the fonts available on the printer, the paper size, and so on.

When creating a TPrinter descendant, you must call the SetPrinter (see page 18402) routine in order for the TPrinter descendant object to work correctly.

See Also

Printer (see page 18412)

TCustomForm (see page 13849)

SetPrinter Routine

123.1.2.1 TPrinter Members

The following tables list the members exposed by TPrinter.

Public Methods

	Name	Description
	Abort (see page 18395)	Terminates the printing of a print job, dropping all unprinted data.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDoc (see page 18397)	Sends a print job to the printer.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18394)	Creates a printer.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18395)	Destroys an instance of a printer.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndDoc (see page 18399)	Ends the current print job and closes the text file variable.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetPrinter (see page 18400)	Retrieves information about the current printer.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NewPage (see page 18400)	Starts a new page and increments the PageNumber (see page 18408) property.
	Refresh (see page 18401)	Updates the Fonts (see page 18405) and Printers (see page 18409) properties.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetPrinter (see page 18402)	Specifies the current printer.

Public Properties

	Name	Description
R	Aborted (see page 18403)	Determines if the user aborted the print job.
R	Canvas (see page 18404)	Represents the surface of the currently printing page.
R	Capabilities (see page 18404)	Indicates the current settings of a printer device driver.
	Copies (see page 18405)	Specifies the number of copies to print.
R	Fonts (see page 18405)	Lists the fonts supported by the current printer.
R	Handle (see page 18405)	Provides access to the handle of the printer object.
	Orientation (see page 18406)	Determines if the print job prints vertically or horizontally on a page.
R	PageHeight (see page 18407)	Indicates the height (in pixels) of the currently printing page.
R	PageNumber (see page 18408)	Indicates the number of the page currently printing.
R	PageWidth (see page 18408)	Indicates the value of width (in pixels) of the currently printing page.
	PrinterIndex (see page 18409)	Specifies which printer listed in the Printers (see page 18409) property is the currently selected printer.
R	Printers (see page 18409)	Lists all printers installed in Windows.
R	Printing (see page 18409)	Indicates whether a print job is printing.
	Title (see page 18411)	Determines the text that is listed in the Print Manager and on network header pages.

123.1.2.2 TPrinter.Create Constructor

Creates a printer.

Pascal

```
constructor Create;
```

C++

```
__fastcall TPrinter();
```

Description

Never call Create directly. Create is called automatically by the Printer (see page 18412) function. Create allocates memory for a printer and calls the inherited Create. Then it sets the correct driver, device, and port.

See Also

Create (see page 22287)

123.1.2.3 TPrinter.Destroy Destructor

Destroys an instance of a printer.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TPrinter();
```

Description

Do not call Destroy directly. The printer object is automatically created and destroyed.

When Destroy is called, it verifies that any currently printing job has ended, then frees resources such as the handle, fonts, and canvas, closes the printer, and calls the inherited Destroy method.

See Also

Destroy (see page 22287)

Free (see page 22300)

123.1.2.4 TPrinter Methods

The methods of the TPrinter class are listed here.

Public Methods

	Name	Description
	Abort (see page 18395)	Terminates the printing of a print job, dropping all unprinted data.
	BeginDoc (see page 18397)	Sends a print job to the printer.
	EndDoc (see page 18399)	Ends the current print job and closes the text file variable.
	GetPrinter (see page 18400)	Retrieves information about the current printer.
	NewPage (see page 18400)	Starts a new page and increments the PageNumber (see page 18408) property.
	Refresh (see page 18401)	Updates the Fonts (see page 18405) and Printers (see page 18409) properties.
	SetPrinter (see page 18402)	Specifies the current printer.

123.1.2.4.1 TPrinter.Abort Method

Terminates the printing of a print job, dropping all unprinted data.

Pascal

```
procedure Abort;
```

C++

```
__fastcall Abort();
```

Description

Use Abort to terminate the print job before it completes; otherwise, use the EndDoc (see page 18399) method.

When Abort is called, the device is then set for the next print job.

Delphi Examples:

```
{
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
}

uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
var
  I, X, Y: Integer;
  Memo1 : TMemo;
  r: TRect;
begin
  Memo1 := TMemo.Create(Form1);
  Memo1.Parent := Form1;
  Memo1.Visible := True;
  Memo1.Width := 700;
  if (OpenDialog1.Execute) then
  begin
    Memo1.Lines.LoadFromFile(OpenDialog1.FileName);

    Printer.BeginDoc;
    X := 200;
    Y := 200;
    for I := 0 to 140 do
      if (not Printer.Aborted) then
      begin
        Printer.Canvas.TextOut(X, Y, Memo1.Lines[I]);
        Y := Y + 80;
        if (Y > (Printer.PageHeight - 300)) then
        begin
          Y := 200;
          Printer.NewPage;
          Sleep(1000);  // to give you time to abort!
        end;
      end;
    if (not Printer.Aborted) then Printer.EndDoc;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
   KeyPreview := True;
end;

procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word; Shift: TShiftState);
begin
if (Key=VK_ESCAPE) and Printer.Printing then
  begin
  Printer.Abort;
  MessageDlg('Printing aborted', mtInformation, [mbOK],0);
  end;
end;
```

See Also

Aborted (see page 18403)

BeginDoc (see page 18397)

EndDoc (see page 18399)

Printing (see page 18409)

123.1.2.4.2 TPrinter.BeginDoc Method

Sends a print job to the printer.

Pascal

```
procedure BeginDoc;
```

C++

```
__fastcall BeginDoc();
```

Description

Call BeginDoc to initiate a print job. If the print job is sent successfully, the application calls EndDoc (see page 18399) to end the print job. The print job won't actually start printing until EndDoc (see page 18399) is called.

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PrintDialog1->Options.Clear();
  PrintDialog1->Options << poPageNums << poSelection;
  PrintDialog1->FromPage = 1;
  PrintDialog1->MinPage = 1;
  PrintDialog1->ToPage = PageControl1->PageCount;
  PrintDialog1->MaxPage = PageControl1->PageCount;
  if (PrintDialog1->Execute())
  {
    int Start, Stop;
    // determine the range the user wants to print
    switch (PrintDialog1->PrintRange)
    {
      case prSelection:
        Start = PageControl1->ActivePage->PageIndex;
        Stop = Start;
        break;
      case prPageNums:
        Start = PrintDialog1->FromPage - 1;
        Stop =  PrintDialog1->ToPage - 1;
        break;
      default:  // prAllPages
        Start = PrintDialog1->MinPage - 1;
        Stop = PrintDialog1->MaxPage - 1;
        break;
    }
    // now, print the pages
    Printer()->BeginDoc();
    for (int i = Start; i <= Stop; i++)
    {
      PageControl1->Pages[i]->PaintTo(Printer()->Handle, 10, 10);
      if (i != Stop)
        Printer()->NewPage();
    }
```

```
    Printer()->EndDoc();
  }
}
```

Delphi Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
}
procedure TForm1.Button1Click(Sender:TObject);
var
  I, Start, Stop: Integer;
begin
PrintDialog1.Options := [poPageNums, poSelection];
PrintDialog1.FromPage := 1;
PrintDialog1.MinPage := 1;
PrintDialog1.ToPage := PageControl1.PageCount;
PrintDialog1.MaxPage := PageControl1.PageCount;

if PrintDialog1.Execute() then
  begin
    { determine the range the user wants to print }
    with PrintDialog1 do
    begin
      if PrintRange = prAllPages then
        begin
        Start := MinPage - 1;
        Stop := MaxPage - 1;
      end
      else if PrintRange = prSelection then
      begin
        Start := PageControl1.ActivePage.PageIndex;
        Stop := Start;
        end
      else  { PrintRange = prPageNums }
      begin
        Start := FromPage - 1;
        Stop := ToPage - 1;
      end;
    end;
    { now, print the pages }
    with Printer do
    begin
      BeginDoc;
      for I := Start to Stop do
      begin
        PageControl1.Pages[I].PaintTo(Handle, 10, 10);
        if I <> Stop then
          NewPage;
      end;
      EndDoc;
    end;
  end;
end;
```

See Also

Abort (see page 18395)

EndDoc (see page 18399)

Printing (see page 18409)

123.1.2.4.3 TPrinter.EndDoc Method

Ends the current print job and closes the text file variable.

Pascal

```
procedure EndDoc;
```

C++

```
__fastcall EndDoc();
```

Description

EndDoc terminates the print job (and closes the currently open Text). The print job will begin printing on the printer after a call to EndDoc.

After the application calls EndDoc, the printer begins printing. Use EndDoc after successfully sending a print job to the printer. If the print job isn't successful, use the Abort (see page 18395) method.

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PrintDialog1->Options.Clear();
  PrintDialog1->Options << poPageNums << poSelection;
  PrintDialog1->FromPage = 1;
  PrintDialog1->MinPage = 1;
  PrintDialog1->ToPage = PageControl1->PageCount;
  PrintDialog1->MaxPage = PageControl1->PageCount;
  if (PrintDialog1->Execute())
  {
    int Start, Stop;
    // determine the range the user wants to print
    switch (PrintDialog1->PrintRange)
    {
      case prSelection:
        Start = PageControl1->ActivePage->PageIndex;
        Stop = Start;
        break;
      case prPageNums:
        Start = PrintDialog1->FromPage - 1;
        Stop =  PrintDialog1->ToPage - 1;
        break;
      default:  // prAllPages
        Start = PrintDialog1->MinPage - 1;
        Stop = PrintDialog1->MaxPage - 1;
        break;
    }
    // now, print the pages
    Printer()->BeginDoc();
    for (int i = Start; i <= Stop; i++)
    {
      PageControl1->Pages[i]->PaintTo(Printer()->Handle, 10, 10);
```

```
        if (i != Stop)
          Printer()->NewPage();
      }
      Printer()->EndDoc();
    }
  }
```

See Also

Abort (see page 18395)

BeginDoc (see page 18397)

Printing (see page 18409)

123.1.2.4.4 TPrinter.GetPrinter Method

Retrieves information about the current printer.

Pascal

```
procedure GetPrinter(ADevice: PChar; ADriver: PChar; APort: PChar; var ADeviceMode: THandle);
```

C++

```
__fastcall GetPrinter(const char * ADevice, const char * ADriver, const char * APort, THandle
ADeviceMode);
```

Description

Call GetPrinter to obtain information about the current printer.

ADevice is a buffer that receives the device name of the current printer. This is the name that appears in the Print Manager (for example, "Epson FX-80"). It is not the printer model name.

ADriver is a buffer that receives the driver name for the current printer. Some versions of Windows do not use printer driver names, in which case this buffer is unused. On versions of Windows that support printer driver names, this is the name of a printer driver (usually 'WINSPOOL').

APort is a buffer that receives the port used by the current printer. It is not used on 32-bit versions of Windows, but is included for backward compatibility.

DeviceMode returns the handle to a memory buffer containing device-specific initialization data for the device driver. Use the GlobalLock function to convert this handle into a pointer to a DeviceMode record (Delphi) or DEVMODE structure (C++).

See Also

Printers (see page 18409)

123.1.2.4.5 TPrinter.NewPage Method

Starts a new page and increments the PageNumber (see page 18408) property.

Pascal

```
procedure NewPage;
```

C++

```
__fastcall NewPage();
```

Description

NewPage forces the current print job to begin printing on a new page in the printer.

NewPage increments the value of the PageNumber (see page 18408) property. It also resets the value of the Pen property of

the Canvas (see page 18404) back to (0, 0).

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PrintDialog1->Options.Clear();
  PrintDialog1->Options << poPageNums << poSelection;
  PrintDialog1->FromPage = 1;
  PrintDialog1->MinPage = 1;
  PrintDialog1->ToPage = PageControl1->PageCount;
  PrintDialog1->MaxPage = PageControl1->PageCount;
  if (PrintDialog1->Execute())
  {
    int Start, Stop;
    // determine the range the user wants to print
    switch (PrintDialog1->PrintRange)
    {
      case prSelection:
        Start = PageControl1->ActivePage->PageIndex;
        Stop = Start;
        break;
      case prPageNums:
        Start = PrintDialog1->FromPage - 1;
        Stop =  PrintDialog1->ToPage - 1;
        break;
      default:  // prAllPages
        Start = PrintDialog1->MinPage - 1;
        Stop = PrintDialog1->MaxPage - 1;
        break;
    }
    // now, print the pages
    Printer()->BeginDoc();
    for (int i = Start; i <= Stop; i++)
    {
      PageControl1->Pages[i]->PaintTo(Printer()->Handle, 10, 10);
      if (i != Stop)
        Printer()->NewPage();
    }
    Printer()->EndDoc();
  }
}
```

See Also

PageNumber (see page 18408)

123.1.2.4.6 TPrinter.Refresh Method

Updates the Fonts (see page 18405) and Printers (see page 18409) properties.

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

Call Refresh when the installed fonts or printers on the current system may have changed. Refresh clears the internal cache of installed fonts and printers, so that the Fonts (see page 18405) and Printers (see page 18409) properties are updated when they are next read.

See Also

Fonts (see page 18405)

Printers (see page 18409)

123.1.2.4.7 TPrinter.SetPrinter Method

Specifies the current printer.

Pascal

```
procedure SetPrinter(ADevice: PChar; ADriver: PChar; APort: PChar; ADeviceMode: THandle);
```

C++

```
__fastcall SetPrinter(const char * ADevice, const char * ADriver, const char * APort, THandle
ADeviceMode);
```

Description

Call SetPrinter to change the current printer.

ADevice specifies the device name of the new printer. This is the name that appears in the Print Manager (for example, "Epson FX-80"). It is not the printer model name.

ADriver specifies the driver name for the new printer (usually 'WINSPOOL').

APort is included for backward compatibility. It should be set to an empty string.

DeviceMode is the handle to a memory buffer device-specific initialization data for the device driver. This handle can be obtained by calling the GlobalAlloc function to allocate a DeviceMode record (Delphi) or DEVMODE structure (C++).

See Also

Printers (see page 18409)

123.1.2.5 TPrinter Properties

The properties of the TPrinter class are listed here.

Public Properties

	Name	Description
R	Aborted (see page 18403)	Determines if the user aborted the print job.
R	Canvas (see page 18404)	Represents the surface of the currently printing page.
R	Capabilities (see page 18404)	Indicates the current settings of a printer device driver.
	Copies (see page 18405)	Specifies the number of copies to print.
R	Fonts (see page 18405)	Lists the fonts supported by the current printer.
R	Handle (see page 18405)	Provides access to the handle of the printer object.
	Orientation (see page 18406)	Determines if the print job prints vertically or horizontally on a page.
R	PageHeight (see page 18407)	Indicates the height (in pixels) of the currently printing page.

R	PageNumber (see page 18408)	Indicates the number of the page currently printing.
R	PageWidth (see page 18408)	Indicates the value of width (in pixels) of the currently printing page.
	PrinterIndex (see page 18409)	Specifies which printer listed in the Printers (see page 18409) property is the currently selected printer.
R	Printers (see page 18409)	Lists all printers installed in Windows.
R	Printing (see page 18409)	Indicates whether a print job is printing.
	Title (see page 18411)	Determines the text that is listed in the Print Manager and on network header pages.

123.1.2.5.1 TPrinter.Aborted Property

Determines if the user aborted the print job.

Pascal

```
property Aborted: Boolean;
```

C++

```
__property Boolean Aborted;
```

Description

If Aborted is true, the print job was aborted. If it is false, the user did not abort the print job.

The Abort (see page 18395) method sets the Aborted property to true.

Delphi Examples:

```
{
The following code displays a dialog box if the print job
was aborted.  This code aborts a print job if the user
presses Esc. Note that you should set KeyPreview to true
to ensure that the OnKeyDown event handler of Form1 is called.
Also notice that the Button1Click routine continues to run
even after the print job has been aborted.
}

uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
var
  I, X, Y: Integer;
  Memo1 : TMemo;
  r: TRect;
begin
  Memo1 := TMemo.Create(Form1);
  Memo1.Parent := Form1;
  Memo1.Visible := True;
  Memo1.Width := 700;
  if (OpenDialog1.Execute) then
  begin
    Memo1.Lines.LoadFromFile(OpenDialog1.FileName);

    Printer.BeginDoc;
    X := 200;
    Y := 200;
    for I := 0 to 140 do
      if (not Printer.Aborted) then
      begin
        Printer.Canvas.TextOut(X, Y, Memo1.Lines[I]);
        Y := Y + 80;
        if (Y > (Printer.PageHeight - 300)) then
        begin
          Y := 200;
          Printer.NewPage;
```

```
            Sleep(1000);  // to give you time to abort!
          end;
        end;
      if (not Printer.Aborted) then Printer.EndDoc;
    end;
    if Printer.Aborted then
      MessageDlg('The print job did not finish printing', mtInformation, [mbOK], 0);
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
     KeyPreview := True;
  end;

  procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word; Shift: TShiftState);
  begin
  if (Key=VK_ESCAPE) and Printer.Printing then
    begin
    Printer.Abort;
  //  MessageDlg('Printing aborted', mtInformation, [mbOK],0);
    end;
  end;
```

See Also

Abort (see page 18395)

123.1.2.5.2 TPrinter.Canvas Property

Represents the surface of the currently printing page.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Canvas represents the printing surface of a page. Use the Brush, Font, and Pen properties of the Canvas object to determine how drawing or text appears on the page.

Note:

See Also

Brush (see page 14484)

CopyRect (see page 14452)

Draw (see page 14454)

Font (see page 14488)

Pen (see page 14492)

StretchDraw (see page 14472)

Handle (see page 14489)

123.1.2.5.3 TPrinter.Capabilities Property

Indicates the current settings of a printer device driver.

Pascal

```
property Capabilities: TPrinterCapabilities;
```

C++

```
__property TPrinterCapabilities Capabilities;
```

Description

Capabilities contains the capabilities for the printer, indicating the orientation, number of copies, and whether or not collated is selected.

123.1.2.5.4 TPrinter.Copies Property

Specifies the number of copies to print.

Pascal

```
property Copies: Integer;
```

C++

```
__property int Copies;
```

Description

Set Copies to indicate the number of copies to print.

Copies uses the device mode to determine the number of copies to print.

123.1.2.5.5 TPrinter.Fonts Property

Lists the fonts supported by the current printer.

Pascal

```
property Fonts: TStrings;
```

C++

```
__property TStrings Fonts;
```

Description

Read Fonts to get a list of the fonts supported by the printer. Each string in Fonts is the name of a typeface.

Fonts contains TrueType fonts even if the printer doesn't support them natively because the Windows Graphics (see page 14387) Device Interface (GDI) can draw TrueType fonts accurately when a print job uses them.

See Also

Name (see page 14510)

123.1.2.5.6 TPrinter.Handle Property

Provides access to the handle of the printer object.

Pascal

```
property Handle: HDC;
```

C++

```
__property HDC Handle;
```

Description

Use Handle to gain access to the handle of the printer object.

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PrintDialog1->Options.Clear();
  PrintDialog1->Options << poPageNums << poSelection;
  PrintDialog1->FromPage = 1;
  PrintDialog1->MinPage = 1;
  PrintDialog1->ToPage = PageControl1->PageCount;
  PrintDialog1->MaxPage = PageControl1->PageCount;
  if (PrintDialog1->Execute())
  {
    int Start, Stop;
    // determine the range the user wants to print
    switch (PrintDialog1->PrintRange)
    {
      case prSelection:
        Start = PageControl1->ActivePage->PageIndex;
        Stop = Start;
        break;
      case prPageNums:
        Start = PrintDialog1->FromPage - 1;
        Stop =  PrintDialog1->ToPage - 1;
        break;
      default:  // prAllPages
        Start = PrintDialog1->MinPage - 1;
        Stop = PrintDialog1->MaxPage - 1;
        break;
    }
    // now, print the pages
    Printer()->BeginDoc();
    for (int i = Start; i <= Stop; i++)
    {
      PageControl1->Pages[i]->PaintTo(Printer()->Handle, 10, 10);
      if (i != Stop)
        Printer()->NewPage();
    }
    Printer()->EndDoc();
  }
}
```

123.1.2.5.7 TPrinter.Orientation Property

Determines if the print job prints vertically or horizontally on a page.

Pascal

```
property Orientation: TPrinterOrientation;
```

C++

```
__property TPrinterOrientation Orientation;
```

Description

Use Orientation to determine if a print job prints in landscape or portrait.

123.1.2.5.8 TPrinter.PageHeight Property

Indicates the height (in pixels) of the currently printing page.

Pascal

```
property PageHeight: Integer;
```

C++

```
__property int PageHeight;
```

Description

Use PageHeight to find the height in pixels of the currently printing page.

Delphi Examples:

```
{
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
}

uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
var
  I, X, Y: Integer;
  Memo1 : TMemo;
  r: TRect;
begin
  Memo1 := TMemo.Create(Form1);
  Memo1.Parent := Form1;
  Memo1.Visible := True;
  Memo1.Width := 700;
  if (OpenDialog1.Execute) then
  begin
    Memo1.Lines.LoadFromFile(OpenDialog1.FileName);

    Printer.BeginDoc;
    X := 200;
    Y := 200;
    for I := 0 to 140 do
      if (not Printer.Aborted) then
      begin
        Printer.Canvas.TextOut(X, Y, Memo1.Lines[I]);
        Y := Y + 80;
        if (Y > (Printer.PageHeight - 300)) then
        begin
          Y := 200;
          Printer.NewPage;
          Sleep(1000);  // to give you time to abort!
        end;
      end;
    if (not Printer.Aborted) then Printer.EndDoc;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
   KeyPreview := True;
```

```
end;

procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word; Shift: TShiftState);
begin
if (Key=VK_ESCAPE) and Printer.Printing then
  begin
  Printer.Abort;
  MessageDlg('Printing aborted', mtInformation, [mbOK],0);
  end;
end;
```

See Also

PageNumber (see page 18408)

PageWidth (see page 18408)

123.1.2.5.9 TPrinter.PageNumber Property

Indicates the number of the page currently printing.

Pascal

```
property PageNumber: Integer;
```

C++

```
__property int PageNumber;
```

Description

Use PageNumber to find the page number of the currently printing page.

PageNumber is incremented whenever the NewPage (see page 18400) method is called. It is also incremented when a Text variable is written and a CR is encountered on the last line of the page.

See Also

NewPage (see page 18400)

PageHeight (see page 18407)

PageWidth (see page 18408)

123.1.2.5.10 TPrinter.PageWidth Property

Indicates the value of width (in pixels) of the currently printing page.

Pascal

```
property PageWidth: Integer;
```

C++

```
__property int PageWidth;
```

Description

Use PageWidth to find the width in pixels of the currently printing page.

See Also

PageHeight (see page 18407)

PageNumber (see page 18408)

123.1.2.5.11 TPrinter.PrinterIndex Property

Specifies which printer listed in the Printers (see page 18409) property is the currently selected printer.

Pascal

```
property PrinterIndex: Integer;
```

C++

```
__property int PrinterIndex;
```

Description

The value of PrinterIndex is the currently selected printer. If this value is changed, EndDoc (see page 18399) is called automatically. To select the default printer, set the value of PrinterIndex to -1.

The list of installed printers is found in the Printers (see page 18409) property. The list of fonts supported by the current printer is found in the Fonts (see page 18405) property.

See Also

EndDoc (see page 18399)

Fonts (see page 18405)

Printers (see page 18409)

123.1.2.5.12 TPrinter.Printers Property

Lists all printers installed in Windows.

Pascal

```
property Printers: TStrings;
```

C++

```
__property TStrings Printers;
```

Description

The list of installed printers is found in the Printers property. The value of the PrinterIndex (see page 18409) property is the currently selected printer. The list of fonts supported by the current printer is found in the Fonts (see page 18405) property.

See Also

GetPrinter (see page 18400)

123.1.2.5.13 TPrinter.Printing Property

Indicates whether a print job is printing.

Pascal

```
property Printing: Boolean;
```

C++

```
__property Boolean Printing;
```

Description

Use Printing to determine if a job is printing.

Printing is true when the application has called the BeginDoc (see page 18397) method but the EndDoc (see page 18399)

method (or the Abort (see page 18395) method) hasn't yet been called.

Delphi Examples:

```
{
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
}

uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
var
  I, X, Y: Integer;
  Memo1 : TMemo;
  r: TRect;
begin
  Memo1 := TMemo.Create(Form1);
  Memo1.Parent := Form1;
  Memo1.Visible := True;
  Memo1.Width := 700;
  if (OpenDialog1.Execute) then
  begin
    Memo1.Lines.LoadFromFile(OpenDialog1.FileName);

    Printer.BeginDoc;
    X := 200;
    Y := 200;
    for I := 0 to 140 do
      if (not Printer.Aborted) then
      begin
        Printer.Canvas.TextOut(X, Y, Memo1.Lines[I]);
        Y := Y + 80;
        if (Y > (Printer.PageHeight - 300)) then
        begin
          Y := 200;
          Printer.NewPage;
          Sleep(1000);  // to give you time to abort!
        end;
      end;
    if (not Printer.Aborted) then Printer.EndDoc;
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
   KeyPreview := True;
end;

procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word; Shift: TShiftState);
begin
if (Key=VK_ESCAPE) and Printer.Printing then
  begin
  Printer.Abort;
  MessageDlg('Printing aborted', mtInformation, [mbOK],0);
  end;
end;
```

See Also

Abort (see page 18395)

BeginDoc (see page 18397)

EndDoc (see page 18399)

123.1.2.5.14 TPrinter.Title Property

Determines the text that is listed in the Print Manager and on network header pages.

Pascal

```
property Title: string;
```

C++

```
__property AnsiString Title;
```

Description

Title is used by Windows in the Print Manager and for network title pages.

123.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AssignPrn (see page 18412)	Assigns a text file variable to the printer.
	Printer (see page 18412)	Returns a global instance of TPrinter (see page 18392) to manage interaction with the printer.
	SetPrinter (see page 18414)	Replaces the global instance of TPrinter (see page 18392) that manages interaction with the printer.

123.2.1 Printers.AssignPrn Function

Assigns a text file variable to the printer.

Pascal

```
procedure AssignPrn(var F: Text);
```

C++

```
AssignPrn(Text F);
```

File

Printers

Description

In Delphi code, Call AssignPrn to cause all information written to the text file variable F to be directed to the printer. After the variable is assigned, the application must call the Rewrite procedure.

See Also

Rewrite

123.2.2 Printers.Printer Function

Returns a global instance of TPrinter (see page 18392) to manage interaction with the printer.

Pascal

```
function Printer: TPrinter;
```

C++

```
TPrinter Printer();
```

File

Printers

Description

Printer creates an instance of a global TPrinter (see page 18392) object the first time it is called. Use the Printer function to

print using the TPrinter (see page 18392) object.

Printer is declared in the Printers (see page 18391) unit. To use the Printer function and the TPrinter (see page 18392) object, add Printers (see page 18391) to the uses clause of your unit (Delphi) or include Printers.hpp in the source file (C++).

C++ Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PrintDialog1->Options.Clear();
  PrintDialog1->Options << poPageNums << poSelection;
  PrintDialog1->FromPage = 1;
  PrintDialog1->MinPage = 1;
  PrintDialog1->ToPage = PageControl1->PageCount;
  PrintDialog1->MaxPage = PageControl1->PageCount;
  if (PrintDialog1->Execute())
  {
    int Start, Stop;
    // determine the range the user wants to print
    switch (PrintDialog1->PrintRange)
    {
      case prSelection:
        Start = PageControl1->ActivePage->PageIndex;
        Stop = Start;
        break;
      case prPageNums:
        Start = PrintDialog1->FromPage - 1;
        Stop =  PrintDialog1->ToPage - 1;
        break;
      default:  // prAllPages
        Start = PrintDialog1->MinPage - 1;
        Stop = PrintDialog1->MaxPage - 1;
        break;
    }
    // now, print the pages
    Printer()->BeginDoc();
    for (int i = Start; i <= Stop; i++)
    {
      PageControl1->Pages[i]->PaintTo(Printer()->Handle, 10, 10);
      if (i != Stop)
        Printer()->NewPage();
    }
    Printer()->EndDoc();
  }
}
```

Delphi Examples:

```
{
This example uses a button, a Page Control, and a Print
dialog box on a form. When the user clicks the button, the
print dialog is displayed.  The user can select any subset
of the pages in the page control for printing.  The selected
pages are then printed.  To run this example successfully,
you must add the Printers unit to the uses clause of your
unit.  Right click on the PageControl to add at least one
page to the PageControl.
```

```
}
procedure TForm1.Button1Click(Sender:TObject);
var
  I, Start, Stop: Integer;
begin
PrintDialog1.Options := [poPageNums, poSelection];
PrintDialog1.FromPage := 1;
PrintDialog1.MinPage := 1;
PrintDialog1.ToPage := PageControl1.PageCount;
PrintDialog1.MaxPage := PageControl1.PageCount;

if PrintDialog1.Execute() then
  begin
    { determine the range the user wants to print }
    with PrintDialog1 do
    begin
      if PrintRange = prAllPages then
        begin
        Start := MinPage - 1;
        Stop := MaxPage - 1;
      end
      else if PrintRange = prSelection then
      begin
        Start := PageControl1.ActivePage.PageIndex;
        Stop := Start;
        end
      else  { PrintRange = prPageNums }
      begin
        Start := FromPage - 1;
        Stop := ToPage - 1;
      end;
    end;
    { now, print the pages }
    with Printer do
    begin
      BeginDoc;
      for I := Start to Stop do
      begin
        PageControl1.Pages[I].PaintTo(Handle, 10, 10);
        if I <> Stop then
          NewPage;
      end;
      EndDoc;
    end;
  end;
end;
```

See Also

SetPrinter (see page 18414)

123.2.3 Printers.SetPrinter Function

Replaces the global instance of TPrinter (see page 18392) that manages interaction with the printer.

Pascal

```
function SetPrinter(NewPrinter: TPrinter): TPrinter;
```

C++

```
TPrinter SetPrinter(TPrinter NewPrinter);
```

File

Printers

Description

SetPrinter replaces the global TPrinter (see page 18392) object with another TPrinter (see page 18392) object. This allows applications to change the way they handle printing by substituting a TPrinter (see page 18392) descendant for the default TPrinter (see page 18392) object.

NewPrinter is the new TPrinter (see page 18392) object that replaces the current global TPrinter (see page 18392) object.

SetPrinter returns the previous global TPrinter (see page 18392) object.

Note: The global TPrinter (see page 18392) object is freed automatically when the application shuts down. After a call to SetPrinter, the printer that is returned is not automatically freed. It is the caller's responsibility to either free the return value, or replace it using another call to SetPrinter and to free the substitute printer that the second SetPrinter call returns.

SetPrinter is declared in the Printers (see page 18391) unit. To use the SetPrinter function, add Printers (see page 18391) to the uses clause of your unit (Delphi) or include Printers.hpp in the source file (C++) .

Printer (see page 18412)

123.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TPrinterCapability (see page 18416)	TPrinterCapability and TPrinterCapabilities (see page 18418) specify the capabilities of a printer device driver.
	TPrinterOrientation (see page 18416)	TPrinterOrientation indicates the orientation of pages when printing.
	TPrinterState (see page 18417)	This is record Printers.TPrinterState.

123.3.1 Printers.TPrinterCapability Enumeration

TPrinterCapability and TPrinterCapabilities (see page 18418) specify the capabilities of a printer device driver.

Pascal

```
TPrinterCapability = (
  pcCopies,
  pcOrientation,
  pcCollation
);
```

C++

```
enum TPrinterCapability {
  pcCopies,
  pcOrientation,
  pcCollation
};
```

File

Printers

Description

TPrinterCapabilities (see page 18418) is a set of TPrinterCapability values. The possible values of TPrinterCapability are

Value	Meaning
pcCopies	The printer driver allows the user to specify the number of copies.
pcOrientation	The printer driver allows the user to specify portrait or landscape orientation.
pcCollation	The printer driver allows the user to specify whether copies should be collated.

123.3.2 Printers.TPrinterOrientation Enumeration

TPrinterOrientation indicates the orientation of pages when printing.

Pascal

```
TPrinterOrientation = (
```

```
    poPortrait,
    poLandscape
  );
```

C++

```
  enum TPrinterOrientation {
    poPortrait,
    poLandscape
  };
```

File

Printers

Description

These are the possible values for TPrinterOrientation:

Value	Meaning
poPortrait	The job prints vertically on the page.
poLandscape	The job prints horizontally on the page.

123.3.3 Printers.TPrinterState Enumeration

Pascal

```
  TPrinterState = (
    psNoHandle,
    psHandleIC,
    psHandleDC
  );
```

C++

```
  enum TPrinterState {
    psNoHandle,
    psHandleIC,
    psHandleDC
  };
```

File

Printers

Description

This is record Printers.TPrinterState.

123.4 Types

The following table lists types in this documentation.

Types

Name	Description
TPrinterCapabilities (see page 18418)	This is type Printers.TPrinterCapabilities.

123.4.1 Printers.TPrinterCapabilities Type

Pascal

```
TPrinterCapabilities = set of TPrinterCapability;
```

C++

```
TPrinterCapability TPrinterCapabilities;
```

File

Printers

Description

This is type Printers.TPrinterCapabilities.

124 Provider Namespace

This is namespace Provider.

Topics

Name	Description
Classes (see page 18421)	The following table lists classes in this documentation.
Interfaces (see page 18613)	The following table lists interfaces in this documentation.
Functions (see page 18615)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 18617)	The following table lists structs, records, enums in this documentation.
Types (see page 18622)	The following table lists types in this documentation.
Variables (see page 18628)	The following table lists variables in this documentation.
Constants (see page 18629)	The following table lists constants in this documentation.

Classes

	Name	Description
	EDSWriter (see page 18421)	EDSWriter is the exception class for errors that occur when creating data packets to represent the data or metadata in a dataset.
	TBaseProvider (see page 18423)	TBaseProvider is a base class for all providers that represent the data in a dataset.
	TCustomPacketWriter (see page 18445)	This is class Provider.TCustomPacketWriter.
	TCustomProvider (see page 18449)	TCustomProvider is the base class for data providers.
	TCustomResolver (see page 18483)	TCustomResolver is the base class for components that apply updates on behalf of a provider.
	TDataPacketWriter (see page 18497)	This is class Provider.TDataPacketWriter.
	TDataSetProvider (see page 18508)	TDataSetProvider provides data from a dataset and resolves updates to that dataset or its database server.
	TDataSetResolver (see page 18544)	TDataSetResolver applies updates to a dataset on behalf of a provider.
	TLocalAppServer (see page 18553)	This is class Provider.TLocalAppServer.
	TPacketDataSet (see page 18564)	TPacketDataSet represents a data packet or delta packet that is used by a provider.
	TProvider (see page 18589)	TProvider provides data to and applies updates from a client dataset.
	TSQLResolver (see page 18589)	TSQLResolver applies updates to a database server on behalf of a provider.
	TUpdateTree (see page 18600)	TUpdateTree stores information about a delta packet on behalf of a resolver.

Constants

Name	Description
MetaDataOption (see page 18629)	Specifies the options available when retrieving metadata from a target database.

ResetOption (see page 18630)	This is constant Provider.ResetOption.
XMLOption (see page 18630)	This is constant Provider.XMLOption.
XMLUTF8Option (see page 18631)	This is constant Provider.XMLUTF8Option.

Functions

	Name	Description
	GetObjectProperty (see page 18615)	This is function Provider.GetObjectProperty.
	GetStringProperty (see page 18615)	This is function Provider.GetStringProperty.
	VarArrayFromStrings (see page 18615)	Creates a Variant array that contains the strings in a TStrings object.
	VarArrayFromWideStrings (see page 18616)	This is function Provider.VarArrayFromWideStrings.

Interfaces

	Name	Description
	IProviderContainer (see page 18613)	This is class Provider.IProviderContainer.

Structs, Records, Enums

	Name	Description
	TGetRecordOption (see page 18617)	TGetRecordOption and TGetRecordOptions (see page 18624) influence what type of information is added to data packets.
	TProviderOption (see page 18618)	TProviderOption and TProviderOptions (see page 18626) influence what type of information is communicated between client datasets and provider components.
	TPutFieldInfo (see page 18620)	This is record Provider.TPutFieldInfo.
	TResolverResponse (see page 18620)	TResolverResponse indicates the action a resolver component should take after an OnUpdateError event handler handles an update error.

Types

Name	Description
PPutFieldInfo (see page 18622)	This is type Provider.PPutFieldInfo.
TAfterUpdateRecordEvent (see page 18622)	This is type Provider.TAfterUpdateRecordEvent.
TBeforeCommitEvent (see page 18623)	This is type Provider.TBeforeCommitEvent.
TBeforeUpdateRecordEvent (see page 18623)	This is type Provider.TBeforeUpdateRecordEvent.
TDataRequestEvent (see page 18623)	This is type Provider.TDataRequestEvent.
TGetDSProps (see page 18624)	This is type Provider.TGetDSProps.
TGetParamsEvent (see page 18624)	This is type Provider.TGetParamsEvent.
TGetRecordOptions (see page 18624)	This is type Provider.TGetRecordOptions.
TGetTableNameEvent (see page 18625)	This is type Provider.TGetTableNameEvent.
TInfoArray (see page 18625)	This is type Provider.TInfoArray.
TOnValidate (see page 18625)	This is type Provider.TOnValidate.
TProviderDataEvent (see page 18626)	This is type Provider.TProviderDataEvent.
TProviderOptions (see page 18626)	This is type Provider.TProviderOptions.
TPutFieldProc (see page 18626)	This is type Provider.TPutFieldProc.
TResolverErrorEvent (see page 18627)	This is type Provider.TResolverErrorEvent.

Variables

Name	Description
InformixLob (see page 18628)	This is variable Provider.InformixLob.

124.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EDSWriter (see page 18421)	EDSWriter is the exception class for errors that occur when creating data packets to represent the data or metadata in a dataset.
	TBaseProvider (see page 18423)	TBaseProvider is a base class for all providers that represent the data in a dataset.
	TCustomPacketWriter (see page 18445)	This is class Provider.TCustomPacketWriter.
	TCustomProvider (see page 18449)	TCustomProvider is the base class for data providers.
	TCustomResolver (see page 18483)	TCustomResolver is the base class for components that apply updates on behalf of a provider.
	TDataPacketWriter (see page 18497)	This is class Provider.TDataPacketWriter.
	TDataSetProvider (see page 18508)	TDataSetProvider provides data from a dataset and resolves updates to that dataset or its database server.
	TDataSetResolver (see page 18544)	TDataSetResolver applies updates to a dataset on behalf of a provider.
	TLocalAppServer (see page 18553)	This is class Provider.TLocalAppServer.
	TPacketDataSet (see page 18564)	TPacketDataSet represents a data packet or delta packet that is used by a provider.
	TProvider (see page 18589)	TProvider provides data to and applies updates from a client dataset.
	TSQLResolver (see page 18589)	TSQLResolver applies updates to a database server on behalf of a provider.
	TUpdateTree (see page 18600)	TUpdateTree stores information about a delta packet on behalf of a resolver.

124.1.1 EDSWriter Class

EDSWriter is the exception class for errors that occur when creating data packets to represent the data or metadata in a dataset.

Class Hierarchy

Pascal

```
EDSWriter = class(Exception);
```

C++

```
class EDSWriter : public Exception;
```

File

Provider

Description

EDSWriter is raised whenever a provider component encounters an error while trying to create a data packet from a dataset.

See Also

TDataSetProvider (see page 18508)

TCustomProvider (see page 18449)

124.1.1.1 EDSWriter Members

The following tables list the members exposed by EDSWriter.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18423)	Creates an instance of EDSWriter (see page 18421) using a specified error code and message string.
	CreateFmt (see page 22754)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 22755)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 22755)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateRes (see page 22756)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 22756)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 22757)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 22759)	This is the overview for the CreateResHelp constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ErrorCode (see page 18423)	Indicates the error code that this exception represents.
	HelpContext (see page 22760)	Indicates the context ID number for context-sensitive online help associated with the exception.
	Message (see page 22760)	Message contains the text string to display in the exception dialog box when the exception is raised.

124.1.1.2 EDSWriter.Create Constructor

Creates an instance of EDSWriter (see page 18421) using a specified error code and message string.

Pascal

```
constructor Create(ErrMsg: string; Status: Integer);
```

C++

```
__fastcall EDSWriter(AnsiString ErrMsg, int Status);
```

Description

Create instantiates EDSWriter (see page 18421), setting the Message property to ErrMsg and the ErrorCode (see page 18423) property to Status.

See Also

Create (see page 22752)

ErrorCode (see page 18423)

124.1.1.3 EDSWriter Properties

The properties of the EDSWriter class are listed here.

Public Properties

	Name	Description
R	ErrorCode (see page 18423)	Indicates the error code that this exception represents.

124.1.1.3.1 EDSWriter.ErrorCode Property

Indicates the error code that this exception represents.

Pascal

```
property ErrorCode: Integer;
```

C++

```
__property int ErrorCode;
```

Description

Use ErrorCode to determine what error gave rise to this exception. ErrorCode is the value passed to the canonical EDSWriter (see page 18421) constructor (C++) or Create (see page 18423) method (Delphi).

See Also

Create (see page 18423)

124.1.2 TBaseProvider Class

TBaseProvider is a base class for all providers that represent the data in a dataset.

Class Hierarchy

Pascal

```
TBaseProvider = class(TCustomProvider);
```

C++

```
class TBaseProvider : public TCustomProvider;
```

File

Provider

Description

TBaseProvider is the immediate ancestor of TDataSetProvider (see page 18508), which provides data from any dataset and applies updates back to that dataset or directly to an SQL server. Use TBaseProvider to derive other customized data provider objects, such as providers that apply updates directly to a database without using SQL.

Unlike its immediate ancestor (TCustomProvider (see page 18449)) TBaseProvider includes no abstract (Delphi) or pure virtual (C++) methods. However, applications should not create instances of TBaseProvider, as many of the methods are merely stubs that provide a backstop for specialized descendants that do not implement all the provider methods. To add a provider component to a form or data module, use TDataSetProvider (see page 18508) (or TXMLTransformProvider).

A provider derived from TBaseProvider is an intermediate link between a TClientDataSet or TXMLBroker object and a source dataset. The source dataset can reside in the same application as the client dataset or XML broker, or it can be part of a separate application server. The provider packages data from the source dataset and passes it in one or more transportable data packets to the client dataset or XML broker. The client dataset reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the database or source dataset.

When the provider supplies data to a client dataset, the client dataset reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the database or source dataset.

When the provider supplies data to an XML broker, the XML broker adds the data packet, in XML format, to an HTML document that is downloaded by a Web client. When the XML broker receives updates from the Web client, it sends the updates to the provider, which applies them to the database or source dataset.

Client datasets and XML brokers communicate with a provider through the IAppServer interface. In multi-tiered applications, this is the interface of the remote data module that contains the provider. To enable the remote data module to pass calls to the provider, the provider's Exported (see page 18474) property must be true, and its Owner property must specify the remote data module.

See Also

TClientDataSet (see page 8289)

TDataSetProvider (see page 18508)

IAppServer (see page 16450)

TCustomProvider (see page 18449)

TXMLTransformProvider (see page 26492)

TSoapDataModule (see page 19884)

124.1.2.1 TBaseProvider Members

The following tables list the members exposed by TBaseProvider.

Protected Events

	Name	Description
	AfterApplyUpdates (see page 18475)	Occurs after the provider applies updates.
	AfterExecute (see page 18476)	Occurs after the provider passes an execute command to its dataset.
	AfterGetParams (see page 18477)	This is AfterGetParams, a member of class TCustomProvider.
	AfterGetRecords (see page 18477)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 18478)	Occurs after the provider fetches new information about the current record.
	BeforeApplyUpdates (see page 18479)	Occurs before the provider applies updates from a client dataset.
	BeforeExecute (see page 18479)	This is BeforeExecute, a member of class TCustomProvider.
	BeforeGetParams (see page 18480)	Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.
	BeforeGetRecords (see page 18480)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 18482)	Occurs before the provider creates a delta packet with information about the current record.
	OnValidate (see page 18483)	This is OnValidate, a member of class TCustomProvider.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckResolver (see page 18433)	Instantiates a resolver for the Resolver (see page 18441) property if it does not already exist.
V	CreateDataPacket (see page 18433)	Generates a data packet for the data associated with the provider.
V	CreateResolver (see page 18434)	Creates a resolver component for handling the application of updates.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterApplyUpdates (see page 18460)	Generates an AfterApplyUpdates (see page 18475) event.
V	DoAfterExecute (see page 18461)	Generates an AfterExecute (see page 18476) event.
V	DoAfterGetParams (see page 18461)	Generates an AfterGetParams (see page 18477) event.
V	DoAfterGetRecords (see page 18462)	Generates an AfterGetRecords (see page 18477) event.
V	DoAfterRowRequest (see page 18462)	Generates an AfterRowRequest (see page 18478) event.
V	DoAfterUpdateRecord (see page 18434)	Generates an AfterUpdateRecord (see page 18442) event.
V	DoApplyUpdates (see page 18463)	This is DoApplyUpdates, a member of class TCustomProvider.
V	DoBeforeApplyUpdates (see page 18463)	Generates a BeforeApplyUpdates (see page 18479) event.
V	DoBeforeCommit (see page 18435)	This is DoBeforeCommit, a member of class TBaseProvider.
V	DoBeforeExecute (see page 18464)	Generates a BeforeExecute (see page 18479) event.
V	DoBeforeGetParams (see page 18464)	Generates a BeforeGetParams (see page 18480) event.
V	DoBeforeGetRecords (see page 18465)	Generates a BeforeGetRecords (see page 18480) event.
V	DoBeforeRowRequest (see page 18465)	Generates a BeforeRowRequest (see page 18482) event.
V	DoBeforeUpdateRecord (see page 18435)	This is DoBeforeUpdateRecord, a member of class TBaseProvider.

	DoGetRecords (see page 18466)	This is DoGetRecords, a member of class TCustomProvider.
	DoOnGetData (see page 18435)	Generates an OnGetData (see page 18443) event.
	DoOnUpdateData (see page 18435)	Generates an OnUpdateData (see page 18443) event.
	FetchDetails (see page 18436)	Fills a delta dataset with all nested dataset field values.
	FreeResolver (see page 18436)	Frees the resolver specified by the Resolver (see page 18441) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InternalApplyUpdates (see page 18436)	Provides the underlying implementation of the ApplyUpdates (see page 18459) method.
	InternalExecute (see page 18470)	Provides the underlying implementation of the Execute (see page 18466) method.
	InternalGetParams (see page 18471)	Returns the requested parameter values as a Variant array.
	InternalGetRecords (see page 18437)	Provides the underlying implementation of the GetRecords (see page 18468) method.
	InternalRowRequest (see page 18438)	Provides the underlying implementation of the RowRequest (see page 18472) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 18439)	Positions a data set on the record that corresponds to the current update in a specified delta packet.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActiveUpdateException (see page 18473)	This is SetActiveUpdateException, a member of class TCustomProvider.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRecord (see page 18439)	Retrieves specified data from a source dataset into a delta packet.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveUpdateException (see page 18474)	This is ActiveUpdateException, a member of class TCustomProvider.
	OwnerData (see page 18475)	This is OwnerData, a member of class TCustomProvider.
	PacketDataSet (see page 18440)	This is PacketDataSet, a member of class TBaseProvider.

Public Events

	Name	Description
	AfterUpdateRecord (see page 18442)	Occurs when the associated resolver has just updated a record.
	BeforeUpdateRecord (see page 18442)	This is BeforeUpdateRecord, a member of class TBaseProvider.
	OnDataRequest (see page 18442)	Occurs when a provider calls its DataRequest method.
	OnGetData (see page 18443)	Occurs after a provider retrieves data but before it is sent to the client.
	OnUpdateData (see page 18443)	Occurs when a provider begins to apply updates.
	OnUpdateError (see page 18444)	Occurs when a provider can't update a record because of an error condition.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	ApplyUpdates (see page 18459)	This is the overview for the ApplyUpdates method overload.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 18429)	Creates and initializes a TBaseProvider (see page 18423) object.
V	DataRequest (see page 18460)	Generates an OnDataRequest (see page 18482) event.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18430)	Frees an instance of a provider object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Execute (see page 18466)	Executes a query, stored procedure, or custom SQL statement.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParams (see page 18467)	Returns the current parameter values.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetRecords (see page 18468)	This is the overview for the GetRecords method overload.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	RowRequest (see page 18472)	Returns information from a specified record.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 18474)	Denotes a data packet created by the provider.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Exported (see page 18474)	Allows client applications to pass calls to the provider when it resides on an application server.
	Options (see page 18440)	Influences what is included in data packets and how the information in data packets is used.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Resolver (see page 18441)	Provides access to the resolver component that applies updates and resolves update errors.
	UpdateMode (see page 18441)	Controls (see page 5711) how the provider locates records when applying updates.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	Tag (see page 2808)	Stores an integer value as part of a component.

Strict private Fields

	Name	Description
	FActiveUpdateAbortException (see page 18455)	This is FActiveUpdateAbortException, a member of class TCustomProvider.
	FAfterApplyUpdates (see page 18455)	This is FAfterApplyUpdates, a member of class TCustomProvider.
	FAfterExecute (see page 18456)	This is FAfterExecute, a member of class TCustomProvider.
	FAfterGetParams (see page 18456)	This is FAfterGetParams, a member of class TCustomProvider.
	FAfterGetRecords (see page 18456)	This is FAfterGetRecords, a member of class TCustomProvider.
	FAfterRowRequest (see page 18456)	This is FAfterRowRequest, a member of class TCustomProvider.
	FAfterUpdateRecord (see page 18430)	This is FAfterUpdateRecord, a member of class TBaseProvider.
	FBeforeApplyUpdates (see page 18456)	This is FBeforeApplyUpdates, a member of class TCustomProvider.
	FBeforeCommit (see page 18430)	This is FBeforeCommit, a member of class TBaseProvider.
	FBeforeExecute (see page 18457)	This is FBeforeExecute, a member of class TCustomProvider.
	FBeforeGetParams (see page 18457)	This is FBeforeGetParams, a member of class TCustomProvider.
	FBeforeGetRecords (see page 18457)	This is FBeforeGetRecords, a member of class TCustomProvider.
	FBeforeRowRequest (see page 18457)	This is FBeforeRowRequest, a member of class TCustomProvider.
	FBeforeUpdateRecord (see page 18431)	This is FBeforeUpdateRecord, a member of class TBaseProvider.
	FDataDS (see page 18431)	This is FDataDS, a member of class TBaseProvider.
	FExported (see page 18458)	This is FExported, a member of class TCustomProvider.
	FOnDataRequest (see page 18458)	This is FOnDataRequest, a member of class TCustomProvider.
	FOnGetData (see page 18431)	This is FOnGetData, a member of class TBaseProvider.
	FOnUpdateData (see page 18431)	This is FOnUpdateData, a member of class TBaseProvider.
	FOnUpdateError (see page 18432)	This is FOnUpdateError, a member of class TBaseProvider.
	FOnValidate (see page 18458)	This is FOnValidate, a member of class TCustomProvider.
	FOwnerData (see page 18458)	This is FOwnerData, a member of class TCustomProvider.
	FProviderOptions (see page 18432)	This is FProviderOptions, a member of class TBaseProvider.
	FResolver (see page 18432)	This is FResolver, a member of class TBaseProvider.
	FUpdateMode (see page 18432)	This is FUpdateMode, a member of class TBaseProvider.

Strict private Methods

	Name	Description
	GetData (see page 18467)	This is GetData, a member of class TCustomProvider.

124.1.2.2 TBaseProvider.Create Constructor

Creates and initializes a TBaseProvider (see page 18423) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBaseProvider(TComponent * AOwner);
```

Description

Call Create to instantiate a provider at runtime. Providers placed in forms or data modules at design time are created automatically.

AOwner specifies the component, typically a form or data module, that is responsible for freeing the provider.

See Also

Owner (see page 2807)

124.1.2.3 TBaseProvider.Destroy Destructor

Frees an instance of a provider object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBaseProvider();
```

Description

Do not call Destroy directly. Instead, call Free, which checks that the provider is not nil before calling the Destroy method.

See Also

Free (see page 22300)

Resolver (see page 18441)

124.1.2.4 TBaseProvider Fields

The fields of the TBaseProvider class are listed here.

Strict private Fields

	Name	Description
	FAfterUpdateRecord (see page 18430)	This is FAfterUpdateRecord, a member of class TBaseProvider.
	FBeforeCommit (see page 18430)	This is FBeforeCommit, a member of class TBaseProvider.
	FBeforeUpdateRecord (see page 18431)	This is FBeforeUpdateRecord, a member of class TBaseProvider.
	FDataDS (see page 18431)	This is FDataDS, a member of class TBaseProvider.
	FOnGetData (see page 18431)	This is FOnGetData, a member of class TBaseProvider.
	FOnUpdateData (see page 18431)	This is FOnUpdateData, a member of class TBaseProvider.
	FOnUpdateError (see page 18432)	This is FOnUpdateError, a member of class TBaseProvider.
	FProviderOptions (see page 18432)	This is FProviderOptions, a member of class TBaseProvider.
	FResolver (see page 18432)	This is FResolver, a member of class TBaseProvider.
	FUpdateMode (see page 18432)	This is FUpdateMode, a member of class TBaseProvider.

124.1.2.4.1 TBaseProvider.FAfterUpdateRecord Field

Pascal

```
FAfterUpdateRecord: TAfterUpdateRecordEvent;
```

C++

```
TAfterUpdateRecordEvent FAfterUpdateRecord;
```

Description

This is FAfterUpdateRecord, a member of class TBaseProvider.

124.1.2.4.2 TBaseProvider.FBeforeCommit Field

Pascal

```
FBeforeCommit: TBeforeCommitEvent;
```

C++

```
TBeforeCommitEvent FBeforeCommit;
```

Description

This is FBeforeCommit, a member of class TBaseProvider.

124.1.2.4.3 TBaseProvider.FBeforeUpdateRecord Field

Pascal

```
FBeforeUpdateRecord: TBeforeUpdateRecordEvent;
```

C++

```
TBeforeUpdateRecordEvent FBeforeUpdateRecord;
```

Description

This is FBeforeUpdateRecord, a member of class TBaseProvider.

124.1.2.4.4 TBaseProvider.FDataDS Field

Pascal

```
FDataDS: TPacketDataSet;
```

C++

```
TPacketDataSet FDataDS;
```

Description

This is FDataDS, a member of class TBaseProvider.

124.1.2.4.5 TBaseProvider.FOnGetData Field

Pascal

```
FOnGetData: TProviderDataEvent;
```

C++

```
TProviderDataEvent FOnGetData;
```

Description

This is FOnGetData, a member of class TBaseProvider.

124.1.2.4.6 TBaseProvider.FOnUpdateData Field

Pascal

```
FOnUpdateData: TProviderDataEvent;
```

C++

```
TProviderDataEvent FOnUpdateData;
```

Description

This is FOnUpdateData, a member of class TBaseProvider.

124.1.2.4.7 TBaseProvider.FOnUpdateError Field

Pascal

```
FOnUpdateError: TResolverErrorEvent;
```

C++

```
TResolverErrorEvent FOnUpdateError;
```

Description

This is FOnUpdateError, a member of class TBaseProvider.

124.1.2.4.8 TBaseProvider.FProviderOptions Field

Pascal

```
FProviderOptions: TProviderOptions;
```

C++

```
TProviderOptions FProviderOptions;
```

Description

This is FProviderOptions, a member of class TBaseProvider.

124.1.2.4.9 TBaseProvider.FResolver Field

Pascal

```
FResolver: TCustomResolver;
```

C++

```
TCustomResolver FResolver;
```

Description

This is FResolver, a member of class TBaseProvider.

124.1.2.4.10 TBaseProvider.FUpdateMode Field

Pascal

```
FUpdateMode: TUpdateMode;
```

C++

```
TUpdateMode FUpdateMode;
```

Description

This is FUpdateMode, a member of class TBaseProvider.

124.1.2.5 TBaseProvider Methods

The methods of the TBaseProvider class are listed here.

Protected Methods

	Name	Description
	CheckResolver (see page 18433)	Instantiates a resolver for the Resolver (see page 18441) property if it does not already exist.
V	CreateDataPacket (see page 18433)	Generates a data packet for the data associated with the provider.
V	CreateResolver (see page 18434)	Creates a resolver component for handling the application of updates.
V	DoAfterUpdateRecord (see page 18434)	Generates an AfterUpdateRecord (see page 18442) event.
V	DoBeforeCommit (see page 18435)	This is DoBeforeCommit, a member of class TBaseProvider.
V	DoBeforeUpdateRecord (see page 18435)	This is DoBeforeUpdateRecord, a member of class TBaseProvider.
V	DoOnGetData (see page 18435)	Generates an OnGetData (see page 18443) event.
	DoOnUpdateData (see page 18435)	Generates an OnUpdateData (see page 18443) event.
V	FetchDetails (see page 18436)	Fills a delta dataset with all nested dataset field values.
	FreeResolver (see page 18436)	Frees the resolver specified by the Resolver (see page 18441) property.
V	InternalApplyUpdates (see page 18436)	Provides the underlying implementation of the ApplyUpdates (see page 18459) method.
V	InternalGetRecords (see page 18437)	Provides the underlying implementation of the GetRecords (see page 18468) method.
V	InternalRowRequest (see page 18438)	Provides the underlying implementation of the RowRequest (see page 18472) method.
V	LocateRecord (see page 18439)	Positions a data set on the record that corresponds to the current update in a specified delta packet.
V	UpdateRecord (see page 18439)	Retrieves specified data from a source dataset into a delta packet.

124.1.2.5.1 TBaseProvider.CheckResolver Method

Instantiates a resolver for the Resolver (see page 18441) property if it does not already exist.

Pascal

```
procedure CheckResolver;
```

C++

```
__fastcall CheckResolver();
```

Description

CheckResolver is called internally when the provider needs to use its resolver component. It checks whether Resolver (see page 18441) is nil (Delphi) or NULL (C++), and if so, calls CreateResolver (see page 18434) to assign a value.

See Also

Resolver (see page 18441)

CreateResolver (see page 18434)

124.1.2.5.2 TBaseProvider.CreateDataPacket Method

Generates a data packet for the data associated with the provider.

Pascal

```
procedure CreateDataPacket(PacketOpts: TGetRecordOptions; ProvOpts: TProviderOptions; var
RecsOut: Integer; var Data: OleVariant); virtual;
```

C++

```
virtual __fastcall CreateDataPacket(TGetRecordOptions PacketOpts, TProviderOptions ProvOpts,
int RecsOut, OleVariant Data);
```

Description

CreateDataPacket is used internally to generate data packets. As implemented in TBaseProvider (see page 18423),

CreateDataPacket sets RecsOut to 0 and Data (see page 18474) to NULL. Descendants override this method to create the data packets that are returned by GetRecords (see page 18468).

The PacketOpts parameter indicates what information (other than record values) is included in the data packet. It reflects the Options (see page 18440) passed to the GetRecords (see page 18468) method.

The ProvOpts parameter reflects the current value of the Options (see page 18440) property.

The RecsOut parameter specifies the number of records desired in the packet and returns the actual number of records in the generated data packet.

The Data (see page 18474) parameter returns the generated data packet.

See Also

GetRecords (see page 18468)

Options (see page 18440)

124.1.2.5.3 TBaseProvider.CreateResolver Method

Creates a resolver component for handling the application of updates.

Pascal

```
function CreateResolver: TCustomResolver; virtual;
```

C++

```
virtual __fastcall TCustomResolver CreateResolver();
```

Description

CreateResolver is called automatically when a resolver is needed to implement one of TBaseProvider (see page 18423)'s methods. As implemented in TBaseProvider (see page 18423), CreateResolver always returns nil (Delphi) or NULL (C++). Descendants of TBaseProvider (see page 18423) override this method to create a TCustomResolver (see page 18483) descendant that applies updates in the desired manner.

See Also

Resolver (see page 18441)

FreeResolver (see page 18436)

124.1.2.5.4 TBaseProvider.DoAfterUpdateRecord Method

Generates an AfterUpdateRecord (see page 18442) event.

Pascal

```
procedure DoAfterUpdateRecord(SourceDS: TDataSet; DeltaDS: TCustomClientDataSet; UpdateKind:
TUpdateKind); virtual;
```

C++

```
virtual __fastcall DoAfterUpdateRecord(TDataSet SourceDS, TCustomClientDataSet DeltaDS,
TUpdateKind UpdateKind);
```

Description

DoAfterUpdateRecord is the protected implementation of the AfterUpdateRecord (see page 18442) event. Override this method to perform class-specific actions in response to data requests.

See Also

AfterUpdateRecord (see page 18442)

124.1.2.5.5 TBaseProvider.DoBeforeCommit Method

Pascal

```
procedure DoBeforeCommit(Delta: TPacketDataSet; ErrorCount: Integer; MaxErrors: Integer; const
ReturnVar: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeCommit(TPacketDataSet Delta, int ErrorCount, int MaxErrors, const
OleVariant ReturnVar);
```

Description

This is DoBeforeCommit, a member of class TBaseProvider.

124.1.2.5.6 TBaseProvider.DoBeforeUpdateRecord Method

Pascal

```
procedure DoBeforeUpdateRecord(SourceDS: TDataSet; DeltaDS: TCustomClientDataSet; UpdateKind:
TUpdateKind; var Applied: Boolean); virtual;
```

C++

```
virtual __fastcall DoBeforeUpdateRecord(TDataSet SourceDS, TCustomClientDataSet DeltaDS,
TUpdateKind UpdateKind, Boolean Applied);
```

Description

This is DoBeforeUpdateRecord, a member of class TBaseProvider.

124.1.2.5.7 TBaseProvider.DoOnGetData Method

Generates an OnGetData (see page 18443) event.

Pascal

```
procedure DoOnGetData(var Data: OleVariant); virtual;
```

C++

```
virtual __fastcall DoOnGetData(OleVariant Data);
```

Description

DoOnGetData is the protected implementation of the OnGetData (see page 18443) event. Override this method to perform class-specific actions in response to data requests.

See Also

OnGetData (see page 18443)

124.1.2.5.8 TBaseProvider.DoOnUpdateData Method

Generates an OnUpdateData (see page 18443) event.

Pascal

```
procedure DoOnUpdateData(Delta: TPacketDataSet);
```

C++

```
__fastcall DoOnUpdateData(TPacketDataSet Delta);
```

Description

DoOnUpdateData is the protected implementation of the OnUpdateData (see page 18443) event. The Delta property contains the delta packet of records to update. It is passed to the OnUpdateData (see page 18443) event handler as a client dataset.

Override this method to perform class-specific actions in response to update requests.

See Also

OnUpdateData (see page 18443)

124.1.2.5.9 TBaseProvider.FetchDetails Method

Fills a delta dataset with all nested dataset field values.

Pascal

```
procedure FetchDetails(Source: TDataSet; Delta: TDataSet); virtual;
```

C++

```
virtual __fastcall FetchDetails(TDataSet Source, TDataSet Delta);
```

Description

FetchDetails is used internally to fetch the current values of any nested datasets when the provider is executing its RowRequest (see page 18472) method. As implemented in TBaseProvider (see page 18423), FetchDetails does nothing. Descendants override this method to add nested detail datasets to the delta packet specified by Delta.

Source is a source dataset that has the current values for all fields. Delta is a delta dataset that must be updated so that its nested detail fields match the values in Source.

See Also

RowRequest (see page 18472)

124.1.2.5.10 TBaseProvider.FreeResolver Method

Frees the resolver specified by the Resolver (see page 18441) property.

Pascal

```
procedure FreeResolver;
```

C++

```
__fastcall FreeResolver();
```

Description

Call FreeResolver to safely dispose of the component specified by the Resolver (see page 18441) property. FreeResolver sets the Resolver (see page 18441) property to nil (Delphi) or NULL (C++) after calling the resolver's Free method.

See Also

Resolver (see page 18441)

CreateResolver (see page 18434)

Free (see page 22300)

124.1.2.5.11 TBaseProvider.InternalApplyUpdates Method

Provides the underlying implementation of the ApplyUpdates (see page 18459) method.

Pascal

```
function InternalApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount:
Integer): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalApplyUpdates(const OleVariant Delta, int MaxErrors, int
ErrorCount);
```

Description

The ApplyUpdates (see page 18459) method calls InternalApplyUpdates to apply the updates contained in a delta packet after generating the BeforeApplyUpdates (see page 18479) event and before generating the AfterApplyUpdates (see page 18475) event.

If the Options (see page 18440) property includes poReadOnly, InternalApplyUpdates raises an exception. Otherwise, it calls the ApplyUpdates (see page 18459) method of its Resolver (see page 18441) component to handle the actual update and resolving process. If the Resolver (see page 18441) property is nil (Delphi) or NULL (C++), ApplyUpdates (see page 18459) calls the CreateResolver (see page 18434) method and assigns the resulting resolver to the Resolver (see page 18441) property.

Delta is the delta packet containing insertions, deletions, and modifications to be applied.

MaxErrors indicates the maximum number of errors that can be applied before stopping the update operation. If MaxErrors is –1, the provider tries to apply all updates.

ErrorCount returns the number of errors encountered during the update operation.

InternalApplyUpdates returns a data packet of updates that could not be applied to the database as an OleVariant.

See Also

Resolver (see page 18441)

ApplyUpdates (see page 18490)

CreateResolver (see page 18434)

Options (see page 18440)

applyupdates (see page 18459)

124.1.2.5.12 TBaseProvider.InternalGetRecords Method

Provides the underlying implementation of the GetRecords (see page 18468) method.

Pascal

```
function InternalGetRecords(Count: Integer; out RecsOut: Integer; Options: TGetRecordOptions;
const CommandText: WideString; var Params: OleVariant): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalGetRecords(int Count, int RecsOut, TGetRecordOptions
Options, const BSTR CommandText, OleVariant Params);
```

Description

The GetRecords (see page 18468) method calls InternalGetRecords to assemble a data packet after calling DoBeforeGetRecords (see page 18465) to apply the CommandText and Params and generate a BeforeGetRecords (see page 18480) event. InternalGetRecords calls CreateDataPacket (see page 18433) to create a data packet that reflects the current property settings of the provider. It then generates an OnGetData (see page 18443) event.

Count indicates the number of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is

retrieved. If Count is greater than 0, only the specified number of records are retrieved.

RecsOut returns the actual number of records retrieved.

Options (see page 18440) indicates what information should be added to the data packet in addition to data. It can include grMetaData (include metadata), grReset (start providing records with the first one in the dataset), and grXML (encode the datapacket in XML rather than as an OleVariant) or grXMLUTF8 (same as grXML except extended characters are encoded using UTF8).

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a table or stored procedure that replaces the associated table or stored procedure. This parameter is ignored if the Options (see page 18440) property does not include poAllowCommandText.

Params specifies any parameter values that should be applied to CommandText or to an associated query or stored procedure. If the provider is associated with a table, Params specifies field values that filter the result set. On exit from GetRecords (see page 18468), Params returns any output parameters.

Records are returned as a data packet in a Variant.

See Also

Data (see page 18474)

CreateDataPacket (see page 18433)

GetRecords (see page 18468)

OnGetData (see page 18443)

124.1.2.5.13 TBaseProvider.InternalRowRequest Method

Provides the underlying implementation of the RowRequest (see page 18472) method.

Pascal

```
function InternalRowRequest(const Row: OleVariant; RequestType: TFetchOptions): OleVariant;
override;
```

C++

```
virtual __fastcall OleVariant InternalRowRequest(const OleVariant Row, TFetchOptions
RequestType);
```

Description

The RowRequest (see page 18472) method calls InternalRowRequest to assemble the specified information after generating a BeforeRowRequest (see page 18482) event and before generating an AfterRowRequest (see page 18478) event. InternalRowRequest passes this request on to its associated Resolver (see page 18441).

The Row parameter is an OleVariant that describes the record for which information is requested. The provider uses Row to locate the record before assembling the requested information.

InternalRowRequest returns the requested information in a delta packet.

See Also

RowRequest (see page 18472)

Resolver (see page 18441)

RowRequest (see page 18496)

124.1.2.5.14 TBaseProvider.LocateRecord Method

Positions a data set on the record that corresponds to the current update in a specified delta packet.

Pascal

```
procedure LocateRecord(Source: TDataSet; Delta: TDataSet); virtual;
```

C++

```
virtual __fastcall LocateRecord(TDataSet Source, TDataSet Delta);
```

Description

LocateRecord is called indirectly by the RowRequest (see page 18472) method to locate a record before fetching information about a specified record. The Source parameter is the dataset containing current record values. The Delta parameter is a delta packet that identifies the desired type of information and information identifying the desired record.

As implemented in TBaseProvider (see page 18423), LocateRecord does nothing. Descendants override this method to locate the specified record in Source and navigate to it.

See Also

RowRequest (see page 18472)

124.1.2.5.15 TBaseProvider.UpdateRecord Method

Retrieves specified data from a source dataset into a delta packet.

Pascal

```
procedure UpdateRecord(Source: TDataSet; Delta: TDataSet; BlobsOnly: Boolean; KeyOnly:
Boolean); virtual;
```

C++

```
virtual __fastcall UpdateRecord(TDataSet Source, TDataSet Delta, Boolean BlobsOnly, Boolean
KeyOnly);
```

Description

UpdateRecord is called indirectly by the RowRequest (see page 18472) method to fetch BLOB fields or nested detail sets. The Source parameter is the dataset containing the BLOB fields or the detail dataset. The Delta parameter is a delta packet that returns the requested data. BlobsOnly indicates whether all field values should be provided (BlobsOnly == false) or only Blob field values (BlobsOnly == true).

As implemented in TBaseProvider (see page 18423), UpdateRecord does nothing. Descendants override this method to fill the Delta parameter with the requested information.

See Also

RowRequest (see page 18472)

124.1.2.6 TBaseProvider Properties

The properties of the TBaseProvider class are listed here.

Protected Properties

	Name	Description
	PacketDataSet (see page 18440)	This is PacketDataSet, a member of class TBaseProvider.

Public Properties

	Name	Description
	Options (see page 18440)	Influences what is included in data packets and how the information in data packets is used.
R	Resolver (see page 18441)	Provides access to the resolver component that applies updates and resolves update errors.
	UpdateMode (see page 18441)	Controls (see page 5711) how the provider locates records when applying updates.

124.1.2.6.1 TBaseProvider.Options Property

Influences what is included in data packets and how the information in data packets is used.

Pascal

```
property Options: TProviderOptions;
```

C++

```
__property TProviderOptions Options;
```

Description

Set Options to customize how the provider communicates with client datasets. Options is a set that specifies

Whether nested detail sets and BLOB data are included in data packets or fetched separately.

Whether data packets include field component properties such as formats, display names, and maximum & minimum values.

Whether data packets are provided on a read-only basis, and whether specific types of changes (insertions, edits, or deletions) are disabled.

Whether changes to master table fields should cause corresponding updates to detail tables.

Whether a single update can affect multiple server records.

Whether the client's records are refreshed when it applies updates.

Whether the client can send SQL statements that override the provider's dataset.

Note: Not all options are supported by an InternetExpress client. Specifically, InternetExpress clients don't support poFetchBlobsOnDemand, poFetchDetailsOnDemand, poDisableInserts, poDisableEdits, psDisableDeletes, poPropogateChanges, and poAllowCommandText.

Data (see page 18474)

applyupdates (see page 18459)

Overriding the Dataset On the Application Server

Setting Options That Influence the Data Packets

124.1.2.6.2 TBaseProvider.PacketDataSet Property

Pascal

```
property PacketDataSet: TPacketDataSet;
```

C++

```
__property TPacketDataSet PacketDataSet;
```

Description

This is PacketDataSet, a member of class TBaseProvider.

124.1.2.6.3 TBaseProvider.Resolver Property

Provides access to the resolver component that applies updates and resolves update errors.

Pascal

```
property Resolver: TCustomResolver;
```

C++

```
__property TCustomResolver Resolver;
```

Description

Provider (see page 18419) components use a resolver to handle the details of applying updates and resolving update errors. Most applications do not need to use the resolver directly.

When any method that uses a resolver is called, the provider automatically creates a resolver component (using the CreateResolver (see page 18434) method) if the value of Resolver is nil (Delphi) or NULL (C++). Thus, this property is nil (Delphi) or NULL (C++) until the first method that requires a resolver is called.

See Also

applyupdates (see page 18459)

CreateResolver (see page 18434)

124.1.2.6.4 TBaseProvider.UpdateMode Property

Controls (see page 5711) how the provider locates records when applying updates.

Pascal

```
property UpdateMode: TUpdateMode;
```

C++

```
__property TUpdateMode UpdateMode;
```

Description

Use UpdateMode to specify the criteria for locating a record in the dataset when applying updates. UpdateMode specifies whether modified records are located based on all columns (fields), on only the key fields, or on the key fields plus the original values of fields that have been modified.

Note: To control how the provider locates records by specifying individual fields, use the field components' ProviderFlags property.

See Also

applyupdates (see page 18459)

ProviderFlags (see page 7176)

Influencing How Updates Are Applied

124.1.2.7 TBaseProvider Events

The events of the TBaseProvider class are listed here.

Public Events

	Name	Description
	AfterUpdateRecord (see page 18442)	Occurs when the associated resolver has just updated a record.
	BeforeUpdateRecord (see page 18442)	This is BeforeUpdateRecord, a member of class TBaseProvider.
	OnDataRequest (see page 18442)	Occurs when a provider calls its DataRequest method.
	OnGetData (see page 18443)	Occurs after a provider retrieves data but before it is sent to the client.
	OnUpdateData (see page 18443)	Occurs when a provider begins to apply updates.
	OnUpdateError (see page 18444)	Occurs when a provider can't update a record because of an error condition.

124.1.2.7.1 TBaseProvider.AfterUpdateRecord Event

Occurs when the associated resolver has just updated a record.

Pascal

```
property AfterUpdateRecord: TAfterUpdateRecordEvent;
```

C++

```
__property TAfterUpdateRecordEvent AfterUpdateRecord;
```

Description

Write an AfterUpdateRecord event handler to provide special processing immediately after a record has been successfully updated. For example, use AfterUpdateRecord to maintain a log of successful updates.

See Also

beforeupdaterecord (see page 18442)

AfterApplyUpdates (see page 18475)

124.1.2.7.2 TBaseProvider.BeforeUpdateRecord Event

Pascal

```
property BeforeUpdateRecord: TBeforeUpdateRecordEvent;
```

C++

```
__property TBeforeUpdateRecordEvent BeforeUpdateRecord;
```

Description

This is BeforeUpdateRecord, a member of class TBaseProvider.

124.1.2.7.3 TBaseProvider.OnDataRequest Event

Occurs when a provider calls its DataRequest method.

Pascal

```
property OnDataRequest: TDataRequestEvent;
```

C++

```
__property TDataRequestEvent OnDataRequest;
```

Description

Write an OnDataRequest event handler to do custom processing of data. OnDataRequest has no built-in use. Instead, it allows developers to augment the IAppServer interface so that clients in a multi-tiered application can communicate directly with an individual provider.

If an application does not provide an OnDataRequest event handler, calls to DataRequest return NULL.

Note: To provide the same sort of custom processing on the client side, use an automation method on the connection component.

See Also

DataRequest (see page 18460)

IAppServer (see page 16450)

Communicating with Providers Using Custom Events

Communicating with the Client Dataset

Responding to Client-generated Events

124.1.2.7.4 TBaseProvider.OnGetData Event

Occurs after a provider retrieves data but before it is sent to the client.

Pascal

```
property OnGetData: TProviderDataEvent;
```

C++

```
__property TProviderDataEvent OnGetData;
```

Description

Write an OnGetData event handler to perform any custom data processing the provider should handle before returning data to a client. The OnGetData event occurs after a provider fetches data from its dataset but before the data is sent on to the client. Using the methods of the DataSet parameter, data can be edited in the OnGetData event handler before sending it to the client dataset or XML broker.

Note: OnGetData occurs when the Data (see page 18474) property is read, as well as when the GetRecords (see page 18468) method is called.

See Also

GetRecords (see page 18468)

OnUpdateData (see page 18443)

BeforeGetRecords (see page 18480)

AfterGetRecords (see page 18477)

Responding to Client Data Requests

124.1.2.7.5 TBaseProvider.OnUpdateData Event

Occurs when a provider begins to apply updates.

Pascal

```
property OnUpdateData: TProviderDataEvent;
```

C++

```
__property TProviderDataEvent OnUpdateData;
```

Description

Write an OnUpdateData event to handle special processing before the provider begins applying updates received from the client dataset or XML broker. Using the methods belonging to the DataSet parameter, an application can

Examine data (for example, for values or data changes that should not permitted), and raise exceptions that cancel applying of updates before they occur.

Change data (for example encrypting or decrypting values) before it is sent on to the source dataset or database server.

See Also

applyupdates (see page 18459)

beforeupdaterecord (see page 18442)

Adding Custom Information to Data Packets

Editing Delta Packets Before Updating the Database

Influencing How Updates Are Applied

124.1.2.7.6 TBaseProvider.OnUpdateError Event

Occurs when a provider can't update a record because of an error condition.

Pascal

```
property OnUpdateError: TResolverErrorEvent;
```

C++

```
__property TResolverErrorEvent OnUpdateError;
```

Description

Write an OnUpdateError event handler to respond to error conditions that arise when the provider applies a client dataset's updates. The OnUpdateError event handler is called for each record that can't be updated.

Warning: The provider can't detect when an update conflicts with another user's changes to a memo field. This situation will not generate an OnUpdateError event.

Resolving Update Errors On the Provider

124.1.3 TCustomPacketWriter Class

Class Hierarchy

System::TObject → Provider.TCustomPacketWriter

Pascal

```
TCustomPacketWriter = class(TObject);
```

C++

```
class TCustomPacketWriter : public TObject;
```

File

Provider

Description

This is class Provider.TCustomPacketWriter.

124.1.3.1 TCustomPacketWriter Members

The following tables list the members exposed by TCustomPacketWriter.

Protected Fields

	Name	Description
	FBuffer (see page 18447)	This is FBuffer, a member of class TCustomPacketWriter.

Protected Methods

	Name	Description
V	AddAttribute (see page 18448)	This is AddAttribute, a member of class TCustomPacketWriter.
	Check (see page 18448)	This is Check, a member of class TCustomPacketWriter.
	SetDSWriter (see page 18448)	This is SetDSWriter, a member of class TCustomPacketWriter.

Protected Properties

	Name	Description
R	DSWriter (see page 18449)	This is DSWriter, a member of class TCustomPacketWriter.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 18446)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18446)	Disposes of an object instance.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Strict private Fields

	Name	Description
	FIDSWriter (see page 18447)	This is FIDSWriter, a member of class TCustomPacketWriter.

124.1.3.2 TCustomPacketWriter.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TCustomPacketWriter();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

124.1.3.3 TCustomPacketWriter.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomPacketWriter();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

124.1.3.4 TCustomPacketWriter Fields

The fields of the TCustomPacketWriter class are listed here.

Protected Fields

	Name	Description
	FBuffer (see page 18447)	This is FBuffer, a member of class TCustomPacketWriter.

Strict private Fields

	Name	Description
	FIDSWriter (see page 18447)	This is FIDSWriter, a member of class TCustomPacketWriter.

124.1.3.4.1 TCustomPacketWriter.FBuffer Field

Pascal

```
FBuffer: TBlobByteData;
```

C++

```
TBlobByteData FBuffer;
```

Description

This is FBuffer, a member of class TCustomPacketWriter.

124.1.3.4.2 TCustomPacketWriter.FIDSWriter Field

Pascal

```
FIDSWriter: IDSWriter;
```

C++

```
IDSWriter FIDSWriter;
```

Description

This is FIDSWriter, a member of class TCustomPacketWriter.

124.1.3.5 TCustomPacketWriter Methods

The methods of the TCustomPacketWriter class are listed here.

Protected Methods

	Name	Description
	AddAttribute (see page 18448)	This is AddAttribute, a member of class TCustomPacketWriter.
	Check (see page 18448)	This is Check, a member of class TCustomPacketWriter.
	SetDSWriter (see page 18448)	This is SetDSWriter, a member of class TCustomPacketWriter.

124.1.3.5.1 TCustomPacketWriter.AddAttribute Method

Pascal

```
procedure AddAttribute(Area: TPcktAttrArea; const ParamName: string; const Value: OleVariant;
IncludeInDelta: Boolean); virtual;
```

C++

```
virtual __fastcall AddAttribute(TPcktAttrArea Area, const AnsiString ParamName, const
OleVariant Value, Boolean IncludeInDelta);
```

Description

This is AddAttribute, a member of class TCustomPacketWriter.

124.1.3.5.2 TCustomPacketWriter.Check Method

Pascal

```
procedure Check(Status: Integer);
```

C++

```
__fastcall Check(int Status);
```

Description

This is Check, a member of class TCustomPacketWriter.

124.1.3.5.3 TCustomPacketWriter.SetDSWriter Method

Pascal

```
procedure SetDSWriter(const Value: IDSWriter);
```

C++

```
__fastcall SetDSWriter(const IDSWriter Value);
```

Description

This is SetDSWriter, a member of class TCustomPacketWriter.

124.1.3.6 TCustomPacketWriter Properties

The properties of the TCustomPacketWriter class are listed here.

Protected Properties

	Name	Description
	DSWriter (see page 18449)	This is DSWriter, a member of class TCustomPacketWriter.

124.1.3.6.1 TCustomPacketWriter.DSWriter Property

Pascal

```
property DSWriter: IDSWriter;
```

C++

```
__property IDSWriter DSWriter;
```

Description

This is DSWriter, a member of class TCustomPacketWriter.

124.1.4 TCustomProvider Class

TCustomProvider is the base class for data providers.

Class Hierarchy

Pascal

```
TCustomProvider = class(TComponent);
```

C++

```
class TCustomProvider : public TComponent;
```

File

Provider

Description

TCustomProvider defines the fundamental properties, methods, and events required of all provider objects, either through abstract (in C++ terminology, pure virutal) method declarations, or through virtual methods that do nothing but provide a backstop.

Do not create instances of TCustomProvider. To add a provider component to a form or data module, use a descendant of TCustomProvider such as TDataSetProvider (see page 18508) or TXMLTransformProvider.

A provider derived from TCustomProvider is an intermediate link between TClientDataSet or TXMLBroker object and a source dataset or source XML document. The source dataset or XML document can reside in the same application as the client dataset or XML broker, or it can be part of a separate application server. The provider packages data from the source dataset or XML document and passes it in one or more transportable data packets to the client dataset or XML broker. The client dataset

reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the database or source dataset.

When the provider supplies data to a client dataset, the client dataset reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the database, to the source dataset, or to the source XML document.

If the provider can encode data packets in XML, it can supply data to an XML broker, which adds the data packet to an HTML document that is downloaded by a Web client. When the XML broker receives updates from the Web client, it sends the updates to the provider, which applies them to the database, to the source dataset, or to the source XML document.

Client datasets and XML brokers communicate with a provider through the IAppServer interface. In multi-tiered applications, this is the interface of the remote data module that contains the provider. To enable the remote data module to pass calls to the provider, the provider's Exported (see page 18474) property must be true, and its Owner property must specify the remote data module.

See Also

TClientDataSet (see page 8289)

TDataSetProvider (see page 18508)

IAppServer (see page 16450)

TXMLTransformProvider (see page 26492)

124.1.4.1 TCustomProvider Members

The following tables list the members exposed by TCustomProvider.

Protected Events

	Name	Description
	AfterApplyUpdates (see page 18475)	Occurs after the provider applies updates.
	AfterExecute (see page 18476)	Occurs after the provider passes an execute command to its dataset.
	AfterGetParams (see page 18477)	This is AfterGetParams, a member of class TCustomProvider.
	AfterGetRecords (see page 18477)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 18478)	Occurs after the provider fetches new information about the current record.
	BeforeApplyUpdates (see page 18479)	Occurs before the provider applies updates from a client dataset.
	BeforeExecute (see page 18479)	This is BeforeExecute, a member of class TCustomProvider.
	BeforeGetParams (see page 18480)	Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.
	BeforeGetRecords (see page 18480)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 18482)	Occurs before the provider creates a delta packet with information about the current record.
	OnDataRequest (see page 18482)	Occurs when a provider calls its DataRequest (see page 18460) method.
	OnValidate (see page 18483)	This is OnValidate, a member of class TCustomProvider.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAfterApplyUpdates (see page 18460)	Generates an AfterApplyUpdates (see page 18475) event.
	DoAfterExecute (see page 18461)	Generates an AfterExecute (see page 18476) event.
	DoAfterGetParams (see page 18461)	Generates an AfterGetParams (see page 18477) event.
	DoAfterGetRecords (see page 18462)	Generates an AfterGetRecords (see page 18477) event.
	DoAfterRowRequest (see page 18462)	Generates an AfterRowRequest (see page 18478) event.
	DoApplyUpdates (see page 18463)	This is DoApplyUpdates, a member of class TCustomProvider.
	DoBeforeApplyUpdates (see page 18463)	Generates a BeforeApplyUpdates (see page 18479) event.
	DoBeforeExecute (see page 18464)	Generates a BeforeExecute (see page 18479) event.
	DoBeforeGetParams (see page 18464)	Generates a BeforeGetParams (see page 18480) event.
	DoBeforeGetRecords (see page 18465)	Generates a BeforeGetRecords (see page 18480) event.
	DoBeforeRowRequest (see page 18465)	Generates a BeforeRowRequest (see page 18482) event.
	DoGetRecords (see page 18466)	This is DoGetRecords, a member of class TCustomProvider.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InternalApplyUpdates (see page 18469)	Provides the underlying implementation of the ApplyUpdates (see page 18459) method.
	InternalExecute (see page 18470)	Provides the underlying implementation of the Execute (see page 18466) method.
	InternalGetParams (see page 18471)	Returns the requested parameter values as a Variant array.
	InternalGetRecords (see page 18471)	Provides the underlying implementation of the GetRecords (see page 18468) method.
	InternalRowRequest (see page 18472)	Provides the underlying implementation of the RowRequest (see page 18472) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActiveUpdateException (see page 18473)	This is SetActiveUpdateException, a member of class TCustomProvider.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActiveUpdateException (see page 18474)	This is ActiveUpdateException, a member of class TCustomProvider.
	OwnerData (see page 18475)	This is OwnerData, a member of class TCustomProvider.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	ApplyUpdates (see page 18459)	This is the overview for the ApplyUpdates method overload.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18454)	Creates a new TCustomProvider (see page 18449) object.
	DataRequest (see page 18460)	Generates an OnDataRequest (see page 18482) event.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 18454)	Frees an instance of a provider object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 18466)	Executes a query, stored procedure, or custom SQL statement.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParams (see page 18467)	Returns the current parameter values.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetRecords (see page 18468)	This is the overview for the GetRecords method overload.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	RowRequest (see page 18472)	Returns information from a specified record.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 18474)	Denotes a data packet created by the provider.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Exported (see page 18474)	Allows client applications to pass calls to the provider when it resides on an application server.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

Strict private Fields

	Name	Description
	FActiveUpdateAbortException (see page 18455)	This is FActiveUpdateAbortException, a member of class TCustomProvider.
	FAfterApplyUpdates (see page 18455)	This is FAfterApplyUpdates, a member of class TCustomProvider.
	FAfterExecute (see page 18456)	This is FAfterExecute, a member of class TCustomProvider.

	FAfterGetParams (see page 18456)	This is FAfterGetParams, a member of class TCustomProvider.
	FAfterGetRecords (see page 18456)	This is FAfterGetRecords, a member of class TCustomProvider.
	FAfterRowRequest (see page 18456)	This is FAfterRowRequest, a member of class TCustomProvider.
	FBeforeApplyUpdates (see page 18456)	This is FBeforeApplyUpdates, a member of class TCustomProvider.
	FBeforeExecute (see page 18457)	This is FBeforeExecute, a member of class TCustomProvider.
	FBeforeGetParams (see page 18457)	This is FBeforeGetParams, a member of class TCustomProvider.
	FBeforeGetRecords (see page 18457)	This is FBeforeGetRecords, a member of class TCustomProvider.
	FBeforeRowRequest (see page 18457)	This is FBeforeRowRequest, a member of class TCustomProvider.
	FExported (see page 18458)	This is FExported, a member of class TCustomProvider.
	FOnDataRequest (see page 18458)	This is FOnDataRequest, a member of class TCustomProvider.
	FOnValidate (see page 18458)	This is FOnValidate, a member of class TCustomProvider.
	FOwnerData (see page 18458)	This is FOwnerData, a member of class TCustomProvider.

Strict private Methods

	Name	Description
	GetData (see page 18467)	This is GetData, a member of class TCustomProvider.

124.1.4.2 TCustomProvider.Create Constructor

Creates a new TCustomProvider (see page 18449) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomProvider(TComponent * AOwner);
```

Description

Call Create to instantiate a provider at runtime. Providers placed in forms or data modules at design time are created automatically.

The constructor assigns the AOwner parameter as the owner of the provider. This owner is responsible for freeing the provider when it is destroyed. If the owner is a remote data module, the constructor registers the provider with that remote data module so that it is available to client applications through the IAppServer interface.

See Also

IAppServer (see page 16450)

Providers (see page 19908)

registerprovider (see page 19902)

Owner (see page 2807)

124.1.4.3 TCustomProvider.Destroy Destructor

Frees an instance of a provider object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomProvider();
```

Description

Do not call Destroy directly. Instead, call Free, which checks that the provider is not nil before calling its Destroy method. If the provider's Owner is a remote data module, Destroy unregisters the provider from that remote data module.

124.1.4.4 TCustomProvider Fields

The fields of the TCustomProvider class are listed here.

Strict private Fields

	Name	Description
	FActiveUpdateAbortException (see page 18455)	This is FActiveUpdateAbortException, a member of class TCustomProvider.
	FAfterApplyUpdates (see page 18455)	This is FAfterApplyUpdates, a member of class TCustomProvider.
	FAfterExecute (see page 18456)	This is FAfterExecute, a member of class TCustomProvider.
	FAfterGetParams (see page 18456)	This is FAfterGetParams, a member of class TCustomProvider.
	FAfterGetRecords (see page 18456)	This is FAfterGetRecords, a member of class TCustomProvider.
	FAfterRowRequest (see page 18456)	This is FAfterRowRequest, a member of class TCustomProvider.
	FBeforeApplyUpdates (see page 18456)	This is FBeforeApplyUpdates, a member of class TCustomProvider.
	FBeforeExecute (see page 18457)	This is FBeforeExecute, a member of class TCustomProvider.
	FBeforeGetParams (see page 18457)	This is FBeforeGetParams, a member of class TCustomProvider.
	FBeforeGetRecords (see page 18457)	This is FBeforeGetRecords, a member of class TCustomProvider.
	FBeforeRowRequest (see page 18457)	This is FBeforeRowRequest, a member of class TCustomProvider.
	FExported (see page 18458)	This is FExported, a member of class TCustomProvider.
	FOnDataRequest (see page 18458)	This is FOnDataRequest, a member of class TCustomProvider.
	FOnValidate (see page 18458)	This is FOnValidate, a member of class TCustomProvider.
	FOwnerData (see page 18458)	This is FOwnerData, a member of class TCustomProvider.

124.1.4.4.1 TCustomProvider.FActiveUpdateAbortException Field

Pascal

```
FActiveUpdateAbortException: Exception;
```

C++

```
Exception FActiveUpdateAbortException;
```

Description

This is FActiveUpdateAbortException, a member of class TCustomProvider.

124.1.4.4.2 TCustomProvider.FAfterApplyUpdates Field

Pascal

```
FAfterApplyUpdates: TRemoteEvent;
```

C++

```
TRemoteEvent FAfterApplyUpdates;
```

Description

This is FAfterApplyUpdates, a member of class TCustomProvider.

124.1.4.4.3 TCustomProvider.FAfterExecute Field

Pascal

```
FAfterExecute: TRemoteEvent;
```

C++

```
TRemoteEvent FAfterExecute;
```

Description

This is FAfterExecute, a member of class TCustomProvider.

124.1.4.4.4 TCustomProvider.FAfterGetParams Field

Pascal

```
FAfterGetParams: TRemoteEvent;
```

C++

```
TRemoteEvent FAfterGetParams;
```

Description

This is FAfterGetParams, a member of class TCustomProvider.

124.1.4.4.5 TCustomProvider.FAfterGetRecords Field

Pascal

```
FAfterGetRecords: TRemoteEvent;
```

C++

```
TRemoteEvent FAfterGetRecords;
```

Description

This is FAfterGetRecords, a member of class TCustomProvider.

124.1.4.4.6 TCustomProvider.FAfterRowRequest Field

Pascal

```
FAfterRowRequest: TRemoteEvent;
```

C++

```
TRemoteEvent FAfterRowRequest;
```

Description

This is FAfterRowRequest, a member of class TCustomProvider.

124.1.4.4.7 TCustomProvider.FBeforeApplyUpdates Field

Pascal

```
FBeforeApplyUpdates: TRemoteEvent;
```

C++

```
TRemoteEvent FBeforeApplyUpdates;
```

Description

This is FBeforeApplyUpdates, a member of class TCustomProvider.

124.1.4.4.8 TCustomProvider.FBeforeExecute Field

Pascal

```
FBeforeExecute: TRemoteEvent;
```

C++

```
TRemoteEvent FBeforeExecute;
```

Description

This is FBeforeExecute, a member of class TCustomProvider.

124.1.4.4.9 TCustomProvider.FBeforeGetParams Field

Pascal

```
FBeforeGetParams: TRemoteEvent;
```

C++

```
TRemoteEvent FBeforeGetParams;
```

Description

This is FBeforeGetParams, a member of class TCustomProvider.

124.1.4.4.10 TCustomProvider.FBeforeGetRecords Field

Pascal

```
FBeforeGetRecords: TRemoteEvent;
```

C++

```
TRemoteEvent FBeforeGetRecords;
```

Description

This is FBeforeGetRecords, a member of class TCustomProvider.

124.1.4.4.11 TCustomProvider.FBeforeRowRequest Field

Pascal

```
FBeforeRowRequest: TRemoteEvent;
```

C++

```
TRemoteEvent FBeforeRowRequest;
```

Description

This is FBeforeRowRequest, a member of class TCustomProvider.

124.1.4.4.12 TCustomProvider.FExported Field

Pascal

```
FExported: Boolean;
```

C++

```
Boolean FExported;
```

Description

This is FExported, a member of class TCustomProvider.

124.1.4.4.13 TCustomProvider.FOnDataRequest Field

Pascal

```
FOnDataRequest: TDataRequestEvent;
```

C++

```
TDataRequestEvent FOnDataRequest;
```

Description

This is FOnDataRequest, a member of class TCustomProvider.

124.1.4.4.14 TCustomProvider.FOnValidate Field

Pascal

```
FOnValidate: TOnValidate;
```

C++

```
TOnValidate FOnValidate;
```

Description

This is FOnValidate, a member of class TCustomProvider.

124.1.4.4.15 TCustomProvider.FOwnerData Field

Pascal

```
FOwnerData: OleVariant;
```

C++

```
OleVariant FOwnerData;
```

Description

This is FOwnerData, a member of class TCustomProvider.

124.1.4.5 TCustomProvider Methods

The methods of the TCustomProvider class are listed here.

Protected Methods

	Name	Description
	DoAfterApplyUpdates (see page 18460)	Generates an AfterApplyUpdates (see page 18475) event.
	DoAfterExecute (see page 18461)	Generates an AfterExecute (see page 18476) event.
	DoAfterGetParams (see page 18461)	Generates an AfterGetParams (see page 18477) event.
	DoAfterGetRecords (see page 18462)	Generates an AfterGetRecords (see page 18477) event.
	DoAfterRowRequest (see page 18462)	Generates an AfterRowRequest (see page 18478) event.
	DoApplyUpdates (see page 18463)	This is DoApplyUpdates, a member of class TCustomProvider.
	DoBeforeApplyUpdates (see page 18463)	Generates a BeforeApplyUpdates (see page 18479) event.
	DoBeforeExecute (see page 18464)	Generates a BeforeExecute (see page 18479) event.
	DoBeforeGetParams (see page 18464)	Generates a BeforeGetParams (see page 18480) event.
	DoBeforeGetRecords (see page 18465)	Generates a BeforeGetRecords (see page 18480) event.
	DoBeforeRowRequest (see page 18465)	Generates a BeforeRowRequest (see page 18482) event.
	DoGetRecords (see page 18466)	This is DoGetRecords, a member of class TCustomProvider.
	InternalApplyUpdates (see page 18469)	Provides the underlying implementation of the ApplyUpdates (see page 18459) method.
	InternalExecute (see page 18470)	Provides the underlying implementation of the Execute (see page 18466) method.
	InternalGetParams (see page 18471)	Returns the requested parameter values as a Variant array.
	InternalGetRecords (see page 18471)	Provides the underlying implementation of the GetRecords (see page 18468) method.
	InternalRowRequest (see page 18472)	Provides the underlying implementation of the RowRequest (see page 18472) method.
	SetActiveUpdateException (see page 18473)	This is SetActiveUpdateException, a member of class TCustomProvider.

Public Methods

	Name	Description
	ApplyUpdates (see page 18459)	This is the overview for the ApplyUpdates method overload.
	DataRequest (see page 18460)	Generates an OnDataRequest (see page 18482) event.
	Execute (see page 18466)	Executes a query, stored procedure, or custom SQL statement.
	GetParams (see page 18467)	Returns the current parameter values.
	GetRecords (see page 18468)	This is the overview for the GetRecords method overload.
	RowRequest (see page 18472)	Returns information from a specified record.

Strict private Methods

	Name	Description
	GetData (see page 18467)	This is GetData, a member of class TCustomProvider.

124.1.4.5.1 ApplyUpdates Method

This is the overview for the ApplyUpdates method overload.

Overload List

	Name	Description
	TCustomProvider.ApplyUpdates (OleVariant, Integer, Integer) (see page 18459)	This is ApplyUpdates, a member of class TCustomProvider.
	TCustomProvider.ApplyUpdates (OleVariant, Integer, Integer, OleVariant) (see page 18460)	This is ApplyUpdates, a member of class TCustomProvider.

124.1.4.5.1.1 TCustomProvider.ApplyUpdates Method (OleVariant, Integer, Integer)

Pascal

```
function ApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount: Integer):
```

```
OleVariant; overload;
```

C++

```
__fastcall OleVariant ApplyUpdates(const OleVariant Delta, int MaxErrors, int ErrorCount);
```

Description

This is ApplyUpdates, a member of class TCustomProvider.

124.1.4.5.1.2 TCustomProvider.ApplyUpdates Method (OleVariant, Integer, Integer, OleVariant)

Pascal

```
function ApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount: Integer;
var OwnerData: OleVariant): OleVariant; overload;
```

C++

```
__fastcall OleVariant ApplyUpdates(const OleVariant Delta, int MaxErrors, int ErrorCount,
OleVariant OwnerData);
```

Description

This is ApplyUpdates, a member of class TCustomProvider.

124.1.4.5.2 TCustomProvider.DataRequest Method

Generates an OnDataRequest (see page 18482) event.

Pascal

```
function DataRequest(Input: OleVariant): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant DataRequest(OleVariant Input);
```

Description

Write an OnDataRequest (see page 18482) event handler and call the DataRequest function to invoke the event handler at runtime. This function and the event it invokes enable an application to perform custom processing in response to a request for data.

Note: Calling the client dataset's DataRequest method causes a call to the provider's DataRequest method.

See Also

OnDataRequest (see page 18482)

AS_DataRequest (see page 16452)

DataRequest (see page 8404)

Communicating with the Client Dataset

124.1.4.5.3 TCustomProvider.DoAfterApplyUpdates Method

Generates an AfterApplyUpdates (see page 18475) event.

Pascal

```
procedure DoAfterApplyUpdates(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterApplyUpdates(OleVariant OwnerData);
```

Description

The ApplyUpdates (see page 18459) method calls DoAfterApplyUpdates to generate the AfterApplyUpdates (see page 18475) event after applying updates and resolving any update errors that are handled by the provider.

OwnerData (see page 18475) supplies custom information to the AfterApplyUpdates (see page 18475) event handler. This is the same as the outgoing OwnerData (see page 18475) parameter of the BeforeApplyUpdates (see page 18479) event handler. The AfterApplyUpdates (see page 18475) event handler can change this value. The returned value is then passed to the client if it supplied an OwnerData (see page 18475) parameter when calling ApplyUpdates (see page 18459).

See Also

applyupdates (see page 18459)

AfterApplyUpdates (see page 18475)

BeforeApplyUpdates (see page 18479)

124.1.4.5.4 TCustomProvider.DoAfterExecute Method

Generates an AfterExecute (see page 18476) event.

Pascal

```
procedure DoAfterExecute(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterExecute(OleVariant OwnerData);
```

Description

The Execute (see page 18466) method calls DoAfterExecute to generate the AfterExecute (see page 18476) event after executing CommandText or the associated query or stored procedure but before fetching any output parameters.

OwnerData (see page 18475) supplies custom information to the AfterExecute (see page 18476) event handler. This is the same as the outgoing OwnerData (see page 18475) parameter of the BeforeExecute (see page 18479) event handler. The AfterExecute (see page 18476) event handler can change this value. The returned value is then passed to the client.

See Also

Execute (see page 18466)

AfterExecute (see page 18476)

beforeexecute (see page 18479)

124.1.4.5.5 TCustomProvider.DoAfterGetParams Method

Generates an AfterGetParams (see page 18477) event.

Pascal

```
procedure DoAfterGetParams(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterGetParams(OleVariant OwnerData);
```

Description

The GetParams (see page 18467) method calls DoAfterGetParams to generate the AfterGetParams (see page 18477) event after fetching the current parameter values of the associated dataset.

OwnerData (see page 18475) supplies custom information to the AfterGetParams (see page 18477) event handler. This is the same as the outgoing OwnerData (see page 18475) parameter of the BeforeGetParams (see page 18480) event handler. The AfterGetParams (see page 18477) event handler can change this value. The returned value is then passed to the client.

See Also

GetParams (see page 18467)

aftergetparams (see page 18477)

BeforeGetParams (see page 18480)

124.1.4.5.6 TCustomProvider.DoAfterGetRecords Method

Generates an AfterGetRecords (see page 18477) event.

Pascal

```
procedure DoAfterGetRecords(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterGetRecords(OleVariant OwnerData);
```

Description

The GetRecords (see page 18468) method calls DoAfterGetRecords to generate the AfterGetRecords (see page 18477) event after assembling a data packet but before updating the parameters to reflect any output parameters.

OwnerData (see page 18475) supplies custom information to the AfterGetRecords (see page 18477) event handler. This is the same as the outgoing OwnerData (see page 18475) parameter of the BeforeGetRecords (see page 18480) event handler. The AfterGetRecords (see page 18477) event handler can change this value. The returned value is then passed to the client.

See Also

GetRecords (see page 18468)

AfterGetRecords (see page 18477)

BeforeGetRecords (see page 18480)

124.1.4.5.7 TCustomProvider.DoAfterRowRequest Method

Generates an AfterRowRequest (see page 18478) event.

Pascal

```
procedure DoAfterRowRequest(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoAfterRowRequest(OleVariant OwnerData);
```

Description

The RowRequest (see page 18472) method calls DoAfterRowRequest to generate the AfterRowRequest (see page 18478) event after fetching the requested data.

OwnerData (see page 18475) supplies custom information to the AfterRowRequest (see page 18478) event handler. This is the same as the outgoing OwnerData (see page 18475) parameter of the BeforeRowRequest (see page 18482) event handler. The AfterRowRequest (see page 18478) event handler can change this value. The returned value is then passed to the client.

See Also

RowRequest (see page 18472)

AfterRowRequest (see page 18478)

BeforeRowRequest (see page 18482)

124.1.4.5.8 TCustomProvider.DoApplyUpdates Method

Pascal

```
function DoApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount: Integer;
var OwnerData: OleVariant): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant DoApplyUpdates(const OleVariant Delta, int MaxErrors, int
ErrorCount, OleVariant OwnerData);
```

Description

This is DoApplyUpdates, a member of class TCustomProvider.

124.1.4.5.9 TCustomProvider.DoBeforeApplyUpdates Method

Generates a BeforeApplyUpdates (see page 18479) event.

Pascal

```
procedure DoBeforeApplyUpdates(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeApplyUpdates(OleVariant OwnerData);
```

Description

The ApplyUpdates (see page 18459) method calls DoBeforeApplyUpdates to generate the BeforeApplyUpdates (see page 18479) event before it applies the updates in Delta.

Delta is the delta packet containing the updates as received from the client.

MaxErrors is the number of errors tolerated before the update operation should aborted.

OwnerData (see page 18475) supplies custom information to the BeforeApplyUpdates (see page 18479) event handler. The BeforeApplyUpdates (see page 18479) event handler can change this value. The returned value is then passed to the AfterApplyUpdates (see page 18475) event handler after applying the updates in Delta.

As implemented in TCustomProvider (see page 18449), Delta and MaxErrors are ignored.

See Also

applyupdates (see page 18459)

AfterApplyUpdates (see page 18475)

BeforeApplyUpdates (see page 18479)

124.1.4.5.10 TCustomProvider.DoBeforeExecute Method

Generates a BeforeExecute (see page 18479) event.

Pascal

```
procedure DoBeforeExecute(const CommandText: WideString; var Params: OleVariant; var
OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeExecute(const BSTR CommandText, OleVariant Params, OleVariant
OwnerData);
```

Description

The Execute (see page 18466) method calls DoBeforeExecute to generate the BeforeExecute (see page 18479) event before it executes CommandText or executes an associated query or stored procedure.

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a stored procedure that replaces the associated stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

Params contains any parameter values that should be applied to CommandText or to the query or stored procedure before execution.

OwnerData (see page 18475) supplies custom information to the BeforeExecute (see page 18479) event handler. The event handler can change this value. The returned value is then passed to an AfterExecute (see page 18476) event handler and then returned to the caller of the Execute (see page 18466) method.

As implemented in TCustomProvider (see page 18449), CommandText and Params are ignored. Descendant classes apply these values before generating the BeforeExecute (see page 18479) event.

See Also

Execute (see page 18466)

beforeexecute (see page 18479)

AfterExecute (see page 18476)

Options (see page 18440)

124.1.4.5.11 TCustomProvider.DoBeforeGetParams Method

Generates a BeforeGetParams (see page 18480) event.

Pascal

```
procedure DoBeforeGetParams(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeGetParams(OleVariant OwnerData);
```

Description

The GetParams (see page 18467) method calls DoBeforeGetParams to generate the BeforeGetParams (see page 18480) event before fetching the current parameter values of the associated dataset.

OwnerData (see page 18475) supplies custom information to the BeforeGetParams (see page 18480) event handler. The event handler can change this value. The returned value is then passed to an AfterGetParams (see page 18477) event handler and then returned to the caller of the GetParams (see page 18467) method.

See Also

GetParams (see page 18467)

BeforeGetParams (see page 18480)

aftergetparams (see page 18477)

124.1.4.5.12 TCustomProvider.DoBeforeGetRecords Method

Generates a BeforeGetRecords (see page 18480) event.

Pascal

```
procedure DoBeforeGetRecords(Count: Integer; Options: Integer; const CommandText: WideString;
var Params: OleVariant; var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeGetRecords(int Count, int Options, const BSTR CommandText,
OleVariant Params, OleVariant OwnerData);
```

Description

The GetRecords (see page 18468) method calls DoBeforeGetRecords to generate the BeforeGetRecords (see page 18480) event before it fetches data and assembles it into a data packet.

Count is the number of records requested. If Count is –1, all records are requested.

Options indicates whether the data packet should include metadata, whether it should start with the first record, and whether the data packet should be encoded in XML. For details, see the GetRecords (see page 18468) method.

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a table or stored procedure that replaces the associated table or stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText or if the provider does not have an Options property.

Params contains any parameter values that should be applied to CommandText or to a query or stored procedure before fetching data into a data packet.

OwnerData (see page 18475) supplies custom information to the BeforeGetRecords (see page 18480) event handler. The event handler can change this value. The returned value is then passed to an AfterGetRecords (see page 18477) event handler and then (optionally) returned to the caller of the GetRecords (see page 18468) method.

As implemented in TCustomProvider (see page 18449), Count, Options, CommandText, and Params are ignored. Descendant classes can apply these values before generating the BeforeExecute (see page 18479) event.

See Also

GetRecords (see page 18468)

BeforeGetRecords (see page 18480)

AfterGetRecords (see page 18477)

Options (see page 18440)

124.1.4.5.13 TCustomProvider.DoBeforeRowRequest Method

Generates a BeforeRowRequest (see page 18482) event.

Pascal

```
procedure DoBeforeRowRequest(var OwnerData: OleVariant); virtual;
```

C++

```
virtual __fastcall DoBeforeRowRequest(OleVariant OwnerData);
```

Description

The RowRequest (see page 18472) method calls DoBeforeRowRequest to generate the BeforeRowRequest (see page 18482) event before fetching the requested data.

OwnerData (see page 18475) supplies custom information to the BeforeRowRequest (see page 18482) event handler. The event handler can change this value. The returned value is then passed to an AfterRowRequest (see page 18478) event handler and then returned to the caller of the RowRequest (see page 18472) method.

See Also

RowRequest (see page 18472)

BeforeRowRequest (see page 18482)

AfterRowRequest (see page 18478)

124.1.4.5.14 TCustomProvider.DoGetRecords Method

Pascal

```
function DoGetRecords(Count: Integer; out RecsOut: Integer; Options: Integer; const
CommandText: WideString; var Params: OleVariant; var OwnerData: OleVariant): OleVariant;
virtual;
```

C++

```
virtual __fastcall OleVariant DoGetRecords(int Count, int RecsOut, int Options, const BSTR
CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

This is DoGetRecords, a member of class TCustomProvider.

124.1.4.5.15 TCustomProvider.Execute Method

Executes a query, stored procedure, or custom SQL statement.

Pascal

```
procedure Execute(const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant); virtual;
```

C++

```
virtual __fastcall Execute(const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

Client datasets call Execute through the AS_Execute method of the IAppServer interface. In response, the provider executes an SQL command. If the provider represents a query or stored procedure that does not return a cursor, calling Execute causes the provider to execute the query or stored procedure. If the caller supplies a value for CommandText, Execute may execute that statement instead (see below).

Before executing the appropriate command, Execute generates a BeforeExecute (see page 18479) event. After executing the command, it generates an AfterExecute (see page 18476) event. Finally, it returns any output parameters as the value of the Params parameter.

CommandText is an SQL statement that replaces the SQL of an associated query, or the name of a stored procedure that replaces the associated stored procedure. This parameter is ignored if the Options property does not include

poAllowCommandText.

On entry, Params supplies parameter values for the query, stored procedure, or CommandText string. On exit, Params returns any output parameters.

OwnerData (see page 18475) contains custom information passed to the provider from the client dataset's BeforeExecute (see page 18479) event handler. This information is passed in to the provider's BeforeExecute (see page 18479) event handler and is returned by the provider's AfterExecute (see page 18476) event handler.

Communicating with the Client Dataset

124.1.4.5.16 TCustomProvider.GetData Method

Pascal

```
function GetData: OleVariant;
```

C++

```
__fastcall OleVariant GetData();
```

Description

This is GetData, a member of class TCustomProvider.

124.1.4.5.17 TCustomProvider.GetParams Method

Returns the current parameter values.

Pascal

```
function GetParams(var OwnerData: OleVariant): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant GetParams(OleVariant OwnerData);
```

Description

GetParams returns a variant array of variant arrays that contains the current parameter values for the provider's data source. The first array dimension is an index into all the parameter values. Its value runs from 0 to one less than the number of parameters. The second array dimension has four values: The parameter name (a Delphi string or a C++ AnsiString), the parameter data type (a TFieldType), the parameter type (a TParamType), and the parameter value (a Variant). The values in this array can be applied to a TParams object using the global UnpackParams procedure.

Before fetching the current parameter values, GetParams generates a BeforeGetParams (see page 18480) event, passing the value supplied as the OwnerData (see page 18475) parameter to the event handler. After creating the OleVariant that contains the parameter values, GetParams generates an AfterGetParams (see page 18477) event, passing in the current value of OwnerData (see page 18475). Finally, the value of OwnerData (see page 18475) returned by the AfterGetParams (see page 18477) is returned in the OwnerData (see page 18475) parameter.

Communicating with the Client Dataset

124.1.4.5.18 GetRecords Method

This is the overview for the GetRecords method overload.

Overload List

	Name	Description
	TCustomProvider.GetRecords (Integer, Integer, Integer) (see page 18468)	Retrieves a data packet that represents the provider's associated data.
	TCustomProvider.GetRecords (Integer, Integer, Integer, WideString, OleVariant, OleVariant) (see page 18468)	Retrieves a data packet that represents the provider's associated data.

124.1.4.5.18.1 TCustomProvider.GetRecords Method (Integer, Integer, Integer)

Retrieves a data packet that represents the provider's associated data.

Pascal

```
function GetRecords(Count: Integer; out RecsOut: Integer; Options: Integer): OleVariant;
overload;
function GetRecords(Count: Integer; out RecsOut: Integer; Options: Integer; const CommandText:
WideString; var Params: OleVariant; var OwnerData: OleVariant): OleVariant; overload;
```

C++

```
__fastcall OleVariant GetRecords(int Count, int RecsOut, int Options);
__fastcall OleVariant GetRecords(int Count, int RecsOut, int Options, const BSTR CommandText,
OleVariant Params, OleVariant OwnerData);
```

Description

Call GetRecords to retrieve a data packet containing a specified number of records. GetRecords generates a BeforeGetRecords

(see page 18480) event, assembles a data packet, and then generates an AfterGetRecords (see page 18477) event.

Count indicates the number of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only the specified number of records are retrieved.

RecsOut returns the actual number of records in the data packet.

Options indicates what information should be added to the data packet in addition to data. It is a combination of the GetRecordOption constants. For example, the following value requests metadata along with a data packet encoded in XML:

```
MetaDataOption + XMLOption
MetaDataOption || XMLOption
```

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a table or stored procedure that replaces the associated table or stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText or if the provider does not have an Options property.

Params specifies any parameter values that should be applied to CommandText or to an associated query or stored procedure. If the provider is associated with a TTable, Params specifies field values that filter the result set. On exit from GetRecords, Params returns any output parameters.

OwnerData (see page 18475) contains custom information that is supplied by a client dataset's BeforeGetRecords (see page 18480) event handler. This information is passed to the provider's BeforeGetRecords (see page 18480) event handler and is returned by the provider's AfterGetRecords (see page 18477) event handler.

Records are returned as a data packet in a Variant.

Note: GetRecords always generates the BeforeGetRecords (see page 18480) and AfterGetRecords (see page 18477) events, even if you use the syntax that does not include an OwnerData (see page 18475) parameter. In that case, the value of OwnerData (see page 18475) is nil (Delphi) or NULL (C++) on entry to the BeforeGetRecords (see page 18480) event handler and is discarded on exit from the AfterGetRecords (see page 18477) event handler.

Tip: If the provider is part of a stateless application server, there is no guarantee that the provider will be positioned on the desired record before it creates a data packet. Use a BeforeGetRecords (see page 18480) event handler to position the cursor before the call to GetRecords.

Communicating with the Client Dataset

Responding to Client Data Requests

124.1.4.5.19 TCustomProvider.InternalApplyUpdates Method

Provides the underlying implementation of the ApplyUpdates (see page 18459) method.

Pascal

```
function InternalApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount:
Integer): OleVariant; virtual; abstract;
```

C++

```
virtual __fastcall OleVariant InternalApplyUpdates(const OleVariant Delta, int MaxErrors, int
ErrorCount) = 0;
```

Description

The ApplyUpdates (see page 18459) method calls InternalApplyUpdates to apply the updates contained in a delta packet after generating the BeforeApplyUpdates (see page 18479) event and before generating the AfterApplyUpdates (see page 18475) event. The InternalApplyUpdates method of TCustomProvider (see page 18449) is abstract (Delphi) or pure virtual (C++), meaning that it has no implementation. Descendant classes override this method to apply updates, resolve update errors, and return any updates that could not be applied.

Delta is the delta packet containing insertions, deletions, and modifications to be applied.

MaxErrors indicates the maximum number of errors that can be applied before stopping the update operation. If MaxErrors is –1, the provider tries to apply all updates.

ErrorCount returns the number of errors encountered during the update operation.

InternalApplyUpdates returns a data packet of updates that could not be applied to the database as an OleVariant.

See Also

applyupdates (see page 18459)

124.1.4.5.20 TCustomProvider.InternalExecute Method

Provides the underlying implementation of the Execute (see page 18466) method.

Pascal

```
procedure InternalExecute(const CommandText: WideString; var Params: OleVariant); virtual;
```

C++

```
virtual __fastcall InternalExecute(const BSTR CommandText, OleVariant Params);
```

Description

The Execute (see page 18466) method calls InternalExecute to execute the appropriate SQL statement after calling DoBeforeExecute (see page 18464) to generate a BeforeExecute (see page 18479) event and apply the CommandText and Params. As Implemented in TCustomProvider (see page 18449), InternalExecute does nothing. Descendants override this method to pass the execute command on to an associated dataset.

CommandText is an SQL statement that replaces the SQL of an associated query, or the name of a stored procedure that replaces the associated stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

On entry, Params supplies parameter values for the query, stored procedure, or CommandText string. On exit, Params returns any output parameters.

See Also

Execute (see page 18466)

DoBeforeExecute (see page 18464)

124.1.4.5.21 TCustomProvider.InternalGetParams Method

Returns the requested parameter values as a Variant array.

Pascal

```
function InternalGetParams(Types: TParamTypes = AllParamTypes): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant InternalGetParams(TParamTypes Types = AllParamTypes);
```

Description

TCustomProvider (see page 18449) uses InternalGetParams internally whenever it needs to assemble the current parameter values into an OleVariant. This provides the underlying implementation of the GetParams (see page 18467) method, as well as assembling parameter values for methods that return output parameters (such as Execute (see page 18466) or GetRecords (see page 18468)).

The Types (see page 23293) parameter limits the parameter values that are returned to a subset of all possible parameter types. If this parameter is omitted, all parameter values are returned.

As implemented in TCustomProvider (see page 18449), InternalGetParams always returns NULL. Descendants override this method to return the requested parameter values.

See Also

GetParams (see page 18467)

Execute (see page 18466)

GetRecords (see page 18468)

124.1.4.5.22 TCustomProvider.InternalGetRecords Method

Provides the underlying implementation of the GetRecords (see page 18468) method.

Pascal

```
function InternalGetRecords(Count: Integer; out RecsOut: Integer; Options: TGetRecordOptions;
const CommandText: WideString; var Params: OleVariant): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant InternalGetRecords(int Count, int RecsOut, TGetRecordOptions
Options, const BSTR CommandText, OleVariant Params);
```

Description

The GetRecords (see page 18468) method calls InternalGetRecords to assemble a data packet after calling DoBeforeGetRecords (see page 18465) to apply the CommandText and Params and generate a BeforeGetRecords (see page 18480) event. As implemented in TCustomProvider (see page 18449), InternalGetRecords always returns NULL. Descendant classes override this method to fetch the requested records and assemble them into a data packet.

Count indicates the number of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only the specified number of records are retrieved.

RecsOut returns the actual number of records retrieved.

Options indicates what information should be added to the data packet in addition to data. It can include grMetaData (include metadata), grReset (start providing records with the first one in the dataset), and grXML (encode the datapacket in XML rather than as an OleVariant) or grXMLUTF8 (same as grXML except extended characters are encoded using UTF8).

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a table or

stored procedure that replaces the associated table or stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText or if the provider does not have an Options property.

Params specifies any parameter values that should be applied to CommandText or to an associated query or stored procedure. If the provider is associated with a TTable object, Params specifies field values that filter the result set. On exit from GetRecords (see page 18468), Params returns any output parameters.

Records are returned as a data packet in a Variant.

See Also

GetRecords (see page 18468)

DoBeforeGetRecords (see page 18465)

124.1.4.5.23 TCustomProvider.InternalRowRequest Method

Provides the underlying implementation of the RowRequest (see page 18472) method.

Pascal

```
function InternalRowRequest(const Row: OleVariant; RequestType: TFetchOptions): OleVariant;
virtual;
```

C++

```
virtual __fastcall OleVariant InternalRowRequest(const OleVariant Row, TFetchOptions
RequestType);
```

Description

The RowRequest (see page 18472) method calls InternalRowRequest to assemble the specified information after generating a BeforeRowRequest (see page 18482) event and before generating an AfterRowRequest (see page 18478) event. As implemented in TCustomProvider (see page 18449), InternalRowRequest does nothing. Descendant classes override this method to assemble the requested information into an OleVariant.

The Row parameter is an OleVariant that describes the current record on the client dataset. It enables the provider to locate the record of interest.

InternalRowRequest returns the requested information in a delta packet.

See Also

RowRequest (see page 18472)

124.1.4.5.24 TCustomProvider.RowRequest Method

Returns information from a specified record.

Pascal

```
function RowRequest(const Row: OleVariant; RequestType: Integer; var OwnerData: OleVariant):
OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant RowRequest(const OleVariant Row, int RequestType, OleVariant
OwnerData);
```

Description

RowRequest is called automatically in response to the client dataset's FetchBlobs, FetchDetails, or RefreshRecord method. It generates a BeforeRowRequest (see page 18482) event, assembles the requested information, and generates an AfterRowRequest (see page 18478) event.

The Row parameter is an OleVariant that describes the record about which information is requested. It enables the provider to locate the record of interest.

The RequestType parameter indicates the type of information required. It is an integer version of the TFetchOptions type. (Its an integer because the value must be marshaled over an IAppServer interface). In Delphi, to convert the TFetchOptions value to the appropriate integer, use the Ord function. In C++, to combine TFetchOption values, use the bitwise "or" operator. For example:

```
Ord(foBlobs) + Ord(foDetails);
foBlobs || foDetails
```

RowRequest returns the requested information in a delta packet.

As implemented in TCustomProvider (see page 18449), RowRequest always returns NULL. Descendant classes override this method to return the requested data.

Communicating with the Client Dataset

124.1.4.5.25 TCustomProvider.SetActiveUpdateException Method

Pascal

```
procedure SetActiveUpdateException(E: Exception);
```

C++

```
__fastcall SetActiveUpdateException(Exception E);
```

Description

This is SetActiveUpdateException, a member of class TCustomProvider.

124.1.4.6 TCustomProvider Properties

The properties of the TCustomProvider class are listed here.

Protected Properties

	Name	Description
R	ActiveUpdateException (see page 18474)	This is ActiveUpdateException, a member of class TCustomProvider.
	OwnerData (see page 18475)	This is OwnerData, a member of class TCustomProvider.

Public Properties

	Name	Description
R	Data (see page 18474)	Denotes a data packet created by the provider.
	Exported (see page 18474)	Allows client applications to pass calls to the provider when it resides on an application server.

124.1.4.6.1 TCustomProvider.ActiveUpdateException Property

Pascal

```
property ActiveUpdateException: Exception;
```

C++

```
__property Exception ActiveUpdateException;
```

Description

This is ActiveUpdateException, a member of class TCustomProvider.

124.1.4.6.2 TCustomProvider.Data Property

Denotes a data packet created by the provider.

Pascal

```
property Data: OleVariant;
```

C++

```
__property OleVariant Data;
```

Description

Data is a read-only property that provides access to a data packet containing all records. Reading Data calls GetRecords (see page 18468) with a parameter of -1.

As implemented in TCustomProvider (see page 18449), GetRecords (see page 18468) returns NULL. Descendants of TCustomProvider (see page 18449) reimplement the GetRecords (see page 18468) method to implement the Data property.

See Also

GetRecords (see page 18468)

124.1.4.6.3 TCustomProvider.Exported Property

Allows client applications to pass calls to the provider when it resides on an application server.

Pascal

```
property Exported: Boolean;
```

C++

```
__property Boolean Exported;
```

Description

Use Exported to indicate whether the provider is made available to clients of a remote data module that owns it. When Exported is true, client applications can specify the provider as a target for calls made using the IAppServer interface. When Exported is false, IAppServer calls that specify the provider cause an exception.

Note: In addition to the Exported property, the provider must be registered with the remote data module for clients to access it using the data module's IAppServer interface. When the provider's Owner is the remote data module, it is automatically registered. If the provider has a different owner, the server application must explicitly register providers using the remote data module's RegisterProvider method.

See Also

IAppServer (see page 16450)

Providers (see page 19908)

registerprovider (see page 19902)

124.1.4.6.4 TCustomProvider.OwnerData Property

Pascal

```
property OwnerData: OleVariant;
```

C++

```
__property OleVariant OwnerData;
```

Description

This is OwnerData, a member of class TCustomProvider.

124.1.4.7 TCustomProvider Events

The events of the TCustomProvider class are listed here.

Protected Events

	Name	Description
	AfterApplyUpdates (see page 18475)	Occurs after the provider applies updates.
	AfterExecute (see page 18476)	Occurs after the provider passes an execute command to its dataset.
	AfterGetParams (see page 18477)	This is AfterGetParams, a member of class TCustomProvider.
	AfterGetRecords (see page 18477)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 18478)	Occurs after the provider fetches new information about the current record.
	BeforeApplyUpdates (see page 18479)	Occurs before the provider applies updates from a client dataset.
	BeforeExecute (see page 18479)	This is BeforeExecute, a member of class TCustomProvider.
	BeforeGetParams (see page 18480)	Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.
	BeforeGetRecords (see page 18480)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 18482)	Occurs before the provider creates a delta packet with information about the current record.
	OnDataRequest (see page 18482)	Occurs when a provider calls its DataRequest (see page 18460) method.
	OnValidate (see page 18483)	This is OnValidate, a member of class TCustomProvider.

124.1.4.7.1 TCustomProvider.AfterApplyUpdates Event

Occurs after the provider applies updates.

Pascal

```
property AfterApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterApplyUpdates;
```

Description

Write an AfterApplyUpdates event handler to return custom information to a client dataset after applying updates. AfterApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_ApplyUpdates method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeApplyUpdates (see page 18479) event, where it can respond to or change custom information that the client dataset sends.

2.If it is a dataset provider, the provider receives an OnUpdateData event where it can edit the updates before they are applied.

3. The provider applies the updates, and attempts to resolve problems.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData (see page 18475) parameter or respond to information from the BeforeApplyUpdates (see page 18479) event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates event handler.

Note: If ApplyUpdates (see page 18459) is called without the OwnerData (see page 18475) parameter, on entry to the event handler the OwnerData (see page 18475) parameter contains the value set in the BeforeApplyUpdates (see page 18479) event handler and it is ignored on exit from the AfterApplyUpdates event handler.

See Also

applyupdates (see page 18459)

Responding to Client Update Requests

Communicating with the Client Dataset

124.1.4.7.2 TCustomProvider.AfterExecute Event

Occurs after the provider passes an execute command to its dataset.

Pascal

```
property AfterExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterExecute;
```

Description

Write an AfterExecute event handler to return custom information to a client dataset after executing a query or stored procedure. AfterExecute is part of the mechanism by which a client dataset and a provider communicate information when executing queries or stored procedures that do not return a cursor. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_Execute method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeExecute (see page 18479) event, where it can respond to or change custom information that the client dataset sends.

2.The provider dispatches its Execute (see page 18466) method to execute a query or stored procedure.

3.The provider receives an AfterExecute event, where it can encode custom information into its OwnerData (see page 18475) parameter or respond to information from the BeforeExecute (see page 18479) event handler.

4.The client dataset receives an AfterExecute event, where it can respond to the custom information returned by the provider in its AfterExecute event handler.

See Also

Execute (see page 18466)

AS_Execute (see page 16453)

Execute (see page 8413)

AfterExecute (see page 8504)

Communicating with the Client Dataset

124.1.4.7.3 TCustomProvider.AfterGetParams Event

Pascal

```
property AfterGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetParams;
```

Description

This is AfterGetParams, a member of class TCustomProvider.

124.1.4.7.4 TCustomProvider.AfterGetRecords Event

Occurs after the provider creates a data packet to send to the client dataset.

Pascal

```
property AfterGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetRecords;
```

Description

Write an AfterGetRecords event handler to send custom information to a client dataset when providing a data packet. AfterGetRecords is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_GetRecords method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeGetRecords (see page 18480) event, where it can respond to or change custom information that the client dataset sends.

2.If it is a dataset provider, the provider receives an OnGetData event where it can edit the data before creating a data packet, and then generates the data packet.

3.The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData (see page 18475) parameter or respond to information from the BeforeGetRecords (see page 18480) event handler.

4.The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider in its AfterGetRecords event handler.

Communicating with the Client Dataset

Responding to Client Data Requests

124.1.4.7.5 TCustomProvider.AfterRowRequest Event

Occurs after the provider fetches new information about the current record.

Pascal

```
property AfterRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterRowRequest;
```

Description

Write an AfterRowRequest event handler to send custom information to a client dataset along with information about the current record. AfterRowRequest is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_RowRequest method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeRowRequest (see page 18482) event, where it can respond to or change custom information that the client dataset sends.

2.The provider creates a delta packet that contains the requested information.

3.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData (see page 18475) parameter or respond to information from the BeforeRowRequest (see page 18482) event handler.

4.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider in its AfterRowRequest event handler.

Communicating with the Client Dataset

124.1.4.7.6 TCustomProvider.BeforeApplyUpdates Event

Occurs before the provider applies updates from a client dataset.

Pascal

```
property BeforeApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeApplyUpdates;
```

Description

Write a BeforeApplyUpdates event handler to respond to custom information from a client dataset. BeforeApplyUpdates is part of the mechanism by which a provider and a client dataset communicate information about updates. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset's ApplyUpdates (see page 18459) method is called, the following events occur:

1.The client dataset receives a BeforeApplyUpdates event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeApplyUpdates event, where the OleVariant from the client dataset appears as the OwnerData (see page 18475) parameter. The provider can respond to or change that information before applying the updates.

3.If it is a dataset provider, the provider applies the updates, and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates (see page 18475) event, where it can encode custom information into its OwnerData (see page 18475) parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates (see page 18475) event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates (see page 18475) event handler.

Note: If ApplyUpdates (see page 18459) is called without the OwnerData (see page 18475) parameter, the OwnerData (see page 18475) parameter is nil (Delphi) or NULL (C++) on entry to the event handler and its value (on exit) is only passed to the AfterApplyUpdates (see page 18475) event handler but not returned to the caller.

Communicating with the Client Dataset

124.1.4.7.7 TCustomProvider.BeforeExecute Event

Pascal

```
property BeforeExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeExecute;
```

Description

This is BeforeExecute, a member of class TCustomProvider.

124.1.4.7.8 TCustomProvider.BeforeGetParams Event

Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.

Pascal

```
property BeforeGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetParams;
```

Description

Write a BeforeGetParams event handler to respond to custom information from a client dataset. BeforeGetParams is part of the mechanism by which a provider and a client dataset communicate information during parameter fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches parameter values from the provider, the following events occur:

1.The client dataset receives a BeforeGetParams event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeGetParams event, where the OleVariant from the client dataset appears as the OwnerData (see page 18475) parameter. The provider can respond to or change that information before it fetches and encodes the parameter values.

3.The provider generates an OleVariant for the current parameter values of its dataset, if appropriate.

4.The provider receives an AfterGetParams (see page 18477) event, where it can encode custom information into its OwnerData (see page 18475) parameter or respond to information from the BeforeGetParams event handler.

5.The client dataset receives an AfterGetParams (see page 18477) event, where it can respond to the custom information returned by the provider in its AfterGetParams (see page 18477) event handler.

See Also

AS_GetParams (see page 16454)

BeforeGetParams (see page 8514)

aftergetparams (see page 18477)

Communicating with the Client Dataset

124.1.4.7.9 TCustomProvider.BeforeGetRecords Event

Occurs before the provider creates a data packet and sends it to a client dataset.

Pascal

```
property BeforeGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetRecords;
```

Description

Write a BeforeGetRecords event handler to respond to custom information from a client dataset. BeforeGetRecords is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches data from the provider, the following events occur:

1.The client dataset receives a BeforeGetRecords event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeGetRecords event, where the OleVariant from the client dataset appears as the OwnerData (see page 18475) parameter. The provider can respond to or change that information before it creates a data packet.

3.The provider generates the data packet.

4.The provider receives an AfterGetRecords (see page 18477) event, where it can encode custom information into its OwnerData (see page 18475) parameter or respond to information from the BeforeGetRecords event handler.

5.The client dataset receives an AfterGetRecords (see page 18477) event, where it can respond to the custom information returned by the provider in its AfterGetRecords (see page 18477) event handler.

Delphi Examples:

```
{
This example shows the implementation of a provider BeforeGetRecords
event handler and a RemoteDataModule UpdateRegistry method.  The
complete project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TPooledRDM.DataSetProvider1BeforeGetRecords(Sender: TObject;
  var OwnerData: OleVariant);
begin
  try
    Query1.Close;
    Query1.SQL.Text := OwnerData[0];
    if not VarIsNull(OwnerData[1]) and not VarIsEmpty(OwnerData[1]) then
    begin
      Query1.Open;
      if not Query1.Locate(Query1.Fields[0].FieldName, OwnerData[1], []) then
        raise Exception.Create('Record not found');
      Query1.Next;
    end;
  finally
    OwnerData := NULL;
  end;
end;
```

Responding to Client Data Requests

124.1.4.7.10 TCustomProvider.BeforeRowRequest Event

Occurs before the provider creates a delta packet with information about the current record.

Pascal

```
property BeforeRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeRowRequest;
```

Description

Write a BeforeRowRequest event handler to respond to custom information from a client dataset. BeforeRowRequest is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeRowRequest event, where the custom information appears as the OwnerData (see page 18475) parameter. The provider can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest (see page 18478) event, where it can encode custom information into its OwnerData (see page 18475) parameter or respond to information from the BeforeRowRequest event handler.

5.The client dataset receives an AfterRowRequest (see page 18478) event, where it can respond to the custom information returned by the provider in its AfterRowRequest (see page 18478) event handler.

Communicating with the Client Dataset

124.1.4.7.11 TCustomProvider.OnDataRequest Event

Occurs when a provider calls its DataRequest (see page 18460) method.

Pascal

```
property OnDataRequest: TDataRequestEvent;
```

C++

```
__property TDataRequestEvent OnDataRequest;
```

Description

Write an OnDataRequest event handler to do custom processing of data. OnDataRequest has no built-in use. Instead, it allows developers to augment the IAppServer interface so that clients in a multi-tiered application can communicate directly with an individual provider.

If an application does not provide an OnDataRequest event handler, calls to DataRequest (see page 18460) return NULL.

Note: To provide the same sort of custom processing on the client side, use an automation method on the connection component.

124.1.4.7.12 TCustomProvider.OnValidate Event

Pascal

```
property OnValidate: TOnValidate;
```

C++

```
__property TOnValidate OnValidate;
```

Description

This is OnValidate, a member of class TCustomProvider.

124.1.5 TCustomResolver Class

TCustomResolver is the base class for components that apply updates on behalf of a provider.

Class Hierarchy

Pascal

```
TCustomResolver = class(TComponent);
```

C++

```
class TCustomResolver : public TComponent;
```

File

Provider

Description

TCustomResolver defines the fundamental properties and methods used by resolver components for applying updates from a client dataset or XML broker and resolving errors that occur as part of that update process.

TCustomResolver has two descendants: TDataSetResolver (see page 18544), which applies updates to a dataset, and TSQLResolver (see page 18589), which applies updates directly to a database server.

Do not create resolver instances. Provider (see page 18496) components create their own TCustomResolver descendants for applying updates.

124.1.5.1 TCustomResolver Members

The following tables list the members exposed by TCustomResolver.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	BeginUpdate (see page 18490)	Provides the interface for a method that performs any initialization before applying updates.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
A	DoDelete (see page 18491)	Defines a method that deletes a record.
A	DoInsert (see page 18491)	Defines a method that inserts a record.
A	DoUpdate (see page 18491)	Defines a method that modifies a record.
V	EndUpdate (see page 18492)	Provides the interface for a method that performs any finalization after applying updates.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleUpdateError (see page 18493)	Manages the resolving process when errors occur while applying updates.

	InitializeConflictBuffer (see page 18493)	Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LogUpdateError (see page 18495)	This is LogUpdateError, a member of class TCustomResolver.
	LogUpdateRecord (see page 18495)	Adds records to the error log if their data has been changed by another application.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	ApplyUpdates (see page 18490)	Applies updates received from a provider.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18487)	Creates and initializes a resolver.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 18487)	Frees an instance of a resolver object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.

	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	FreeTreeData (see page 18492)	This is FreeTreeData, a member of class TCustomResolver.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	InitKeyFields (see page 18494)	Sets the provider flag pfInKey on all key fields in a delta data packet.
V	InitTreeData (see page 18494)	This is InitTreeData, a member of class TCustomResolver.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	InternalBeforeResolve (see page 18494)	Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.
V	InternalUpdateRecord (see page 18495)	Manages the updating process once a delta packet is wrapped in a TUpdateTree (see page 18600) object.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	RowRequest (see page 18496)	Returns information from a specified record.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.

R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Provider (see page 18496)	Indicates the provider that uses this resolver to apply updates.
R	UpdateTree (see page 18497)	This is UpdateTree, a member of class TCustomResolver.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

Strict private Fields

	Name	Description
	FErrorCount (see page 18488)	This is FErrorCount, a member of class TCustomResolver.
	FMaxErrors (see page 18488)	This is FMaxErrors, a member of class TCustomResolver.
	FPrevResponse (see page 18488)	This is FPrevResponse, a member of class TCustomResolver.
	FProvider (see page 18489)	This is FProvider, a member of class TCustomResolver.
	FUpdateTree (see page 18489)	This is FUpdateTree, a member of class TCustomResolver.

124.1.5.2 TCustomResolver.Create Constructor

Creates and initializes a resolver.

Pascal

```
constructor Create(AProvider: TBaseProvider); reintroduce;
```

C++

```
__fastcall TCustomResolver(TBaseProvider AProvider);
```

Description

Provider (see page 18496) components call the TCustomResolver (see page 18483) constructor when they need a resolver component for applying updates. The AProvider parameter specifies the provider that creates and uses the resolver.

Do not create resolver instances directly. Resolvers are designed to be created and used by providers, and can not function independently of a provider.

See Also

Resolver (see page 18441)

124.1.5.3 TCustomResolver.Destroy Destructor

Frees an instance of a resolver object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomResolver();
```

Description

Applications rarely have to destroy resolvers explicitly. Once a resolver has been assigned as the Resolver property of a provider, the provider is responsible for freeing the resolver.

See Also

Free (see page 22300)

Resolver (see page 18441)

124.1.5.4 TCustomResolver Fields

The fields of the TCustomResolver class are listed here.

Strict private Fields

	Name	Description
	FErrorCount (see page 18488)	This is FErrorCount, a member of class TCustomResolver.
	FMaxErrors (see page 18488)	This is FMaxErrors, a member of class TCustomResolver.
	FPrevResponse (see page 18488)	This is FPrevResponse, a member of class TCustomResolver.
	FProvider (see page 18489)	This is FProvider, a member of class TCustomResolver.
	FUpdateTree (see page 18489)	This is FUpdateTree, a member of class TCustomResolver.

124.1.5.4.1 TCustomResolver.FErrorCount Field

Pascal

```
FErrorCount: Integer;
```

C++

```
int FErrorCount;
```

Description

This is FErrorCount, a member of class TCustomResolver.

124.1.5.4.2 TCustomResolver.FMaxErrors Field

Pascal

```
FMaxErrors: Integer;
```

C++

```
int FMaxErrors;
```

Description

This is FMaxErrors, a member of class TCustomResolver.

124.1.5.4.3 TCustomResolver.FPrevResponse Field

Pascal

```
FPrevResponse: TResolverResponse;
```

C++

```
TResolverResponse FPrevResponse;
```

Description

This is FPrevResponse, a member of class TCustomResolver.

124.1.5.4.4 TCustomResolver.FProvider Field

Pascal

```
FProvider: TBaseProvider;
```

C++

```
TBaseProvider FProvider;
```

Description

This is FProvider, a member of class TCustomResolver.

124.1.5.4.5 TCustomResolver.FUpdateTree Field

Pascal

```
FUpdateTree: TUpdateTree;
```

C++

```
TUpdateTree FUpdateTree;
```

Description

This is FUpdateTree, a member of class TCustomResolver.

124.1.5.5 TCustomResolver Methods

The methods of the TCustomResolver class are listed here.

Protected Methods

	Name	Description
V	BeginUpdate (see page 18490)	Provides the interface for a method that performs any initialization before applying updates.
A	DoDelete (see page 18491)	Defines a method that deletes a record.
A	DoInsert (see page 18491)	Defines a method that inserts a record.
A	DoUpdate (see page 18491)	Defines a method that modifies a record.
V	EndUpdate (see page 18492)	Provides the interface for a method that performs any finalization after applying updates.
V	HandleUpdateError (see page 18493)	Manages the resolving process when errors occur while applying updates.
A	InitializeConflictBuffer (see page 18493)	Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.
V	LogUpdateError (see page 18495)	This is LogUpdateError, a member of class TCustomResolver.
V	LogUpdateRecord (see page 18495)	Adds records to the error log if their data has been changed by another application.

Public Methods

	Name	Description
V	ApplyUpdates (see page 18490)	Applies updates received from a provider.
V	FreeTreeData (see page 18492)	This is FreeTreeData, a member of class TCustomResolver.
V	InitKeyFields (see page 18494)	Sets the provider flag pfInKey on all key fields in a delta data packet.
V	InitTreeData (see page 18494)	This is InitTreeData, a member of class TCustomResolver.
V	InternalBeforeResolve (see page 18494)	Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.
V	InternalUpdateRecord (see page 18495)	Manages the updating process once a delta packet is wrapped in a TUpdateTree (see page 18600) object.
V	RowRequest (see page 18496)	Returns information from a specified record.

124.1.5.5.1 TCustomResolver.ApplyUpdates Method

Applies updates received from a provider.

Pascal

```
function ApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount: Integer):
OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant ApplyUpdates(const OleVariant Delta, int MaxErrors, int
ErrorCount);
```

Description

Providers call ApplyUpdates to apply updates received from a client dataset or XML broker.

ApplyUpdates generates an OnUpdateData event on the associated provider, and then applies the updates passed in as the Delta parameter, returning an OleVariant that contains any updates that could not be applied.

The Delta parameter specifies a delta packet that contains the insertions, deletions, and modifications to be applied. MaxErrors indicates the maximum number of errors to permit before aborting the update operation. ErrorCount returns the actual number of errors encountered during the update operation. If ErrorCount is greater than MaxErrors, (or an OnUpdateError event returns rrAbort), all updates that have been successfully applied so far are rolled back, and the update process is aborted.

If the associated provider has an OnUpdateError event handler, it is called automatically whenever a record in Delta cannot be updated. In the OnUpdateError handler, applications can correct error conditions and try reapplying an update before returning unsuccessfully updated records back to the client dataset or XML broker.

See Also

OnUpdateData (see page 18443)

OnUpdateError (see page 18444)

applyupdates (see page 18459)

124.1.5.5.2 TCustomResolver.BeginUpdate Method

Provides the interface for a method that performs any initialization before applying updates.

Pascal

```
procedure BeginUpdate; virtual;
```

C++

```
virtual __fastcall BeginUpdate();
```

Description

The ApplyUpdates (see page 18490) method calls BeginUpdate before applying updates in a delta packet.

As implemented in TCustomResolver (see page 18483), BeginUpdate does nothing. Descendants that need take specific action before applying updates override this method.

See Also

EndUpdate (see page 18492)

ApplyUpdates (see page 18490)

124.1.5.5.3 TCustomResolver.DoDelete Method

Defines a method that deletes a record.

Pascal

```
procedure DoDelete(Tree: TUpdateTree); virtual; abstract;
```

C++

```
virtual __fastcall DoDelete(TUpdateTree Tree) = 0;
```

Description

DoDelete is one of several helper methods internal to the ApplyUpdates (see page 18490) method. These helper methods perform the actual updates in the delta packet. ApplyUpdates (see page 18490) wraps the delta packet in a TUpdateTree (see page 18600) object. For each record that must be deleted, the resolver calls DoDelete.

TCustomResolver (see page 18483) does not implement the DoDelete method. Descendants override this method to delete records in their own specialized way.

See Also

ApplyUpdates (see page 18490)

DoInsert (see page 18491)

DoUpdate (see page 18491)

124.1.5.5.4 TCustomResolver.DoInsert Method

Defines a method that inserts a record.

Pascal

```
procedure DoInsert(Tree: TUpdateTree); virtual; abstract;
```

C++

```
virtual __fastcall DoInsert(TUpdateTree Tree) = 0;
```

Description

DoInsert is one of several helper methods internal to the ApplyUpdates (see page 18490) method. These helper methods perform the actual updates in the delta packet. ApplyUpdates (see page 18490) wraps the delta packet in a TUpdateTree (see page 18600) object. For each record that must be inserted, the resolver calls DoInsert.

TCustomResolver (see page 18483) does not implement the DoInsert method. Descendants override this method to insert records in their own specialized way.

See Also

ApplyUpdates (see page 18490)

DoDelete (see page 18491)

DoUpdate (see page 18491)

124.1.5.5.5 TCustomResolver.DoUpdate Method

Defines a method that modifies a record.

Pascal

```
procedure DoUpdate(Tree: TUpdateTree); virtual; abstract;
```

C++

```
virtual __fastcall DoUpdate(TUpdateTree Tree) = 0;
```

Description

DoUpdate is one of several helper methods internal to the ApplyUpdates (see page 18490) method. These helper methods perform the actual updates passed in the delta packet. ApplyUpdates (see page 18490) wraps the delta packet in a TUpdateTree (see page 18600) object. For each record that must be modified, the resolver calls DoUpdate.

TCustomResolver (see page 18483) does not implement the DoUpdate method. Descendants override this method to insert records in their own specialized way.

See Also

ApplyUpdates (see page 18490)

DoDelete (see page 18491)

DoInsert (see page 18491)

124.1.5.5.6 TCustomResolver.EndUpdate Method

Provides the interface for a method that performs any finalization after applying updates.

Pascal

```
procedure EndUpdate; virtual;
```

C++

```
virtual __fastcall EndUpdate();
```

Description

The ApplyUpdates (see page 18490) method calls EndUpdate after applying updates.

As implemented in TCustomResolver (see page 18483), EndUpdate does nothing. Descendants that need take specific action after applying updates override this method.

See Also

BeginUpdate (see page 18490)

ApplyUpdates (see page 18490)

124.1.5.5.7 TCustomResolver.FreeTreeData Method

Pascal

```
procedure FreeTreeData(Tree: TUpdateTree); virtual;
```

C++

```
virtual __fastcall FreeTreeData(TUpdateTree Tree);
```

Description

This is FreeTreeData, a member of class TCustomResolver.

124.1.5.5.8 TCustomResolver.HandleUpdateError Method

Manages the resolving process when errors occur while applying updates.

Pascal

```
function HandleUpdateError(Tree: TUpdateTree; E: EUpdateError; var MaxErrors: Integer; var
ErrorCount: Integer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean HandleUpdateError(TUpdateTree Tree, EUpdateError E, int MaxErrors,
int ErrorCount);
```

Description

When a resolver encounters errors in applying updates, it calls HandleUpdateError to determine how to proceed. HandleUpdateError generates an OnUpdateError event on the associated provider so that applications have an opportunity to correct update errors. Depending on the response provided by the OnUpdateError handler (if any), HandleUpdateError logs the unresolved error or signals that the resolver should try to apply the (corrected) record again.

The Tree parameter specifies the TUpdateTree (see page 18600) that wraps all the updates currently being applied. The MaxErrors parameter indicates the maximum number of errors that the resolver will tolerate before the update operation is rolled back. The ErrorCount parameter specifies how many errors have been encountered so far.

HandleUpdateError returns true if the record has been corrected and the resolver should try to reapply the update. It returns false if the record is added to the error log.

See Also

OnUpdateError (see page 18444)

ApplyUpdates (see page 18490)

124.1.5.5.9 TCustomResolver.InitializeConflictBuffer Method

Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.

Pascal

```
procedure InitializeConflictBuffer(Tree: TUpdateTree); virtual; abstract;
```

C++

```
virtual __fastcall InitializeConflictBuffer(TUpdateTree Tree) = 0;
```

Description

The HandleUpdateError (see page 18493) method calls InitializeConflictBuffer before generating an OnUpdateError event. This ensures that the client dataset passed to an OnUpdateError event handler represents the update that caused the problem, with appropriate values for field's CurValue property.

Descendants of TCustomResolver (see page 18483) implement this method to obtain information from the dataset or server to which they are applying updates.

See Also

HandleUpdateError (see page 18493)

OnUpdateError (see page 18444)

124.1.5.5.10 TCustomResolver.InitKeyFields Method

Sets the provider flag pfInKey on all key fields in a delta data packet.

Pascal

```
procedure InitKeyFields(Tree: TUpdateTree; ADelta: TPacketDataSet); virtual;
```

C++

```
virtual __fastcall InitKeyFields(TUpdateTree Tree, TPacketDataSet ADelta);
```

Description

InitKeyFields is used internally to mark fields from a delta packet that can be used to uniquely identify records in the underlying dataset.

The Tree parameter is the internal TUpdateTree (see page 18600) that the resolver uses to store information about the delta packet. The ADelta parameter is the delta packet of changes to apply. For every field in this delta packet that acts as a key value to uniquely identify records, InitKeyFields adds pfInKey to its ProviderFlags property.

See Also

ProviderFlags (see page 7176)

124.1.5.5.11 TCustomResolver.InitTreeData Method

Pascal

```
procedure InitTreeData(Tree: TUpdateTree); virtual;
```

C++

```
virtual __fastcall InitTreeData(TUpdateTree Tree);
```

Description

This is InitTreeData, a member of class TCustomResolver.

124.1.5.5.12 TCustomResolver.InternalBeforeResolve Method

Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.

Pascal

```
procedure InternalBeforeResolve(Tree: TUpdateTree); virtual;
```

C++

```
virtual __fastcall InternalBeforeResolve(TUpdateTree Tree);
```

Description

The ApplyUpdates (see page 18490) method wraps delta packets in a TUpdateTree (see page 18600) object. Once this is complete, InternalBeforeResolve performs any other initialization before the updates are applied.

As implemented in TCustomResolver (see page 18483), InternalBeforeResolve does nothing. Descendants override this method to perform class-specific initialization.

See Also

ApplyUpdates (see page 18490)

inittreedata (see page 18494)

124.1.5.5.13 TCustomResolver.InternalUpdateRecord Method

Manages the updating process once a delta packet is wrapped in a TUpdateTree (see page 18600) object.

Pascal

```
function InternalUpdateRecord(Tree: TUpdateTree): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean InternalUpdateRecord(TUpdateTree Tree);
```

Description

InternalUpdateRecord orchestrates the updating process, ensuring that updates are applied in the correct order and that errors are resolved or logged. For each record that must be updated, InternalUpdateRecord

1.Generates a BeforeUpdateRecord event.

2.Applies the update.

3.Generates an AfterUpdateRecord event if the update is successful, or calls HandleUpdateError (see page 18493) to generate an OnUpdateError event.

See Also

ApplyUpdates (see page 18490)

beforeupdaterecord (see page 18442)

AfterUpdateRecord (see page 18442)

OnUpdateError (see page 18444)

HandleUpdateError (see page 18493)

124.1.5.5.14 TCustomResolver.LogUpdateError Method

Pascal

```
procedure LogUpdateError(Tree: TUpdateTree; E: EUpdateError; Response: TResolverResponse);
virtual;
```

C++

```
virtual __fastcall LogUpdateError(TUpdateTree Tree, EUpdateError E, TResolverResponse
Response);
```

Description

This is LogUpdateError, a member of class TCustomResolver.

124.1.5.5.15 TCustomResolver.LogUpdateRecord Method

Adds records to the error log if their data has been changed by another application.

Pascal

```
procedure LogUpdateRecord(Tree: TUpdateTree); virtual;
```

C++

```
virtual __fastcall LogUpdateRecord(TUpdateTree Tree);
```

Description

When the InternalUpdateRecord (see page 18495) method detects that a record includes other changes than those specified by an update in the delta packet, it calls LogUpdateRecord to add the changed and updated record to the error log so that the client dataset or XML broker can refresh the updated record. This error log is eventually returned by the ApplyUpdates (see page 18490) method when the update operation ends.

The Tree parameter represents the set of updates being applied.

See Also

logupdateerror (see page 18495)

InternalUpdateRecord (see page 18495)

124.1.5.5.16 TCustomResolver.RowRequest Method

Returns information from a specified record.

Pascal

```
function RowRequest(Row: OleVariant; Options: TFetchOptions): OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant RowRequest(OleVariant Row, TFetchOptions Options);
```

Description

RowRequest is called automatically in response to the associated provider's RowRequest method.

The Row parameter is an OleVariant that describes the record about which information is requested. The resolver uses this to locate the desired record.

The requested information is returned as a delta packet.

See Also

RowRequest (see page 18472)

124.1.5.6 TCustomResolver Properties

The properties of the TCustomResolver class are listed here.

Public Properties

	Name	Description
R	Provider (see page 18496)	Indicates the provider that uses this resolver to apply updates.
R	UpdateTree (see page 18497)	This is UpdateTree, a member of class TCustomResolver.

124.1.5.6.1 TCustomResolver.Provider Property

Indicates the provider that uses this resolver to apply updates.

Pascal

```
property Provider: TBaseProvider;
```

C++

```
__property TBaseProvider Provider;
```

Description

Provider is a read-only property that points to the provider that uses this resolver for applying updates. The Provider property is set in the constructor.

Resolvers use the Provider property internally to obtain information supplied in the provider's properties. They also use it to generate events on the provider at appropriate points in the update process.

See Also

Create (see page 18487)

Resolver (see page 18441)

124.1.5.6.2 TCustomResolver.UpdateTree Property

Pascal

```
property UpdateTree: TUpdateTree;
```

C++

```
__property TUpdateTree UpdateTree;
```

Description

This is UpdateTree, a member of class TCustomResolver.

124.1.6 TDataPacketWriter Class

Class Hierarchy

Pascal

```
TDataPacketWriter = class(TCustomPacketWriter);
```

C++

```
class TDataPacketWriter : public TCustomPacketWriter;
```

File

Provider

Description

This is class Provider.TDataPacketWriter.

124.1.6.1 TDataPacketWriter Members

The following tables list the members exposed by TDataPacketWriter.

Protected Fields

	Name	Description
	FBuffer (see page 18447)	This is FBuffer, a member of class TCustomPacketWriter.

Protected Methods

	Name	Description
V	AddAttribute (see page 18448)	This is AddAttribute, a member of class TCustomPacketWriter.
V	AddColumn (see page 18502)	This is AddColumn, a member of class TDataPacketWriter.
V	AddConstraints (see page 18502)	This is AddConstraints, a member of class TDataPacketWriter.
V	AddDataSetAttributes (see page 18502)	This is AddDataSetAttributes, a member of class TDataPacketWriter.
	AddExtraFieldProps (see page 18502)	This is AddExtraFieldProps, a member of class TDataPacketWriter.
V	AddFieldLinks (see page 18503)	This is AddFieldLinks, a member of class TDataPacketWriter.
V	AddIndexDefs (see page 18503)	This is AddIndexDefs, a member of class TDataPacketWriter.
	Check (see page 18448)	This is Check, a member of class TCustomPacketWriter.
	FreeInfoRecords (see page 18503)	This is FreeInfoRecords, a member of class TDataPacketWriter.
	GetFieldIdx (see page 18503)	This is GetFieldIdx, a member of class TDataPacketWriter.
	InitPutProcs (see page 18504)	This is InitPutProcs, a member of class TDataPacketWriter.
	PutADTField (see page 18504)	This is PutADTField, a member of class TDataPacketWriter.
	PutArrayField (see page 18504)	This is PutArrayField, a member of class TDataPacketWriter.
	PutBlobField (see page 18504)	This is PutBlobField, a member of class TDataPacketWriter.
	PutCalcField (see page 18505)	This is PutCalcField, a member of class TDataPacketWriter.
	PutDataSetField (see page 18505)	This is PutDataSetField, a member of class TDataPacketWriter.
	PutField (see page 18505)	This is PutField, a member of class TDataPacketWriter.
	PutStringField (see page 18505)	This is PutStringField, a member of class TDataPacketWriter.
	PutVarBytesField (see page 18505)	This is PutVarBytesField, a member of class TDataPacketWriter.
	PutWideStringField (see page 18506)	This is PutWideStringField, a member of class TDataPacketWriter.
	RefreshPutProcs (see page 18506)	This is RefreshPutProcs, a member of class TDataPacketWriter.
	SetDSWriter (see page 18448)	This is SetDSWriter, a member of class TCustomPacketWriter.
V	WriteDataSet (see page 18506)	This is WriteDataSet, a member of class TDataPacketWriter.
V	WriteMetaData (see page 18507)	This is WriteMetaData, a member of class TDataPacketWriter.

Protected Properties

	Name	Description
R	DSWriter (see page 18449)	This is DSWriter, a member of class TCustomPacketWriter.

Public Events

	Name	Description
	OnGetParams (see page 18508)	This is OnGetParams, a member of class TDataPacketWriter.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 18446)	Constructs an object and initializes its data before the object is first used.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18499)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetDataPacket (see page 18503)	This is GetDataPacket, a member of class TDataPacketWriter.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Reset (see page 18506)	This is Reset, a member of class TDataPacketWriter.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Constraints (see page 18507)	This is Constraints, a member of class TDataPacketWriter.
	Options (see page 18507)	This is Options, a member of class TDataPacketWriter.
	PacketOptions (see page 18507)	This is PacketOptions, a member of class TDataPacketWriter.

Strict private Fields

	Name	Description
	FConstraints (see page 18500)	This is FConstraints, a member of class TDataPacketWriter.
	FIDSWriter (see page 18447)	This is FIDSWriter, a member of class TCustomPacketWriter.
	FOnGetParams (see page 18500)	This is FOnGetParams, a member of class TDataPacketWriter.
	FOptions (see page 18500)	This is FOptions, a member of class TDataPacketWriter.
	FPacketOptions (see page 18501)	This is FPacketOptions, a member of class TDataPacketWriter.
	FPutFieldInfo (see page 18501)	This is FPutFieldInfo, a member of class TDataPacketWriter.

124.1.6.2 TDataPacketWriter.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataPacketWriter();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually

allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

124.1.6.3 TDataPacketWriter Fields

The fields of the TDataPacketWriter class are listed here.

Strict private Fields

	Name	Description
	FConstraints (see page 18500)	This is FConstraints, a member of class TDataPacketWriter.
	FOnGetParams (see page 18500)	This is FOnGetParams, a member of class TDataPacketWriter.
	FOptions (see page 18500)	This is FOptions, a member of class TDataPacketWriter.
	FPacketOptions (see page 18501)	This is FPacketOptions, a member of class TDataPacketWriter.
	FPutFieldInfo (see page 18501)	This is FPutFieldInfo, a member of class TDataPacketWriter.

124.1.6.3.1 TDataPacketWriter.FConstraints Field

Pascal

```
FConstraints: Boolean;
```

C++

```
Boolean FConstraints;
```

Description

This is FConstraints, a member of class TDataPacketWriter.

124.1.6.3.2 TDataPacketWriter.FOnGetParams Field

Pascal

```
FOnGetParams: TGetParamsEvent;
```

C++

```
TGetParamsEvent FOnGetParams;
```

Description

This is FOnGetParams, a member of class TDataPacketWriter.

124.1.6.3.3 TDataPacketWriter.FOptions Field

Pascal

```
FOptions: TProviderOptions;
```

C++

```
TProviderOptions FOptions;
```

Description

This is FOptions, a member of class TDataPacketWriter.

124.1.6.3.4 TDataPacketWriter.FPacketOptions Field

Pascal

```
FPacketOptions: TGetRecordOptions;
```

C++

```
TGetRecordOptions FPacketOptions;
```

Description

This is FPacketOptions, a member of class TDataPacketWriter.

124.1.6.3.5 TDataPacketWriter.FPutFieldInfo Field

Pascal

```
FPutFieldInfo: TInfoArray;
```

C++

```
TInfoArray FPutFieldInfo;
```

Description

This is FPutFieldInfo, a member of class TDataPacketWriter.

124.1.6.4 TDataPacketWriter Methods

The methods of the TDataPacketWriter class are listed here.

Protected Methods

	Name	Description
	AddColumn (see page 18502)	This is AddColumn, a member of class TDataPacketWriter.
	AddConstraints (see page 18502)	This is AddConstraints, a member of class TDataPacketWriter.
	AddDataSetAttributes (see page 18502)	This is AddDataSetAttributes, a member of class TDataPacketWriter.
	AddExtraFieldProps (see page 18502)	This is AddExtraFieldProps, a member of class TDataPacketWriter.
	AddFieldLinks (see page 18503)	This is AddFieldLinks, a member of class TDataPacketWriter.
	AddIndexDefs (see page 18503)	This is AddIndexDefs, a member of class TDataPacketWriter.
	FreeInfoRecords (see page 18503)	This is FreeInfoRecords, a member of class TDataPacketWriter.
	GetFieldIdx (see page 18503)	This is GetFieldIdx, a member of class TDataPacketWriter.
	InitPutProcs (see page 18504)	This is InitPutProcs, a member of class TDataPacketWriter.
	PutADTField (see page 18504)	This is PutADTField, a member of class TDataPacketWriter.
	PutArrayField (see page 18504)	This is PutArrayField, a member of class TDataPacketWriter.
	PutBlobField (see page 18504)	This is PutBlobField, a member of class TDataPacketWriter.
	PutCalcField (see page 18505)	This is PutCalcField, a member of class TDataPacketWriter.
	PutDataSetField (see page 18505)	This is PutDataSetField, a member of class TDataPacketWriter.
	PutField (see page 18505)	This is PutField, a member of class TDataPacketWriter.
	PutStringField (see page 18505)	This is PutStringField, a member of class TDataPacketWriter.
	PutVarBytesField (see page 18505)	This is PutVarBytesField, a member of class TDataPacketWriter.
	PutWideStringField (see page 18506)	This is PutWideStringField, a member of class TDataPacketWriter.
	RefreshPutProcs (see page 18506)	This is RefreshPutProcs, a member of class TDataPacketWriter.
	WriteDataSet (see page 18506)	This is WriteDataSet, a member of class TDataPacketWriter.

	WriteMetaData (see page 18507)	This is WriteMetaData, a member of class TDataPacketWriter.

Public Methods

	Name	Description
	GetDataPacket (see page 18503)	This is GetDataPacket, a member of class TDataPacketWriter.
	Reset (see page 18506)	This is Reset, a member of class TDataPacketWriter.

124.1.6.4.1 TDataPacketWriter.AddColumn Method

Pascal

```
procedure AddColumn(const Info: TPutFieldInfo); virtual;
```

C++

```
virtual __fastcall AddColumn(const TPutFieldInfo Info);
```

Description

This is AddColumn, a member of class TDataPacketWriter.

124.1.6.4.2 TDataPacketWriter.AddConstraints Method

Pascal

```
procedure AddConstraints(DataSet: TDataSet); virtual;
```

C++

```
virtual __fastcall AddConstraints(TDataSet DataSet);
```

Description

This is AddConstraints, a member of class TDataPacketWriter.

124.1.6.4.3 TDataPacketWriter.AddDataSetAttributes Method

Pascal

```
procedure AddDataSetAttributes(DataSet: TDataSet); virtual;
```

C++

```
virtual __fastcall AddDataSetAttributes(TDataSet DataSet);
```

Description

This is AddDataSetAttributes, a member of class TDataPacketWriter.

124.1.6.4.4 TDataPacketWriter.AddExtraFieldProps Method

Pascal

```
procedure AddExtraFieldProps(Field: TField);
```

C++

```
__fastcall AddExtraFieldProps(TField Field);
```

Description

This is AddExtraFieldProps, a member of class TDataPacketWriter.

124.1.6.4.5 TDataPacketWriter.AddFieldLinks Method

Pascal

```
procedure AddFieldLinks(const Info: TInfoArray); virtual;
```

C++

```
virtual __fastcall AddFieldLinks(const TInfoArray Info);
```

Description

This is AddFieldLinks, a member of class TDataPacketWriter.

124.1.6.4.6 TDataPacketWriter.AddIndexDefs Method

Pascal

```
procedure AddIndexDefs(DataSet: TDataSet; const Info: TInfoArray); virtual;
```

C++

```
virtual __fastcall AddIndexDefs(TDataSet DataSet, const TInfoArray Info);
```

Description

This is AddIndexDefs, a member of class TDataPacketWriter.

124.1.6.4.7 TDataPacketWriter.FreeInfoRecords Method

Pascal

```
procedure FreeInfoRecords(var Info: TInfoArray);
```

C++

```
__fastcall FreeInfoRecords(TInfoArray Info);
```

Description

This is FreeInfoRecords, a member of class TDataPacketWriter.

124.1.6.4.8 TDataPacketWriter.GetDataPacket Method

Pascal

```
procedure GetDataPacket(DataSet: TDataSet; var RecsOut: Integer; out Data: OleVariant);
virtual;
```

C++

```
virtual __fastcall GetDataPacket(TDataSet DataSet, int RecsOut, OleVariant Data);
```

Description

This is GetDataPacket, a member of class TDataPacketWriter.

124.1.6.4.9 TDataPacketWriter.GetFieldIdx Method

Pascal

```
function GetFieldIdx(const FieldName: WideString; const Info: TInfoArray): Integer;
```

C++

```
__fastcall int GetFieldIdx(const BSTR FieldName, const TInfoArray Info);
```

Description

This is GetFieldIdx, a member of class TDataPacketWriter.

124.1.6.4.10 TDataPacketWriter.InitPutProcs Method

Pascal

```
function InitPutProcs(ADataSet: TDataSet; var GlobalIdx: Integer): TInfoArray;
```

C++

```
__fastcall TInfoArray InitPutProcs(TDataSet ADataSet, int GlobalIdx);
```

Description

This is InitPutProcs, a member of class TDataPacketWriter.

124.1.6.4.11 TDataPacketWriter.PutADTField Method

Pascal

```
procedure PutADTField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutADTField(PPutFieldInfo Info);
```

Description

This is PutADTField, a member of class TDataPacketWriter.

124.1.6.4.12 TDataPacketWriter.PutArrayField Method

Pascal

```
procedure PutArrayField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutArrayField(PPutFieldInfo Info);
```

Description

This is PutArrayField, a member of class TDataPacketWriter.

124.1.6.4.13 TDataPacketWriter.PutBlobField Method

Pascal

```
procedure PutBlobField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutBlobField(PPutFieldInfo Info);
```

Description

This is PutBlobField, a member of class TDataPacketWriter.

124.1.6.4.14 TDataPacketWriter.PutCalcField Method

Pascal

```
procedure PutCalcField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutCalcField(PPutFieldInfo Info);
```

Description

This is PutCalcField, a member of class TDataPacketWriter.

124.1.6.4.15 TDataPacketWriter.PutDataSetField Method

Pascal

```
procedure PutDataSetField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutDataSetField(PPutFieldInfo Info);
```

Description

This is PutDataSetField, a member of class TDataPacketWriter.

124.1.6.4.16 TDataPacketWriter.PutField Method

Pascal

```
procedure PutField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutField(PPutFieldInfo Info);
```

Description

This is PutField, a member of class TDataPacketWriter.

124.1.6.4.17 TDataPacketWriter.PutStringField Method

Pascal

```
procedure PutStringField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutStringField(PPutFieldInfo Info);
```

Description

This is PutStringField, a member of class TDataPacketWriter.

124.1.6.4.18 TDataPacketWriter.PutVarBytesField Method

Pascal

```
procedure PutVarBytesField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutVarBytesField(PPutFieldInfo Info);
```

Description

This is PutVarBytesField, a member of class TDataPacketWriter.

124.1.6.4.19 TDataPacketWriter.PutWideStringField Method

Pascal

```
procedure PutWideStringField(Info: PPutFieldInfo);
```

C++

```
__fastcall PutWideStringField(PPutFieldInfo Info);
```

Description

This is PutWideStringField, a member of class TDataPacketWriter.

124.1.6.4.20 TDataPacketWriter.RefreshPutProcs Method

Pascal

```
procedure RefreshPutProcs(ADataSet: TDataSet; var Info: TInfoArray);
```

C++

```
__fastcall RefreshPutProcs(TDataSet ADataSet, TInfoArray Info);
```

Description

This is RefreshPutProcs, a member of class TDataPacketWriter.

124.1.6.4.21 TDataPacketWriter.Reset Method

Pascal

```
procedure Reset;
```

C++

```
__fastcall Reset();
```

Description

This is Reset, a member of class TDataPacketWriter.

124.1.6.4.22 TDataPacketWriter.WriteDataSet Method

Pascal

```
function WriteDataSet(DataSet: TDataSet; var Info: TInfoArray; RecsOut: Integer): Integer;
virtual;
```

C++

```
virtual __fastcall int WriteDataSet(TDataSet DataSet, TInfoArray Info, int RecsOut);
```

Description

This is WriteDataSet, a member of class TDataPacketWriter.

124.1.6.4.23 TDataPacketWriter.WriteMetaData Method

Pascal

```
procedure WriteMetaData(DataSet: TDataSet; const Info: TInfoArray; IsReference: Boolean =
False); virtual;
```

C++

```
virtual __fastcall WriteMetaData(TDataSet DataSet, const TInfoArray Info, Boolean IsReference
= False);
```

Description

This is WriteMetaData, a member of class TDataPacketWriter.

124.1.6.5 TDataPacketWriter Properties

The properties of the TDataPacketWriter class are listed here.

Public Properties

	Name	Description
	Constraints (see page 18507)	This is Constraints, a member of class TDataPacketWriter.
	Options (see page 18507)	This is Options, a member of class TDataPacketWriter.
	PacketOptions (see page 18507)	This is PacketOptions, a member of class TDataPacketWriter.

124.1.6.5.1 TDataPacketWriter.Constraints Property

Pascal

```
property Constraints: Boolean;
```

C++

```
__property Boolean Constraints;
```

Description

This is Constraints, a member of class TDataPacketWriter.

124.1.6.5.2 TDataPacketWriter.Options Property

Pascal

```
property Options: TProviderOptions;
```

C++

```
__property TProviderOptions Options;
```

Description

This is Options, a member of class TDataPacketWriter.

124.1.6.5.3 TDataPacketWriter.PacketOptions Property

Pascal

```
property PacketOptions: TGetRecordOptions;
```

C++

```
__property TGetRecordOptions PacketOptions;
```

Description

This is PacketOptions, a member of class TDataPacketWriter.

124.1.6.6 TDataPacketWriter Events

The events of the TDataPacketWriter class are listed here.

Public Events

	Name	Description
	OnGetParams (see page 18508)	This is OnGetParams, a member of class TDataPacketWriter.

124.1.6.6.1 TDataPacketWriter.OnGetParams Event

Pascal

```
property OnGetParams: TGetParamsEvent;
```

C++

```
__property TGetParamsEvent OnGetParams;
```

Description

This is OnGetParams, a member of class TDataPacketWriter.

124.1.7 TDataSetProvider Class

TDataSetProvider provides data from a dataset and resolves updates to that dataset or its database server.

Class Hierarchy

Pascal

```
TDataSetProvider = class(TBaseProvider);
```

C++

```
class TDataSetProvider : public TBaseProvider;
```

File

Provider

Description

Use TDataSetProvider to provide data from a dataset to a client dataset or XML broker and to resolve updates from that client dataset or XML broker back to the dataset or to its underlying database server. TDataSetProvider can be a part of the same application as the client dataset or XML broker, or it can be placed in the application server of a multi-tiered application. It serves as a data broker between a remote database server and a client dataset.

TDataSetProvider packages data from a dataset and passes it in one or more transportable data packets to the client dataset or XML broker. The client dataset reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the database or source dataset.

When the provider supplies data to a client dataset, the client dataset reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the database or source dataset.

When the provider supplies data to an XML broker, the XML broker adds the data packet, in XML format, to an HTML document that is downloaded by a Web client. When the XML broker receives updates from the Web client, it sends the updates to the provider, which applies them to the database or source dataset.

Client datasets and XML brokers communicate with a provider through the IAppServer interface. In multi-tiered applications, this is the interface of the remote data module that contains the provider. To enable the remote data module to pass calls to the provider, the provider's Exported (see page 18530) property must be true, and its Owner property must specify the remote data module.

Determining the Source of Data

Using Provider Components

124.1.7.1 TDataSetProvider Members

The following tables list the members exposed by TDataSetProvider.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckDataSet (see page 18518)	This is CheckDataSet, a member of class TDataSetProvider.
	CheckResolver (see page 18433)	Instantiates a resolver for the Resolver (see page 18441) property if it does not already exist.
V	CreateDataPacket (see page 18518)	Generates a data packet for the data associated with the provider.
V	CreateResolver (see page 18519)	Creates a resolver component for handling the application of updates.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterApplyUpdates (see page 18460)	Generates an AfterApplyUpdates (see page 18475) event.
V	DoAfterExecute (see page 18461)	Generates an AfterExecute (see page 18476) event.
V	DoAfterGetParams (see page 18461)	Generates an AfterGetParams (see page 18477) event.
V	DoAfterGetRecords (see page 18462)	Generates an AfterGetRecords (see page 18477) event.
V	DoAfterRowRequest (see page 18462)	Generates an AfterRowRequest (see page 18478) event.

	DoAfterUpdateRecord (see page 18434)	Generates an AfterUpdateRecord (see page 18442) event.
	DoApplyUpdates (see page 18463)	This is DoApplyUpdates, a member of class TCustomProvider.
	DoBeforeApplyUpdates (see page 18463)	Generates a BeforeApplyUpdates (see page 18479) event.
	DoBeforeCommit (see page 18435)	This is DoBeforeCommit, a member of class TBaseProvider.
	DoBeforeExecute (see page 18519)	Generates a BeforeExecute (see page 18538) event.
	DoBeforeGetParams (see page 18464)	Generates a BeforeGetParams (see page 18480) event.
	DoBeforeGetRecords (see page 18520)	Generates a BeforeGetRecords (see page 18539) event.
	DoBeforeRowRequest (see page 18465)	Generates a BeforeRowRequest (see page 18482) event.
	DoBeforeUpdateRecord (see page 18435)	This is DoBeforeUpdateRecord, a member of class TBaseProvider.
	DoGetProviderAttributes (see page 18521)	Fills a list with information about the dataset that can be used when providing or resolving.
	DoGetRecords (see page 18466)	This is DoGetRecords, a member of class TCustomProvider.
	DoGetTableName (see page 18521)	Generates an OnGetTableName (see page 18542) event.
	DoOnGetData (see page 18435)	Generates an OnGetData (see page 18443) event.
	DoOnUpdateData (see page 18435)	Generates an OnUpdateData (see page 18443) event.
	FetchDetails (see page 18521)	Fills a delta dataset with all nested dataset field values.
	FindRecord (see page 18522)	This is FindRecord, a member of class TDataSetProvider.
	FreeResolver (see page 18436)	Frees the resolver specified by the Resolver (see page 18441) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDataSetFromDelta (see page 18522)	Returns a dataset positioned on the record of the source dataset that is currently being fetched or updated.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InternalApplyUpdates (see page 18522)	Provides the underlying implementation of the ApplyUpdates (see page 18459) method.
	InternalExecute (see page 18523)	Provides the underlying implementation of the Execute method.
	InternalGetParams (see page 18524)	Returns the requested parameter values as a Variant array.
	InternalGetRecords (see page 18524)	Provides the underlying implementation of the GetRecords (see page 18468) method.
	InternalRowRequest (see page 18525)	Provides the underlying implementation of the RowRequest (see page 18472) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 18525)	Positions a data set on the record that corresponds to the current update in a specified delta packet.
	Notification (see page 18526)	Responds to notifications that objects are being created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	Reset (see page 18526)	This is Reset, a member of class TDataSetProvider.
	SetActiveUpdateException (see page 18473)	This is SetActiveUpdateException, a member of class TCustomProvider.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetCommandText (see page 18526)	This is SetCommandText, a member of class TDataSetProvider.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.

	SetParams (see page 18527)	This is SetParams, a member of class TDataSetProvider.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRecord (see page 18527)	Retrieves specified data from a source dataset into a delta packet.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	PacketDataSet (see page 18440)	This is PacketDataSet, a member of class TBaseProvider.
	TransactionStarted (see page 18532)	This is TransactionStarted, a member of class TDataSetProvider.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	ApplyUpdates (see page 18459)	This is the overview for the ApplyUpdates method overload.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18514)	Creates and initializes a TDataSetProvider (see page 18508) object.
	DataRequest (see page 18460)	Generates an OnDataRequest (see page 18482) event.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 18514)	Frees an instance of a data set provider.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 18466)	Executes a query, stored procedure, or custom SQL statement.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.

	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParams (see page 18467)	Returns the current parameter values.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetRecords (see page 18468)	This is the overview for the GetRecords method overload.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	RowRequest (see page 18472)	Returns information from a specified record.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	ActiveUpdateException (see page 18528)	This is ActiveUpdateException, a member of class TDataSetProvider.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 18474)	Denotes a data packet created by the provider.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	OwnerData (see page 18531)	This is OwnerData, a member of class TDataSetProvider.
R	Params (see page 18531)	Stores the parameter values currently in use.
R	Resolver (see page 18441)	Provides access to the resolver component that applies updates and resolves update errors.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterApplyUpdates (see page 18533)	Occurs after the provider applies updates.
	AfterExecute (see page 18534)	Occurs after the provider passes an execute command to its dataset.
	AfterGetParams (see page 18535)	This is AfterGetParams, a member of class TDataSetProvider.
	AfterGetRecords (see page 18535)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 18536)	Occurs after the provider fetches new information about the current record.
	AfterUpdateRecord (see page 18536)	Occurs when the associated resolver has just updated a record.
	BeforeApplyUpdates (see page 18537)	Occurs before the provider applies updates from a client dataset.
	BeforeExecute (see page 18538)	This is BeforeExecute, a member of class TDataSetProvider.
	BeforeGetParams (see page 18538)	Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.
	BeforeGetRecords (see page 18539)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 18540)	Occurs before the provider creates a delta packet with information about the current record.
	BeforeUpdateRecord (see page 18541)	This is BeforeUpdateRecord, a member of class TDataSetProvider.
	OnDataRequest (see page 18541)	Occurs when a provider calls its DataRequest method.
	OnGetData (see page 18541)	Occurs after a provider retrieves data but before it is sent to the client.
	OnGetDataSetProperties (see page 18542)	Occurs when the provider adds additional information to a data packet it is creating.
	OnGetTableName (see page 18542)	This is OnGetTableName, a member of class TDataSetProvider.
	OnUpdateData (see page 18543)	Occurs when a provider begins to apply updates.
	OnUpdateError (see page 18543)	Occurs when a provider can't update a record because of an error condition.
	OnValidate (see page 18544)	This is OnValidate, a member of class TDataSetProvider.

Published Properties

	Name	Description
	Constraints (see page 18528)	Controls (see page 5711) whether database constraints are passed to the client so that it can check them locally.
	DataSet (see page 18529)	Specifies the dataset from which the provider provides data and to which it applies updates.
	Exported (see page 18530)	Allows client applications to pass calls to the provider when it resides on an application server.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Options (see page 18530)	Influences what is included in data packets and how the information in data packets is used.
	ResolveToDataSet (see page 18531)	Specifies whether updates should be applied to a dataset or directly to the database server.
	Tag (see page 2808)	Stores an integer value as part of a component.
	UpdateMode (see page 18532)	Controls how the provider locates records when applying updates.

Strict private Fields

	Name	Description
	FActiveUpdateAbortException (see page 18455)	This is FActiveUpdateAbortException, a member of class TCustomProvider.
	FAfterApplyUpdates (see page 18455)	This is FAfterApplyUpdates, a member of class TCustomProvider.
	FAfterExecute (see page 18456)	This is FAfterExecute, a member of class TCustomProvider.
	FAfterGetParams (see page 18456)	This is FAfterGetParams, a member of class TCustomProvider.
	FAfterGetRecords (see page 18456)	This is FAfterGetRecords, a member of class TCustomProvider.
	FAfterRowRequest (see page 18456)	This is FAfterRowRequest, a member of class TCustomProvider.
	FAfterUpdateRecord (see page 18430)	This is FAfterUpdateRecord, a member of class TBaseProvider.
	FBeforeApplyUpdates (see page 18456)	This is FBeforeApplyUpdates, a member of class TCustomProvider.
	FBeforeCommit (see page 18430)	This is FBeforeCommit, a member of class TBaseProvider.
	FBeforeExecute (see page 18457)	This is FBeforeExecute, a member of class TCustomProvider.
	FBeforeGetParams (see page 18457)	This is FBeforeGetParams, a member of class TCustomProvider.
	FBeforeGetRecords (see page 18457)	This is FBeforeGetRecords, a member of class TCustomProvider.
	FBeforeRowRequest (see page 18457)	This is FBeforeRowRequest, a member of class TCustomProvider.

	FBeforeUpdateRecord (see page 18431)	This is FBeforeUpdateRecord, a member of class TBaseProvider.
	FConstraints (see page 18515)	This is FConstraints, a member of class TDataSetProvider.
	FDataDS (see page 18431)	This is FDataDS, a member of class TBaseProvider.
	FDataSet (see page 18515)	This is FDataSet, a member of class TDataSetProvider.
	FDataSetOpened (see page 18516)	This is FDataSetOpened, a member of class TDataSetProvider.
	FDSWriter (see page 18516)	This is FDSWriter, a member of class TDataSetProvider.
	FExported (see page 18458)	This is FExported, a member of class TCustomProvider.
	FGetDSProps (see page 18516)	This is FGetDSProps, a member of class TDataSetProvider.
	FGetTableName (see page 18516)	This is FGetTableName, a member of class TDataSetProvider.
	FOnDataRequest (see page 18458)	This is FOnDataRequest, a member of class TCustomProvider.
	FOnGetData (see page 18431)	This is FOnGetData, a member of class TBaseProvider.
	FOnUpdateData (see page 18431)	This is FOnUpdateData, a member of class TBaseProvider.
	FOnUpdateError (see page 18432)	This is FOnUpdateError, a member of class TBaseProvider.
	FOnValidate (see page 18458)	This is FOnValidate, a member of class TCustomProvider.
	FOwnerData (see page 18458)	This is FOwnerData, a member of class TCustomProvider.
	FParams (see page 18516)	This is FParams, a member of class TDataSetProvider.
	FProviderOptions (see page 18432)	This is FProviderOptions, a member of class TBaseProvider.
	FRecordsSent (see page 18517)	This is FRecordsSent, a member of class TDataSetProvider.
	FResolver (see page 18432)	This is FResolver, a member of class TBaseProvider.
	FResolveToDataSet (see page 18517)	This is FResolveToDataSet, a member of class TDataSetProvider.
	FTransactionStarted (see page 18517)	This is FTransactionStarted, a member of class TDataSetProvider.
	FUpdateMode (see page 18432)	This is FUpdateMode, a member of class TBaseProvider.

Strict private Methods

	Name	Description
	GetData (see page 18467)	This is GetData, a member of class TCustomProvider.
	SetDataSet (see page 18527)	This is SetDataSet, a member of class TDataSetProvider.
	SetResolveToDataSet (see page 18527)	This is SetResolveToDataSet, a member of class TDataSetProvider.

124.1.7.2 TDataSetProvider.Create Constructor

Creates and initializes a TDataSetProvider (see page 18508) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TDataSetProvider(TComponent * AOwner);
```

Description

Call Create to instantiate a provider at runtime. Providers placed in forms or data modules at design time are created automatically.

Create (see page 18429)

124.1.7.3 TDataSetProvider.Destroy Destructor

Frees an instance of a data set provider.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataSetProvider();
```

Description

Do not call Destroy directly. Instead, call Free, which checks that the reference to the provider is not nil before calling its Destroy method. Destroy frees all helper objects, including the resolver component referenced by the Resolver (see page 18441) property.

See Also

Free (see page 22300)

Resolver (see page 18441)

124.1.7.4 TDataSetProvider Fields

The fields of the TDataSetProvider class are listed here.

Strict private Fields

	Name	Description
	FConstraints (see page 18515)	This is FConstraints, a member of class TDataSetProvider.
	FDataSet (see page 18515)	This is FDataSet, a member of class TDataSetProvider.
	FDataSetOpened (see page 18516)	This is FDataSetOpened, a member of class TDataSetProvider.
	FDSWriter (see page 18516)	This is FDSWriter, a member of class TDataSetProvider.
	FGetDSProps (see page 18516)	This is FGetDSProps, a member of class TDataSetProvider.
	FGetTableName (see page 18516)	This is FGetTableName, a member of class TDataSetProvider.
	FParams (see page 18516)	This is FParams, a member of class TDataSetProvider.
	FRecordsSent (see page 18517)	This is FRecordsSent, a member of class TDataSetProvider.
	FResolveToDataSet (see page 18517)	This is FResolveToDataSet, a member of class TDataSetProvider.
	FTransactionStarted (see page 18517)	This is FTransactionStarted, a member of class TDataSetProvider.

124.1.7.4.1 TDataSetProvider.FConstraints Field

Pascal

```
FConstraints: Boolean;
```

C++

```
Boolean FConstraints;
```

Description

This is FConstraints, a member of class TDataSetProvider.

124.1.7.4.2 TDataSetProvider.FDataSet Field

Pascal

```
FDataSet: TDataSet;
```

C++

```
TDataSet FDataSet;
```

Description

This is FDataSet, a member of class TDataSetProvider.

124.1.7.4.3 TDataSetProvider.FDataSetOpened Field

Pascal

```
FDataSetOpened: Boolean;
```

C++

```
Boolean FDataSetOpened;
```

Description

This is FDataSetOpened, a member of class TDataSetProvider.

124.1.7.4.4 TDataSetProvider.FDSWriter Field

Pascal

```
FDSWriter: TDataPacketWriter;
```

C++

```
TDataPacketWriter FDSWriter;
```

Description

This is FDSWriter, a member of class TDataSetProvider.

124.1.7.4.5 TDataSetProvider.FGetDSProps Field

Pascal

```
FGetDSProps: TGetDSProps;
```

C++

```
TGetDSProps FGetDSProps;
```

Description

This is FGetDSProps, a member of class TDataSetProvider.

124.1.7.4.6 TDataSetProvider.FGetTableName Field

Pascal

```
FGetTableName: TGetTableNameEvent;
```

C++

```
TGetTableNameEvent FGetTableName;
```

Description

This is FGetTableName, a member of class TDataSetProvider.

124.1.7.4.7 TDataSetProvider.FParams Field

Pascal

```
FParams: TParams;
```

C++

```
TParams FParams;
```

Description

This is FParams, a member of class TDataSetProvider.

124.1.7.4.8 TDataSetProvider.FRecordsSent Field

Pascal

```
FRecordsSent: Integer;
```

C++

```
int FRecordsSent;
```

Description

This is FRecordsSent, a member of class TDataSetProvider.

124.1.7.4.9 TDataSetProvider.FResolveToDataSet Field

Pascal

```
FResolveToDataSet: Boolean;
```

C++

```
Boolean FResolveToDataSet;
```

Description

This is FResolveToDataSet, a member of class TDataSetProvider.

124.1.7.4.10 TDataSetProvider.FTransactionStarted Field

Pascal

```
FTransactionStarted: Boolean;
```

C++

```
Boolean FTransactionStarted;
```

Description

This is FTransactionStarted, a member of class TDataSetProvider.

124.1.7.5 TDataSetProvider Methods

The methods of the TDataSetProvider class are listed here.

Protected Methods

	Name	Description
	CheckDataSet (see page 18518)	This is CheckDataSet, a member of class TDataSetProvider.
V	CreateDataPacket (see page 18518)	Generates a data packet for the data associated with the provider.
V	CreateResolver (see page 18519)	Creates a resolver component for handling the application of updates.
V	DoBeforeExecute (see page 18519)	Generates a BeforeExecute (see page 18538) event.
V	DoBeforeGetRecords (see page 18520)	Generates a BeforeGetRecords (see page 18539) event.
V	DoGetProviderAttributes (see page 18521)	Fills a list with information about the dataset that can be used when providing or resolving.
V	DoGetTableName (see page 18521)	Generates an OnGetTableName (see page 18542) event.
V	FetchDetails (see page 18521)	Fills a delta dataset with all nested dataset field values.

	FindRecord (see page 18522)	This is FindRecord, a member of class TDataSetProvider.
	GetDataSetFromDelta (see page 18522)	Returns a dataset positioned on the record of the source dataset that is currently being fetched or updated.
	InternalApplyUpdates (see page 18522)	Provides the underlying implementation of the ApplyUpdates (see page 18459) method.
	InternalExecute (see page 18523)	Provides the underlying implementation of the Execute method.
	InternalGetParams (see page 18524)	Returns the requested parameter values as a Variant array.
	InternalGetRecords (see page 18524)	Provides the underlying implementation of the GetRecords (see page 18468) method.
	InternalRowRequest (see page 18525)	Provides the underlying implementation of the RowRequest (see page 18472) method.
	LocateRecord (see page 18525)	Positions a data set on the record that corresponds to the current update in a specified delta packet.
	Notification (see page 18526)	Responds to notifications that objects are being created or destroyed.
	Reset (see page 18526)	This is Reset, a member of class TDataSetProvider.
	SetCommandText (see page 18526)	This is SetCommandText, a member of class TDataSetProvider.
	SetParams (see page 18527)	This is SetParams, a member of class TDataSetProvider.
	UpdateRecord (see page 18527)	Retrieves specified data from a source dataset into a delta packet.

Strict private Methods

	Name	Description
	SetDataSet (see page 18527)	This is SetDataSet, a member of class TDataSetProvider.
	SetResolveToDataSet (see page 18527)	This is SetResolveToDataSet, a member of class TDataSetProvider.

124.1.7.5.1 TDataSetProvider.CheckDataSet Method

Pascal

```
procedure CheckDataSet;
```

C++

```
__fastcall CheckDataSet();
```

Description

This is CheckDataSet, a member of class TDataSetProvider.

124.1.7.5.2 TDataSetProvider.CreateDataPacket Method

Generates a data packet for the data associated with the provider.

Pascal

```
procedure CreateDataPacket(PacketOpts: TGetRecordOptions; ProvOpts: TProviderOptions; var
RecsOut: Integer; var Data: OleVariant); override;
```

C++

```
virtual __fastcall CreateDataPacket(TGetRecordOptions PacketOpts, TProviderOptions ProvOpts,
int RecsOut, OleVariant Data);
```

Description

CreateDataPacket is used internally to generate the data packets that are returned by GetRecords (see page 18468).

The PacketOpts parameter indicates what information (other than record values) is included in the data packet. It reflects any Options (see page 18530) passed to the GetRecords (see page 18468) method.

The ProvOpts parameter reflects the current value of the Options (see page 18530) property.

The RecsOut parameter specifies the number of records desired in the packet and returns the actual number of records in the generated data packet.

The Data (see page 18474) parameter returns the generated data packet.

See Also

GetRecords (see page 18468)

DataSet (see page 18529)

Options (see page 18440)

124.1.7.5.3 TDataSetProvider.CreateResolver Method

Creates a resolver component for handling the application of updates.

Pascal

```
function CreateResolver: TCustomResolver; override;
```

C++

```
virtual __fastcall TCustomResolver CreateResolver();
```

Description

CreateResolver is called automatically when a resolver is needed to implement one of the provider's methods. CreateResolver returns a newly instantiated resolver object, which is assigned to the Resolver (see page 18441) property. The type of resolver created depends on the ResolveToDataSet (see page 18531) property:

When ResolveToDataSet (see page 18531) is true, CreateResolver returns a TDataSetResolver (see page 18544) component, which applies updates directly to the dataset specified by the DataSet (see page 18529) property.

When ResolveToDataSet (see page 18531) is false, CreateResolver returns a TSQLResolver (see page 18589) component, which applies updates directly to the database server associated with DataSet (see page 18529).

See Also

Resolver (see page 18441)

ResolveToDataSet (see page 18531)

124.1.7.5.4 TDataSetProvider.DoBeforeExecute Method

Generates a BeforeExecute (see page 18538) event.

Pascal

```
procedure DoBeforeExecute(const CommandText: WideString; var Params: OleVariant; var
OwnerData: OleVariant); override;
```

C++

```
virtual __fastcall DoBeforeExecute(const BSTR CommandText, OleVariant Params, OleVariant
OwnerData);
```

Description

The Execute (see page 18466) method calls DoBeforeExecute to generate the BeforeExecute (see page 18538) event before it executes CommandText or executes an associated query or stored procedure.

CommandText is either an optional SQL statement that replaces the SQL of an associated query, or the name of a stored procedure that replaces the associated stored procedure. If Options (see page 18530) includes poAllowCommandText, DoBeforeExecute sends CommandText to the associated dataset so that it can execute the provided statement instead of its query or stored procedure.

Params (see page 18531) contains any parameter values that should be applied to CommandText or to the query or stored

procedure before execution. DoBeforeExecute assigns these parameter values to the dataset (if appropriate).

OwnerData (see page 18531) supplies custom information to the BeforeExecute (see page 18538) event handler. The event handler can change this value. The returned value is then passed to an AfterExecute (see page 18534) event handler and then returned to the caller of the Execute (see page 18466) method.

See Also

Execute (see page 18466)

beforeexecute (see page 18479)

AfterExecute (see page 18476)

DataSet (see page 18529)

124.1.7.5.5 TDataSetProvider.DoBeforeGetRecords Method

Generates a BeforeGetRecords (see page 18539) event.

Pascal

```
procedure DoBeforeGetRecords(Count: Integer; Options: Integer; const CommandText: WideString;
var Params: OleVariant; var OwnerData: OleVariant); override;
```

C++

```
virtual __fastcall DoBeforeGetRecords(int Count, int Options, const BSTR CommandText,
OleVariant Params, OleVariant OwnerData);
```

Description

The GetRecords (see page 18468) method calls DoBeforeGetRecords to generate the BeforeGetRecords (see page 18539) event before it fetches data and assembles it into a data packet.

Count is the number of records requested. TDataSetProvider (see page 18508) does not use this parameter.

Options (see page 18530) indicates whether the data packet should include metadata, whether it should start with the first record, and whether the data packet should be encoded in XML. In TDataSetProvider (see page 18508), DoBeforeGetRecords ignores this parameter.

CommandText specifies either an optional SQL statement that replaces the SQL of an associated query, or the name of a table or stored procedure that replaces the associated table or stored procedure. If Options (see page 18530) includes poAllowCommandText, DoBeforeGetRecords sends CommandText to the associated dataset so that it can generate the set of records.

Params (see page 18531) contains any parameter values that should be applied to CommandText or to a query or stored procedure before fetching data into a data packet. DoBeforeGetRecords assigns these values to the associated dataset, if appropriate.

OwnerData (see page 18531) supplies custom information to the BeforeGetRecords (see page 18539) event handler. The event handler can change this value. The returned value is then passed to an AfterGetRecords (see page 18535) event handler and then (optionally) returned to the caller of the GetRecords (see page 18468) method.

See Also

GetRecords (see page 18468)

BeforeGetRecords (see page 18480)

AfterGetRecords (see page 18477)

DataSet (see page 18529)

124.1.7.5.6 TDataSetProvider.DoGetProviderAttributes Method

Fills a list with information about the dataset that can be used when providing or resolving.

Pascal

```
procedure DoGetProviderAttributes(DataSet: TDataSet; List: TList); virtual;
```

C++

```
virtual __fastcall DoGetProviderAttributes(TDataSet DataSet, TList List);
```

Description

DoGetProviderAttributes is used internally to fetch information about the dataset. This includes both information provided by the dataset (using the IProviderSupport method PSGetAttributes) and custom information supplied by an OnGetDataSetProperties (see page 18542) event handler.

The DataSet (see page 18529) parameter specifies the dataset that stores the information. The List parameter is the list that is filled by DoGetProviderAttributes. DoGetProviderAttributes adds information to the list in Name/Value pairs.

See Also

PSGetAttributes (see page 7579)

OnGetDataSetProperties (see page 18542)

124.1.7.5.7 TDataSetProvider.DoGetTableName Method

Generates an OnGetTableName (see page 18542) event.

Pascal

```
procedure DoGetTableName(DataSet: TDataSet; var TableName: WideString); virtual;
```

C++

```
virtual __fastcall DoGetTableName(TDataSet DataSet, BSTR TableName);
```

Description

The resolver calls DoGetTableName when it initializes the information it needs to apply updates. Override this method to provide an alternate mechanism for determining the name of the dataset that is the target of an update operation.

DataSet (see page 18529) is the dataset that is the target of the update operation.

The name of the target dataset as it should appear in generated SQL statements is returned as the TableName parameter.

See Also

ongettablename (see page 18542)

Resolver (see page 18441)

124.1.7.5.8 TDataSetProvider.FetchDetails Method

Fills a delta dataset with all nested dataset field values.

Pascal

```
procedure FetchDetails(Source: TDataSet; Delta: TDataSet); override;
```

C++

```
virtual __fastcall FetchDetails(TDataSet Source, TDataSet Delta);
```

Description

FetchDetails is used internally to fetch the current values of any nested datasets when the provider is executing its RowRequest (see page 18472) method. Source is a source dataset that has the current values for all fields. Delta is a delta dataset that must be updated so that its nested detail fields match the values in Source.

See Also

RowRequest (see page 18472)

124.1.7.5.9 TDataSetProvider.FindRecord Method

Pascal

```
function FindRecord(Source: TDataSet; Delta: TDataSet; UpdateMode: TUpdateMode): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean FindRecord(TDataSet Source, TDataSet Delta, TUpdateMode UpdateMode);
```

Description

This is FindRecord, a member of class TDataSetProvider.

124.1.7.5.10 TDataSetProvider.GetDataSetFromDelta Method

Returns a dataset positioned on the record of the source dataset that is currently being fetched or updated.

Pascal

```
function GetDataSetFromDelta(ATree: TUpdateTree; Source: TDataSet; Delta: TDataSet; Mode:
TUpdateMode): TDataSet; virtual;
```

C++

```
virtual __fastcall TDataSet GetDataSetFromDelta(TUpdateTree ATree, TDataSet Source, TDataSet
Delta, TUpdateMode Mode);
```

Description

GetDataSetFromDelta is used internally to fetch a specific record when the source dataset is unidirectional.

ATree is a TUpdateTree (see page 18600) object that represents the update or data fetch operation.

Source is a source dataset. Because it is unidirectional, however, it is not necessarily positioned on the correct record.

Delta is a delta dataset that indicates the desired record.

Mode indicates the criteria to use for locating a record on the server from the dataset that Source uses. The values that follow these criteria come from Delta.

GetDataSetFromDelta returns a unidirectional dataset that corresponds to Source but that contains a single record based on the criteria in Delta and Mode.

See Also

IsUniDirectional (see page 7029)

DataSet (see page 18529)

124.1.7.5.11 TDataSetProvider.InternalApplyUpdates Method

Provides the underlying implementation of the ApplyUpdates (see page 18459) method.

Pascal

```
function InternalApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount:
Integer): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalApplyUpdates(const OleVariant Delta, int MaxErrors, int
ErrorCount);
```

Description

The ApplyUpdates (see page 18459) method calls InternalApplyUpdates to apply the updates contained in a delta packet after generating the BeforeApplyUpdates (see page 18537) event and before generating the AfterApplyUpdates (see page 18533) event.

If the Options (see page 18530) property includes poReadOnly, InternalApplyUpdates raises an exception. Otherwise, it tells the dataset to start a transaction, calls the ApplyUpdates (see page 18459) method of its Resolver (see page 18441) component to handle the actual update and resolving process, and tells the dataset to complete the transaction.

Delta is the delta packet containing insertions, deletions, and modifications to be applied.

MaxErrors indicates the maximum number of errors that can be applied before stopping the update operation. If MaxErrors is –1, the provider tries to apply all updates.

ErrorCount returns the number of errors encountered during the update operation.

InternalApplyUpdates returns a data packet of updates that could not be applied to the database as an OleVariant.

See Also

Resolver (see page 18441)

ApplyUpdates (see page 18490)

CreateResolver (see page 18519)

Options (see page 18440)

applyupdates (see page 18459)

124.1.7.5.12 TDataSetProvider.InternalExecute Method

Provides the underlying implementation of the Execute method.

Pascal

```
procedure InternalExecute(const CommandText: WideString; var Params: OleVariant); override;
```

C++

```
virtual __fastcall InternalExecute(const BSTR CommandText, OleVariant Params);
```

Description

The Execute method calls InternalExecute to execute the appropriate SQL statement after calling DoBeforeExecute to generate a BeforeExecute event and apply the CommandText and Params. As Implemented in TCustomProvider, InternalExecute does nothing. Descendants override this method to pass the execute command on to an associated dataset.

CommandText is an SQL statement that replaces the SQL of an associated query, or the name of a stored procedure that replaces the associated stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

On entry, Params supplies parameter values for the query, stored procedure, or CommandText string. On exit, Params returns any output parameters.

See Also

Execute (see page 18466)

DoBeforeExecute (see page 18464)

124.1.7.5.13 TDataSetProvider.InternalGetParams Method

Returns the requested parameter values as a Variant array.

Pascal

```
function InternalGetParams(Types: TParamTypes = AllParamTypes): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalGetParams(TParamTypes Types = AllParamTypes);
```

Description

The provider uses InternalGetParams internally whenever it needs to assemble the current parameter values into an OleVariant. This provides the underlying implementation of the GetParams (see page 18467) method, as well as assembling parameter values for methods that return output parameters (such as Execute (see page 18466) or GetRecords (see page 18468)).

The Types (see page 23293) parameter limits the parameter values that are returned to a subset of all possible parameter types. If this parameter is omitted, all parameter values are returned.

See Also

GetParams (see page 18467)

Execute (see page 18466)

GetRecords (see page 18468)

DataSet (see page 18529)

124.1.7.5.14 TDataSetProvider.InternalGetRecords Method

Provides the underlying implementation of the GetRecords (see page 18468) method.

Pascal

```
function InternalGetRecords(Count: Integer; out RecsOut: Integer; Options: TGetRecordOptions;
const CommandText: WideString; var Params: OleVariant): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalGetRecords(int Count, int RecsOut, TGetRecordOptions
Options, const BSTR CommandText, OleVariant Params);
```

Description

The GetRecords (see page 18468) method calls InternalGetRecords to assemble a data packet after calling DoBeforeGetRecords (see page 18520) to apply the CommandText and Params (see page 18531) and generate a BeforeGetRecords (see page 18539) event. InternalGetRecords calls CreateDataPacket (see page 18518) to create a data packet that reflects the current property settings of the provider. It then generates an OnGetData (see page 18541) event.

Count indicates the number of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only the specified number of records are retrieved.

RecsOut returns the actual number of records retrieved.

Options (see page 18530) indicates what information should be added to the data packet in addition to data. It can include

grMetaData (include metadata), grReset (start providing records with the first one in the dataset), and grXML (encode the datapacket in XML rather than as an OleVariant) or grXMLUTF8 (same as grXML but use UTF8 to encode extended characters).

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a table or stored procedure that replaces the associated table or stored procedure. This parameter is ignored if the Options (see page 18530) property does not include poAllowCommandText.

Params (see page 18531) specifies any parameter values that should be applied to CommandText or to an associated query or stored procedure. If the provider is associated with a TTable, Params (see page 18531) specifies field values that filter the result set. On exit from GetRecords (see page 18468), Params (see page 18531) returns any output parameters.

Records are returned as a data packet in a Variant.

Note: If the DataSet (see page 18529) property is not set, InternalGetRecords raises an exception.

See Also

Data (see page 18474)

CreateDataPacket (see page 18518)

OnGetData (see page 18443)

BeforeGetRecords (see page 18480)

AfterGetRecords (see page 18477)

DoBeforeGetRecords (see page 18520)

124.1.7.5.15 TDataSetProvider.InternalRowRequest Method

Provides the underlying implementation of the RowRequest (see page 18472) method.

Pascal

```
function InternalRowRequest(const Row: OleVariant; Options: TFetchOptions): OleVariant;
override;
```

C++

```
virtual __fastcall OleVariant InternalRowRequest(const OleVariant Row, TFetchOptions Options);
```

Description

The RowRequest (see page 18472) method calls InternalRowRequest to assemble the specified information after generating a BeforeRowRequest (see page 18540) event and before generating an AfterRowRequest (see page 18536) event. InternalRowRequest passes this request on to its associated Resolver (see page 18441).

The Row parameter is an OleVariant that describes the record about which information is requested.

InternalRowRequest returns the requested information in a delta packet.

See Also

RowRequest (see page 18472)

Resolver (see page 18441)

RowRequest (see page 18496)

124.1.7.5.16 TDataSetProvider.LocateRecord Method

Positions a data set on the record that corresponds to the current update in a specified delta packet.

Pascal

```
procedure LocateRecord(Source: TDataSet; Delta: TDataSet); override;
```

C++

```
virtual __fastcall LocateRecord(TDataSet Source, TDataSet Delta);
```

Description

LocateRecord is called indirectly by the RowRequest (see page 18472) method to locate a record before fetching information about it. The Source parameter is the dataset containing current record values. The Delta parameter is a delta packet that identifies the desired type of information and information identifying the desired record.

LocateRecord uses the criteria specified by UpdateMode (see page 18532) to identify the desired record.

See Also

RowRequest (see page 18472)

UpdateMode (see page 18441)

124.1.7.5.17 TDataSetProvider.Notification Method

Responds to notifications that objects are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification overrides the inherited method to add a check that the dataset specified by the DataSet (see page 18529) property is not being deleted. If DataSet (see page 18529) is about to be destroyed, Notification sets the DataSet (see page 18529) property to nil (Delphi) or NULL (C++).

See Also

OnUpdateError (see page 18444)

Create (see page 6733)

124.1.7.5.18 TDataSetProvider.Reset Method

Pascal

```
procedure Reset;
```

C++

```
__fastcall Reset();
```

Description

This is Reset, a member of class TDataSetProvider.

124.1.7.5.19 TDataSetProvider.SetCommandText Method

Pascal

```
procedure SetCommandText(const CommandText: WideString); virtual;
```

C++

```
virtual __fastcall SetCommandText(const BSTR CommandText);
```

Description

This is SetCommandText, a member of class TDataSetProvider.

124.1.7.5.20 TDataSetProvider.SetDataSet Method

Pascal

```
procedure SetDataSet(ADataSet: TDataSet);
```

C++

```
__fastcall SetDataSet(TDataSet ADataSet);
```

Description

This is SetDataSet, a member of class TDataSetProvider.

124.1.7.5.21 TDataSetProvider.SetParams Method

Pascal

```
procedure SetParams(Values: OleVariant); virtual;
```

C++

```
virtual __fastcall SetParams(OleVariant Values);
```

Description

This is SetParams, a member of class TDataSetProvider.

124.1.7.5.22 TDataSetProvider.SetResolveToDataSet Method

Pascal

```
procedure SetResolveToDataSet(Value: Boolean);
```

C++

```
__fastcall SetResolveToDataSet(Boolean Value);
```

Description

This is SetResolveToDataSet, a member of class TDataSetProvider.

124.1.7.5.23 TDataSetProvider.UpdateRecord Method

Retrieves specified data from a source dataset into a delta packet.

Pascal

```
procedure UpdateRecord(Source: TDataSet; Delta: TDataSet; BlobsOnly: Boolean; KeyOnly:
Boolean); override;
```

C++

```
virtual __fastcall UpdateRecord(TDataSet Source, TDataSet Delta, Boolean BlobsOnly, Boolean
KeyOnly);
```

Description

UpdateRecord is called indirectly by the RowRequest (see page 18472) method to fetch information about a specified record. The Source parameter is the dataset containing indicated record. The Delta parameter is a delta packet that returns the requested data. BlobsOnly indicates whether all field values should be provided (BlobsOnly == false) or only Blob field values (BlobsOnly == true).

See Also

RowRequest (see page 18472)

124.1.7.6 TDataSetProvider Properties

The properties of the TDataSetProvider class are listed here.

Protected Properties

	Name	Description
	TransactionStarted (see page 18532)	This is TransactionStarted, a member of class TDataSetProvider.

Public Properties

	Name	Description
	ActiveUpdateException (see page 18528)	This is ActiveUpdateException, a member of class TDataSetProvider.
	OwnerData (see page 18531)	This is OwnerData, a member of class TDataSetProvider.
R	Params (see page 18531)	Stores the parameter values currently in use.

Published Properties

	Name	Description
	Constraints (see page 18528)	Controls (see page 5711) whether database constraints are passed to the client so that it can check them locally.
	DataSet (see page 18529)	Specifies the dataset from which the provider provides data and to which it applies updates.
	Exported (see page 18530)	Allows client applications to pass calls to the provider when it resides on an application server.
	Options (see page 18530)	Influences what is included in data packets and how the information in data packets is used.
	ResolveToDataSet (see page 18531)	Specifies whether updates should be applied to a dataset or directly to the database server.
	UpdateMode (see page 18532)	Controls how the provider locates records when applying updates.

124.1.7.6.1 TDataSetProvider.ActiveUpdateException Property

Pascal

```
property ActiveUpdateException: Exception;
```

C++

```
__property Exception ActiveUpdateException;
```

Description

This is ActiveUpdateException, a member of class TDataSetProvider.

124.1.7.6.2 TDataSetProvider.Constraints Property

Controls (see page 5711) whether database constraints are passed to the client so that it can check them locally.

Pascal

```
property Constraints: Boolean;
```

C++

```
__property Boolean Constraints;
```

Description

Set Constraints to specify whether data constraints defined for the provider's associated dataset are sent along with the metadata for the dataset. Sending constraints allows client datasets to check for constraint violations locally, so that updates are less likely to fail when sent back to the database server.

When Constraints is true, constraints are sent. To prevent the provider from sending constraint information, set Constraints to false.

Note: Before constraints can be sent to client applications, they must be imported to the data dictionary on the application server. Use SQL explorer to import constraints to the data dictionary.

See Also

Constraints (see page 7013)

DataSet (see page 18529)

124.1.7.6.3 TDataSetProvider.DataSet Property

Specifies the dataset from which the provider provides data and to which it applies updates.

Pascal

```
property DataSet: TDataSet;
```

C++

```
__property TDataSet DataSet;
```

Description

Set DataSet to link the dataset provider to a dataset that it represents. The dataset provider packages the records from (and other information about) DataSet into data packets that can be used by client datasets and XML brokers. DataSet must be defined if the provider is used to create data packets.

If the ResolveToDataSet (see page 18531) property is true, the provider applies updates from the application server directly to this dataset. Otherwise, the provider applies updates directly to the underlying database server.

Note: The provider communicates with DataSet using the IProviderSupport interface. This interface is available in all datasets, although in TDataSet most of the IProviderSupport methods are simple stubs that either do nothing or generate an exception. The dataset classes that ship with the IDE (dbExpress datasets, BDE-enabled datasets, ADO-enabled datasets, InterBase Express datasets,

and client datasets) override these protected methods to implement the IProviderSupport interface in a more useful fashion. If you are using custom dataset components, check with the vendor whether they can work with a dataset provider.

IProviderSupport (see page 7576)

Connecting a Client Dataset to Another Dataset in the Same Application

Determining the Source of Data

124.1.7.6.4 TDataSetProvider.Exported Property

Allows client applications to pass calls to the provider when it resides on an application server.

Pascal

```
property Exported: Boolean;
```

C++

```
__property Boolean Exported;
```

Description

Use Exported to indicate whether the provider is made available to clients of a remote data module that owns it. When Exported is true, client applications can specify the provider as a target for calls made using the IAppServer interface. When Exported is false, IAppServer calls that specify the provider cause an exception.

Note: In addition to the Exported property, the provider must be registered with the remote data module for clients to access it using the data module's IAppServer interface. When the provider's Owner is the remote data module, it is automatically registered. If the provider has a different owner, the server application must explicitly register providers using the remote data module's RegisterProvider method.

See Also

IAppServer (see page 16450)

Providers (see page 19908)

registerprovider (see page 19902)

124.1.7.6.5 TDataSetProvider.Options Property

Influences what is included in data packets and how the information in data packets is used.

Pascal

```
property Options: TProviderOptions;
```

C++

```
__property TProviderOptions Options;
```

Description

Set Options to customize how the provider communicates with client datasets. Options is a set that specifies

Whether nested detail sets and BLOB data are included in data packets or fetched separately.

Whether data packets include field component properties such as formats, display names, and maximum & minimum values.

Whether data packets are provided on a read-only basis, and whether specific types of changes (insertions, edits, or deletions) are disabled.

Whether changes to master table fields should cause corresponding updates to detail tables.

Whether a single update can affect multiple server records.

Whether the client's records are refreshed when it applies updates.

Whether the client can send SQL statements that override the provider's dataset.

Note: Not all options are supported by an InternetExpress client. Specifically, InternetExpress clients don't support poFetchBlobsOnDemand, poFetchDetailsOnDemand, poDisableInserts, poDisableEdits, psDisableDeletes, poPropogateChanges, and poAllowCommandText.

Overriding the Dataset On the Application Server

Setting Options That Influence the Data Packets

124.1.7.6.6 TDataSetProvider.OwnerData Property

Pascal

```
property OwnerData: OleVariant;
```

C++

```
__property OleVariant OwnerData;
```

Description

This is OwnerData, a member of class TDataSetProvider.

124.1.7.6.7 TDataSetProvider.Params Property

Stores the parameter values currently in use.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

This protected property acts as a temporary cache for parameter values from clients. It is set to the parameter values supplied by calls to the Execute (see page 18466) or GetRecords (see page 18468) method.

Note: If the dataset provider is responding to multiple client datasets or XML brokers

, the value of Params can only be used within the context of a single call to SetParams (see page 18527), Execute (see page 18466), or GetRecords (see page 18468). After that, other client calls can change the value of parameters.

See Also

Execute (see page 18466)

GetRecords (see page 18468)

124.1.7.6.8 TDataSetProvider.ResolveToDataSet Property

Specifies whether updates should be applied to a dataset or directly to the database server.

Pascal

```
property ResolveToDataSet: Boolean;
```

C++

```
__property Boolean ResolveToDataSet;
```

Description

Set ResolveToDataSet to specify how updates are applied. When ResolveToDataSet is true, the Resolver (see page 18441) property is set to a TDataSetResolver (see page 18544) component, which applies updates directly to the dataset specified by the DataSet (see page 18529) property. This can be useful if the application uses the events on the dataset component or if the dataset does not represent the data from a database server (for example, a client dataset).

When ResolveToDataSet is false, the Resolver (see page 18441) property is set to a TSQLResolver (see page 18589) component, which applies updates directly to the database server associated with DataSet (see page 18529). This can be more efficient, because it skips the intermediate step of using the dataset. It is the only way to resolve updates if the source dataset is read-only (for example, a unidirectional dataset).

DataSet (see page 18529)

Resolver (see page 18441)

Choosing How to Apply Updates Using a Datasetm Provider

124.1.7.6.9 TDataSetProvider.TransactionStarted Property

Pascal

```
property TransactionStarted: Boolean;
```

C++

```
__property Boolean TransactionStarted;
```

Description

This is TransactionStarted, a member of class TDataSetProvider.

124.1.7.6.10 TDataSetProvider.UpdateMode Property

Controls how the provider locates records when applying updates.

Pascal

```
property UpdateMode: TUpdateMode;
```

C++

```
__property TUpdateMode UpdateMode;
```

Description

Use UpdateMode to specify the criteria for locating a record in the dataset when applying updates. UpdateMode specifies whether modified records are located based on all columns (fields), on only the key fields, or on the key fields plus the original values of fields that have been modified.

Note: To control how the provider locates records by specifying individual fields, use the field components' ProviderFlags property.

Influencing How Updates Are Applied

124.1.7.7 TDataSetProvider Events

The events of the TDataSetProvider class are listed here.

Published Events

	Name	Description
	AfterApplyUpdates (see page 18533)	Occurs after the provider applies updates.
	AfterExecute (see page 18534)	Occurs after the provider passes an execute command to its dataset.
	AfterGetParams (see page 18535)	This is AfterGetParams, a member of class TDataSetProvider.
	AfterGetRecords (see page 18535)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 18536)	Occurs after the provider fetches new information about the current record.
	AfterUpdateRecord (see page 18536)	Occurs when the associated resolver has just updated a record.
	BeforeApplyUpdates (see page 18537)	Occurs before the provider applies updates from a client dataset.
	BeforeExecute (see page 18538)	This is BeforeExecute, a member of class TDataSetProvider.
	BeforeGetParams (see page 18538)	Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.
	BeforeGetRecords (see page 18539)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 18540)	Occurs before the provider creates a delta packet with information about the current record.
	BeforeUpdateRecord (see page 18541)	This is BeforeUpdateRecord, a member of class TDataSetProvider.
	OnDataRequest (see page 18541)	Occurs when a provider calls its DataRequest method.
	OnGetData (see page 18541)	Occurs after a provider retrieves data but before it is sent to the client.
	OnGetDataSetProperties (see page 18542)	Occurs when the provider adds additional information to a data packet it is creating.
	OnGetTableName (see page 18542)	This is OnGetTableName, a member of class TDataSetProvider.
	OnUpdateData (see page 18543)	Occurs when a provider begins to apply updates.
	OnUpdateError (see page 18543)	Occurs when a provider can't update a record because of an error condition.
	OnValidate (see page 18544)	This is OnValidate, a member of class TDataSetProvider.

124.1.7.7.1 TDataSetProvider.AfterApplyUpdates Event

Occurs after the provider applies updates.

Pascal

```
property AfterApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterApplyUpdates;
```

Description

Write an AfterApplyUpdates event handler to return custom information to a client dataset after applying updates. AfterApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_ApplyUpdates method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeApplyUpdates event, where it can respond to or change custom information that the client dataset sends.

2.If it is a dataset provider, the provider receives an OnUpdateData event where it can edit the updates before they are applied.

3. The provider applies the updates, and attempts to resolve problems.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates event handler.

Note: If ApplyUpdates is called without the OwnerData parameter, on entry to the event handler the OwnerData parameter contains the value set in the BeforeApplyUpdates event handler and it is ignored on exit from the AfterApplyUpdates event handler.

Responding to Client Update Requests

Communicating with the Client Dataset

124.1.7.7.2 TDataSetProvider.AfterExecute Event

Occurs after the provider passes an execute command to its dataset.

Pascal

```
property AfterExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterExecute;
```

Description

Write an AfterExecute event handler to return custom information to a client dataset after executing a query or stored procedure. AfterExecute is part of the mechanism by which a client dataset and a provider communicate information when executing queries or stored procedures that do not return a cursor. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_Execute method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeExecute event, where it can respond to or change custom information that the client dataset sends.

2.The provider dispatches its Execute method to execute a query or stored procedure.

3.The provider receives an AfterExecute event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeExecute event handler.

4.The client dataset receives an AfterExecute event, where it can respond to the custom information returned by the provider in its AfterExecute event handler.

Communicating with the Client Dataset

124.1.7.7.3 TDataSetProvider.AfterGetParams Event

Pascal

```
property AfterGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetParams;
```

Description

This is AfterGetParams, a member of class TDataSetProvider.

124.1.7.7.4 TDataSetProvider.AfterGetRecords Event

Occurs after the provider creates a data packet to send to the client dataset.

Pascal

```
property AfterGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetRecords;
```

Description

Write an AfterGetRecords event handler to send custom information to a client dataset when providing a data packet. AfterGetRecords is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_GetRecords method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeGetRecords event, where it can respond to or change custom information that the client dataset sends.

2.If it is a dataset provider, the provider receives an OnGetData event where it can edit the data before creating a data packet, and then generates the data packet.

3.The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.

4.The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider in its AfterGetRecords event handler.

Communicating with the Client Dataset

Responding to Client Data Requests

124.1.7.7.5 TDataSetProvider.AfterRowRequest Event

Occurs after the provider fetches new information about the current record.

Pascal

```
property AfterRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterRowRequest;
```

Description

Write an AfterRowRequest event handler to send custom information to a client dataset along with information about the current record. AfterRowRequest is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_RowRequest method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeRowRequest event, where it can respond to or change custom information that the client dataset sends.

2.The provider creates a delta packet that contains the requested information.

3.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

4.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider in its AfterRowRequest event handler.

See Also

Communicating with the Client Dataset

124.1.7.7.6 TDataSetProvider.AfterUpdateRecord Event

Occurs when the associated resolver has just updated a record.

Pascal

```
property AfterUpdateRecord: TAfterUpdateRecordEvent;
```

C++

```
__property TAfterUpdateRecordEvent AfterUpdateRecord;
```

Description

Write an AfterUpdateRecord event handler to provide special processing immediately after a record has been successfully updated. For example, use AfterUpdateRecord to maintain a log of successful updates.

See Also

beforeupdaterecord (see page 18442)

AfterApplyUpdates (see page 18475)

124.1.7.7.7 TDataSetProvider.BeforeApplyUpdates Event

Occurs before the provider applies updates from a client dataset.

Pascal

```
property BeforeApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeApplyUpdates;
```

Description

Write a BeforeApplyUpdates event handler to respond to custom information from a client dataset. BeforeApplyUpdates is part of the mechanism by which a provider and a client dataset communicate information about updates. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset's ApplyUpdates method is called, the following events occur:

1.The client dataset receives a BeforeApplyUpdates event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeApplyUpdates event, where the OleVariant from the client dataset appears as the OwnerData parameter. The provider can respond to or change that information before applying the updates.

3.If it is a dataset provider, the provider applies the updates, and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates event handler.

Note: If ApplyUpdates is called without the OwnerData parameter, the OwnerData parameter is nil (Delphi) or NULL (C++) on entry to the event handler and its value (on exit) is only passed to the AfterApplyUpdates event handler but not returned to the caller.

Responding to Client Update Requests

Communicating with the Client Dataset

124.1.7.7.8 TDataSetProvider.BeforeExecute Event

Pascal

```
property BeforeExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeExecute;
```

Description

This is BeforeExecute, a member of class TDataSetProvider.

124.1.7.7.9 TDataSetProvider.BeforeGetParams Event

Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.

Pascal

```
property BeforeGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetParams;
```

Description

Write a BeforeGetParams event handler to respond to custom information from a client dataset. BeforeGetParams is part of the mechanism by which a provider and a client dataset communicate information during parameter fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches parameter values from the provider, the following events occur:

1.The client dataset receives a BeforeGetParams event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeGetParams event, where the OleVariant from the client dataset appears as the OwnerData parameter. The provider can respond to or change that information before it fetches and encodes the parameter values.

3.The provider generates an OleVariant for the current parameter values of its dataset, if appropriate.

4.The provider receives an AfterGetParams event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetParams event handler.

5.The client dataset receives an AfterGetParams event, where it can respond to the custom information returned by the provider in its AfterGetParams event handler.

See Also

AS_GetParams (see page 16454)

aftergetparams (see page 18477)

Communicating with the Client Dataset

124.1.7.7.10 TDataSetProvider.BeforeGetRecords Event

Occurs before the provider creates a data packet and sends it to a client dataset.

Pascal

```
property BeforeGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetRecords;
```

Description

Write a BeforeGetRecords event handler to respond to custom information from a client dataset. BeforeGetRecords is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches data from the provider, the following events occur:

1.The client dataset receives a BeforeGetRecords event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeGetRecords event, where the OleVariant from the client dataset appears as the OwnerData parameter. The provider can respond to or change that information before it creates a data packet.

3.The provider generates the data packet.

4.The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.

5.The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider in its AfterGetRecords event handler.

Delphi Examples:

```
{
This example shows the implementation of a provider BeforeGetRecords
event handler and a RemoteDataModule UpdateRegistry method.  The
complete project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TPooledRDM.DataSetProvider1BeforeGetRecords(Sender: TObject;
  var OwnerData: OleVariant);
begin
  try
    Query1.Close;
    Query1.SQL.Text := OwnerData[0];
    if not VarIsNull(OwnerData[1]) and not VarIsEmpty(OwnerData[1]) then
    begin
      Query1.Open;
      if not Query1.Locate(Query1.Fields[0].FieldName, OwnerData[1], []) then
        raise Exception.Create('Record not found');
      Query1.Next;
    end;
  finally
    OwnerData := NULL;
  end;
end;
```

Communicating with the Client Dataset

Responding to Client Data Requests

124.1.7.7.11 TDataSetProvider.BeforeRowRequest Event

Occurs before the provider creates a delta packet with information about the current record.

Pascal

```
property BeforeRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeRowRequest;
```

Description

Write a BeforeRowRequest event handler to respond to custom information from a client dataset. BeforeRowRequest is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeRowRequest event, where the custom information appears as the OwnerData parameter. The provider can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

5.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider in its AfterRowRequest event handler.

Communicating with the Client Dataset

124.1.7.7.12 TDataSetProvider.BeforeUpdateRecord Event

Pascal

```
property BeforeUpdateRecord: TBeforeUpdateRecordEvent;
```

C++

```
__property TBeforeUpdateRecordEvent BeforeUpdateRecord;
```

Description

This is BeforeUpdateRecord, a member of class TDataSetProvider.

124.1.7.7.13 TDataSetProvider.OnDataRequest Event

Occurs when a provider calls its DataRequest method.

Pascal

```
property OnDataRequest: TDataRequestEvent;
```

C++

```
__property TDataRequestEvent OnDataRequest;
```

Description

Write an OnDataRequest event handler to do custom processing of data. OnDataRequest has no built-in use. Instead, it allows developers to augment the IAppServer interface so that clients in a multi-tiered application can communicate directly with an individual provider.

If an application does not provide an OnDataRequest event handler, calls to DataRequest return NULL.

Note: To provide the same sort of custom processing on the client side, use an automation method on the connection component.

Communicating with Providers Using Custom Events

Communicating with the Client Dataset

Responding to Client-generated Events

124.1.7.7.14 TDataSetProvider.OnGetData Event

Occurs after a provider retrieves data but before it is sent to the client.

Pascal

```
property OnGetData: TProviderDataEvent;
```

C++

```
__property TProviderDataEvent OnGetData;
```

Description

Write an OnGetData event handler to perform any custom data processing the provider should handle before returning data to a

client. The OnGetData event occurs after a provider fetches data from its dataset but before the data is sent on to the client. Using the methods of the DataSet parameter, data can be edited in the OnGetData event handler before sending it to the client dataset or XML broker.

Note: OnGetData occurs when the Data property is read, as well as when the GetRecords method is called.

AfterGetRecords (see page 18477)

Responding to Client Data Requests

124.1.7.7.15 TDataSetProvider.OnGetDataSetProperties Event

Occurs when the provider adds additional information to a data packet it is creating.

Pascal

```
property OnGetDataSetProperties: TGetDSProps;
```

C++

```
__property TGetDSProps OnGetDataSetProperties;
```

Description

Write an OnGetDataSetProperties event handler to include application-defined information in the data packets. This information can later be returned using the GetOptionalParam method of the client dataset that represents the data in the packet.

Note: The following names are reserved and can't be used as the name for storing custom information:

UNIQUE_KEY	DEFAULT_ORDER	CHANGE_LOG	SERVER_COL
CONSTRAINTS	DATASET_CONTEXT	DATASET_DELTA	LCID
BDERECORD_X	TABLE_NAME	MD_FIELDLINKS	UPDATEMODE

124.1.7.7.16 TDataSetProvider.OnGetTableName Event

Pascal

```
property OnGetTableName: TGetTableNameEvent;
```

C++

```
__property TGetTableNameEvent OnGetTableName;
```

Description

This is OnGetTableName, a member of class TDataSetProvider.

124.1.7.7.17 TDataSetProvider.OnUpdateData Event

Occurs when a provider begins to apply updates.

Pascal

```
property OnUpdateData: TProviderDataEvent;
```

C++

```
__property TProviderDataEvent OnUpdateData;
```

Description

Write an OnUpdateData event to handle special processing before the provider begins applying updates received from the client dataset or XML broker. Using the methods belonging to the DataSet parameter, an application can

Examine data (for example, for values or data changes that should not permitted), and raise exceptions that cancel applying of updates before they occur.

Change data (for example encrypting or decrypting values) before it is sent on to the source dataset or database server.

applyupdates (see page 18459)

beforeupdaterecord (see page 18442)

Adding Custom Information to Data Packets

Editing Delta Packets Before Updating the Database

Influencing How Updates Are Applied

124.1.7.7.18 TDataSetProvider.OnUpdateError Event

Occurs when a provider can't update a record because of an error condition.

Pascal

```
property OnUpdateError: TResolverErrorEvent;
```

C++

```
__property TResolverErrorEvent OnUpdateError;
```

Description

Write an OnUpdateError event handler to respond to error conditions that arise when the provider applies a client dataset's updates. The OnUpdateError event handler is called for each record that can't be updated.

Warning: The provider can't detect when an update conflicts with another user's changes to a memo field. This situation will not generate an OnUpdateError event.

See Also

applyupdates (see page 18459)

OldValue (see page 7175)

CurValue (see page 7155)

Resolving Update Errors On the Provider

124.1.7.7.19 TDataSetProvider.OnValidate Event

Pascal

```
property OnValidate: TOnValidate;
```

C++

```
__property TOnValidate OnValidate;
```

Description

This is OnValidate, a member of class TDataSetProvider.

124.1.8 TDataSetResolver Class

TDataSetResolver applies updates to a dataset on behalf of a provider.

Class Hierarchy

Pascal

```
TDataSetResolver = class(TCustomResolver);
```

C++

```
class TDataSetResolver : public TCustomResolver;
```

File

Provider

Description

TDataSetProvider (see page 18508) components use TDataSetResolver to apply updates to a dataset when their ResolveToDataSet property is true. Otherwise, they use TSQLResolver (see page 18589).

Do not create instances of TDataSetResolver. Provider (see page 18553) components create their own TDataSetResolver objects for applying updates.

See Also

TDataSetProvider (see page 18508)

TBaseProvider (see page 18423)

TSQLResolver (see page 18589)

TDataSetProvider (see page 18508)

124.1.8.1 TDataSetResolver Members

The following tables list the members exposed by TDataSetResolver.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	BeginUpdate (see page 18549)	Provides the interface for a method that performs any initialization before applying updates.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoDelete (see page 18550)	Defines a method that deletes a record.
V	DoInsert (see page 18550)	Defines a method that inserts a record.
V	DoUpdate (see page 18551)	Defines a method that modifies a record.
V	EndUpdate (see page 18551)	Provides the interface for a method that performs any finalization after applying updates.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleUpdateError (see page 18493)	Manages the resolving process when errors occur while applying updates.
V	InitializeConflictBuffer (see page 18552)	Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	LogUpdateError (see page 18495)	This is LogUpdateError, a member of class TCustomResolver.
V	LogUpdateRecord (see page 18495)	Adds records to the error log if their data has been changed by another application.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Provider (see page 18553)	Indicates the provider that uses this resolver to apply updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	ApplyUpdates (see page 18490)	Applies updates received from a provider.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18548)	Creates and initializes a dataset resolver.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 18487)	Frees an instance of a resolver object.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	FreeTreeData (see page 18492)	This is FreeTreeData, a member of class TCustomResolver.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	InitKeyFields (see page 18494)	Sets the provider flag pfInKey on all key fields in a delta data packet.
V	InitTreeData (see page 18494)	This is InitTreeData, a member of class TCustomResolver.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	InternalBeforeResolve (see page 18552)	Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.
V	InternalUpdateRecord (see page 18495)	Manages the updating process once a delta packet is wrapped in a TUpdateTree (see page 18600) object.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	RowRequest (see page 18496)	Returns information from a specified record.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	UpdateTree (see page 18497)	This is UpdateTree, a member of class TCustomResolver.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

Strict private Fields

	Name	Description
	FBookmark (see page 18548)	This is FBookmark, a member of class TDataSetResolver.
	FErrorCount (see page 18488)	This is FErrorCount, a member of class TCustomResolver.
	FMaxErrors (see page 18488)	This is FMaxErrors, a member of class TCustomResolver.
	FOpened (see page 18549)	This is FOpened, a member of class TDataSetResolver.
	FPrevResponse (see page 18488)	This is FPrevResponse, a member of class TCustomResolver.
	FProvider (see page 18489)	This is FProvider, a member of class TCustomResolver.
	FUpdateTree (see page 18489)	This is FUpdateTree, a member of class TCustomResolver.

Strict private Methods

	Name	Description
	GetProvider (see page 18551)	This is GetProvider, a member of class TDataSetResolver.
	PutRecord (see page 18552)	This is PutRecord, a member of class TDataSetResolver.

124.1.8.2 TDataSetResolver.Create Constructor

Creates and initializes a dataset resolver.

Pascal

```
constructor Create(AProvider: TDataSetProvider); reintroduce;
```

C++

```
__fastcall TDataSetResolver(TDataSetProvider AProvider);
```

Description

Provider (see page 18553) components call Create when they need a resolver component for applying updates to a dataset. The AProvider parameter specifies the provider that creates and uses the resolver.

Do not create resolver instances directly. Resolvers are designed to be created and used by providers, and can not function independently of a provider.

See Also

Resolver (see page 18441)

124.1.8.3 TDataSetResolver Fields

The fields of the TDataSetResolver class are listed here.

Strict private Fields

	Name	Description
	FBookmark (see page 18548)	This is FBookmark, a member of class TDataSetResolver.
	FOpened (see page 18549)	This is FOpened, a member of class TDataSetResolver.

124.1.8.3.1 TDataSetResolver.FBookmark Field

Pascal

```
FBookmark: TBookmarkStr;
```

C++

```
TBookmarkStr FBookmark;
```

Description

This is FBookmark, a member of class TDataSetResolver.

124.1.8.3.2 TDataSetResolver.FOpened Field

Pascal

```
FOpened: Boolean;
```

C++

```
Boolean FOpened;
```

Description

This is FOpened, a member of class TDataSetResolver.

124.1.8.4 TDataSetResolver Methods

The methods of the TDataSetResolver class are listed here.

Protected Methods

	Name	Description
	BeginUpdate (see page 18549)	Provides the interface for a method that performs any initialization before applying updates.
	DoDelete (see page 18550)	Defines a method that deletes a record.
	DoInsert (see page 18550)	Defines a method that inserts a record.
	DoUpdate (see page 18551)	Defines a method that modifies a record.
	EndUpdate (see page 18551)	Provides the interface for a method that performs any finalization after applying updates.
	InitializeConflictBuffer (see page 18552)	Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.

Public Methods

	Name	Description
	InternalBeforeResolve (see page 18552)	Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.

Strict private Methods

	Name	Description
	GetProvider (see page 18551)	This is GetProvider, a member of class TDataSetResolver.
	PutRecord (see page 18552)	This is PutRecord, a member of class TDataSetResolver.

124.1.8.4.1 TDataSetResolver.BeginUpdate Method

Provides the interface for a method that performs any initialization before applying updates.

Pascal

```
procedure BeginUpdate; override;
```

C++

```
virtual __fastcall BeginUpdate();
```

Description

The ApplyUpdates method calls BeginUpdate before applying updates in a delta packet.

As implemented in TCustomResolver, BeginUpdate does nothing. Descendants that need take specific action before applying updates override this method.

See Also

EndUpdate (see page 18492)

ApplyUpdates (see page 18490)

124.1.8.4.2 TDataSetResolver.DoDelete Method

Defines a method that deletes a record.

Pascal

```
procedure DoDelete(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall DoDelete(TUpdateTree Tree);
```

Description

DoDelete is one of several helper methods internal to the ApplyUpdates method. These helper methods perform the actual updates in the delta packet. ApplyUpdates wraps the delta packet in a TUpdateTree object. For each record that must be deleted, the resolver calls DoDelete.

TCustomResolver does not implement the DoDelete method. Descendants override this method to delete records in their own specialized way.

See Also

ApplyUpdates (see page 18490)

DoInsert (see page 18491)

DoUpdate (see page 18491)

124.1.8.4.3 TDataSetResolver.DoInsert Method

Defines a method that inserts a record.

Pascal

```
procedure DoInsert(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall DoInsert(TUpdateTree Tree);
```

Description

DoInsert is one of several helper methods internal to the ApplyUpdates method. These helper methods perform the actual updates in the delta packet. ApplyUpdates wraps the delta packet in a TUpdateTree object. For each record that must be inserted, the resolver calls DoInsert.

TCustomResolver does not implement the DoInsert method. Descendants override this method to insert records in their own specialized way.

See Also

ApplyUpdates (see page 18490)

DoDelete (see page 18491)

DoUpdate (see page 18491)

124.1.8.4.4 TDataSetResolver.DoUpdate Method

Defines a method that modifies a record.

Pascal

```
procedure DoUpdate(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall DoUpdate(TUpdateTree Tree);
```

Description

DoUpdate is one of several helper methods internal to the ApplyUpdates method. These helper methods perform the actual updates passed in the delta packet. ApplyUpdates wraps the delta packet in a TUpdateTree object. For each record that must be modified, the resolver calls DoUpdate.

TCustomResolver does not implement the DoUpdate method. Descendants override this method to insert records in their own specialized way.

See Also

ApplyUpdates (see page 18490)

DoDelete (see page 18491)

DoInsert (see page 18491)

124.1.8.4.5 TDataSetResolver.EndUpdate Method

Provides the interface for a method that performs any finalization after applying updates.

Pascal

```
procedure EndUpdate; override;
```

C++

```
virtual __fastcall EndUpdate();
```

Description

The ApplyUpdates method calls EndUpdate after applying updates.

As implemented in TCustomResolver, EndUpdate does nothing. Descendants that need take specific action after applying updates override this method.

See Also

BeginUpdate (see page 18490)

ApplyUpdates (see page 18490)

124.1.8.4.6 TDataSetResolver.GetProvider Method

Pascal

```
function GetProvider: TDataSetProvider;
```

C++

```
__fastcall TDataSetProvider GetProvider();
```

Description

This is GetProvider, a member of class TDataSetResolver.

124.1.8.4.7 TDataSetResolver.InitializeConflictBuffer Method

Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.

Pascal

```
procedure InitializeConflictBuffer(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall InitializeConflictBuffer(TUpdateTree Tree);
```

Description

The HandleUpdateError method calls InitializeConflictBuffer before generating an OnUpdateError event. This ensures that the client dataset passed to an OnUpdateError event handler represents the update that caused the problem, with appropriate values for field's CurValue property.

Descendants of TCustomResolver implement this method to obtain information from the dataset or server to which they are applying updates.

See Also

HandleUpdateError (see page 18493)

OnUpdateError (see page 18444)

124.1.8.4.8 TDataSetResolver.InternalBeforeResolve Method

Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.

Pascal

```
procedure InternalBeforeResolve(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall InternalBeforeResolve(TUpdateTree Tree);
```

Description

The ApplyUpdates method wraps delta packets in a TUpdateTree object. Once this is complete, InternalBeforeResolve performs any other initialization before the updates are applied.

As implemented in TCustomResolver, InternalBeforeResolve does nothing. Descendants override this method to perform class-specific initialization.

See Also

ApplyUpdates (see page 18490)

inittreedata (see page 18494)

124.1.8.4.9 TDataSetResolver.PutRecord Method

Pascal

```
procedure PutRecord(Tree: TUpdateTree);
```

C++

```
__fastcall PutRecord(TUpdateTree Tree);
```

Description

This is PutRecord, a member of class TDataSetResolver.

124.1.8.5 TDataSetResolver Properties

The properties of the TDataSetResolver class are listed here.

Protected Properties

	Name	Description
	Provider (see page 18553)	Indicates the provider that uses this resolver to apply updates.

124.1.8.5.1 TDataSetResolver.Provider Property

Indicates the provider that uses this resolver to apply updates.

Pascal

```
property Provider: TDataSetProvider;
```

C++

```
__property TDataSetProvider Provider;
```

Description

Provider is a read-only property that points to the provider that uses this resolver for applying updates. The Provider property is set in the constructor.

Resolvers use the Provider property internally to obtain information supplied in the provider's properties. They also use it to generate events on the provider at appropriate points in the update process.

See Also

Create (see page 18487)

Resolver (see page 18441)

124.1.9 TLocalAppServer Class

Class Hierarchy

Pascal

```
TLocalAppServer = class(TInterfacedObject, IAppServer, ISupportErrorInfo);
```

C++

```
class TLocalAppServer : public TInterfacedObject, public IAppServer, public ISupportErrorInfo;
```

File

Provider

Description

This is class Provider.TLocalAppServer.

124.1.9.1 TLocalAppServer Members

The following tables list the members exposed by TLocalAppServer.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	AS_ApplyUpdates (see page 18557)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 18558)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 18559)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 18560)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 18560)	Returns a list of all the available providers on a remote data module.
	AS_GetRecords (see page 18561)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 18562)	Returns information from a specified record of the provider's dataset.
	GetIDsOfNames (see page 18563)	This is GetIDsOfNames, a member of class TLocalAppServer.
	GetTypeInfo (see page 18563)	This is GetTypeInfo, a member of class TLocalAppServer.
	GetTypeInfoCount (see page 18563)	This is GetTypeInfoCount, a member of class TLocalAppServer.
	InterfaceSupportsErrorInfo (see page 18563)	This is InterfaceSupportsErrorInfo, a member of class TLocalAppServer.
	Invoke (see page 18564)	This is Invoke, a member of class TLocalAppServer.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18555)	This is the overview for the Create constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

	Destroy (see page 18556)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 18564)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

Strict private Fields

	Name	Description
	FProvider (see page 18557)	This is FProvider, a member of class TLocalAppServer.
	FProviderCreated (see page 18557)	This is FProviderCreated, a member of class TLocalAppServer.

124.1.9.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TLocalAppServer.Create (TCustomProvider) (see page 18555)	This is Create, a member of class TLocalAppServer.
	TLocalAppServer.Create (TDataset) (see page 18556)	This is Create, a member of class TLocalAppServer.

124.1.9.2.1 TLocalAppServer.Create Constructor (TCustomProvider)

Pascal

```
constructor Create(AProvider: TCustomProvider); overload;
```

C++

```
__fastcall TLocalAppServer(TCustomProvider AProvider);
```

Description

This is Create, a member of class TLocalAppServer.

124.1.9.2.2 TLocalAppServer.Create Constructor (TDataset)

Pascal

```
constructor Create(ADataset: TDataset); overload;
```

C++

```
__fastcall TLocalAppServer(TDataset ADataset);
```

Description

This is Create, a member of class TLocalAppServer.

124.1.9.3 TLocalAppServer.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TLocalAppServer();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

124.1.9.4 TLocalAppServer Fields

The fields of the TLocalAppServer class are listed here.

Strict private Fields

	Name	Description
	FProvider (see page 18557)	This is FProvider, a member of class TLocalAppServer.
	FProviderCreated (see page 18557)	This is FProviderCreated, a member of class TLocalAppServer.

124.1.9.4.1 TLocalAppServer.FProvider Field

Pascal

```
FProvider: TCustomProvider;
```

C++

```
TCustomProvider FProvider;
```

Description

This is FProvider, a member of class TLocalAppServer.

124.1.9.4.2 TLocalAppServer.FProviderCreated Field

Pascal

```
FProviderCreated: Boolean;
```

C++

```
Boolean FProviderCreated;
```

Description

This is FProviderCreated, a member of class TLocalAppServer.

124.1.9.5 TLocalAppServer Methods

The methods of the TLocalAppServer class are listed here.

Protected Methods

	Name	Description
	AS_ApplyUpdates (see page 18557)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 18558)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 18559)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 18560)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 18560)	Returns a list of all the available providers on a remote data module.
	AS_GetRecords (see page 18561)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 18562)	Returns information from a specified record of the provider's dataset.
	GetIDsOfNames (see page 18563)	This is GetIDsOfNames, a member of class TLocalAppServer.
	GetTypeInfo (see page 18563)	This is GetTypeInfo, a member of class TLocalAppServer.
	GetTypeInfoCount (see page 18563)	This is GetTypeInfoCount, a member of class TLocalAppServer.
	InterfaceSupportsErrorInfo (see page 18563)	This is InterfaceSupportsErrorInfo, a member of class TLocalAppServer.
	Invoke (see page 18564)	This is Invoke, a member of class TLocalAppServer.

Public Methods

	Name	Description
V	SafeCallException (see page 18564)	Handles exceptions in methods declared using the safecall calling convention.

124.1.9.5.1 TLocalAppServer.AS_ApplyUpdates Method

Applies updates received from a client dataset using a specified provider.

Pascal

```
function AS_ApplyUpdates(const ProviderName: WideString; Delta: OleVariant; MaxErrors:
```

```
Integer; out ErrorCount: Integer; var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_ApplyUpdates(const BSTR ProviderName, OleVariant Delta, int
MaxErrors, int ErrorCount, OleVariant OwnerData);
```

Description

AS_AS_ApplyUpdates writes client updates to a dataset or database server.

ProviderName specifies the name of the provider component that manages the update operation.

Delta is a Variant containing the updated, inserted, and deleted records to write to the database.

MaxErrors indicates the maximum number of errors to permit before stopping the update operation.

ErrorCount returns the actual number of errors encountered during the update operation.

OwnerData is information supplied by the client application in a BeforeAS_ApplyUpdates event handler and returned to the client application in an AfterAS_ApplyUpdates event handler.

AS_AS_ApplyUpdates (Delphi) or AS_ApplyUpdates_result parameter (C++) returns a Variant that is a data packet containing all records that could not be applied to the database.

See Also

ApplyUpdates (see page 8394)

applyupdates (see page 18459)

BeforeApplyUpdates (see page 18479)

AfterApplyUpdates (see page 18475)

BeforeApplyUpdates (see page 8511)

AfterApplyUpdates (see page 8497)

AS_ApplyUpdates (see page 6590)

as_applyupdates (see page 19892)

Communicating with the Client Dataset

124.1.9.5.2 TLocalAppServer.AS_DataRequest Method

Generates an OnAS_DataRequest event on the specified provider component.

Pascal

```
function AS_DataRequest(const ProviderName: WideString; Data: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_DataRequest(const BSTR ProviderName, OleVariant Data);
```

Description

Use AS_AS_DataRequest to invoke an OnAS_DataRequest event handler of the provider named by ProviderName. This method is provided to allow application developers to customize the communication between a client application and a provider component. There is no predefined meaning for the Data parameter or the return value (Delphi) or the AS_DataRequest_result parameter (C++), which is returned to the caller.

See Also

OnDataRequest (see page 18482)

DataRequest (see page 8404)

Communicating with the Client Dataset

124.1.9.5.3 TLocalAppServer.AS_Execute Method

AS_Executes the query or stored procedure bound to a specified provider.

Pascal

```
procedure AS_Execute(const ProviderName: WideString; const CommandText: WideString; var
Params: OleVariant; var OwnerData: OleVariant); safecall;
```

C++

```
__fastcall AS_Execute(const BSTR ProviderName, const BSTR CommandText, OleVariant Params,
OleVariant OwnerData);
```

Description

Use AS_AS_Execute to pass an execute command to a remote provider, using a specified set of parameters. AS_AS_Execute calls the AS_Execute method of the specified provider after assigning any parameters. Output parameters that result from executing a query or stored procedure are returned in the Params parameter.

The provider's AS_Execute method generates a BeforeAS_Execute event, passes the command on to its associated dataset, and generates an AfterAS_Execute event. The dataset must represent a query or stored procedure that does not return a cursor.

The ProviderName parameter specifies the name of the provider component associated with the query or stored procedure.

CommandText specifies an optional SQL statement that replaces the SQL of the query, or the name of a stored procedure that replaces the dataset's stored procedure. This parameter is ignored if the provider's Options property does not include poAllowCommandText.

The Params parameter encodes any parameters expected by the query or stored procedure and returns any output parameters. To create a properly encoded value for Params from a TParams object, use the PackageParams routine. To decode Params into a TParams object, use the Unpackparams routine.

The OwnerData parameter contains custom information that appears as an argument to the provider's BeforeAS_Execute and AfterAS_Execute event handlers. This information originates in a client dataset's BeforeAS_Execute event handler. The value returned in OwnerData is passed to the client dataset's AfterAS_Execute event handler.

AfterExecute (see page 18476)

Params (see page 8489)

Execute (see page 8413)

Execute (see page 18466)

BeforeExecute (see page 8514)

AfterExecute (see page 8504)

Options (see page 18440)

PackageParams (see page 8534)

UnpackParams (see page 8534)

Communicating with the Client Dataset

124.1.9.5.4 TLocalAppServer.AS_GetParams Method

Fetches current parameter values from the dataset bound to a specified provider.

Pascal

```
function AS_GetParams(const ProviderName: WideString; var OwnerData: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_GetParams(const BSTR ProviderName, OleVariant OwnerData);
```

Description

Use AS_AS_GetParams to retrieve the current parameter values from the dataset associated with a provider.

The ProviderName parameter specifies the name of the provider component whose dataset has the parameters.

The OwnerData represents custom information that originates in a client dataset's BeforeAS_GetParams event handler and returns information that is passed to the client dataset's AfterAS_GetParams event handler.

AS_GetParams_result (C++) or AS_AS_GetParams (Delphi) returns the parameters, encoded as a Variant array, where each element is a 2-element Variant array containing a parameter name and a parameter value. These parameters can be converted to a TParams object using the UnpackParams procedure. If the dataset has no parameters, or if the provider does not support parameter fetching, AS_GetParams_result (C++) or AS_AS_GetParams (Delphi) returns a Null Variant.

Note: AS_AS_GetParams should not be used to retrieve output parameters from stateless application servers, because parameter values may be changed by other applications. When writing a stateless application server, retrieve parameter values using the AS_Execute method instead.

See Also

DataSet (see page 18529)

BeforeGetParams (see page 18480)

aftergetparams (see page 18477)

AS_Execute (see page 16453)

UnpackParams (see page 8534)

Communicating with the Client Dataset

124.1.9.5.5 TLocalAppServer.AS_GetProviderNames Method

Returns a list of all the available providers on a remote data module.

Pascal

```
function AS_GetProviderNames: OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetProviderNames();
```

Description

Call AS_AS_GetProviderNames for a list of all providers available from a remote data module. These values indicate the possible values for the ProviderName property of a client dataset that uses the IAppServer interface of an application server. When calling any other IAppServer method, pass one of these names to indicate the provider that is the target of the method call.

AS_AS_GetProviderNames returns the names of the providers in a Variant array. Client datasets are associated with a provider by setting their ProviderName property to one of these names.

See Also

providers (see page 6599)

ProviderName (see page 8492)

Providers (see page 19908)

Communicating with the Client Dataset

124.1.9.5.6 TLocalAppServer.AS_GetRecords Method

Returns a data packet that contains the specified data.

Pascal

```
function AS_GetRecords(const ProviderName: WideString; Count: Integer; out RecsOut: Integer;
Options: Integer; const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetRecords(const BSTR ProviderName, int Count, int RecsOut, int
Options, const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

Call AS_AS_GetRecords to retrieve a specified number of records. AS_GetRecords returns the requested records, starting with the current record of the provider's dataset. When working with a stateless remote data module, you may need to reposition the cursor or re-execute a query or stored procedure in the provider's BeforeAS_GetRecords event handler.

ProviderName gives the name of the provider component that provides the records.

Count indicates the number or type of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only Count records are retrieved.

RecsOut returns the actual number of records retrieved.

Options indicates what information should be added to the data packet in addition to data. It is a combination of the GetRecordOption constants. For example, the following value requests metadata along with a data packet encoded in XML:

```
MetaDataOption + XMLOption
MetaDataOption || XMLOption
```

CommandText specifies an optional SQL statement that replaces the SQL of a query, or the name of a table or stored procedure that replaces the provider's table or stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

Params is a Variant containing any parameters that should be passed to the provider's dataset before it executes to generate the requested data. It returns any output parameters. You can convert between the Variant format for parameters used by this argument and a TParams object using the global PackageParams and UnpackParams routines.

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_GetRecords event handler. This information is passed to the provider's BeforeAS_GetRecords event handler. OwnerData returns information supplied by the

provider's AfterAS_GetRecords event handler.

Records are returned as a data packet in a Variantparameter, AS_GetRecords_result (C++).

UnpackParams (see page 8534)

Communicating with the Client Dataset

124.1.9.5.7 TLocalAppServer.AS_RowRequest Method

Returns information from a specified record of the provider's dataset.

Pascal

```
function AS_RowRequest(const ProviderName: WideString; Row: OleVariant; RequestType: Integer;
var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_RowRequest(const BSTR ProviderName, OleVariant Row, int RequestType,
OleVariant OwnerData);
```

Description

Client datasets call AS_AS_RowRequest automatically to implement their FetchBlobs, FetchDetails , or RefreshRecord method.

The ProviderName parameter indicates the provider associated with the dataset from which information should be fetched.

The Row parameter is an OleVariant that describes the current record on the client dataset.

The RequestType parameter indicates the type of information required. It is an integer version of the TFetchOptions type. (An integer because the value may be marshaled to a remote application server). To create a value for RequestType, take the corresponding TFetchOptions value, cast it to a Byte, and cast the result to an Integer:

```
Integer(Byte([foBlobs, foDetails]));
(int) (Byte) (TFetchOptions() << foBlobs << foDetails);
```

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_RowRequest event handler. This information is passed to the provider's BeforeAS_RowRequest event handler. OwnerData returns custom information supplied by the provider's AfterAS_RowRequest event handler.

The requested data is returned as a delta packet in AS_RowRequest_result (C++).

Communicating with the Client Dataset

124.1.9.5.8 TLocalAppServer.GetIDsOfNames Method

Pascal

```
function GetIDsOfNames(const IID: TGUID; Names: Pointer; NameCount: Integer; LocaleID:
Integer; DispIDs: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetIDsOfNames(const TGUID IID, void * Names, int NameCount, int
LocaleID, void * DispIDs);
```

Description

This is GetIDsOfNames, a member of class TLocalAppServer.

124.1.9.5.9 TLocalAppServer.GetTypeInfo Method

Pascal

```
function GetTypeInfo(Index: Integer; LocaleID: Integer; out TypeInfo): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfo(int Index, int LocaleID,  TypeInfo);
```

Description

This is GetTypeInfo, a member of class TLocalAppServer.

124.1.9.5.10 TLocalAppServer.GetTypeInfoCount Method

Pascal

```
function GetTypeInfoCount(out Count: Integer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfoCount(int Count);
```

Description

This is GetTypeInfoCount, a member of class TLocalAppServer.

124.1.9.5.11 TLocalAppServer.InterfaceSupportsErrorInfo Method

Pascal

```
function InterfaceSupportsErrorInfo(const iid: TGUID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT InterfaceSupportsErrorInfo(const TGUID iid);
```

Description

This is InterfaceSupportsErrorInfo, a member of class TLocalAppServer.

124.1.9.5.12 TLocalAppServer.Invoke Method

Pascal

```
function Invoke(DispID: Integer; const IID: TGUID; LocaleID: Integer; Flags: Word; var Params;
VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Invoke(int DispID, const TGUID IID, int LocaleID, Word Flags,
Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

This is Invoke, a member of class TLocalAppServer.

124.1.9.5.13 TLocalAppServer.SafeCallException Method

Handles exceptions in methods declared using the safecall calling convention.

Pascal

```
function SafeCallException(ExceptObject: TObject; ExceptAddr: Pointer): HResult; override;
```

C++

```
virtual __fastcall HRESULT SafeCallException(TObject * ExceptObject, void * ExceptAddr);
```

Description

System::TObject::SafeCallException handles exceptions in methods that use the safecall calling convention. Some classes that implement interfaces override this method to handle errors that might occur.

As implemented in System::TObject::TObject, System::TObject::SafeCallException simply returns E_UNEXPECTED. This is the appropriate response for classes that do no support interfaces

124.1.10 TPacketDataSet Class

TPacketDataSet represents a data packet or delta packet that is used by a provider.

Class Hierarchy

Pascal

```
TPacketDataSet = class(TCustomClientDataSet);
```

C++

```
class TPacketDataSet : public TCustomClientDataSet;
```

File

Provider

Description

TPacketDataSet represents a data packet that a provider creates to represent its dataset's records and metadata or a delta data packet that a provider receives when it should apply updates. Provider (see page 18419) components create instances of TPacketDataSet to represent data packets before they are sent to clients and to represent delta packets after they are received from clients.

TPacketDataSet provides a convenient way for providers and resolvers to work with data packets. As a descendant of TCustomClientDataSet, TPacketDataSet allows providers and resolvers to use any of the standard dataset properties and methods to manipulate the data packet's records. In addition, TPacketDataSet introduces new properties and methods that describe what information goes into the data packet or how updates should be applied.

Applications do not need to work directly with packet datasets. They are mainly of use to component writers who want to create custom provider components.

See Also

TCUstomClientDataSet

TCustomProvider (see page 18449)

124.1.10.1 TPacketDataSet Members

The following tables list the members exposed by TPacketDataSet.

Protected Events

	Name	Description
	AfterApplyUpdates (see page 8497)	Occurs after the client dataset applies updates to the provider but before it attempts to reconcile update errors.
	AfterCancel (see page 8498)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 8500)	Occurs after an application closes a dataset.
	AfterDelete (see page 8501)	Occurs after an application deletes a record.
	AfterEdit (see page 8504)	Occurs after an application starts editing a record.
	AfterExecute (see page 8504)	Occurs after the client dataset receives the results from an execute command.
	AfterGetParams (see page 8505)	Occurs after the client dataset receives parameter values from the provider.
	AfterGetRecords (see page 8506)	Occurs after the client dataset fetches a data packet from the provider.
	AfterInsert (see page 8507)	Occurs after an application inserts a new record.
	AfterOpen (see page 8507)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 8509)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 8509)	Occurs after an application refreshes the data in the dataset.
	AfterRowRequest (see page 8509)	Occurs after the client dataset fetches new information about the current record.
	AfterScroll (see page 8510)	Occurs after an application scrolls from one record to another.
	BeforeApplyUpdates (see page 8511)	Occurs before the client dataset applies updates to the remote server.
	BeforeCancel (see page 8512)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 8512)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 8512)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 8513)	Occurs before an application enters edit mode for the active record.
	BeforeExecute (see page 8514)	Occurs before the client dataset executes the provider's query or stored procedure.
	BeforeGetParams (see page 8514)	Occurs before the client dataset fetches parameter values from the provider.

	BeforeGetRecords (see page 8515)	Occurs before the client dataset fetches a data packet from the provider.
	BeforeInsert (see page 8517)	Occurs before an application enters insert mode.
	BeforeOpen (see page 8518)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 8518)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 8519)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeRowRequest (see page 8520)	Occurs before the client dataset fetches new information about the current record.
	BeforeScroll (see page 8520)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 8521)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 8522)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 8522)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 8523)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 8523)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 8524)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnReconcileError (see page 8524)	Occurs when a client dataset needs to reconcile an update to a record that could not be applied.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	ActivateFilters (see page 8391)	This is ActivateFilters, a member of class TCustomClientDataSet.
V	AddDataPacket (see page 8391)	This is AddDataPacket, a member of class TCustomClientDataSet.
	AddFieldDesc (see page 8391)	This is AddFieldDesc, a member of class TCustomClientDataSet.
	AllocKeyBuffers (see page 8392)	This is AllocKeyBuffers, a member of class TCustomClientDataSet.
V	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
V	AllocRecordBuffer (see page 8393)	This is AllocRecordBuffer, a member of class TCustomClientDataSet.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
V	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
V	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Check (see page 8397)	This is Check, a member of class TCustomClientDataSet.
V	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
V	CheckDetailRecords (see page 8397)	This is CheckDetailRecords, a member of class TCustomClientDataSet.
V	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
V	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
V	CheckProviderEOF (see page 8397)	This is CheckProviderEOF, a member of class TCustomClientDataSet.
	CheckSetKeyMode (see page 8397)	This is CheckSetKeyMode, a member of class TCustomClientDataSet.
V	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
V	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
V	ClearCalcFields (see page 8398)	This is ClearCalcFields, a member of class TCustomClientDataSet.
V	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
V	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.
V	CloseCursor (see page 8400)	This is CloseCursor, a member of class TCustomClientDataSet.

	ConstraintsStored (see page 8401)	This is ConstraintsStored, a member of class TCustomClientDataSet.
	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
	DataConvert (see page 8404)	This is DataConvert, a member of class TCustomClientDataSet.
	DataEvent (see page 18583)	This is DataEvent, a member of class TPacketDataSet.
	DeactivateFilters (see page 8405)	This is DeactivateFilters, a member of class TCustomClientDataSet.
	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
	DefChanged (see page 8405)	This is DefChanged, a member of class TCustomClientDataSet.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 8405)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
	DestroyLookupCursor (see page 8406)	This is DestroyLookupCursor, a member of class TCustomClientDataSet.
	DoAfterApplyUpdates (see page 8407)	This is DoAfterApplyUpdates, a member of class TCustomClientDataSet.
	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
	DoAfterExecute (see page 8407)	This is DoAfterExecute, a member of class TCustomClientDataSet.
	DoAfterGetParams (see page 8407)	This is DoAfterGetParams, a member of class TCustomClientDataSet.
	DoAfterGetRecords (see page 8407)	This is DoAfterGetRecords, a member of class TCustomClientDataSet.
	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
	DoAfterRowRequest (see page 8408)	This is DoAfterRowRequest, a member of class TCustomClientDataSet.
	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoApplyUpdates (see page 8408)	This is DoApplyUpdates, a member of class TCustomClientDataSet.
	DoBeforeApplyUpdates (see page 8408)	This is DoBeforeApplyUpdates, a member of class TCustomClientDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeExecute (see page 8408)	This is DoBeforeExecute, a member of class TCustomClientDataSet.
	DoBeforeGetParams (see page 8408)	This is DoBeforeGetParams, a member of class TCustomClientDataSet.
	DoBeforeGetRecords (see page 8409)	This is DoBeforeGetRecords, a member of class TCustomClientDataSet.
	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
	DoBeforeInsert (see page 8409)	This is DoBeforeInsert, a member of class TCustomClientDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeRowRequest (see page 8409)	This is DoBeforeRowRequest, a member of class TCustomClientDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
	DoExecute (see page 8409)	This is DoExecute, a member of class TCustomClientDataSet.
	DoGetRecords (see page 8410)	This is DoGetRecords, a member of class TCustomClientDataSet.
	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	DoOnNewRecord (see page 8410)	This is DoOnNewRecord, a member of class TCustomClientDataSet.
	DoRowRequest (see page 8410)	This is DoRowRequest, a member of class TCustomClientDataSet.
	FetchMoreData (see page 8415)	This is FetchMoreData, a member of class TCustomClientDataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.

	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.
	FindRecord (see page 8417)	This is FindRecord, a member of class TCustomClientDataSet.
	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeKeyBuffers (see page 8417)	This is FreeKeyBuffers, a member of class TCustomClientDataSet.
	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
	FreeRecordBuffer (see page 8417)	This is FreeRecordBuffer, a member of class TCustomClientDataSet.
	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
	GetAggregateValue (see page 8418)	This is GetAggregateValue, a member of class TCustomClientDataSet.
	GetAppServer (see page 8418)	This is GetAppServer, a member of class TCustomClientDataSet.
	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.
	GetBookmarkData (see page 8418)	This is GetBookmarkData, a member of class TCustomClientDataSet.
	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.
	GetBookmarkFlag (see page 8418)	This is GetBookmarkFlag, a member of class TCustomClientDataSet.
	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
	GetCanModify (see page 6950)	This is GetCanModify, a member of class TDataSet.
	GetCanModify (see page 8418)	This is GetCanModify, a member of class TCustomClientDataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
	GetDataSource (see page 6951)	This is GetDataSource, a member of class TDataSet.
	GetDataSource (see page 8419)	This is GetDataSource, a member of class TCustomClientDataSet.
	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
	GetIndexField (see page 8421)	This is GetIndexField, a member of class TCustomClientDataSet.
	GetIndexFieldCount (see page 8421)	This is GetIndexFieldCount, a member of class TCustomClientDataSet.
	GetIsClone (see page 8422)	This is GetIsClone, a member of class TCustomClientDataSet.
	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
	GetIsIndexField (see page 8422)	This is GetIsIndexField, a member of class TCustomClientDataSet.
	GetKeyBuffer (see page 8423)	This is GetKeyBuffer, a member of class TCustomClientDataSet.
	GetKeyExclusive (see page 8423)	This is GetKeyExclusive, a member of class TCustomClientDataSet.
	GetKeyFieldCount (see page 8423)	This is GetKeyFieldCount, a member of class TCustomClientDataSet.
	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
	GetRecNo (see page 8425)	This is GetRecNo, a member of class TCustomClientDataSet.
	GetRecord (see page 6956)	This is GetRecord, a member of class TDataSet.
	GetRecord (see page 8425)	This is GetRecord, a member of class TCustomClientDataSet.
	GetRecordCount (see page 6956)	This is GetRecordCount, a member of class TDataSet.
	GetRecordCount (see page 8426)	This is GetRecordCount, a member of class TCustomClientDataSet.
	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
	GetRecordSize (see page 8426)	This is GetRecordSize, a member of class TCustomClientDataSet.
	GetRemoteServer (see page 8426)	This is GetRemoteServer, a member of class TCustomClientDataSet.
	GetStateFieldValue (see page 18584)	This is GetStateFieldValue, a member of class TPacketDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
	InitKeyBuffer (see page 8428)	This is InitKeyBuffer, a member of class TCustomClientDataSet.
V	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
V	InitRecord (see page 8428)	This is InitRecord, a member of class TCustomClientDataSet.
V	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
V	InternalAddRecord (see page 8428)	This is InternalAddRecord, a member of class TCustomClientDataSet.
V	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
V	InternalCancel (see page 8429)	This is InternalCancel, a member of class TCustomClientDataSet.
V	InternalClose (see page 18585)	This is InternalClose, a member of class TPacketDataSet.
V	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
V	InternalDelete (see page 8429)	This is InternalDelete, a member of class TCustomClientDataSet.
V	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.
V	InternalEdit (see page 8429)	This is InternalEdit, a member of class TCustomClientDataSet.
V	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
V	InternalFirst (see page 8430)	This is InternalFirst, a member of class TCustomClientDataSet.
	InternalGetOptionalParam (see page 8430)	This is InternalGetOptionalParam, a member of class TCustomClientDataSet.
V	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
V	InternalGotoBookmark (see page 8430)	This is InternalGotoBookmark, a member of class TCustomClientDataSet.
A	InternalHandleException (see page 6964)	This is InternalHandleException, a member of class TDataSet.
V	InternalHandleException (see page 8430)	This is InternalHandleException, a member of class TCustomClientDataSet.
A	InternalInitFieldDefs (see page 6965)	This is InternalInitFieldDefs, a member of class TDataSet.
V	InternalInitFieldDefs (see page 8430)	This is InternalInitFieldDefs, a member of class TCustomClientDataSet.
V	InternalInitRecord (see page 18586)	This is InternalInitRecord, a member of class TPacketDataSet.
V	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
V	InternalInsert (see page 8431)	This is InternalInsert, a member of class TCustomClientDataSet.
V	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
V	InternalLast (see page 8431)	This is InternalLast, a member of class TCustomClientDataSet.
V	InternalOpen (see page 18586)	This is InternalOpen, a member of class TPacketDataSet.
V	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
V	InternalPost (see page 8432)	This is InternalPost, a member of class TCustomClientDataSet.
V	InternalRefresh (see page 6966)	This is InternalRefresh, a member of class TDataSet.
V	InternalRefresh (see page 8432)	This is InternalRefresh, a member of class TCustomClientDataSet.
	InternalSetOptionalParam (see page 8432)	This is InternalSetOptionalParam, a member of class TCustomClientDataSet.
V	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
V	InternalSetToRecord (see page 8432)	This is InternalSetToRecord, a member of class TCustomClientDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
A	IsCursorOpen (see page 6966)	This is IsCursorOpen, a member of class TDataSet.
V	IsCursorOpen (see page 8432)	This is IsCursorOpen, a member of class TCustomClientDataSet.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 6969)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 8433)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 8436)	This is LocateRecord, a member of class TCustomClientDataSet.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 8437)	Forwards notification messages to all owned components.
V	OpenCursor (see page 6976)	This is OpenCursor, a member of class TDataSet.
V	OpenCursor (see page 8438)	This is OpenCursor, a member of class TCustomClientDataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PostKeyBuffer (see page 8439)	This is PostKeyBuffer, a member of class TCustomClientDataSet.
V	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.

	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 6982)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 7537)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 8439)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 6982)	Gets the command type to be executed by PSExecute.
	PSGetCommandType (see page 8440)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 6983)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 8440)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 6984)	This is PSGetKeyFieldsW, a member of class TDataSet.
	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 6985)	This is PSGetQuoteCharW, a member of class TDataSet.
	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 6986)	This is PSGetTableNameW, a member of class TDataSet.
	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadDataPacket (see page 8441)	This is ReadDataPacket, a member of class TCustomClientDataSet.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	RefreshInternalCalcFields (see page 8441)	This is RefreshInternalCalcFields, a member of class TCustomClientDataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	ResetAggField (see page 8442)	This is ResetAggField, a member of class TCustomClientDataSet.
	ResetCursorRange (see page 8443)	This is ResetCursorRange, a member of class TCustomClientDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAggregates (see page 8445)	This is SetAggregates, a member of class TCustomClientDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppServer (see page 8446)	This is SetAppServer, a member of class TCustomClientDataSet.

	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
	SetBookmarkData (see page 8446)	This is SetBookmarkData, a member of class TCustomClientDataSet.
	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
	SetBookmarkFlag (see page 8446)	This is SetBookmarkFlag, a member of class TCustomClientDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 8447)	This is SetCommandText, a member of class TCustomClientDataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetCursorRange (see page 8447)	This is SetCursorRange, a member of class TCustomClientDataSet.
	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDataSetField (see page 8447)	This is SetDataSetField, a member of class TCustomClientDataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldData (see page 18586)	This is SetFieldData, a member of class TPacketDataSet.
	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
	SetFilterData (see page 8448)	This is SetFilterData, a member of class TCustomClientDataSet.
	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
	SetFiltered (see page 8448)	This is SetFiltered, a member of class TCustomClientDataSet.
	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.
	SetFilterOptions (see page 8448)	This is SetFilterOptions, a member of class TCustomClientDataSet.
	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
	SetFilterText (see page 8448)	This is SetFilterText, a member of class TCustomClientDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetIndexField (see page 8448)	This is SetIndexField, a member of class TCustomClientDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetKeyBuffer (see page 8449)	This is SetKeyBuffer, a member of class TCustomClientDataSet.
	SetKeyExclusive (see page 8449)	This is SetKeyExclusive, a member of class TCustomClientDataSet.
	SetKeyFieldCount (see page 8450)	This is SetKeyFieldCount, a member of class TCustomClientDataSet.
	SetKeyFields (see page 8450)	This is SetKeyFields, a member of class TCustomClientDataSet.
	SetLinkRanges (see page 8450)	This is SetLinkRanges, a member of class TCustomClientDataSet.
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetOnFilterRecord (see page 8450)	This is SetOnFilterRecord, a member of class TCustomClientDataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetProviderEOF (see page 8452)	This is SetProviderEOF, a member of class TCustomClientDataSet.
	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
	SetRecNo (see page 8454)	This is SetRecNo, a member of class TCustomClientDataSet.
	SetRemoteServer (see page 8454)	This is SetRemoteServer, a member of class TCustomClientDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
	SetStateFieldValue (see page 18586)	This is SetStateFieldValue, a member of class TPacketDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	SwitchToIndex (see page 8455)	This is SwitchToIndex, a member of class TCustomClientDataSet.
	SyncCursors (see page 8455)	This is SyncCursors, a member of class TCustomClientDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateIndexDefs (see page 7002)	This is UpdateIndexDefs, a member of class TDataSet.
V	UpdateIndexDefs (see page 8455)	This is UpdateIndexDefs, a member of class TCustomClientDataSet.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteDataPacket (see page 8456)	This is WriteDataPacket, a member of class TCustomClientDataSet.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
	Aggregates (see page 8461)	Lists all aggregates that apply to the client dataset.
	AggregatesActive (see page 8461)	Specifies whether the client dataset calculates and maintains aggregate values.
	AutoCalcFields (see page 8463)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
	CommandText (see page 8465)	Specifies an SQL command to be executed by the database server.
	Constraints (see page 7013)	Specifies record-level constraints that must be met when editing the data.
	Constraints (see page 8466)	Specifies record-level constraints that must be met when editing the data.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
	DisableStringTrim (see page 8470)	Specifies whether trailing spaces are trimmed from field values when records are posted.
	DSBase (see page 8471)	Specifies the interface the client dataset uses to communicate with classes in Midas.dll or Midaslib.dcu (on Windows) or midas.so (on Linux).
R	DSCursor (see page 8471)	Provides access to the interface for the client dataset's data cursor.
	FetchOnDemand (see page 8471)	Indicates whether to fetch data packets from the provider on an as-needed basis.
	FieldDefs (see page 8472)	Points to the list of field definitions for the dataset.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
	Filter (see page 8476)	Specifies the text of the current filter.
	Filtered (see page 8478)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 8478)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
	IndexDefs (see page 8480)	Contains information about the indexes for a client dataset.
	IndexName (see page 8483)	Identifies an index for the client dataset.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	IsClone (see page 8484)	This is IsClone, a member of class TCustomClientDataSet.
	MasterSource (see page 8486)	Specifies a data source component for the master dataset when establishing a detail-master relationship between this dataset and another one.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
	ObjectView (see page 8487)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.

	Params (see page 8489)	Contains parameter values that are sent to the provider.
	ProviderEOF (see page 8491)	Indicates whether the client dataset has all of its data.
R	Ranged (see page 8492)	This is Ranged, a member of class TCustomClientDataSet.
	ReadOnly (see page 8493)	Specifies whether the client dataset is read-only for this application.
	Reserved (see page 7035)	For internal use only.
	StoreDefs (see page 8495)	Indicates whether field and index definitions are saved with the client dataset.
	WritingCurValues (see page 18589)	This is WritingCurValues, a member of class TPacketDataSet.

Public Events

	Name	Description
	AfterCancel (see page 7038)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 7040)	Occurs after an application closes a dataset.
	AfterDelete (see page 7041)	Occurs after an application deletes a record.
	AfterEdit (see page 7044)	Occurs after an application starts editing a record.
	AfterInsert (see page 7044)	Occurs after an application inserts a new record.
	AfterOpen (see page 7045)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 7046)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 7047)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 7047)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 7048)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 7048)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 7049)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 7049)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 7050)	Occurs before an application enters insert mode.
	BeforeOpen (see page 7051)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 7052)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 7052)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 7053)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 7053)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 7054)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 7054)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 7055)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 7056)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 7056)	Occurs when an application attempts to modify or insert a record and an exception is raised.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
	AddIndex (see page 8391)	Creates a new index for the client dataset.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendData (see page 8393)	Adds a newly fetched packet of records to those already stored in the client dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
	ApplyRange (see page 8393)	Applies a range to the dataset.
V	ApplyUpdates (see page 8394)	Sends all updated, inserted, and deleted records from the client dataset to the provider for writing to the database.

	Assign (see page 2930)	Copies the contents of another, similar object.
	AssignCurValues (see page 18582)	This is the overview for the AssignCurValues method overload.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.
	BookmarkValid (see page 8395)	Tests the validity of a specified bookmark.
	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
	Cancel (see page 8395)	Cancels unposted changes to the current record.
	CancelRange (see page 8396)	Removes any ranges currently in effect for the client dataset.
	CancelUpdates (see page 8396)	Clears all pending edits and clears the change log.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
	CloneCursor (see page 8398)	Shares the data belonging to another client dataset.
	Close (see page 6920)	Closes a dataset.
	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.
	CompareBookmarks (see page 8400)	Compares two bookmarks.
	ConstraintsDisabled (see page 8400)	Indicates whether constraints are enabled for a client dataset.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
	Create (see page 18580)	Creates and initializes instance of TPacketDataSet (see page 18564).
	CreateBlobStream (see page 6922)	Provides the interface for a method that creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CreateBlobStream (see page 8401)	Returns a TClientBlobStream (see page 8285) object for reading or writing the data in a specified blob field.
	CreateDataSet (see page 8401)	Creates a new, empty client dataset.
	CreateFromDelta (see page 18583)	This is CreateFromDelta, a member of class TPacketDataSet.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
	DataRequest (see page 8404)	Generates an OnDataRequest event on the associated provider
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
	DeleteIndex (see page 8406)	Deletes an index for the client dataset.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 6904)	Destroys the TDataSet (see page 6894) instance.
	Destroy (see page 8387)	Destroys the instance of a client dataset component.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableConstraints (see page 8406)	Disables the enforcement of constraints.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EditKey (see page 8410)	Enables modification of the search key buffer.
	EditRangeEnd (see page 8411)	Enables changing the ending value for an existing range.
	EditRangeStart (see page 8411)	Enables changing the starting value for an existing range.

	EmptyDataSet (see page 8412)	Removes all records from the dataset.
	EnableConstraints (see page 8412)	Reenables enforcement of constraints when records are posted.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
	Execute (see page 8413)	Executes an SQL command by the provider's dataset.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FetchBlobs (see page 8414)	Retrieves BLOB field values from the provider.
	FetchDetails (see page 8414)	Retrieves nested detail datasets from the provider.
	FetchParams (see page 8415)	Retrieves parameter values from the provider.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
	FindKey (see page 8416)	Searches for a record containing specified field values.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNearest (see page 8416)	Moves the cursor to the record that most closely matches a specified set of key values.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.
	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
	GetCurrentRecord (see page 8419)	Retrieves the current record into a buffer.
	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
	GetFieldData (see page 8419)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetGroupState (see page 8420)	Indicates where the current record sits within a specified group of records.
	GetIndexInfo (see page 8421)	Retrieves information about the current index.
	GetIndexNames (see page 8422)	Retrieves a list of available indexes for a client dataset.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNextPacket (see page 8423)	Retrieves the next block of records from the provider.
	GetOptionalParam (see page 8425)	Retrieves a custom parameter from the data packet.
	GetParentComponent (see page 2778)	Returns the containing Component.

	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	GotoCurrent (see page 8427)	Sets the current record in this dataset the same as the current record in another, cloned dataset.
	GotoKey (see page 8427)	Moves the cursor to a record specified by the current key.
	GotoNearest (see page 8427)	Moves the cursor to the record that most closely matches the current key.
	HasCurValues (see page 18584)	Indicates whether the CurValue property is available for fields in the packet dataset.
	HasMergeConflicts (see page 18585)	Indicates whether a current record can be merged with updates in a delta packet.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitAltRecBuffers (see page 18585)	Fetches values for the CurValue, OldValue, and NewValue properties of fields.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
V	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
	LoadFromFile (see page 8433)	Loads a client dataset's data from a file.
	LoadFromStream (see page 8435)	Loads a client dataset's data from a stream.
V	Locate (see page 6970)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
V	Locate (see page 8435)	Searches the dataset for a specified record and makes that record current.
V	Lookup (see page 6970)	Implements a virtual method to retrieve field values from a record that matches specified search values.
V	Lookup (see page 8436)	Retrieves field values from a record that matches specified search values.
	MergeChangeLog (see page 8437)	Merges any data changes in the change log into the client dataset, overwriting existing values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	Open (see page 6976)	Opens the dataset.
V	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
V	Post (see page 8438)	Writes a modified record to the Data (see page 8467) property or the change log.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 7579)	Gets the SQL command to be executed by PSExecute (see page 7578).
	PSGetCommandText (see page 7591)	Gets the SQL command to be executed by PSExecute (see page 7590).

	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).
	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Reconcile (see page 8441)	Clears successfully updated records from the client dataset's cache of changes.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RefreshRecord (see page 8442)	Updates the base values of the current record to match the current values of the provider's dataset.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
	RevertRecord (see page 8443)	Undoes edits to the current record.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 8443)	Saves a client dataset's data to an external file.
	SaveToStream (see page 8445)	Saves a client dataset's data to a stream.
	SetAltRecBuffers (see page 8446)	Sets record buffers when accessing field values.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetKey (see page 8449)	Enables setting of keys and ranges for a dataset prior to a search.
V	SetOptionalParam (see page 8450)	Saves a custom parameter with the data packet.
	SetProvider (see page 8451)	Associates the client dataset with a provider in the same process space.
	SetRange (see page 8452)	Sets the starting and ending values of a range, and applies it.
	SetRangeEnd (see page 8453)	Indicates that subsequent assignments to field values specify the end of the range of rows to include in the dataset.
	SetRangeStart (see page 8454)	Indicates that subsequent assignments to field values specify the start of the range of rows to include in the dataset.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UndoLastChange (see page 8455)	Undoes the last edit, insert, or delete operation to a record in the client dataset.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateKind (see page 18587)	Indicates the type of update the current record represents.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.
V	UpdateStatus (see page 8456)	Reports the update status for the current record in the dataset.

Public Properties

	Name	Description
	Active (see page 7004)	Specifies whether or not a dataset is open.
	Active (see page 8458)	Specifies whether the client dataset contains data.
R	ActiveAggs (see page 8460)	Lists the maintained aggregates supported by the current index.
R	AggFields (see page 7006)	Contains any aggregate fields.
	AppServer (see page 8462)	Provides access to the interface the client dataset uses to communicate with a provider.
	AutoCalcFields (see page 7006)	Determines when the OnCalcFields (see page 7053) event is triggered and when lookup field values are calculated.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
R	ChangeCount (see page 8463)	Indicates the number of changes in the change log.
R	CloneSource (see page 8464)	Indicates the client dataset (if any) with which this client dataset shares data.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	ConnectionBroker (see page 8466)	Specifies a connection broker that handles the connection to an application server.
	Data (see page 8467)	Represents the data of the client dataset in a transportable format.
	DataSetField (see page 7013)	Indicates the persistent TDataSetField (see page 7060) object that owns a nested dataset.
	DataSetField (see page 8469)	Indicates the TDataSetField component that represents this client dataset.
R	DataSize (see page 8469)	Indicates the number of bytes required to represent the Data (see page 8467) property.
R	DataSource (see page 7014)	Represents the data source of another dataset that supplies values to the dataset.

R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Delta (see page 8470)	Represents a packet of change log data.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
	FieldDefs (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset
	FileName (see page 8475)	Specifies a file that stores the data of the client dataset.
	Filter (see page 7026)	Specifies the text of the current filter for a dataset.
	Filtered (see page 7027)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 7027)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
R	GroupingLevel (see page 8479)	Indicates the depth of grouping support provided by the current index.
R	HasAppServer (see page 8480)	Indicates whether the client dataset is connected to a provider.
R	IndexFieldCount (see page 8481)	Indicates the number of fields that make up the current index.
	IndexFieldNames (see page 8482)	Lists the fields to use as an index.
	IndexFields (see page 8482)	Specifies the fields associated with the current index.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
	KeyExclusive (see page 8484)	Specifies the upper and lower boundaries for a range.
	KeyFieldCount (see page 8484)	Specifies the number of fields to use when conducting a partial key search on a multi-field key.
R	KeySize (see page 8485)	Indicates the size of the current key used for the dataset.
	LogChanges (see page 8485)	Indicates whether to maintain a change log separate from the data.
	MasterFields (see page 8486)	Names one or more fields in a master table to link with corresponding fields in this dataset in order to establish a master-detail relationship.
R	Modified (see page 7029)	Indicates whether the active record is modified.
R	NewValuesModified (see page 18588)	Indicates whether the NewValue property of any field in the current record has changed.
	ObjectView (see page 7031)	Specifies whether fields are stored hierarchically or flattened out in the Fields (see page 7023) property.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	PacketRecords (see page 8488)	Indicates the number or type of records in a single data packet.
	ProviderName (see page 8492)	Specifies the name of a provider component that supplies data to and applies updates from the client dataset..
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
	RemoteServer (see page 8493)	Specifies the connection component that this client dataset uses to connect to an application server.
	SavePoint (see page 8494)	Represents the current state of edits when logging changes.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	StatusFilter (see page 8495)	Filters the client dataset so that it exposes only those records with a specific update status.
	StreamMetaData (see page 18588)	This is StreamMetaData, a member of class TPacketDataSet.
	UseCurValues (see page 18588)	Indicates that the CurValue property of fields in the dataset should be used instead of the OldValue property.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	XMLData (see page 8496)	Represents the data of the client dataset in XML.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

Strict private Fields

	Name	Description
	FCurRecBuf (see page 18581)	This is FCurRecBuf, a member of class TPacketDataSet.
	FCurValues (see page 18581)	This is FCurValues, a member of class TPacketDataSet.
	FNewValuesModified (see page 18581)	This is FNewValuesModified, a member of class TPacketDataSet.
	FOldRecBuf (see page 18581)	This is FOldRecBuf, a member of class TPacketDataSet.
	FUseCurValues (see page 18581)	This is FUseCurValues, a member of class TPacketDataSet.
	FWritingCurValues (see page 18582)	This is FWritingCurValues, a member of class TPacketDataSet.

Strict private Methods

	Name	Description
	GetStreamMetaData (see page 18584)	This is GetStreamMetaData, a member of class TPacketDataSet.
	SetStreamMetaData (see page 18587)	This is SetStreamMetaData, a member of class TPacketDataSet.
	SetWritingCurValues (see page 18587)	This is SetWritingCurValues, a member of class TPacketDataSet.

124.1.10.2 TPacketDataSet.Create Constructor

Creates and initializes instance of TPacketDataSet (see page 18564).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TPacketDataSet(TComponent * AOwner);
```

Description

Most applications do not need to create packet datasets because they are created by the provider components that use them.Create initializes the properties of the packet dataset.

AOwner is the component that is responsible for freeing the TPacketDataSet (see page 18564) instance. If AOwner is nil (Delphi) or NULL (C++), the application must explicitly free the packet data set object.

See Also

Owner (see page 2807)

124.1.10.3 TPacketDataSet Fields

The fields of the TPacketDataSet class are listed here.

Strict private Fields

	Name	Description
	FCurRecBuf (see page 18581)	This is FCurRecBuf, a member of class TPacketDataSet.
	FCurValues (see page 18581)	This is FCurValues, a member of class TPacketDataSet.
	FNewValuesModified (see page 18581)	This is FNewValuesModified, a member of class TPacketDataSet.
	FOldRecBuf (see page 18581)	This is FOldRecBuf, a member of class TPacketDataSet.
	FUseCurValues (see page 18581)	This is FUseCurValues, a member of class TPacketDataSet.
	FWritingCurValues (see page 18582)	This is FWritingCurValues, a member of class TPacketDataSet.

124.1.10.3.1 TPacketDataSet.FCurRecBuf Field

Pascal

```
FCurRecBuf: PChar;
```

C++

```
const char * FCurRecBuf;
```

Description

This is FCurRecBuf, a member of class TPacketDataSet.

124.1.10.3.2 TPacketDataSet.FCurValues Field

Pascal

```
FCurValues: PChar;
```

C++

```
const char * FCurValues;
```

Description

This is FCurValues, a member of class TPacketDataSet.

124.1.10.3.3 TPacketDataSet.FNewValuesModified Field

Pascal

```
FNewValuesModified: Boolean;
```

C++

```
Boolean FNewValuesModified;
```

Description

This is FNewValuesModified, a member of class TPacketDataSet.

124.1.10.3.4 TPacketDataSet.FOldRecBuf Field

Pascal

```
FOldRecBuf: PChar;
```

C++

```
const char * FOldRecBuf;
```

Description

This is FOldRecBuf, a member of class TPacketDataSet.

124.1.10.3.5 TPacketDataSet.FUseCurValues Field

Pascal

```
FUseCurValues: Boolean;
```

C++

```
Boolean FUseCurValues;
```

Description

This is FUseCurValues, a member of class TPacketDataSet.

124.1.10.3.6 TPacketDataSet.FWritingCurValues Field

Pascal

```
FWritingCurValues: Boolean;
```

C++

```
Boolean FWritingCurValues;
```

Description

This is FWritingCurValues, a member of class TPacketDataSet.

124.1.10.4 TPacketDataSet Methods

The methods of the TPacketDataSet class are listed here.

Protected Methods

	Name	Description
	DataEvent (see page 18583)	This is DataEvent, a member of class TPacketDataSet.
	GetStateFieldValue (see page 18584)	This is GetStateFieldValue, a member of class TPacketDataSet.
	InternalClose (see page 18585)	This is InternalClose, a member of class TPacketDataSet.
	InternalInitRecord (see page 18586)	This is InternalInitRecord, a member of class TPacketDataSet.
	InternalOpen (see page 18586)	This is InternalOpen, a member of class TPacketDataSet.
	SetFieldData (see page 18586)	This is SetFieldData, a member of class TPacketDataSet.
	SetStateFieldValue (see page 18586)	This is SetStateFieldValue, a member of class TPacketDataSet.

Public Methods

	Name	Description
	AssignCurValues (see page 18582)	This is the overview for the AssignCurValues method overload.
	CreateFromDelta (see page 18583)	This is CreateFromDelta, a member of class TPacketDataSet.
	HasCurValues (see page 18584)	Indicates whether the CurValue property is available for fields in the packet dataset.
	HasMergeConflicts (see page 18585)	Indicates whether a current record can be merged with updates in a delta packet.
	InitAltRecBuffers (see page 18585)	Fetches values for the CurValue, OldValue, and NewValue properties of fields.
	UpdateKind (see page 18587)	Indicates the type of update the current record represents.

Strict private Methods

	Name	Description
	GetStreamMetaData (see page 18584)	This is GetStreamMetaData, a member of class TPacketDataSet.
	SetStreamMetaData (see page 18587)	This is SetStreamMetaData, a member of class TPacketDataSet.
	SetWritingCurValues (see page 18587)	This is SetWritingCurValues, a member of class TPacketDataSet.

124.1.10.4.1 AssignCurValues Method

This is the overview for the AssignCurValues method overload.

Overload List

	Name	Description
	TPacketDataSet.AssignCurValues (TDataSet) (see page 18583)	Updates the current field value for each field in the packet dataset.
	TPacketDataSet.AssignCurValues (Variant) (see page 18583)	Updates the current field value for each field in the packet dataset.

124.1.10.4.1.1 TPacketDataSet.AssignCurValues Method (TDataSet)

Updates the current field value for each field in the packet dataset.

Pascal

```
procedure AssignCurValues(Source: TDataSet); overload;
procedure AssignCurValues(const CurValues: Variant); overload;
```

C++

```
__fastcall AssignCurValues(TDataSet Source);
__fastcall AssignCurValues(const Variant CurValues);
```

Description

When a resolver component encounters an update error, it calls AssignCurValues to set the CurValue property of fields before triggering the OnUpdateError event handler.

If AssignCurValues is passed a dataset as the Source parameter, then for each field in the packet dataset, the CurValue property is set to the value of the field with the same name in the source dataset.

If AssignCurValues is passed a Variant array as the CurValues parameter, then each entry in the array is used to assign the CurValue property of a field in the packet dataset. CurValues can have one of two forms: an array of field values, or an array of Variant arrays, where each of those arrays has two elements: a field name and a value. In the first form, field values are assigned by position. In the second form, fields are located based on name and the CurValue property assigned accordingly.

See Also

CurValue (see page 7155)

OnUpdateError (see page 18444)

124.1.10.4.2 TPacketDataSet.CreateFromDelta Method

Pascal

```
procedure CreateFromDelta(Source: TPacketDataSet);
```

C++

```
__fastcall CreateFromDelta(TPacketDataSet Source);
```

Description

This is CreateFromDelta, a member of class TPacketDataSet.

124.1.10.4.3 TPacketDataSet.DataEvent Method

Pascal

```
procedure DataEvent(Event: TDataEvent; Info: Longint); override;
```

C++

```
virtual __fastcall DataEvent(TDataEvent Event, Longint Info);
```

Description

This is DataEvent, a member of class TPacketDataSet.

124.1.10.4.4 TPacketDataSet.GetStateFieldValue Method

Pascal

```
function GetStateFieldValue(State: TDataSetState; Field: TField): Variant; override;
```

C++

```
virtual __fastcall Variant GetStateFieldValue(TDataSetState State, TField Field);
```

Description

This is GetStateFieldValue, a member of class TPacketDataSet.

124.1.10.4.5 TPacketDataSet.GetStreamMetaData Method

Pascal

```
function GetStreamMetaData: Boolean;
```

C++

```
__fastcall Boolean GetStreamMetaData();
```

Description

This is GetStreamMetaData, a member of class TPacketDataSet.

124.1.10.4.6 TPacketDataSet.HasCurValues Method

Indicates whether the CurValue property is available for fields in the packet dataset.

Pascal

```
function HasCurValues: Boolean;
```

C++

```
__fastcall Boolean HasCurValues();
```

Description

When an error occurs while applying an updated record, resolver components attempt to locate the current record in the underlying database (or the dataset to which updates are applied.) This current record can then be used when trying to determine the cause of the update error. If the current record can be located, HasCurValues returns true and the fields in the packet dataset have their CurValue properties set from this record. If the record can't be located (for example, if another user changed a key field value or deleted the record), then HasCurValues returns false and the CurValue property of packet dataset fields can't be used.

See Also

UseCurValues (see page 18588)

CurValue (see page 7155)

124.1.10.4.7 TPacketDataSet.HasMergeConflicts Method

Indicates whether a current record can be merged with updates in a delta packet.

Pascal

```
function HasMergeConflicts: Boolean;
```

C++

```
__fastcall Boolean HasMergeConflicts();
```

Description

When resolving update errors in an OnUpdateError event handler, applications can specify that the updated record should be merged automatically with the current field values of the record. (To do this, set the Response parameter to rrMerge.) However, it is not always possible to merge client edits with the current record. If the updated record includes changes to field values that were also changed by other users, the merge will fail and HasMergeConflicts returns true.

See Also

CurValue (see page 7155)

NewValue (see page 7174)

OnUpdateError (see page 18444)

124.1.10.4.8 TPacketDataSet.InitAltRecBuffers Method

Fetches values for the CurValue, OldValue, and NewValue properties of fields.

Pascal

```
procedure InitAltRecBuffers(CheckModified: Boolean = True);
```

C++

```
__fastcall InitAltRecBuffers(Boolean CheckModified = True);
```

Description

While applying updates, InitAltRecBuffers is called automatically to ensure that fields in the packet dataset have values for the CurValue, OldValue, and NewValue properties. The CheckModified parameter specifies whether InitAltRecBuffers should check if the current record has been modified when it sets values. This check allows the packet dataset to reflect appropriate values when applying updates that are changed by an OnUpdateError event handler.

See Also

OldValue (see page 7175)

NewValue (see page 7174)

CurValue (see page 7155)

OnUpdateError (see page 18444)

124.1.10.4.9 TPacketDataSet.InternalClose Method

Pascal

```
procedure InternalClose; override;
```

C++

```
virtual __fastcall InternalClose();
```

Description

This is InternalClose, a member of class TPacketDataSet.

124.1.10.4.10 TPacketDataSet.InternalInitRecord Method

Pascal

```
procedure InternalInitRecord(Buffer: PChar); override;
```

C++

```
virtual __fastcall InternalInitRecord(const char * Buffer);
```

Description

This is InternalInitRecord, a member of class TPacketDataSet.

124.1.10.4.11 TPacketDataSet.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TPacketDataSet.

124.1.10.4.12 TPacketDataSet.SetFieldData Method

Pascal

```
procedure SetFieldData(Field: TField; Buffer: Pointer); override;
```

C++

```
virtual __fastcall SetFieldData(TField Field, void * Buffer);
```

Description

This is SetFieldData, a member of class TPacketDataSet.

124.1.10.4.13 TPacketDataSet.SetStateFieldValue Method

Pascal

```
procedure SetStateFieldValue(State: TDataSetState; Field: TField; const Value: Variant);
override;
```

C++

```
virtual __fastcall SetStateFieldValue(TDataSetState State, TField Field, const Variant Value);
```

Description

This is SetStateFieldValue, a member of class TPacketDataSet.

124.1.10.4.14 TPacketDataSet.SetStreamMetaData Method

Pascal

```
procedure SetStreamMetaData(Value: Boolean);
```

C++

```
__fastcall SetStreamMetaData(Boolean Value);
```

Description

This is SetStreamMetaData, a member of class TPacketDataSet.

124.1.10.4.15 TPacketDataSet.SetWritingCurValues Method

Pascal

```
procedure SetWritingCurValues(const Value: Boolean);
```

C++

```
__fastcall SetWritingCurValues(const Boolean Value);
```

Description

This is SetWritingCurValues, a member of class TPacketDataSet.

124.1.10.4.16 TPacketDataSet.UpdateKind Method

Indicates the type of update the current record represents.

Pascal

```
function UpdateKind: TUpdateKind;
```

C++

```
__fastcall TUpdateKind UpdateKind();
```

Description

Call UpdateKind while applying updates to determine the type of update the current record represents. UpdateKind returns

ukInsert if the current record is a newly inserted record.

ukDelete if the current record represents a record that should be deleted.

ukModify if the current record represents updates to an existing record.

124.1.10.5 TPacketDataSet Properties

The properties of the TPacketDataSet class are listed here.

Protected Properties

	Name	Description
	WritingCurValues (see page 18589)	This is WritingCurValues, a member of class TPacketDataSet.

Public Properties

	Name	Description
R	NewValuesModified (see page 18588)	Indicates whether the NewValue property of any field in the current record has changed.

	StreamMetaData (see page 18588)	This is StreamMetaData, a member of class TPacketDataSet.
	UseCurValues (see page 18588)	Indicates that the CurValue property of fields in the dataset should be used instead of the OldValue property.

124.1.10.5.1 TPacketDataSet.NewValuesModified Property

Indicates whether the NewValue property of any field in the current record has changed.

Pascal

```
property NewValuesModified: Boolean;
```

C++

```
__property Boolean NewValuesModified;
```

Description

Read NewValuesModified to determine whether any fields in the current record were edited during the resolving process.

See Also

NewValue (see page 7174)

124.1.10.5.2 TPacketDataSet.StreamMetaData Property

Pascal

```
property StreamMetaData: Boolean;
```

C++

```
__property Boolean StreamMetaData;
```

Description

This is StreamMetaData, a member of class TPacketDataSet.

124.1.10.5.3 TPacketDataSet.UseCurValues Property

Indicates that the CurValue property of fields in the dataset should be used instead of the OldValue property.

Pascal

```
property UseCurValues: Boolean;
```

C++

```
__property Boolean UseCurValues;
```

Description

UseCurValues is set during the resolving process when a record is corrected in an OnUpdateError event handler. This allows the resolver to reapply a corrected record rather than using the originally provided values as the basis of an update.

See Also

HasCurValues (see page 18584)

CurValue (see page 7155)

OldValue (see page 7175)

OnUpdateError (see page 18444)

124.1.10.5.4 TPacketDataSet.WritingCurValues Property

Pascal

```
property WritingCurValues: Boolean;
```

C++

```
__property Boolean WritingCurValues;
```

Description

This is WritingCurValues, a member of class TPacketDataSet.

124.1.11 TProvider Class

TProvider provides data to and applies updates from a client dataset.

Class Hierarchy

Pascal

```
TProvider = class(TDataSetProvider);
```

C++

```
class TProvider : public TDataSetProvider;
```

File

Provider

Description

TProvider is provided for backward compatibility. It is identical to TDataSetProvider (see page 18508). New applications should use TDataSetProvider (see page 18508) instead.

See Also

TDataSetProvider (see page 18508)

124.1.12 TSQLResolver Class

TSQLResolver applies updates to a database server on behalf of a provider.

Class Hierarchy

Pascal

```
TSQLResolver = class(TCustomResolver);
```

C++

```
class TSQLResolver : public TCustomResolver;
```

File

Provider

Description

Provider (see page 18600) components use TSQLResolver to apply updates from a client application directly to a database server when their ResolveToDataSet property is false. Otherwise, they use TDataSetResolver (see page 18544).

Do not create instances of TSQLResolver. Provider (see page 18600) components create their own TSQLResolver objects for applying updates.

See Also

TBaseProvider (see page 18423)

TDataSetResolver (see page 18544)

TDataSetProvider (see page 18508)

124.1.12.1 TSQLResolver Members

The following tables list the members exposed by TSQLResolver.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	BeginUpdate (see page 18490)	Provides the interface for a method that performs any initialization before applying updates.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoDelete (see page 18595)	Defines a method that deletes a record.
V	DoExecSQL (see page 18596)	This is DoExecSQL, a member of class TSQLResolver.
V	DoGetValues (see page 18596)	This is DoGetValues, a member of class TSQLResolver.
V	DoInsert (see page 18596)	Defines a method that inserts a record.
V	DoUpdate (see page 18596)	Defines a method that modifies a record.
V	EndUpdate (see page 18492)	Provides the interface for a method that performs any finalization after applying updates.
V	GenDeleteSQL (see page 18597)	This is GenDeleteSQL, a member of class TSQLResolver.
V	GenInsertSQL (see page 18597)	This is GenInsertSQL, a member of class TSQLResolver.
V	GenSelectSQL (see page 18598)	This is GenSelectSQL, a member of class TSQLResolver.
V	GenUpdateSQL (see page 18598)	This is GenUpdateSQL, a member of class TSQLResolver.
V	GenWhereSQL (see page 18598)	This is GenWhereSQL, a member of class TSQLResolver.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.

	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetProvider (see page 18598)	This is GetProvider, a member of class TSQLResolver.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleUpdateError (see page 18493)	Manages the resolving process when errors occur while applying updates.
V	InitializeConflictBuffer (see page 18599)	Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.
V	InternalDoUpdate (see page 18599)	This is InternalDoUpdate, a member of class TSQLResolver.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	LogUpdateError (see page 18495)	This is LogUpdateError, a member of class TCustomResolver.
V	LogUpdateRecord (see page 18495)	Adds records to the error log if their data has been changed by another application.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
V	UseFieldInUpdate (see page 18599)	This is UseFieldInUpdate, a member of class TSQLResolver.
V	UseFieldInWhere (see page 18600)	This is UseFieldInWhere, a member of class TSQLResolver.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Provider (see page 18600)	Indicates the provider that uses this resolver to apply updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	ApplyUpdates (see page 18490)	Applies updates received from a provider.

	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18593)	Creates and initializes an SQL resolver.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 18594)	Destroys an instance of TSQLResolver (see page 18589).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	FreeTreeData (see page 18597)	This is FreeTreeData, a member of class TSQLResolver.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InitKeyFields (see page 18494)	Sets the provider flag pfInKey on all key fields in a delta data packet.
	InitTreeData (see page 18599)	This is InitTreeData, a member of class TSQLResolver.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalBeforeResolve (see page 18494)	Initializes internal data structures once the delta packet has been wrapped in an update tree but before any updates are applied.
	InternalUpdateRecord (see page 18495)	Manages the updating process once a delta packet is wrapped in a TUpdateTree (see page 18600) object.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.

	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	RowRequest (see page 18496)	Returns information from a specified record.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	UpdateTree (see page 18497)	This is UpdateTree, a member of class TCustomResolver.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

Strict private Fields

	Name	Description
	FErrorCount (see page 18488)	This is FErrorCount, a member of class TCustomResolver.
	FMaxErrors (see page 18488)	This is FMaxErrors, a member of class TCustomResolver.
	FParams (see page 18594)	This is FParams, a member of class TSQLResolver.
	FPrevResponse (see page 18488)	This is FPrevResponse, a member of class TCustomResolver.
	FProvider (see page 18489)	This is FProvider, a member of class TCustomResolver.
	FSQL (see page 18594)	This is FSQL, a member of class TSQLResolver.
	FUpdateTree (see page 18489)	This is FUpdateTree, a member of class TCustomResolver.

124.1.12.2 TSQLResolver.Create Constructor

Creates and initializes an SQL resolver.

Pascal

```
constructor Create(AProvider: TDataSetProvider); reintroduce;
```

C++

```
__fastcall TSQLResolver(TDataSetProvider AProvider);
```

Description

Provider (see page 18600) components call Create when they need a resolver component for applying updates to a database server. Do not create resolver instances directly. Resolvers are designed to be created and used by providers, and can not function independently of a provider.

The AProvider parameter specifies the provider that creates and uses the resolver.

See Also

Resolver (see page 18441)

124.1.12.3 TSQLResolver.Destroy Destructor

Destroys an instance of TSQLResolver (see page 18589).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSQLResolver();
```

Description

Most applications should not delete instances of TSQLResolver (see page 18589). SQL resolvers are freed automatically by the provider components that use them.

See Also

Free (see page 22300)

Resolver (see page 18441)

124.1.12.4 TSQLResolver Fields

The fields of the TSQLResolver class are listed here.

Strict private Fields

	Name	Description
	FParams (see page 18594)	This is FParams, a member of class TSQLResolver.
	FSQL (see page 18594)	This is FSQL, a member of class TSQLResolver.

124.1.12.4.1 TSQLResolver.FParams Field

Pascal

```
FParams: TParams;
```

C++

```
TParams FParams;
```

Description

This is FParams, a member of class TSQLResolver.

124.1.12.4.2 TSQLResolver.FSQL Field

Pascal

```
FSQL: TWideStringList;
```

C++

```
TWideStringList FSQL;
```

Description

This is FSQL, a member of class TSQLResolver.

124.1.12.5 TSQLResolver Methods

The methods of the TSQLResolver class are listed here.

Protected Methods

	Name	Description
	DoDelete (see page 18595)	Defines a method that deletes a record.
	DoExecSQL (see page 18596)	This is DoExecSQL, a member of class TSQLResolver.
	DoGetValues (see page 18596)	This is DoGetValues, a member of class TSQLResolver.
	DoInsert (see page 18596)	Defines a method that inserts a record.
	DoUpdate (see page 18596)	Defines a method that modifies a record.
	GenDeleteSQL (see page 18597)	This is GenDeleteSQL, a member of class TSQLResolver.
	GenInsertSQL (see page 18597)	This is GenInsertSQL, a member of class TSQLResolver.
	GenSelectSQL (see page 18598)	This is GenSelectSQL, a member of class TSQLResolver.
	GenUpdateSQL (see page 18598)	This is GenUpdateSQL, a member of class TSQLResolver.
	GenWhereSQL (see page 18598)	This is GenWhereSQL, a member of class TSQLResolver.
	GetProvider (see page 18598)	This is GetProvider, a member of class TSQLResolver.
	InitializeConflictBuffer (see page 18599)	Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.
	InternalDoUpdate (see page 18599)	This is InternalDoUpdate, a member of class TSQLResolver.
	UseFieldInUpdate (see page 18599)	This is UseFieldInUpdate, a member of class TSQLResolver.
	UseFieldInWhere (see page 18600)	This is UseFieldInWhere, a member of class TSQLResolver.

Public Methods

	Name	Description
	FreeTreeData (see page 18597)	This is FreeTreeData, a member of class TSQLResolver.
	InitTreeData (see page 18599)	This is InitTreeData, a member of class TSQLResolver.

124.1.12.5.1 TSQLResolver.DoDelete Method

Defines a method that deletes a record.

Pascal

```
procedure DoDelete(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall DoDelete(TUpdateTree Tree);
```

Description

DoDelete is one of several helper methods internal to the ApplyUpdates method. These helper methods perform the actual updates in the delta packet. ApplyUpdates wraps the delta packet in a TUpdateTree object. For each record that must be deleted, the resolver calls DoDelete.

TCustomResolver does not implement the DoDelete method. Descendants override this method to delete records in their own specialized way.

See Also

ApplyUpdates (see page 18490)

DoInsert (see page 18491)

DoUpdate (see page 18491)

124.1.12.5.2 TSQLResolver.DoExecSQL Method

Pascal

```
procedure DoExecSQL(SQL: TWideStringList; Params: TParams); virtual;
```

C++

```
virtual __fastcall DoExecSQL(TWideStringList SQL, TParams Params);
```

Description

This is DoExecSQL, a member of class TSQLResolver.

124.1.12.5.3 TSQLResolver.DoGetValues Method

Pascal

```
procedure DoGetValues(SQL: TWideStringList; Params: TParams; DataSet: TDataSet); virtual;
```

C++

```
virtual __fastcall DoGetValues(TWideStringList SQL, TParams Params, TDataSet DataSet);
```

Description

This is DoGetValues, a member of class TSQLResolver.

124.1.12.5.4 TSQLResolver.DoInsert Method

Defines a method that inserts a record.

Pascal

```
procedure DoInsert(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall DoInsert(TUpdateTree Tree);
```

Description

DoInsert is one of several helper methods internal to the ApplyUpdates method. These helper methods perform the actual updates in the delta packet. ApplyUpdates wraps the delta packet in a TUpdateTree object. For each record that must be inserted, the resolver calls DoInsert.

TCustomResolver does not implement the DoInsert method. Descendants override this method to insert records in their own specialized way.

See Also

ApplyUpdates (see page 18490)

DoDelete (see page 18491)

DoUpdate (see page 18491)

124.1.12.5.5 TSQLResolver.DoUpdate Method

Defines a method that modifies a record.

Pascal

```
procedure DoUpdate(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall DoUpdate(TUpdateTree Tree);
```

Description

DoUpdate is one of several helper methods internal to the ApplyUpdates method. These helper methods perform the actual updates passed in the delta packet. ApplyUpdates wraps the delta packet in a TUpdateTree object. For each record that must be modified, the resolver calls DoUpdate.

TCustomResolver does not implement the DoUpdate method. Descendants override this method to insert records in their own specialized way.

See Also

ApplyUpdates (see page 18490)

DoDelete (see page 18491)

DoInsert (see page 18491)

124.1.12.5.6 TSQLResolver.FreeTreeData Method

Pascal

```
procedure FreeTreeData(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall FreeTreeData(TUpdateTree Tree);
```

Description

This is FreeTreeData, a member of class TSQLResolver.

124.1.12.5.7 TSQLResolver.GenDeleteSQL Method

Pascal

```
procedure GenDeleteSQL(Tree: TUpdateTree; SQL: TWideStrings; Params: TParams; Alias: string);
virtual;
```

C++

```
virtual __fastcall GenDeleteSQL(TUpdateTree Tree, TWideStrings SQL, TParams Params, AnsiString
Alias);
```

Description

This is GenDeleteSQL, a member of class TSQLResolver.

124.1.12.5.8 TSQLResolver.GenInsertSQL Method

Pascal

```
procedure GenInsertSQL(Tree: TUpdateTree; SQL: TWideStrings; Params: TParams); virtual;
```

C++

```
virtual __fastcall GenInsertSQL(TUpdateTree Tree, TWideStrings SQL, TParams Params);
```

Description

This is GenInsertSQL, a member of class TSQLResolver.

124.1.12.5.9 TSQLResolver.GenSelectSQL Method

Pascal

```
procedure GenSelectSQL(Tree: TUpdateTree; SQL: TWideStrings; Params: TParams; Alias: string;
Mode: TUpdateMode = upWhereKeyOnly); virtual;
```

C++

```
virtual __fastcall GenSelectSQL(TUpdateTree Tree, TWideStrings SQL, TParams Params, AnsiString
Alias, TUpdateMode Mode = upWhereKeyOnly);
```

Description

This is GenSelectSQL, a member of class TSQLResolver.

124.1.12.5.10 TSQLResolver.GenUpdateSQL Method

Pascal

```
procedure GenUpdateSQL(Tree: TUpdateTree; SQL: TWideStrings; Params: TParams; Alias: string);
virtual;
```

C++

```
virtual __fastcall GenUpdateSQL(TUpdateTree Tree, TWideStrings SQL, TParams Params, AnsiString
Alias);
```

Description

This is GenUpdateSQL, a member of class TSQLResolver.

124.1.12.5.11 TSQLResolver.GenWhereSQL Method

Pascal

```
procedure GenWhereSQL(Tree: TUpdateTree; SQL: TWideStrings; Params: TParams; GenUpdateMode:
TUpdateMode; Alias: string); virtual;
```

C++

```
virtual __fastcall GenWhereSQL(TUpdateTree Tree, TWideStrings SQL, TParams Params, TUpdateMode
GenUpdateMode, AnsiString Alias);
```

Description

This is GenWhereSQL, a member of class TSQLResolver.

124.1.12.5.12 TSQLResolver.GetProvider Method

Pascal

```
function GetProvider: TDataSetProvider; virtual;
```

C++

```
virtual __fastcall TDataSetProvider GetProvider();
```

Description

This is GetProvider, a member of class TSQLResolver.

124.1.12.5.13 TSQLResolver.InitializeConflictBuffer Method

Introduces a method for adding information about a failed update that is passed to an OnUpdateError event handler.

Pascal

```
procedure InitializeConflictBuffer(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall InitializeConflictBuffer(TUpdateTree Tree);
```

Description

The HandleUpdateError method calls InitializeConflictBuffer before generating an OnUpdateError event. This ensures that the client dataset passed to an OnUpdateError event handler represents the update that caused the problem, with appropriate values for field's CurValue property.

Descendants of TCustomResolver implement this method to obtain information from the dataset or server to which they are applying updates.

See Also

HandleUpdateError (see page 18493)

OnUpdateError (see page 18444)

124.1.12.5.14 TSQLResolver.InitTreeData Method

Pascal

```
procedure InitTreeData(Tree: TUpdateTree); override;
```

C++

```
virtual __fastcall InitTreeData(TUpdateTree Tree);
```

Description

This is InitTreeData, a member of class TSQLResolver.

124.1.12.5.15 TSQLResolver.InternalDoUpdate Method

Pascal

```
procedure InternalDoUpdate(Tree: TUpdateTree; UpdateKind: TUpdateKind); virtual;
```

C++

```
virtual __fastcall InternalDoUpdate(TUpdateTree Tree, TUpdateKind UpdateKind);
```

Description

This is InternalDoUpdate, a member of class TSQLResolver.

124.1.12.5.16 TSQLResolver.UseFieldInUpdate Method

Pascal

```
function UseFieldInUpdate(Field: TField): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UseFieldInUpdate(TField Field);
```

Description

This is UseFieldInUpdate, a member of class TSQLResolver.

124.1.12.5.17 TSQLResolver.UseFieldInWhere Method

Pascal

```
function UseFieldInWhere(Field: TField; Mode: TUpdateMode): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UseFieldInWhere(TField Field, TUpdateMode Mode);
```

Description

This is UseFieldInWhere, a member of class TSQLResolver.

124.1.12.6 TSQLResolver Properties

The properties of the TSQLResolver class are listed here.

Protected Properties

	Name	Description
	Provider (see page 18600)	Indicates the provider that uses this resolver to apply updates.

124.1.12.6.1 TSQLResolver.Provider Property

Indicates the provider that uses this resolver to apply updates.

Pascal

```
property Provider: TDataSetProvider;
```

C++

```
__property TDataSetProvider Provider;
```

Description

Provider is a read-only property that points to the provider that uses this resolver for applying updates. The Provider property is set in the constructor.

Resolvers use the Provider property internally to obtain information supplied in the provider's properties. They also use it to generate events on the provider at appropriate points in the update process.

See Also

Create (see page 18487)

Resolver (see page 18441)

124.1.13 TUpdateTree Class

TUpdateTree stores information about a delta packet on behalf of a resolver.

Class Hierarchy

Pascal

```
TUpdateTree = class(TObject);
```

C++

```
class TUpdateTree : public TObject;
```

File

Provider

Description

When a client dataset applies its updates to the source dataset or database server, the provider that represents that dataset or server passes the updates to a resolver component. The resolver takes this delta data packet and builds a TUpdateTree to store the updates and information about them in a convenient form. In particular, the TUpdateTree structure allows a resolver to handle master/detail relationships (represented as nested dataset fields in the delta packet) so that updates are applied in the proper order.

Applications can't use TUpdateTree directly. Most of the structured information about the delta packet is represented in protected properties that are only available to the resolver classes in the Provider (see page 18419) unit.

See Also

TCustomResolver (see page 18483)

TCustomClientDataSet (see page 8373)

TCustomProvider (see page 18449)

124.1.13.1 TUpdateTree Members

The following tables list the members exposed by TUpdateTree.

Protected Properties

	Name	Description
R	DetailList (see page 18610)	This is DetailList, a member of class TUpdateTree.
	Opened (see page 18612)	This is Opened, a member of class TUpdateTree.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 18606)	This is Clear, a member of class TUpdateTree.
	Create (see page 18603)	Creates and initializes an instance of TUpdateTree (see page 18600).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18603)	Destroys an instance of TUpdateTree (see page 18600).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	DoUpdates (see page 18606)	This is DoUpdates, a member of class TUpdateTree.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitData (see page 18608)	This is InitData, a member of class TUpdateTree.
V	InitDelta (see page 18608)	This is the overview for the InitDelta method overload.
V	InitErrorPacket (see page 18609)	This is InitErrorPacket, a member of class TUpdateTree.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	RefreshData (see page 18609)	This is RefreshData, a member of class TUpdateTree.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Data (see page 18610)	This is Data, a member of class TUpdateTree.
	Delta (see page 18610)	This is Delta, a member of class TUpdateTree.
R	DetailCount (see page 18610)	This is DetailCount, a member of class TUpdateTree.
R	Details (see page 18610)	This is Details, a member of class TUpdateTree.
	ErrorDS (see page 18611)	This is ErrorDS, a member of class TUpdateTree.
R	HasErrors (see page 18611)	This is HasErrors, a member of class TUpdateTree.
R	IsNested (see page 18611)	This is IsNested, a member of class TUpdateTree.
	Name (see page 18611)	This is Name, a member of class TUpdateTree.
R	Parent (see page 18612)	This is Parent, a member of class TUpdateTree.
R	Resolver (see page 18612)	This is Resolver, a member of class TUpdateTree.
	Source (see page 18612)	This is Source, a member of class TUpdateTree.

Strict private Fields

	Name	Description
	FData (see page 18604)	This is FData, a member of class TUpdateTree.
	FDeltaDS (see page 18604)	This is FDeltaDS, a member of class TUpdateTree.
	FDetails (see page 18604)	This is FDetails, a member of class TUpdateTree.
	FErrorDS (see page 18604)	This is FErrorDS, a member of class TUpdateTree.
	FName (see page 18604)	This is FName, a member of class TUpdateTree.
	FOpened (see page 18605)	This is FOpened, a member of class TUpdateTree.
	FParent (see page 18605)	This is FParent, a member of class TUpdateTree.
	FResolver (see page 18605)	This is FResolver, a member of class TUpdateTree.
	FSourceDS (see page 18605)	This is FSourceDS, a member of class TUpdateTree.

Strict private Methods

	Name	Description
	GetDetail (see page 18606)	This is GetDetail, a member of class TUpdateTree.
	GetDetailCount (see page 18607)	This is GetDetailCount, a member of class TUpdateTree.
	GetErrorDS (see page 18607)	This is GetErrorDS, a member of class TUpdateTree.
	GetHasErrors (see page 18607)	This is GetHasErrors, a member of class TUpdateTree.
	GetIsNested (see page 18607)	This is GetIsNested, a member of class TUpdateTree.
	GetTree (see page 18608)	This is GetTree, a member of class TUpdateTree.

124.1.13.2 TUpdateTree.Create Constructor

Creates and initializes an instance of TUpdateTree (see page 18600).

Pascal

```
constructor Create(AParent: TUpdateTree; AResolver: TCustomResolver);
```

C++

```
__fastcall TUpdateTree(TUpdateTree AParent, TCustomResolver AResolver);
```

Description

Applications do not need to call the TUpdateTree (see page 18600) constructor. Update trees are created automatically by the resolver components that use them.

The AParent parameter specifies the TUpdateTree (see page 18600) for the updates to a master table if this update tree represents a detail data set. If the TUpdateTree (see page 18600) does not represent the updates to a detail dataset, AParent is nil (Delphi) or NULL (C++).

The AResolver parameter specifies the resolver component that uses this update tree when applying updates. This parameter must be specified because the update tree calls some of this resolver's methods.

124.1.13.3 TUpdateTree.Destroy Destructor

Destroys an instance of TUpdateTree (see page 18600).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TUpdateTree();
```

Description

Applications do not need to free TUpdateTree (see page 18600) instances. Update trees are freed by the resolver components that use them.

See Also

Free (see page 22300)

124.1.13.4 TUpdateTree Fields

The fields of the TUpdateTree class are listed here.

Strict private Fields

	Name	Description
	FData (see page 18604)	This is FData, a member of class TUpdateTree.
	FDeltaDS (see page 18604)	This is FDeltaDS, a member of class TUpdateTree.
	FDetails (see page 18604)	This is FDetails, a member of class TUpdateTree.
	FErrorDS (see page 18604)	This is FErrorDS, a member of class TUpdateTree.
	FName (see page 18604)	This is FName, a member of class TUpdateTree.
	FOpened (see page 18605)	This is FOpened, a member of class TUpdateTree.
	FParent (see page 18605)	This is FParent, a member of class TUpdateTree.

	FResolver (see page 18605)	This is FResolver, a member of class TUpdateTree.
	FSourceDS (see page 18605)	This is FSourceDS, a member of class TUpdateTree.

124.1.13.4.1 TUpdateTree.FData Field

Pascal

```
FData: Pointer;
```

C++

```
void * FData;
```

Description

This is FData, a member of class TUpdateTree.

124.1.13.4.2 TUpdateTree.FDeltaDS Field

Pascal

```
FDeltaDS: TPacketDataSet;
```

C++

```
TPacketDataSet FDeltaDS;
```

Description

This is FDeltaDS, a member of class TUpdateTree.

124.1.13.4.3 TUpdateTree.FDetails Field

Pascal

```
FDetails: TList;
```

C++

```
TList FDetails;
```

Description

This is FDetails, a member of class TUpdateTree.

124.1.13.4.4 TUpdateTree.FErrorDS Field

Pascal

```
FErrorDS: TPacketDataSet;
```

C++

```
TPacketDataSet FErrorDS;
```

Description

This is FErrorDS, a member of class TUpdateTree.

124.1.13.4.5 TUpdateTree.FName Field

Pascal

```
FName: WideString;
```

C++

```
BSTR FName;
```

Description

This is FName, a member of class TUpdateTree.

124.1.13.4.6 TUpdateTree.FOpened Field

Pascal

```
FOpened: Boolean;
```

C++

```
Boolean FOpened;
```

Description

This is FOpened, a member of class TUpdateTree.

124.1.13.4.7 TUpdateTree.FParent Field

Pascal

```
FParent: TUpdateTree;
```

C++

```
TUpdateTree FParent;
```

Description

This is FParent, a member of class TUpdateTree.

124.1.13.4.8 TUpdateTree.FResolver Field

Pascal

```
FResolver: TCustomResolver;
```

C++

```
TCustomResolver FResolver;
```

Description

This is FResolver, a member of class TUpdateTree.

124.1.13.4.9 TUpdateTree.FSourceDS Field

Pascal

```
FSourceDS: TDataSet;
```

C++

```
TDataSet FSourceDS;
```

Description

This is FSourceDS, a member of class TUpdateTree.

124.1.13.5 TUpdateTree Methods

The methods of the TUpdateTree class are listed here.

Public Methods

	Name	Description
	Clear (see page 18606)	This is Clear, a member of class TUpdateTree.
	DoUpdates (see page 18606)	This is DoUpdates, a member of class TUpdateTree.
	InitData (see page 18608)	This is InitData, a member of class TUpdateTree.
	InitDelta (see page 18608)	This is the overview for the InitDelta method overload.
	InitErrorPacket (see page 18609)	This is InitErrorPacket, a member of class TUpdateTree.
	RefreshData (see page 18609)	This is RefreshData, a member of class TUpdateTree.

Strict private Methods

	Name	Description
	GetDetail (see page 18606)	This is GetDetail, a member of class TUpdateTree.
	GetDetailCount (see page 18607)	This is GetDetailCount, a member of class TUpdateTree.
	GetErrorDS (see page 18607)	This is GetErrorDS, a member of class TUpdateTree.
	GetHasErrors (see page 18607)	This is GetHasErrors, a member of class TUpdateTree.
	GetIsNested (see page 18607)	This is GetIsNested, a member of class TUpdateTree.
	GetTree (see page 18608)	This is GetTree, a member of class TUpdateTree.

124.1.13.5.1 TUpdateTree.Clear Method

Pascal

```
procedure Clear; virtual;
```

C++

```
virtual __fastcall Clear();
```

Description

This is Clear, a member of class TUpdateTree.

124.1.13.5.2 TUpdateTree.DoUpdates Method

Pascal

```
function DoUpdates: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean DoUpdates();
```

Description

This is DoUpdates, a member of class TUpdateTree.

124.1.13.5.3 TUpdateTree.GetDetail Method

Pascal

```
function GetDetail(Index: Integer): TUpdateTree;
```

C++

```
__fastcall TUpdateTree GetDetail(int Index);
```

Description

This is GetDetail, a member of class TUpdateTree.

124.1.13.5.4 TUpdateTree.GetDetailCount Method

Pascal

```
function GetDetailCount: Integer;
```

C++

```
__fastcall int GetDetailCount();
```

Description

This is GetDetailCount, a member of class TUpdateTree.

124.1.13.5.5 TUpdateTree.GetErrorDS Method

Pascal

```
function GetErrorDS: TPacketDataSet;
```

C++

```
__fastcall TPacketDataSet GetErrorDS();
```

Description

This is GetErrorDS, a member of class TUpdateTree.

124.1.13.5.6 TUpdateTree.GetHasErrors Method

Pascal

```
function GetHasErrors: Boolean;
```

C++

```
__fastcall Boolean GetHasErrors();
```

Description

This is GetHasErrors, a member of class TUpdateTree.

124.1.13.5.7 TUpdateTree.GetIsNested Method

Pascal

```
function GetIsNested: Boolean;
```

C++

```
__fastcall Boolean GetIsNested();
```

Description

This is GetIsNested, a member of class TUpdateTree.

124.1.13.5.8 TUpdateTree.GetTree Method

Pascal

```
function GetTree(const AName: WideString): TUpdateTree;
```

C++

```
__fastcall TUpdateTree GetTree(const BSTR AName);
```

Description

This is GetTree, a member of class TUpdateTree.

124.1.13.5.9 TUpdateTree.InitData Method

Pascal

```
procedure InitData(ASource: TDataSet); virtual;
```

C++

```
virtual __fastcall InitData(TDataSet ASource);
```

Description

This is InitData, a member of class TUpdateTree.

124.1.13.5.10 InitDelta Method

This is the overview for the InitDelta method overload.

Overload List

	Name	Description
	TUpdateTree.InitDelta (OleVariant) (see page 18608)	This is InitDelta, a member of class TUpdateTree.
	TUpdateTree.InitDelta (TPacketDataSet) (see page 18608)	This is InitDelta, a member of class TUpdateTree.

124.1.13.5.10.1 TUpdateTree.InitDelta Method (OleVariant)

Pascal

```
procedure InitDelta(const ADelta: OleVariant); virtual; overload;
```

C++

```
virtual __fastcall InitDelta(const OleVariant ADelta);
```

Description

This is InitDelta, a member of class TUpdateTree.

124.1.13.5.10.2 TUpdateTree.InitDelta Method (TPacketDataSet)

Pascal

```
procedure InitDelta(ADelta: TPacketDataSet); virtual; overload;
```

C++

```
virtual __fastcall InitDelta(TPacketDataSet ADelta);
```

Description

This is InitDelta, a member of class TUpdateTree.

124.1.13.5.11 TUpdateTree.InitErrorPacket Method

Pascal

```
procedure InitErrorPacket(E: EUpdateError; Response: TResolverResponse); virtual;
```

C++

```
virtual __fastcall InitErrorPacket(EUpdateError E, TResolverResponse Response);
```

Description

This is InitErrorPacket, a member of class TUpdateTree.

124.1.13.5.12 TUpdateTree.RefreshData Method

Pascal

```
procedure RefreshData(Options: TFetchOptions); virtual;
```

C++

```
virtual __fastcall RefreshData(TFetchOptions Options);
```

Description

This is RefreshData, a member of class TUpdateTree.

124.1.13.6 TUpdateTree Properties

The properties of the TUpdateTree class are listed here.

Protected Properties

	Name	Description
R	DetailList (see page 18610)	This is DetailList, a member of class TUpdateTree.
	Opened (see page 18612)	This is Opened, a member of class TUpdateTree.

Public Properties

	Name	Description
	Data (see page 18610)	This is Data, a member of class TUpdateTree.
	Delta (see page 18610)	This is Delta, a member of class TUpdateTree.
R	DetailCount (see page 18610)	This is DetailCount, a member of class TUpdateTree.
R	Details (see page 18610)	This is Details, a member of class TUpdateTree.
	ErrorDS (see page 18611)	This is ErrorDS, a member of class TUpdateTree.
R	HasErrors (see page 18611)	This is HasErrors, a member of class TUpdateTree.
R	IsNested (see page 18611)	This is IsNested, a member of class TUpdateTree.
	Name (see page 18611)	This is Name, a member of class TUpdateTree.
R	Parent (see page 18612)	This is Parent, a member of class TUpdateTree.
R	Resolver (see page 18612)	This is Resolver, a member of class TUpdateTree.
	Source (see page 18612)	This is Source, a member of class TUpdateTree.

124.1.13.6.1 TUpdateTree.Data Property

Pascal

```
property Data: Pointer;
```

C++

```
__property void * Data;
```

Description

This is Data, a member of class TUpdateTree.

124.1.13.6.2 TUpdateTree.Delta Property

Pascal

```
property Delta: TPacketDataSet;
```

C++

```
__property TPacketDataSet Delta;
```

Description

This is Delta, a member of class TUpdateTree.

124.1.13.6.3 TUpdateTree.DetailCount Property

Pascal

```
property DetailCount: Integer;
```

C++

```
__property int DetailCount;
```

Description

This is DetailCount, a member of class TUpdateTree.

124.1.13.6.4 TUpdateTree.DetailList Property

Pascal

```
property DetailList: TList;
```

C++

```
__property TList DetailList;
```

Description

This is DetailList, a member of class TUpdateTree.

124.1.13.6.5 TUpdateTree.Details Property

Pascal

```
property Details [Index: Integer]: TUpdateTree;
```

C++

```
__property TUpdateTree Details[int Index];
```

Description

This is Details, a member of class TUpdateTree.

124.1.13.6.6 TUpdateTree.ErrorDS Property

Pascal

```
property ErrorDS: TPacketDataSet;
```

C++

```
__property TPacketDataSet ErrorDS;
```

Description

This is ErrorDS, a member of class TUpdateTree.

124.1.13.6.7 TUpdateTree.HasErrors Property

Pascal

```
property HasErrors: Boolean;
```

C++

```
__property Boolean HasErrors;
```

Description

This is HasErrors, a member of class TUpdateTree.

124.1.13.6.8 TUpdateTree.IsNested Property

Pascal

```
property IsNested: Boolean;
```

C++

```
__property Boolean IsNested;
```

Description

This is IsNested, a member of class TUpdateTree.

124.1.13.6.9 TUpdateTree.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class TUpdateTree.

124.1.13.6.10 TUpdateTree.Opened Property

Pascal

```
property Opened: Boolean;
```

C++

```
__property Boolean Opened;
```

Description

This is Opened, a member of class TUpdateTree.

124.1.13.6.11 TUpdateTree.Parent Property

Pascal

```
property Parent: TUpdateTree;
```

C++

```
__property TUpdateTree Parent;
```

Description

This is Parent, a member of class TUpdateTree.

124.1.13.6.12 TUpdateTree.Resolver Property

Pascal

```
property Resolver: TCustomResolver;
```

C++

```
__property TCustomResolver Resolver;
```

Description

This is Resolver, a member of class TUpdateTree.

124.1.13.6.13 TUpdateTree.Source Property

Pascal

```
property Source: TDataSet;
```

C++

```
__property TDataSet Source;
```

Description

This is Source, a member of class TUpdateTree.

124.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IProviderContainer (see page 18613)	This is class Provider.IProviderContainer.

124.2.1 IProviderContainer Interface

Class Hierarchy

Provider.IProviderContainer

Pascal

```
IProviderContainer = interface;
```

C++

```
__interface IProviderContainer;
```

File

Provider

Description

This is class Provider.IProviderContainer.

124.2.1.1 IProviderContainer Members

The following tables list the members exposed by IProviderContainer.

Public Methods

	Name	Description
	RegisterProvider (see page 18614)	This is RegisterProvider, a member of class IProviderContainer.
	UnRegisterProvider (see page 18614)	This is UnRegisterProvider, a member of class IProviderContainer.

124.2.1.2 IProviderContainer Methods

The methods of the IProviderContainer class are listed here.

Public Methods

	Name	Description
	RegisterProvider (see page 18614)	This is RegisterProvider, a member of class IProviderContainer.
	UnRegisterProvider (see page 18614)	This is UnRegisterProvider, a member of class IProviderContainer.

124.2.1.2.1 IProviderContainer.RegisterProvider Method

Pascal

```
procedure RegisterProvider(Prov: TCustomProvider);
```

C++

```
__fastcall RegisterProvider(TCustomProvider Prov);
```

Description

This is RegisterProvider, a member of class IProviderContainer.

124.2.1.2.2 IProviderContainer.UnRegisterProvider Method

Pascal

```
procedure UnRegisterProvider(Prov: TCustomProvider);
```

C++

```
__fastcall UnRegisterProvider(TCustomProvider Prov);
```

Description

This is UnRegisterProvider, a member of class IProviderContainer.

124.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetObjectProperty (see page 18615)	This is function Provider.GetObjectProperty.
	GetStringProperty (see page 18615)	This is function Provider.GetStringProperty.
	VarArrayFromStrings (see page 18615)	Creates a Variant array that contains the strings in a TStrings object.
	VarArrayFromWideStrings (see page 18616)	This is function Provider.VarArrayFromWideStrings.

124.3.1 Provider.GetObjectProperty Function

Pascal

```
function GetObjectProperty(Instance: TPersistent; const PropName: string): TObject;
```

C++

```
TObject * GetObjectProperty(TPersistent * Instance, const AnsiString PropName);
```

File

Provider

Description

This is function Provider.GetObjectProperty.

124.3.2 Provider.GetStringProperty Function

Pascal

```
function GetStringProperty(Instance: TPersistent; const PropName: string): WideString;
```

C++

```
BSTR GetStringProperty(TPersistent * Instance, const AnsiString PropName);
```

File

Provider

Description

This is function Provider.GetStringProperty.

124.3.3 Provider.VarArrayFromStrings Function

Creates a Variant array that contains the strings in a TStrings object.

Pascal

```
function VarArrayFromStrings(Strings: TStrings): Variant;
```

C++

```
Variant VarArrayFromStrings(TStrings Strings);
```

File

Provider

Description

Call VarArrayFromStrings to create a Variant array to represent the strings in a TStrings object. VarArrayFromStrings creates a new Variant array of WideString values, where each WideString corresponds to a string in the specified TStrings object.

Strings is the TStrings object that supplies the strings for the Variant array.

VarArrayFromStrings returns the new Variant array.

See Also

PackageParams

VarArrayCreate

124.3.4 Provider.VarArrayFromWideStrings Function

Pascal

```
function VarArrayFromWideStrings(Strings: TWideStrings): Variant;
```

C++

```
Variant VarArrayFromWideStrings(TWideStrings Strings);
```

File

Provider

Description

This is function Provider.VarArrayFromWideStrings.

124.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TGetRecordOption (see page 18617)	TGetRecordOption and TGetRecordOptions (see page 18624) influence what type of information is added to data packets.
	TProviderOption (see page 18618)	TProviderOption and TProviderOptions (see page 18626) influence what type of information is communicated between client datasets and provider components.
	TResolverResponse (see page 18620)	TResolverResponse indicates the action a resolver component should take after an OnUpdateError event handler handles an update error.

Records

	Name	Description
	TPutFieldInfo (see page 18620)	This is record Provider.TPutFieldInfo.

124.4.1 Provider.TGetRecordOption Enumeration

TGetRecordOption and TGetRecordOptions (see page 18624) influence what type of information is added to data packets.

Pascal

```
TGetRecordOption = (
  grMetaData,
  grReset,
  grXML,
  grXMLUTF8
);
```

C++

```
enum TGetRecordOption {
  grMetaData,
  grReset,
  grXML,
  grXMLUTF8
};
```

File

Provider

Description

TGetRecordOptions (see page 18624) is a set of TGetRecordOption values. TGetRecordOption values are listed in the following table:

Value	Meaning
grMetaData	The data packet includes metadata as well as record values.
grReset	The records in the data packet start with the first record, regardless of the contents of any previously sent data packets.

grXML	The data packet is transmitted as a string of XML instead of as an OleVariant. Extended characters are expressed using escape sequences.
grXMLUTF8	The data packet is transmitted as a string of XML instead of as an OleVariant. Extended characters are encoded using UTF-8.

See Also

TCustomProvider (see page 18449)

124.4.2 Provider.TProviderOption Enumeration

TProviderOption and TProviderOptions (see page 18626) influence what type of information is communicated between client datasets and provider components.

Pascal

```
TProviderOption = (
  poFetchBlobsOnDemand,
  poFetchDetailsOnDemand,
  poIncFieldProps,
  poCascadeDeletes,
  poCascadeUpdates,
  poReadOnly,
  poAllowMultiRecordUpdates,
  poDisableInserts,
  poDisableEdits,
  poDisableDeletes,
  poNoReset,
  poAutoRefresh,
  poPropogateChanges,
  poAllowCommandText,
  poRetainServerOrder,
  poUseQuoteChar
);
```

C++

```
enum TProviderOption {
  poFetchBlobsOnDemand,
  poFetchDetailsOnDemand,
  poIncFieldProps,
  poCascadeDeletes,
  poCascadeUpdates,
  poReadOnly,
  poAllowMultiRecordUpdates,
  poDisableInserts,
  poDisableEdits,

  poNoReset,
  poAutoRefresh,
  poPropogateChanges,
  poAllowCommandText,
  poRetainServerOrder,
  poUseQuoteChar
};
```

File

Provider

Description

TProviderOptions (see page 18626) is a set of TProviderOption values. TProviderOption values are listed in the following table:

Value	Meaning
poFetchBlobsOnDemand	BLOB fields are not included in data packets. Instead, client applications must request these values on an as-needed basis. If the client dataset's FetchOnDemand property is true, the client requests these values automatically. Otherwise, the client application uses the FetchBlobs method to retrieve BLOB data.
poFetchDetailsOnDemand	When the provider represents the master of a master/detail relationship, nested detail values are not included in the data packet. Instead, client applications request these on an as-needed basis. If the client dataset's FetchOnDemand property is true, the client requests these values automatically. Otherwise the client application uses the FetchDetails method to retrieve nested detail sets.
poIncFieldProps	The data packet includes the following field properties (where applicable): Alignment, DisplayLabel, DisplayWidth, Visible, DisplayFormat, EditFormat, MaxValue, MinValue, Currency, EditMask, DisplayValues
poCascadeDeletes	Tells the server to delete detail records automatically when master table records are deleted. To use this option, the provider must represent the master of a master/detail relationship and the database must support cascaded deletes as part of its referential integrity settings.
poCascadeUpdates	Tells the server to update detail records automatically when master table key values are changed. To use this option, the provider must represent the master of a master/detail relationship and the database must support cascaded updates as part of its referential integrity settings.
poReadOnly	The client dataset can't apply updates to the provider.
poAllowMultiRecordUpdates	Enables individual updates that affect multiple records. When poAllowMultiRecordUpdates is not included, updates that change multiple records are automatically aborted.
poDisableInserts	Clients can't add new records. If the client tries to insert a record an exception is raised. (This does not affect the client's ability to edit or delete records)
poDisableEdits	Clients can't modify existing data values. If the client tries to edit a field an exception is raised. (This does not affect the client's ability to insert or delete records)
poDisableDeletes	Clients can't delete records. If the client tries to delete a record an exception is raised. (This does not affect the client's ability to edit or insert records)
poNoReset	Ignores the reset flag in calls to AS_GetRecords (TGetRecordsOption value of grReset).
poAutoRefresh	Refreshes the client dataset with current record values whenever it applies updates.
poPropogateChanges	Changes made in a BeforeUpdateRecord or AfterUpdateRecord event handler are sent back to the client and merged into the client dataset.
poAllowCommandText	Enables the client to override the provider's dataset by replacing its associated SQL text or the name of its stored procedure or table. These overrides are supplied to the GetRecords or Execute method.
poRetainServerOrder	Signals that the client should not attempt to re-establish the default order by sorting the records in the data packet. This prevents the client from changing the record order because, for example, it is unable to duplicate the locale on the server.
poUseQuoteChar	Specifies that the quote character (“) used by the SQL provider will also be used to quote SQL identifiers in the SQL queries created by the provider. This option is True by default; set it False to eliminate the quotes.

TGetRecordOption (see page 18617)

124.4.3 Provider.TPutFieldInfo Record

Pascal

```
TPutFieldInfo = record
  FieldNo: Integer;
  Field: TField;
  DataSet: TDataSet;
  Size: Integer;
  IsDetail: Boolean;
  Opened: Boolean;
  PutProc: TPutFieldProc;
  LocalFieldIndex: Integer;
  FieldInfos: Pointer;
end;
```

C++

```
struct TPutFieldInfo {
  int FieldNo;
  TField Field;
  TDataSet DataSet;
  int Size;
  Boolean IsDetail;
  Boolean Opened;
  TPutFieldProc PutProc;
  int LocalFieldIndex;
  void * FieldInfos;
};
```

File

Provider

Description

This is record Provider.TPutFieldInfo.

124.4.4 Provider.TResolverResponse Enumeration

TResolverResponse indicates the action a resolver component should take after an OnUpdateError event handler handles an update error.

Pascal

```
TResolverResponse = (
  rrSkip,
  rrAbort,
  rrMerge,
  rrApply,
  rrIgnore
);
```

C++

```
enum TResolverResponse {
  rrSkip,
  rrAbort,
```

```
    rrMerge,
    rrApply,
    rrIgnore
  };
```

File

Provider

Description

The following table lists the possible values for TResolverResponse and what they indicate:

Value	Meaning
rrSkip	Skip updating the record that raised the error condition, and leave the unapplied changes in the cache.
rrAbort	Abort the entire update operation without displaying an error message.
rrMerge	Merge the updates in the delta packet with the new underlying value from the database. This will only succeed if none of the updated fields have been changed by another user.
rrApply	Apply the current record value (as it has been fixed in the OnUpdateError handler) instead of the original update.
rrIgnore	Ignore the error condition: Do not apply the record but do not return the record to the client dataset for resolving either.

OnUpdateError (see page 18444)

TCustomResolver (see page 18483)

124.5 Types

The following table lists types in this documentation.

Types

Name	Description
PPutFieldInfo (see page 18622)	This is type Provider.PPutFieldInfo.
TAfterUpdateRecordEvent (see page 18622)	This is type Provider.TAfterUpdateRecordEvent.
TBeforeCommitEvent (see page 18623)	This is type Provider.TBeforeCommitEvent.
TBeforeUpdateRecordEvent (see page 18623)	This is type Provider.TBeforeUpdateRecordEvent.
TDataRequestEvent (see page 18623)	This is type Provider.TDataRequestEvent.
TGetDSProps (see page 18624)	This is type Provider.TGetDSProps.
TGetParamsEvent (see page 18624)	This is type Provider.TGetParamsEvent.
TGetRecordOptions (see page 18624)	This is type Provider.TGetRecordOptions.
TGetTableNameEvent (see page 18625)	This is type Provider.TGetTableNameEvent.
TInfoArray (see page 18625)	This is type Provider.TInfoArray.
TOnValidate (see page 18625)	This is type Provider.TOnValidate.
TProviderDataEvent (see page 18626)	This is type Provider.TProviderDataEvent.
TProviderOptions (see page 18626)	This is type Provider.TProviderOptions.
TPutFieldProc (see page 18626)	This is type Provider.TPutFieldProc.
TResolverErrorEvent (see page 18627)	This is type Provider.TResolverErrorEvent.

124.5.1 Provider.PPutFieldInfo Type

Pascal

```
PPutFieldInfo = ^TPutFieldInfo;
```

C++

```
^TPutFieldInfo PPutFieldInfo;
```

File

Provider

Description

This is type Provider.PPutFieldInfo.

124.5.2 Provider.TAfterUpdateRecordEvent Type

Pascal

```
TAfterUpdateRecordEvent = procedure (Sender: TObject; SourceDS: TDataSet; DeltaDS:
TCustomClientDataSet; UpdateKind: TUpdateKind) of object;
```

C++

```
(Sender: TObject; SourceDS: TDataSet; DeltaDS: TCustomClientDataSet; UpdateKind: TUpdateKind)
( TAfterUpdateRecordEvent)();
```

File

Provider

Description

This is type Provider.TAfterUpdateRecordEvent.

124.5.3 Provider.TBeforeCommitEvent Type

Pascal

```
TBeforeCommitEvent = procedure (Sender:TObject; DeltaDS: TCustomClientDataSet; ErrorCount,
MaxErrors: integer; const ResultVar: OleVariant) of object;
```

C++

```
(Sender:TObject; DeltaDS: TCustomClientDataSet; ErrorCount, MaxErrors: integer; const
ResultVar: OleVariant) ( TBeforeCommitEvent)();
```

File

Provider

Description

This is type Provider.TBeforeCommitEvent.

124.5.4 Provider.TBeforeUpdateRecordEvent Type

Pascal

```
TBeforeUpdateRecordEvent = procedure (Sender: TObject; SourceDS: TDataSet; DeltaDS:
TCustomClientDataSet; UpdateKind: TUpdateKind; var Applied: Boolean) of object;
```

C++

```
(Sender: TObject; SourceDS: TDataSet; DeltaDS: TCustomClientDataSet; UpdateKind: TUpdateKind;
var Applied: Boolean) ( TBeforeUpdateRecordEvent)();
```

File

Provider

Description

This is type Provider.TBeforeUpdateRecordEvent.

124.5.5 Provider.TDataRequestEvent Type

Pascal

```
TDataRequestEvent = function (Sender: TObject; Input: OleVariant): OleVariant of object;
```

C++

```
(Sender: TObject; Input: OleVariant): OleVariant ( TDataRequestEvent)();
```

File

Provider

Description

This is type Provider.TDataRequestEvent.

124.5.6 Provider.TGetDSProps Type

Pascal

```
TGetDSProps = procedure (Sender: TObject; DataSet: TDataSet; out Properties: OleVariant) of
object;
```

C++

```
(Sender: TObject; DataSet: TDataSet; out Properties: OleVariant) ( TGetDSProps)();
```

File

Provider

Description

This is type Provider.TGetDSProps.

124.5.7 Provider.TGetParamsEvent Type

Pascal

```
TGetParamsEvent = procedure (DataSet: TDataSet; Params: TList) of object;
```

C++

```
(DataSet: TDataSet; Params: TList) ( TGetParamsEvent)();
```

File

Provider

Description

This is type Provider.TGetParamsEvent.

124.5.8 Provider.TGetRecordOptions Type

Pascal

```
TGetRecordOptions = set of TGetRecordOption;
```

C++

```
TGetRecordOption TGetRecordOptions;
```

File

Provider

Description

This is type Provider.TGetRecordOptions.

124.5.9 Provider.TGetTableNameEvent Type

Pascal

```
TGetTableNameEvent = procedure (Sender: TObject; DataSet: TDataSet; var TableName: WideString)
of object;
```

C++

```
(Sender: TObject; DataSet: TDataSet; var TableName: WideString) ( TGetTableNameEvent)();
```

File

Provider

Description

This is type Provider.TGetTableNameEvent.

124.5.10 Provider.TInfoArray Type

Pascal

```
TInfoArray = array of TPutFieldInfo;
```

C++

```
array of TPutFieldInfo TInfoArray;
```

File

Provider

Description

This is type Provider.TInfoArray.

124.5.11 Provider.TOnValidate Type

Pascal

```
TOnValidate = procedure (const Delta: OleVariant) of object;
```

C++

```
(const Delta: OleVariant) ( TOnValidate)();
```

File

Provider

Description

This is type Provider.TOnValidate.

124.5.12 Provider.TProviderDataEvent Type

Pascal

```
TProviderDataEvent = procedure (Sender: TObject; DataSet: TCustomClientDataSet) of object;
```

C++

```
(Sender: TObject; DataSet: TCustomClientDataSet) ( TProviderDataEvent)();
```

File

Provider

Description

This is type Provider.TProviderDataEvent.

124.5.13 Provider.TProviderOptions Type

Pascal

```
TProviderOptions = set of TProviderOption;
```

C++

```
TProviderOption TProviderOptions;
```

File

Provider

Description

This is type Provider.TProviderOptions.

124.5.14 Provider.TPutFieldProc Type

Pascal

```
TPutFieldProc = procedure (Info: PPutFieldInfo) of object;
```

C++

```
(Info: PPutFieldInfo) ( TPutFieldProc)();
```

File

Provider

Description

This is type Provider.TPutFieldProc.

124.5.15 Provider.TResolverErrorEvent Type

Pascal

```
TResolverErrorEvent = procedure (Sender: TObject; DataSet: TCustomClientDataSet; E:
EUpdateError; UpdateKind: TUpdateKind; var Response: TResolverResponse) of object;
```

C++

```
(Sender: TObject; DataSet: TCustomClientDataSet; E: EUpdateError; UpdateKind: TUpdateKind; var
Response: TResolverResponse) ( TResolverErrorEvent)();
```

File

Provider

Description

This is type Provider.TResolverErrorEvent.

124.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
InformixLob (see page 18628)	This is variable Provider.InformixLob.

124.6.1 Provider.InformixLob Variable

Pascal

```
InformixLob: Boolean;
```

C++

```
Boolean InformixLob;
```

File

Provider

Description

This is variable Provider.InformixLob.

124.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
MetaDataOption (see page 18629)	Specifies the options available when retrieving metadata from a target database.
ResetOption (see page 18630)	This is constant Provider.ResetOption.
XMLOption (see page 18630)	This is constant Provider.XMLOption.
XMLUTF8Option (see page 18631)	This is constant Provider.XMLUTF8Option.

124.7.1 Provider.MetaDataOption Constant

Specifies the options available when retrieving metadata from a target database.

Pascal

```
MetaDataOption: Integer = 1 shl ord(grMetaData);
```

C++

```
int MetaDataOption = 1 shl ord(grMetaData);
```

File

Provider

Description

Each database provides a number of options for data that can be retrieved from and about the database. When you build your own data provider, it can be helpful to use these options when implementing the ISQLMetaData interface. The following table describes the allowable metadata options.

Element	Description
CatalogName	Specifies a system table name.
DatabaseName	Specifies the name of the database.
DatabaseVersion	Specifies the version number of the database.
MaxColumnInSelect	Limits the number of columns that can be specified in a SELECT statement. The column count starts with the first column. Any columns beyond the limit are not returned.
MaxColumnsInTable	Limits the number of columns that can be returned from a table. The column count starts with the first column. Any columns beyond the limit are not returned.
MaxObjectNameLength	Limits the number of characters returned of a database object name. Names exceeding this limit are truncated. If database object names are similar, truncating them might result in duplicate names or meaningless names.
MaxRowSize	Limits the size of any returned rows. This can be useful if you suspect there might be BLOBs in the rows you are selecting, but you want to protect the performance of your query.
MaxSQLLength	Limits the length, in characters, of a SQL statement.
ObjectQuoteChar	Specifies the quote character to use when delimiting object names containing special characters, such as spaces.

PackageName	Specifies the name of a package.
ProcSupportsCursor	Specifies whether or not a stored procedure supports the use of a cursor. Set to **true** if it supports a cursor, otherwise set to **false**.
ProcSupportsCursors	Specifies whether or not a stored procedure supports the use of multiple cursors. Set to **true** if it supports cursors, otherwise set to **false**.
SQLEscapeChar	Specifies the character to use to delimit escape sequences in SQL statements.
SchemaName	Specifies the name of a database schema if different from the DatabaseName.
SupportsTransaction	Specifies whether or not the database can be named in a transaction-based SQL statement. Set to **true** if it supports a transaction, otherwise set to **false**.
SupportsTransactions	Specifies whether or not the database can be named in multiple transaction-based SQL statements. Set to **true** if it supports transactions, otherwise set to **false**.
TransactionIsoLevel	Specifies the transaction isolation level. Isolation levels supported by BDP.NET include ReadCommitted, RepeatableRead, DirtyRead, and Custom.

124.7.2 Provider.ResetOption Constant

Pascal

```
ResetOption: Integer = 1 shl ord(grReset);
```

C++

```
int ResetOption = 1 shl ord(grReset);
```

File

Provider

Description

This is constant Provider.ResetOption.

124.7.3 Provider.XMLOption Constant

Pascal

```
XMLOption: Integer = 1 shl ord(grXML);
```

C++

```
int XMLOption = 1 shl ord(grXML);
```

File

Provider

Description

This is constant Provider.XMLOption.

124.7.4 Provider.XMLUTF8Option Constant

Pascal

```
XMLUTF8Option: Integer = 1 shl ord(grXMLUTF8);
```

C++

```
int XMLUTF8Option = 1 shl ord(grXMLUTF8);
```

File

Provider

Description

This is constant Provider.XMLUTF8Option.

125 Registry Namespace

This is namespace Registry.

Topics

Name	Description
Classes (see page 18634)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 18691)	The following table lists structs, records, enums in this documentation.

Classes

	Name	Description
	ERegistryException (see page 18634)	ERegistryException is the exception class for registry errors.
	TRegIniFile (see page 18635)	TRegIniFile is a low-level wrapper for the Windows 95/NT system registry.
	TRegistry (see page 18645)	TRegistry is a low-level wrapper for the system registry and functions that operate on the registry.
	TRegistryIniFile (see page 18675)	TRegistryIniFile is a wrapper for the Windows system registry.

Structs, Records, Enums

	Name	Description
	TRegDataInfo (see page 18691)	TRegDataInfo is a type used by the GetDataInfo method of TRegistery.
	TRegDataType (see page 18691)	TRegDataType is a type used by the GetDataInfo method of TRegistery.
	TRegKeyInfo (see page 18692)	TRegKeyInfo is a type used by the GetRegKeyInfo method of TRegistery.

125.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ERegistryException (see page 18634)	ERegistryException is the exception class for registry errors.
	TRegIniFile (see page 18635)	TRegIniFile is a low-level wrapper for the Windows 95/NT system registry.
	TRegistry (see page 18645)	TRegistry is a low-level wrapper for the system registry and functions that operate on the registry.
	TRegistryIniFile (see page 18675)	TRegistryIniFile is a wrapper for the Windows system registry.

125.1.1 ERegistryException Class

ERegistryException is the exception class for registry errors.

Class Hierarchy

Pascal

```
ERegistryException = class(Exception);
```

C++

```
class ERegistryException : public Exception;
```

File

Registry

Description

ERegistryException is raised when an application cannot

Create a new key in the registry.

Read a data value associated with a key.

Read a binary data value associated with a key into a local buffer.

Write a data value to a key.

Key creation fails when an application attempts to create a subkey under a key for which it does not have KEY_CREATE_SUB_KEY security access.

Reading a data value associated with a key fails when an application does not have KEY_READ security access, or when the application attempts to read the wrong kind of data from a key (for example, attempting to read string data from an integer data value).

Reading a binary data value into a local buffer fails when an application does not allocate a buffer large enough for the data.

Writing a data value to a key fails because an application does not have KEY_WRITE security access for the current key.

See Also

TRegistry (see page 18645)

TRegIniFile (see page 18635)

TRegistry (see page 18645)

125.1.2 TRegIniFile Class

TRegIniFile is a low-level wrapper for the Windows 95/NT system registry.

Class Hierarchy

Pascal

```
TRegIniFile = class(TRegistry);
```

C++

```
class TRegIniFile : public TRegistry;
```

File

Registry

Description

TRegIniFile presents a simple interface to the system registry, hiding the need to know about the underlying structure of the registry. TRegIniFile acts as a helper object to TRegistryIniFile (see page 18675), which descends from TCustomIniFile (and is therefore more widely compatible with other INI file classes).

TRegIniFile enables handling the Windows 95/NT system registry as if it were a Windows 3.x INI file. Instead of processing an INI file, however, TRegIniFile reads from and writes to the system registry.

Although TRegIniFile descends from TRegistry (see page 18645), it adds the properties and methods used by a TIniFile object. The FileName (see page 18644) passed to a TRegIniFile object becomes a subkey under the system registry's root key (HKEY_CURRENT_USER by default). What corresponds to a section in an INI file is treated as a key in the system registry, and what corresponds to data entries under a section in an INI file are treated as data values under a key in the system registry.

Note: TRegIniFile is intended to be used primarily as a helper object to TRegistryIniFile (see page 18675), which unifies the interface to INI files and the system registry. However, applications can use TRegIniFile directly.

See Also

TIniFile (see page 15455)

TMemIniFile (see page 15462)

TCustomIniFile (see page 15434)

TRegistryIniFile (see page 18675)

125.1.2.1 TRegIniFile Members

The following tables list the members exposed by TRegIniFile.

Protected Methods

	Name	Description
	ChangeKey (see page 18650)	This is ChangeKey, a member of class TRegistry.
	GetBaseKey (see page 18653)	This is GetBaseKey, a member of class TRegistry.

	GetData (see page 18653)	This is GetData, a member of class TRegistry.
	GetKey (see page 18655)	This is GetKey, a member of class TRegistry.
	PutData (see page 18659)	This is PutData, a member of class TRegistry.
	SetCurrentKey (see page 18666)	This is SetCurrentKey, a member of class TRegistry.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CloseKey (see page 18650)	Writes the current key to the registry and closes the key.
	Create (see page 18638)	This is the overview for the Create constructor overload.
	Create (see page 18647)	This is the overview for the Create constructor overload.
	CreateKey (see page 18651)	Creates a new key in the registry.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DeleteKey (see page 18639)	Erases a data value that is associated with a key.
	DeleteValue (see page 18652)	Erases a data value that is associated with the current key.
V	Destroy (see page 18648)	Closes the current key and destroys the TRegistry (see page 18645) object.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EraseSection (see page 18639)	Deletes a key and its data values in the system registry.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetDataInfo (see page 18653)	Returns information about a specified data value associated with the current key.
	GetDataSize (see page 18654)	Returns the size, in bytes, of a specified data value associated with the current key.
	GetDataType (see page 18654)	Returns the enumerated data type of a specified data value associated with the current key.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyInfo (see page 18655)	Returns information about the current key.
	GetKeyNames (see page 18655)	Returns a string list containing the names of all subkeys belonging to the current key.
	GetValueNames (see page 18656)	Returns a string list containing the names of all data values associated with the current key.
	HasSubKeys (see page 18656)	Determines if the current key has subkeys.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	KeyExists (see page 18656)	Determines if a specified key exists.
	LoadKey (see page 18657)	Creates a subkey under the root key and loads registry information from a file into the newly created subkey.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

	MoveKey (see page 18657)	Moves an existing key, its subkeys, and data values to a new location using a new key name.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	OpenKey (see page 18658)	Opens a specified key.
	OpenKeyReadOnly (see page 18658)	Opens a specified key in a read-only manner.
	ReadBinaryData (see page 18659)	Retrieves a binary value from a specified data value associated with the current key.
	ReadBool (see page 18640)	Retrieves a Boolean value from a specified data value associated with a key.
	ReadCurrency (see page 18660)	Retrieves a currency value from a specified data value associated with the current key.
	ReadDate (see page 18661)	Retrieves a date value from a specified data value associated with the current key.
	ReadDateTime (see page 18661)	Retrieves a date and time value from a specified data value associated with the current key.
	ReadFloat (see page 18662)	Retrieves a float value from a specified data value associated with the current key.
	ReadInteger (see page 18640)	Retrieves an integer value from a specified data value (Ident) associated with a key (Section).
	ReadSection (see page 18641)	Retrieves the names of all data values associated with a key, and stores the names in a TStrings object.
	ReadSections (see page 18641)	Retrieves the names of all subkeys associated with the current key.
	ReadSectionValues (see page 18642)	Retrieves the data-values associated with a specified key, and stores the retrieved values in a string object.
	ReadString (see page 18642)	Retrieves a string value from a specified data value (Ident) associated with a key (Section).
	ReadTime (see page 18663)	Retrieves a time value from a specified data value associated with the current key.
	RegistryConnect (see page 18663)	Establishes a connection to a registry on another computer.
	RenameValue (see page 18664)	Changes the name of a data value associated with the current key.
	ReplaceKey (see page 18664)	Replaces the hive file backing a key and all its subkeys with a hive stored in a different file, so that when the system is next started, the key and subkeys will have the values stored in the new file.
	RestoreKey (see page 18665)	Reopens the specified key, and overwrites any information contained in this key and its subkeys keys with registry data stored in a hive file.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveKey (see page 18666)	Opens the specified key with the security access value KEY_ALL_ACCESS and saves the specified key and all of its subkeys and values to a hive file.
	UnLoadKey (see page 18666)	Removes a hive from the registry.
	ValueExists (see page 18667)	Determines if a specified data value exists for the current key.
	WriteBinaryData (see page 18667)	Stores a specifically named data value associated with the current key.
	WriteBool (see page 18643)	Writes a Boolean value to a specified data value associated with a specified key.
	WriteCurrency (see page 18668)	Stores a currency value in a specifically named data value associated with the current key.
	WriteDate (see page 18669)	Stores a date value in a specifically named data value associated with the current key.
	WriteDateTime (see page 18669)	Stores a datetime value in a specifically named data value associated with the current key.
	WriteExpandString (see page 18670)	Stores a string containing unexpanded references to environment variables in a specifically named data value associated with the current key.
	WriteFloat (see page 18670)	Stores a Double value in a specifically named data value associated with the current key.
	WriteInteger (see page 18643)	Writes a long integer value to a specified data value associated with a specified key.
	WriteString (see page 18644)	Writes a string value to a specified data value associated with a specified key.
	WriteTime (see page 18671)	Stores a time value in a specifically named data value associated with the current key.

Public Properties

	Name	Description
	Access (see page 18672)	Specifies the level of access to use when opening keys.

R	CurrentKey (see page 18673)	Specifies the registry key that is currently open.
R	CurrentPath (see page 18673)	Indicates the registry path associated with the current key.
R	FileName (see page 18644)	Specifies the name of the key opened or created in the system registry.
	LazyWrite (see page 18674)	Specifies how keys are written to the registry when calling the CloseKey (see page 18650) procedure.
	RootKey (see page 18674)	Specifies the root key for the TRegistry (see page 18645) object in an application.

125.1.2.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TRegIniFile.Create (string) (see page 18638)	Creates a TRegIniFile (see page 18635) object for an application.
	TRegIniFile.Create (string, LongWord) (see page 18638)	Creates a TRegIniFile (see page 18635) object for an application.

125.1.2.2.1 TRegIniFile.Create Constructor (string)

Creates a TRegIniFile (see page 18635) object for an application.

Pascal

```
constructor Create(const FileName: string); overload;
constructor Create(const FileName: string; AAccess: LongWord); overload;
```

C++

```
__fastcall TRegIniFile(const AnsiString FileName);
__fastcall TRegIniFile(const AnsiString FileName, LongWord AAccess);
```

Description

Use Create to construct a TRegIniFile (see page 18635) object for an application.

FileName (see page 18644) initializes the FileName (see page 18644) property.

AAccess initializes the Access (see page 18672) property, which determines the access rights used when opening keys. If no AAccess parameter is supplied, Access (see page 18672) is initialized to KEY_ALL_ACCESS.

See Also

FileName (see page 18644)

Create (see page 18648)

Access (see page 18672)

125.1.2.3 TRegIniFile Methods

The methods of the TRegIniFile class are listed here.

Public Methods

	Name	Description
	DeleteKey (see page 18639)	Erases a data value that is associated with a key.

	EraseSection (see page 18639)	Deletes a key and its data values in the system registry.
	ReadBool (see page 18640)	Retrieves a Boolean value from a specified data value associated with a key.
	ReadInteger (see page 18640)	Retrieves an integer value from a specified data value (Ident) associated with a key (Section).
	ReadSection (see page 18641)	Retrieves the names of all data values associated with a key, and stores the names in a TStrings object.
	ReadSections (see page 18641)	Retrieves the names of all subkeys associated with the current key.
	ReadSectionValues (see page 18642)	Retrieves the data-values associated with a specified key, and stores the retrieved values in a string object.
	ReadString (see page 18642)	Retrieves a string value from a specified data value (Ident) associated with a key (Section).
	WriteBool (see page 18643)	Writes a Boolean value to a specified data value associated with a specified key.
	WriteInteger (see page 18643)	Writes a long integer value to a specified data value associated with a specified key.
	WriteString (see page 18644)	Writes a string value to a specified data value associated with a specified key.

125.1.2.3.1 TRegIniFile.DeleteKey Method

Erases a data value that is associated with a key.

Pascal

```
procedure DeleteKey(const Section: String; const Ident: String);
```

C++

```
__fastcall DeleteKey(const AnsiString Section, const AnsiString Ident);
```

Description

Call DeleteKey to erase a data value associated with a key. Section is string containing the name of the system registry key containing the value to delete. Ident is a string containing the name of the data value to delete.

Note: DeleteKey for TRegIniFile (see page 18635) obscures the DeleteKey method of TRegistry (see page 18645), from which TRegIniFile (see page 18635) descends. You can access TRegistry (see page 18645)'s DeleteKey method by casting the call to DeleteKey as type TRegistry (see page 18645), or by using the scope resolution operator.

Note: On Windows 95, DeleteKey will delete the key and all its subkeys. On Windows NT, the subkeys must be explicitly deleted by separate calls to DeleteKey.

See Also

DeleteKey (see page 18651)

EraseSection (see page 18639)

125.1.2.3.2 TRegIniFile.EraseSection Method

Deletes a key and its data values in the system registry.

Pascal

```
procedure EraseSection(const Section: string);
```

C++

```
__fastcall EraseSection(const AnsiString Section);
```

Description

Call EraseSection to remove a key and its data values from the system registry. Section identifies the key to delete.

See Also

DeleteKey (see page 18639)

125.1.2.3.3 TRegIniFile.ReadBool Method

Retrieves a Boolean value from a specified data value associated with a key.

Pascal

```
function ReadBool(const Section: string; const Ident: string; Default: Boolean): Boolean;
```

C++

```
__fastcall Boolean ReadBool(const AnsiString Section, const AnsiString Ident, Boolean Default);
```

Description

Call ReadBool to retrieve a Boolean value from a specified data value associated with a key.

Section is a string that identifies the key from which to retrieve a data value. Ident is a string that identifies the name of the data value to return. Default is a Boolean value to use if there is no key corresponding to Section or no data value corresponding to Ident.

Note: This function overrides the ReadBool function of TRegistry (see page 18645), from which TRegIniFile (see page 18635) is derived. To call the ReadBool function of TRegistry (see page 18645) instead of this function, cast the call to ReadBool as TRegistry (see page 18645).

See Also

ReadInteger (see page 18640)

ReadString (see page 18642)

ReadBool (see page 18660)

125.1.2.3.4 TRegIniFile.ReadInteger Method

Retrieves an integer value from a specified data value (Ident) associated with a key (Section).

Pascal

```
function ReadInteger(const Section: string; const Ident: string; Default: Longint): Longint;
```

C++

```
__fastcall Longint ReadInteger(const AnsiString Section, const AnsiString Ident, Longint
Default);
```

Description

Call ReadInteger to retrieve an integer value from a specified data value associated with a key.

Section is a string that identifies the key from which to retrieve a data value. Ident is a string that identifies the name of the data value to return. Default is an integer value to use if there is no key corresponding to Section or no data value corresponding to Ident.

Note: This function overrides the ReadInteger function of TRegistry (see page 18645), from which TRegIniFile (see page 18635) is derived. To call the ReadInteger function of TRegistry (see page 18645) instead of this function, cast the call to ReadInteger as TRegistry (see page 18645).

See Also

ReadBool (see page 18640)

ReadString (see page 18642)

ReadInteger (see page 18662)

125.1.2.3.5 TRegIniFile.ReadSection Method

Retrieves the names of all data values associated with a key, and stores the names in a TStrings object.

Pascal

```
procedure ReadSection(const Section: string; Strings: TStrings);
```

C++

```
__fastcall ReadSection(const AnsiString Section, TStrings Strings);
```

Description

Call ReadSection to retrieve the names of all data values associated with a key into a TStrings object.

Section is a string identifying the key for which to retrieve data-value names.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings object such as a string list, or to a component property, such as Items for a TListBox component, that is a TStrings object itself.

See Also

ReadSections (see page 18641)

ReadSectionValues (see page 18642)

TListBox (see page 21598)

Items (see page 21348)

125.1.2.3.6 TRegIniFile.ReadSections Method

Retrieves the names of all subkeys associated with the current key.

Pascal

```
procedure ReadSections(Strings: TStrings);
```

C++

```
__fastcall ReadSections(TStrings Strings);
```

Description

Call ReadSections to retrieve the names of all subkeys associated with the current key.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component, that is a TStrings object itself.

See Also

CurrentKey (see page 18673)

ReadSection (see page 18641)

ReadSectionValues (see page 18642)

TListBox (see page 21598)

Items (see page 21348)

125.1.2.3.7 TRegIniFile.ReadSectionValues Method

Retrieves the data-values associated with a specified key, and stores the retrieved values in a string object.

Pascal

```
procedure ReadSectionValues(const Section: string; Strings: TStrings);
```

C++

```
__fastcall ReadSectionValues(const AnsiString Section, TStrings Strings);
```

Description

Call ReadSectionValues to read all data values associated with a specified key into a string object.

Section is the name of the key from which to retrieve data-values.

Strings specifies the string list object to hold the retrieved values. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component, that is a TStrings object itself. Use the Values property of the string object to access a specific string in the object.

See Also

ReadSection (see page 18641)

ReadSections (see page 18641)

TListBox (see page 21598)

Items (see page 21348)

Values (see page 3086)

125.1.2.3.8 TRegIniFile.ReadString Method

Retrieves a string value from a specified data value (Ident) associated with a key (Section).

Pascal

```
function ReadString(const Section: string; const Ident: string; const Default: string): string;
```

C++

```
__fastcall AnsiString ReadString(const AnsiString Section, const AnsiString Ident, const
AnsiString Default);
```

Description

Call ReadString to retrieve a string value from a specified data value associated with a key.

Section is a string that identifies the key from which to retrieve a data value. Ident is a string that identifies the name of the data value to return. Default is a string value to use if there is no key corresponding to Section or no data value corresponding to Ident.

Note: This function overrides the ReadString function of TRegistry (see page 18645), from which TRegIniFile (see page 18635) is derived. To call the ReadString function of TRegistry (see page 18645) instead of this function, cast the call to ReadString as TRegistry (see page 18645).

See Also

ReadBool (see page 18640)

ReadInteger (see page 18640)

ReadString (see page 18662)

125.1.2.3.9 TRegIniFile.WriteBool Method

Writes a Boolean value to a specified data value associated with a specified key.

Pascal

```
procedure WriteBool(const Section: string; const Ident: string; Value: Boolean);
```

C++

```
__fastcall WriteBool(const AnsiString Section, const AnsiString Ident, Boolean Value);
```

Description

Call WriteBool to store a Boolean value in a data value associated with a specified key.

Section is a string identifying the key into which to store a data value. Ident is a string identifying the name of the data value into which to write. Value is the Boolean value to write into the data value.

Note: This function overrides the WriteBool procedure of TRegistry (see page 18645), from which TRegIniFile (see page 18635) is derived. To call the WriteBool procedure of TRegistry (see page 18645) instead of this procedure, cast the call to WriteBool as TRegistry (see page 18645).

See Also

WriteInteger (see page 18643)

WriteString (see page 18644)

WriteBool (see page 18668)

125.1.2.3.10 TRegIniFile.WriteInteger Method

Writes a long integer value to a specified data value associated with a specified key.

Pascal

```
procedure WriteInteger(const Section: string; const Ident: string; Value: Longint);
```

C++

```
__fastcall WriteInteger(const AnsiString Section, const AnsiString Ident, Longint Value);
```

Description

Call WriteInteger to store an integer value in a data value associated with a specified key.

Section is a string identifying the key into which to store a data value. Ident is a string identifying the name of the data value into which to write. Value is the integer value to write into the data value.

Note: This function overrides the WriteInteger procedure of TRegistry (see page 18645), from which TRegIniFile (see page 18635) is derived. To call the WriteInteger procedure of TRegistry (see page 18645) instead of this procedure, cast the call to WriteInteger as TRegistry (see page 18645).

See Also

WriteBool (see page 18643)

WriteString (see page 18644)

WriteInteger (see page 18671)

125.1.2.3.11 TRegIniFile.WriteString Method

Writes a string value to a specified data value associated with a specified key.

Pascal

```
procedure WriteString(const Section: String; const Ident: String; const Value: String);
```

C++

```
__fastcall WriteString(const AnsiString Section, const AnsiString Ident, const AnsiString
Value);
```

Description

Call WriteString to store a string value in a data value associated with a specified key.

Section is a string identifying the key into which to store a data value. Ident is a string identifying the name of the data value into which to write. Value is the string value to write into the data value.

Note: This function overrides the WriteString procedure of TRegistry (see page 18645), from which TRegIniFile (see page 18635) is derived. To call the WriteString procedure of TRegistry (see page 18645) instead of this procedure, cast the call to WriteString as TRegistry (see page 18645).

See Also

WriteBool (see page 18643)

WriteInteger (see page 18643)

WriteString (see page 18671)

125.1.2.4 TRegIniFile Properties

The properties of the TRegIniFile class are listed here.

Public Properties

	Name	Description
R	FileName (see page 18644)	Specifies the name of the key opened or created in the system registry.

125.1.2.4.1 TRegIniFile.FileName Property

Specifies the name of the key opened or created in the system registry.

Pascal

```
property FileName: string;
```

C++

```
__property AnsiString FileName;
```

Description

Query FileName to determine the name of the key in the system registry that is the root key for all TRegIniFile (see page 18635) operations.

See Also

CurrentKey (see page 18673)

RootKey (see page 18674)

125.1.3 TRegistry Class

TRegistry is a low-level wrapper for the system registry and functions that operate on the registry.

Class Hierarchy

Pascal

```
TRegistry = class(TObject);
```

C++

```
class TRegistry : public TObject;
```

File

Registry

Description

Use TRegistry to encapsulate access to the Windows system registry in an application. The registry is a database that an application can use to store and retrieve configuration information. Configuration information is stored in a hierarchical tree. Each node in the tree is called a key. Every key can contain subkeys and data values that represent part of the configuration information for an application.

All keys that an application creates, opens, reads, or writes are subkeys of predefined root keys. By default, a TRegistry object is created with a root key of HKEY_CURRENT_USER.

Only one key is accessible at a time in a TRegistry object. To determine the key that is currently accessible, read the value of the CurrentKey (see page 18673) property. TRegistry methods enable an application to open, close, save, move, copy, and delete keys.

One or more data values containing actual configuration information can be stored in a key. TRegistry methods enable an application to query a key to see if it contains data, to read data in a key, and to write data to a key.

Note: The TRegistry component is not fully compatable with the Windows NT environment. Functions such as RestoreKey (see page 18665) and SaveKey (see page 18666) may not perform properly without a significant number of workarounds.

125.1.3.1 TRegistry Members

The following tables list the members exposed by TRegistry.

Protected Methods

	Name	Description
	ChangeKey (see page 18650)	This is ChangeKey, a member of class TRegistry.
	GetBaseKey (see page 18653)	This is GetBaseKey, a member of class TRegistry.
	GetData (see page 18653)	This is GetData, a member of class TRegistry.
	GetKey (see page 18655)	This is GetKey, a member of class TRegistry.
	PutData (see page 18659)	This is PutData, a member of class TRegistry.
	SetCurrentKey (see page 18666)	This is SetCurrentKey, a member of class TRegistry.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CloseKey (see page 18650)	Writes the current key to the registry and closes the key.
	Create (see page 18647)	This is the overview for the Create constructor overload.
	CreateKey (see page 18651)	Creates a new key in the registry.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DeleteKey (see page 18651)	Removes a specified key and its associated data from the registry.
	DeleteValue (see page 18652)	Erases a data value that is associated with the current key.
	Destroy (see page 18648)	Closes the current key and destroys the TRegistry (see page 18645) object.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetDataInfo (see page 18653)	Returns information about a specified data value associated with the current key.
	GetDataSize (see page 18654)	Returns the size, in bytes, of a specified data value associated with the current key.
	GetDataType (see page 18654)	Returns the enumerated data type of a specified data value associated with the current key.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyInfo (see page 18655)	Returns information about the current key.
	GetKeyNames (see page 18655)	Returns a string list containing the names of all subkeys belonging to the current key.
	GetValueNames (see page 18656)	Returns a string list containing the names of all data values associated with the current key.
	HasSubKeys (see page 18656)	Determines if the current key has subkeys.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	KeyExists (see page 18656)	Determines if a specified key exists.
	LoadKey (see page 18657)	Creates a subkey under the root key and loads registry information from a file into the newly created subkey.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveKey (see page 18657)	Moves an existing key, its subkeys, and data values to a new location using a new key name.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	OpenKey (see page 18658)	Opens a specified key.
	OpenKeyReadOnly (see page 18658)	Opens a specified key in a read-only manner.
	ReadBinaryData (see page 18659)	Retrieves a binary value from a specified data value associated with the current key.
	ReadBool (see page 18660)	Retrieves a Boolean value from a specified data value associated with the current key.
	ReadCurrency (see page 18660)	Retrieves a currency value from a specified data value associated with the current key.

	ReadDate (see page 18661)	Retrieves a date value from a specified data value associated with the current key.
	ReadDateTime (see page 18661)	Retrieves a date and time value from a specified data value associated with the current key.
	ReadFloat (see page 18662)	Retrieves a float value from a specified data value associated with the current key.
	ReadInteger (see page 18662)	Retrieves an integer value from a specified data value associated with the current key.
	ReadString (see page 18662)	Retrieves a string value from a specified data value associated with the current key.
	ReadTime (see page 18663)	Retrieves a time value from a specified data value associated with the current key.
	RegistryConnect (see page 18663)	Establishes a connection to a registry on another computer.
	RenameValue (see page 18664)	Changes the name of a data value associated with the current key.
	ReplaceKey (see page 18664)	Replaces the hive file backing a key and all its subkeys with a hive stored in a different file, so that when the system is next started, the key and subkeys will have the values stored in the new file.
	RestoreKey (see page 18665)	Reopens the specified key, and overwrites any information contained in this key and its subkeys keys with registry data stored in a hive file.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveKey (see page 18666)	Opens the specified key with the security access value KEY_ALL_ACCESS and saves the specified key and all of its subkeys and values to a hive file.
	UnLoadKey (see page 18666)	Removes a hive from the registry.
	ValueExists (see page 18667)	Determines if a specified data value exists for the current key.
	WriteBinaryData (see page 18667)	Stores a specifically named data value associated with the current key.
	WriteBool (see page 18668)	Stores a Boolean value in a specifically named data value associated with the current key.
	WriteCurrency (see page 18668)	Stores a currency value in a specifically named data value associated with the current key.
	WriteDate (see page 18669)	Stores a date value in a specifically named data value associated with the current key.
	WriteDateTime (see page 18669)	Stores a datetime value in a specifically named data value associated with the current key.
	WriteExpandString (see page 18670)	Stores a string containing unexpanded references to environment variables in a specifically named data value associated with the current key.
	WriteFloat (see page 18670)	Stores a Double value in a specifically named data value associated with the current key.
	WriteInteger (see page 18671)	Stores an integer value in a specifically named data value associated with the current key.
	WriteString (see page 18671)	Stores a string value in a specifically named data value associated with the current key.
	WriteTime (see page 18671)	Stores a time value in a specifically named data value associated with the current key.

Public Properties

	Name	Description
	Access (see page 18672)	Specifies the level of access to use when opening keys.
R	CurrentKey (see page 18673)	Specifies the registry key that is currently open.
R	CurrentPath (see page 18673)	Indicates the registry path associated with the current key.
	LazyWrite (see page 18674)	Specifies how keys are written to the registry when calling the CloseKey (see page 18650) procedure.
	RootKey (see page 18674)	Specifies the root key for the TRegistry (see page 18645) object in an application.

125.1.3.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TRegistry.Create () (see page 18648)	Creates a TRegistry (see page 18645) object for an application.
	TRegistry.Create (LongWord) (see page 18648)	Creates a TRegistry (see page 18645) object for an application.

125.1.3.2.1 TRegistry.Create Constructor ()

Creates a TRegistry (see page 18645) object for an application.

Pascal

```
constructor Create; overload;
constructor Create(AAccess: LongWord); overload;
```

C++

```
__fastcall TRegistry();
__fastcall TRegistry(LongWord AAccess);
```

Description

Create instantiates a TRegistry (see page 18645) object and sets the RootKey (see page 18674) property to HKEY_CURRENT_USER and the LazyWrite (see page 18674) property to true. If an AAccess parameter is supplied, this value is used to initialize the Access (see page 18672) property. Otherwise, Access (see page 18672) is initialized to KEY_ALL_ACCESS.

See Also

LazyWrite (see page 18674)

RootKey (see page 18674)

Destroy (see page 18648)

Access (see page 18672)

125.1.3.3 TRegistry.Destroy Destructor

Closes the current key and destroys the TRegistry (see page 18645) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRegistry();
```

Description

Destroy closes the current key and frees the resources allocated for a registry object when it is no longer needed.

See Also

CurrentKey (see page 18673)

Create (see page 18648)

Free (see page 22300)

125.1.3.4 TRegistry Methods

The methods of the TRegistry class are listed here.

Protected Methods

	Name	Description
	ChangeKey (see page 18650)	This is ChangeKey, a member of class TRegistry.
	GetBaseKey (see page 18653)	This is GetBaseKey, a member of class TRegistry.
	GetData (see page 18653)	This is GetData, a member of class TRegistry.
	GetKey (see page 18655)	This is GetKey, a member of class TRegistry.
	PutData (see page 18659)	This is PutData, a member of class TRegistry.
	SetCurrentKey (see page 18666)	This is SetCurrentKey, a member of class TRegistry.

Public Methods

	Name	Description
	CloseKey (see page 18650)	Writes the current key to the registry and closes the key.
	CreateKey (see page 18651)	Creates a new key in the registry.
	DeleteKey (see page 18651)	Removes a specified key and its associated data from the registry.
	DeleteValue (see page 18652)	Erases a data value that is associated with the current key.
	GetDataInfo (see page 18653)	Returns information about a specified data value associated with the current key.
	GetDataSize (see page 18654)	Returns the size, in bytes, of a specified data value associated with the current key.
	GetDataType (see page 18654)	Returns the enumerated data type of a specified data value associated with the current key.
	GetKeyInfo (see page 18655)	Returns information about the current key.
	GetKeyNames (see page 18655)	Returns a string list containing the names of all subkeys belonging to the current key.
	GetValueNames (see page 18656)	Returns a string list containing the names of all data values associated with the current key.
	HasSubKeys (see page 18656)	Determines if the current key has subkeys.
	KeyExists (see page 18656)	Determines if a specified key exists.
	LoadKey (see page 18657)	Creates a subkey under the root key and loads registry information from a file into the newly created subkey.
	MoveKey (see page 18657)	Moves an existing key, its subkeys, and data values to a new location using a new key name.
	OpenKey (see page 18658)	Opens a specified key.
	OpenKeyReadOnly (see page 18658)	Opens a specified key in a read-only manner.
	ReadBinaryData (see page 18659)	Retrieves a binary value from a specified data value associated with the current key.
	ReadBool (see page 18660)	Retrieves a Boolean value from a specified data value associated with the current key.
	ReadCurrency (see page 18660)	Retrieves a currency value from a specified data value associated with the current key.
	ReadDate (see page 18661)	Retrieves a date value from a specified data value associated with the current key.
	ReadDateTime (see page 18661)	Retrieves a date and time value from a specified data value associated with the current key.
	ReadFloat (see page 18662)	Retrieves a float value from a specified data value associated with the current key.
	ReadInteger (see page 18662)	Retrieves an integer value from a specified data value associated with the current key.
	ReadString (see page 18662)	Retrieves a string value from a specified data value associated with the current key.
	ReadTime (see page 18663)	Retrieves a time value from a specified data value associated with the current key.
	RegistryConnect (see page 18663)	Establishes a connection to a registry on another computer.
	RenameValue (see page 18664)	Changes the name of a data value associated with the current key.

	ReplaceKey (see page 18664)	Replaces the hive file backing a key and all its subkeys with a hive stored in a different file, so that when the system is next started, the key and subkeys will have the values stored in the new file.
	RestoreKey (see page 18665)	Reopens the specified key, and overwrites any information contained in this key and its subkeys keys with registry data stored in a hive file.
	SaveKey (see page 18666)	Opens the specified key with the security access value KEY_ALL_ACCESS and saves the specified key and all of its subkeys and values to a hive file.
	UnLoadKey (see page 18666)	Removes a hive from the registry.
	ValueExists (see page 18667)	Determines if a specified data value exists for the current key.
	WriteBinaryData (see page 18667)	Stores a specifically named data value associated with the current key.
	WriteBool (see page 18668)	Stores a Boolean value in a specifically named data value associated with the current key.
	WriteCurrency (see page 18668)	Stores a currency value in a specifically named data value associated with the current key.
	WriteDate (see page 18669)	Stores a date value in a specifically named data value associated with the current key.
	WriteDateTime (see page 18669)	Stores a datetime value in a specifically named data value associated with the current key.
	WriteExpandString (see page 18670)	Stores a string containing unexpanded references to environment variables in a specifically named data value associated with the current key.
	WriteFloat (see page 18670)	Stores a Double value in a specifically named data value associated with the current key.
	WriteInteger (see page 18671)	Stores an integer value in a specifically named data value associated with the current key.
	WriteString (see page 18671)	Stores a string value in a specifically named data value associated with the current key.
	WriteTime (see page 18671)	Stores a time value in a specifically named data value associated with the current key.

125.1.3.4.1 TRegistry.ChangeKey Method

Pascal

```
procedure ChangeKey(Value: HKey; const Path: string);
```

C++

```
__fastcall ChangeKey(HKey Value, const AnsiString Path);
```

Description

This is ChangeKey, a member of class TRegistry.

125.1.3.4.2 TRegistry.CloseKey Method

Writes the current key to the registry and closes the key.

Pascal

```
procedure CloseKey;
```

C++

```
__fastcall CloseKey();
```

Description

Call CloseKey to write the current key to the registry and close the key. An application should not keep keys open any longer than necessary. Many TRegistry (see page 18645) methods routinely call CloseKey after reading from or writing to the registry. Calling CloseKey when there is no current key has no effect.

Note: When an application closes a key, the key is written to the registry. The LazyWrite (see page 18674) property determines how the write takes place.

See Also

CurrentKey (see page 18673)

LazyWrite (see page 18674)

125.1.3.4.3 TRegistry.CreateKey Method

Creates a new key in the registry.

Pascal

```
function CreateKey(const Key: string): Boolean;
```

C++

```
__fastcall Boolean CreateKey(const AnsiString Key);
```

Description

Use CreateKey to add a new key to the registry. Key is the name of the key to create. Key can be an absolute or relative name. An absolute key begins with a backslash (\) and is a subkey of the root key. A relative key is a subkey of the current key.

CreateKey returns true if key creation is successful. On error, an exception is raised. Attempting to create a key that already exists has no effect.

CreateKey creates only non-volatile keys. If you need to create volatile keys on Windows NT, you must call the Windows API directly.

CreateKey creates keys with a security access of KEY_ALL_ACCESS. If you need to create keys with more restricted access, you must call the Windows API directly.

A key created by CreateKey has no values. To set key values, use the WriteCurrency (see page 18668), WriteBinaryData (see page 18667), WriteBool (see page 18668), WriteDate (see page 18669), WriteDateTime (see page 18669), WriteFloat (see page 18670), WriteInteger (see page 18671), WriteString (see page 18671), or WriteTime (see page 18671) procedures.

See Also

WriteCurrency (see page 18668)

WriteBinaryData (see page 18667)

WriteBool (see page 18668)

WriteDate (see page 18669)

WriteDateTime (see page 18669)

WriteFloat (see page 18670)

WriteInteger (see page 18671)

WriteString (see page 18671)

WriteTime (see page 18671)

Access (see page 18672)

125.1.3.4.4 TRegistry.DeleteKey Method

Removes a specified key and its associated data from the registry.

Pascal

```
function DeleteKey(const Key: string): Boolean;
```

C++

```
__fastcall Boolean DeleteKey(const AnsiString Key);
```

Description

Call DeleteKey to remove a specified key and its associated data, if any, from the registry. Under Windows 95, if the key has subkeys, the subkeys and any associated data are also removed. Under Windows NT, subkeys must be explicitly deleted by separate calls to DeleteKey.

DeleteKey returns true if key deletion is successful. On error, DeleteKey returns false.

See Also

CreateKey (see page 18651)

DeleteValue (see page 18652)

125.1.3.4.5 TRegistry.DeleteValue Method

Erases a data value that is associated with the current key.

Pascal

```
function DeleteValue(const Name: string): Boolean;
```

C++

```
__fastcall Boolean DeleteValue(const AnsiString Name);
```

Description

Call DeleteValue to remove a specific data value associated with the current key. Name is string containing the name of the value to delete. Keys can contain multiple data values, and every value associated with a key has a unique name.

DeleteValue returns true if the deletion is successful, false if the deletion fails.

See Also

DeleteKey (see page 18651)

WriteCurrency (see page 18668)

WriteBinaryData (see page 18667)

WriteBool (see page 18668)

WriteDate (see page 18669)

WriteDateTime (see page 18669)

WriteFloat (see page 18670)

WriteInteger (see page 18671)

WriteString (see page 18671)

WriteTime (see page 18671)

125.1.3.4.6 TRegistry.GetBaseKey Method

Pascal

```
function GetBaseKey(Relative: Boolean): HKey;
```

C++

```
__fastcall HKey GetBaseKey(Boolean Relative);
```

Description

This is GetBaseKey, a member of class TRegistry.

125.1.3.4.7 TRegistry.GetData Method

Pascal

```
function GetData(const Name: string; Buffer: Pointer; BufSize: Integer; var RegData:
TRegDataType): Integer;
```

C++

```
__fastcall int GetData(const AnsiString Name, void * Buffer, int BufSize, TRegDataType
RegData);
```

Description

This is GetData, a member of class TRegistry.

125.1.3.4.8 TRegistry.GetDataInfo Method

Returns information about a specified data value associated with the current key.

Pascal

```
function GetDataInfo(const ValueName: string; var Value: TRegDataInfo): Boolean;
```

C++

```
__fastcall Boolean GetDataInfo(const AnsiString ValueName, TRegDataInfo Value);
```

Description

Call GetDataInfo to get information about a data value associated with the current key. ValueName is a string containing the name of the data value to query. Value is a TRegDataInfo (see page 18691) value in which information about the data value is returned. If the data value is of type rdString or rdExpandString, the size of the data value includes an extra byte for the terminating null character.

GetDataInfo returns true if data value information is returned. If GetDataInfo fails, it returns false, and the Value record is filled with zeros.

See Also

CurrentKey (see page 18673)

GetDataSize (see page 18654)

GetDataType (see page 18654)

GetKeyInfo (see page 18655)

125.1.3.4.9 TRegistry.GetDataSize Method

Returns the size, in bytes, of a specified data value associated with the current key.

Pascal

```
function GetDataSize(const ValueName: string): Integer;
```

C++

```
__fastcall int GetDataSize(const AnsiString ValueName);
```

Description

Call GetDataSize to determine the size, in bytes, of a data value associated with the current key. ValueName is a string containing the name of the data value to query.

On success, GetDataSize returns the size of the data value. On failure, GetDataSize returns -1.

Note: If the data value is a string, GetDataSize returns the size of the data value and one extra byte for the terminating null character.

See Also

CcurrentKey (see page 18673)

GetDataInfo (see page 18653)

GetDataType (see page 18654)

GetKeyInfo (see page 18655)

125.1.3.4.10 TRegistry.GetDataType Method

Returns the enumerated data type of a specified data value associated with the current key.

Pascal

```
function GetDataType(const ValueName: string): TRegDataType;
```

C++

```
__fastcall TRegDataType GetDataType(const AnsiString ValueName);
```

Description

Call GetDataType to determine the data type of a data value associated with the current key. ValueName is a string containing the name of the data value to query.

GetDataType returns a TRegDataType (see page 18691) value that indicates the type of value associated with the current key.

See Also

CurrentKey (see page 18673)

GetDataInfo (see page 18653)

GetDataSize (see page 18654)

GetKeyInfo (see page 18655)

125.1.3.4.11 TRegistry.GetKey Method

Pascal

```
function GetKey(const Key: string): HKEY;
```

C++

```
__fastcall HKEY GetKey(const AnsiString Key);
```

Description

This is GetKey, a member of class TRegistry.

125.1.3.4.12 TRegistry.GetKeyInfo Method

Returns information about the current key.

Pascal

```
function GetKeyInfo(var Value: TRegKeyInfo): Boolean;
```

C++

```
__fastcall Boolean GetKeyInfo(TRegKeyInfo Value);
```

Description

Call GetKeyInfo to return all information about the current key to an application. Value is a variable declared in an application to store the key information returned by this function.

On success GetKeyInfo returns true. On failure it returns false, and the Value record is set to zeros.

See Also

CurrentKey (see page 18673)

GetKeyNames (see page 18655)

GetValueNames (see page 18656)

HasSubKeys (see page 18656)

125.1.3.4.13 TRegistry.GetKeyNames Method

Returns a string list containing the names of all subkeys belonging to the current key.

Pascal

```
procedure GetKeyNames(Strings: TStrings);
```

C++

```
__fastcall GetKeyNames(TStrings Strings);
```

Description

Call GetKeyNames to determine the names of all subkeys belonging to the current key. Determining the names of subkeys is useful in an application that iterates through a set of keys.

Strings is a variable of type TStrings into which to return the list of subkey names.

See Also

CurrentKey (see page 18673)

GetKeyInfo (see page 18655)

GetValueNames (see page 18656)

125.1.3.4.14 TRegistry.GetValueNames Method

Returns a string list containing the names of all data values associated with the current key.

Pascal

```
procedure GetValueNames(Strings: TStrings);
```

C++

```
__fastcall GetValueNames(TStrings Strings);
```

Description

Call GetValueNames to determine the names of all data values associated with the current key. Determining the names of data values is useful in an application that iterates through a set of data values for a key.

Strings is a variable of type TStrings into which to return the list of data value names.

See Also

CurrentKey (see page 18673)

GetDataInfo (see page 18653)

GetKeyNames (see page 18655)

ValueExists (see page 18667)

125.1.3.4.15 TRegistry.HasSubKeys Method

Determines if the current key has subkeys.

Pascal

```
function HasSubKeys: Boolean;
```

C++

```
__fastcall Boolean HasSubKeys();
```

Description

Call HasSubKeys to determine if the current key has any subkeys. HasSubKeys returns true if the current key has at least one subkey. Otherwise it returns false.

See Also

CurrentKey (see page 18673)

KeyExists (see page 18656)

125.1.3.4.16 TRegistry.KeyExists Method

Determines if a specified key exists.

Pascal

```
function KeyExists(const Key: string): Boolean;
```

C++

```
__fastcall Boolean KeyExists(const AnsiString Key);
```

Description

Call KeyExists to determine if a key of a specified name exists. Key is the name of the key for which to search.

See Also

LoadKey (see page 18657)

ValueExists (see page 18667)

125.1.3.4.17 TRegistry.LoadKey Method

Creates a subkey under the root key and loads registry information from a file into the newly created subkey.

Pascal

```
function LoadKey(const Key: string; const FileName: string): Boolean;
```

C++

```
__fastcall Boolean LoadKey(const AnsiString Key, const AnsiString FileName);
```

Description

Call LoadKey to:

1Create (see page 18648) a new subkey under the root key, and

2Load registry information from a file into the subkey. Registry (see page 18633) information can include data values, subkeys, and data values for those subkeys.

LoadKey is intended to simplify creation of a key, its values and subkeys, and the values for those subkeys in a single operation. A key, its subkeys, and all data values of the key and its subkeys is called a hive. Rather than creating each key and value separately, an application can read a hive from a file. This is especially useful for applications that users can reconfigure at run time.

Note: Before an application calls LoadKey, the RootKey (see page 18674) property must be set to HKEY_USERS, HKEY_LOCAL_MACHINE, or to a key returned by a previous call to RegistryConnect (see page 18663).

The Key parameter is the name of the subkey to create. The FileName parameter is the location of the file containing registry information to store in the subkey. The file specified by FileName must be one previously created using the SaveKey (see page 18666) function or the RegSaveKey Windows API function. On systems that use a file allocation table (FAT), FileName cannot include an extension.

See Also

RootKey (see page 18674)

CreateKey (see page 18651)

RegistryConnect (see page 18663)

SaveKey (see page 18666)

UnLoadKey (see page 18666)

125.1.3.4.18 TRegistry.MoveKey Method

Moves an existing key, its subkeys, and data values to a new location using a new key name.

Pascal

```
procedure MoveKey(const OldName: string; const NewName: string; Delete: Boolean);
```

C++

```
__fastcall MoveKey(const AnsiString OldName, const AnsiString NewName, Boolean Delete);
```

Description

Call MoveKey to copy or move an existing key, its subkeys, and data values to a different location. Under Windows 95, copying is recursive. If a key contains subkeys and data values, they too, are copied. When the operation is complete, the new key is closed. Under Windows NT, subkeys must be moved explicitly with separate calls to MoveKey.

OldName specifies the key to copy or move. NewName specifies a name for the duplicate key to create. If the key specified by NewName does not exist, MoveKey creates it. Delete specifies whether to delete the old key after the copy operation. If Delete is true, the key specified by OldName is deleted after it is copied. Otherwise the old key is closed.

See Also

CreateKey (see page 18651)

DeleteKey (see page 18651)

OpenKey (see page 18658)

OpenKey (see page 18658)

125.1.3.4.19 TRegistry.OpenKey Method

Opens a specified key.

Pascal

```
function OpenKey(const Key: string; CanCreate: Boolean): Boolean;
```

C++

```
__fastcall Boolean OpenKey(const AnsiString Key, Boolean CanCreate);
```

Description

Call OpenKey to make a specified key the current key. Key is the name of the key to open. If Key is nil (Delphi) or NULL (C++), the CurrentKey (see page 18673) property is set to the key specified by the RootKey (see page 18674) property.

CanCreate specifies whether to create the specified key if it does not exist. If CanCreate is true, the key is created if necessary.

Key is opened or created with the security access value specified by the Access (see page 18672) property. OpenKey only creates non-volatile keys, A non-volatile key is stored in the registry and is preserved when the system is restarted.

OpenKey returns true if the key is successfully opened or created

See Also

CurrentKey (see page 18673)

RootKey (see page 18674)

CreateKey (see page 18651)

OpenKeyReadOnly (see page 18658)

Access (see page 18672)

125.1.3.4.20 TRegistry.OpenKeyReadOnly Method

Opens a specified key in a read-only manner.

Pascal

```
function OpenKeyReadOnly(const Key: String): Boolean;
```

C++

```
__fastcall Boolean OpenKeyReadOnly(const AnsiString Key);
```

Description

Call OpenKeyReadOnly to make a specified key the current key. Key is the name of the key to open. If Key is nil (Delphi) or NULL (C++), the CurrentKey (see page 18673) property is set to the key specified by the RootKey (see page 18674) property.

Key is opened with the security access value KEY_READ.

OpenKey (see page 18658) returns true if the key is successfully opened and CurrentKey (see page 18673) is set to the key.

Note: After a successful call to OpenKeyReadOnly the Access (see page 18672) property of the registry component is automatically changed to KEY_READ, regardless of what that property was set to prior to the method call.

See Also

CurrentKey (see page 18673)

RootKey (see page 18674)

CreateKey (see page 18651)

OpenKey (see page 18658)

Access (see page 18672)

125.1.3.4.21 TRegistry.PutData Method

Pascal

```
procedure PutData(const Name: string; Buffer: Pointer; BufSize: Integer; RegData:
TRegDataType);
```

C++

```
__fastcall PutData(const AnsiString Name, void * Buffer, int BufSize, TRegDataType RegData);
```

Description

This is PutData, a member of class TRegistry.

125.1.3.4.22 TRegistry.ReadBinaryData Method

Retrieves a binary value from a specified data value associated with the current key.

Pascal

```
function ReadBinaryData(const Name: string; var Buffer; BufSize: Integer): Integer;
```

C++

```
__fastcall int ReadBinaryData(const AnsiString Name,  Buffer, int BufSize);
```

Description

Call ReadBinaryData to read a binary value from a specified data value associated with the current key. Name is the name of the data value to read. Buffer is the application variable into which to read the registry data. Buffer must be large enough to hold all of the data returned. BufSize specifies the size of Buffer.

If successful, ReadBinaryData writes the requested data into Buffer and returns the number of bytes written. If the Registry (see page 18633) entry contains a known type (such as a string), ReadBinaryData raises an exception.

Note: Binary data is typically a complex data structure (a record in Delphi or struct in C++). It might also be an icon or a bitmap although Microsoft recommends against storing graphics objects in the registry for performance reasons.

See Also

CurrentKey (see page 18673)

ReadBool (see page 18660)

ReadCurrency (see page 18660)

ReadDate (see page 18661)

ReadDateTime (see page 18661)

ReadFloat (see page 18662)

ReadInteger (see page 18662)

ReadString (see page 18662)

ReadTime (see page 18663)

125.1.3.4.23 TRegistry.ReadBool Method

Retrieves a Boolean value from a specified data value associated with the current key.

Pascal

```
function ReadBool(const Name: string): Boolean;
```

C++

```
__fastcall Boolean ReadBool(const AnsiString Name);
```

Description

Call ReadBool to read a Boolean value from a specified data value associated with the current key. Name is the name of the data value to read.

If successful, ReadBool returns the requested Boolean value. If the Registry (see page 18633) entry does not contain a boolean or integer value, an exception is raised.

See Also

CurrentKey (see page 18673)

WriteBool (see page 18668)

125.1.3.4.24 TRegistry.ReadCurrency Method

Retrieves a currency value from a specified data value associated with the current key.

Pascal

```
function ReadCurrency(const Name: string): Currency;
```

C++

```
__fastcall Currency ReadCurrency(const AnsiString Name);
```

Description

Call ReadCurrency to read a Currency value from a specified data value associated with the current key. Name is the name of the data value to read.

If successful, ReadCurrency returns a Currency value. If the Registry (see page 18633) entry does not contain a Currency value, an exception is raised.

See Also

CurrentKey (see page 18673)

WriteCurrency (see page 18668)

125.1.3.4.25 TRegistry.ReadDate Method

Retrieves a date value from a specified data value associated with the current key.

Pascal

```
function ReadDate(const Name: string): TDateTime;
```

C++

```
__fastcall TDateTime ReadDate(const AnsiString Name);
```

Description

Call ReadDate to read a date value from a specified data value associated with the current key. Name is the name of the data value to read.

If successful, ReadDate returns a TDateTime value. The integral part of a TDateTime value is the number of days that have passed since 12/30/1899. The fractional part of a TDateTime value is the time of day.

If the Registry (see page 18633) entry does not contain a date or time value, an exception is raised.

Note: Only use ReadDate to read data values previously stored with the WriteDate (see page 18669) procedure.

See Also

CurrentKey (see page 18673)

WriteDate (see page 18669)

ReadDateTime (see page 18661)

125.1.3.4.26 TRegistry.ReadDateTime Method

Retrieves a date and time value from a specified data value associated with the current key.

Pascal

```
function ReadDateTime(const Name: string): TDateTime;
```

C++

```
__fastcall TDateTime ReadDateTime(const AnsiString Name);
```

Description

Call ReadDateTime to read a datetime value from a specified data value associated with the current key. Name is the name of the data value to read.

If successful, ReadDateTime returns a TDateTime value. The integral part of a TDateTime value is the number of days that have passed since 12/30/1899. The fractional part of a TDateTime value is the time of day.

If the Registry (see page 18633) entry does not contain a date or time value, an exception is raised.

See Also

CurrentKey (see page 18673)

WriteDateTime (see page 18669)

ReadDate (see page 18661)

ReadTime (see page 18663)

125.1.3.4.27 TRegistry.ReadFloat Method

Retrieves a float value from a specified data value associated with the current key.

Pascal

```
function ReadFloat(const Name: string): Double;
```

C++

```
__fastcall Double ReadFloat(const AnsiString Name);
```

Description

Call ReadFloat to read a float value from a specified data value associated with the current key. Name is the name of the data value to read.

If the Registry (see page 18633) entry does not contain a floating-point value, an exception is raised.

See Also

CurrentKey (see page 18673)

WriteFloat (see page 18670)

125.1.3.4.28 TRegistry.ReadInteger Method

Retrieves an integer value from a specified data value associated with the current key.

Pascal

```
function ReadInteger(const Name: string): Integer;
```

C++

```
__fastcall int ReadInteger(const AnsiString Name);
```

Description

Call ReadInteger to read an integer value from a specified data value associated with the current key. Name is the name of the data value to read.

If the Registry (see page 18633) entry does not contain an integer, an exception is raised.

See Also

CurrentKey (see page 18673)

WriteInteger (see page 18671)

125.1.3.4.29 TRegistry.ReadString Method

Retrieves a string value from a specified data value associated with the current key.

Pascal

```
function ReadString(const Name: string): string;
```

C++

```
__fastcall AnsiString ReadString(const AnsiString Name);
```

Description

Call ReadString to read a string value from a specified data value associated with the current key. Name is the name of the data value to read.

If there is no Registry (see page 18633) entry with the specified name, ReadString returns an empty string. If the Registry (see page 18633) entry contains something other than a string, an exception is raised.

Note: ReadString retrieves data stored by either the WriteString (see page 18671) or WriteExpandString (see page 18670) method.

See Also

CurrentKey (see page 18673)

WriteString (see page 18671)

WriteExpandString (see page 18670)

125.1.3.4.30 TRegistry.ReadTime Method

Retrieves a time value from a specified data value associated with the current key.

Pascal

```
function ReadTime(const Name: string): TDateTime;
```

C++

```
__fastcall TDateTime ReadTime(const AnsiString Name);
```

Description

Call ReadTime to read a time value from a specified data value associated with the current key. Name is the name of the data value to read.

If successful, ReadTime returns a TDateTime value. The integral part of a TDateTime value is the number of days that have passed since 12/30/1899. The fractional part of a TDateTime value is the time of day.

If the specified Registry (see page 18633) entry does not contain a date or time value, an exception is raised.

Note: Only use ReadTime to read data values previously stored with the WriteTime (see page 18671) method.

See Also

CurrentKey (see page 18673)

WriteTime (see page 18671)

ReadDateTime (see page 18661)

125.1.3.4.31 TRegistry.RegistryConnect Method

Establishes a connection to a registry on another computer.

Pascal

```
function RegistryConnect(const UNCName: string): Boolean;
```

C++

```
__fastcall Boolean RegistryConnect(const AnsiString UNCName);
```

Description

Call RegistryConnect to establish a connection to a registry on another computer running Windows 95 or Windows NT. UNCName is the name of the remote computer, and must take the following form:

```
\\computername
```

where computername is the name of the remote computer. If UNCName is nil (Delphi) or NULL (C++), the local machine name is used.

Note: Before calling RegistryConnect, an application must set the RootKey (see page 18674) property for its registry object to HKEY_USERS or HKEY_LOCAL_MACHINE.

If connection is successful, RegistryConnect sets the RootKey (see page 18674) property to the root key of the remote computer and returns true. If unsuccessful, RegistryConnect returns false, and RootKey (see page 18674) remains unchanged.

See Also

RootKey (see page 18674)

LoadKey (see page 18657)

ReplaceKey (see page 18664)

RestoreKey (see page 18665)

SaveKey (see page 18666)

125.1.3.4.32 TRegistry.RenameValue Method

Changes the name of a data value associated with the current key.

Pascal

```
procedure RenameValue(const OldName: string; const NewName: string);
```

C++

```
__fastcall RenameValue(const AnsiString OldName, const AnsiString NewName);
```

Description

Call RenameValue to change the name of a data value associated with the current key. OldName is a string containing the current name of the data value. NewName is a string containing the replacement name for the data value.

If OldName is the name of an existing data value for the current key, and NewName is not the name of an existing data value for the current key, RenameValue changes the data value name as specified. Otherwise the current name remains unchanged.

See Also

CurrentKey (see page 18673)

GetValueNames (see page 18656)

ValueExists (see page 18667)

MoveKey (see page 18657)

125.1.3.4.33 TRegistry.ReplaceKey Method

Replaces the hive file backing a key and all its subkeys with a hive stored in a different file, so that when the system is next

started, the key and subkeys will have the values stored in the new file.

Pascal

```
function ReplaceKey(const Key: string; const FileName: string; const BackUpFileName: string):
Boolean;
```

C++

```
__fastcall Boolean ReplaceKey(const AnsiString Key, const AnsiString FileName, const
AnsiString BackUpFileName);
```

Description

Call ReplaceKey to replace the hive file backing a key and all its subkeys with a different hive file. A hive is a discrete collection of keys, subkeys, and values that is rooted at the top of the registry hierarchy.

FileName indicates the name of the file containing the new key and subkey information. BackUpFileName is the name of a backup file used to store the current key and subkey information before it is overwritten.

ReplaceKey returns true if it is successful.

Note: The file specified by FileName parameter must be created with the SaveKey (see page 18666) function, or by directly calling the Windows 95/NT RegSaveKey API function. Under the FAT file system FileName cannot have an extension.

See Also

LoadKey (see page 18657)

RestoreKey (see page 18665)

SaveKey (see page 18666)

125.1.3.4.34 TRegistry.RestoreKey Method

Reopens the specified key, and overwrites any information contained in this key and its subkeys keys with registry data stored in a hive file.

Pascal

```
function RestoreKey(const Key: string; const FileName: string): Boolean;
```

C++

```
__fastcall Boolean RestoreKey(const AnsiString Key, const AnsiString FileName);
```

Description

Call RestoreKey to open the specified key with a security access value of KEY_ALL_ACCESS and overwrite any information in the key and its subkeys with registry data stored in a hive file. A hive is a discrete collection of keys, subkeys, and values that is rooted at the top of the registry hierarchy.

Key is the name of the key to open. FileName is the name of the file containing the hive information.

If RestoreKey successfully reads and copies the registry information in FileName to the specified key, the return value of RestoreKey is true and the key is closed.

Note: The file specified by FileName parameter must be created with the SaveKey (see page 18666) function, or by directly calling the Windows 95/NT RegSaveKey API function. Under the FAT file system FileName cannot have an extension.

See Also

LoadKey (see page 18657)

ReplaceKey (see page 18664)

RegistryConnect (see page 18663)

SaveKey (see page 18666)

125.1.3.4.35 TRegistry.SaveKey Method

Opens the specified key with the security access value KEY_ALL_ACCESS and saves the specified key and all of its subkeys and values to a hive file.

Pascal

```
function SaveKey(const Key: string; const FileName: string): Boolean;
```

C++

```
__fastcall Boolean SaveKey(const AnsiString Key, const AnsiString FileName);
```

Description

Call SaveKey to open a key with a security access value of KEY_ALL_ACCESS, and save the key and its subkeys and data values to a hive file. A hive is a discrete collection of keys, subkeys, and values that is rooted at the top of the registry hierarchy.

Key is the key to save. FileName is the file into which to save the key information. It must be the name of a new file that does not already exist. On FAT file systems FileName cannot include an extension.

Files created by SaveKey are passed as parameters to the RestoreKey (see page 18665), ReplaceKey (see page 18664) and LoadKey (see page 18657) functions.

If SaveKey is successful it returns true and closes the key.

See Also

LoadKey (see page 18657)

ReplaceKey (see page 18664)

RestoreKey (see page 18665)

125.1.3.4.36 TRegistry.SetCurrentKey Method

Pascal

```
procedure SetCurrentKey(Value: HKEY);
```

C++

```
__fastcall SetCurrentKey(HKEY Value);
```

Description

This is SetCurrentKey, a member of class TRegistry.

125.1.3.4.37 TRegistry.UnLoadKey Method

Removes a hive from the registry.

Pascal

```
function UnLoadKey(const Key: string): Boolean;
```

C++

```
__fastcall Boolean UnLoadKey(const AnsiString Key);
```

Description

Call UnLoadKey to remove a hive from the registry without modifying its associated hive file, if any. A hive is a discrete collection

of keys, subkeys, and values that is rooted at the top of the registry hierarchy.

Key is the name of the key at the root of the hive to remove.

If successful, UnLoadKey returns true.

Note: Before calling this function, set RootKey (see page 18674) to HKEY_USERS, HKEY_LOCAL_MACHINE, or call RegistryConnect (see page 18663).

See Also

RootKey (see page 18674)

LoadKey (see page 18657)

ReplaceKey (see page 18664)

RestoreKey (see page 18665)

SaveKey (see page 18666)

125.1.3.4.38 TRegistry.ValueExists Method

Determines if a specified data value exists for the current key.

Pascal

```
function ValueExists(const Name: string): Boolean;
```

C++

```
__fastcall Boolean ValueExists(const AnsiString Name);
```

Description

Call ValueExists to determine if a particular data item exists in the registry. Calling ValueExists is especially useful before calling other TRegistry (see page 18645) methods that operate only on existing data items.

Name is the name of the data value for which to check.

ValueExists returns true if a match if found, false otherwise.

See Also

CurrentKey (see page 18673)

KeyExists (see page 18656)

125.1.3.4.39 TRegistry.WriteBinaryData Method

Stores a specifically named data value associated with the current key.

Pascal

```
procedure WriteBinaryData(const Name: string; var Buffer; BufSize: Integer);
```

C++

```
__fastcall WriteBinaryData(const AnsiString Name,  Buffer, int BufSize);
```

Description

Call WriteBinaryData to store a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteBinary. If Name does not exist, it is created.

Buffer is a data buffer containing the data to store in the registry. BufSize indicates the size of Buffer.

Note: Data-value lengths are limited by available memory. Long values (more than 2048 bytes) should be stored as separate files, and those file names should be stored in the registry. Application elements such as icons, bitmaps, and executable files should be stored as separate files rather than as values in the registry.

If WriteBinaryData fails, an exception is raised, and the value is not written to the registry.

See Also

CurrentKey (see page 18673)

ReadBinaryData (see page 18659)

125.1.3.4.40 TRegistry.WriteBool Method

Stores a Boolean value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteBool(const Name: string; Value: Boolean);
```

C++

```
__fastcall WriteBool(const AnsiString Name, Boolean Value);
```

Description

Call WriteBool to store a boolean value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteBool. If Name does not exist, it is created.

If WriteBool fails, an exception is raised, and the value is not written to the registry.

See Also

CurrentKey (see page 18673)

ReadBool (see page 18660)

125.1.3.4.41 TRegistry.WriteCurrency Method

Stores a currency value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteCurrency(const Name: string; Value: Currency);
```

C++

```
__fastcall WriteCurrency(const AnsiString Name, Currency Value);
```

Description

Call WriteCurrency to store a Currency value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteCurrency. If Name does not exist, it is created.

Value is a Currency value to store in the registry.

If WriteCurrency fails, an exception is raised, and the value is not written to the registry.

See Also

CurrentKey (see page 18673)

ReadCurrency (see page 18660)

125.1.3.4.42 TRegistry.WriteDate Method

Stores a date value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteDate(const Name: string; Value: TDateTime);
```

C++

```
__fastcall WriteDate(const AnsiString Name, TDateTime Value);
```

Description

Call WriteDate to store a datetime value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteDate. If Name does not exist, it is created.

Value is a datetime value to store in the registry.

If WriteDate fails, an exception is raised, and the value is not written to the registry.

If successful, WriteDate stores a TDateTime value. The integral part of a TDateTime value is the number of days that have passed since 12/30/1899. The fractional part of a TDateTime value is the time of day.

See Also

CurrentKey (see page 18673)

ReadDate (see page 18661)

WriteDateTime (see page 18669)

125.1.3.4.43 TRegistry.WriteDateTime Method

Stores a datetime value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteDateTime(const Name: string; Value: TDateTime);
```

C++

```
__fastcall WriteDateTime(const AnsiString Name, TDateTime Value);
```

Description

Call WriteDateTime to store a datetime value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteDateTime. If Name does not exist, it is created.

Value is a datetime value to store in the registry.

If WriteDateTime fails, an exception is raised, and the value is not written to the registry.

If successful, WriteDateTime stores a TDateTime value. The integral part of a TDateTime value is the number of days that have passed since 12/30/1899. The fractional part of a TDateTime value is the time of day.

See Also

CurrentKey (see page 18673)

ReadDateTime (see page 18661)

WriteDate (see page 18669)

WriteTime (see page 18671)

125.1.3.4.44 TRegistry.WriteExpandString Method

Stores a string containing unexpanded references to environment variables in a specifically named data value associated with the current key.

Pascal

```
procedure WriteExpandString(const Name: string; const Value: string);
```

C++

```
__fastcall WriteExpandString(const AnsiString Name, const AnsiString Value);
```

Description

Call WriteExpandString to store a string that contains unexpanded references to environment variables such as "%PATH%". The string is stored in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteExpandString. If Name does not exist, it is created.

Value is a string value to store in the registry.

If WriteExpandString fails, an exception is raised.

Note: To write strings that do not contain unexpanded environment variables, use WriteString (see page 18671) instead.

See Also

CurrentKey (see page 18673)

ReadString (see page 18662)

WriteString (see page 18671)

125.1.3.4.45 TRegistry.WriteFloat Method

Stores a Double value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteFloat(const Name: string; Value: Double);
```

C++

```
__fastcall WriteFloat(const AnsiString Name, Double Value);
```

Description

Call WriteFloat to store a float value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteFloat. If Name does not exist, it is created.

Value is a float value to store in the registry.

If WriteFloat fails, an exception is raised, and the value is not written to the registry.

See Also

CurrentKey (see page 18673)

ReadFloat (see page 18662)

125.1.3.4.46 TRegistry.WriteInteger Method

Stores an integer value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteInteger(const Name: string; Value: Integer);
```

C++

```
__fastcall WriteInteger(const AnsiString Name, int Value);
```

Description

Call WriteInteger to store an integer value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteInteger. If Name does not exist, it is created.

Value is a integer value to store in the registry.

If WriteInteger fails, an exception is raised, and the value is not written to the registry.

See Also

CurrentKey (see page 18673)

ReadInteger (see page 18662)

125.1.3.4.47 TRegistry.WriteString Method

Stores a string value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteString(const Name: string; const Value: string);
```

C++

```
__fastcall WriteString(const AnsiString Name, const AnsiString Value);
```

Description

Call WriteString to store a string value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteString. If Name does not exist, it is created.

Value is a string value to store in the registry.

If WriteString fails, an exception is raised, and the value is not written to the registry.

See Also

CurrentKey (see page 18673)

ReadString (see page 18662)

WriteExpandString (see page 18670)

125.1.3.4.48 TRegistry.WriteTime Method

Stores a time value in a specifically named data value associated with the current key.

Pascal

```
procedure WriteTime(const Name: string; Value: TDateTime);
```

C++

```
__fastcall WriteTime(const AnsiString Name, TDateTime Value);
```

Description

Call WriteTime to store a datetime value in a data value associated with the current key.

Name is a string containing the name of the data value in which to store data. If Name already exists, its current value is overwritten by WriteTime. If Name does not exist, it is created.

Value is a datetime value to store in the registry.

If WriteTime fails, an exception is raised, and the value is not written to the registry.

If successful, WriteTime stores a TDateTime value. The integral part of a TDateTime value is the number of days that have passed since 12/30/1899. The fractional part of a TDateTime value is the time of day.

See Also

CurrentKey (see page 18673)

ReadTime (see page 18663)

WriteDateTime (see page 18669)

125.1.3.5 TRegistry Properties

The properties of the TRegistry class are listed here.

Public Properties

	Name	Description
	Access (see page 18672)	Specifies the level of access to use when opening keys.
R	CurrentKey (see page 18673)	Specifies the registry key that is currently open.
R	CurrentPath (see page 18673)	Indicates the registry path associated with the current key.
	LazyWrite (see page 18674)	Specifies how keys are written to the registry when calling the CloseKey (see page 18650) procedure.
	RootKey (see page 18674)	Specifies the root key for the TRegistry (see page 18645) object in an application.

125.1.3.5.1 TRegistry.Access Property

Specifies the level of access to use when opening keys.

Pascal

```
property Access: LongWord;
```

C++

```
__property LongWord Access;
```

Description

Use Access to specify the level of security access to use when opening keys. The OpenKey (see page 18658) method uses the value of Access when opening a registry key. Access is initialized by the TRegistry (see page 18645) constructor, but can be altered before calling OpenKey (see page 18658).

The value of Access is a set of flags or'd together, where each flag indicates a type of permission. Choose a value that grants

sufficient permission to allow the desired actions while not exceeding the access level of the system running the application. The following table lists the flags that can be included:

Flag	Meaning
KEY_ALL_ACCESS	combination of KEY_READ, KEY_WRITE, and KEY_CREATE_LINK.
KEY_READ	combination of KEY_QUERY_VALUE, KEY_ENUMERATE_SUB_KEYS, and KEY_NOTIFY.
KEY_WRITE	combination of KEY_SET_VALUE and KEY_CREATE_SUB_KEY.
KEY_QUERY_VALUE	grants permission to query subkey data.
KEY_ENUMERATE_SUB_KEYS	grants permission to enumerate subkeys.
KEY_NOTIFY	grants ability to receive change notifications.
KEY_SET_VALUE	grants permission to set subkey data.
KEY_CREATE_SUB_KEY	grants permission to create subkeys.
KEY_CREATE_LINK	grants permission to create symbolic links.
KEY_EXECUTE	restricts permission to read-only access.

Note: Access is ignored by the CreateKey (see page 18651) method, which always uses KEY_ALL_ACCESS.

See Also

OpenKey (see page 18658)

Create (see page 18648)

OpenKeyReadOnly (see page 18658)

125.1.3.5.2 TRegistry.CurrentKey Property

Specifies the registry key that is currently open.

Pascal

```
property CurrentKey: HKEY;
```

C++

```
__property HKEY CurrentKey;
```

Description

Use CurrentKey to determine the registry key that is currently open. All operations performed by TRegistry (see page 18645) affect only the current key. To access another key, call the OpenKey (see page 18658) or OpenKeyReadOnly (see page 18658) method.

See Also

CurrentPath (see page 18673)

RootKey (see page 18674)

OpenKey (see page 18658)

OpenKeyReadOnly (see page 18658)

125.1.3.5.3 TRegistry.CurrentPath Property

Indicates the registry path associated with the current key.

Pascal

```
property CurrentPath: string;
```

C++

```
__property AnsiString CurrentPath;
```

Description

Use CurrentPath to determine the registry path of the current key. The system registry is hierarchical, and CurrentPath returns a string that spells out the hierarchy of keys from the root key to the current key, inclusive.

CurrentPath is automatically reset each time a different key becomes the current key.

See Also

CurrentKey (see page 18673)

RootKey (see page 18674)

125.1.3.5.4 TRegistry.LazyWrite Property

Specifies how keys are written to the registry when calling the CloseKey (see page 18650) procedure.

Pascal

```
property LazyWrite: Boolean;
```

C++

```
__property Boolean LazyWrite;
```

Description

Use LazyWrite to specify how keys are written to the registry. LazyWrite is initialized to true when a registry object is first created. When LazyWrite is true, keys are written to the registry when they are closed, but the CloseKey (see page 18650) procedure may return before the write operation takes place.

When LazyWrite is false, keys are written to the registry before CloseKey (see page 18650) returns. Set LazyWrite to false only when absolutely necessary. Setting LazyWrite to false guarantees that the changes an application makes to keys are written to the registry before further application processing takes place, but it uses more system resources when keys are closed. If LazyWrite is false, and an application is displaying or changing many registry entries, there will be a degradation in application performance.

See Also

CloseKey (see page 18650)

125.1.3.5.5 TRegistry.RootKey Property

Specifies the root key for the TRegistry (see page 18645) object in an application.

Pascal

```
property RootKey: HKEY;
```

C++

```
__property HKEY RootKey;
```

Description

Use RootKey to determine the hierarchy of subkeys an application can access, or to specify the root key for the application.

By default, RootKey is set to HKEY_CURRENT_USER when the registry object is created. To change the root key, specify a

valid integer value for the RootKey property.

Note: For some operations, such as LoadKey (see page 18657) or RegistryConnect (see page 18663), an application may need to change the default value of RootKey.

See Also

CurrentKey (see page 18673)

LoadKey (see page 18657)

RegistryConnect (see page 18663)

125.1.4 TRegistryIniFile Class

TRegistryIniFile is a wrapper for the Windows system registry.

Class Hierarchy

Pascal

```
TRegistryIniFile = class(TCustomIniFile);
```

C++

```
class TRegistryIniFile : public TCustomIniFile;
```

File

Registry

Description

TRegistryIniFile presents a simple interface to the system registry and hides the need to know about the underlying structure of the registry. TRegistryIniFile enables handling the Windows system registry as if it were a Windows 3.x INI file. Instead of processing an INI file, however, TRegistryIniFile reads from and writes to the system registry. Because TRegistryIniFile, like TIniFile, descends from TCustomIniFile, you can use it in common code that writes to both INI files and the registry.

In addition, application developers that are switching from the use of INI files to the system registry can use this object to migrate their application with a minimum of coding changes. By finding all references to TIniFile in an application, replacing them with TRegistryIniFile, and recompiling the application, a developer can update an application to use the system registry instead of INI files without having to code any new logic into the application.

Note: Information contained in existing users' INI files is not migrated into the system registry using the method described above. A one-time operation to explicitly copy the INI file data, through TRegistryIniFile, must be used to do this.

TRegistryIniFile adapts the methods inherited from TCustomIniFile to operate on Registry (see page 18633) entries rather than INI file keys. It reinterprets the FileName property as a subkey under the system registry's root key (HKEY_CURRENT_USER by default). What corresponds to a section in an INI file is treated as a key in the system registry, and what corresponds to data entries under a section in an INI file are treated as data values under a key in the system registry.

See Also

TIniFile (see page 15455)

TMemIniFile (see page 15462)

TCustomIniFile (see page 15434)

TRegIniFile (see page 18635)

125.1.4.1 TRegistryIniFile Members

The following tables list the members exposed by TRegistryIniFile.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18677)	This is the overview for the Create constructor overload.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DeleteKey (see page 18679)	Erases the data value associated with an INI file entry.
	Destroy (see page 18678)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EraseSection (see page 18679)	Erases an entire section of an INI file.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ReadBinaryStream (see page 18679)	Retrieves a binary value from the registry.
	ReadBool (see page 15439)	Retrieves a Boolean value from an ini file.
	ReadDate (see page 18680)	Retrieves a date value from an INI file.
	ReadDateTime (see page 18681)	Retrieves a date-time value from an INI file.
	ReadFloat (see page 18681)	Retrieves a float value from an INI file.
	ReadInteger (see page 18682)	Retrieves an integer value from an INI file.
	ReadSection (see page 18682)	Reads all the key names from a specified section of an INI file into a string list.
	ReadSections (see page 15442)	This is the overview for the ReadSections method overload.
	ReadSections (see page 18683)	This is the overview for the ReadSections method overload.
	ReadSectionValues (see page 18683)	Retrieves the data-values associated with a specified key, and stores the retrieved values in a string object.
	ReadString (see page 18684)	Retrieves a string value from an INI file.
	ReadTime (see page 18685)	Retrieves a time value from an INI file.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SectionExists (see page 15444)	Indicates whether a section exists in the ini file.
	UpdateFile (see page 18685)	Flushes buffered INI file data to disk.

	ValueExists (see page 15445)	Indicates whether a key exists in the ini file.
	WriteBinaryStream (see page 18685)	Writes a binary value to the registry.
	WriteBool (see page 15446)	Writes a Boolean value to an ini file.
	WriteDate (see page 18686)	Writes a date value to an INI file.
	WriteDateTime (see page 18687)	Writes a date-time value to an INI file.
	WriteFloat (see page 18687)	Writes a float value to an INI file.
	WriteInteger (see page 18688)	Writes an integer value to an INI file.
	WriteString (see page 18688)	Writes a string value to an INI file.
	WriteTime (see page 18689)	Writes a time value to an INI file.

Public Properties

	Name	Description
	FileName (see page 15450)	Contains the name of the ini file from which to read and to which to write information.
	RegIniFile (see page 18689)	Contains and internal instance of a TRegIniFile (see page 18635) object.

125.1.4.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TRegistryIniFile.Create (string) (see page 18677)	Creates a TRegistryIniFile (see page 18675) object for an application.
	TRegistryIniFile.Create (string, LongWord) (see page 18677)	Creates a TRegistryIniFile (see page 18675) object for an application.

125.1.4.2.1 TRegistryIniFile.Create Constructor (string)

Creates a TRegistryIniFile (see page 18675) object for an application.

Pascal

```
constructor Create(const FileName: string); overload;
constructor Create(const FileName: string; AAccess: LongWord); overload;
```

C++

```
__fastcall TRegistryIniFile(const AnsiString FileName);
__fastcall TRegistryIniFile(const AnsiString FileName, LongWord AAccess);
```

Description

Create constructs a TRegistryIniFile (see page 18675) and creates an internal TRegIniFile (see page 18635) object used to access the system registry. TRegistryIniFile (see page 18675) uses this TRegIniFile (see page 18635) object as a helper object to provide much of its functionality.

FileName is used as the FileName property for the internal TRegIniFile (see page 18635) object in the RegIniFile (see page 18689) property.

AAccess initializes the Access property of the internal TRegIniFile (see page 18635) object.

See Also

TRegIniFile (see page 18635)

RegIniFile (see page 18689)

Create (see page 22287)

Access (see page 18672)

125.1.4.3 TRegistryIniFile.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRegistryIniFile();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

125.1.4.4 TRegistryIniFile Methods

The methods of the TRegistryIniFile class are listed here.

Public Methods

	Name	Description
	DeleteKey (see page 18679)	Erases the data value associated with an INI file entry.
	EraseSection (see page 18679)	Erases an entire section of an INI file.
	ReadBinaryStream (see page 18679)	Retrieves a binary value from the registry.
	ReadDate (see page 18680)	Retrieves a date value from an INI file.
	ReadDateTime (see page 18681)	Retrieves a date-time value from an INI file.
	ReadFloat (see page 18681)	Retrieves a float value from an INI file.
	ReadInteger (see page 18682)	Retrieves an integer value from an INI file.
	ReadSection (see page 18682)	Reads all the key names from a specified section of an INI file into a string list.
	ReadSections (see page 18683)	This is the overview for the ReadSections method overload.
	ReadSectionValues (see page 18683)	Retrieves the data-values associated with a specified key, and stores the retrieved values in a string object.
	ReadString (see page 18684)	Retrieves a string value from an INI file.

	ReadTime (see page 18685)	Retrieves a time value from an INI file.
	UpdateFile (see page 18685)	Flushes buffered INI file data to disk.
	WriteBinaryStream (see page 18685)	Writes a binary value to the registry.
	WriteDate (see page 18686)	Writes a date value to an INI file.
	WriteDateTime (see page 18687)	Writes a date-time value to an INI file.
	WriteFloat (see page 18687)	Writes a float value to an INI file.
	WriteInteger (see page 18688)	Writes an integer value to an INI file.
	WriteString (see page 18688)	Writes a string value to an INI file.
	WriteTime (see page 18689)	Writes a time value to an INI file.

125.1.4.4.1 TRegistryIniFile.DeleteKey Method

Erases the data value associated with an INI file entry.

Pascal

```
procedure DeleteKey(const Section: String; const Ident: String); override;
```

C++

```
virtual __fastcall DeleteKey(const AnsiString Section, const AnsiString Ident);
```

Description

Call DeleteKey to erase a data value associated with an INI file entry. Section is string containing the name of an INI file section, and Ident is a string containing the name of the key from for which to set a nil (Delphi) or NULL (C++) value.

Note: Attempting to erase a data value in a nonexistent section or attempting to erase data from a nonexistent key are not errors. In these cases, DeleteKey creates the section and key and sets its initial value to an empty value.

See Also

EraseSection (see page 18679)

ValueExists (see page 15445)

125.1.4.4.2 TRegistryIniFile.EraseSection Method

Erases an entire section of an INI file.

Pascal

```
procedure EraseSection(const Section: string); override;
```

C++

```
virtual __fastcall EraseSection(const AnsiString Section);
```

Description

Call EraseSection to remove a section, all its keys, and their data values from an INI file. Section identifies the INI file section to remove. If a section cannot be removed, an exception is raised.

See Also

SectionExists (see page 15444)

DeleteKey (see page 18679)

125.1.4.4.3 TRegistryIniFile.ReadBinaryStream Method

Retrieves a binary value from the registry.

Pascal

```
function ReadBinaryStream(const Section: string; const Name: string; Value: TStream): Integer;
override;
```

C++

```
virtual __fastcall int ReadBinaryStream(const AnsiString Section, const AnsiString Name,
TStream Value);
```

Description

Call ReadBinaryStream to read a binary value into a specified stream. After reading the binary value from the INI file into the current position of the stream, ReadBinaryStream returns the number of bytes written to the stream. The stream is left positioned immediately after the new binary value.

Section is the key for the section that contains the binary data.

Name is the subkey under which the binary data is stored.

Value is a stream to which the binary value is written.

See Also

ReadString (see page 18684)

WriteBinaryStream (see page 18685)

125.1.4.4.4 TRegistryIniFile.ReadDate Method

Retrieves a date value from an INI file.

Pascal

```
function ReadDate(const Section: string; const Name: string; Default: TDateTime): TDateTime;
override;
```

C++

```
virtual __fastcall TDateTime ReadDate(const AnsiString Section, const AnsiString Name,
TDateTime Default);
```

Description

Call ReadDate to read a date value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the date value. Default is the date value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 15439)

ReadDateTime (see page 18681)

ReadFloat (see page 18681)

ReadInteger (see page 18682)

ReadString (see page 18684)

ReadTime (see page 18685)

125.1.4.4.5 TRegistryIniFile.ReadDateTime Method

Retrieves a date-time value from an INI file.

Pascal

```
function ReadDateTime(const Section: string; const Name: string; Default: TDateTime):
TDateTime; override;
```

C++

```
virtual __fastcall TDateTime ReadDateTime(const AnsiString Section, const AnsiString Name,
TDateTime Default);
```

Description

Call ReadDateTime to read a date-time value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the date-time value. Default is the date-time value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 15439)

ReadDate (see page 18680)

ReadDateTime

ReadFloat (see page 18681)

ReadInteger (see page 18682)

ReadString (see page 18684)

ReadTime (see page 18685)

125.1.4.4.6 TRegistryIniFile.ReadFloat Method

Retrieves a float value from an INI file.

Pascal

```
function ReadFloat(const Section: string; const Name: string; Default: Double): Double;
override;
```

C++

```
virtual __fastcall Double ReadFloat(const AnsiString Section, const AnsiString Name, Double
Default);
```

Description

Call ReadFloat to read a float value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the float value. Default is the float value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 15439)

ReadDate (see page 18680)

ReadDateTime (see page 18681)

ReadInteger (see page 18682)

ReadString (see page 18684)

ReadTime (see page 18685)

125.1.4.4.7 TRegistryIniFile.ReadInteger Method

Retrieves an integer value from an INI file.

Pascal

```
function ReadInteger(const Section: string; const Ident: string; Default: Longint): Longint;
override;
```

C++

```
virtual __fastcall Longint ReadInteger(const AnsiString Section, const AnsiString Ident,
Longint Default);
```

Description

Call ReadInteger to read an integer value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the integer value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 15439)

ReadDate (see page 18680)

ReadDateTime (see page 18681)

ReadFloat (see page 18681)

ReadString (see page 18684)

ReadTime (see page 18685)

125.1.4.4.8 TRegistryIniFile.ReadSection Method

Reads all the key names from a specified section of an INI file into a string list.

Pascal

```
procedure ReadSection(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSection(const AnsiString Section, TStrings Strings);
```

Description

Call ReadSection to retrieve the names of all keys within a specified section of an INI file into a string list object.

Section identifies the section from which to retrieve a list of key names. Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings object such as a string list, or to a component property, such as Items for a TListBox component, that is a TStrings object itself.

See Also

ReadSections (see page 18683)

ReadSectionValues (see page 18683)

SectionExists (see page 15444)

125.1.4.4.9 ReadSections Method

This is the overview for the ReadSections method overload.

Overload List

	Name	Description
	TRegistryIniFile.ReadSections (string, TStrings) (see page 18683)	Reads the names of all sections in an INI file into a string list.
	TRegistryIniFile.ReadSections (TStrings) (see page 18683)	Reads the names of all sections in an INI file into a string list.

125.1.4.4.9.1 TRegistryIniFile.ReadSections Method (TStrings)

Reads the names of all sections in an INI file into a string list.

Pascal

```
procedure ReadSections(Strings: TStrings); override; overload;
procedure ReadSections(const Section: string; Strings: TStrings); override; overload;
```

C++

```
virtual __fastcall ReadSections(TStrings Strings);
virtual __fastcall ReadSections(const AnsiString Section, TStrings Strings);
```

Description

Call ReadSections to retrieve the names of all sections in an INI file into a string list object.

Strings specifies the string object to hold the retrieved names. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component, that is a TStrings object itself.

See Also

ReadSection (see page 18682)

ReadSectionValues (see page 18683)

125.1.4.4.10 TRegistryIniFile.ReadSectionValues Method

Retrieves the data-values associated with a specified key, and stores the retrieved values in a string object.

Pascal

```
procedure ReadSectionValues(const Section: string; Strings: TStrings); override;
```

C++

```
virtual __fastcall ReadSectionValues(const AnsiString Section, TStrings Strings);
```

Description

Call ReadSectionValues to read all data values associated with a specified key into a string object.

Section is the name of the key from which to retrieve data-values.

Strings specifies the string list object to hold the retrieved values. Strings can point to a TStrings object, or to a component property, such as Items for a TListBox component, that is a TStrings object itself. Use the Values property of the string object to access a specific string in the object.

See Also

ReadSection (see page 18682)

ReadSections (see page 18683)

SectionExists (see page 15444)

125.1.4.4.11 TRegistryIniFile.ReadString Method

Retrieves a string value from an INI file.

Pascal

```
function ReadString(const Section: string; const Ident: string; const Default: string):
string; override;
```

C++

```
virtual __fastcall AnsiString ReadString(const AnsiString Section, const AnsiString Ident,
const AnsiString Default);
```

Description

Call ReadString to read a string value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the value. Default is the string value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 15439)

ReadDate (see page 18680)

ReadDateTime (see page 18681)

ReadFloat (see page 18681)

ReadInteger (see page 18682)

ReadTime (see page 18685)

125.1.4.4.12 TRegistryIniFile.ReadTime Method

Retrieves a time value from an INI file.

Pascal

```
function ReadTime(const Section: string; const Name: string; Default: TDateTime): TDateTime;
override;
```

C++

```
virtual __fastcall TDateTime ReadTime(const AnsiString Section, const AnsiString Name,
TDateTime Default);
```

Description

Call ReadTime to read a time value from an INI file. Section identifies the section in the file that contains the desired key. Ident is the name of the key from which to retrieve the time value. Default is the time value to return if the:

Section does not exist.

Key does not exist.

Data value for the key is not assigned.

See Also

ReadBool (see page 15439)

ReadDate (see page 18680)

ReadDateTime (see page 18681)

ReadFloat (see page 18681)

ReadInteger (see page 18682)

ReadString (see page 18684)

125.1.4.4.13 TRegistryIniFile.UpdateFile Method

Flushes buffered INI file data to disk.

Pascal

```
procedure UpdateFile; override;
```

C++

```
virtual __fastcall UpdateFile();
```

Description

Call UpdateFile to flush buffered reads from and writes to the INI file to disk. UpdateFile is useful under Windows95, but has no effect under Windows NT as NT does not buffer INI file reads and writes.

See Also

FileName (see page 15450)

125.1.4.4.14 TRegistryIniFile.WriteBinaryStream Method

Writes a binary value to the registry.

Pascal

```
procedure WriteBinaryStream(const Section: string; const Name: string; Value: TStream);
override;
```

C++

```
virtual __fastcall WriteBinaryStream(const AnsiString Section, const AnsiString Name, TStream
Value);
```

Description

Call WriteBinaryStream to write a binary value from a specified stream to a specified key in the registry. WriteBinaryStream writes from the current position in the stream to the end.

Section is the key for the section that contains the subkey where the binary data should be written.

Name is the subkey under which the binary data is stored.

Value is a stream from which the binary value can be read.

Note: Attempting to write a value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteBinaryStream creates the section and key and sets its initial value to the stream's data.

See Also

WriteString (see page 18688)

ReadBinaryStream (see page 18679)

125.1.4.4.15 TRegistryIniFile.WriteDate Method

Writes a date value to an INI file.

Pascal

```
procedure WriteDate(const Section: string; const Name: string; Value: TDateTime); override;
```

C++

```
virtual __fastcall WriteDate(const AnsiString Section, const AnsiString Name, TDateTime Value);
```

Description

Call WriteDate to write a date value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the date value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteDate creates the section and key and sets its initial value to Value.

See Also

WriteBool (see page 15446)

WriteDateTime (see page 18687)

WriteFloat (see page 18687)

WriteInteger (see page 18688)

WriteString (see page 18688)

WriteTime (see page 18689)

125.1.4.4.16 TRegistryIniFile.WriteDateTime Method

Writes a date-time value to an INI file.

Pascal

```
procedure WriteDateTime(const Section: string; const Name: string; Value: TDateTime); override;
```

C++

```
virtual __fastcall WriteDateTime(const AnsiString Section, const AnsiString Name, TDateTime
Value);
```

Description

Call WriteDateTime to write a date-time value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the date-time value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteDateTime creates the section and key and sets its initial value to Value.

See Also

WriteBool (see page 15446)

WriteDate (see page 18686)

WriteFloat (see page 18687)

WriteInteger (see page 18688)

WriteString (see page 18688)

WriteTime (see page 18689)

125.1.4.4.17 TRegistryIniFile.WriteFloat Method

Writes a float value to an INI file.

Pascal

```
procedure WriteFloat(const Section: string; const Name: string; Value: Double); override;
```

C++

```
virtual __fastcall WriteFloat(const AnsiString Section, const AnsiString Name, Double Value);
```

Description

Call WriteFloat to write a float value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the float value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteFloat creates the section and key and sets its initial value to Value.

See Also

WriteBool (see page 15446)

WriteDate (see page 18686)

WriteDateTime (see page 18687)

WriteInteger (see page 18688)

WriteString (see page 18688)

WriteTime (see page 18689)

125.1.4.4.18 TRegistryIniFile.WriteInteger Method

Writes an integer value to an INI file.

Pascal

```
procedure WriteInteger(const Section: string; const Ident: string; Value: Longint); override;
```

C++

```
virtual __fastcall WriteInteger(const AnsiString Section, const AnsiString Ident, Longint
Value);
```

Description

Call WriteInteger to write an integer value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the integer value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteInteger creates the section and key and sets its initial value to Value.

See Also

WriteBool (see page 15446)

WriteDate (see page 18686)

WriteDateTime (see page 18687)

WriteFloat (see page 18687)

WriteString (see page 18688)

WriteTime (see page 18689)

125.1.4.4.19 TRegistryIniFile.WriteString Method

Writes a string value to an INI file.

Pascal

```
procedure WriteString(const Section: String; const Ident: String; const Value: String);
override;
```

C++

```
virtual __fastcall WriteString(const AnsiString Section, const AnsiString Ident, const
AnsiString Value);
```

Description

Call WriteString to write a string value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the string value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteString creates the section and key and sets its initial value to Value.

See Also

WriteBool (see page 15446)

WriteDate (see page 18686)

WriteDateTime (see page 18687)

WriteFloat (see page 18687)

WriteInteger (see page 18688)

WriteTime (see page 18689)

125.1.4.4.20 TRegistryIniFile.WriteTime Method

Writes a time value to an INI file.

Pascal

```
procedure WriteTime(const Section: string; const Name: string; Value: TDateTime); override;
```

C++

```
virtual __fastcall WriteTime(const AnsiString Section, const AnsiString Name, TDateTime Value);
```

Description

Call WriteTime to write a time value to an INI file. Section identifies the section in the file that contain the key to which to write. Ident is the name of the key for which to set a value. Value is the time value to write.

Note: Attempting to write a data value to a nonexistent section or attempting to write data to a nonexistent key are not errors. In these cases, WriteTime creates the section and key and sets its initial value to Value.

See Also

WriteBool (see page 15446)

WriteDate (see page 18686)

WriteInteger (see page 18688)

WriteString (see page 18688)

125.1.4.5 TRegistryIniFile Properties

The properties of the TRegistryIniFile class are listed here.

Public Properties

	Name	Description
R	RegIniFile (see page 18689)	Contains and internal instance of a TRegIniFile (see page 18635) object.

125.1.4.5.1 TRegistryIniFile.RegIniFile Property

Contains and internal instance of a TRegIniFile (see page 18635) object.

Pascal

```
property RegIniFile: TRegIniFile;
```

C++

```
__property TRegIniFile RegIniFile;
```

Description

RegIniFile is used internally by the TRegistryIniFile (see page 18675) object as the gateway connection between

TRegistryIniFile (see page 18675) methods and the system registry.

See Also

Create (see page 18677)

TRegIniFile (see page 18635)

125.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TRegDataType (see page 18691)	TRegDataType is a type used by the GetDataInfo method of TRegistery.

Records

	Name	Description
	TRegDataInfo (see page 18691)	TRegDataInfo is a type used by the GetDataInfo method of TRegistery.
	TRegKeyInfo (see page 18692)	TRegKeyInfo is a type used by the GetRegKeyInfo method of TRegistery.

125.2.1 Registry.TRegDataInfo Record

TRegDataInfo is a type used by the GetDataInfo method of TRegistery.

Pascal

```
TRegDataInfo = record
  RegData: TRegDataType;
  DataSize: Integer;
end;
```

C++

```
struct TRegDataInfo {
  TRegDataType RegData;
  int DataSize;
};
```

File

Registry

Description

TRegDataInfo is a type used by the GetDataInfo method of TRegistery. Records of type TRegDataInfo contain two fields: a field called RegData, of type TRegDataType (see page 18691), that specifies the data type of the data value; and a field called DataSize that specifies the size, in bytes, of the data value.

125.2.2 Registry.TRegDataType Enumeration

TRegDataType is a type used by the GetDataInfo method of TRegistery.

Pascal

```
TRegDataType = (
  rdUnknown,
  rdString,
  rdExpandString,
  rdInteger,
```

```
  rdBinary
);
```

C++

```
enum TRegDataType {
  rdUnknown,
  rdString,
  rdExpandString,
  rdInteger,
  rdBinary
};
```

File

Registry

Description

TRegDataType is a type used by the GetDataInfo method of TRegistery.It can have the following values:

Value	Meaning
rdUnknown	Data value type is of no defined value type.
rdString	Data value type is a null-terminated string. It is a Unicode or ANSI string depending on whether the application calls the Unicode or ANSI string functions.
rdExpandString	Data value type is a null-terminated string that contains unexpanded references to environment variables (for example, "%PATH%"). It is a Unicode or ANSI string depending on whether the application calls the Unicode or ANSI string functions.
rdInteger	Data value type is a32-bit number.
rdBinary	Data value type is binary data, in any form.

125.2.3 Registry.TRegKeyInfo Record

TRegKeyInfo is a type used by the GetRegKeyInfo method of TRegistery.

Pascal

```
TRegKeyInfo = record
  NumSubKeys: Integer;
  MaxSubKeyLen: Integer;
  NumValues: Integer;
  MaxValueLen: Integer;
  MaxDataLen: Integer;
  FileTime: TFileTime;
end;
```

C++

```
struct TRegKeyInfo {
  int NumSubKeys;
  int MaxSubKeyLen;
  int NumValues;
  int MaxValueLen;
  int MaxDataLen;
  TFileTime FileTime;
};
```

File

Registry

Description

TRegKeyInfo is a type used by the GetRegKeyInfo method of TRegistery to return information about the current key:

Note: Number of subkeys

Note: Longest subkey name length, in characters

Note: Number of data values

Note: Longest data-value name length

Note: Longest data-value length

Note: Time of last write to the key

126 ReqFiles Namespace

This is namespace ReqFiles.

Topics

Name	Description
Classes (see page 18696)	The following table lists classes in this documentation.

Classes

	Name	Description
	TWebRequestFile (see page 18696)	TWebRequestFile describes the content of a file extracted from an HTTP request.
	TWebRequestFiles (see page 18700)	TWebRequestFiles stores a collection of TWebAbstractRequestFile objects.
	TWebRequestFileStream (see page 18704)	This is class ReqFiles.TWebRequestFileStream.

126.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWebRequestFile (see page 18696)	TWebRequestFile describes the content of a file extracted from an HTTP request.
	TWebRequestFiles (see page 18700)	TWebRequestFiles stores a collection of TWebAbstractRequestFile objects.
	TWebRequestFileStream (see page 18704)	This is class ReqFiles.TWebRequestFileStream.

126.1.1 TWebRequestFile Class

TWebRequestFile describes the content of a file extracted from an HTTP request.

Class Hierarchy

Pascal

```
TWebRequestFile = class(TAbstractWebRequestFile);
```

C++

```
class TWebRequestFile : public TAbstractWebRequestFile;
```

File

ReqFiles

Description

TWebRequestFile describes and provides access to an uploaded file from an HTTP request. The following properties support this access:

FileName, which gives the name of the uploaded file.

FieldName, which gives the name of the adapter field whose value is the uploaded file.

ContentType, which describes how the file data is encoded.

Stream, which is a stream object from which you can read the file content.

Each TWebRequestFile object describes a single uploaded file. A collection of all the uploaded files from the current request is available as the Files property of TWebRequest. In addition, adapter fields that work with uploaded files surface those files using a TUpdateFileList object or IActionFieldValues interface.

See Also

TWebRequestFiles (see page 18700)

IActionFieldValues (see page 925)

TUpdateFileList (see page 24550)

TAdapterFileField (see page 23837)

126.1.1.1 TWebRequestFile Members

The following tables list the members exposed by TWebRequestFile.

Protected Methods

	Name	Description
	GetContentType (see page 18699)	Returns the value of the ContentType property.
	GetFieldName (see page 18699)	Returns the value of the FieldName property.
	GetFileName (see page 18699)	Returns the value of the FileName property.
	GetStream (see page 18700)	Returns the value of the Stream property.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18698)	Creates an initializes an instance of TWebRequestFile (see page 18696).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 18698)	Frees an instance of TWebRequestFile (see page 18696).
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	ContentType (see page 15076)	Describes how the file data is encoded.
	FieldName (see page 15077)	Indicates the name of the adapter field whose value is the contents of the file.
	FileName (see page 15077)	Indicates the name of the uploaded file.
	Stream (see page 15077)	Provides access to the contents of the uploaded file.

126.1.1.2 TWebRequestFile.Create Constructor

Creates an initializes an instance of TWebRequestFile (see page 18696).

Pascal

```
constructor Create(const AFieldName: string; const AFileName: string; const AContentType:
string; AContent: Pointer; AContentLength: Integer);
```

C++

```
__fastcall TWebRequestFile(const AnsiString AFieldName, const AnsiString AFileName, const
AnsiString AContentType, void * AContent, int AContentLength);
```

Description

Typically, applications do not call the TWebRequestFile (see page 18696) constructor. Instead, new Web request file objects are created by calling the Add method of a TWebRequestFiles (see page 18700) collection as the file uploads are extracted from the current Web request.

AFieldName is the name of the adapter field whose value this file represents. It becomes the value of the FieldName property.

AFileName is the name of the file this object represents. It becomes the value of the FileName property.

AContentType describes how the file content is encoded. It becomes the value of the ContentType property.

AContent is an array of bytes that is the content of the file. It is used to initialize the Stream property.

AContentLength is the number of bytes in AContent.

See Also

FieldName

FileName

ContentType

Stream

Add (see page 18703)

126.1.1.3 TWebRequestFile.Destroy Destructor

Frees an instance of TWebRequestFile (see page 18696).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebRequestFile();
```

Description

Do not free instances of TWebRequestFile (see page 18696). TWebRequestFile (see page 18696) objects are created and destroyed by the TWebRequestFiles (see page 18700) object that lists the uploaded files from the current request.

See Also

TWebRequestFiles (see page 18700)

126.1.1.4 TWebRequestFile Methods

The methods of the TWebRequestFile class are listed here.

Protected Methods

	Name	Description
	GetContentType (see page 18699)	Returns the value of the ContentType property.
	GetFieldName (see page 18699)	Returns the value of the FieldName property.
	GetFileName (see page 18699)	Returns the value of the FileName property.
	GetStream (see page 18700)	Returns the value of the Stream property.

126.1.1.4.1 TWebRequestFile.GetContentType Method

Returns the value of the ContentType property.

Pascal

```
function GetContentType: string; override;
```

C++

```
virtual __fastcall AnsiString GetContentType();
```

Description

GetContentType is the protected read implementation for the ContentType property.

In TAbstractWebRequestFile, GetContentType is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the ContentType property.

See Also

ContentType (see page 15076)

126.1.1.4.2 TWebRequestFile.GetFieldName Method

Returns the value of the FieldName property.

Pascal

```
function GetFieldName: string; override;
```

C++

```
virtual __fastcall AnsiString GetFieldName();
```

Description

GetFieldName is the protected read implementation for the FieldName property.

In TAbstractWebRequestFile, GetFieldName is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the FieldName property.

See Also

FieldName (see page 15077)

126.1.1.4.3 TWebRequestFile.GetFileName Method

Returns the value of the FileName property.

Pascal

```
function GetFileName: string; override;
```

C++

```
virtual __fastcall AnsiString GetFileName();
```

Description

GetFileName is the protected read implementation for the FileName property.

In TAbstractWebRequestFile, GetFileName is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the FileName property.

See Also

FileName (see page 15077)

126.1.1.4.4 TWebRequestFile.GetStream Method

Returns the value of the Stream property.

Pascal

```
function GetStream: TStream; override;
```

C++

```
virtual __fastcall TStream GetStream();
```

Description

GetStream is the protected read implementation for the Stream property.

In TAbstractWebRequestFile, GetStream is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Stream property.

See Also

Stream (see page 15077)

126.1.2 TWebRequestFiles Class

TWebRequestFiles stores a collection of TWebAbstractRequestFile objects.

Class Hierarchy

Pascal

```
TWebRequestFiles = class(TAbstractWebRequestFiles);
```

C++

```
class TWebRequestFiles : public TAbstractWebRequestFiles;
```

File

ReqFiles

Description

TWebRequestFiles manages a set of Web request files objects (TWebRequestFile (see page 18696) objects). Each Web

request file object in the collection describes an uploaded file that was extracted from the current HTTP request object.

See Also

TWebRequestFile (see page 18696)

TWebRequest (see page 15161)

126.1.2.1 TWebRequestFiles Members

The following tables list the members exposed by TWebRequestFiles.

Protected Methods

	Name	Description
V	GetCount (see page 18704)	Returns the value of the Count property.
V	GetItem (see page 18704)	Returns the value of the Items property.

Public Methods

	Name	Description
	Add (see page 18702)	This is the overview for the Add method overload.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18702)	Creates and initializes an instance of TWebRequestFiles (see page 18700).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18702)	Frees an instance of TWebRequestFiles (see page 18700).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Count (see page 15081)	Indicates the number of uploaded files in the collection.
R	Items (see page 15081)	Lists the uploaded files in the collection.

126.1.2.2 TWebRequestFiles.Create Constructor

Creates and initializes an instance of TWebRequestFiles (see page 18700).

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebRequestFiles();
```

Description

Call Create to instantiate TWebRequestFiles (see page 18700) at runtime. TWebRequestFiles (see page 18700) instances are created automatically by the Web request object to implement its Files property.

See Also

Files (see page 15182)

126.1.2.3 TWebRequestFiles.Destroy Destructor

Frees an instance of TWebRequestFiles (see page 18700).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebRequestFiles();
```

Description

Use the Free method to delete an instance of TWebRequestFiles (see page 18700). Free checks for a nil reference before calling Destroy.

See Also

Free (see page 22300)

126.1.2.4 TWebRequestFiles Methods

The methods of the TWebRequestFiles class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 18704)	Returns the value of the Count property.
	GetItem (see page 18704)	Returns the value of the Items property.

Public Methods

	Name	Description
	Add (see page 18702)	This is the overview for the Add method overload.

126.1.2.4.1 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	TWebRequestFiles.Add (string, string, string, Pointer, Integer) (see page 18703)	Adds a new Web request file object to the collection.
	TWebRequestFiles.Add (TWebRequestFile) (see page 18703)	Adds a new Web request file object to the collection.

126.1.2.4.1.1 TWebRequestFiles.Add Method (TWebRequestFile)

Adds a new Web request file object to the collection.

Pascal

```
procedure Add(const AName: string; const AFileName: string; const AContentType: string;
AContent: Pointer; AContentLength: Integer); overload;
procedure Add(AFile: TWebRequestFile); overload;
```

C++

```
__fastcall Add(const AnsiString AName, const AnsiString AFileName, const AnsiString
AContentType, void * AContent, int AContentLength);
__fastcall Add(TWebRequestFile AFile);
```

Description

Call Add to add a TWebRequestFile (see page 18696) object to the collection. Add inserts the new Web request file object at the end of the Items property array and increments the value of the Count property.

Use the first syntax to cause TWebRequestFiles (see page 18700) to create the Web request file object you are adding. Use the second syntax to add an existing TWebRequestFile (see page 18696) object. Using either syntax, TWebRequestFiles (see page 18700) assumes ownership of the new Web request file object and is responsible for freeing it.

AName is the name of the adapter field whose value the new file represents. It becomes the value of the FieldName property of the new TWebRequestFile (see page 18696) object.

AFileName is the name of the file to add. It becomes the value of the FileName property of the new TWebRequestFile (see page 18696) object.

AContentType describes how the file content is encoded. It becomes the value of the ContentType property of the new TWebRequestFile (see page 18696) object.

AContent is an array of bytes that is the content of the file. It is used to initialize the Stream property of the new TWebRequestFile (see page 18696) object.

AContentLength is the number of bytes in AContent.

AFile is an existing TWebRequestFile (see page 18696) object that describes the file you are adding.

See Also

Count

Items

FieldName

FileName

ContentType

Stream

126.1.2.4.2 TWebRequestFiles.GetCount Method

Returns the value of the Count property.

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

GetCount is the protected read implementation of the Count property.

In TAbstractWebRequestFile, GetCount is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Count property.

See Also

Count (see page 15081)

126.1.2.4.3 TWebRequestFiles.GetItem Method

Returns the value of the Items property.

Pascal

```
function GetItem(I: Integer): TAbstractWebRequestFile; override;
```

C++

```
virtual __fastcall TAbstractWebRequestFile GetItem(int I);
```

Description

GetItem is the protected read implementation of the Items property.

I is the index of the Web request file object to return.

In TAbstractWebRequestFile, GetCount is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Count property.

126.1.3 TWebRequestFileStream Class

Class Hierarchy

Pascal

```
TWebRequestFileStream = class(TCustomMemoryStream);
```

C++

```
class TWebRequestFileStream : public TCustomMemoryStream;
```

File

ReqFiles

Description

This is class ReqFiles.TWebRequestFileStream.

126.1.3.1 TWebRequestFileStream Members

The following tables list the members exposed by TWebRequestFileStream.

Protected Methods

	Name	Description
	GetSize (see page 2982)	This is GetSize, a member of class TStream.
	SetPointer (see page 2823)	Replaces the memory buffer associated with the memory stream.
	SetSize (see page 2989)	This is the overview for the SetSize method overload.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CopyFrom (see page 2979)	Copies a specified number of bytes from one stream to another.
	Create (see page 18706)	This is Create, a member of class TWebRequestFileStream.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FixupResourceHeader (see page 2981)	Patches the resource header for a resource that has been written to the stream.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Read (see page 2817)	Reads up to Count bytes from the memory stream into Buffer and advances the current position of the stream by the number of bytes read.
	Read (see page 2982)	Introduces an abstract or pure virtual method responsible for reading from the stream.
	ReadBuffer (see page 2983)	Reads bytes from the stream into Buffer.
	ReadComponent (see page 2983)	Initiates streaming of components and their properties.
	ReadComponentRes (see page 2987)	Reads components and their properties from a stream in a resource file format.

	ReadResHeader (see page 2987)	Reads a resource-file header from the stream.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 2818)	Writes the entire contents of the memory stream to the file with a given file name.
	SaveToStream (see page 2818)	Writes the entire contents of the memory stream to the stream object specified by Stream.
V	Seek (see page 2819)	Moves the current position of the stream by Offset bytes, relative to the origin specified by Origin.
V	Seek (see page 2988)	This is the overview for the Seek method overload.
V	Write (see page 18706)	Introduces a pure virtual method for writing to the stream.
	WriteBuffer (see page 2990)	Writes Count bytes from Buffer onto the stream and advances the current position of the stream by Count bytes.
	WriteComponent (see page 2990)	Initiates the writing of components and their properties to a stream.
	WriteComponentRes (see page 2994)	Writes components and their properties to a stream from a resource file format.
	WriteDescendent (see page 2994)	Streams components and their properties in inherited forms.
	WriteDescendentRes (see page 2995)	Streams components and their properties in inherited forms.
	WriteResourceHeader (see page 2995)	Writes a resource-file header to the stream.

Public Properties

	Name	Description
R	Memory (see page 2823)	Provides direct access to the memory pool allocated for the memory stream.
	Position (see page 2996)	Indicates the current offset into the stream for reading and writing.
	Size (see page 2997)	Indicates the size in bytes of the stream.

126.1.3.2 TWebRequestFileStream.Create Constructor

Pascal

```
constructor Create(ABuffer: Pointer; Size: Integer);
```

C++

```
__fastcall TWebRequestFileStream(void * ABuffer, int Size);
```

Description

This is Create, a member of class TWebRequestFileStream.

126.1.3.3 TWebRequestFileStream Methods

The methods of the TWebRequestFileStream class are listed here.

Public Methods

	Name	Description
V	Write (see page 18706)	Introduces a pure virtual method for writing to the stream.

126.1.3.3.1 TWebRequestFileStream.Write Method

Introduces a pure virtual method for writing to the stream.

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

Each descendant stream object defines a Write method that writes data to its particular storage medium (such as memory or a disk file). Write attempts to write up to Count bytes from Buffer, and returns the number of bytes actually written.

All the other data-writing methods of a stream (WriteBuffer, WriteComponent) call Write to do their actual writing.

	Name	Description
	TMultipartContentParser (see page 18710)	TMultipartContentParser extracts named value strings and uploaded files from an HTTP request sent by a multipart form.

127.1.1 TMultipartContentParser Class

TMultipartContentParser extracts named value strings and uploaded files from an HTTP request sent by a multipart form.

Class Hierarchy

Pascal

```
TMultipartContentParser = class(TAbstractContentParser);
```

C++

```
class TMultipartContentParser : public TAbstractContentParser;
```

File

ReqMulti

Description

Web request objects use TMultipartContentParser object to parse the content of an HTTP request message from a multipart form when that request may contain uploaded files. The Web request uses this content parser to assign values for its ContentFields and Files properties.

TMultipartContentParser is only used when the current HTTP request object has a content type of 'multipart/form-data'. Multipart forms built using a WebSnap application automatically use this content type.

To allow your WebSnap application to use TMultipartContentParser in Delphi, add the ReqMulti (see page 18709) unit to the end of your project uses clause. In C++, include ReqMulti.hpp in the header of your project source file.

127.1.1.1 TMultipartContentParser Members

The following tables list the members exposed by TMultipartContentParser.

Protected Methods

	Name	Description
	BufferContent (see page 18712)	This is BufferContent, a member of class TMultipartContentParser.
	ExtractContentTypeFields (see page 18713)	This is ExtractContentTypeFields, a member of class TMultipartContentParser.
	ExtractMultipartContentFields (see page 18713)	This is ExtractMultipartContentFields, a member of class TMultipartContentParser.
V	GetContentFields (see page 18714)	Returns the named value strings that are included in the content of the current Web request.
V	GetFiles (see page 18714)	Returns a set of uploaded files that the parser extracts from the current Web request.
	ParseMultiPart (see page 18715)	This is ParseMultiPart, a member of class TMultipartContentParser.
	ParseMultiPartContent (see page 18715)	This is ParseMultiPartContent, a member of class TMultipartContentParser.
	ParseMultipartHeaders (see page 18715)	This is ParseMultipartHeaders, a member of class TMultipartContentParser.

Protected Properties

	Name	Description
R	WebRequest (see page 15043)	Indicates the Web request object that uses this parser to parse its content.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	CanParse (see page 18713)	Indicates whether a specified request message contains information encoded in a way that this parser understands.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 15041)	Creates and initializes a new TAbstractContentParser (see page 15039) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18712)	Frees the memory associated with the TMultipartContentParser (see page 18710) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

127.1.1.2 TMultipartContentParser.Destroy Destructor

Frees the memory associated with the TMultipartContentParser (see page 18710) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMultipartContentParser();
```

Description

Do not free content parser instances. The Web request object frees the content parser when it no longer needs it.

127.1.1.3 TMultipartContentParser Methods

The methods of the TMultipartContentParser class are listed here.

Protected Methods

	Name	Description
	BufferContent (see page 18712)	This is BufferContent, a member of class TMultipartContentParser.
	ExtractContentTypeFields (see page 18713)	This is ExtractContentTypeFields, a member of class TMultipartContentParser.
	ExtractMultipartContentFields (see page 18713)	This is ExtractMultipartContentFields, a member of class TMultipartContentParser.
V	GetContentFields (see page 18714)	Returns the named value strings that are included in the content of the current Web request.
V	GetFiles (see page 18714)	Returns a set of uploaded files that the parser extracts from the current Web request.
	ParseMultiPart (see page 18715)	This is ParseMultiPart, a member of class TMultipartContentParser.
	ParseMultiPartContent (see page 18715)	This is ParseMultiPartContent, a member of class TMultipartContentParser.
	ParseMultipartHeaders (see page 18715)	This is ParseMultipartHeaders, a member of class TMultipartContentParser.

Public Methods

	Name	Description
V	CanParse (see page 18713)	Indicates whether a specified request message contains information encoded in a way that this parser understands.

127.1.1.3.1 TMultipartContentParser.BufferContent Method

Pascal

```
procedure BufferContent;
```

C++

```
__fastcall BufferContent();
```

Description

This is BufferContent, a member of class TMultipartContentParser.

127.1.1.3.2 TMultipartContentParser.CanParse Method

Indicates whether a specified request message contains information encoded in a way that this parser understands.

Pascal

```
class function CanParse(AWebRequest: TWebRequest): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanParse(TWebRequest AWebRequest);
```

Description

CanParse indicates whether a content parser class can handle parsing a specified request message. CanParse is a class method (Delphi) or static method (C++), which means the Web request does not need an instantiated object to call this method. The Web request object calls the CanParse method of every registered content parser until it finds one that can parse its content.

AWebRequest is the current HTTP request message.

CanParse returns true if this class can parse AWebRequest, false if AWebRequest does not indicate an encoding that this class understands.

In TMultipartContentParser (see page 18710), CanParse returns true if AWebRequest has a content type of 'multipart/form-data'. If the Web request indicates some other content type, the Web request uses a different content parser class such as TContentParser.

See Also

ContentType (see page 15179)

TContentParser (see page 15088)

127.1.1.3.3 TMultipartContentParser.ExtractContentTypeFields Method

Pascal

```
procedure ExtractContentTypeFields(Strings: TStrings);
```

C++

```
__fastcall ExtractContentTypeFields(TStrings Strings);
```

Description

This is ExtractContentTypeFields, a member of class TMultipartContentParser.

127.1.1.3.4 TMultipartContentParser.ExtractMultipartContentFields Method

Pascal

```
procedure ExtractMultipartContentFields;
```

C++

```
__fastcall ExtractMultipartContentFields();
```

Description

This is ExtractMultipartContentFields, a member of class TMultipartContentParser.

127.1.1.3.5 TMultipartContentParser.GetContentFields Method

Returns the named value strings that are included in the content of the current Web request.

Pascal

```
function GetContentFields: TStrings; override;
```

C++

```
virtual __fastcall TStrings GetContentFields();
```

Description

GetContentFields returns a list of strings with the form "Name=Value" that represent any name/value pairs that the parser identifies in the content of the current Web request.

In TAbstractContentParser, GetContentFields is abstract or, in C++ terminology, pure virtual, meaning that this class does not supply an implementation. Descendant classes override this method to extract name/value pairs from the current request and add them to the returned string list.

Note: The content parser owns the string list it returns. The caller should not free the string list.

See Also

ContentFields (see page 15177)

WebRequest (see page 15043)

ExtractContentFields (see page 15166)

127.1.1.3.6 TMultipartContentParser.GetFiles Method

Returns a set of uploaded files that the parser extracts from the current Web request.

Pascal

```
function GetFiles: TAbstractWebRequestFiles; override;
```

C++

```
virtual __fastcall TAbstractWebRequestFiles GetFiles();
```

Description

GetFiles returns a list of Web request file objects, each of which represents an uploaded file from the current Web request. Each Web request file object has properties to describe an uploaded file, including a stream object from which to read the content of the uploaded file.

In TAbstractContentParser, GetFiles is abstract or, in C++ terminology, pure virtual, meaning that this class does not supply an implementation. Descendant classes override this method to extract uploaded files from the current request and add them to the Web request files object.

Note: The content parser owns the list it returns. The caller should not free this list.

127.1.1.3.7 TMultipartContentParser.ParseMultiPart Method

Pascal

```
procedure ParseMultiPart(Part: Pointer; Size: Integer);
```

C++

```
__fastcall ParseMultiPart(void * Part, int Size);
```

Description

This is ParseMultiPart, a member of class TMultipartContentParser.

127.1.1.3.8 TMultipartContentParser.ParseMultiPartContent Method

Pascal

```
procedure ParseMultiPartContent;
```

C++

```
__fastcall ParseMultiPartContent();
```

Description

This is ParseMultiPartContent, a member of class TMultipartContentParser.

127.1.1.3.9 TMultipartContentParser.ParseMultipartHeaders Method

Pascal

```
procedure ParseMultipartHeaders(Parser: THTTPParser; AContent: Pointer; AContentLength:
Integer);
```

C++

```
__fastcall ParseMultipartHeaders(THTTPParser Parser, void * AContent, int AContentLength);
```

Description

This is ParseMultipartHeaders, a member of class TMultipartContentParser.

128 Rio Namespace

This is namespace Rio.

TBeforeExecuteEvent (see page 18735)	This is type Rio.TBeforeExecuteEvent.

128.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TRIO (see page 18718)	TRIO is the base class for components that generate calls to remote interfaced objects.

128.1.1 TRIO Class

TRIO is the base class for components that generate calls to remote interfaced objects.

Class Hierarchy

Pascal

```
TRIO = class(TComponent, IInterface, IRIOAccess);
```

C++

```
class TRIO : public TComponent, public IInterface, public IRIOAccess;
```

File

Rio

Description

Use TRIO as a base class for components that generate statically-linked calls to invokable interfaces. When an application casts a TRIO descendant to a registered invokable interface, it dynamically generates an in-memory method table, providing an implementation to that invokable interface. TRIO uses two helper objects when generating this implementation. These helper objects implement the IOPConvert and IWebNode interfaces. IOPConvert handles the marshaling and unmarshaling of calls to methods on the generated method table, and IWebNode receives the marshaled message call, executes it (typically by sending it to a remote server application), and returns the results of executing the call. These interfaces do not assume any particular encoding or transport protocol. Each TRIO descendant uses its own protocol-specific helper objects to implement these interfaces.

Before TRIO can generate a method table for an invokable interface, the interface must be registered with the invocation registry. To register an invokable interface, use the global InvRegistry function to obtain access to the registry, and call its RegisterInterface method.

Do not create instances of TRIO. To add a component that generates calls to a registered invokable interface, use a TRIO descendant such as THTTPRIO.

128.1.1.1 TRIO Members

The following tables list the members exposed by TRIO.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FConverter (see page 18723)	This is FConverter, a member of class TRIO.
	FIID (see page 18723)	This is FIID, a member of class TRIO.
	FWebNode (see page 18723)	This is FWebNode, a member of class TRIO.
	IntfMD (see page 18723)	This is IntfMD, a member of class TRIO.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecute (see page 18725)	Generates an OnAfterExecute (see page 18730) event.
V	DoBeforeExecute (see page 18725)	Generates an OnBeforeExecute (see page 18730) event.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetResponseStream (see page 18726)	Returns a newly created stream that receives the results of executing a method call.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 18727)	Implements the IInterface QueryInterface method.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 18724)	Updates the reference count after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 18725)	Prevents the destruction of a TRIO (see page 18718) instance if the reference count is greater than zero.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 18722)	Creates an instance of TRIO (see page 18718).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18722)	Destroys the instance of a TRIO (see page 18718) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.

	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetRIO (see page 18734)	Returns the value of the RIO (see page 18734) property.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 18726)	Allocates memory for each instance of a remote interfaced object.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Converter (see page 18728)	Handles the marshaling and unmarshaling of calls to an invokable interface.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	RefCount (see page 18728)	Maintains a reference count on the use of the TRIO (see page 18718) object's interface.
R	RIO (see page 18734)	Provides access to the remote interfaced object that implements this interface.
R	SOAPHeaders (see page 18728)	Provides access to the headers of SOAP messages that the remote interface object sends or receives.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	WebNode (see page 18729)	Handles the execution of method calls on the invokable interface.

Published Events

	Name	Description
	OnAfterExecute (see page 18730)	Occurs when TRIO (see page 18718) receives the results from executing a method of the invokable interface.
	OnBeforeExecute (see page 18730)	Occurs before TRIO (see page 18718) sends an encoded method call for execution.
	OnGetAttachment (see page 18731)	Occurs when TRIO (see page 18718) reads each attachment included in the results from executing a method of the invokable interface.
	OnSendAttachment (see page 18731)	Occurs when TRIO (see page 18718) sends each attachment that is the value of an argument of the method call on the invokable interface.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

128.1.1.2 TRIO.Create Constructor

Creates an instance of TRIO (see page 18718).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRIO(TComponent * AOwner);
```

Description

Call Create to instantiate a TRIO (see page 18718) descendant at runtime. TRIO (see page 18718) descendants added to forms or data modules at design time are created automatically.

The AOwner parameter specifies another component (usually a form or data module) that is responsible for freeing the TRIO (see page 18718) instance. It becomes the value of the Owner property. If the TRIO (see page 18718) instance is created with AOwner set to nil (Delphi) or NULL (C++), then it is automatically freed when its reference count drops to zero.

See Also

RefCount (see page 18728)

Owner (see page 2807)

128.1.1.3 TRIO.Destroy Destructor

Destroys the instance of a TRIO (see page 18718) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRIO();
```

Description

There is no need to explicitly free a TRIO (see page 18718) instance.

If the TRIO (see page 18718) object is created with an Owner, then that Owner handles the freeing of the TRIO (see page 18718) instance. If the TRIO (see page 18718) object is created without an Owner, then it is automatically freed when the reference count on its interface drops to zero.

See Also

Create (see page 18722)

Owner (see page 2807)

RefCount (see page 18728)

128.1.1.4 TRIO Fields

The fields of the TRIO class are listed here.

Protected Fields

	Name	Description
	FConverter (see page 18723)	This is FConverter, a member of class TRIO.
	FIID (see page 18723)	This is FIID, a member of class TRIO.
	FWebNode (see page 18723)	This is FWebNode, a member of class TRIO.
	IntfMD (see page 18723)	This is IntfMD, a member of class TRIO.

128.1.1.4.1 TRIO.FConverter Field

Pascal

```
FConverter: IOPConvert;
```

C++

```
IOPConvert FConverter;
```

Description

This is FConverter, a member of class TRIO.

128.1.1.4.2 TRIO.FIID Field

Pascal

```
FIID: TGUID;
```

C++

```
TGUID FIID;
```

Description

This is FIID, a member of class TRIO.

128.1.1.4.3 TRIO.FWebNode Field

Pascal

```
FWebNode: IWebNode;
```

C++

```
IWebNode FWebNode;
```

Description

This is FWebNode, a member of class TRIO.

128.1.1.4.4 TRIO.IntfMD Field

Pascal

```
IntfMD: TIntfMetaData;
```

C++

```
TIntfMetaData IntfMD;
```

Description

This is IntfMD, a member of class TRIO.

128.1.1.5 TRIO Methods

The methods of the TRIO class are listed here.

Protected Methods

	Name	Description
	DoAfterExecute (see page 18725)	Generates an OnAfterExecute (see page 18730) event.
	DoBeforeExecute (see page 18725)	Generates an OnBeforeExecute (see page 18730) event.
	GetResponseStream (see page 18726)	Returns a newly created stream that receives the results of executing a method call.
	QueryInterface (see page 18727)	Implements the IInterface QueryInterface method.

Public Methods

	Name	Description
	AfterConstruction (see page 18724)	Updates the reference count after the last constructor has executed.
	BeforeDestruction (see page 18725)	Prevents the destruction of a TRIO (see page 18718) instance if the reference count is greater than zero.
	NewInstance (see page 18726)	Allocates memory for each instance of a remote interfaced object.

128.1.1.5.1 TRIO.AfterConstruction Method

Updates the reference count after the last constructor has executed.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction is called automatically after the TRIO (see page 18718) object's last constructor has executed. Do not call it explicitly in your applications.

TRIO (see page 18718) overrides the AfterConstruction method to update the RefCount (see page 18728) property. TRIO (see page 18718) artificially increments the reference count when it is first created to prevent changes to the reference count from causing the TRIO (see page 18718) instance to be freed before it is fully instantiated. AfterConstruction returns the reference count back to an appropriate level, now that the constructor is finished.

See Also

RefCount (see page 18728)

Create (see page 18722)

NewInstance (see page 18726)

128.1.1.5.2 TRIO.BeforeDestruction Method

Prevents the destruction of a TRIO (see page 18718) instance if the reference count is greater than zero.

Pascal

```
procedure BeforeDestruction; override;
```

C++

```
virtual __fastcall BeforeDestruction();
```

Description

BeforeDestruction is called automatically before the TRIO (see page 18718) object's first destructor executes. Do not call it explicitly in your applications.

TRIO (see page 18718) overrides the BeforeDestruction method to check the RefCount (see page 18728) property. If RefCount (see page 18728) is greater than zero, then there is still an outstanding reference to the TRIO (see page 18718) object's interface,. and BeforeDestruction raises an exception to prevent the destruction of this object.

See Also

RefCount (see page 18728)

128.1.1.5.3 TRIO.DoAfterExecute Method

Generates an OnAfterExecute (see page 18730) event.

Pascal

```
procedure DoAfterExecute(const MethodName: string; Response: TStream); virtual;
```

C++

```
virtual __fastcall DoAfterExecute(const AnsiString MethodName, TStream Response);
```

Description

TRIO (see page 18718) calls DoAfterExecute internally after it receives the results of a method call but before it unmarshals those results. This method simply generates an OnAfterExecute (see page 18730) event, passing the MethodName and Response parameters to the event handler. Override this method to perform class-specific actions before or after the OnAfterExecute (see page 18730) event.

MethodName is the name of the method that was just executed on the server.

Response is a stream from that contains the results that the server returned after executing the specified method.

See Also

OnAfterExecute (see page 18730)

128.1.1.5.4 TRIO.DoBeforeExecute Method

Generates an OnBeforeExecute (see page 18730) event.

Pascal

```
procedure DoBeforeExecute(const MethodName: string; Request: TStream); virtual;
```

C++

```
virtual __fastcall DoBeforeExecute(const AnsiString MethodName, TStream Request);
```

Description

TRIO (see page 18718) calls DoBeforeExecute internally before it sends a SOAP packet to the server for execution. This method simply generates an OnBeforeExecute (see page 18730) event, passing the MethodName parameter and the string in the Request parameter to the event handler. Override this method to perform class-specific actions before or after the OnBeforeExecute (see page 18730) event.

MethodName is the name of the method that the encoded SOAP request calls.

Request is a stream from which the encoded SOAP request packet can be read.

See Also

OnBeforeExecute (see page 18730)

128.1.1.5.5 TRIO.GetResponseStream Method

Returns a newly created stream that receives the results of executing a method call.

Pascal

```
function GetResponseStream(BindingType: TWebServiceBindingType): TStream; virtual;
```

C++

```
virtual __fastcall TStream GetResponseStream(TWebServiceBindingType BindingType);
```

Description

TRIO (see page 18718) calls GetResponseStream internally when it executes a method call. It passes the returned stream as the Response parameter of the Execute method on the interface that the WebNode (see page 18729) property specifies. After this stream receives the encoded response of a method call, the RIO (see page 18734) component decodes the response and frees the stream.

BindingType indicates the expected coding of the response that the stream will hold. GetResponseStream can use this information to determine what type of stream to create.

See Also

Execute (see page 25432)

WebNode (see page 18729)

128.1.1.5.6 TRIO.NewInstance Method

Allocates memory for each instance of a remote interfaced object.

Pascal

```
class function NewInstance: TObject; override;
```

C++

```
virtual __fastcall TObject * NewInstance();
```

Description

All constructors call NewInstance automatically. NewInstance calls InstanceSize to determine how much memory to allocate from the heap to contain a particular instance. Do not call NewInstance directly.

TRIO (see page 18718) overrides NewInstance to increment the reference count when a new instance is created. This prevents any constructor from accidentally deleting the instance due to a RefCount (see page 18728) of zero. The AfterConstruction (see page 18724) method decrements the value of RefCount (see page 18728) after all constructors have

executed.

See Also

InstanceSize (see page 22306)

NewInstance (see page 22306)

AfterConstruction (see page 18724)

128.1.1.5.7 TRIO.QueryInterface Method

Implements the IInterface QueryInterface method.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface is called through the IInterface interface to obtain an interface pointer for the interface identified by the IID parameter. In Delphi, this call is generated when an application casts TRIO (see page 18718) to an invokable interface using the as operator.

TRIO (see page 18718) can only return a single type of interface pointer. The first time an application calls QueryInterface, TRIO (see page 18718) generates an in-memory method table to support calls to the methods on the requested interface.

IID specifies the invokable interface that the application wants to call using this TRIO (see page 18718) instance. If the TRIO (see page 18718) object has already been typecast to an interface, then IID must identify that interface. If the TRIO (see page 18718) instance has not yet been typecast to an interface, then IID must be a registered invokable interface.

Obj returns an interface pointer for the specified interface, unless TRIO (see page 18718) was already implementing a different interface or IID identified an interface that was not registered.

QueryInterface returns 0 (S_OK) if Obj successfully returns an interface pointer. It returns E_NOINTERFACE otherwise.

If QueryInterface successfully returns an interface pointer, it automatically increments the reference count.

See Also

InvRegistry (see page 15620)

RegisterInterface (see page 15552)

RefCount (see page 18728)

128.1.1.6 TRIO Properties

The properties of the TRIO class are listed here.

Public Properties

	Name	Description
	Converter (see page 18728)	Handles the marshaling and unmarshaling of calls to an invokable interface.
R	RefCount (see page 18728)	Maintains a reference count on the use of the TRIO (see page 18718) object's interface.
R	SOAPHeaders (see page 18728)	Provides access to the headers of SOAP messages that the remote interface object sends or receives.
	WebNode (see page 18729)	Handles the execution of method calls on the invokable interface.

128.1.1.6.1 TRIO.Converter Property

Handles the marshaling and unmarshaling of calls to an invokable interface.

Pascal

```
property Converter: IOPConvert;
```

C++

```
__property IOPConvert Converter;
```

Description

TRIO (see page 18718) uses Converter internally to marshal and unmarshal calls to an invokable interface. That is, when the TRIO (see page 18718) object has been typecast to an invokable interface, it implements each method call by using Converter to marshal the call into an encoding protocol, and to unmarshal any return values after that call is executed.

Each TRIO (see page 18718) descendant uses its own protocol-specific helper object as the value of the Converter property.

See Also

WebNode (see page 18729)

TOPToSoapDomConvert (see page 18137)

128.1.1.6.2 TRIO.RefCount Property

Maintains a reference count on the use of the TRIO (see page 18718) object's interface.

Pascal

```
property RefCount: Integer;
```

C++

```
__property int RefCount;
```

Description

RefCount keeps track of the usage on the TRIO (see page 18718) object's interface. RefCount is incremented by the interface's _AddRef method (Delphi) or AddRef method (C++) and decremented by its _Release method (Delphi) or Release method (C++).

If the TRIO (see page 18718) object is created without an Owner, then when RefCount drops to zero, the TRIO (see page 18718) instance is automatically freed.

See Also

QueryInterface (see page 18727)

Create (see page 18722)

_AddRef (see page 22397)

_Release (see page 22397)

128.1.1.6.3 TRIO.SOAPHeaders Property

Provides access to the headers of SOAP messages that the remote interface object sends or receives.

Pascal

```
property SOAPHeaders: TSOAPHeaders;
```

C++

```
__property TSOAPHeaders SOAPHeaders;
```

Description

SOAPHeaders is a helper object that lets TRIO (see page 18718) support the ISOAPHeaders interface. It has methods to add headers to an outgoing request message and to retrieve the headers from the resulting response message. You can use the SOAPHeaders property directly, or access it through an ISOAPHeaders interface, which is obtained from the invokable interface using the as operator (Delphi) or the Supports method (C++).

Note: Although TRIO (see page 18718) uses the SOAPHeaders property to implement an ISOAPHeaders interface, you can't obtain an ISOAPHeaders interface directly from TRIO (see page 18718). Rather, you must obtain this interface from an invokable interface.

See Also

ISOAPHeaders (see page 15613)

128.1.1.6.4 TRIO.WebNode Property

Handles the execution of method calls on the invokable interface.

Pascal

```
property WebNode: IWebNode;
```

C++

```
__property IWebNode WebNode;
```

Description

TRIO (see page 18718) uses WebNode internally to execute method calls after they have been marshaled by Converter (see page 18728). That is, when the TRIO (see page 18718) object has been typecast to an invokable interface, it implements each method call by using Converter (see page 18728) to marshal the call into an encoding protocol, and then uses WebNode to execute the encoded call.

Each TRIO (see page 18718) descendant uses its own protocol-specific helper object as the value of the WebNode property.

See Also

Converter (see page 18728)

THTTPReqResp (see page 19961)

OnAfterExecute (see page 18730)

OnBeforeExecute (see page 18730)

128.1.1.7 TRIO Events

The events of the TRIO class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 18730)	Occurs when TRIO (see page 18718) receives the results from executing a method of the invokable interface.
	OnBeforeExecute (see page 18730)	Occurs before TRIO (see page 18718) sends an encoded method call for execution.

	OnGetAttachment (see page 18731)	Occurs when TRIO (see page 18718) reads each attachment included in the results from executing a method of the invokable interface.
	OnSendAttachment (see page 18731)	Occurs when TRIO (see page 18718) sends each attachment that is the value of an argument of the method call on the invokable interface.

128.1.1.7.1 TRIO.OnAfterExecute Event

Occurs when TRIO (see page 18718) receives the results from executing a method of the invokable interface.

Pascal

```
property OnAfterExecute: TAfterExecuteEvent;
```

C++

```
__property TAfterExecuteEvent OnAfterExecute;
```

Description

Write an OnAfterExecute event handler to examine or alter the encoded results from executing a method call. OnAfterExecute occurs after TRIO (see page 18718) calls the Execute method of the interface that the WebNode (see page 18729) property specifies, but before the interface that the Converter (see page 18728) property specifies unmarshals those results.

You can use the SOAPResponse stream of the event handler to alter the encoded results from the server before they are unmarshaled. This lets you compensate for known idiosyncrasies of a server or of the Converter (see page 18728) that is the value of the Converter (see page 18728) property. For example, if the Web Service provider publishes interoperability information, you can use this event to adjust SOAP packets to compensate for differences that the Web Service provider reports.

See Also

OnBeforeExecute (see page 18730)

Execute (see page 25432)

WebNode (see page 18729)

Converter (see page 18728)

OnGetAttachment (see page 18731)

128.1.1.7.2 TRIO.OnBeforeExecute Event

Occurs before TRIO (see page 18718) sends an encoded method call for execution.

Pascal

```
property OnBeforeExecute: TBeforeExecuteEvent;
```

C++

```
__property TBeforeExecuteEvent OnBeforeExecute;
```

Description

Write an OnBeforeExecute event handler to examine or alter an encoded method call before it is sent to the server. OnBeforeExecute occurs after the interface that the Converter (see page 18728) property specifies marshals a method call into a SOAP request packet, but before TRIO (see page 18718) calls the Execute method of the interface that the WebNode (see page 18729) property specifies.

You can use the SoapRequest parameter to read or alter the SOAP request before it is passed to the server. For example, if the Web Service provider publishes interoperability information, you can use this parameter to adjust SOAP packets to compensate for differences that the Web Service provider reports.

See Also

OnAfterExecute (see page 18730)

Execute (see page 25432)

WebNode (see page 18729)

Converter (see page 18728)

OnSendAttachment (see page 18731)

128.1.1.7.3 TRIO.OnGetAttachment Event

Occurs when TRIO (see page 18718) reads each attachment included in the results from executing a method of the invokable interface.

Pascal

```
property OnGetAttachment: TOnGetAttachmentEvent;
```

C++

```
__property TOnGetAttachmentEvent OnGetAttachment;
```

Description

Write an OnGetAttachment event handler to examine the encoded attachments included in the results from executing a method call or to redirect them so that they are saved to a specific file. OnGetAttachment occurs once for each attachment received in the results from a call to the Execute method of the interface that the WebNode (see page 18729) property specifies. All OnGetAttachment events occur before the OnAfterExecute (see page 18730) event.

See Also

OnAfterExecute (see page 18730)

Execute (see page 25432)

WebNode (see page 18729)

128.1.1.7.4 TRIO.OnSendAttachment Event

Occurs when TRIO (see page 18718) sends each attachment that is the value of an argument of the method call on the invokable interface.

Pascal

```
property OnSendAttachment: TOnSendAttachmentEvent;
```

C++

```
__property TOnSendAttachmentEvent OnSendAttachment;
```

Description

Write an OnSendAttachment event handler to examine or alter the attachments that are to be included in a request message that represents a method call. OnSendAttachment occurs once for each attachment sent with the request message to the Web Service provider. All OnSendAttachment events occur after the OnBeforeExecute (see page 18730) event.

See Also

OnBeforeExecute (see page 18730)

Execute (see page 25432)

WebNode (see page 18729)

128.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IRIOAccess (see page 18733)	IRIOAccess is the interface for accessing a remote interfaced object from its invokable interface.

128.2.1 IRIOAccess Interface

IRIOAccess is the interface for accessing a remote interfaced object from its invokable interface.

Class Hierarchy

Rio.IRIOAccess

Pascal

```
IRIOAccess = interface;
```

C++

```
__interface IRIOAccess;
```

File

Rio

Description

Remote interfaced objects (TRIO (see page 18718) and its descendants) implement IRIOAccess so that you can access the TRIO (see page 18718) instance given an invokable interface that it implements. This interface defines a single property, RIO (see page 18734), which returns the TRIO (see page 18718) instance that implements it.

Note: C++ method declarations that use IRIOAccess use the _di_IRIOAccess type instead. This type is a DelphiInterface wrapper around the IRIOAccess interface:

Note: typedef System::DelphiInterface (see page 22167)< IRIOAccess > _di_IRIOAccess;

See Also

TRIO (see page 18718)

128.2.1.1 IRIOAccess Members

The following tables list the members exposed by IRIOAccess.

Public Methods

	Name	Description
	GetRIO (see page 18734)	Returns the value of the RIO (see page 18734) property.

Public Properties

	Name	Description
	RIO (see page 18734)	Provides access to the remote interfaced object that implements this interface.

128.2.1.2 IRIOAccess Methods

The methods of the IRIOAccess class are listed here.

Public Methods

	Name	Description
	GetRIO (see page 18734)	Returns the value of the RIO (see page 18734) property.

128.2.1.2.1 IRIOAccess.GetRIO Method

Returns the value of the RIO (see page 18734) property.

Pascal

```
function GetRIO: TRIO;
```

C++

```
__fastcall TRIO GetRIO();
```

Description

GetRIO is the read implementation for the RIO (see page 18734) property.

See Also

RIO (see page 18734)

128.2.1.3 IRIOAccess Properties

The properties of the IRIOAccess class are listed here.

Public Properties

	Name	Description
	RIO (see page 18734)	Provides access to the remote interfaced object that implements this interface.

128.2.1.3.1 IRIOAccess.RIO Property

Provides access to the remote interfaced object that implements this interface.

Pascal

```
property RIO: TRIO;
```

C++

```
__property TRIO RIO;
```

Description

Call GetRIO (see page 18734) to access the underlying remote interfaced object. This method is useful when the client of a Web Service uses the automatically-generated function to obtain an invokable interface rather than explicitly creating a TRIO (see page 18718) instance.

128.3 Types

The following table lists types in this documentation.

Types

Name	Description
TAfterExecuteEvent (see page 18735)	This is type Rio.TAfterExecuteEvent.
TBeforeExecuteEvent (see page 18735)	This is type Rio.TBeforeExecuteEvent.

128.3.1 Rio.TAfterExecuteEvent Type

Pascal

```
TAfterExecuteEvent = procedure (const MethodName: string; SOAPResponse: TStream) of object;
```

C++

```
(const MethodName: string; SOAPResponse: TStream) ( TAfterExecuteEvent)();
```

File

Rio

Description

This is type Rio.TAfterExecuteEvent.

128.3.2 Rio.TBeforeExecuteEvent Type

Pascal

```
TBeforeExecuteEvent = procedure (const MethodName: string; var SOAPRequest: InvString) of
object;
```

C++

```
(const MethodName: string; var SOAPRequest: InvString) ( TBeforeExecuteEvent)();
```

File

Rio

Description

This is type Rio.TBeforeExecuteEvent.

128.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
StubSize (see page 18736)	This is constant Rio.StubSize.

128.4.1 Rio.StubSize Constant

Pascal

```
StubSize = 19;
```

C++

```
StubSize = 19;
```

File

Rio

Description

This is constant Rio.StubSize.

129 ScktComp Namespace

This is namespace ScktComp.

Topics

Name	Description
Classes (see page 18739)	The following table lists classes in this documentation.
Functions (see page 18883)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 18884)	The following table lists structs, records, enums in this documentation.
Types (see page 18889)	The following table lists types in this documentation.
Constants (see page 18893)	The following table lists constants in this documentation.

Classes

	Name	Description
	ESocketError (see page 18739)	ESocketError is the exception class for failures that occur when trying to create, use, or shut down Windows socket objects.
	TAbstractSocket (see page 18740)	TAbstractSocket is the abstract base class for all socket components.
	TClientSocket (see page 18752)	TClientSocket manages socket connections for a TCP/IP client.
	TClientWinSocket (see page 18766)	TClientWinSocket describes the client endpoint of a Windows socket connection.
	TCustomServerSocket (see page 18770)	TCustomServerSocket is the base class for all server socket components.
	TCustomSocket (see page 18789)	TCustomSocket is the base class for socket components.
	TCustomWinSocket (see page 18799)	TCustomWinSocket is the base class for all Windows socket objects.
	TServerAcceptThread (see page 18825)	This is class ScktComp.TServerAcceptThread.
	TServerClientThread (see page 18831)	TServerClientThread is an execution thread used for a single connection to a client socket accepted by a Windows server socket.
	TServerClientWinSocket (see page 18840)	TServerClientWinSocket describes the server endpoint of a socket connection to a client socket.
	TServerSocket (see page 18843)	TServerSocket manages server socket connections for a TCP/IP server.
	TServerWinSocket (see page 18858)	TServerWinSocket describes the endpoint of a listening server socket connection.
	TWinSocketStream (see page 18876)	TWinSocketStream is a stream that provides services which allow applications to read from or write to socket connections.

Constants

Name	Description
CM_DEFERFREE (see page 18893)	This is constant ScktComp.CM_DEFERFREE.
CM_LOOKUPCOMPLETE (see page 18893)	This is constant ScktComp.CM_LOOKUPCOMPLETE.
CM_SOCKETMESSAGE (see page 18893)	This is constant ScktComp.CM_SOCKETMESSAGE.

Functions

	Name	Description
	SetErrorProc (see page 18883)	Replaces the exception handler for error messages that are received from a Windows socket connection.

Structs, Records, Enums

	Name	Description
	TAsyncStyle (see page 18884)	This is record ScktComp.TAsyncStyle.
	TClientType (see page 18885)	This is record ScktComp.TClientType.
	TCMLookupComplete (see page 18885)	This is record ScktComp.TCMLookupComplete.
	TCMSocketMessage (see page 18886)	This is record ScktComp.TCMSocketMessage.
	TErrorEvent (see page 18886)	This is record ScktComp.TErrorEvent.
	TLookupState (see page 18887)	This is record ScktComp.TLookupState.
	TServerType (see page 18887)	This is record ScktComp.TServerType.
	TSocketEvent (see page 18887)	TSocketEvent identifies the operation that a socket is performing.

Types

Name	Description
TAsyncStyles (see page 18889)	This is type ScktComp.TAsyncStyles.
TGetSocketEvent (see page 18889)	This is type ScktComp.TGetSocketEvent.
TGetThreadEvent (see page 18890)	This is type ScktComp.TGetThreadEvent.
TSocketErrorEvent (see page 18890)	TSocketErrorEvent is the type for event handlers that respond when a Windows socket reports an error.
TSocketErrorProc (see page 18891)	This is type ScktComp.TSocketErrorProc.
TSocketEventEvent (see page 18891)	This is type ScktComp.TSocketEventEvent.
TSocketNotifyEvent (see page 18891)	The type for event handlers which respond to events during the expected course of forming or using a socket connection.
TThreadNotifyEvent (see page 18892)	This is type ScktComp.TThreadNotifyEvent.

129.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ESocketError (see page 18739)	ESocketError is the exception class for failures that occur when trying to create, use, or shut down Windows socket objects.
	TAbstractSocket (see page 18740)	TAbstractSocket is the abstract base class for all socket components.
	TClientSocket (see page 18752)	TClientSocket manages socket connections for a TCP/IP client.
	TClientWinSocket (see page 18766)	TClientWinSocket describes the client endpoint of a Windows socket connection.
	TCustomServerSocket (see page 18770)	TCustomServerSocket is the base class for all server socket components.
	TCustomSocket (see page 18789)	TCustomSocket is the base class for socket components.
	TCustomWinSocket (see page 18799)	TCustomWinSocket is the base class for all Windows socket objects.
	TServerAcceptThread (see page 18825)	This is class SocktComp.TServerAcceptThread.
	TServerClientThread (see page 18831)	TServerClientThread is an execution thread used for a single connection to a client socket accepted by a Windows server socket.
	TServerClientWinSocket (see page 18840)	TServerClientWinSocket describes the server endpoint of a socket connection to a client socket.
	TServerSocket (see page 18843)	TServerSocket manages server socket connections for a TCP/IP server.
	TServerWinSocket (see page 18858)	TServerWinSocket describes the endpoint of a listening server socket connection.
	TWinSocketStream (see page 18876)	TWinSocketStream is a stream that provides services which allow applications to read from or write to socket connections.

129.1.1 ESocketError Class

ESocketError is the exception class for failures that occur when trying to create, use, or shut down Windows socket objects.

Class Hierarchy

Pascal

```
ESocketError = class(Exception);
```

C++

```
class ESocketError : public Exception;
```

File

ScktComp

Description

ESocketError is raised if

A socket cannot be created.

A socket cannot be initialized.

A socket cannot be opened.

An application tries to change the properties of an already open socket.

A failure occurs when reading from or writing to a socket.

A socket cannot be properly closed.

There are two ESocketError classes, one in the ScktComp (see page 18737) unit and one in the Sockets (see page 20039) unit. The two exception classes are identically defined and serve the same function for different categories of socket objects. The two definitions occur simply to ensure that ESocketError is defined for all socket objects.

See Also

TCustomWinSocket (see page 18799)

129.1.2 TAbstractSocket Class

TAbstractSocket is the abstract base class for all socket components.

Class Hierarchy

Pascal

```
TAbstractSocket = class(TComponent);
```

C++

```
class TAbstractSocket : public TComponent;
```

File

ScktComp

Description

TAbstractSocket introduces properties and methods to enable an application to work with sockets. A socket encapsulates a set of communication protocols to allow the application to connect to other machines for reading or writing information. Sockets (see page 20039) provide connections based on the TCP/IP protocol. They also allow connections that use the Xerox Network System (see page 22079) (XNS), Digital's DECnet protocol, or Novell's IPX/SPX family. Sockets (see page 20039) allow an application to form connections to other machines without being concerned with the details of the actual networking software.

The properties of TAbstractSocket describe the IP address of the socket and service it provides or seeks. Not all descendants of TAbstractSocket use all of these properties. For example, server sockets do not surface the IP address because it is read implicitly from the system running the application.

Do not create instances of TAbstractSocket. Use a descendant of TAbstractSocket to add the ability to communicate with other machines to an application. To create a socket that initiates the connection with another machine, use TClientSocket (see page 18752). To create a socket that responds to requests for connections from other machines, use TServerSocket (see page 18843).

See Also

TClientSocket (see page 18752)

TCustomWinSocket (see page 18799)

TServerSocket (see page 18843)

TCustomSocket (see page 18789)

129.1.2.1 TAbstractSocket Members

The following tables list the members exposed by TAbstractSocket.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
A	DoActivate (see page 18744)	Provides the prototype of a method to open or close the socket connection.
A	Error (see page 18745)	Provides the prototype of a method that responds to error conditions.
A	Event (see page 18746)	Provides the prototype of a method that responds when specific socket events occur.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InitSocket (see page 18746)	Tells a Windows socket object to call the Error (see page 18745) and Event (see page 18746) methods.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 18747)	Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see page 18750) property.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActive (see page 18748)	Sets the Active (see page 18750) property.
	SetAddress (see page 18748)	Sets the Address (see page 18750) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHost (see page 18748)	Sets the Host (see page 18751) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetPort (see page 18749)	Sets the Port (see page 18751) property.

	SetService (see page 18749)	Sets the Service (see page 18752) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Active (see page 18750)	Indicates whether the socket connection is open and available for communication with other machines.
	Address (see page 18750)	Specifies the IP address of the server system.
	Host (see page 18751)	Specifies an alias for the IP address of the server system.
	Port (see page 18751)	Specifies the ID number that identifies the server socket connection.
	Service (see page 18752)	Specifies the name of the service for which the socket connection is used.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 18744)	Shuts down the socket connection.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 18747)	Opens the socket connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

129.1.2.2 TAbstractSocket Methods

The methods of the TAbstractSocket class are listed here.

Protected Methods

	Name	Description
A	DoActivate (see page 18744)	Provides the prototype of a method to open or close the socket connection.
A	Error (see page 18745)	Provides the prototype of a method that responds to error conditions.
A	Event (see page 18746)	Provides the prototype of a method that responds when specific socket events occur.
	InitSocket (see page 18746)	Tells a Windows socket object to call the Error (see page 18745) and Event (see page 18746) methods.
V	Loaded (see page 18747)	Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see page 18750) property.
	SetActive (see page 18748)	Sets the Active (see page 18750) property.
	SetAddress (see page 18748)	Sets the Address (see page 18750) property.
	SetHost (see page 18748)	Sets the Host (see page 18751) property.
	SetPort (see page 18749)	Sets the Port (see page 18751) property.
	SetService (see page 18749)	Sets the Service (see page 18752) property.

Public Methods

	Name	Description
	Close (see page 18744)	Shuts down the socket connection.
	Open (see page 18747)	Opens the socket connection.

129.1.2.2.1 TAbstractSocket.Close Method

Shuts down the socket connection.

Pascal

```
procedure Close;
```

C++

```
__fastcall Close();
```

Description

Call Close to shut down the socket connection. Close sets the Active (see page 18750) property to false.

For client sockets, Close terminates the connection to the server. For server sockets, Close shuts down the connection so that the server socket is no longer listening for client requests.

See Also

Active (see page 18750)

129.1.2.2.2 TAbstractSocket.DoActivate Method

Provides the prototype of a method to open or close the socket connection.

Pascal

```
procedure DoActivate(Value: Boolean); virtual; abstract;
```

C++

```
virtual __fastcall DoActivate(Boolean Value) = 0;
```

Description

Descendants of TAbstractSocket (see page 18740) override DoActivate to provide a method that initiates or terminates the socket connection. The steps that need to be taken to open or close a connection depend on whether the socket is a client socket or a server socket.

See Also

Active (see page 18750)

Open (see page 18747)

Close (see page 18744)

129.1.2.2.3 TAbstractSocket.Error Method

Provides the prototype of a method that responds to error conditions.

Pascal

```
procedure Error(Socket: TCustomWinSocket; ErrorEvent: TErrorEvent; var ErrorCode: Integer);
virtual; abstract;
```

C++

```
virtual __fastcall Error(TCustomWinSocket Socket, TErrorEvent ErrorEvent, int ErrorCode) = 0;
```

Description

Descendants of TAbstractSocket (see page 18740) must override the abstract or, in C++ terminology, pure virtual Error method to provide a response when socket errors occur. Applications cannot call Error. The Windows socket object that encounters the error condition calls Error automatically.

The Socket parameter indicates the Windows socket object that encounters the error condition.

The ErrorEvent parameter indicates what the socket was trying to do when the error occurred. It has one of the following values:

Value	Meaning
eeGeneral	The socket received an error message that does not fit into any of the following categories.
eeSend	An error occurred when trying to write to the socket connection.
eeReceive	An error occurred when trying to read from the socket connection.
eeConnect	For client sockets, this indicates that the client socket can't locate the server, or that a problem on the server prevents the opening of a connection. For server sockets, this indicates that a client connection request that has already been accepted could not be completed.
eeDisconnect	An error occurred when trying to close a connection.
eeAccept	For server sockets only, this indicates that a problem occurred when trying to accept a client connection request.

The ErrorCode parameter is the error code received by the Windows socket object. Setting this value to 0 in the Error method prevents the socket from raising an exception. For information on possible error codes, see the Microsoft documentation on Windows sockets.

See Also

OnErrorEvent (see page 18824)

InitSocket (see page 18746)

129.1.2.2.4 TAbstractSocket.Event Method

Provides the prototype of a method that responds when specific socket events occur.

Pascal

```
procedure Event(Socket: TCustomWinSocket; SocketEvent: TSocketEvent); virtual; abstract;
```

C++

```
virtual __fastcall Event(TCustomWinSocket Socket, TSocketEvent SocketEvent) = 0;
```

Description

Descendants of TAbstractSocket (see page 18740) must override the abstract or, in C++ terminology, pure virtual Event method to provide a response to calls that arise during the normal functioning of the socket. Applications cannot call Event. The Windows socket object calls Event at appropriate times.

The Socket parameter indicates the Windows socket object that calls Event to indicate when specific events occur.

The SocketEvent parameter indicates the event that occurred. It has one of the following values:

Value	Meaning
seLookup	(client sockets only) The Windows socket object is about to locate the server socket. Changing the properties of the client socket has no effect at this point, but changes to the Windows socket object specified by the Socket parameter will affect the attempted connection.
seConnecting	(client sockets only) The server socket has been located but the connection isn't completed. This is the first opportunity to obtain the actual server port and IP address used for the connection, which may differ from those of the listening socket contacted initially.
seConnect	The socket connection has just been established. This is the point when a socket starts reading or writing over the connection.
seListen	(server sockets only) The Windows socket object has been initialized and is about to open a listening connection. Changing the properties of the server socket has no effect at this point, but changes to the Windows socket object specified by the Socket parameter will the listening connection.
seAccept	(server sockets only) A client connection request has just been accepted. This is the first opportunity to obtain the port and IP address of the individual client connection.
seWrite	The socket is ready for information to be written.
seRead	The socket is receiving information from a socket on the other end of the connection.

See Also

OnSocketEvent (see page 18824)

InitSocket (see page 18746)

129.1.2.2.5 TAbstractSocket.InitSocket Method

Tells a Windows socket object to call the Error (see page 18745) and Event (see page 18746) methods.

Pascal

```
procedure InitSocket(Socket: TCustomWinSocket);
```

C++

```
__fastcall InitSocket(TCustomWinSocket Socket);
```

Description

Applications cannot call this protected method. InitSocket is called automatically by the socket's constructor, immediately after the Windows socket object is created. It allows the socket component to respond to events on the Windows socket object by assigning an OnErrorEvent handler that calls Error (see page 18745) and an OnSocketEvent handler that calls Event (see page 18746).

The Socket parameter specifies the Windows socket object that passes events on to the socket component.

See Also

Error (see page 18745)

TAbstractSocket (see page 18740)

OnErrorEvent (see page 18824)

OnSocketEvent (see page 18824)

129.1.2.2.6 TAbstractSocket.Loaded Method

Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see page 18750) property.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Applications cannot call this protected method. Loaded is called automatically after the socket component has been loaded from a stream. Loaded overrides the default method to implement the value of the Active (see page 18750) property that was saved with the socket component.

See Also

Active (see page 18750)

129.1.2.2.7 TAbstractSocket.Open Method

Opens the socket connection.

Pascal

```
procedure Open;
```

C++

```
__fastcall Open();
```

Description

Call Open to initiate the socket connection. Open sets the Active (see page 18750) property to true.

For client sockets, Open locates and connects to a server. For server sockets, Open opens the socket connection in a listening mode, but does not complete the connection to a client socket.

See Also

Active (see page 18750)

129.1.2.2.8 TAbstractSocket.SetActive Method

Sets the Active (see page 18750) property.

Pascal

```
procedure SetActive(Value: Boolean);
```

C++

```
__fastcall SetActive(Boolean Value);
```

Description

SetActive is the protected implementation of the Active (see page 18750) property. SetActive calls the DoActivate (see page 18744) method to open or close the socket connection.

See Also

Active (see page 18750)

DoActivate (see page 18744)

129.1.2.2.9 TAbstractSocket.SetAddress Method

Sets the Address (see page 18750) property.

Pascal

```
procedure SetAddress(Value: string);
```

C++

```
__fastcall SetAddress(AnsiString Value);
```

Description

SetAddress is the protected implementation of the Address (see page 18750) property. SetAddress raises an ESocketError (see page 18739) exception if an attempt is made to set the Address (see page 18750) property when the socket connection is open.

See Also

Active (see page 18750)

Address (see page 18750)

ESocketError

129.1.2.2.10 TAbstractSocket.SetHost Method

Sets the Host (see page 18751) property.

Pascal

```
procedure SetHost(Value: string);
```

C++

```
__fastcall SetHost(AnsiString Value);
```

Description

SetHost is the protected implementation of the Host (see page 18751) property. SetHost raises an ESocketError (see page 18739) exception if an attempt is made to set the Host (see page 18751) property when the socket connection is open.

See Also

Active (see page 18750)

ESocketError

Host (see page 18751)

129.1.2.2.11 TAbstractSocket.SetPort Method

Sets the Port (see page 18751) property.

Pascal

```
procedure SetPort(Value: Integer);
```

C++

```
__fastcall SetPort(int Value);
```

Description

SetPort is the protected implementation of the Port (see page 18751) property. SetPort raises an ESocketError (see page 18739) exception if an attempt is made to set the Port (see page 18751) property when the socket connection is open.

See Also

Active (see page 18750)

ESocketError

Port (see page 18751)

129.1.2.2.12 TAbstractSocket.SetService Method

Sets the Service (see page 18752) property.

Pascal

```
procedure SetService(Value: string);
```

C++

```
__fastcall SetService(AnsiString Value);
```

Description

SetService is the protected implementation of the Service (see page 18752) property. SetService raises an ESocketError (see page 18739) exception if an attempt is made to set the Service (see page 18752) property when the socket connection is open.

See Also

Active (see page 18750)

ESocketError

Service (see page 18752)

129.1.2.3 TAbstractSocket Properties

The properties of the TAbstractSocket class are listed here.

Protected Properties

	Name	Description
	Active (see page 18750)	Indicates whether the socket connection is open and available for communication with other machines.
	Address (see page 18750)	Specifies the IP address of the server system.
	Host (see page 18751)	Specifies an alias for the IP address of the server system.
	Port (see page 18751)	Specifies the ID number that identifies the server socket connection.
	Service (see page 18752)	Specifies the name of the service for which the socket connection is used.

129.1.2.3.1 TAbstractSocket.Active Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before attempting to use or change the socket connection, read Active to determine whether the connection is open and ready. For client sockets, setting Active opens or shuts down a socket connection to another machine. For server sockets, setting Active opens or shuts down a listening connection that makes the socket available for client requests.

At design time, set Active to true to make the socket open a connection when the application starts running. At runtime, use the Open (see page 18747) or Close (see page 18744) method to open or close the connection.

See Also

Close (see page 18744)

Open (see page 18747)

SetActive (see page 18748)

129.1.2.3.2 TAbstractSocket.Address Property

Specifies the IP address of the server system.

Pascal

```
property Address: string;
```

C++

```
__property AnsiString Address;
```

Description

Address is a string of four numeric (byte) values in the standard Internet dot notation, such as

```
123.197.1.2
```

For client sockets, set Address to the IP address of the server to which the socket should connect. When the connection is opened, the value of Address is bound to the connection.

If the socket specifies the Host (see page 18751) property, the address for the connection is taken from the IP address associated with Host (see page 18751), rather than the value of Address. Specifying the server system by giving the IP address is faster, because the socket doesn't need to search for the IP address associated with the host name before it can locate the server system.

A single system may support more than one IP address.

Note: Trying to change Address when the connection is open will raise an ESocketError (see page 18739) exception.

See Also

ESocketError

Host (see page 18751)

SetAddress (see page 18748)

129.1.2.3.3 TAbstractSocket.Host Property

Specifies an alias for the IP address of the server system.

Pascal

```
property Host: string;
```

C++

```
__property AnsiString Host;
```

Description

Host is a string containing the domain name and service of a particular system, such as

`http://www.wSite.Com`

For client sockets, set Host to the system with which the client socket should form a connection. When the socket opens a connection, it looks up the IP address for the server socket using the value of Host.

Some servers change the system or IP address that is associated with a particular host name. Using a host name allows the client socket to find the abstract site represented by the host name, even when it has moved to a new IP address.

If Host is set, it takes precedence over the Address (see page 18750) property when looking up the address of the server.

Note: Trying to change Host when the connection is open will raise an ESocketError (see page 18739) exception.

See Also

Address (see page 18750)

ESocketError

SetHost (see page 18748)

129.1.2.3.4 TAbstractSocket.Port Property

Specifies the ID number that identifies the server socket connection.

Pascal

```
property Port: Integer;
```

C++

```
__property int Port;
```

Description

Port numbers allow a single system, identified by the Host (see page 18751) or Address (see page 18750) property, to host multiple connections simultaneously. Many values of Port are associated by convention with a particular service such as ftp or http.

For server sockets, Port is the ID of the connection on which the server socket listens for client requests. Server sockets

generally set Port to a predefined value which clients can use to initiate connections.

For client sockets, Port is the ID of the desired server connection. The value of Port is usually associated with the service the client wishes to use on the server application.

Note: Trying to change Port when the connection is open will raise an ESocketError (see page 18739) exception.

See Also

Address (see page 18750)

ESocketError

Host (see page 18751)

Service (see page 18752)

SetPort (see page 18749)

129.1.2.3.5 TAbstractSocket.Service Property

Specifies the name of the service for which the socket connection is used.

Pascal

```
property Service: string;
```

C++

```
__property AnsiString Service;
```

Description

Use Service to identify the use of the connection. Windows provides There are a number of standard service names such as ftp, http, finger, and time. Servers can specify additional services and their associated ports in a SERVICES file. For more information, see the Microsoft documentation for Windows sockets.

Certain port numbers are reserved for specific values of service. Thus, Service provides a more meaningful way to specify the server Port (see page 18751) to use for the socket connection. For server sockets, using Service rather than Port (see page 18751) ensures that the server will listen for TCP/IP requests on the appropriate port.

Note: Trying to change Service when the connection is open will raise an ESocketError (see page 18739) exception.

LookupService (see page 18810)

129.1.3 TClientSocket Class

TClientSocket manages socket connections for a TCP/IP client.

Class Hierarchy

Pascal

```
TClientSocket = class(TCustomSocket);
```

C++

```
class TClientSocket : public TCustomSocket;
```

File

ScktComp

Description

Add a TClientSocket object to a form or data module to turn an application into a TCP/IP client. TClientSocket specifies a desired connection to a TCP/IP server, manages the connection when it is open, and terminates the connection when the application is through.

Note: See the CHAT demo for an example of how to use TClientSocket.

See Also

TClientWinSocket (see page 18766)

TServerSocket (see page 18843)

129.1.3.1 TClientSocket Members

The following tables list the members exposed by TClientSocket.

Protected Events

	Name	Description
	OnAccept (see page 18795)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnListen (see page 18797)	Occurs just before a server socket is opened for listening.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoActivate (see page 18757)	Provides the prototype of a method to open or close the socket connection.
A	Error (see page 18745)	Provides the prototype of a method that responds to error conditions.
V	Error (see page 18793)	Generates an OnError (see page 18797) event.

	Event (see page 18746)	Provides the prototype of a method that responds when specific socket events occur.
	Event (see page 18794)	Dispatches the events that occur in the normal operation of the socket to the appropriate event handlers.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientType (see page 18758)	This is GetClientType, a member of class TClientSocket.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InitSocket (see page 18746)	Tells a Windows socket object to call the Error (see page 18745) and Event (see page 18746) methods.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 18747)	Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see page 18750) property.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActive (see page 18748)	Sets the Active (see page 18750) property.
	SetAddress (see page 18748)	Sets the Address (see page 18750) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetClientType (see page 18758)	This is SetClientType, a member of class TClientSocket.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHost (see page 18748)	Sets the Host (see page 18751) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetPort (see page 18749)	Sets the Port (see page 18751) property.
	SetService (see page 18749)	Sets the Service (see page 18752) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 18744)	Shuts down the socket connection.
	Create (see page 18756)	Creates an instance of TClientSocket (see page 18752).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 18757)	Destroys an instance of TClientSocket (see page 18752).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 18747)	Opens the socket connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Socket (see page 18762)	Describes the client endpoint of the Windows client socket connection.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnConnect (see page 18762)	Occurs on client sockets just after the connection to the server is opened.
	OnConnecting (see page 18763)	Occurs for a client socket after the server socket has been located, but before the connection is established.
	OnDisconnect (see page 18764)	Occurs just before a client socket closes the connection to a server socket.
	OnError (see page 18764)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnLookup (see page 18764)	Occurs when a client socket is about to look up the server socket with which it wants to connect.
	OnRead (see page 18765)	Occurs when a client socket should read information from the socket connection.
	OnWrite (see page 18765)	Occurs when a client socket should write information to the socket connection.

Published Properties

	Name	Description
	Active (see page 18759)	Indicates whether the socket connection is open and available for communication with other machines.
	Address (see page 18759)	Specifies the IP address of the server system.
	ClientType (see page 18760)	Specifies whether the client socket reads and writes information asynchronously over the socket connection.
	Host (see page 18760)	Specifies an alias for the IP address of the server system.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Port (see page 18761)	Specifies the ID number that identifies the server socket connection.
	Service (see page 18761)	Specifies the name of the service for which the socket connection is used.
	Tag (see page 2808)	Stores an integer value as part of a component.

129.1.3.2 TClientSocket.Create Constructor

Creates an instance of TClientSocket (see page 18752).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TClientSocket(TComponent * AOwner);
```

Description

Call Create to create and initialize a client socket component at runtime. TClientSocket (see page 18752) objects placed at design time are created automatically.

After calling the inherited constructor, Create

Allocates the TClientWinSocket (see page 18766) object that describes the client endpoint of the Windows socket connection.

I initializes the event and error dispatchers for the client socket.

See Also

TClientWinSocket (see page 18766)

Create (see page 2766)

129.1.3.3 TClientSocket.Destroy Destructor

Destroys an instance of TClientSocket (see page 18752).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TClientSocket();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the client socket is not nil, and only then calls Destroy.

Destroy frees the TClientWinSocket (see page 18766) object that describes the client endpoint of the Windows socket connection.

See Also

Free (see page 22300)

TClientWinSocket (see page 18766)

129.1.3.4 TClientSocket Methods

The methods of the TClientSocket class are listed here.

Protected Methods

	Name	Description
	DoActivate (see page 18757)	Provides the prototype of a method to open or close the socket connection.
	GetClientType (see page 18758)	This is GetClientType, a member of class TClientSocket.
	SetClientType (see page 18758)	This is SetClientType, a member of class TClientSocket.

129.1.3.4.1 TClientSocket.DoActivate Method

Provides the prototype of a method to open or close the socket connection.

Pascal

```
procedure DoActivate(Value: Boolean); override;
```

C++

```
virtual __fastcall DoActivate(Boolean Value);
```

Description

Descendants of TAbstractSocket override DoActivate to provide a method that initiates or terminates the socket connection. The steps that need to be taken to open or close a connection depend on whether the socket is a client socket or a server socket.

See Also

Active (see page 18750)

Open (see page 18747)

Close (see page 18744)

129.1.3.4.2 TClientSocket.GetClientType Method

Pascal

```
function GetClientType: TClientType;
```

C++

```
__fastcall TClientType GetClientType();
```

Description

This is GetClientType, a member of class TClientSocket.

129.1.3.4.3 TClientSocket.SetClientType Method

Pascal

```
procedure SetClientType(Value: TClientType);
```

C++

```
__fastcall SetClientType(TClientType Value);
```

Description

This is SetClientType, a member of class TClientSocket.

129.1.3.5 TClientSocket Properties

The properties of the TClientSocket class are listed here.

Public Properties

	Name	Description
R	Socket (see page 18762)	Describes the client endpoint of the Windows client socket connection.

Published Properties

	Name	Description
	Active (see page 18759)	Indicates whether the socket connection is open and available for communication with other machines.
	Address (see page 18759)	Specifies the IP address of the server system.
	ClientType (see page 18760)	Specifies whether the client socket reads and writes information asynchronously over the socket connection.
	Host (see page 18760)	Specifies an alias for the IP address of the server system.
	Port (see page 18761)	Specifies the ID number that identifies the server socket connection.

	Service (see page 18761)	Specifies the name of the service for which the socket connection is used.

129.1.3.5.1 TClientSocket.Active Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before attempting to use or change the socket connection, read Active to determine whether the connection is open and ready. For client sockets, setting Active opens or shuts down a socket connection to another machine. For server sockets, setting Active opens or shuts down a listening connection that makes the socket available for client requests.

At design time, set Active to true to make the socket open a connection when the application starts running. At runtime, use the Open or Close method to open or close the connection.

See Also

Close (see page 18744)

Open (see page 18747)

SetActive (see page 18748)

129.1.3.5.2 TClientSocket.Address Property

Specifies the IP address of the server system.

Pascal

```
property Address: string;
```

C++

```
__property AnsiString Address;
```

Description

Address is a string of four numeric (byte) values in the standard Internet dot notation, such as

```
123.197.1.2
```

For client sockets, set Address to the IP address of the server to which the socket should connect. When the connection is opened, the value of Address is bound to the connection.

If the socket specifies the Host property, the address for the connection is taken from the IP address associated with Host, rather than the value of Address. Specifying the server system by giving the IP address is faster, because the socket doesn't need to search for the IP address associated with the host name before it can locate the server system.

A single system may support more than one IP address.

Note: Trying to change Address when the connection is open will raise an ESocketError exception.

See Also

ESocketError

Host (see page 18751)

SetAddress (see page 18748)

129.1.3.5.3 TClientSocket.ClientType Property

Specifies whether the client socket reads and writes information asynchronously over the socket connection.

Pascal

```
property ClientType: TClientType;
```

C++

```
__property TClientType ClientType;
```

Description

Set ClientType to ctNonBlocking to enable the client socket to respond to asynchronous reading and writing events. When ClientType is ctNonBlocking, execution is not blocked by reading and writing over the socket connection. OnRead (see page 18765) or OnWrite (see page 18765) events occur when the socket needs to read or write over the connection.

Set ClientType to ctBlocking to force all reading and writing to occur synchronously. It is a good idea to include the client socket object in a thread if the ClientType is ctBlocking, so that I/O does not block all execution within the client application.

When ClientType is ctBlocking, use a TWinSocketStream (see page 18876) object for reading and writing. TWinSocketStream (see page 18876) prevents the application from hanging indefinitely if a problem occurs while reading or writing. It also can wait for the socket connection to indicate its readiness for reading.

Use a non-blocking socket when the socket needs to synchronize reading and writing with server sockets.

See Also

OnRead (see page 18798)

OnWrite (see page 18799)

TThread (see page 3108)

TWinSocketStream (see page 18876)

129.1.3.5.4 TClientSocket.Host Property

Specifies an alias for the IP address of the server system.

Pascal

```
property Host: string;
```

C++

```
__property AnsiString Host;
```

Description

Host is a string containing the domain name and service of a particular system, such as

`http://www.wSite.Com`

For client sockets, set Host to the system with which the client socket should form a connection. When the socket opens a connection, it looks up the IP address for the server socket using the value of Host.

Some servers change the system or IP address that is associated with a particular host name. Using a host name allows the client socket to find the abstract site represented by the host name, even when it has moved to a new IP address.

If Host is set, it takes precedence over the Address property when looking up the address of the server.

Note: Trying to change Host when the connection is open will raise an ESocketError exception.

See Also

Address (see page 18750)

ESocketError

SetHost (see page 18748)

129.1.3.5.5 TClientSocket.Port Property

Specifies the ID number that identifies the server socket connection.

Pascal

```
property Port: Integer;
```

C++

```
__property int Port;
```

Description

Port numbers allow a single system, identified by the Host or Address property, to host multiple connections simultaneously. Many values of Port are associated by convention with a particular service such as ftp or http.

For server sockets, Port is the ID of the connection on which the server socket listens for client requests. Server sockets generally set Port to a predefined value which clients can use to initiate connections.

For client sockets, Port is the ID of the desired server connection. The value of Port is usually associated with the service the client wishes to use on the server application.

Note: Trying to change Port when the connection is open will raise an ESocketError exception.

See Also

Address (see page 18750)

ESocketError

Host (see page 18751)

Service (see page 18752)

SetPort (see page 18749)

129.1.3.5.6 TClientSocket.Service Property

Specifies the name of the service for which the socket connection is used.

Pascal

```
property Service: string;
```

C++

```
__property AnsiString Service;
```

Description

Use Service to identify the use of the connection. Windows provides There are a number of standard service names such as ftp, http, finger, and time. Servers can specify additional services and their associated ports in a SERVICES file. For more information, see the Microsoft documentation for Windows sockets.

Certain port numbers are reserved for specific values of service. Thus, Service provides a more meaningful way to specify the

server Port to use for the socket connection. For server sockets, using Service rather than Port ensures that the server will listen for TCP/IP requests on the appropriate port.

Note: Trying to change Service when the connection is open will raise an ESocketError exception.

See Also

ESocketError

Port (see page 18751)

SetService (see page 18749)

LookupService (see page 18810)

129.1.3.5.7 TClientSocket.Socket Property

Describes the client endpoint of the Windows client socket connection.

Pascal

```
property Socket: TClientWinSocket;
```

C++

```
__property TClientWinSocket Socket;
```

Description

Use Socket to

Determine the address and port of both the client and server sockets that are bound to the connection.

Read or write information through the socket connection.

Determine what server notifications the client will respond to.

Obtain the Windows socket handle for making Windows socket API calls.

129.1.3.6 TClientSocket Events

The events of the TClientSocket class are listed here.

Published Events

	Name	Description
	OnConnect (see page 18762)	Occurs on client sockets just after the connection to the server is opened.
	OnConnecting (see page 18763)	Occurs for a client socket after the server socket has been located, but before the connection is established.
	OnDisconnect (see page 18764)	Occurs just before a client socket closes the connection to a server socket.
	OnError (see page 18764)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnLookup (see page 18764)	Occurs when a client socket is about to look up the server socket with which it wants to connect.
	OnRead (see page 18765)	Occurs when a client socket should read information from the socket connection.
	OnWrite (see page 18765)	Occurs when a client socket should write information to the socket connection.

129.1.3.6.1 TClientSocket.OnConnect Event

Occurs on client sockets just after the connection to the server is opened.

Pascal

```
property OnConnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnConnect;
```

Description

Write an OnConnect event handler for a client socket to take specific action after the connection to a server socket has been established. Depending on the service, this may be the point when the socket should start reading or writing over the connection.

When a client socket opens a connection, the following events occur:

1An OnLookup event occurs prior to an attempt to locate the server socket.

2The Windows socket is set up, and initialized for event notification.

3An OnConnecting event occurs after the server socket is located.

4The connection request is accepted by the server and completed by the client socket.

5An OnConnect event occurs after the connection is established.

See Also

OnAccept (see page 18795)

OnConnecting (see page 18796)

OnLookup (see page 18797)

129.1.3.6.2 TClientSocket.OnConnecting Event

Occurs for a client socket after the server socket has been located, but before the connection is established.

Pascal

```
property OnConnecting: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnConnecting;
```

Description

Write an OnConnecting event handler for a client socket to take specific action just before the connection to a server socket is established. This is the first opportunity to obtain the actual port and IP address of the server endpoint of the connection that is about to form.

When a client socket opens a connection, the following events occur:

1An OnLookup event occurs prior to an attempt to locate the server socket.

2The Windows socket is set up, and initialized for event notification.

3An OnConnecting event occurs after the server socket is located.

4The connection request is accepted by the server and completed by the client socket.

5An OnConnect event occurs after the connection is established.

See Also

OnConnect (see page 18795)

OnLookup (see page 18797)

129.1.3.6.3 TClientSocket.OnDisconnect Event

Occurs just before a client socket closes the connection to a server socket.

Pascal

```
property OnDisconnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnDisconnect;
```

Description

Write an OnDisconnect event handler to take specific action when the connection to a server socket is about to be terminated. OnDisconnect occurs after the value of the Active property is set to false, but before the actual connection is closed.

See Also

Active (see page 18750)

Close (see page 18744)

OnConnect (see page 18795)

129.1.3.6.4 TClientSocket.OnError Event

Occurs when the socket fails in making, using, or shutting down a connection.

Pascal

```
property OnError: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnError;
```

Description

Write an OnError event handler to respond to errors that arise with the socket connection. Set the ErrorCode parameter to 0 if the OnError event handler successfully deals with the error condition, to prevent an ESocketError from being raised.

See Also

ESocketError

129.1.3.6.5 TClientSocket.OnLookup Event

Occurs when a client socket is about to look up the server socket with which it wants to connect.

Pascal

```
property OnLookup: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnLookup;
```

Description

Write an OnLookup event handler for a client socket to take specific action just before attempting to locate a server socket. This is the first opportunity to make Windows API calls that affect the client properties of the socket, such as specifying a particular port number. Use the SocketHandle property of the Socket parameter for Windows API calls.

When a client socket opens a connection, the following events occur:

1An OnLookup event occurs prior to an attempt to locate the server socket.

2The Windows socket is set up, and initialized for event notification.

3An OnConnecting event occurs after the server socket is located.

4The connection request is accepted by the server and completed by the client socket.

5An OnConnect event occurs after the connection is established.

Note: Changing the Address, Host, Port, or Service properties of socket component in an OnLookup event handler has no effect on the address or port used to locate a server socket. These properties must be correct before the Open method is called.

See Also

Address (see page 18750)

Host (see page 18751)

OnConnect (see page 18795)

OnConnecting (see page 18796)

Open (see page 18747)

Port (see page 18751)

Service (see page 18752)

129.1.3.6.6 TClientSocket.OnRead Event

Occurs when a client socket should read information from the socket connection.

Pascal

```
property OnRead: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnRead;
```

Description

Write an OnRead event handler to read from the socket connection. If the socket is a blocking socket, use a TWinSocketStream object to read from the connection. Otherwise, u Use the methods of the Socket parameter to perform the actual reading.

Note: Non-blocking sockets do not always receive an OnRead event for the last bit of data passed over the connection. When using a non-blocking socket, check for any unread data in the OnDisconnect event to make sure that everything is handled.

See Also

receivebuf (see page 18812)

ReceiveText (see page 18812)

TWinSocketStream (see page 18876)

OnDisconnect (see page 18796)

129.1.3.6.7 TClientSocket.OnWrite Event

Occurs when a client socket should write information to the socket connection.

Pascal

```
property OnWrite: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnWrite;
```

Description

Write an OnWrite to write from the socket connection. If the socket is a blocking socket, use a TWinSocketStream object to write to the connection. Otherwise, u Use the methods of the Socket parameter to perform the actual writing.

See Also

SendBuf (see page 18813)

sendstream (see page 18814)

SendStreamThenDrop (see page 18814)

SendText (see page 18814)

TWinSocketStream (see page 18876)

129.1.4 TClientWinSocket Class

TClientWinSocket describes the client endpoint of a Windows socket connection.

Class Hierarchy

Pascal

```
TClientWinSocket = class(TCustomWinSocket);
```

C++

```
class TClientWinSocket : public TCustomWinSocket;
```

File

ScktComp

Description

Client socket components use TClientWinSocket to manage the Windows socket API calls for a TCP/IP client application. TClientWinSocket differs from its immediate ancestor TCustomWinSocket (see page 18799) only in that it introduces a ClientType (see page 18769) property to distinguish blocking from non-blocking client sockets.

See Also

TClientSocket (see page 18752)

TServerClientWinSocket (see page 18840)

TServerWinSocket (see page 18858)

129.1.4.1 TClientWinSocket Members

The following tables list the members exposed by TClientWinSocket.

Protected Methods

	Name	Description
	AsyncInitSocket (see page 18803)	Looks up information or forms socket connections asynchronously.
	DoListen (see page 18806)	Opens a listening connection.
	DoOpen (see page 18806)	Opens a connection to a remote socket.
	Error (see page 18806)	Generates an OnErrorEvent (see page 18824) event.
	Event (see page 18807)	This is Event, a member of class TCustomWinSocket.
	InitSocket (see page 18807)	Generates a windows Internet socket address structure from a description of the desired socket port.
	SetAsyncStyles (see page 18815)	Sets the AsyncStyles property.
	SetClientType (see page 18769)	This is SetClientType, a member of class TClientWinSocket.

Public Events

	Name	Description
	OnErrorEvent (see page 18824)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnSocketEvent (see page 18824)	Occurs when the Windows socket receives notification of asynchronous events.

Public Methods

	Name	Description
V	Accept (see page 18803)	Provides the interface for a method that accepts a connection to a client socket.
	Close (see page 18804)	Shuts down the socket connection if it is open.
V	Connect (see page 18768)	Responds to connection notifications.
	Create (see page 18801)	Creates an instance of TCustomWinSocket (see page 18799) from a Windows socket handle.
V	DefaultHandler (see page 18805)	Processes message records.
V	Destroy (see page 18802)	Destroys an instance of TCustomWinSocket (see page 18799).
V	Disconnect (see page 18805)	Shuts down the socket connection represented by a Windows socket handle.
	Listen (see page 18808)	Opens a listening connection for a server socket.
	Lock (see page 18809)	Starts a critical section, blocking all other execution threads until the Unlock (see page 18815) method is called.
	LookupName (see page 18809)	Generates the portion of a Windows Internet socket address structure that describes the host.
	LookupService (see page 18810)	Returns the port number associated with a specific service.
	Open (see page 18810)	Opens a connection to a remote socket.
V	Read (see page 18811)	Generates an OnSocketEvent (see page 18824) of type seRead in response to notifications that the socket connection is ready.
	ReceiveBuf (see page 18812)	This is ReceiveBuf, a member of class TCustomWinSocket.
	ReceiveLength (see page 18812)	Returns the number of bytes ready to be sent over the socket connection.
	ReceiveText (see page 18812)	Reads a string from the socket connection.
	SendBuf (see page 18813)	Writes Count bytes to the socket connection from the Buf parameter.
	SendStream (see page 18814)	This is SendStream, a member of class TCustomWinSocket.
	SendStreamThenDrop (see page 18814)	Writes all the information that can be read from the AStream parameter to the socket connection and then terminates the connection.
	SendText (see page 18814)	Writes the string S to the socket connection.
	Unlock (see page 18815)	Reenables execution in other threads after a critical section begun by the Lock (see page 18809) method.
V	Write (see page 18816)	Generates an OnSocketEvent (see page 18824) of type seWrite in response to notifications that the socket connection is ready.

Public Properties

	Name	Description
R	Addr (see page 18817)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the socket port.
	ASyncStyles (see page 18817)	Determines which asynchronous events the socket can receive.
	ClientType (see page 18769)	Specifies whether the client Windows socket reads and writes information asynchronously over the socket connection.

R	Connected (see page 18818)	Indicates whether the socket connection is open and available for communication with other machines.
	Data (see page 18818)	Points to application-specific data associated with the socket.
R	Handle (see page 18819)	Specifies the handle of the window that receives notifications from the Windows socket.
R	LocalAddress (see page 18819)	Specifies the IP address of the local system that was bound to the socket connection.
R	LocalHost (see page 18820)	Specifies the name of the local system.
R	LocalPort (see page 18820)	Specifies the ID number of the port used by the socket connection.
R	LookupState (see page 18821)	Indicates any asynchronous activities occurring while opening a connection.
R	RemoteAddr (see page 18821)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the remote socket port.
R	RemoteAddress (see page 18822)	Specifies the IP address of the remote system that was bound to the socket connection.
R	RemoteHost (see page 18822)	Specifies the name of the remote system.
R	RemotePort (see page 18823)	Specifies the ID number of the port used by the RemoteHost (see page 18822) to form the socket connection.
R	SocketHandle (see page 18823)	Specifies the Windows handle for the socket.

129.1.4.2 TClientWinSocket Methods

The methods of the TClientWinSocket class are listed here.

Protected Methods

	Name	Description
	SetClientType (see page 18769)	This is SetClientType, a member of class TClientWinSocket.

Public Methods

	Name	Description
V	Connect (see page 18768)	Responds to connection notifications.

129.1.4.2.1 TClientWinSocket.Connect Method

Responds to connection notifications.

Pascal

```
procedure Connect(Socket: TSocket); override;
```

C++

```
virtual __fastcall Connect(TSocket Socket);
```

Description

Applications can not call this protected method. Connect is called in response to notifications that the client socket has successfully completed a connection to a server socket. The Socket parameter is the Windows socket handle for the socket that receives the notification.

Connect generates an OnSocketEvent (see page 18824) event with the SocketEvent parameter set to seConnect. Socket components assign an OnSocketEvent (see page 18824) event handler that responds to this event by generating an OnConnect event on the socket component.

Note: Connect is only called if the ASyncStyles (see page 18817) property includes asConnect.

See Also

ASyncStyles (see page 18817)

OnSocketEvent (see page 18824)

OnConnect (see page 18795)

129.1.4.2.2 TClientWinSocket.SetClientType Method

Pascal

```
procedure SetClientType(Value: TClientType);
```

C++

```
__fastcall SetClientType(TClientType Value);
```

Description

This is SetClientType, a member of class TClientWinSocket.

129.1.4.3 TClientWinSocket Properties

The properties of the TClientWinSocket class are listed here.

Public Properties

	Name	Description
	ClientType (see page 18769)	Specifies whether the client Windows socket reads and writes information asynchronously over the socket connection.

129.1.4.3.1 TClientWinSocket.ClientType Property

Specifies whether the client Windows socket reads and writes information asynchronously over the socket connection.

Pascal

```
property ClientType: TClientType;
```

C++

```
__property TClientType ClientType;
```

Description

Client socket components set ClientType to reflect their own ClientType property. When ClientType is ctNonBlocking, the client Windows socket responds to asynchronous reading and writing events, and execution is not blocked by reading and writing over the connection. OnSocketEvent (see page 18824) events occur when the socket needs to read or write over the connection.

When ClientType is ctBlocking, all reading and writing occur synchronously. It is a good idea to perform all reading and writing in a separate thread if ClientType is ctBlocking. Reading and writing in a separate thread ensures that these operations do not block all execution within the client application.

When ClientType is ctBlocking, use a TWinSocketStream (see page 18876) object for reading and writing. TWinSocketStream (see page 18876) times out so that the application does not hang when a problem occurs while reading or writing. TWinSocketStream (see page 18876) also provides a method to wait, before reading, until the socket connection is ready to send information.

Use a non-blocking socket when the socket needs to synchronize reading and writing with server sockets.

See Also

OnSocketEvent (see page 18824)

TThread (see page 3108)

TWinSocketStream (see page 18876)

129.1.5 TCustomServerSocket Class

TCustomServerSocket is the base class for all server socket components.

Class Hierarchy

Pascal

```
TCustomServerSocket = class(TCustomSocket);
```

C++

```
class TCustomServerSocket : public TCustomSocket;
```

File

ScktComp

Description

TCustomServerSocket introduces new properties and events specific to the functions of a TCP/IP server.

Do not create instances of TCustomServerSocket. Use TCustomServerSocket as a base class when declaring server socket objects that listen for connection requests from other machines.

See Also

TServerWinSocket (see page 18858)

TServerSocket (see page 18843)

129.1.5.1 TCustomServerSocket Members

The following tables list the members exposed by TCustomServerSocket.

Protected Events

	Name	Description
	OnAccept (see page 18795)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnClientConnect (see page 18784)	Occurs when a client socket completes a connection accepted by the server socket.
	OnClientDisconnect (see page 18785)	Occurs when one of the connections to a client socket is closed.
	OnClientError (see page 18785)	Occurs when there is a failure in establishing, using, or terminating the socket connection to an individual client socket.
	OnClientRead (see page 18786)	Occurs when the server socket should read information from a client socket.
	OnClientWrite (see page 18786)	Occurs when the server socket should write information to a client socket.
	OnConnect (see page 18795)	Occurs on client sockets just after the connection to the server is opened.
	OnConnecting (see page 18796)	Occurs for a client socket after the server socket has been located, but before the connection is established.
	OnDisconnect (see page 18796)	Occurs just before a client socket closes the connection to a server socket.
	OnError (see page 18797)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnGetSocket (see page 18787)	Occurs when the server socket needs to create a new TServerClientWinSocket (see page 18840) object to represent the server endpoint of a connection to a client socket.

	OnGetThread (see page 18787)	Occurs when the server socket needs to create a new execution thread for a connection to a client socket.
	OnListen (see page 18797)	Occurs just before a server socket is opened for listening.
	OnLookup (see page 18797)	Occurs when a client socket is about to look up the server socket with which it wants to connect.
	OnRead (see page 18798)	Occurs when a client socket should read information from the socket connection.
	OnThreadEnd (see page 18788)	Occurs when a client socket connection is terminated and the associated thread finishes execution.
	OnThreadStart (see page 18788)	Occurs when the execution thread for a connection to a client socket starts up.
	OnWrite (see page 18799)	Occurs when a client socket should write information to the socket connection.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FServerSocket (see page 18775)	This is FServerSocket, a member of class TCustomServerSocket.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoActivate (see page 18775)	Opens or Closes the socket connection.
A	Error (see page 18745)	Provides the prototype of a method that responds to error conditions.
V	Error (see page 18793)	Generates an OnError (see page 18797) event.
A	Event (see page 18746)	Provides the prototype of a method that responds when specific socket events occur.
V	Event (see page 18794)	Dispatches the events that occur in the normal operation of the socket to the appropriate event handlers.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetGetSocketEvent (see page 18776)	Returns the OnGetSocket (see page 18787) event handler.
	GetGetThreadEvent (see page 18776)	Returns the OnGetThread (see page 18787) event handler.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOnClientError (see page 18776)	Returns the OnClientError (see page 18785) event handler.
	GetOnClientEvent (see page 18777)	Provides indexed access to the various event handlers that respond to client events.
	GetOnThreadEnd (see page 18777)	Returns the OnThreadEnd (see page 18788) event handler.
	GetOnThreadStart (see page 18778)	Returns the OnThreadStart (see page 18788) event handler.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetServerType (see page 18778)	Returns the ServerType (see page 18782) property.
	GetThreadCacheSize (see page 18778)	Returns the value of the ThreadCacheSize (see page 18783) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InitSocket (see page 18746)	Tells a Windows socket object to call the Error (see page 18745) and Event (see page 18746) methods.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.

	Loaded (see page 18747)	Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see page 18750) property.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActive (see page 18748)	Sets the Active (see page 18750) property.
	SetAddress (see page 18748)	Sets the Address (see page 18750) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetGetSocketEvent (see page 18779)	Sets the OnGetSocket (see page 18787) event handler.
	SetGetThreadEvent (see page 18779)	Sets the OnGetThread (see page 18787) event handler.
	SetHost (see page 18748)	Sets the Host (see page 18751) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnClientError (see page 18779)	Sets the OnClientError (see page 18785) event handler.
	SetOnClientEvent (see page 18780)	Sets the client event handlers of the associated TServerWinSocket (see page 18858) object.
	SetOnThreadEnd (see page 18780)	Sets the OnThreadEnd (see page 18788) event handler.
	SetOnThreadStart (see page 18781)	Sets the OnThreadStart (see page 18788) event handler.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetPort (see page 18749)	Sets the Port (see page 18751) property.
	SetServerType (see page 18781)	Sets the ServerType (see page 18782) property.
	SetService (see page 18749)	Sets the Service (see page 18752) property.
	SetThreadCacheSize (see page 18781)	Sets the ThreadCacheSize (see page 18783) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Active (see page 18750)	Indicates whether the socket connection is open and available for communication with other machines.
	Address (see page 18750)	Specifies the IP address of the server system.
	Host (see page 18751)	Specifies an alias for the IP address of the server system.
	Port (see page 18751)	Specifies the ID number that identifies the server socket connection.
	ServerType (see page 18782)	Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.
	Service (see page 18752)	Specifies the name of the service for which the socket connection is used.
	ThreadCacheSize (see page 18783)	Specifies the maximum number of threads that can be reused for new client connections.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.

	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 18744)	Shuts down the socket connection.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 18774)	Destroys an instance of TCustomServerSocket (see page 18770).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 18747)	Opens the socket connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

129.1.5.2 TCustomServerSocket.Destroy Destructor

Destroys an instance of TCustomServerSocket (see page 18770).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomServerSocket();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the server socket is not nil, and only then calls Destroy.

Destroy frees the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection.

See Also

Free (see page 22300)

TServerWinSocket (see page 18858)

129.1.5.3 TCustomServerSocket Fields

The fields of the TCustomServerSocket class are listed here.

Protected Fields

	Name	Description
	FServerSocket (see page 18775)	This is FServerSocket, a member of class TCustomServerSocket.

129.1.5.3.1 TCustomServerSocket.FServerSocket Field

Pascal

```
FServerSocket: TServerWinSocket;
```

C++

```
TServerWinSocket FServerSocket;
```

Description

This is FServerSocket, a member of class TCustomServerSocket.

129.1.5.4 TCustomServerSocket Methods

The methods of the TCustomServerSocket class are listed here.

Protected Methods

	Name	Description
V	DoActivate (see page 18775)	Opens or Closes the socket connection.
	GetGetSocketEvent (see page 18776)	Returns the OnGetSocket (see page 18787) event handler.
	GetGetThreadEvent (see page 18776)	Returns the OnGetThread (see page 18787) event handler.
	GetOnClientError (see page 18776)	Returns the OnClientError (see page 18785) event handler.
	GetOnClientEvent (see page 18777)	Provides indexed access to the various event handlers that respond to client events.
	GetOnThreadEnd (see page 18777)	Returns the OnThreadEnd (see page 18788) event handler.
	GetOnThreadStart (see page 18778)	Returns the OnThreadStart (see page 18788) event handler.
	GetServerType (see page 18778)	Returns the ServerType (see page 18782) property.
	GetThreadCacheSize (see page 18778)	Returns the value of the ThreadCacheSize (see page 18783) property.
	SetGetSocketEvent (see page 18779)	Sets the OnGetSocket (see page 18787) event handler.
	SetGetThreadEvent (see page 18779)	Sets the OnGetThread (see page 18787) event handler.
	SetOnClientError (see page 18779)	Sets the OnClientError (see page 18785) event handler.
	SetOnClientEvent (see page 18780)	Sets the client event handlers of the associated TServerWinSocket (see page 18858) object.
	SetOnThreadEnd (see page 18780)	Sets the OnThreadEnd (see page 18788) event handler.
	SetOnThreadStart (see page 18781)	Sets the OnThreadStart (see page 18788) event handler.
	SetServerType (see page 18781)	Sets the ServerType (see page 18782) property.
	SetThreadCacheSize (see page 18781)	Sets the ThreadCacheSize (see page 18783) property.

129.1.5.4.1 TCustomServerSocket.DoActivate Method

Opens or Closes the socket connection.

Pascal

```
procedure DoActivate(Value: Boolean); override;
```

C++

```
virtual __fastcall DoActivate(Boolean Value);
```

Description

DoActivate provides the underlying implementation of the Open (see page 18747) and Close (see page 18744) methods.

When Value is true, DoActivate opens a listening connection to accept connection requests. When Value is false, DoActivate terminates the current listening connection and any connections to client sockets.

See Also

Active (see page 18750)

Open (see page 18747)

Close (see page 18744)

129.1.5.4.2 TCustomServerSocket.GetGetSocketEvent Method

Returns the OnGetSocket (see page 18787) event handler.

Pascal

```
function GetGetSocketEvent: TGetSocketEvent;
```

C++

```
__fastcall TGetSocketEvent GetGetSocketEvent();
```

Description

Applications cannot call this protected method. GetGetSocketEvent returns the OnGetSocket (see page 18787) event handler of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection.

See Also

OnGetSocket (see page 18787)

OnGetSocket (see page 18874)

129.1.5.4.3 TCustomServerSocket.GetGetThreadEvent Method

Returns the OnGetThread (see page 18787) event handler.

Pascal

```
function GetGetThreadEvent: TGetThreadEvent;
```

C++

```
__fastcall TGetThreadEvent GetGetThreadEvent();
```

Description

Applications cannot call this protected method. GetGetThreadEvent returns the OnGetThread (see page 18787) event handler of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection.

See Also

OnGetThread (see page 18787)

OnGetThread (see page 18875)

129.1.5.4.4 TCustomServerSocket.GetOnClientError Method

Returns the OnClientError (see page 18785) event handler.

Pascal

```
function GetOnClientError: TSocketErrorEvent;
```

C++

```
__fastcall TSocketErrorEvent GetOnClientError();
```

Description

Applications cannot call this protected method. GetOnClientError returns the OnClientError (see page 18785) event handler of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection.

See Also

OnClientError (see page 18785)

OnClientError (see page 18872)

129.1.5.4.5 TCustomServerSocket.GetOnClientEvent Method

Provides indexed access to the various event handlers that respond to client events.

Pascal

```
function GetOnClientEvent(Index: Integer): TSocketNotifyEvent;
```

C++

```
__fastcall TSocketNotifyEvent GetOnClientEvent(int Index);
```

Description

Applications can't call this protected method. It is used internally to implement the event handlers that respond to client events.

See Also

OnClientRead (see page 18786)

OnClientWrite (see page 18786)

OnClientConnect (see page 18784)

OnClientDisconnect (see page 18785)

OnClientRead (see page 18873)

OnClientWrite (see page 18874)

OnClientConnect (see page 18871)

OnClientDisconnect (see page 18872)

129.1.5.4.6 TCustomServerSocket.GetOnThreadEnd Method

Returns the OnThreadEnd (see page 18788) event handler.

Pascal

```
function GetOnThreadEnd: TThreadNotifyEvent;
```

C++

```
__fastcall TThreadNotifyEvent GetOnThreadEnd();
```

Description

Applications cannot call this protected method. GetOnThreadEnd returns the OnThreadEnd (see page 18788) event handler of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection.

See Also

OnThreadEnd (see page 18788)

OnThreadEnd (see page 18875)

129.1.5.4.7 TCustomServerSocket.GetOnThreadStart Method

Returns the OnThreadStart (see page 18788) event handler.

Pascal

```
function GetOnThreadStart: TThreadNotifyEvent;
```

C++

```
__fastcall TThreadNotifyEvent GetOnThreadStart();
```

Description

Applications cannot call this protected method. GetOnThreadStart returns the OnThreadStart (see page 18788) event handler of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection.

See Also

OnThreadStart (see page 18788)

OnThreadStart (see page 18876)

129.1.5.4.8 TCustomServerSocket.GetServerType Method

Returns the ServerType (see page 18782) property.

Pascal

```
function GetServerType: TServerType;
```

C++

```
__fastcall TServerType GetServerType();
```

Description

Applications cannot call this protected method. GetServerType returns the value of the ServerType (see page 18782) property of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection.

See Also

ServerType (see page 18782)

ServerType (see page 18869)

129.1.5.4.9 TCustomServerSocket.GetThreadCacheSize Method

Returns the value of the ThreadCacheSize (see page 18783) property.

Pascal

```
function GetThreadCacheSize: Integer;
```

C++

```
__fastcall int GetThreadCacheSize();
```

Description

Applications cannot call this protected method. GetThreadCacheSize returns the value of the ThreadCacheSize (see page 18783) property of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection.

See Also

ThreadCacheSize (see page 18783)

ThreadCacheSize (see page 18870)

129.1.5.4.10 TCustomServerSocket.SetGetSocketEvent Method

Sets the OnGetSocket (see page 18787) event handler.

Pascal

```
procedure SetGetSocketEvent(Value: TGetSocketEvent);
```

C++

```
__fastcall SetGetSocketEvent(TGetSocketEvent Value);
```

Description

Applications cannot call this protected method. SetGetSocketEvent sets the OnGetSocket (see page 18787) event handler of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 18858) to implement their OnGetSocket (see page 18787) event.

See Also

OnGetSocket (see page 18787)

OnGetSocket (see page 18874)

129.1.5.4.11 TCustomServerSocket.SetGetThreadEvent Method

Sets the OnGetThread (see page 18787) event handler.

Pascal

```
procedure SetGetThreadEvent(Value: TGetThreadEvent);
```

C++

```
__fastcall SetGetThreadEvent(TGetThreadEvent Value);
```

Description

Applications cannot call this protected method. SetGetThreadEvent sets the OnGetThread (see page 18787) event handler of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 18858) to implement their OnGetThread (see page 18787) event.

See Also

OnGetThread (see page 18787)

OnGetThread (see page 18875)

129.1.5.4.12 TCustomServerSocket.SetOnClientError Method

Sets the OnClientError (see page 18785) event handler.

Pascal

```
procedure SetOnClientError(Value: TSocketErrorEvent);
```

C++

```
__fastcall SetOnClientError(TSocketErrorEvent Value);
```

Description

Applications cannot call this protected method. SetOnClientError sets the OnClientError (see page 18785) event handler of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 18858) to implement their OnClientError (see page 18785) event.

See Also

OnClientError (see page 18785)

OnClientError (see page 18872)

129.1.5.4.13 TCustomServerSocket.SetOnClientEvent Method

Sets the client event handlers of the associated TServerWinSocket (see page 18858) object.

Pascal

```
procedure SetOnClientEvent(Index: Integer; Value: TSocketNotifyEvent);
```

C++

```
__fastcall SetOnClientEvent(int Index, TSocketNotifyEvent Value);
```

Description

Applications cannot call this protected method. SetOnClientEvent sets the various event handlers that respond to events from the server endpoint of a client connection. Server socket components use TServerWinSocket (see page 18858) to implement these events.

See Also

OnClientRead (see page 18786)

OnClientWrite (see page 18786)

OnClientConnect (see page 18784)

OnClientDisconnect (see page 18785)

OnClientRead (see page 18873)

OnClientWrite (see page 18874)

OnClientConnect (see page 18871)

OnClientDisconnect (see page 18872)

129.1.5.4.14 TCustomServerSocket.SetOnThreadEnd Method

Sets the OnThreadEnd (see page 18788) event handler.

Pascal

```
procedure SetOnThreadEnd(Value: TThreadNotifyEvent);
```

C++

```
__fastcall SetOnThreadEnd(TThreadNotifyEvent Value);
```

Description

Applications cannot call this protected method. SetOnThreadEnd sets the OnThreadEnd (see page 18788) event handler of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 18858) to implement their OnThreadEnd (see page 18788) event.

See Also

OnThreadEnd (see page 18788)

OnThreadEnd (see page 18875)

129.1.5.4.15 TCustomServerSocket.SetOnThreadStart Method

Sets the OnThreadStart (see page 18788) event handler.

Pascal

```
procedure SetOnThreadStart(Value: TThreadNotifyEvent);
```

C++

```
__fastcall SetOnThreadStart(TThreadNotifyEvent Value);
```

Description

Applications cannot call this protected method. SetOnThreadStart sets the OnThreadEnd (see page 18788) event handler of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 18858) to implement their OnThreadEnd (see page 18788) event.

See Also

OnThreadStart (see page 18788)

OnThreadEnd (see page 18875)

129.1.5.4.16 TCustomServerSocket.SetServerType Method

Sets the ServerType (see page 18782) property.

Pascal

```
procedure SetServerType(Value: TServerType);
```

C++

```
__fastcall SetServerType(TServerType Value);
```

Description

Applications cannot call this protected method. SetServerType sets the ServerType (see page 18782) property of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 18858) to implement their ServerType (see page 18782) property.

See Also

ServerType (see page 18782)

ServerType (see page 18869)

129.1.5.4.17 TCustomServerSocket.SetThreadCacheSize Method

Sets the ThreadCacheSize (see page 18783) property.

Pascal

```
procedure SetThreadCacheSize(Value: Integer);
```

C++

```
__fastcall SetThreadCacheSize(int Value);
```

Description

Applications cannot call this protected method. SetThreadCacheSize sets the ThreadCacheSize (see page 18783) property of the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection. Server socket objects use TServerWinSocket (see page 18858) to implement their ThreadCacheSize (see page 18783) property.

See Also

ThreadCacheSize (see page 18783)

ThreadCacheSize (see page 18870)

129.1.5.5 TCustomServerSocket Properties

The properties of the TCustomServerSocket class are listed here.

Protected Properties

	Name	Description
	ServerType (see page 18782)	Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.
	ThreadCacheSize (see page 18783)	Specifies the maximum number of threads that can be reused for new client connections.

129.1.5.5.1 TCustomServerSocket.ServerType Property

Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.

Pascal

```
property ServerType: TServerType;
```

C++

```
__property TServerType ServerType;
```

Description

Set ServerType to stThreadBlocking to automatically spawn a new thread for each socket connection accepted by the server socket. When ServerType is stThreadBlocking, the execution of the connection thread is suspended while reading or writing until all information has been transferred over the connection. The thread for each connection generates OnClientRead (see page 18786) or OnClientWrite (see page 18786) events when the server socket needs to read or write.

Set ServerType to stNonBlocking to handle all reading and writing over the socket connections asynchronously. When ServerType is stNonBlocking, all client connections are handled in a single execution thread by default. OnClientRead (see page 18786) or OnClientWrite (see page 18786) events occur when the client socket on the other end of one of the connections tries to send or receive information over the connection.

Use a non-blocking socket when the socket needs to synchronize reading and writing with client sockets.

Note: When ServerType is stThreadBlocking, it is important that the OnClient... event handlers contain thread-safe code.

See Also

OnClientRead (see page 18786)

OnClientWrite (see page 18786)

TServerClientThread (see page 18831)

129.1.5.5.2 TCustomServerSocket.ThreadCacheSize Property

Specifies the maximum number of threads that can be reused for new client connections.

Pascal

```
property ThreadCacheSize: Integer;
```

C++

```
__property int ThreadCacheSize;
```

Description

When ServerType (see page 18782) is stThreadBlocking, each new connection that is accepted by the server socket is given a separate execution thread. In order to improve performance, server sockets store these threads in a cache rather than freeing them when the connection is closed. New connections can then reuse threads from the cache, rather than requiring the socket server to create a new thread every time a connection is accepted.

Set ThreadCacheSize to specify the number of threads that are cached for reuse. The ideal value for ThreadCacheSize depends on the number and frequency of client socket requests received by the server socket. If ThreadCacheSize is too low, the server socket will spend more time freeing and creating threads when client connections are accepted. If ThreadCacheSize is too high, the server socket may unnecessarily lock up the memory for threads that are never reused.

See Also

ServerType (see page 18782)

TServerClientThread (see page 18831)

ActiveThreads (see page 18867)

IdleThreads (see page 18869)

129.1.5.6 TCustomServerSocket Events

The events of the TCustomServerSocket class are listed here.

Protected Events

	Name	Description
	OnClientConnect (see page 18784)	Occurs when a client socket completes a connection accepted by the server socket.
	OnClientDisconnect (see page 18785)	Occurs when one of the connections to a client socket is closed.
	OnClientError (see page 18785)	Occurs when there is a failure in establishing, using, or terminating the socket connection to an individual client socket.
	OnClientRead (see page 18786)	Occurs when the server socket should read information from a client socket.
	OnClientWrite (see page 18786)	Occurs when the server socket should write information to a client socket.
	OnGetSocket (see page 18787)	Occurs when the server socket needs to create a new TServerClientWinSocket (see page 18840) object to represent the server endpoint of a connection to a client socket.
	OnGetThread (see page 18787)	Occurs when the server socket needs to create a new execution thread for a connection to a client socket.

	OnThreadEnd (see page 18788)	Occurs when a client socket connection is terminated and the associated thread finishes execution.
	OnThreadStart (see page 18788)	Occurs when the execution thread for a connection to a client socket starts up.

129.1.5.6.1 TCustomServerSocket.OnClientConnect Event

Occurs when a client socket completes a connection accepted by the server socket.

Pascal

```
property OnClientConnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientConnect;
```

Description

Write an OnClientConnect event handler to take specific action when a client socket completes the socket connection to the server socket. For example, the socket may start reading or writing over the connection in an OnClientConnect event handler.

The order of server socket events leading up to OnClientConnect is as follows:

1An OnListen (see page 18797) event occurs just before the server socket is opened for listening.

2The server socket receives client requests in a listening queue. The server socket accepts one of those requests, and receives a Windows socket handle for the new socket connection.

3The server socket generates an OnGetSocket (see page 18787) event, passing in the Windows socket handle. If a TServerClientWinSocket (see page 18840) object for the server endpoint of the new connection is not created in an OnGetSocket (see page 18787) event handler, the server socket creates one. The TServerWinSocket (see page 18858) object continues to listen for other clients.

4An OnAccept (see page 18795) event occurs, using the new TServerClientWinSocket (see page 18840) object.

5If ServerType (see page 18782) is stThreadBlocking and no thread is available in the cache, an OnGetThread (see page 18787) event occurs. If the OnGetThread (see page 18787) event handler does not create a thread, the server socket creates a TServerClientThread (see page 18831).

6If ServerType (see page 18782) is stThreadBlocking, an OnThreadStart (see page 18788) event occurs as the thread begins execution.

7The client completes the connection to the TServerClientWinSocket (see page 18840) object and an OnClientConnect event occurs.

Note: If ServerType (see page 18782) is stThreadBlocking, make sure that all code in an OnClientConnect event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

Note: The OnClientConnect event handler for TServerSocket (see page 18843) is also set when setting the OnClientConnect event handler of the associated TServerWinSocket (see page 18858).

GetClientThread (see page 18865)

129.1.5.6.2 TCustomServerSocket.OnClientDisconnect Event

Occurs when one of the connections to a client socket is closed.

Pascal

```
property OnClientDisconnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientDisconnect;
```

Description

Write an OnClientDisconnect event handler to take specific action when the connection to a client socket is ending. The termination of a client connection does not close the server socket. The server socket remains open and listening for client requests on its listening connection.

The TServerClientWinSocket (see page 18840) that describes the server endpoint of the client connection is freed after OnClientDisconnect. If ServerType (see page 18782) is stThreadBlocking, OnThreadEnd (see page 18788) occurs after OnClientDisconnect.

Note: If ServerType (see page 18782) is stThreadBlocking, make sure that all code in an OnClientDisconnect event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

Note: The OnClientDisconnect event handler for TServerSocket (see page 18843) is also set when setting the OnClientDisconnect event handler of the associated TServerWinSocket (see page 18858).

See Also

OnThreadEnd (see page 18788)

ServerType (see page 18782)

TServerClientWinSocket (see page 18840)

TServerWinSocket (see page 18858)

GetClientThread (see page 18865)

129.1.5.6.3 TCustomServerSocket.OnClientError Event

Occurs when there is a failure in establishing, using, or terminating the socket connection to an individual client socket.

Pascal

```
property OnClientError: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnClientError;
```

Description

Write an OnClientError event handler to respond to errors that arise with a connection to an individual client. Set the ErrorCode

parameter to 0 if the OnClientError event handler successfully deals with the error condition to prevent an ESocketError (see page 18739) from being raised.

Note: If ServerType (see page 18782) is stThreadBlocking, make sure that all code in an OnClientError event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

Note: The OnClientError event handler for TServerSocket (see page 18843) is also set when setting the OnClientError event handler of the associated TServerWinSocket (see page 18858).

See Also

ESocketError

ServerType (see page 18782)

TServerClientWinSocket (see page 18840)

GetClientThread (see page 18865)

129.1.5.6.4 TCustomServerSocket.OnClientRead Event

Occurs when the server socket should read information from a client socket.

Pascal

```
property OnClientRead: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientRead;
```

Description

Write an OnClientRead event handler to write to the socket connection. If the ServerType (see page 18782) property is stThreadBlocking, use a TWinSocketStream (see page 18876) object to prevent problems that arise while writing from causing the execution thread to hang indefinitely. Otherwise, uUse the methods of the Socket parameter to perform the actual writing.

Note: If ServerType (see page 18782) is stThreadBlocking, make sure that all code in an OnClientRead event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

ReceiveText (see page 18812)

TServerClientWinSocket (see page 18840)

GetClientThread (see page 18865)

TWinSocketStream (see page 18876)

129.1.5.6.5 TCustomServerSocket.OnClientWrite Event

Occurs when the server socket should write information to a client socket.

Pascal

```
property OnClientWrite: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientWrite;
```

Description

Write an OnClientWrite event handler to write to the socket connection. If the ServerType (see page 18782) property is stThreadBlocking, use a TWinSocketStream (see page 18876) object to prevent problems that arise while writing from causing the execution thread to hang indefinitely. Otherwise, uUse the methods of the Socket parameter to perform the actual writing.

Note: If ServerType (see page 18782) is stThreadBlocking, make sure that all code in an OnClientWrite event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

See Also

ServerType (see page 18782)

SendBuf (see page 18813)

sendstream (see page 18814)

SendText (see page 18814)

GetClientThread (see page 18865)

TWinSocketStream (see page 18876)

129.1.5.6.6 TCustomServerSocket.OnGetSocket Event

Occurs when the server socket needs to create a new TServerClientWinSocket (see page 18840) object to represent the server endpoint of a connection to a client socket.

Pascal

```
property OnGetSocket: TGetSocketEvent;
```

C++

```
__property TGetSocketEvent OnGetSocket;
```

Description

Write an OnGetSocket event handler to create a specialized descendant of TServerClientWinSocket (see page 18840) for the server socket component to use. Return the new TServerClientWinSocket (see page 18840) object in the ClientSocket parameter. The Sender parameter is the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection.

See Also

TServerClientWinSocket (see page 18840)

Create (see page 18842)

TServerWinSocket (see page 18858)

129.1.5.6.7 TCustomServerSocket.OnGetThread Event

Occurs when the server socket needs to create a new execution thread for a connection to a client socket.

Pascal

```
property OnGetThread: TGetThreadEvent;
```

C++

```
__property TGetThreadEvent OnGetThread;
```

Description

Write an OnGetThread event handler to create a specialized descendant of TServerClientThread (see page 18831) for the connection to the client socket. Return the new TServerClientThread (see page 18831) object in the SocketThread parameter.

Most applications that use thread-blocking server components will want to provide an OnGetThread event handler and implement a TServerClientThread (see page 18831) that handles its own reading and writing in a thread-safe manner rather than relying on the default TServerClientThread (see page 18831) which triggers OnClientRead (see page 18786) and OnClientWrite (see page 18786) events. This is because the OnClientRead (see page 18786) and OnClientWrite (see page 18786) event handlers reside on the server socket, which is in global memory.

The Sender parameter is the TServerWinSocket (see page 18858) object that describes the server endpoint of the listening connection. The ClientSocket parameter is the TServerClientWinSocket (see page 18840) object that describes the server endpoint of the connection to the client socket that is about to be formed.

See Also

ServerType (see page 18782)

TServerClientThread (see page 18831)

TServerClientWinSocket (see page 18840)

TServerWinSocket (see page 18858)

129.1.5.6.8 TCustomServerSocket.OnThreadEnd Event

Occurs when a client socket connection is terminated and the associated thread finishes execution.

Pascal

```
property OnThreadEnd: TThreadNotifyEvent;
```

C++

```
__property TThreadNotifyEvent OnThreadEnd;
```

Description

Write an OnThreadEnd to take specific action when the thread for a client connection finishes execution. OnThreadEnd occurs after the OnClientDisconnect (see page 18785) event.

The Sender parameter is the TServerWinSocket (see page 18858) that describes the server endpoint of the listening connection. The Thread parameter is the thread that is finishing up.

See Also

OnClientDisconnect (see page 18785)

TServerWinSocket (see page 18858)

129.1.5.6.9 TCustomServerSocket.OnThreadStart Event

Occurs when the execution thread for a connection to a client socket starts up.

Pascal

```
property OnThreadStart: TThreadNotifyEvent;
```

C++

```
__property TThreadNotifyEvent OnThreadStart;
```

Description

Write an OnThreadStart to initialize the TServerClientThread (see page 18831) for the connection to a single client socket. The Sender parameter is the TServerWinSocket (see page 18858) that describes the server endpoint of the listening connection. The Thread parameter is the thread that is about to start execution.

See Also

TServerClientThread (see page 18831)

TServerWinSocket (see page 18858)

129.1.6 TCustomSocket Class

TCustomSocket is the base class for socket components.

Class Hierarchy

Pascal

```
TCustomSocket = class(TAbstractSocket);
```

C++

```
class TCustomSocket : public TAbstractSocket;
```

File

ScktComp

Description

Override TCustomSocket to create a socket component that can be assigned event handlers for the events and error conditions that occur. In addition to the properties and methods introduced by TAbstractSocket (see page 18740) that enable an application to work with Windows sockets, TCustomSocket introduces several events that can be used by applications.

Do not create instances of TCustomSocket. Use a descendant of TCustomSocket to add the ability to communicate with other machines using TCP/IP. To create a socket that initiates the connection with another machine, use TClientSocket (see page 18752). To create a socket that responds to requests for connections from other machines, use TServerSocket (see page 18843).

See Also

TClientSocket (see page 18752)

TCustomWinSocket (see page 18799)

TServerSocket (see page 18843)

129.1.6.1 TCustomSocket Members

The following tables list the members exposed by TCustomSocket.

Protected Events

	Name	Description
	OnAccept (see page 18795)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnConnect (see page 18795)	Occurs on client sockets just after the connection to the server is opened.
	OnConnecting (see page 18796)	Occurs for a client socket after the server socket has been located, but before the connection is established.
	OnDisconnect (see page 18796)	Occurs just before a client socket closes the connection to a server socket.
	OnError (see page 18797)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnListen (see page 18797)	Occurs just before a server socket is opened for listening.
	OnLookup (see page 18797)	Occurs when a client socket is about to look up the server socket with which it wants to connect.
	OnRead (see page 18798)	Occurs when a client socket should read information from the socket connection.
	OnWrite (see page 18799)	Occurs when a client socket should write information to the socket connection.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
A	DoActivate (see page 18744)	Provides the prototype of a method to open or close the socket connection.
V	Error (see page 18793)	Generates an OnError (see page 18797) event.
V	Event (see page 18794)	Dispatches the events that occur in the normal operation of the socket to the appropriate event handlers.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InitSocket (see page 18746)	Tells a Windows socket object to call the Error (see page 18745) and Event (see page 18746) methods.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 18747)	Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see page 18750) property.
V	Notification (see page 2783)	Forwards notification messages to all owned components.

	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActive (see page 18748)	Sets the Active (see page 18750) property.
	SetAddress (see page 18748)	Sets the Address (see page 18750) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHost (see page 18748)	Sets the Host (see page 18751) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetPort (see page 18749)	Sets the Port (see page 18751) property.
	SetService (see page 18749)	Sets the Service (see page 18752) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Active (see page 18750)	Indicates whether the socket connection is open and available for communication with other machines.
	Address (see page 18750)	Specifies the IP address of the server system.
	Host (see page 18751)	Specifies an alias for the IP address of the server system.
	Port (see page 18751)	Specifies the ID number that identifies the server socket connection.
	Service (see page 18752)	Specifies the name of the service for which the socket connection is used.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 18744)	Shuts down the socket connection.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.

V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 18747)	Opens the socket connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

129.1.6.2 TCustomSocket Methods

The methods of the TCustomSocket class are listed here.

Protected Methods

	Name	Description
V	Error (see page 18793)	Generates an OnError (see page 18797) event.
V	Event (see page 18794)	Dispatches the events that occur in the normal operation of the socket to the appropriate event handlers.

129.1.6.2.1 TCustomSocket.Error Method

Generates an OnError (see page 18797) event.

Pascal

```
procedure Error(Socket: TCustomWinSocket; ErrorEvent: TErrorEvent; var ErrorCode: Integer);
override;
```

C++

```
virtual __fastcall Error(TCustomWinSocket Socket, TErrorEvent ErrorEvent, int ErrorCode);
```

Description

Applications cannot call Error. It responds to error conditions by calling the OnError (see page 18797) event handler if it is assigned. Override Error to add class-specific error processing or to block the OnError (see page 18797) event.

The Socket parameter indicates the Windows socket object which encounters the error condition.

The ErrorEvent parameter indicates what the socket was trying to do when the error occurred. It has one of the following values:

Value	Meaning
eeGeneral	The socket received an error message that does not fit into any of the following categories.
eeSend	An error occurred when trying to write to the socket connection.
eeReceive	An error occurred when trying to read from the socket connection.
eeConnect	For client sockets, this indicates that the client socket can't locate the server, or that a problem on the server prevents the opening of a connection. For server sockets, this indicates that a client connection request that has already been accepted could not be completed.
eeDisconnect	An error occurred when trying to close a connection.
eeAccept	For server sockets only, this indicates that a problem occurred when trying to accept a client connection request.

The ErrorCode parameter is the error code received by the Windows socket object. Setting this value to 0 in the Error method prevents the socket from raising an exception. For information on possible error codes, see the Microsoft documentation on Windows sockets.

See Also

OnError (see page 18797)

129.1.6.2.2 TCustomSocket.Event Method

Dispatches the events that occur in the normal operation of the socket to the appropriate event handlers.

Pascal

```
procedure Event(Socket: TCustomWinSocket; SocketEvent: TSocketEvent); override;
```

C++

```
virtual __fastcall Event(TCustomWinSocket Socket, TSocketEvent SocketEvent);
```

Description

Applications cannot call Event. It is called automatically when various events occur. Override Event to introduce class-specific responses when certain events occur or to prevent the socket from calling the associated event handler.

The Socket parameter indicates the Windows socket object that calls Event to indicate when specific events occur.

The SocketEvent parameter indicates the event that occurred.

See Also

OnAccept (see page 18795)

OnConnect (see page 18795)

OnConnecting (see page 18796)

OnDisconnect (see page 18796)

OnListen (see page 18797)

OnLookup (see page 18797)

OnRead (see page 18798)

OnWrite (see page 18799)

129.1.6.3 TCustomSocket Events

The events of the TCustomSocket class are listed here.

Protected Events

	Name	Description
	OnAccept (see page 18795)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnConnect (see page 18795)	Occurs on client sockets just after the connection to the server is opened.
	OnConnecting (see page 18796)	Occurs for a client socket after the server socket has been located, but before the connection is established.
	OnDisconnect (see page 18796)	Occurs just before a client socket closes the connection to a server socket.
	OnError (see page 18797)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnListen (see page 18797)	Occurs just before a server socket is opened for listening.
	OnLookup (see page 18797)	Occurs when a client socket is about to look up the server socket with which it wants to connect.

	OnRead (see page 18798)	Occurs when a client socket should read information from the socket connection.
	OnWrite (see page 18799)	Occurs when a client socket should write information to the socket connection.

129.1.6.3.1 TCustomSocket.OnAccept Event

Occurs on server sockets just after the connection to a client socket is accepted.

Pascal

```
property OnAccept: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnAccept;
```

Description

Write an OnAccept event handler for a server socket to take specific action after the connection to a client socket has been accepted. This is the first point when information is available about the local port and IP address that will be used in the server endpoint of the connection. The port number, and possibly the IP address, will differ from those of the listening socket.

Server sockets open a socket connection for listening to establish a queue to hold client requests. After a request from the queue is accepted by the server socket, an OnAccept event occurs. After the server socket accepts the connection, the client socket completes the connection, and an OnConnect (see page 18795) event occurs for the client socket.

See Also

OnConnect (see page 18795)

OnListen (see page 18797)

129.1.6.3.2 TCustomSocket.OnConnect Event

Occurs on client sockets just after the connection to the server is opened.

Pascal

```
property OnConnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnConnect;
```

Description

Write an OnConnect event handler for a client socket to take specific action after the connection to a server socket has been established. Depending on the service, this may be the point when the socket should start reading or writing over the connection.

When a client socket opens a connection, the following events occur:

1An OnLookup (see page 18797) event occurs prior to an attempt to locate the server socket.

2The Windows socket is set up, and initialized for event notification.

3An OnConnecting (see page 18796) event occurs after the server socket is located.

4The connection request is accepted by the server and completed by the client socket.

5An OnConnect event occurs after the connection is established.

See Also

OnAccept (see page 18795)

OnConnecting (see page 18796)

OnLookup (see page 18797)

129.1.6.3.3 TCustomSocket.OnConnecting Event

Occurs for a client socket after the server socket has been located, but before the connection is established.

Pascal

```
property OnConnecting: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnConnecting;
```

Description

Write an OnConnecting event handler for a client socket to take specific action just before the connection to a server socket is established. This is the first opportunity to obtain the actual port and IP address of the server endpoint of the connection that is about to form.

When a client socket opens a connection, the following events occur:

1An OnLookup (see page 18797) event occurs prior to an attempt to locate the server socket.

2The Windows socket is set up, and initialized for event notification.

3An OnConnecting event occurs after the server socket is located.

4The connection request is accepted by the server and completed by the client socket.

5An OnConnect (see page 18795) event occurs after the connection is established.

See Also

OnConnect (see page 18795)

OnLookup (see page 18797)

129.1.6.3.4 TCustomSocket.OnDisconnect Event

Occurs just before a client socket closes the connection to a server socket.

Pascal

```
property OnDisconnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnDisconnect;
```

Description

Write an OnDisconnect event handler to take specific action when the connection to a server socket is about to be terminated. OnDisconnect occurs after the value of the Active (see page 18750) property is set to false, but before the actual connection is closed.

See Also

Active (see page 18750)

Close (see page 18744)

OnConnect (see page 18795)

129.1.6.3.5 TCustomSocket.OnError Event

Occurs when the socket fails in making, using, or shutting down a connection.

Pascal

```
property OnError: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnError;
```

Description

Write an OnError event handler to respond to errors that arise with the socket connection. Set the ErrorCode parameter to 0 if the OnError event handler successfully deals with the error condition, to prevent an ESocketError (see page 18739) from being raised.

See Also

ESocketError

129.1.6.3.6 TCustomSocket.OnListen Event

Occurs just before a server socket is opened for listening.

Pascal

```
property OnListen: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnListen;
```

Description

Write an OnListen event handler for a server socket to take specific action just before the socket is opened for listening. OnListen occurs after Address (see page 18750) and Port (see page 18751) have been bound to the socket connection, but before it is opened. This is the last opportunity to make changes to the socket endpoint before it is opened for listening. Use the SocketHandle property of the Socket parameter for Windows API calls that change the socket.

Server sockets open a socket connection for listening to establish a queue to hold client requests. The connection to a client socket is completed when a request from the queue is accepted.

See Also

Accept (see page 18803)

Address (see page 18750)

Port (see page 18751)

129.1.6.3.7 TCustomSocket.OnLookup Event

Occurs when a client socket is about to look up the server socket with which it wants to connect.

Pascal

```
property OnLookup: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnLookup;
```

Description

Write an OnLookup event handler for a client socket to take specific action just before attempting to locate a server socket. This is the first opportunity to make Windows API calls that affect the client properties of the socket, such as specifying a particular port number. Use the SocketHandle property of the Socket parameter for Windows API calls.

When a client socket opens a connection, the following events occur:

1An OnLookup event occurs prior to an attempt to locate the server socket.

2The Windows socket is set up, and initialized for event notification.

3An OnConnecting (see page 18796) event occurs after the server socket is located.

4The connection request is accepted by the server and completed by the client socket.

5An OnConnect (see page 18795) event occurs after the connection is established.

Note: Changing the Address (see page 18750), Host (see page 18751), Port (see page 18751), or Service (see page 18752) properties of socket component in an OnLookup event handler has no effect on the address or port used to locate a server socket. These properties must be correct before the Open (see page 18747) method is called.

See Also

Address (see page 18750)

Host (see page 18751)

OnConnect (see page 18795)

OnConnecting (see page 18796)

Open (see page 18747)

Port (see page 18751)

Service (see page 18752)

129.1.6.3.8 TCustomSocket.OnRead Event

Occurs when a client socket should read information from the socket connection.

Pascal

```
property OnRead: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnRead;
```

Description

Write an OnRead event handler to read from the socket connection. If the socket is a blocking socket, use a TWinSocketStream (see page 18876) object to read from the connection. Otherwise, u Use the methods of the Socket parameter to perform the actual reading.

Note: Non-blocking sockets do not always receive an OnRead event for the last bit of data passed over the connection. When using a non-blocking socket, check for any unread data in the OnDisconnect (see page 18796) event to make sure that everything is handled.

See Also

receivebuf (see page 18812)

ReceiveText (see page 18812)

TWinSocketStream (see page 18876)

OnDisconnect (see page 18796)

129.1.6.3.9 TCustomSocket.OnWrite Event

Occurs when a client socket should write information to the socket connection.

Pascal

```
property OnWrite: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnWrite;
```

Description

Write an OnWrite to write from the socket connection. If the socket is a blocking socket, use a TWinSocketStream (see page 18876) object to write to the connection. Otherwise, u Use the methods of the Socket parameter to perform the actual writing.

See Also

SendBuf (see page 18813)

sendstream (see page 18814)

SendStreamThenDrop (see page 18814)

SendText (see page 18814)

TWinSocketStream (see page 18876)

129.1.7 TCustomWinSocket Class

TCustomWinSocket is the base class for all Windows socket objects.

Class Hierarchy

Pascal

```
TCustomWinSocket = class;
```

C++

```
class TCustomWinSocket;
```

File

ScktComp

Description

TCustomWinSocket introduces properties, events, and methods to describe an endpoint in a Windows socket connection. Descendants of TCustomWinSocket are used by socket components to manage the Windows socket API calls and to store information about a socket communication link.

A Windows socket encapsulates a set of communication protocols to allow the application to connect to other machines for reading or writing information. Windows sockets provide connections based on the TCP/IP protocol. They also allow connections that use the Xerox Network System (see page 22079) (XNS), Digital's DECnet protocol, or Novell's IPX/SPX family. Sockets (see page 20039) allow an application to form connections to other machines without being concerned with the details of the

actual networking software.

Descendants of TCustomWinSocket represent different endpoints in socket connections. TClientWinSocket (see page 18766) represents the client endpoint of a socket communication link to a server socket. TServerWinSocket (see page 18858) represents the server endpoint of a listening connection. TServerClientWinSocket (see page 18840) represents the server endpoint of a socket communication link to a client socket.

See Also

TAbstractSocket (see page 18740)

TClientWinSocket (see page 18766)

TServerClientWinSocket (see page 18840)

TServerWinSocket (see page 18858)

129.1.7.1 TCustomWinSocket Members

The following tables list the members exposed by TCustomWinSocket.

Protected Methods

	Name	Description
	AsyncInitSocket (see page 18803)	Looks up information or forms socket connections asynchronously.
	DoListen (see page 18806)	Opens a listening connection.
	DoOpen (see page 18806)	Opens a connection to a remote socket.
	Error (see page 18806)	Generates an OnErrorEvent (see page 18824) event.
	Event (see page 18807)	This is Event, a member of class TCustomWinSocket.
	InitSocket (see page 18807)	Generates a windows Internet socket address structure from a description of the desired socket port.
	SetAsyncStyles (see page 18815)	Sets the AsyncStyles property.

Public Events

	Name	Description
	OnErrorEvent (see page 18824)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnSocketEvent (see page 18824)	Occurs when the Windows socket receives notification of asynchronous events.

Public Methods

	Name	Description
	Accept (see page 18803)	Provides the interface for a method that accepts a connection to a client socket.
	Close (see page 18804)	Shuts down the socket connection if it is open.
	Connect (see page 18805)	Provides the interface for a method that responds to connection notifications from client sockets.
	Create (see page 18801)	Creates an instance of TCustomWinSocket (see page 18799) from a Windows socket handle.
	DefaultHandler (see page 18805)	Processes message records.
	Destroy (see page 18802)	Destroys an instance of TCustomWinSocket (see page 18799).
	Disconnect (see page 18805)	Shuts down the socket connection represented by a Windows socket handle.
	Listen (see page 18808)	Opens a listening connection for a server socket.
	Lock (see page 18809)	Starts a critical section, blocking all other execution threads until the Unlock (see page 18815) method is called.
	LookupName (see page 18809)	Generates the portion of a Windows Internet socket address structure that describes the host.
	LookupService (see page 18810)	Returns the port number associated with a specific service.
	Open (see page 18810)	Opens a connection to a remote socket.
	Read (see page 18811)	Generates an OnSocketEvent (see page 18824) of type seRead in response to notifications that the socket connection is ready.

	ReceiveBuf (see page 18812)	This is ReceiveBuf, a member of class TCustomWinSocket.
	ReceiveLength (see page 18812)	Returns the number of bytes ready to be sent over the socket connection.
	ReceiveText (see page 18812)	Reads a string from the socket connection.
	SendBuf (see page 18813)	Writes Count bytes to the socket connection from the Buf parameter.
	SendStream (see page 18814)	This is SendStream, a member of class TCustomWinSocket.
	SendStreamThenDrop (see page 18814)	Writes all the information that can be read from the AStream parameter to the socket connection and then terminates the connection.
	SendText (see page 18814)	Writes the string S to the socket connection.
	Unlock (see page 18815)	Reenables execution in other threads after a critical section begun by the Lock (see page 18809) method.
V	Write (see page 18816)	Generates an OnSocketEvent (see page 18824) of type seWrite in response to notifications that the socket connection is ready.

Public Properties

	Name	Description
R	Addr (see page 18817)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the socket port.
	ASyncStyles (see page 18817)	Determines which asynchronous events the socket can receive.
R	Connected (see page 18818)	Indicates whether the socket connection is open and available for communication with other machines.
	Data (see page 18818)	Points to application-specific data associated with the socket.
R	Handle (see page 18819)	Specifies the handle of the window that receives notifications from the Windows socket.
R	LocalAddress (see page 18819)	Specifies the IP address of the local system that was bound to the socket connection.
R	LocalHost (see page 18820)	Specifies the name of the local system.
R	LocalPort (see page 18820)	Specifies the ID number of the port used by the socket connection.
R	LookupState (see page 18821)	Indicates any asynchronous activities occurring while opening a connection.
R	RemoteAddr (see page 18821)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the remote socket port.
R	RemoteAddress (see page 18822)	Specifies the IP address of the remote system that was bound to the socket connection.
R	RemoteHost (see page 18822)	Specifies the name of the remote system.
R	RemotePort (see page 18823)	Specifies the ID number of the port used by the RemoteHost (see page 18822) to form the socket connection.
R	SocketHandle (see page 18823)	Specifies the Windows handle for the socket.

129.1.7.2 TCustomWinSocket.Create Constructor

Creates an instance of TCustomWinSocket (see page 18799) from a Windows socket handle.

Pascal

```
constructor Create(ASocket: TSocket);
```

C++

```
__fastcall TCustomWinSocket(TSocket ASocket);
```

Description

Call Create to create a Windows socket object. Most Windows socket objects are created automatically by the socket component that uses them. Applications may create their own Windows socket objects in an OnGetSocket event handler for a server socket component.

After calling the inherited constructor, Create

Makes sure that Winsock.dll is initialized.

Allocates helper objects to manage multithreading issues.

Initializes ASyncStyles (see page 18817) to [asRead, asWrite, asConnect, asClose]

Initializes the SocketHandle (see page 18823) property to the ASocket parameter and sets the Connected (see page 18818) property to reflect whether ASocket is the handle of a valid open Windows socket.

Initializes the Addr (see page 18817) property.

See Also

Addr (see page 18817)

ASyncStyles (see page 18817)

Connected (see page 18818)

SocketHandle (see page 18823)

OnGetSocket (see page 18787)

129.1.7.3 TCustomWinSocket.Destroy Destructor

Destroys an instance of TCustomWinSocket (see page 18799).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWinSocket();
```

Description

Most applications do not need to explicitly free Windows socket objects. They are freed by the socket components that use them.

See Also

Free (see page 22300)

TCustomSocket (see page 18789)

129.1.7.4 TCustomWinSocket Methods

The methods of the TCustomWinSocket class are listed here.

Protected Methods

	Name	Description
	AsyncInitSocket (see page 18803)	Looks up information or forms socket connections asynchronously.
	DoListen (see page 18806)	Opens a listening connection.
	DoOpen (see page 18806)	Opens a connection to a remote socket.
	Error (see page 18806)	Generates an OnErrorEvent (see page 18824) event.
	Event (see page 18807)	This is Event, a member of class TCustomWinSocket.
	InitSocket (see page 18807)	Generates a windows Internet socket address structure from a description of the desired socket port.
	SetAsyncStyles (see page 18815)	Sets the AsyncStyles property.

Public Methods

	Name	Description
V	Accept (see page 18803)	Provides the interface for a method that accepts a connection to a client socket.
	Close (see page 18804)	Shuts down the socket connection if it is open.

	Connect (see page 18805)	Provides the interface for a method that responds to connection notifications from client sockets.
	DefaultHandler (see page 18805)	Processes message records.
	Disconnect (see page 18805)	Shuts down the socket connection represented by a Windows socket handle.
	Listen (see page 18808)	Opens a listening connection for a server socket.
	Lock (see page 18809)	Starts a critical section, blocking all other execution threads until the Unlock (see page 18815) method is called.
	LookupName (see page 18809)	Generates the portion of a Windows Internet socket address structure that describes the host.
	LookupService (see page 18810)	Returns the port number associated with a specific service.
	Open (see page 18810)	Opens a connection to a remote socket.
	Read (see page 18811)	Generates an OnSocketEvent (see page 18824) of type seRead in response to notifications that the socket connection is ready.
	ReceiveBuf (see page 18812)	This is ReceiveBuf, a member of class TCustomWinSocket.
	ReceiveLength (see page 18812)	Returns the number of bytes ready to be sent over the socket connection.
	ReceiveText (see page 18812)	Reads a string from the socket connection.
	SendBuf (see page 18813)	Writes Count bytes to the socket connection from the Buf parameter.
	SendStream (see page 18814)	This is SendStream, a member of class TCustomWinSocket.
	SendStreamThenDrop (see page 18814)	Writes all the information that can be read from the AStream parameter to the socket connection and then terminates the connection.
	SendText (see page 18814)	Writes the string S to the socket connection.
	Unlock (see page 18815)	Reenables execution in other threads after a critical section begun by the Lock (see page 18809) method.
	Write (see page 18816)	Generates an OnSocketEvent (see page 18824) of type seWrite in response to notifications that the socket connection is ready.

129.1.7.4.1 TCustomWinSocket.Accept Method

Provides the interface for a method that accepts a connection to a client socket.

Pascal

```
procedure Accept(Socket: TSocket); virtual;
```

C++

```
virtual __fastcall Accept(TSocket Socket);
```

Description

Accept is called automatically in response to notifications that a client socket is requesting a connection. The Socket parameter is the Windows socket handle for the socket that receives the notification.

The Accept method for TCustomWinSocket (see page 18799) does nothing with the notification. Descendants of TCustomWinSocket (see page 18799) that represent listening server sockets override this method to accept the connection to the client socket.

Accept is only called if the ASyncStyles (see page 18817) property includes asAccept.

See Also

ASyncStyles (see page 18817)

129.1.7.4.2 TCustomWinSocket.AsyncInitSocket Method

Looks up information or forms socket connections asynchronously.

Pascal

```
procedure AsyncInitSocket(const Name: string; const Address: string; const Service: string;
Port: Word; QueueSize: Integer; Client: Boolean);
```

C++

```
__fastcall AsyncInitSocket(const AnsiString Name, const AnsiString Address, const AnsiString Service, Word Port, int QueueSize, Boolean Client);
```

Description

AsyncInitSocket is used internally to open a socket connection in non-blocking sockets. It is called by the Open (see page 18810) or Listen (see page 18808) method when that method's Block parameter is false.

The Name parameter is the host name for the socket. The Address parameter is the IP address. The Service parameter is the service for which the socket is to used. The Port parameter is the port number for the socket. The QueueSize parameter indicates the number of client requests a listening connection can hold while waiting to form connections. The Client parameter indicates whether the socket address structure is to be used by a client socket to describe the destination of a connection or by a server socket to describe the listening connection.

See Also

ASyncStyles (see page 18817)

ServerType (see page 18869)

ClientType (see page 18769)

Addr (see page 18817)

Listen (see page 18808)

LookupName (see page 18809)

LookupService (see page 18810)

Open (see page 18810)

RemoteAddr (see page 18821)

Address (see page 18750)

Host (see page 18751)

Port (see page 18751)

Service (see page 18752)

129.1.7.4.3 TCustomWinSocket.Close Method

Shuts down the socket connection if it is open.

Pascal

```
procedure Close;
```

C++

```
__fastcall Close();
```

Description

Call Close to terminate an open socket connection. Close triggers an OnSocketEvent (see page 18824) of type seDisconnect before the connection is shut down. If the Windows socket is a listening server socket, Close shuts down all open connections to client sockets before shutting down the listening connection.

See Also

Connected (see page 18818)

OnSocketEvent (see page 18824)

129.1.7.4.4 TCustomWinSocket.Connect Method

Provides the interface for a method that responds to connection notifications from client sockets.

Pascal

```
procedure Connect(Socket: TSocket); virtual;
```

C++

```
virtual __fastcall Connect(TSocket Socket);
```

Description

Connect is called automatically in response to notifications that the client socket has successfully completed a connection to a server socket. The Socket parameter is the Windows socket handle for the socket that receives the notification.

The Connect method for TCustomWinSocket (see page 18799) does nothing with the notification. Descendants of TCustomWinSocket (see page 18799) that represent client sockets override this method to respond to connection notifications.

Connect is only called if the ASyncStyles (see page 18817) property includes asConnect.

See Also

ASyncStyles (see page 18817)

129.1.7.4.5 TCustomWinSocket.DefaultHandler Method

Processes message records.

Pascal

```
procedure DefaultHandler(var Message); override;
```

C++

```
virtual __fastcall DefaultHandler( Message);
```

Description

DefaultHandler overrides the inherited method in order to process all messages that are sent to the Windows socket object. DefaultHandler passes the messages to the Windows CallWindowProc function.

See Also

TMessage

129.1.7.4.6 TCustomWinSocket.Disconnect Method

Shuts down the socket connection represented by a Windows socket handle.

Pascal

```
procedure Disconnect(Socket: TSocket); virtual;
```

C++

```
virtual __fastcall Disconnect(TSocket Socket);
```

Description

Disconnect is called by the Close (see page 18804) method to terminate an individual socket connection.

Disconnect calls the Lock (see page 18809) method to make sure the method is thread-safe. Then, it generates an

OnSocketEvent (see page 18824) of type seDisconnect. After the OnSocketEvent (see page 18824), Disconnect closes the connection. Finally, it calls Unlock (see page 18815) to end the critical section started by Lock (see page 18809).

See Also

Close (see page 18804)

Lock (see page 18809)

OnSocketEvent (see page 18824)

Unlock (see page 18815)

129.1.7.4.7 TCustomWinSocket.DoListen Method

Opens a listening connection.

Pascal

```
procedure DoListen(QueueSize: Integer);
```

C++

```
__fastcall DoListen(int QueueSize);
```

Description

The socket uses DoListen internally to open a listening connection with a queue that can hold QueueSize client connection requests. DoListen handles those tasks that are common to opening a listening connection synchronously or asynchronously.

Do not call DoListen to open a listening connection. Instead, call the public Listen (see page 18808) method, which orchestrates the opening of a connection either synchronously or asynchronously, depending on the socket type.

See Also

Listen (see page 18808)

129.1.7.4.8 TCustomWinSocket.DoOpen Method

Opens a connection to a remote socket.

Pascal

```
procedure DoOpen;
```

C++

```
__fastcall DoOpen();
```

Description

The socket uses DoOpen internally to open a connection to a remote socket. DoOpen handles those tasks that are common to establishing a connection synchronously or asynchronously.

Do not call DoOpen to open a connection. Instead, call the public Open (see page 18810) method, which orchestrates the opening of a connection either synchronously or asynchronously, depending on the socket type.

See Also

Open (see page 18810)

129.1.7.4.9 TCustomWinSocket.Error Method

Generates an OnErrorEvent (see page 18824) event.

Pascal

```
procedure Error(Socket: TCustomWinSocket; ErrorEvent: TErrorEvent; var ErrorCode: Integer);
dynamic;
```

C++

```
__fastcall Error(TCustomWinSocket Socket, TErrorEvent ErrorEvent, int ErrorCode);
```

Description

Error is called automatically when the Windows socket object receives error notifications. It generates the OnErrorEvent (see page 18824) event. When overriding this method, be sure to call the inherited method, because socket components rely on the OnErrorEvent (see page 18824) event for their own error handling.

The Socket parameter indicates the Windows socket object that encounters the error condition.

The ErrorEvent parameter indicates what the socket was trying to do when the error occurred. It has one of the following values:

Value	Meaning
eeGeneral	The socket received an error message that does not fit into any of the following categories.
eeSend	An error occurred when trying to write to the socket connection.
eeReceive	An error occurred when trying to read from the socket connection.
eeConnect	For client sockets, this indicates that the client socket can't locate the server, or that a problem on the server prevents the opening of a connection. For server sockets, this indicates that a client connection request that has already been accepted could not be completed.
eeDisconnect	An error occurred when trying to close a connection.
eeAccept	For server sockets only, this indicates that a problem occurred when trying to accept a client connection request.

The ErrorCode parameter is the error code received by the Windows socket object. Changing this value to 0 in the Error method prevents the socket from raising an exception. For information on possible error codes, see the Microsoft documentation on Windows sockets.

See Also

OnErrorEvent (see page 18824)

129.1.7.4.10 TCustomWinSocket.Event Method

Pascal

```
procedure Event(Socket: TCustomWinSocket; SocketEvent: TSocketEvent); dynamic;
```

C++

```
__fastcall Event(TCustomWinSocket Socket, TSocketEvent SocketEvent);
```

Description

This is Event, a member of class TCustomWinSocket.

129.1.7.4.11 TCustomWinSocket.InitSocket Method

Generates a windows Internet socket address structure from a description of the desired socket port.

Pascal

```
function InitSocket(const Name: string; const Address: string; const Service: string; Port:
Word; Client: Boolean): TSockAddrIn;
```

C++

```
__fastcall TSockAddrIn InitSocket(const AnsiString Name, const AnsiString Address, const
AnsiString Service, Word Port, Boolean Client);
```

Description

Applications can not call InitSocket. It is called by the Open (see page 18810) or Listen (see page 18808) method to obtain a Windows Internet socket address structure for the parameters obtained from a socket component.

The Name parameter is the host name for the socket.The Address parameter is the IP address. The Service parameter is the service for which the socket is to used. The Port parameter is the port number for the socket. The Client parameter indicates whether the socket address structure is to be used by a client socket to describe the destination of a connection or by a server socket to describe the listening connection.

The host portion of the Windows Internet socket address is obtained from the host name if it is given. Otherwise the Address parameter is used. If Client is true, either the Name or the Address parameter must be specified. If Client is false, they may both be left blank to specify a server that listens on multiple addresses.

If port number for the Windows Internet socket address is obtained from the Service parameter if it is given. Otherwise, the Port parameter is used. One of these two parameters must be specified.

Port (see page 18751)

Service (see page 18752)

AsyncInitSocket (see page 18803)

129.1.7.4.12 TCustomWinSocket.Listen Method

Opens a listening connection for a server socket.

Pascal

```
procedure Listen(const Name: string; const Address: string; const Service: string; Port: Word;
QueueSize: Integer; Block: Boolean = True);
```

C++

```
__fastcall Listen(const AnsiString Name, const AnsiString Address, const AnsiString Service,
Word Port, int QueueSize, Boolean Block = True);
```

Description

Server socket components call Listen to open a listening connection.

Listen creates the Windows socket that will make the listening connection, and binds the Windows Internet socket address derived from the parameters to the socket. Listen then generates an OnSocketEvent (see page 18824) of type seListen.

Finally, Listen opens the socket as a listening connection with a queue that can hold QueueSize client requests, setting the Connected (see page 18818) property to true.

The Name, Address, Service, and Port parameters are taken from the Host, Address, Service and Port properties of the server socket component.

QueueSize indicates how many client requests the listening connection can hold. TServerSocket (see page 18843) sets the QueueSize to 5.

Block indicates whether the socket can look up the information it needs to establish a connection asynchronously. When Block is true, the socket blocks execution for each lookup instead of retrieving information about the connection using asynchronous notifications.

See Also

Connected (see page 18818)

InitSocket (see page 18807)

OnSocketEvent (see page 18824)

Address (see page 18750)

Host (see page 18751)

Port (see page 18751)

Service (see page 18752)

TServerSocket (see page 18843)

129.1.7.4.13 TCustomWinSocket.Lock Method

Starts a critical section, blocking all other execution threads until the Unlock (see page 18815) method is called.

Pascal

```
procedure Lock;
```

C++

```
__fastcall Lock();
```

Description

Call Lock before beginning a section of code that is not thread-safe. Call Unlock (see page 18815) when the critical section of code is completed. Unless absolutely necessary, do not use Lock to lock lengthy operations such as reading and writing over a blocking connection. Locking lengthy operations can severely impact performance, because all execution threads in the application that use the Windows socket object must wait until Unlock (see page 18815) is called.

See Also

TThread (see page 3108)

Unlock (see page 18815)

129.1.7.4.14 TCustomWinSocket.LookupName Method

Generates the portion of a Windows Internet socket address structure that describes the host.

Pascal

```
function LookupName(const name: string): TInAddr;
```

C++

```
__fastcall TInAddr LookupName(const AnsiString name);
```

Description

Call LookupName to obtain the Internet address associated with the system identified by the name parameter. LookupName is used by InitSocket (see page 18807) to generate the portion of the Windows Internet socket address structure that identifies the host.

See Also

InitSocket (see page 18807)

Host (see page 18751)

129.1.7.4.15 TCustomWinSocket.LookupService Method

Returns the port number associated with a specific service.

Pascal

```
function LookupService(const service: string): Integer;
```

C++

```
__fastcall int LookupService(const AnsiString service);
```

Description

Call LookupService to obtain the standard port number for the service named by the service parameter. Windows provides a number of standard service names such as ftp, http, finger, or time. Each standard service is associated, by convention, with a specific port number. These standard port numbers allow client sockets to indicate the desired service by requesting a specific port number. They allow server sockets to listen on an expected port number for the service offered. Servers can specify additional services and their associated ports in a SERVICES file. For more information on the SERVICES file, see the Microsoft documentation for Windows sockets.

InitSocket (see page 18807) calls LookupService to obtain the port number for the Service specified by a socket component.

See Also

InitSocket (see page 18807)

Service (see page 18752)

129.1.7.4.16 TCustomWinSocket.Open Method

Opens a connection to a remote socket.

Pascal

```
procedure Open(const Name: string; const Address: string; const Service: string; Port: Word;
Block: Boolean = True);
```

C++

```
__fastcall Open(const AnsiString Name, const AnsiString Address, const AnsiString Service,
Word Port, Boolean Block = True);
```

Description

Client socket components call Open to open a connection to a server socket.

Open creates the Windows socket that will connect to the server socket, and generates an OnSocketEvent (see page 18824) of type seLookup. After the OnSocketEvent (see page 18824), Open binds the Windows Internet socket address derived from

the parameters to the socket, locating the server socket. Open then generates an OnSocketEvent (see page 18824) of type seConnecting. When the server socket accepts the connection, Open completes the connection to the server socket. Then it generates an OnSocketEvent (see page 18824) of type seConnect. After the OnSocketEvent (see page 18824), the Connected (see page 18818) property is set to true.

The Name, Address, Service, and Port parameters are taken from the Host, Address, Service and Port properties of the client socket component.

Block indicates whether the socket can look up the information it needs to establish a connection asynchronously. When Block is true, the socket blocks execution for each lookup instead of retrieving information about the connection using asynchronous notifications.

See Also

Connected (see page 18818)

InitSocket (see page 18807)

OnSocketEvent (see page 18824)

Address (see page 18750)

Host (see page 18751)

Port (see page 18751)

Service (see page 18752)

TClientSocket (see page 18752)

129.1.7.4.17 TCustomWinSocket.Read Method

Generates an OnSocketEvent (see page 18824) of type seRead in response to notifications that the socket connection is ready.

Pascal

```
procedure Read(Socket: TSocket); virtual;
```

C++

```
virtual __fastcall Read(TSocket Socket);
```

Description

Read is called in response to asynchronous notifications that the socket connection is ready for reading. The Windows socket can then read from the connection in the OnSocketEvent (see page 18824) event handler or the socket component can read from the connection in an OnRead or OnClientRead event handler. The event handler can use the ReceiveBuf (see page 18812) method or the ReceiveText (see page 18812) method to read the information from the connection.

Note: Read is only called for asynchronous read notifications in a non-blocking socket. Blocking sockets must use a TWinSocketStream (see page 18876) object for reading. The TWinSocketStream (see page 18876) object waits for the remote socket to be ready before transferring information.

See Also

ASyncStyles (see page 18817)

OnSocketEvent (see page 18824)

receivebuf (see page 18812)

ReceiveText (see page 18812)

OnRead (see page 18798)

OnClientRead (see page 18786)

TWinSocketStream (see page 18876)

129.1.7.4.18 TCustomWinSocket.ReceiveBuf Method

Pascal

```
function ReceiveBuf(var Buf; Count: Integer): Integer;
```

C++

```
__fastcall int ReceiveBuf( Buf, int Count);
```

Description

This is ReceiveBuf, a member of class TCustomWinSocket.

129.1.7.4.19 TCustomWinSocket.ReceiveLength Method

Returns the number of bytes ready to be sent over the socket connection.

Pascal

```
function ReceiveLength: Integer;
```

C++

```
__fastcall int ReceiveLength();
```

Description

Call ReceiveLength to determine the amount of information to read over the socket connection in response to an asynchronous read notification.

Note: ReceiveLength is not guaranteed to be accurate for streaming socket connections.

See Also

ASyncStyles (see page 18817)

receivebuf (see page 18812)

129.1.7.4.20 TCustomWinSocket.ReceiveText Method

Reads a string from the socket connection.

Pascal

```
function ReceiveText: string;
```

C++

```
__fastcall AnsiString ReceiveText();
```

Description

Use ReceiveText to read a string from the socket connection in the OnSocketEvent (see page 18824) event handler of a Windows socket object or in the OnRead or OnClientRead event handler of a socket component. ReceiveText returns the string that was read.

ReceiveText only works in response to a read notification to a non-blocking windows socket. Blocking sockets must use a TWinSocketStream (see page 18876) for reading. The TWinSocketStream (see page 18876) object waits for the remote

socket to be ready before transferring information.

See Also

ASyncStyles (see page 18817)

OnSocketEvent (see page 18824)

receivebuf (see page 18812)

OnRead (see page 18798)

OnClientRead (see page 18786)

TWinSocketStream (see page 18876)

129.1.7.4.21 TCustomWinSocket.SendBuf Method

Writes Count bytes to the socket connection from the Buf parameter.

Pascal

```
function SendBuf(var Buf; Count: Integer): Integer;
```

C++

```
__fastcall int SendBuf( Buf, int Count);
```

Description

Use SendBuf to write to the socket connection. Call this method from the OnSocketEvent (see page 18824) event handler of a Windows socket object or in the OnWrite or OnClientWrite event handler of a socket component. Alternately, Use SendBuf to write when a connection is first formed when the socket does not expect notification that the socket on the other end of the connection is expecting to read.

For non-blocking sockets, the data is sent to the WinSock DLL which has it's own internal buffers. If the WinSock can accept additional data, SendBuf returns immediately with the number of bytes queued. If the WinSock internal buffer space is not able to accept the buffer being sent, SendBuf returns -1 and no data is queued at all. In this case, wait a bit for the WinSock to have a chance to send out already-queued data; then try again.

For blocking sockets, SendBuf returns the number of bytes actually written.

If an error occurs while writing to the connection, SendBuf terminates the connection and raises an ESocketError (see page 18739) exception.

See Also

ESocketError

OnSocketEvent (see page 18824)

sendstream (see page 18814)

SendText (see page 18814)

OnWrite (see page 18799)

OnClientWrite (see page 18786)

TWinSocketStream (see page 18876)

129.1.7.4.22 TCustomWinSocket.SendStream Method

Pascal

```
function SendStream(AStream: TStream): Boolean;
```

C++

```
__fastcall Boolean SendStream(TStream AStream);
```

Description

This is SendStream, a member of class TCustomWinSocket.

129.1.7.4.23 TCustomWinSocket.SendStreamThenDrop Method

Writes all the information that can be read from the AStream parameter to the socket connection and then terminates the connection.

Pascal

```
function SendStreamThenDrop(AStream: TStream): Boolean;
```

C++

```
__fastcall Boolean SendStreamThenDrop(TStream AStream);
```

Description

Use SendStreamThenDrop to write to a socket connection when the connection is no longer needed after the writing is complete. SendStream (see page 18814) reads information from the stream indicated by AStream and writes it to the socket connection, shutting down the connection when it is done. The value returned by SendStream (see page 18814) indicates whether any information was successfully written to the connection.

Note: The Stream passed as a parameter to SendStream (see page 18814) becomes "owned" by the windows socket object. The Windows socket object frees the stream when it is finished with it. Do not attempt to free the stream after it has been passed as a parameter.

See Also

Disconnect (see page 18805)

SendBuf (see page 18813)

sendstream (see page 18814)

SendText (see page 18814)

TStream (see page 2973)

TWinSocketStream (see page 18876)

129.1.7.4.24 TCustomWinSocket.SendText Method

Writes the string S to the socket connection.

Pascal

```
function SendText(const S: string): Integer;
```

C++

```
__fastcall int SendText(const AnsiString S);
```

Description

Use SendText to write a string to the socket connection. The writing may occur in the OnSocketEvent (see page 18824) event handler of a Windows socket object or in the OnWrite or OnClientWrite event handler of a socket component. Alternately, SendText may write from a socket that is expected to write to the connection without a notification to signal the connection's readiness to read. If an error occurs while writing to the connection, SendText terminates the connection and raises an ESocketError (see page 18739) exception.

SendText returns the number of bytes sent. Note that this may be less than the length of the string S if the socket is nonblocking.

See Also

ESocketError

OnSocketEvent (see page 18824)

SendBuf (see page 18813)

sendstream (see page 18814)

OnWrite (see page 18799)

OnClientWrite (see page 18786)

TWinSocketStream (see page 18876)

129.1.7.4.25 TCustomWinSocket.SetAsyncStyles Method

Sets the AsyncStyles property.

Pascal

```
procedure SetAsyncStyles(Value: TASyncStyles);
```

C++

```
__fastcall SetAsyncStyles(TASyncStyles Value);
```

Description

SetAsyncStyles implements the AsyncStyles property. Override SetAsyncStyles to limit the value of AsyncStyles to notifications that are appropriate to a particular type of Windows socket.

See Also

ASyncStyles (see page 18817)

129.1.7.4.26 TCustomWinSocket.Unlock Method

Reenables execution in other threads after a critical section begun by the Lock (see page 18809) method.

Pascal

```
procedure Unlock;
```

C++

```
__fastcall Unlock();
```

Description

Call Unlock at the end of a section of code that is not thread-safe. Every call to Unlock should match a call to the Lock (see page 18809) method at the beginning of the critical section of code.

See Also

Lock (see page 18809)

TThread (see page 3108)

129.1.7.4.27 TCustomWinSocket.Write Method

Generates an OnSocketEvent (see page 18824) of type seWrite in response to notifications that the socket connection is ready.

Pascal

```
procedure Write(Socket: TSocket); virtual;
```

C++

```
virtual __fastcall Write(TSocket Socket);
```

Description

Write is called in response to asynchronous notifications that the socket connection is ready for the socket to send information. The Windows socket can write to the connection in the OnSocketEvent (see page 18824) event handler or the socket component can write to the connection in an OnWrite or OnClientWrite event handler. The event handler can use the SendBuf (see page 18813) method, the SendStream (see page 18814) method, or the SendText (see page 18814) method to write the information to the connection.

Note: Write is only called for asynchronous write notifications in a non-blocking socket. Blocking sockets must use their own mechanisms for determining when the connection is ready for the socket to write.

See Also

ASyncStyles (see page 18817)

OnSocketEvent (see page 18824)

SendBuf (see page 18813)

sendstream (see page 18814)

SendText (see page 18814)

OnClientWrite (see page 18786)

TWinSocketStream (see page 18876)

129.1.7.5 TCustomWinSocket Properties

The properties of the TCustomWinSocket class are listed here.

Public Properties

	Name	Description
R	Addr (see page 18817)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the socket port.
	ASyncStyles (see page 18817)	Determines which asynchronous events the socket can receive.
R	Connected (see page 18818)	Indicates whether the socket connection is open and available for communication with other machines.
	Data (see page 18818)	Points to application-specific data associated with the socket.

R	Handle (see page 18819)	Specifies the handle of the window that receives notifications from the Windows socket.
R	LocalAddress (see page 18819)	Specifies the IP address of the local system that was bound to the socket connection.
R	LocalHost (see page 18820)	Specifies the name of the local system.
R	LocalPort (see page 18820)	Specifies the ID number of the port used by the socket connection.
R	LookupState (see page 18821)	Indicates any asynchronous activities occurring while opening a connection.
R	RemoteAddr (see page 18821)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the remote socket port.
R	RemoteAddress (see page 18822)	Specifies the IP address of the remote system that was bound to the socket connection.
R	RemoteHost (see page 18822)	Specifies the name of the remote system.
R	RemotePort (see page 18823)	Specifies the ID number of the port used by the RemoteHost (see page 18822) to form the socket connection.
R	SocketHandle (see page 18823)	Specifies the Windows handle for the socket.

129.1.7.5.1 TCustomWinSocket.Addr Property

Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the socket port.

Pascal

```
property Addr: TSockAddrIn;
```

C++

```
__property TSockAddrIn Addr;
```

Description

Use Addr to represent the port used by the socket when working directly with Windows socket API calls. For client sockets, the value of Addr represents the target remote port. For server sockets, Addr is determined by the values of the LocalAddress (see page 18819) and LocalPort (see page 18820) properties.

See Also

LocalAddress (see page 18819)

LocalPort (see page 18820)

RemoteAddr (see page 18821)

129.1.7.5.2 TCustomWinSocket.ASyncStyles Property

Determines which asynchronous events the socket can receive.

Pascal

```
property ASyncStyles: TAsyncStyles;
```

C++

```
__property TAsyncStyles ASyncStyles;
```

Description

Use ASyncStyles to determine what sorts of notifications the socket needs to respond to. Set ASyncStyles to change the notifications that the socket receives from the socket connection. ASyncStyles is a set drawn from the following values:

Value	Meaning
asRead	The socket receives notification that the connection is ready for reading.

asWrite	The socket receives notification that the connection is ready for writing.
asOOB	The socket receives notification when out-of-band data arrives.
asAccept	The socket receives notification when another socket requests a connection.
asConnect	The socket receives notification when a communication link to another socket is opened.
asClose	The socket receives notification when a communication link to another socket is terminated.

Any notification specified by ASyncStyles arrives as a window message to the Handle (see page 18819) property.

Note: If the socket is a non-blocking socket, then ASyncStyles should include asRead and asWrite so that the socket will be informed of asynchronous reading and writing events.

See Also

Handle (see page 18819)

ClientType (see page 18769)

ServerType (see page 18869)

129.1.7.5.3 TCustomWinSocket.Connected Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Read (see page 18811) Connected before trying to use or change the Windows socket connection. Connected indicates whether the socket connection has been established. When Connected is true, the Windows socket is open and available for use. When Connected is false, the Windows socket is closed and can be changed.

To open a client Windows socket, use the Open (see page 18810) method. To open a server Windows socket, use the Listen (see page 18808) method. The Windows socket that represents the server endpoint of a connection to a client socket is opened in its constructor.

To close a Windows socket, use the Close (see page 18804) method.

See Also

Open (see page 18810)

Close (see page 18804)

Listen (see page 18808)

Active (see page 18750)

129.1.7.5.4 TCustomWinSocket.Data Property

Points to application-specific data associated with the socket.

Pascal

```
property Data: Pointer;
```

C++

```
__property void * Data;
```

Description

Use Data to associate information specific to the socket connection with the Windows socket object. For example, Data can be used to store access and authentication information used by a server socket to evaluate client connection requests.

Data can store information in a thread-safe manner that would otherwise require the use of global variables. This is useful given the multi-threaded nature of many client-server applications.

129.1.7.5.5 TCustomWinSocket.Handle Property

Specifies the handle of the window that receives notifications from the Windows socket.

Pascal

```
property Handle: HWnd;
```

C++

```
__property HWnd Handle;
```

Description

Use Handle to send messages to the Windows socket or to subclass the Window procedure that receives messages of asynchronous events from the socket connection.

See Also

ASyncStyles (see page 18817)

129.1.7.5.6 TCustomWinSocket.LocalAddress Property

Specifies the IP address of the local system that was bound to the socket connection.

Pascal

```
property LocalAddress: string;
```

C++

```
__property AnsiString LocalAddress;
```

Description

LocalAddress is a string of four numeric (byte) values in the standard Internet dot notation, such as

```
123.197.1.2
```

Each address identifies the system and indicates the types of interfaces supported by the socket. A single system (machine) can support multiple addresses. LocalAddress is the address from among the possible addresses supported by the local system that is bound to the socket connection.

A single LocalAddress can be used simultaneously by multiple socket connections. Each of those connections must have a unique LocalPort (see page 18820) number to distinguish it from other connections to the same LocalAddress.

See Also

LocalHost (see page 18820)

LocalPort (see page 18820)

RemoteAddress (see page 18822)

Address (see page 18750)

129.1.7.5.7 TCustomWinSocket.LocalHost Property

Specifies the name of the local system.

Pascal

```
property LocalHost: string;
```

C++

```
__property AnsiString LocalHost;
```

Description

Use LocalHost to get the name of the system that is running the application that uses the Windows socket. LocalHost is a string containing the domain name and service of the local socket endpoint, such as

`http://www.wSite.Com`

LocalHost provides an alias for the local IP address given in the LocalAddress (see page 18819) property. Most Intranets provide host names for the IP addresses of systems on the net. On Windows 95 and NT machines, if a host name is not available, create one for the local IP address by entering the name into the HOSTS file. See the Microsoft documentation on Windows sockets for more information on the HOSTS file.

See Also

LocalAddress (see page 18819)

RemoteHost (see page 18822)

Host (see page 18751)

129.1.7.5.8 TCustomWinSocket.LocalPort Property

Specifies the ID number of the port used by the socket connection.

Pascal

```
property LocalPort: Integer;
```

C++

```
__property int LocalPort;
```

Description

Use LocalPort to determine the port number that is bound to the socket connection. For server endpoints of listening connections, LocalPort is the ID associated with the service the server socket provides. For client or server endpoints of connections to another socket, LocalPort is usually an arbitrary value picked when the connection was made.

Port numbers allow a single system, identified by the LocalAddress (see page 18819) property, to host multiple connections simultaneously. Each combination of LocalPort and LocalAddress (see page 18819) can only be bound to a single socket connection. This combination is represented by the Addr (see page 18817) property.

Many values of LocalPort are associated by convention with a particular service such as ftp or http. To determine whether the value of LocalPort is associated with a specific service, use the LookupService (see page 18810) method.

See Also

Addr (see page 18817)

LocalAddress (see page 18819)

LookupService (see page 18810)

RemotePort (see page 18823)

129.1.7.5.9 TCustomWinSocket.LookupState Property

Indicates any asynchronous activities occurring while opening a connection.

Pascal

```
property LookupState: TLookupState;
```

C++

```
__property TLookupState LookupState;
```

Description

LookupState is used internally to coordinate asynchronous activities while opening a connection. The AsyncInitSocket (see page 18803) method sets the value of LookupState to indicate when it is looking up various types of information. The following table lists the possible values:

Value	Meaning
lsIdle	The socket is not currently looking up any information asynchronously.
lsLookupAddress	The socket is looking up an IP address asynchronously and has not yet received the result.
lsLookupService	The socket is looking up a Service asynchronously and has not yet received the result.

See Also

AsyncInitSocket (see page 18803)

Open (see page 18810)

Listen (see page 18808)

129.1.7.5.10 TCustomWinSocket.RemoteAddr Property

Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the remote socket port.

Pascal

```
property RemoteAddr: TSockAddrIn;
```

C++

```
__property TSockAddrIn RemoteAddr;
```

Description

When working directly with Windows socket API calls, use RemoteAddr to represent the port used by the socket on the other end of the connection. The value of RemoteAddr is determined by the values of the RemoteAddress (see page 18822) and RemotePort (see page 18823) properties.

See Also

Addr (see page 18817)

RemoteAddress (see page 18822)

RemotePort (see page 18823)

129.1.7.5.11 TCustomWinSocket.RemoteAddress Property

Specifies the IP address of the remote system that was bound to the socket connection.

Pascal

```
property RemoteAddress: string;
```

C++

```
__property AnsiString RemoteAddress;
```

Description

RemoteAddress is a string of four numeric (byte) values in the standard Internet dot notation, such as

`123.197.1.2`

Each address identifies the system on the other end of the socket connection and indicates the types of interfaces supported by the remote socket. A single system can support multiple addresses. RemoteAddress is the address from among the possible addresses supported by the remote system that is bound to the socket connection.

A single RemoteAddress may be participating in multiple socket connections. Each of those connections has a unique RemotePort (see page 18823) number to distinguish it from other connections to the same RemoteAddress. The RemoteAddr (see page 18821) property uniquely identifies the RemoteAddress and RemotePort (see page 18823) combination used by the socket connection.

See Also

LocalAddress (see page 18819)

RemoteAddr (see page 18821)

RemoteHost (see page 18822)

RemotePort (see page 18823)

Address (see page 18750)

129.1.7.5.12 TCustomWinSocket.RemoteHost Property

Specifies the name of the remote system.

Pascal

```
property RemoteHost: string;
```

C++

```
__property AnsiString RemoteHost;
```

Description

Use RemoteHost to get the name of the system on the other end of the socket connection. RemoteHost is a string containing the domain name and service of the remote endpoint of the socket connection, such as

`http://www.wSite.Com`

LocalHost (see page 18820) provides an alias for the local IP address given in the RemoteAddress (see page 18822) property.

See Also

LocalHost (see page 18820)

RemoteAddress (see page 18822)

Address (see page 18750)

Host (see page 18751)

129.1.7.5.13 TCustomWinSocket.RemotePort Property

Specifies the ID number of the port used by the RemoteHost (see page 18822) to form the socket connection.

Pascal

```
property RemotePort: Integer;
```

C++

```
__property int RemotePort;
```

Description

Use RemotePort to determine the port number used by the socket on the other end of the socket connection.

Port numbers allow a single system, identified by the RemoteAddress (see page 18822) or RemoteHost (see page 18822) property, to host multiple connections simultaneously. Each combination of RemotePort and RemoteAddress (see page 18822) can only be bound to a single socket connection. This combination is represented by the RemoteAddr (see page 18821) property.

Many port numbers are associated by convention with a particular service such as ftp or http. To determine whether the value of RemotePort is associated with a specific service, use the LookupService (see page 18810) method.

Note: If a client socket requests a specific port to indicate a desired service, the value of RemotePort for the actual connection may differ from the requested port number. Most server sockets listen on the port associated with a service, but switch to an arbitrary available port number for forming connections.

See Also

LookupState (see page 18821)

RemoteAddr (see page 18821)

RemoteAddress (see page 18822)

RemoteHost (see page 18822)

Port (see page 18751)

129.1.7.5.14 TCustomWinSocket.SocketHandle Property

Specifies the Windows handle for the socket.

Pascal

```
property SocketHandle: TSocket;
```

C++

```
__property TSocket SocketHandle;
```

Description

Use SocketHandle for Windows socket API calls that require the handle to the socket. When the Connected (see page 18818) property is false, SocketHandle is INVALID_SOCKET.

SocketHandle is set to a valid Windows socket handle by the Listen (see page 18808) or Open (see page 18810) method.

See Also

Connected (see page 18818)

Create (see page 18801)

Listen (see page 18808)

Open (see page 18810)

129.1.7.6 TCustomWinSocket Events

The events of the TCustomWinSocket class are listed here.

Public Events

	Name	Description
	OnErrorEvent (see page 18824)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnSocketEvent (see page 18824)	Occurs when the Windows socket receives notification of asynchronous events.

129.1.7.6.1 TCustomWinSocket.OnErrorEvent Event

Occurs when the socket fails in making, using, or shutting down a connection.

Pascal

```
property OnErrorEvent: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnErrorEvent;
```

Description

Socket components provide an OnErrorEvent event handler that converts error notifications into error events on the socket component. Most applications will therefore not provide an event handler for OnErrorEvent.

See Also

ESocketError

InitSocket (see page 18746)

ASyncStyles (see page 18817)

129.1.7.6.2 TCustomWinSocket.OnSocketEvent Event

Occurs when the Windows socket receives notification of asynchronous events.

Pascal

```
property OnSocketEvent: TSocketEventEvent;
```

C++

```
__property TSocketEventEvent OnSocketEvent;
```

Description

Socket components provide an OnSocketEvent event handler that converts Windows socket notifications into events on the socket component. Most applications will therefore not provide an event handler for OnSocketEvent. Replacing this event handler can prevent some expected events from occurring.

The Sender parameter is the Windows socket object that owns the event handler. Usually, this is the same as the Socket parameter.

The Socket parameter indicates the Windows socket that generates or receives notification of the event.

The SocketEvent parameter indicates the event that occurred.

See Also

ASyncStyles (see page 18817)

InitSocket (see page 18746)

129.1.8 TServerAcceptThread Class

Class Hierarchy

Pascal

```
TServerAcceptThread = class(TThread);
```

C++

```
class TServerAcceptThread : public TThread;
```

File

ScktComp

Description

This is class ScktComp.TServerAcceptThread.

129.1.8.1 TServerAcceptThread Members

The following tables list the members exposed by TServerAcceptThread.

Protected Methods

	Name	Description
	CheckThreadError (see page 3114)	This is the overview for the CheckThreadError method overload.
V	DoTerminate (see page 3115)	Generates an OnTerminate (see page 3148) event.

Protected Properties

	Name	Description
	ReturnValue (see page 3141)	Specifies the value returned to other waiting threads when the thread finishes executing.
R	Terminated (see page 3142)	Indicates whether the thread has been asked to terminate.

Public Events

	Name	Description
	OnTerminate (see page 3148)	Occurs after the thread's Execute (see page 3115) method has returned and before the thread is destroyed.

Public Methods

	Name	Description
V	AfterConstruction (see page 3114)	Executes the thread when the thread is created with CreateSuspended set to false.
	Create (see page 18826)	This is Create, a member of class TServerAcceptThread.
V	Destroy (see page 3113)	Destroys the thread object and releases the memory allocated to it.
V	Execute (see page 18827)	Provides an abstract or pure virtual method to contain the code which executes when the thread is run.
	Queue (see page 3119)	This is the overview for the Queue method overload.
	RemoveQueuedEvents (see page 3120)	Remove queued method calls.
	Resume (see page 3120)	Restarts the execution of a suspended thread.
	StaticQueue (see page 3124)	Asynchronously executes a method call within the main thread.
	StaticSynchronize (see page 3125)	Executes a method call within the main thread.
	Suspend (see page 3125)	Pauses a running thread.
	Synchronize (see page 3126)	This is the overview for the Synchronize method overload.
	Terminate (see page 3126)	Signals the thread to terminate by setting the Terminated (see page 3142) property to true.
	WaitFor (see page 3132)	Waits for the thread to terminate and then returns the value of the ReturnValue (see page 3141) property.

Public Properties

	Name	Description
R	FatalException (see page 3133)	Determines whether the thread object is automatically destroyed when the thread terminates.
	FreeOnTerminate (see page 3134)	Determines whether the thread object is automatically destroyed when the thread terminates.
R	Handle (see page 3137)	Indicates the thread's handle (Windows only).
	Priority (see page 3138)	Determines the thread's scheduling priority relative to other threads in the process.
R	ServerSocket (see page 18831)	This is ServerSocket, a member of class TServerAcceptThread.
	Suspended (see page 3142)	Indicates whether a thread is suspended.
R	ThreadID (see page 3148)	Identifies the thread throughout the system.

129.1.8.2 TServerAcceptThread.Create Constructor

Pascal

```
constructor Create(CreateSuspended: Boolean; ASocket: TServerWinSocket);
```

C++

```
__fastcall TServerAcceptThread(Boolean CreateSuspended, TServerWinSocket ASocket);
```

Description

This is Create, a member of class TServerAcceptThread.

129.1.8.3 TServerAcceptThread Methods

The methods of the TServerAcceptThread class are listed here.

Public Methods

	Name	Description
V	Execute (see page 18827)	Provides an abstract or pure virtual method to contain the code which executes when the thread is run.

129.1.8.3.1 TServerAcceptThread.Execute Method

Provides an abstract or pure virtual method to contain the code which executes when the thread is run.

Pascal

```
procedure Execute; override;
```

C++

```
virtual __fastcall Execute();
```

Description

Override Execute and insert the code that should be executed when the thread runs. Execute is responsible for checking the value of the Terminated property to determine if the thread needs to exit.

A thread executes when Create is called if CreateSuspended set to false, or when Resume is first called after the thread is created if CreateSuspended set to true.

Note: Do not use the properties and methods of other objects directly in the Execute method of a thread. Instead, separate the use of other objects into a separate procedure call, and call that procedure by passing it as a parameter to the Synchronize method.

C++ Examples:

```
/*
This example shows how to create a thread and start it
running at a lower priority than the main execution thread.
Set the thread's FreeOnTerminate property is True, so that
there is no need to free the thread when it finishes. To
create the extension choose the
File | New | Other | Thread Object menu.
*/
bool mythreadRunning;
bool youthreadRunning;

class TMyThread : public TThread
{
__published:    // IDE-managed Components
private:    // User declarations
protected:  // User declarations
    void __fastcall Execute();
public:     // User declarations
    __fastcall TMyThread(bool suspended);
};

__fastcall TMyThread::TMyThread(bool suspended)
    : TThread(suspended)
{
}

class TYouThread : public TThread
{
__published:    // IDE-managed Components
private:    // User declarations
protected:  // User declarations
    void __fastcall Execute();
public:     // User declarations
    __fastcall TYouThread(bool suspended);
};

__fastcall TYouThread::TYouThread(bool suspended)
```

```
    : TThread(suspended)
{
}

void __fastcall TMyThread::Execute()
{
  Form1->Memo1->Lines->Add("Process has been running for this many seconds:");
  for (int I = 0; I <= 10; I++)
  {
    Form1->Memo1->Lines->Add("Low priority process " + IntToStr(I));
    Sleep(1000);
  }
  mythreadRunning = FALSE;
}

void __fastcall TYouThread::Execute()
{
  Form1->Memo3->Lines->Add("Second low priority process has been running for this many
seconds:");
  for (int I = 0; I <= 10; I++)
  {
    Form1->Memo3->Lines->Add("Second low priority process " + IntToStr(I));
    Sleep(1000);
  }
  youthreadRunning = FALSE;
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TMyThread *SecondProcess; // TMyThread is a custom descendant of TThread
  if (mythreadRunning == FALSE)
  {
    mythreadRunning = TRUE;
    SecondProcess = new TMyThread(True); // create suspended – secondprocess does not run yet
    SecondProcess->FreeOnTerminate = True; // don't need to cleanup after terminate
    SecondProcess->Priority = tpLower;  // set the priority to lower than normal
    SecondProcess->Resume(); // now run the thread
  }
  else
    MessageDlg("This thread is still running.  You are going to hurt yourself!",
      mtInformation, TMsgDlgButtons() << mbOK, 0);
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Form1->Memo2->Lines->Add("Do some work in the main process for 10 seconds:");
  for (int I = 0; I <= 10; I++)
  {
    Form1->Memo2->Lines->Add("Main process " + IntToStr(I));
    Sleep(1000);
  }
}

129.1.8.4 TServerAcceptThread Properties

The properties of the TServerAcceptThread class are listed here.

Public Properties

	Name	Description
R	ServerSocket (see page 18831)	This is ServerSocket, a member of class TServerAcceptThread.

129.1.8.4.1 TServerAcceptThread.ServerSocket Property

Pascal

```
property ServerSocket: TServerWinSocket;
```

C++

```
__property TServerWinSocket ServerSocket;
```

Description

This is ServerSocket, a member of class TServerAcceptThread.

129.1.9 TServerClientThread Class

TServerClientThread is an execution thread used for a single connection to a client socket accepted by a Windows server socket.

Class Hierarchy

Pascal

```
TServerClientThread = class(TThread);
```

C++

```
class TServerClientThread : public TThread;
```

File

ScktComp

Description

TServerWinSocket (see page 18858) objects spawn TServerClientThread objects to handle separate client connections in separate execution threads. This allows server sockets to perform slow reading and writing operations with client sockets without adversely affecting the performance on other connections.

TServerClientThread introduces new properties to

Access the TServerWinSocket (see page 18858) object that spawned the thread and the TServerClientWinSocket (see page 18840) that is connected to the client socket.

Store and access thread-specific data.

Determine if the thread is stored in a thread cache maintained by the TServerWinSocket (see page 18858).

Applications that receive frequent client requests will want to derive a descendant class from TServerClientThread to handle reading and writing to separate clients. This is because TServerClientThread objects use the OnClientRead and OnClientWrite events of the associated server socket. These events are not thread-local.

129.1.9.1 TServerClientThread Members

The following tables list the members exposed by TServerClientThread.

Protected Methods

	Name	Description
	CheckThreadError (see page 3114)	This is the overview for the CheckThreadError method overload.
V	ClientExecute (see page 18834)	Simulates OnClientRead and OnClientWrite events for the associated server socket.
V	DoTerminate (see page 18835)	Removes the thread from the list of active threads maintained by the associated server socket.
	EndConnect (see page 18835)	Indicates whether the thread should execute again for another client.
V	Error (see page 18836)	Generates an OnClientError event for the associated server socket.
V	Event (see page 18836)	This is Event, a member of class TServerClientThread.
V	Execute (see page 18836)	Manages the caching of server client threads and calls the ClientExecute (see page 18834) method to run the thread for individual client connections.
V	HandleException (see page 18837)	Displays an error message using the main VCL thread.
	ReActivate (see page 18837)	This is ReActivate, a member of class TServerClientThread.
	StartConnect (see page 18837)	Indicates when the thread is ready to execute.

Protected Properties

	Name	Description
	ReturnValue (see page 3141)	Specifies the value returned to other waiting threads when the thread finishes executing.
R	Terminated (see page 3142)	Indicates whether the thread has been asked to terminate.

Public Events

	Name	Description
	OnTerminate (see page 3148)	Occurs after the thread's Execute (see page 3115) method has returned and before the thread is destroyed.

Public Methods

	Name	Description
V	AfterConstruction (see page 3114)	Executes the thread when the thread is created with CreateSuspended set to false.
	Create (see page 18833)	Creates an instance of TServerClientThread (see page 18831).
V	Destroy (see page 18833)	Destroys the server client thread object and releases the memory allocated to it.
	Queue (see page 3119)	This is the overview for the Queue method overload.
	RemoveQueuedEvents (see page 3120)	Remove queued method calls.
	Resume (see page 3120)	Restarts the execution of a suspended thread.
	StaticQueue (see page 3124)	Asynchronously executes a method call within the main thread.
	StaticSynchronize (see page 3125)	Executes a method call within the main thread.
	Suspend (see page 3125)	Pauses a running thread.
	Synchronize (see page 3126)	This is the overview for the Synchronize method overload.
	Terminate (see page 3126)	Signals the thread to terminate by setting the Terminated (see page 3142) property to true.
	WaitFor (see page 3132)	Waits for the thread to terminate and then returns the value of the ReturnValue (see page 3141) property.

Public Properties

	Name	Description
R	ClientSocket (see page 18838)	Specifies the TServerClientWinSocket (see page 18840) object that uses the thread for all reading and writing over the socket connection.
	Data (see page 18838)	Points to application-specific data associated with the thread.
R	FatalException (see page 3133)	Determines whether the thread object is automatically destroyed when the thread terminates.

	FreeOnTerminate (see page 3134)	Determines whether the thread object is automatically destroyed when the thread terminates.
R	Handle (see page 3137)	Indicates the thread's handle (Windows only).
	KeepInCache (see page 18839)	Determines whether the thread should be kept in the thread cache maintained by ServerSocket (see page 18839).
	Priority (see page 3138)	Determines the thread's scheduling priority relative to other threads in the process.
R	ServerSocket (see page 18839)	Specifies the TServerWinSocket (see page 18858) object that manages all the TServerClientThread (see page 18831) objects for its client connections.
	Suspended (see page 3142)	Indicates whether a thread is suspended.
R	ThreadID (see page 3148)	Identifies the thread throughout the system.

129.1.9.2 TServerClientThread.Create Constructor

Creates an instance of TServerClientThread (see page 18831).

Pascal

```
constructor Create(CreateSuspended: Boolean; ASocket: TServerClientWinSocket);
```

C++

```
__fastcall TServerClientThread(Boolean CreateSuspended, TServerClientWinSocket ASocket);
```

Description

Use Create to create an instance of TServerClientThread (see page 18831) for a connection to a client socket, and add the thread to the cache maintained by the associated listening socket.

Initializes FreeOnTerminate to true.

Initializes Priority to tpHigher.

Initializes ClientSocket (see page 18838) to the ASocket parameter and ServerSocket (see page 18839) to ASocket.ServerWinSocket.

Starts the thread executing.

Adds the thread to the cache maintained by ServerSocket (see page 18839).

Sets the OnErrorEvent and OnSocketEvent event handlers of ClientSocket (see page 18838) so that events are sent to ServerSocket (see page 18839).

Signals when initialization is complete and the thread is ready for reading from or writing to the client connection.

See Also

ClientSocket (see page 18838)

FreeOnTerminate (see page 3134)

Priority (see page 3138)

ServerSocket (see page 18839)

OnErrorEvent (see page 18824)

OnSocketEvent (see page 18824)

129.1.9.3 TServerClientThread.Destroy Destructor

Destroys the server client thread object and releases the memory allocated to it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TServerClientThread();
```

Description

Do not call Destroy directly in an application. ServerClientThread objects are freed by the TServerWinSocket (see page 18858) object that manages them.

Destroy frees the TServerClientWinSocket (see page 18840) object that encapsulates the connection to the client socket before calling the inherited destructor.

See Also

ClientSocket (see page 18838)

ServerSocket (see page 18839)

129.1.9.4 TServerClientThread Methods

The methods of the TServerClientThread class are listed here.

Protected Methods

	Name	Description
	ClientExecute (see page 18834)	Simulates OnClientRead and OnClientWrite events for the associated server socket.
	DoTerminate (see page 18835)	Removes the thread from the list of active threads maintained by the associated server socket.
	EndConnect (see page 18835)	Indicates whether the thread should execute again for another client.
	Error (see page 18836)	Generates an OnClientError event for the associated server socket.
	Event (see page 18836)	This is Event, a member of class TServerClientThread.
	Execute (see page 18836)	Manages the caching of server client threads and calls the ClientExecute (see page 18834) method to run the thread for individual client connections.
	HandleException (see page 18837)	Displays an error message using the main VCL thread.
	ReActivate (see page 18837)	This is ReActivate, a member of class TServerClientThread.
	StartConnect (see page 18837)	Indicates when the thread is ready to execute.

129.1.9.4.1 TServerClientThread.ClientExecute Method

Simulates OnClientRead and OnClientWrite events for the associated server socket.

Pascal

```
procedure ClientExecute; virtual;
```

C++

```
virtual __fastcall ClientExecute();
```

Description

TServerClientThread (see page 18831) calls ClientExecute from its Execute (see page 18836) method. ClientExecute checks whether there is any information to read from the associated socket connection, and if so, simulates an OnClientRead event on the associated server socket. If there is no information sent from the client, ClientExecute simulates an OnClientWrite event.

Because the server socket that receives these events is not local to the thread, the events occur within the main VCL thread using the Synchronize method. This method can be too slow if the server socket has many client connections, because each

thread must wait for any other thread to finish reading or writing. When a server socket receives many client connection requests, override ClientExecute to handle the reading or writing using a thread-local instance of TWinSocketStream (see page 18876). In the ClientExecute method, be sure to check the Terminated property periodically.

Note: Do not use the properties and methods of global objects directly in the ClientExecute method. Instead, separate the use of objects that are not thread-local into a separate procedure call, and call that procedure by passing it as a parameter to the Synchronize method.

See Also

Execute (see page 18836)

Synchronize (see page 3126)

TWinSocketStream (see page 18876)

Terminated (see page 3142)

DoTerminate (see page 18835)

129.1.9.4.2 TServerClientThread.DoTerminate Method

Removes the thread from the list of active threads maintained by the associated server socket.

Pascal

```
procedure DoTerminate; override;
```

C++

```
virtual __fastcall DoTerminate();
```

Description

DoTerminate overrides the inherited method to suppress the OnTerminate event. Instead, it removes the thread from the Connections property of the associated TServerWinSocket (see page 18858). The thread is then either added to the server socket's thread cache or destroyed.

See Also

ClientExecute (see page 18834)

Terminated (see page 3142)

Connections (see page 18868)

129.1.9.4.3 TServerClientThread.EndConnect Method

Indicates whether the thread should execute again for another client.

Pascal

```
function EndConnect: Boolean;
```

C++

```
__fastcall Boolean EndConnect();
```

Description

The Execute (see page 18836) method calls EndConnect when the ClientExecute (see page 18834) method finishes. It frees all memory associated with the current client connection and checks whether the Thread is being reused for another client connection. If the thread should be reused, EndConnect returns true to indicate that the ClientExecute (see page 18834) method should be called again.

See Also

ClientExecute (see page 18834)

Execute (see page 18836)

129.1.9.4.4 TServerClientThread.Error Method

Generates an OnClientError event for the associated server socket.

Pascal

```
procedure Error(ErrorEvent: TErrorEvent; var ErrorCode: Integer); virtual;
```

C++

```
virtual __fastcall Error(TErrorEvent ErrorEvent, int ErrorCode);
```

Description

TServerClientThread (see page 18831) assigns the Error method as an event handler for the OnErrorEvent method of the associated TClientWinSocket (see page 18766) object. This allows errors received from the client to generate OnClientError events on the server socket.

Warning: Error is not thread-safe. It should not be called from the server client thread. It is only intended for use by the associated client socket, which is not local to the server client thread.

See Also

OnClientError (see page 18785)

OnErrorEvent (see page 18824)

129.1.9.4.5 TServerClientThread.Event Method

Pascal

```
procedure Event(SocketEvent: TSocketEvent); virtual;
```

C++

```
virtual __fastcall Event(TSocketEvent SocketEvent);
```

Description

This is Event, a member of class TServerClientThread.

129.1.9.4.6 TServerClientThread.Execute Method

Manages the caching of server client threads and calls the ClientExecute (see page 18834) method to run the thread for individual client connections.

Pascal

```
procedure Execute; override;
```

C++

```
virtual __fastcall Execute();
```

Description

Execute is called automatically when the thread runs. A thread runs when Create (see page 18833) is called if CreateSuspended set to false, or when Resume is first called after the thread is created if CreateSuspended set to true.

Do not override the Execute method to implement the thread function of a TServerClientThread (see page 18831) descendant. Instead, override the ClientExecute (see page 18834) method, which is run after the thread is initialized for a particular client connection.

See Also

ClientExecute (see page 18834)

Reactivate (see page 18837)

129.1.9.4.7 TServerClientThread.HandleException Method

Displays an error message using the main VCL thread.

Pascal

```
procedure HandleException; virtual;
```

C++

```
virtual __fastcall HandleException();
```

Description

HandleException obtains the current exception object and calls TApplication.ShowException (for descendants of Exception) or the global ShowException procedure (for other objects) to display an error message. HandleException wraps the call to ShowException in the Synchronize method to ensure that the call is thread-safe.

See Also

ShowException (see page 13698)

ShowException (see page 22941)

Synchronize (see page 3126)

129.1.9.4.8 TServerClientThread.ReActivate Method

Pascal

```
procedure ReActivate(ASocket: TServerClientWinSocket);
```

C++

```
__fastcall ReActivate(TServerClientWinSocket ASocket);
```

Description

This is ReActivate, a member of class TServerClientThread.

129.1.9.4.9 TServerClientThread.StartConnect Method

Indicates when the thread is ready to execute.

Pascal

```
function StartConnect: Boolean;
```

C++

```
__fastcall Boolean StartConnect();
```

Description

The Execute (see page 18836) method calls StartConnect to determine when to call ClientExecute (see page 18834).

StartConnect waits until the Reactivate method has signaled that the thread is properly initialized, and then returns true if the thread is ready to run. If the thread is terminated for any reason before it is fully initialized, StartConnect returns false.

See Also

Reactivate (see page 18837)

ClientExecute (see page 18834)

Execute (see page 18836)

129.1.9.5 TServerClientThread Properties

The properties of the TServerClientThread class are listed here.

Public Properties

	Name	Description
R	ClientSocket (see page 18838)	Specifies the TServerClientWinSocket (see page 18840) object that uses the thread for all reading and writing over the socket connection.
	Data (see page 18838)	Points to application-specific data associated with the thread.
	KeepInCache (see page 18839)	Determines whether the thread should be kept in the thread cache maintained by ServerSocket (see page 18839).
R	ServerSocket (see page 18839)	Specifies the TServerWinSocket (see page 18858) object that manages all the TServerClientThread (see page 18831) objects for its client connections.

129.1.9.5.1 TServerClientThread.ClientSocket Property

Specifies the TServerClientWinSocket (see page 18840) object that uses the thread for all reading and writing over the socket connection.

Pascal

```
property ClientSocket: TServerClientWinSocket;
```

C++

```
__property TServerClientWinSocket ClientSocket;
```

Description

Use ClientSocket to gain direct access to the Windows socket component that uses the thread. If ClientSocket is nil (Delphi) or NULL (C++), the thread is idle and available for reuse by another TServerClientWinSocket (see page 18840) object. TServerClientThread (see page 18831) uses ClientSocket to read from or write to the socket connection.

See Also

TServerClientWinSocket (see page 18840)

129.1.9.5.2 TServerClientThread.Data Property

Points to application-specific data associated with the thread.

Pascal

```
property Data: Pointer;
```

C++

```
__property void * Data;
```

Description

Use Data to associate information with the thread object. Data can store information in a thread-safe manner that would otherwise require the use of global variables.

See Also

Data (see page 18818)

129.1.9.5.3 TServerClientThread.KeepInCache Property

Determines whether the thread should be kept in the thread cache maintained by ServerSocket (see page 18839).

Pascal

```
property KeepInCache: Boolean;
```

C++

```
__property Boolean KeepInCache;
```

Description

The TServerWinSocket (see page 18858) that spawns server client threads for its connections to client sockets maintains a cache of server client threads for reuse. As server client threads are activated, the TServerWinSocket (see page 18858) object sets the KeepInCache property to indicate whether the thread will fit in the thread cache.

When KeepInCache is true, FreeOnTerminate is set to false before the thread terminates, and the thread is left in the thread cache. When KeepInCache is false, the thread is freed when execution terminates.

See Also

FreeOnTerminate (see page 3134)

ServerSocket (see page 18839)

ThreadCacheSize (see page 18870)

129.1.9.5.4 TServerClientThread.ServerSocket Property

Specifies the TServerWinSocket (see page 18858) object that manages all the TServerClientThread (see page 18831) objects for its client connections.

Pascal

```
property ServerSocket: TServerWinSocket;
```

C++

```
__property TServerWinSocket ServerSocket;
```

Description

Use ServerSocket to get direct access to the listening Windows socket object that spawned the thread for a client connection it accepted. TServerClientThread (see page 18831) passes events and errors to the appropriate event handlers assigned to ServerSocket. TServerClientThread (see page 18831) adds itself to the cache of threads maintained by ServerSocket from its constructor, and removes itself when the thread terminates.

See Also

Create (see page 18833)

TServerWinSocket (see page 18858)

129.1.10 TServerClientWinSocket Class

TServerClientWinSocket describes the server endpoint of a socket connection to a client socket.

Class Hierarchy

Pascal

```
TServerClientWinSocket = class(TCustomWinSocket);
```

C++

```
class TServerClientWinSocket : public TCustomWinSocket;
```

File

ScktComp

Description

TServerClientWinSocket is used by server socket components to manage the Windows socket API calls for the socket connection to an individual client socket. TServerClientWinSocket objects are created when a client socket connection is accepted by a listening server socket.

Applications can create and customize the properties of a TServerClientWinSocket object in an OnGetSocket event handler for a server socket component. Component writers can create descendants of TServerClientWinSocket that may be substituted for TServerClientWinSocket in the OnGetSocket event handler.

See Also

TClientWinSocket (see page 18766)

TCustomServerSocket (see page 18770)

TServerSocket (see page 18843)

TServerWinSocket (see page 18858)

129.1.10.1 TServerClientWinSocket Members

The following tables list the members exposed by TServerClientWinSocket.

Protected Methods

	Name	Description
	AsyncInitSocket (see page 18803)	Looks up information or forms socket connections asynchronously.
	DoListen (see page 18806)	Opens a listening connection.
	DoOpen (see page 18806)	Opens a connection to a remote socket.
	Error (see page 18806)	Generates an OnErrorEvent (see page 18824) event.
	Event (see page 18807)	This is Event, a member of class TCustomWinSocket.
	InitSocket (see page 18807)	Generates a windows Internet socket address structure from a description of the desired socket port.
	SetAsyncStyles (see page 18815)	Sets the AsyncStyles property.

Public Events

	Name	Description
	OnErrorEvent (see page 18824)	Occurs when the socket fails in making, using, or shutting down a connection.

	OnSocketEvent (see page 18824)	Occurs when the Windows socket receives notification of asynchronous events.

Public Methods

	Name	Description
V	Accept (see page 18803)	Provides the interface for a method that accepts a connection to a client socket.
	Close (see page 18804)	Shuts down the socket connection if it is open.
V	Connect (see page 18805)	Provides the interface for a method that responds to connection notifications from client sockets.
	Create (see page 18842)	Creates and initializes an instance of TServerClientWinSocket (see page 18840).
V	DefaultHandler (see page 18805)	Processes message records.
V	Destroy (see page 18842)	Destroys an instance of TServerClientWinSocket (see page 18840).
V	Disconnect (see page 18805)	Shuts down the socket connection represented by a Windows socket handle.
	Listen (see page 18808)	Opens a listening connection for a server socket.
	Lock (see page 18809)	Starts a critical section, blocking all other execution threads until the Unlock (see page 18815) method is called.
	LookupName (see page 18809)	Generates the portion of a Windows Internet socket address structure that describes the host.
	LookupService (see page 18810)	Returns the port number associated with a specific service.
	Open (see page 18810)	Opens a connection to a remote socket.
V	Read (see page 18811)	Generates an OnSocketEvent (see page 18824) of type seRead in response to notifications that the socket connection is ready.
	ReceiveBuf (see page 18812)	This is ReceiveBuf, a member of class TCustomWinSocket.
	ReceiveLength (see page 18812)	Returns the number of bytes ready to be sent over the socket connection.
	ReceiveText (see page 18812)	Reads a string from the socket connection.
	SendBuf (see page 18813)	Writes Count bytes to the socket connection from the Buf parameter.
	SendStream (see page 18814)	This is SendStream, a member of class TCustomWinSocket.
	SendStreamThenDrop (see page 18814)	Writes all the information that can be read from the AStream parameter to the socket connection and then terminates the connection.
	SendText (see page 18814)	Writes the string S to the socket connection.
	Unlock (see page 18815)	Reenables execution in other threads after a critical section begun by the Lock (see page 18809) method.
V	Write (see page 18816)	Generates an OnSocketEvent (see page 18824) of type seWrite in response to notifications that the socket connection is ready.

Public Properties

	Name	Description
R	Addr (see page 18817)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the socket port.
	ASyncStyles (see page 18817)	Determines which asynchronous events the socket can receive.
R	Connected (see page 18818)	Indicates whether the socket connection is open and available for communication with other machines.
	Data (see page 18818)	Points to application-specific data associated with the socket.
R	Handle (see page 18819)	Specifies the handle of the window that receives notifications from the Windows socket.
R	LocalAddress (see page 18819)	Specifies the IP address of the local system that was bound to the socket connection.
R	LocalHost (see page 18820)	Specifies the name of the local system.
R	LocalPort (see page 18820)	Specifies the ID number of the port used by the socket connection.
R	LookupState (see page 18821)	Indicates any asynchronous activities occurring while opening a connection.
R	RemoteAddr (see page 18821)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the remote socket port.
R	RemoteAddress (see page 18822)	Specifies the IP address of the remote system that was bound to the socket connection.
R	RemoteHost (see page 18822)	Specifies the name of the remote system.
R	RemotePort (see page 18823)	Specifies the ID number of the port used by the RemoteHost (see page 18822) to form the socket connection.
R	ServerWinSocket (see page 18843)	Describes the endpoint of the listening connection that accepted the connection to the client socket which is managed by this TServerClientWinSocket (see page 18840).

R	SocketHandle (see page 18823)	Specifies the Windows handle for the socket.

129.1.10.2 TServerClientWinSocket.Create Constructor

Creates and initializes an instance of TServerClientWinSocket (see page 18840).

Pascal

```
constructor Create(Socket: TSocket; ServerWinSocket: TServerWinSocket);
```

C++

```
__fastcall TServerClientWinSocket(TSocket Socket, TServerWinSocket ServerWinSocket);
```

Description

Use Create to create an instance of TServerClientWinSocket (see page 18840) in the OnGetSocket event handler of a server socket component. The Socket parameter is the Windows socket handle for the accepted socket connection to a client socket. The ServerWinSocket (see page 18843) parameter is the Windows socket object for the listening connection that accepted the connection to the client socket.

Create adds the new TServerClientWinSocket (see page 18840) object to the list of connections maintained by the listening server socket. It then sets the OnSocketEvent (see page 18824) event handler so that notifications from the connection to the client can be passed on to the server socket. After setting up the connection to the server socket, Create calls the inherited constructor.

See Also

OnSocketEvent (see page 18824)

Create (see page 18801)

Connections (see page 18868)

129.1.10.3 TServerClientWinSocket.Destroy Destructor

Destroys an instance of TServerClientWinSocket (see page 18840).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TServerClientWinSocket();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TServerClientWinSocket (see page 18840) reference is not nil, and only then calls Destroy. Instances of TServerClientWinSocket (see page 18840) are freed automatically when the connection is closed.

Destroy removes the TServerClientWinSocket (see page 18840) from the list of connections maintained by the listening windows socket.

See Also

Free (see page 22300)

Connections (see page 18868)

129.1.10.4 TServerClientWinSocket Properties

The properties of the TServerClientWinSocket class are listed here.

Public Properties

	Name	Description
R	ServerWinSocket (see page 18843)	Describes the endpoint of the listening connection that accepted the connection to the client socket which is managed by this TServerClientWinSocket (see page 18840).

129.1.10.4.1 TServerClientWinSocket.ServerWinSocket Property

Describes the endpoint of the listening connection that accepted the connection to the client socket which is managed by this TServerClientWinSocket (see page 18840).

Pascal

```
property ServerWinSocket: TServerWinSocket;
```

C++

```
__property TServerWinSocket ServerWinSocket;
```

Description

Use ServerWinSocket to gain access to the Windows socket object for the listening connection that spawned this TServerClientWinSocket (see page 18840). Use the ServerWinSocket to trigger events that can be handled by the event handlers of the server socket, to get execution threads from the cache maintained by the Windows server socket, or to get information about the other active connections accepted by the server socket.

See Also

TServerWinSocket (see page 18858)

129.1.11 TServerSocket Class

TServerSocket manages server socket connections for a TCP/IP server.

Class Hierarchy

Pascal

```
TServerSocket = class(TCustomServerSocket);
```

C++

```
class TServerSocket : public TCustomServerSocket;
```

File

ScktComp

Description

Add a TServerSocket object to a form or data module to turn an application into a TCP/IP server. TServerSocket listens for

requests for TCP/IP connections from other machines, and establishes connections when requests are received.

See Also

TClientSocket (see page 18752)

TServerClientWinSocket (see page 18840)

TServerWinSocket (see page 18858)

129.1.11.1 TServerSocket Members

The following tables list the members exposed by TServerSocket.

Protected Events

	Name	Description
	OnConnect (see page 18795)	Occurs on client sockets just after the connection to the server is opened.
	OnConnecting (see page 18796)	Occurs for a client socket after the server socket has been located, but before the connection is established.
	OnDisconnect (see page 18796)	Occurs just before a client socket closes the connection to a server socket.
	OnError (see page 18797)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnLookup (see page 18797)	Occurs when a client socket is about to look up the server socket with which it wants to connect.
	OnRead (see page 18798)	Occurs when a client socket should read information from the socket connection.
	OnWrite (see page 18799)	Occurs when a client socket should write information to the socket connection.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FServerSocket (see page 18775)	This is FServerSocket, a member of class TCustomServerSocket.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
A	DoActivate (see page 18744)	Provides the prototype of a method to open or close the socket connection.
V	DoActivate (see page 18775)	Opens or Closes the socket connection.
A	Error (see page 18745)	Provides the prototype of a method that responds to error conditions.
V	Error (see page 18793)	Generates an OnError (see page 18797) event.
A	Event (see page 18746)	Provides the prototype of a method that responds when specific socket events occur.
V	Event (see page 18794)	Dispatches the events that occur in the normal operation of the socket to the appropriate event handlers.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetGetSocketEvent (see page 18776)	Returns the OnGetSocket (see page 18787) event handler.
	GetGetThreadEvent (see page 18776)	Returns the OnGetThread (see page 18787) event handler.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).

	GetOnClientError (see page 18776)	Returns the OnClientError (see page 18785) event handler.
	GetOnClientEvent (see page 18777)	Provides indexed access to the various event handlers that respond to client events.
	GetOnThreadEnd (see page 18777)	Returns the OnThreadEnd (see page 18788) event handler.
	GetOnThreadStart (see page 18778)	Returns the OnThreadStart (see page 18788) event handler.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetServerType (see page 18778)	Returns the ServerType (see page 18782) property.
	GetThreadCacheSize (see page 18778)	Returns the value of the ThreadCacheSize (see page 18783) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InitSocket (see page 18746)	Tells a Windows socket object to call the Error (see page 18745) and Event (see page 18746) methods.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 18747)	Opens or closes the socket connection when the socket is loaded from a file, depending on the saved value of the Active (see page 18750) property.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActive (see page 18748)	Sets the Active (see page 18750) property.
	SetAddress (see page 18748)	Sets the Address (see page 18750) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetGetSocketEvent (see page 18779)	Sets the OnGetSocket (see page 18787) event handler.
	SetGetThreadEvent (see page 18779)	Sets the OnGetThread (see page 18787) event handler.
	SetHost (see page 18748)	Sets the Host (see page 18751) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnClientError (see page 18779)	Sets the OnClientError (see page 18785) event handler.
	SetOnClientEvent (see page 18780)	Sets the client event handlers of the associated TServerWinSocket (see page 18858) object.
	SetOnThreadEnd (see page 18780)	Sets the OnThreadEnd (see page 18788) event handler.
	SetOnThreadStart (see page 18781)	Sets the OnThreadStart (see page 18788) event handler.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetPort (see page 18749)	Sets the Port (see page 18751) property.
	SetServerType (see page 18781)	Sets the ServerType (see page 18782) property.
	SetService (see page 18749)	Sets the Service (see page 18752) property.
	SetThreadCacheSize (see page 18781)	Sets the ThreadCacheSize (see page 18783) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Address (see page 18750)	Specifies the IP address of the server system.
	Host (see page 18751)	Specifies an alias for the IP address of the server system.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 18744)	Shuts down the socket connection.
V	Create (see page 18848)	Creates an instance of TServerSocket (see page 18843).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 18774)	Destroys an instance of TCustomServerSocket (see page 18770).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 18747)	Opens the socket connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Socket (see page 18851)	Specifies the TServerWinSocket (see page 18858) object that describes the endpoint of the listening connection.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnAccept (see page 18852)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnClientConnect (see page 18852)	Occurs when a client socket completes a connection accepted by the server socket.
	OnClientDisconnect (see page 18853)	Occurs when one of the connections to a client socket is closed.
	OnClientError (see page 18854)	Occurs when there is a failure in establishing, using, or terminating the socket connection to an individual client socket.
	OnClientRead (see page 18855)	Occurs when the server socket should read information from a client socket.
	OnClientWrite (see page 18855)	Occurs when the server socket should write information to a client socket.
	OnGetSocket (see page 18856)	Occurs when the server socket needs to create a new TServerClientWinSocket object to represent the server endpoint of a connection to a client socket.
	OnGetThread (see page 18856)	Occurs when the server socket needs to create a new execution thread for a connection to a client socket.
	OnListen (see page 18857)	Occurs just before a server socket is opened for listening.
	OnThreadEnd (see page 18857)	Occurs when a client socket connection is terminated and the associated thread finishes execution.
	OnThreadStart (see page 18858)	Occurs when the execution thread for a connection to a client socket starts up.

Published Properties

	Name	Description
	Active (see page 18849)	Indicates whether the socket connection is open and available for communication with other machines.

	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Port (see page 18849)	Specifies the ID number that identifies the server socket connection.
	ServerType (see page 18850)	Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.
	Service (see page 18850)	Specifies the name of the service for which the socket connection is used.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ThreadCacheSize (see page 18851)	Specifies the maximum number of threads that can be reused for new client connections.

129.1.11.2 TServerSocket.Create Constructor

Creates an instance of TServerSocket (see page 18843).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TServerSocket(TComponent * AOwner);
```

Description

Call Create to create and initialize a server socket component at runtime. TServerSocket (see page 18843) objects placed at design time are created automatically.

After calling the inherited constructor, Create

Allocates the TServerWinSocket (see page 18858) object that encapsulates the Windows socket connection for the server socket.

Initializes the event and error dispatchers for the server socket.

Initializes ThreadCacheSize (see page 18851) to 10.

See Also

Create (see page 2766)

ThreadCacheSize (see page 18783)

129.1.11.3 TServerSocket Properties

The properties of the TServerSocket class are listed here.

Public Properties

	Name	Description
R	Socket (see page 18851)	Specifies the TServerWinSocket (see page 18858) object that describes the endpoint of the listening connection.

Published Properties

	Name	Description
	Active (see page 18849)	Indicates whether the socket connection is open and available for communication with other machines.
	Port (see page 18849)	Specifies the ID number that identifies the server socket connection.
	ServerType (see page 18850)	Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.
	Service (see page 18850)	Specifies the name of the service for which the socket connection is used.
	ThreadCacheSize (see page 18851)	Specifies the maximum number of threads that can be reused for new client connections.

129.1.11.3.1 TServerSocket.Active Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before attempting to use or change the socket connection, read Active to determine whether the connection is open and ready. For client sockets, setting Active opens or shuts down a socket connection to another machine. For server sockets, setting Active opens or shuts down a listening connection that makes the socket available for client requests.

At design time, set Active to true to make the socket open a connection when the application starts running. At runtime, use the Open or Close method to open or close the connection.

See Also

Close (see page 18744)

Open (see page 18747)

SetActive (see page 18748)

129.1.11.3.2 TServerSocket.Port Property

Specifies the ID number that identifies the server socket connection.

Pascal

```
property Port: Integer;
```

C++

```
__property int Port;
```

Description

Port numbers allow a single system, identified by the Host or Address property, to host multiple connections simultaneously. Many values of Port are associated by convention with a particular service such as ftp or http.

For server sockets, Port is the ID of the connection on which the server socket listens for client requests. Server sockets generally set Port to a predefined value which clients can use to initiate connections.

For client sockets, Port is the ID of the desired server connection. The value of Port is usually associated with the service the client wishes to use on the server application.

Note: Trying to change Port when the connection is open will raise an ESocketError exception.

See Also

Address (see page 18750)

ESocketError

Host (see page 18751)

Service (see page 18752)

SetPort (see page 18749)

129.1.11.3.3 TServerSocket.ServerType Property

Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.

Pascal

```
property ServerType: TServerType;
```

C++

```
__property TServerType ServerType;
```

Description

Set ServerType to stThreadBlocking to automatically spawn a new thread for each socket connection accepted by the server socket. When ServerType is stThreadBlocking, the execution of the connection thread is suspended while reading or writing until all information has been transferred over the connection. The thread for each connection generates OnClientRead or OnClientWrite events when the server socket needs to read or write.

Set ServerType to stNonBlocking to handle all reading and writing over the socket connections asynchronously. When ServerType is stNonBlocking, all client connections are handled in a single execution thread by default. OnClientRead or OnClientWrite events occur when the client socket on the other end of one of the connections tries to send or receive information over the connection.

Use a non-blocking socket when the socket needs to synchronize reading and writing with client sockets.

Note: When ServerType is stThreadBlocking, it is important that the OnClient... event handlers contain thread-safe code.

See Also

OnClientRead (see page 18786)

OnClientWrite (see page 18786)

TServerClientThread (see page 18831)

129.1.11.3.4 TServerSocket.Service Property

Specifies the name of the service for which the socket connection is used.

Pascal

```
property Service: string;
```

C++

```
__property AnsiString Service;
```

Description

Use Service to identify the use of the connection. Windows provides There are a number of standard service names such as ftp, http, finger, and time. Servers can specify additional services and their associated ports in a SERVICES file. For more information, see the Microsoft documentation for Windows sockets.

Certain port numbers are reserved for specific values of service. Thus, Service provides a more meaningful way to specify the server Port to use for the socket connection. For server sockets, using Service rather than Port ensures that the server will listen for TCP/IP requests on the appropriate port.

Note: Trying to change Service when the connection is open will raise an ESocketError exception.

See Also

ESocketError

Port (see page 18751)

SetService (see page 18749)

LookupService (see page 18810)

129.1.11.3.5 TServerSocket.Socket Property

Specifies the TServerWinSocket (see page 18858) object that describes the endpoint of the listening connection.

Pascal

```
property Socket: TServerWinSocket;
```

C++

```
__property TServerWinSocket Socket;
```

Description

Use Socket to obtain

Information about the connections currently active on the server socket.

Information about the connection threads that are cached for use by the server socket.

Access to the Windows socket handle for the listening connection that is needed for Windows socket API calls.

See Also

ThreadCacheSize (see page 18783)

129.1.11.3.6 TServerSocket.ThreadCacheSize Property

Specifies the maximum number of threads that can be reused for new client connections.

Pascal

```
property ThreadCacheSize: Integer;
```

C++

```
__property int ThreadCacheSize;
```

Description

When ServerType is stThreadBlocking, each new connection that is accepted by the server socket is given a separate execution thread. In order to improve performance, server sockets store these threads in a cache rather than freeing them when the connection is closed. New connections can then reuse threads from the cache, rather than requiring the socket server to create a new thread every time a connection is accepted.

Set ThreadCacheSize to specify the number of threads that are cached for reuse. The ideal value for ThreadCacheSize depends on the number and frequency of client socket requests received by the server socket. If ThreadCacheSize is too low, the server socket will spend more time freeing and creating threads when client connections are accepted. If ThreadCacheSize is too high, the server socket may unnecessarily lock up the memory for threads that are never reused.

ServerType (see page 18782)

TServerClientThread (see page 18831)

ActiveThreads (see page 18867)

IdleThreads (see page 18869)

129.1.11.4 TServerSocket Events

The events of the TServerSocket class are listed here.

Published Events

	Name	Description
	OnAccept (see page 18852)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnClientConnect (see page 18852)	Occurs when a client socket completes a connection accepted by the server socket.
	OnClientDisconnect (see page 18853)	Occurs when one of the connections to a client socket is closed.
	OnClientError (see page 18854)	Occurs when there is a failure in establishing, using, or terminating the socket connection to an individual client socket.
	OnClientRead (see page 18855)	Occurs when the server socket should read information from a client socket.
	OnClientWrite (see page 18855)	Occurs when the server socket should write information to a client socket.
	OnGetSocket (see page 18856)	Occurs when the server socket needs to create a new TServerClientWinSocket object to represent the server endpoint of a connection to a client socket.
	OnGetThread (see page 18856)	Occurs when the server socket needs to create a new execution thread for a connection to a client socket.
	OnListen (see page 18857)	Occurs just before a server socket is opened for listening.
	OnThreadEnd (see page 18857)	Occurs when a client socket connection is terminated and the associated thread finishes execution.
	OnThreadStart (see page 18858)	Occurs when the execution thread for a connection to a client socket starts up.

129.1.11.4.1 TServerSocket.OnAccept Event

Occurs on server sockets just after the connection to a client socket is accepted.

Pascal

```
property OnAccept: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnAccept;
```

Description

Write an OnAccept event handler for a server socket to take specific action after the connection to a client socket has been accepted. This is the first point when information is available about the local port and IP address that will be used in the server endpoint of the connection. The port number, and possibly the IP address, will differ from those of the listening socket.

Server sockets open a socket connection for listening to establish a queue to hold client requests. After a request from the queue is accepted by the server socket, an OnAccept event occurs. After the server socket accepts the connection, the client socket completes the connection, and an OnConnect event occurs for the client socket.

See Also

OnConnect (see page 18795)

OnListen (see page 18797)

129.1.11.4.2 TServerSocket.OnClientConnect Event

Occurs when a client socket completes a connection accepted by the server socket.

Pascal

```
property OnClientConnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientConnect;
```

Description

Write an OnClientConnect event handler to take specific action when a client socket completes the socket connection to the server socket. For example, the socket may start reading or writing over the connection in an OnClientConnect event handler.

The order of server socket events leading up to OnClientConnect is as follows:

1An OnListen event occurs just before the server socket is opened for listening.

2The server socket receives client requests in a listening queue. The server socket accepts one of those requests, and receives a Windows socket handle for the new socket connection.

3The server socket generates an OnGetSocket event, passing in the Windows socket handle. If a TServerClientWinSocket object for the server endpoint of the new connection is not created in an OnGetSocket event handler, the server socket creates one. The TServerWinSocket object continues to listen for other clients.

4An OnAccept event occurs, using the new TServerClientWinSocket object.

5If ServerType is stThreadBlocking and no thread is available in the cache, an OnGetThread event occurs. If the OnGetThread event handler does not create a thread, the server socket creates a TServerClientThread.

6If ServerType is stThreadBlocking, an OnThreadStart event occurs as the thread begins execution.

7The client completes the connection to the TServerClientWinSocket object and an OnClientConnect event occurs.

Note: If ServerType is stThreadBlocking, make sure that all code in an OnClientConnect event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

Note: The OnClientConnect event handler for TServerSocket is also set when setting the OnClientConnect event handler of the associated TServerWinSocket.

See Also

OnAccept (see page 18795)

OnGetSocket (see page 18787)

OnGetThread (see page 18787)

OnListen (see page 18797)

OnThreadStart (see page 18788)

ServerType (see page 18782)

TServerClientWinSocket (see page 18840)

TServerWinSocket (see page 18858)

GetClientThread (see page 18865)

129.1.11.4.3 TServerSocket.OnClientDisconnect Event

Occurs when one of the connections to a client socket is closed.

Pascal

```
property OnClientDisconnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientDisconnect;
```

Description

Write an OnClientDisconnect event handler to take specific action when the connection to a client socket is ending. The termination of a client connection does not close the server socket. The server socket remains open and listening for client requests on its listening connection.

The TServerClientWinSocket that describes the server endpoint of the client connection is freed after OnClientDisconnect. If ServerType is stThreadBlocking, OnThreadEnd occurs after OnClientDisconnect.

Note: If ServerType is stThreadBlocking, make sure that all code in an OnClientDisconnect event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

Note: The OnClientDisconnect event handler for TServerSocket is also set when setting the OnClientDisconnect event handler of the associated TServerWinSocket.

See Also

OnThreadEnd (see page 18788)

ServerType (see page 18782)

TServerClientWinSocket (see page 18840)

TServerWinSocket (see page 18858)

GetClientThread (see page 18865)

129.1.11.4.4 TServerSocket.OnClientError Event

Occurs when there is a failure in establishing, using, or terminating the socket connection to an individual client socket.

Pascal

```
property OnClientError: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnClientError;
```

Description

Write an OnClientError event handler to respond to errors that arise with a connection to an individual client. Set the ErrorCode parameter to 0 if the OnClientError event handler successfully deals with the error condition to prevent an ESocketError from being raised.

Note: If ServerType is stThreadBlocking, make sure that all code in an OnClientError event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

Note: The OnClientError event handler for TServerSocket is also set when setting the OnClientError event handler of the associated TServerWinSocket.

See Also

ESocketError

ServerType (see page 18782)

TServerClientWinSocket (see page 18840)

GetClientThread (see page 18865)

129.1.11.4.5 TServerSocket.OnClientRead Event

Occurs when the server socket should read information from a client socket.

Pascal

```
property OnClientRead: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientRead;
```

Description

Write an OnClientRead event handler to write to the socket connection. If the ServerType property is stThreadBlocking, use a TWinSocketStream object to prevent problems that arise while writing from causing the execution thread to hang indefinitely. Otherwise, uUse the methods of the Socket parameter to perform the actual writing.

Note: If ServerType is stThreadBlocking, make sure that all code in an OnClientRead event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

See Also

ServerType (see page 18782)

receivebuf (see page 18812)

ReceiveText (see page 18812)

TServerClientWinSocket (see page 18840)

TWinSocketStream (see page 18876)

129.1.11.4.6 TServerSocket.OnClientWrite Event

Occurs when the server socket should write information to a client socket.

Pascal

```
property OnClientWrite: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientWrite;
```

Description

Write an OnClientWrite event handler to write to the socket connection. If the ServerType property is stThreadBlocking, use a TWinSocketStream object to prevent problems that arise while writing from causing the execution thread to hang indefinitely. Otherwise, uUse the methods of the Socket parameter to perform the actual writing.

Note: If ServerType is stThreadBlocking, make sure that all code in an OnClientWrite event handler is thread-safe. Use the GetClientThread method of the Sender parameter to access thread-specific information.

See Also

ServerType (see page 18782)

SendBuf (see page 18813)

sendstream (see page 18814)

SendText (see page 18814)

GetClientThread (see page 18865)

TWinSocketStream (see page 18876)

129.1.11.4.7 TServerSocket.OnGetSocket Event

Occurs when the server socket needs to create a new TServerClientWinSocket object to represent the server endpoint of a connection to a client socket.

Pascal

```
property OnGetSocket: TGetSocketEvent;
```

C++

```
__property TGetSocketEvent OnGetSocket;
```

Description

Write an OnGetSocket event handler to create a specialized descendant of TServerClientWinSocket for the server socket component to use. Return the new TServerClientWinSocket object in the ClientSocket parameter. The Sender parameter is the TServerWinSocket object that describes the server endpoint of the listening connection.

See Also

TServerClientWinSocket (see page 18840)

Create (see page 18842)

TServerWinSocket (see page 18858)

129.1.11.4.8 TServerSocket.OnGetThread Event

Occurs when the server socket needs to create a new execution thread for a connection to a client socket.

Pascal

```
property OnGetThread: TGetThreadEvent;
```

C++

```
__property TGetThreadEvent OnGetThread;
```

Description

Write an OnGetThread event handler to create a specialized descendant of TServerClientThread for the connection to the client socket. Return the new TServerClientThread object in the SocketThread parameter.

Most applications that use thread-blocking server components will want to provide an OnGetThread event handler and implement a TServerClientThread that handles its own reading and writing in a thread-safe manner rather than relying on the default TServerClientThread which triggers OnClientRead and OnClientWrite events. This is because the OnClientRead and OnClientWrite event handlers reside on the server socket, which is in global memory.

The Sender parameter is the TServerWinSocket object that describes the server endpoint of the listening connection. The ClientSocket parameter is the TServerClientWinSocket object that describes the server endpoint of the connection to the client socket that is about to be formed.

See Also

ServerType (see page 18782)

TServerClientThread (see page 18831)

TServerClientWinSocket (see page 18840)

TServerWinSocket (see page 18858)

129.1.11.4.9 TServerSocket.OnListen Event

Occurs just before a server socket is opened for listening.

Pascal

```
property OnListen: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnListen;
```

Description

Write an OnListen event handler for a server socket to take specific action just before the socket is opened for listening. OnListen occurs after Address and Port have been bound to the socket connection, but before it is opened. This is the last opportunity to make changes to the socket endpoint before it is opened for listening. Use the SocketHandle property of the Socket parameter for Windows API calls that change the socket.

Server sockets open a socket connection for listening to establish a queue to hold client requests. The connection to a client socket is completed when a request from the queue is accepted.

Accept (see page 18803)

Address (see page 18750)

Port (see page 18751)

129.1.11.4.10 TServerSocket.OnThreadEnd Event

Occurs when a client socket connection is terminated and the associated thread finishes execution.

Pascal

```
property OnThreadEnd: TThreadNotifyEvent;
```

C++

```
__property TThreadNotifyEvent OnThreadEnd;
```

Description

Write an OnThreadEnd to take specific action when the thread for a client connection finishes execution. OnThreadEnd occurs after the OnClientDisconnect event.

The Sender parameter is the TServerWinSocket that describes the server endpoint of the listening connection. The Thread parameter is the thread that is finishing up.

See Also

OnClientDisconnect (see page 18785)

TServerWinSocket (see page 18858)

129.1.11.4.11 TServerSocket.OnThreadStart Event

Occurs when the execution thread for a connection to a client socket starts up.

Pascal

```
property OnThreadStart: TThreadNotifyEvent;
```

C++

```
__property TThreadNotifyEvent OnThreadStart;
```

Description

Write an OnThreadStart to initialize the TServerClientThread for the connection to a single client socket. The Sender parameter is the TServerWinSocket that describes the server endpoint of the listening connection. The Thread parameter is the thread that is about to start execution.

See Also

TServerClientThread (see page 18831)

TServerWinSocket (see page 18858)

129.1.12 TServerWinSocket Class

TServerWinSocket describes the endpoint of a listening server socket connection.

Class Hierarchy

Pascal

```
TServerWinSocket = class(TCustomWinSocket);
```

C++

```
class TServerWinSocket : public TCustomWinSocket;
```

File

ScktComp

Description

TServerWinSocket is used by server socket components to manage the Windows socket API calls for a TCP/IP listening connection. TServerWinSocket introduces new properties, events, and methods to manage multiple socket connections to different client sockets, and to generate or reuse TServerClientThread (see page 18831) objects that allow each client connection to have its own execution thread.

See Also

TClientWinSocket (see page 18766)

TServerClientThread (see page 18831)

TServerClientWinSocket (see page 18840)

TServerSocket (see page 18843)

129.1.12.1 TServerWinSocket Members

The following tables list the members exposed by TServerWinSocket.

Protected Methods

	Name	Description
	AsyncInitSocket (see page 18803)	Looks up information or forms socket connections asynchronously.
	ClientConnect (see page 18863)	This is ClientConnect, a member of class TServerWinSocket.
	ClientDisconnect (see page 18863)	This is ClientDisconnect, a member of class TServerWinSocket.
	ClientErrorEvent (see page 18863)	This is ClientErrorEvent, a member of class TServerWinSocket.
	ClientRead (see page 18863)	This is ClientRead, a member of class TServerWinSocket.
	ClientWrite (see page 18863)	This is ClientWrite, a member of class TServerWinSocket.
V	DoCreateThread (see page 18864)	This is DoCreateThread, a member of class TServerWinSocket.
	DoListen (see page 18806)	Opens a listening connection.
	DoOpen (see page 18806)	Opens a connection to a remote socket.
	Error (see page 18806)	Generates an OnErrorEvent (see page 18824) event.
	Event (see page 18807)	This is Event, a member of class TCustomWinSocket.
	GetClientSocket (see page 18864)	This is GetClientSocket, a member of class TServerWinSocket.
	GetServerThread (see page 18865)	This is GetServerThread, a member of class TServerWinSocket.
	InitSocket (see page 18807)	Generates a windows Internet socket address structure from a description of the desired socket port.
	Listen (see page 18865)	Opens a listening connection for a server socket.
	SetAsyncStyles (see page 18815)	Sets the AsyncStyles property.
	SetServerType (see page 18866)	This is SetServerType, a member of class TServerWinSocket.
	SetThreadCacheSize (see page 18866)	This is SetThreadCacheSize, a member of class TServerWinSocket.
	ThreadEnd (see page 18866)	This is ThreadEnd, a member of class TServerWinSocket.
	ThreadStart (see page 18867)	This is ThreadStart, a member of class TServerWinSocket.

Public Events

	Name	Description
	OnClientConnect (see page 18871)	Occurs when a client socket completes a connection accepted by the listening socket.
	OnClientDisconnect (see page 18872)	Occurs when one of the connections to a client socket is closed.
	OnClientError (see page 18872)	Occurs when a failure is encountered when establishing, using, or terminating the socket connection to an individual client socket.
	OnClientRead (see page 18873)	Occurs when the server socket should read information from a client socket.
	OnClientWrite (see page 18874)	Occurs when the server socket should write information to a client socket.
	OnErrorEvent (see page 18824)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnGetSocket (see page 18874)	Occurs when the server socket needs to create a new TServerClientWinSocket (see page 18840) object to form the connection to a client socket.
	OnGetThread (see page 18875)	Occurs when the server socket needs to create a new execution thread for a connection to a client socket.
	OnSocketEvent (see page 18824)	Occurs when the Windows socket receives notification of asynchronous events.
	OnThreadEnd (see page 18875)	Occurs when a client socket connection is terminated and the associated thread finishes execution.
	OnThreadStart (see page 18876)	Occurs when the execution thread for a connection to a client socket starts up.

Public Methods

	Name	Description
V	Accept (see page 18862)	Accepts a connection to a client socket.
	Close (see page 18804)	Shuts down the socket connection if it is open.
V	Connect (see page 18805)	Provides the interface for a method that responds to connection notifications from client sockets.
	Create (see page 18861)	Creates an instance of TServerWinSocket (see page 18858) from a Windows socket handle.

V	DefaultHandler (see page 18805)	Processes message records.
V	Destroy (see page 18861)	Destroys an instance of TServerWinSocket (see page 18858).
V	Disconnect (see page 18864)	Shuts down the socket connection represented by a Windows socket handle.
	GetClientThread (see page 18865)	Returns the execution thread used by the client connection managed by the ClientSocket parameter.
	Lock (see page 18809)	Starts a critical section, blocking all other execution threads until the Unlock (see page 18815) method is called.
	LookupName (see page 18809)	Generates the portion of a Windows Internet socket address structure that describes the host.
	LookupService (see page 18810)	Returns the port number associated with a specific service.
	Open (see page 18810)	Opens a connection to a remote socket.
V	Read (see page 18811)	Generates an OnSocketEvent (see page 18824) of type seRead in response to notifications that the socket connection is ready.
	ReceiveBuf (see page 18812)	This is ReceiveBuf, a member of class TCustomWinSocket.
	ReceiveLength (see page 18812)	Returns the number of bytes ready to be sent over the socket connection.
	ReceiveText (see page 18812)	Reads a string from the socket connection.
	SendBuf (see page 18813)	Writes Count bytes to the socket connection from the Buf parameter.
	SendStream (see page 18814)	This is SendStream, a member of class TCustomWinSocket.
	SendStreamThenDrop (see page 18814)	Writes all the information that can be read from the AStream parameter to the socket connection and then terminates the connection.
	SendText (see page 18814)	Writes the string S to the socket connection.
	Unlock (see page 18815)	Reenables execution in other threads after a critical section begun by the Lock (see page 18809) method.
V	Write (see page 18816)	Generates an OnSocketEvent (see page 18824) of type seWrite in response to notifications that the socket connection is ready.

Public Properties

	Name	Description
R	ActiveConnections (see page 18867)	Indicates the number of connections to client sockets accepted by this listening socket that are currently open.
R	ActiveThreads (see page 18867)	Indicates the number of TServerClientThread (see page 18831) objects currently in use by the socket connections listed in the Connections (see page 18868) array.
R	Addr (see page 18817)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the socket port.
	ASyncStyles (see page 18817)	Determines which asynchronous events the socket can receive.
R	Connected (see page 18818)	Indicates whether the socket connection is open and available for communication with other machines.
R	Connections (see page 18868)	Lists all TServerClientWinSocket (see page 18840) objects that represent open socket connections to client sockets that were accepted by this listening socket.
	Data (see page 18818)	Points to application-specific data associated with the socket.
R	Handle (see page 18819)	Specifies the handle of the window that receives notifications from the Windows socket.
R	IdleThreads (see page 18869)	Indicates the number of unused TServerClientThread (see page 18831) objects available in the cache.
R	LocalAddress (see page 18819)	Specifies the IP address of the local system that was bound to the socket connection.
R	LocalHost (see page 18820)	Specifies the name of the local system.
R	LocalPort (see page 18820)	Specifies the ID number of the port used by the socket connection.
R	LookupState (see page 18821)	Indicates any asynchronous activities occurring while opening a connection.
R	RemoteAddr (see page 18821)	Specifies the Internet socket address structure used in Windows socket API calls to represent the full specification of the remote socket port.
R	RemoteAddress (see page 18822)	Specifies the IP address of the remote system that was bound to the socket connection.
R	RemoteHost (see page 18822)	Specifies the name of the remote system.
R	RemotePort (see page 18823)	Specifies the ID number of the port used by the RemoteHost (see page 18822) to form the socket connection.
	ServerType (see page 18869)	Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.
R	SocketHandle (see page 18823)	Specifies the Windows handle for the socket.

	ThreadCacheSize (see page 18870)	Indicates the number of TServerClientThread (see page 18831) objects cached for reuse by new connections to client sockets.

129.1.12.2 TServerWinSocket.Create Constructor

Creates an instance of TServerWinSocket (see page 18858) from a Windows socket handle.

Pascal

```
constructor Create(ASocket: TSocket);
```

C++

```
__fastcall TServerWinSocket(TSocket ASocket);
```

Description

Call Create to create a Windows listening socket object. Windows listening socket objects are created automatically by the server socket component that uses them.

Create allocates the helper objects that manage the list of active client connections and the thread cache before calling the inherited constructor. Create also initializes the ASyncStyles (see page 18817) property to [asAccept].

See Also

ASyncStyles (see page 18817)

Connections (see page 18868)

Create (see page 18801)

129.1.12.3 TServerWinSocket.Destroy Destructor

Destroys an instance of TServerWinSocket (see page 18858).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TServerWinSocket();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the Windows listening socket object is not nil, and only then calls Destroy. Unless the Windows socket object is not used by a server socket component, it is freed automatically by the socket component.

Destroy frees the helper objects that manage the list of active client connections and the thread cache.

See Also

Free (see page 22300)

TServerSocket (see page 18843)

129.1.12.4 TServerWinSocket Methods

The methods of the TServerWinSocket class are listed here.

Protected Methods

	Name	Description
	ClientConnect (see page 18863)	This is ClientConnect, a member of class TServerWinSocket.
	ClientDisconnect (see page 18863)	This is ClientDisconnect, a member of class TServerWinSocket.
	ClientErrorEvent (see page 18863)	This is ClientErrorEvent, a member of class TServerWinSocket.
	ClientRead (see page 18863)	This is ClientRead, a member of class TServerWinSocket.
	ClientWrite (see page 18863)	This is ClientWrite, a member of class TServerWinSocket.
V	DoCreateThread (see page 18864)	This is DoCreateThread, a member of class TServerWinSocket.
	GetClientSocket (see page 18864)	This is GetClientSocket, a member of class TServerWinSocket.
	GetServerThread (see page 18865)	This is GetServerThread, a member of class TServerWinSocket.
	Listen (see page 18865)	Opens a listening connection for a server socket.
	SetServerType (see page 18866)	This is SetServerType, a member of class TServerWinSocket.
	SetThreadCacheSize (see page 18866)	This is SetThreadCacheSize, a member of class TServerWinSocket.
	ThreadEnd (see page 18866)	This is ThreadEnd, a member of class TServerWinSocket.
	ThreadStart (see page 18867)	This is ThreadStart, a member of class TServerWinSocket.

Public Methods

	Name	Description
V	Accept (see page 18862)	Accepts a connection to a client socket.
V	Disconnect (see page 18864)	Shuts down the socket connection represented by a Windows socket handle.
	GetClientThread (see page 18865)	Returns the execution thread used by the client connection managed by the ClientSocket parameter.

129.1.12.4.1 TServerWinSocket.Accept Method

Accepts a connection to a client socket.

Pascal

```
procedure Accept(Socket: TSocket); override;
```

C++

```
virtual __fastcall Accept(TSocket Socket);
```

Description

Accept is called automatically in response to notifications that a client socket is requesting a connection. The Socket parameter is the Windows socket handle for the listening connection.

Accept accepts the client connection request, obtaining the Windows socket handle for the client connection. It then generates an OnGetSocket (see page 18874) event, passing this socket handle as an argument to any event handler. If a TServerClientWinSocket (see page 18840) is not created by an OnGetSocket (see page 18874) event handler, Accept creates a TServerClientWinSocket (see page 18840) to represent the server endpoint of the accepted connection. Next, Accept obtains a running TServerClientThread (see page 18831), either by restarting a thread in the cache, obtaining one from an OnGetThread (see page 18875) event, or creating a new TServerClientThread (see page 18831) object. This new thread handles the connection to the client socket.

Accept is only called if the ASyncStyles (see page 18817) property includes asAccept.

See Also

ASyncStyles (see page 18817)

OnGetSocket (see page 18874)

OnGetThread (see page 18875)

129.1.12.4.2 TServerWinSocket.ClientConnect Method

Pascal

```
procedure ClientConnect(Socket: TCustomWinSOcket); dynamic;
```

C++

```
__fastcall ClientConnect(TCustomWinSOcket Socket);
```

Description

This is ClientConnect, a member of class TServerWinSocket.

129.1.12.4.3 TServerWinSocket.ClientDisconnect Method

Pascal

```
procedure ClientDisconnect(Socket: TCustomWinSOcket); dynamic;
```

C++

```
__fastcall ClientDisconnect(TCustomWinSOcket Socket);
```

Description

This is ClientDisconnect, a member of class TServerWinSocket.

129.1.12.4.4 TServerWinSocket.ClientErrorEvent Method

Pascal

```
procedure ClientErrorEvent(Socket: TCustomWinSocket; ErrorEvent: TErrorEvent; var ErrorCode:
Integer); dynamic;
```

C++

```
__fastcall ClientErrorEvent(TCustomWinSocket Socket, TErrorEvent ErrorEvent, int ErrorCode);
```

Description

This is ClientErrorEvent, a member of class TServerWinSocket.

129.1.12.4.5 TServerWinSocket.ClientRead Method

Pascal

```
procedure ClientRead(Socket: TCustomWinSocket); dynamic;
```

C++

```
__fastcall ClientRead(TCustomWinSocket Socket);
```

Description

This is ClientRead, a member of class TServerWinSocket.

129.1.12.4.6 TServerWinSocket.ClientWrite Method

Pascal

```
procedure ClientWrite(Socket: TCustomWinSOcket); dynamic;
```

C++

```
__fastcall ClientWrite(TCustomWinSOcket Socket);
```

Description

This is ClientWrite, a member of class TServerWinSocket.

129.1.12.4.7 TServerWinSocket.Disconnect Method

Shuts down the socket connection represented by a Windows socket handle.

Pascal

```
procedure Disconnect(Socket: TSocket); override;
```

C++

```
virtual __fastcall Disconnect(TSocket Socket);
```

Description

Disconnect is called by the Close (see page 18804) method to terminate the socket connection.

Disconnect calls the Lock (see page 18809) method to make sure the method is thread-safe. Then, it terminates all open connections to client sockets. Next it generates an OnSocketEvent (see page 18824) of type seDisconnect. Finally, it closes the listening connection and calls Unlock (see page 18815) to end the critical section started by Lock (see page 18809).

See Also

Close (see page 18804)

Lock (see page 18809)

OnSocketEvent (see page 18824)

Unlock (see page 18815)

129.1.12.4.8 TServerWinSocket.DoCreateThread Method

Pascal

```
function DoCreateThread(ClientSocket: TServerClientWinSocket): TServerClientThread; virtual;
```

C++

```
virtual __fastcall TServerClientThread DoCreateThread(TServerClientWinSocket ClientSocket);
```

Description

This is DoCreateThread, a member of class TServerWinSocket.

129.1.12.4.9 TServerWinSocket.GetClientSocket Method

Pascal

```
function GetClientSocket(Socket: TSocket): TServerClientWinSocket; dynamic;
```

C++

```
__fastcall TServerClientWinSocket GetClientSocket(TSocket Socket);
```

Description

This is GetClientSocket, a member of class TServerWinSocket.

129.1.12.4.10 TServerWinSocket.GetClientThread Method

Returns the execution thread used by the client connection managed by the ClientSocket parameter.

Pascal

```
function GetClientThread(ClientSocket: TServerClientWinSocket): TServerClientThread;
```

C++

```
__fastcall TServerClientThread GetClientThread(TServerClientWinSocket ClientSocket);
```

Description

Use GetClientThread to obtain access to the TServerClientThread (see page 18831) for a particular client connection. GetClientThread allows an OnClient... event handler to access thread-global information saved in the Data (see page 18818) property of the thread.

See Also

OnClientConnect (see page 18871)

OnClientDisconnect (see page 18872)

OnClientError (see page 18872)

OnClientRead (see page 18873)

OnClientWrite (see page 18874)

Data (see page 18838)

129.1.12.4.11 TServerWinSocket.GetServerThread Method

Pascal

```
function GetServerThread(ClientSocket: TServerClientWinSocket): TServerClientThread; dynamic;
```

C++

```
__fastcall TServerClientThread GetServerThread(TServerClientWinSocket ClientSocket);
```

Description

This is GetServerThread, a member of class TServerWinSocket.

129.1.12.4.12 TServerWinSocket.Listen Method

Opens a listening connection for a server socket.

Pascal

```
procedure Listen(var Name: string; var Address: string; var Service: string; Port: Word;
QueueSize: Integer);
```

C++

```
__fastcall Listen(AnsiString Name, AnsiString Address, AnsiString Service, Word Port, int
QueueSize);
```

Description

Server socket components call Listen to open a listening connection.

Listen creates the Windows socket that will make the listening connection, and binds the Windows Internet socket address derived from the parameters to the socket. Listen then generates an OnSocketEvent (see page 18824) of type seListen.

Finally, Listen opens the socket as a listening connection with a queue that can hold QueueSize client requests, setting the Connected (see page 18818) property to true.

The Name, Address, Service, and Port parameters are taken from the Host, Address, Service and Port properties of the server socket component. The QueueSize is set to 5 by TServerSocket (see page 18843).

See Also

Connected (see page 18818)

InitSocket (see page 18807)

OnSocketEvent (see page 18824)

Address (see page 18750)

Host (see page 18751)

Port (see page 18751)

Service (see page 18752)

TServerSocket (see page 18843)

129.1.12.4.13 TServerWinSocket.SetServerType Method

Pascal

```
procedure SetServerType(Value: TServerType);
```

C++

```
__fastcall SetServerType(TServerType Value);
```

Description

This is SetServerType, a member of class TServerWinSocket.

129.1.12.4.14 TServerWinSocket.SetThreadCacheSize Method

Pascal

```
procedure SetThreadCacheSize(Value: Integer);
```

C++

```
__fastcall SetThreadCacheSize(int Value);
```

Description

This is SetThreadCacheSize, a member of class TServerWinSocket.

129.1.12.4.15 TServerWinSocket.ThreadEnd Method

Pascal

```
procedure ThreadEnd(AThread: TServerClientThread); dynamic;
```

C++

```
__fastcall ThreadEnd(TServerClientThread AThread);
```

Description

This is ThreadEnd, a member of class TServerWinSocket.

129.1.12.4.16 TServerWinSocket.ThreadStart Method

Pascal

```
procedure ThreadStart(AThread: TServerClientThread); dynamic;
```

C++

```
__fastcall ThreadStart(TServerClientThread AThread);
```

Description

This is ThreadStart, a member of class TServerWinSocket.

129.1.12.5 TServerWinSocket Properties

The properties of the TServerWinSocket class are listed here.

Public Properties

	Name	Description
R	ActiveConnections (see page 18867)	Indicates the number of connections to client sockets accepted by this listening socket that are currently open.
R	ActiveThreads (see page 18867)	Indicates the number of TServerClientThread (see page 18831) objects currently in use by the socket connections listed in the Connections (see page 18868) array.
R	Connections (see page 18868)	Lists all TServerClientWinSocket (see page 18840) objects that represent open socket connections to client sockets that were accepted by this listening socket.
R	IdleThreads (see page 18869)	Indicates the number of unused TServerClientThread (see page 18831) objects available in the cache.
	ServerType (see page 18869)	Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.
	ThreadCacheSize (see page 18870)	Indicates the number of TServerClientThread (see page 18831) objects cached for reuse by new connections to client sockets.

129.1.12.5.1 TServerWinSocket.ActiveConnections Property

Indicates the number of connections to client sockets accepted by this listening socket that are currently open.

Pascal

```
property ActiveConnections: Integer;
```

C++

```
__property int ActiveConnections;
```

Description

Use ActiveConnections to monitor the use of the server socket. ActiveConnections is the number of entries in the Connections (see page 18868) array.

See Also

Connections (see page 18868)

129.1.12.5.2 TServerWinSocket.ActiveThreads Property

Indicates the number of TServerClientThread (see page 18831) objects currently in use by the socket connections listed in the Connections (see page 18868) array.

Pascal

```
property ActiveThreads: Integer;
```

C++

```
__property int ActiveThreads;
```

Description

Use ActiveThreads to monitor thread usage by the listening socket. If ActiveThreads is usually much higher than ThreadCacheSize (see page 18870), increasing ThreadCacheSize (see page 18870) should improve performance. To determine whether ThreadCacheSize (see page 18870) is too high, use the IdleThreads (see page 18869) property.

When the ServerType (see page 18869) property is stThreadBlocking, each client connection automatically spawns a thread which is added to the cache and counted by ActiveThreads.

See Also

Connections (see page 18868)

GetClientThread (see page 18865)

IdleThreads (see page 18869)

ServerType (see page 18869)

ThreadCacheSize (see page 18870)

129.1.12.5.3 TServerWinSocket.Connections Property

Lists all TServerClientWinSocket (see page 18840) objects that represent open socket connections to client sockets that were accepted by this listening socket.

Pascal

```
property Connections [Index: Integer]: TCustomWinSocket;
```

C++

```
__property TCustomWinSocket Connections[int Index];
```

Description

Use Connections with the ActiveConnections (see page 18867) property to iterate over all open socket connections accepted by the listening socket. Each entry in the Connections array is a TServerClientWinSocket (see page 18840) object, where an Index of 0 gives the first TServerClientWinSocket (see page 18840), an Index of 1 returns the second TServerClientWinSocket (see page 18840), and so on.

If ServerType (see page 18869) is stThreadBlocking, the thread associated with each of the TServerClientWinSocket (see page 18840) objects in the Connections array can be obtained using the GetClientThread (see page 18865) method.

See Also

ActiveConnections (see page 18867)

GetClientThread (see page 18865)

ServerType (see page 18869)

TServerClientWinSocket (see page 18840)

129.1.12.5.4 TServerWinSocket.IdleThreads Property

Indicates the number of unused TServerClientThread (see page 18831) objects available in the cache.

Pascal

```
property IdleThreads: Integer;
```

C++

```
__property int IdleThreads;
```

Description

Use IdleThreads to monitor thread cache usage by the listening socket. If IdleThreads often very high, the thread cache is tying up a lot of unused memory storing extra threads. Monitor the ActiveThreads (see page 18867) property to determine an appropriate value for ThreadCacheSize (see page 18870).

When the ServerType (see page 18869) property is stThreadBlocking, each client connection automatically spawns a thread which is added to the cache. As the threads in the cache complete their execution, they become available for reuse, and are counted by IdleThreads. When there are more active threads than ThreadCacheSize (see page 18870), the extra threads are freed when they finish execution instead.

See Also

ActiveThreads (see page 18867)

ServerType (see page 18869)

ThreadCacheSize (see page 18870)

129.1.12.5.5 TServerWinSocket.ServerType Property

Specifies whether each connection accepted by the server socket is non-blocking, or if it is automatically given a separate execution thread.

Pascal

```
property ServerType: TServerType;
```

C++

```
__property TServerType ServerType;
```

Description

Set ServerType to stThreadBlocking to automatically spawn a new thread for each socket connection accepted by the listening socket connection. When ServerType is stThreadBlocking, the TServerClientThread (see page 18831) object for a connection generates OnClientRead (see page 18873) or OnClientWrite (see page 18874) events when the server socket needs to read or write.

Set ServerType to stNonBlocking to handle all reading and writing over socket connections accepted by the listening socket asynchronously. When ServerType is stNonBlocking, all client connections are handled in a single execution thread by default. OnClientRead (see page 18873) or OnClientWrite (see page 18874) events occur when the server socket needs to attend to I/O over one of the connections.

Use a non-blocking socket when reading and writing must be synchronized with client sockets.

Note: When ServerType is stThreadBlocking, it is important that the OnClient...

event handlers contain thread-safe code.

TServerClientThread (see page 18831)

129.1.12.5.6 TServerWinSocket.ThreadCacheSize Property

Indicates the number of TServerClientThread (see page 18831) objects cached for reuse by new connections to client sockets.

Pascal

```
property ThreadCacheSize: Integer;
```

C++

```
__property int ThreadCacheSize;
```

Description

When ServerType (see page 18869) is stThreadBlocking, each new connection that is accepted by the server socket is given a separate execution thread. In order to improve performance, server sockets store these threads in a cache rather than freeing them when the connection is closed. New connections can then reuse threads from the cache, rather than requiring the socket server to create a new thread every time a connection is accepted.

Set ThreadCacheSize to specify the number of threads that are cached for reuse. The ideal value for ThreadCacheSize depends on the number and frequency of client socket requests received by the server socket. If ThreadCacheSize is too low, the server socket will spend more time freeing and creating threads when client connections are accepted. If ThreadCacheSize is too high, the server socket may unnecessarily lock up the memory for threads that are never reused.

ServerType (see page 18869)

129.1.12.6 TServerWinSocket Events

The events of the TServerWinSocket class are listed here.

Public Events

	Name	Description
	OnClientConnect (see page 18871)	Occurs when a client socket completes a connection accepted by the listening socket.
	OnClientDisconnect (see page 18872)	Occurs when one of the connections to a client socket is closed.
	OnClientError (see page 18872)	Occurs when a failure is encountered when establishing, using, or terminating the socket connection to an individual client socket.
	OnClientRead (see page 18873)	Occurs when the server socket should read information from a client socket.
	OnClientWrite (see page 18874)	Occurs when the server socket should write information to a client socket.
	OnGetSocket (see page 18874)	Occurs when the server socket needs to create a new TServerClientWinSocket (see page 18840) object to form the connection to a client socket.
	OnGetThread (see page 18875)	Occurs when the server socket needs to create a new execution thread for a connection to a client socket.

	OnThreadEnd (see page 18875)	Occurs when a client socket connection is terminated and the associated thread finishes execution.
	OnThreadStart (see page 18876)	Occurs when the execution thread for a connection to a client socket starts up.

129.1.12.6.1 TServerWinSocket.OnClientConnect Event

Occurs when a client socket completes a connection accepted by the listening socket.

Pascal

```
property OnClientConnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientConnect;
```

Description

Write (see page 18816) an OnClientConnect event handler to take specific action when a client socket completes the socket connection to a TServerClientWinSocket (see page 18840) object. Depending on the service, this is the point when the socket should begin reading or writing.

The order of Windows server socket events leading up to OnClientConnect is as follows:

1An OnSocketEvent (see page 18824) event of type seListen occurs just before the Windows socket is opened for listening.

2The listening Windows socket receives client requests in a listening queue. The listening socket accepts one of those requests, and receives a Windows socket handle for the new socket connection.

3The listening socket generates an OnGetSocket (see page 18874) event, passing in the Windows socket handle. If a TServerClientWinSocket (see page 18840) object for the Windows socket handle was not created in the OnGetSocket (see page 18874) event handler, the Windows socket creates one. The Windows socket continues to listen for other clients.

4An OnSocketEvent (see page 18824) event of type seAccept occurs, using the new TServerClientWinSocket (see page 18840) object.

5If ServerType (see page 18869) is stThreadBlocking and no thread is available in the cache, an OnGetThread (see page 18875) event occurs. If the OnGetThread (see page 18875) event handler does not create a thread, the Windows socket object creates a TServerClientThread (see page 18831).

6If ServerType (see page 18869) is stThreadBlocking, an OnThreadStart (see page 18876) event occurs as the thread begins execution.

7The client completes the connection to the TServerClientWinSocket (see page 18840) object and an OnClientConnect event occurs.

The Sender parameter is the TServerWinClient object that listens for client requests. The Socket parameter is the TServerClientWinSocket (see page 18840) object that forms a connection to the client socket.

Note: If ServerType (see page 18869) is stThreadBlocking, make sure that all code in an OnClientConnect event handler is thread-safe. Use the GetClientThread (see page 18865) method to access thread-specific information.

Note: The OnClientConnect event handler for TServerWinSocket (see page 18858) is also set when setting the OnClientConnect event handler of the associated TServerSocket (see page 18843).

OnClientConnect (see page 18784)

129.1.12.6.2 TServerWinSocket.OnClientDisconnect Event

Occurs when one of the connections to a client socket is closed.

Pascal

```
property OnClientDisconnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientDisconnect;
```

Description

Write (see page 18816) an OnClientDisconnect event handler to take specific action when the connection to a client socket is ending. The termination of a client request does not close the listening socket. The listening connection remains open for accepting new client connection requests.

The TServerClientWinSocket (see page 18840) object associated with the client connection is freed after OnClientDisconnect. If ServerType (see page 18869) is stThreadBlocking, OnThreadEnd (see page 18875) occurs after OnClientDisconnect.

The Sender parameter is the TServerWinClient object that received the client request. The Socket parameter is the TServerClientWinSocket (see page 18840) object that is ending a connection with the client socket.

Note: If ServerType (see page 18869) is stThreadBlocking, make sure that all code in an OnClientDisconnect event handler is thread-safe.Use the GetClientThread (see page 18865) method to access thread-specific information.

The OnClientDisconnect event handler for TServerWinSocket (see page 18858) is also set when setting the OnClientDisconnect event handler of the associated TServerSocket (see page 18843).

OnClientDisconnect (see page 18785)

129.1.12.6.3 TServerWinSocket.OnClientError Event

Occurs when a failure is encountered when establishing, using, or terminating the socket connection to an individual client socket.

Pascal

```
property OnClientError: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnClientError;
```

Description

Write (see page 18816) an OnClientError event handler to respond to errors that arise with the connection to a client socket. Set the ErrorCode parameter to 0 if the OnClientError event handler successfully deals with the error condition, to prevent an ESocketError (see page 18739) from being raised.

The Sender parameter is the TServerWinClient object that received the client request. The Socket parameter is the TServerClientWinSocket (see page 18840) object that manages the connection to the client. The ErrorEvent parameter indicates what Socket was attempting to do when the error occurred. The ErrorCode parameter is the error code returned by the Windows socket API call.

Note: If ServerType (see page 18869) is stThreadBlocking, make sure that all code in an OnClientError event handler is thread-safe. Use the GetClientThread (see page 18865) method to access thread-specific information.

Note: The OnClientError event handler for TServerWinSocket (see page 18858) is also set when setting the OnClientError event handler of the associated TServerSocket (see page 18843).

129.1.12.6.4 TServerWinSocket.OnClientRead Event

Occurs when the server socket should read information from a client socket.

Pascal

```
property OnClientRead: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientRead;
```

Description

Write (see page 18816) an OnClientRead event handler to read from the socket connection. Use a TWinSocketStream (see page 18876) object or the methods of the Socket parameter to do the reading.

The Sender parameter is the TServerWinClient object that received the client request. The Socket parameter is the TServerClientWinSocket (see page 18840) object that encapsulates the Windows socket connection.

Note: If ServerType (see page 18869) is stThreadBlocking, make sure that all code in an OnClientRead event handler is thread-safe. Use the GetClientThread (see page 18865) method to access thread-specific information.

Note: The OnClientRead event handler for TServerWinSocket (see page 18858) is also set when setting the OnClientRead event handler of the associated TServerSocket (see page 18843).

See Also

GetClientThread (see page 18865)

TWinSocketStream (see page 18876)

129.1.12.6.5 TServerWinSocket.OnClientWrite Event

Occurs when the server socket should write information to a client socket.

Pascal

```
property OnClientWrite: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnClientWrite;
```

Description

Write (see page 18816) an OnClientWrite event handler to write to the socket connection. Use a TWinSocketStream (see page 18876) object or the methods of the Socket parameter to do the actual writing.

The Sender parameter is the TServerWinClient object that received the client request. The Socket parameter is the TServerClientWinSocket (see page 18840) object that encapsulates the Windows socket connection.

Note: If ServerType (see page 18869) is stThreadBlocking, make sure that all code in an OnClientWrite event handler is thread-safe. Use the GetClientThread (see page 18865) method to access thread-specific information.

Note: The OnClientWrite event handler for TServerWinSocket (see page 18858) is also set when setting the OnClientWrite event handler of the associated TServerSocket (see page 18843).

See Also

GetClientThread (see page 18865)

ServerType (see page 18869)

SendBuf (see page 18813)

sendstream (see page 18814)

SendText (see page 18814)

OnClientWrite (see page 18786)

129.1.12.6.6 TServerWinSocket.OnGetSocket Event

Occurs when the server socket needs to create a new TServerClientWinSocket (see page 18840) object to form the connection to a client socket.

Pascal

```
property OnGetSocket: TGetSocketEvent;
```

C++

```
__property TGetSocketEvent OnGetSocket;
```

Description

Write (see page 18816) an OnGetSocket event handler to create a specialized TServerClientWinSocket (see page 18840) object to use in the connection represented by the Socket parameter. Return the new TServerClientWinSocket (see page 18840) object in the ClientSocket parameter.

The Sender parameter is the TServerWinSocket (see page 18858) object that received the client request. The Socket parameter is the Windows socket handle for the socket connection to the client socket.

Note: The OnGetSocket event handler for TServerWinSocket (see page 18858) is also set when setting the OnGetSocket event handler of the associated TServerSocket (see page 18843).

See Also

Create (see page 18842)

OnGetSocket (see page 18787)

129.1.12.6.7 TServerWinSocket.OnGetThread Event

Occurs when the server socket needs to create a new execution thread for a connection to a client socket.

Pascal

```
property OnGetThread: TGetThreadEvent;
```

C++

```
__property TGetThreadEvent OnGetThread;
```

Description

Write (see page 18816) an OnGetThread event handler to create a specialized descendant of TServerClientThread (see page 18831) for the connection to the client socket. Create (see page 18861) the new thread with the CreateSuspended parameter set to false, and return it in the SocketThread parameter. OnGetThread only occurs if there are no idle threads in the cache.

Most applications that use thread-blocking connections will want to create a new descendant of TServerClientThread (see page 18831) in an OnGetThread event handler. This is because the default behavior of TServerClientThread (see page 18831) uses the OnClientRead (see page 18873) and OnClientWrite (see page 18874) event handlers for reading and writing. These events occur on the server socket, which is not thread-local.

The Sender parameter is the TServerWinSocket (see page 18858) object that received the client request. The ClientSocket parameter is the TServerClientWinSocket (see page 18840) object that will communicate with the client socket.

Note: The OnGetThread event handler for TServerWinSocket (see page 18858) is also set when setting the OnGetThread event handler of the associated TServerSocket (see page 18843).

See Also

IdleThreads (see page 18869)

ServerType (see page 18869)

OnGetThread (see page 18787)

129.1.12.6.8 TServerWinSocket.OnThreadEnd Event

Occurs when a client socket connection is terminated and the associated thread finishes execution.

Pascal

```
property OnThreadEnd: TThreadNotifyEvent;
```

C++

```
__property TThreadNotifyEvent OnThreadEnd;
```

Description

Write (see page 18816) an OnThreadEnd to take specific action when the thread for a client connection finishes execution. OnThreadEnd occurs after the OnClientDisconnect (see page 18872) event.

The Sender parameter is the TServerWinSocket (see page 18858) that received the client request. The Thread parameter is the thread that is finishing up.

Note: The OnThreadEnd event handler for TServerWinSocket (see page 18858) is also set when setting the OnThreadEnd event handler of the associated TServerSocket (see page 18843).

See Also

OnClientDisconnect (see page 18872)

OnThreadEnd (see page 18788)

129.1.12.6.9 TServerWinSocket.OnThreadStart Event

Occurs when the execution thread for a connection to a client socket starts up.

Pascal

```
property OnThreadStart: TThreadNotifyEvent;
```

C++

```
__property TThreadNotifyEvent OnThreadStart;
```

Description

Write (see page 18816) an OnThreadStart to initialize the TServerClientThread (see page 18831) for the connection to a single client socket. The Sender parameter is the TServerWinSocket (see page 18858) that received the client request. The Thread parameter is the thread that is about to start execution.

Note: The OnThreadStart event handler for TServerWinSocket (see page 18858) is also set when setting the OnThreadStart event handler of the associated TServerSocket (see page 18843).

See Also

OnThreadStart (see page 18788)

129.1.13 TWinSocketStream Class

TWinSocketStream is a stream that provides services which allow applications to read from or write to socket connections.

Class Hierarchy

Pascal

```
TWinSocketStream = class(TStream);
```

C++

```
class TWinSocketStream : public TStream;
```

File

ScktComp

Description

Use TWinSocketStream to read or write information over a blocking socket connection. Windows socket objects include methods to read from or write to the socket connection they represent. However, these methods do not provide a mechanism for timing out when the socket connection is dropped or for waiting until the socket connection is ready before reading.

When the socket is a non-blocking socket, this lack of a time-out or waiting mechanism is not a problem, because reading and writing occur asynchronously in response to notifications from the socket connection. For blocking sockets, however, these mechanisms provided by TWinSocketStream are necessary so that the application using the socket does not hang indefinitely.

To use a Windows socket stream, create an instance of TWinSocketStream, use the methods of the stream to read or write the data, and then free the Windows socket stream.

Note: TWinSocketStream does not work with non-blocking sockets.

See Also

TClientSocket (see page 18752)

TServerClientWinSocket (see page 18840)

TServerSocket (see page 18843)

129.1.13.1 TWinSocketStream Members

The following tables list the members exposed by TWinSocketStream.

Protected Methods

	Name	Description
	GetSize (see page 2982)	This is GetSize, a member of class TStream.
	SetSize (see page 2989)	This is the overview for the SetSize method overload.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CopyFrom (see page 2979)	Copies a specified number of bytes from one stream to another.
	Create (see page 18878)	Creates an instance of TWinSocketStream (see page 18876) for a Windows socket object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 18879)	Destroys an instance of TWinSocketStream (see page 18876).

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FixupResourceHeader (see page 2981)	Patches the resource header for a resource that has been written to the stream.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Read (see page 18880)	Reads up to Count bytes from the socket connection into Buffer.
	ReadBuffer (see page 2983)	Reads bytes from the stream into Buffer.
	ReadComponent (see page 2983)	Initiates streaming of components and their properties.
	ReadComponentRes (see page 2987)	Reads components and their properties from a stream in a resource file format.
	ReadResHeader (see page 2987)	Reads a resource-file header from the stream.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Seek (see page 18880)	Always returns 0.
	Seek (see page 2988)	This is the overview for the Seek method overload.
	WaitForData (see page 18881)	Waits up to TimeOut (see page 18882) milliseconds for the socket connection to be ready to transfer data.
	Write (see page 18881)	Writes Count bytes from Buffer to the socket connection.
	WriteBuffer (see page 2990)	Writes Count bytes from Buffer onto the stream and advances the current position of the stream by Count bytes.
	WriteComponent (see page 2990)	Initiates the writing of components and their properties to a stream.
	WriteComponentRes (see page 2994)	Writes components and their properties to a stream from a resource file format.
	WriteDescendent (see page 2994)	Streams components and their properties in inherited forms.
	WriteDescendentRes (see page 2995)	Streams components and their properties in inherited forms.
	WriteResourceHeader (see page 2995)	Writes a resource-file header to the stream.

Public Properties

	Name	Description
	Position (see page 2996)	Indicates the current offset into the stream for reading and writing.
	Size (see page 2997)	Indicates the size in bytes of the stream.
	TimeOut (see page 18882)	Specifies the time, in milliseconds, that the socket stream should wait before timing out on a read or write call.

129.1.13.2 TWinSocketStream.Create Constructor

Creates an instance of TWinSocketStream (see page 18876) for a Windows socket object.

Pascal

```
constructor Create(ASocket: TCustomWinSocket; TimeOut: Longint);
```

C++

```
__fastcall TWinSocketStream(TCustomWinSocket ASocket, Longint TimeOut);
```

Description

Call Create to obtain an instance of TWinSocketStream (see page 18876) for reading from or writing to the socket connection represented by the ASocket parameter. ASocket should be the endpoint of an open blocking socket connection to another Windows socket.

Create associates the stream with the socket connection, and allocates helper objects to allow it to determine when the socket connection is ready for reading or writing. The TimeOut (see page 18882) property (the number of milliseconds before a read or write operation aborts) is initialized to the value of the TimeOut (see page 18882) parameter.

If ASocket represents a non-blocking socket connection, Create raises an ESocketError (see page 18739) exception.

See Also

ESocketError

ClientType (see page 18769)

TCustomWinSocket (see page 18799)

ServerType (see page 18869)

TimeOut (see page 18882)

129.1.13.3 TWinSocketStream.Destroy Destructor

Destroys an instance of TWinSocketStream (see page 18876).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWinSocketStream();
```

Description

Do not call Destroy directly in an application. Instead call Free. Free verifies that the TWinSocketStream (see page 18876) reference is not nil and only then calls Destroy.

Free the TWinSocketStream (see page 18876) object when it is no longer needed for reading from or writing to the socket connection.

Destroy frees the helper objects allocated in the Create (see page 18878) method before calling the default destructor.

See Also

Create (see page 18878)

Free (see page 22300)

129.1.13.4 TWinSocketStream Methods

The methods of the TWinSocketStream class are listed here.

Public Methods

	Name	Description
	Read (see page 18880)	Reads up to Count bytes from the socket connection into Buffer.
	Seek (see page 18880)	Always returns 0.

	WaitForData (see page 18881)	Waits up to TimeOut (see page 18882) milliseconds for the socket connection to be ready to transfer data.
	Write (see page 18881)	Writes Count bytes from Buffer to the socket connection.

129.1.13.4.1 TWinSocketStream.Read Method

Reads up to Count bytes from the socket connection into Buffer.

Pascal

```
function Read(var Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Read( Buffer, Longint Count);
```

Description

Use Read to read data from the socket connection when the number of bytes to be transferred is unknown. Buffer must have at least Count bytes allocated to hold the data that is read from the connection. Read returns the number of bytes actually transferred (which may be less than the number requested in Count.)

Read may return 0 if the socket connection is extremely slow and the read operation has not completed after TimeOut (see page 18882) milliseconds. This ensures that the Read method does not hang indefinitely when a problem occurs with the socket connection.

To guard against the Read method timing out because of a slow connection, set Count fairly low, and make several calls to Read, rather than fewer calls with a large value of Count.

To ensure that the socket connection is ready to send data before calling Read, use the WaitForData (see page 18881) method.

Unlike the ReadBuffer method, Read does not raise an exception if Count bytes are not read from the socket connection.

See Also

ReadBuffer (see page 2983)

WaitForData (see page 18881)

Write (see page 18881)

TimeOut (see page 18882)

129.1.13.4.2 TWinSocketStream.Seek Method

Always returns 0.

Pascal

```
function Seek(Offset: Longint; Origin: Word): Longint; override;
```

C++

```
virtual __fastcall Longint Seek(Longint Offset, Word Origin);
```

Description

Seek overrides the inherited method to always set the Position property of the TWinSocketStream (see page 18876) object to 0. Socket connections do not support random access. The Position property of a Windows socket stream can only reflect the position at the beginning of all remaining data.

See Also

Position (see page 2996)

129.1.13.4.3 TWinSocketStream.WaitForData Method

Waits up to TimeOut (see page 18882) milliseconds for the socket connection to be ready to transfer data.

Pascal

```
function WaitForData(Timeout: Longint): Boolean;
```

C++

```
__fastcall Boolean WaitForData(Longint Timeout);
```

Description

Call WaitForData to ensure that the socket connection is ready to read or write information. WaitForData returns true if the socket connection is ready. WaitForData returns false if the socket connection is not ready after TimeOut (see page 18882) milliseconds elapse.

Call WaitForData before reading or writing information over the socket connection. Otherwise, Read (see page 18880) or Write (see page 18881) method calls may time out before any data is transferred.

See Also

Read (see page 18880)

Write (see page 18881)

129.1.13.4.4 TWinSocketStream.Write Method

Writes Count bytes from Buffer to the socket connection.

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

Use Write to write data from a Buffer to the socket connection. Write returns the number of bytes transferred.

Write may return 0 if the socket connection is extremely slow and the write operation has not completed after TimeOut (see page 18882) milliseconds. This ensures that the Write method does not hang indefinitely when a problem occurs with the socket connection.

To guard against the Write method timing out because of a slow connection, set Count fairly low, and make several calls to Write, rather than fewer calls with a large value of Count.

Unlike the WriteBuffer method, Write does not raise an exception if Count bytes are not written. For example, if the connection is too slow to transfer all the data, Write will return 0, where WriteBuffer will raise an exception.

See Also

Read (see page 18880)

WaitForData (see page 18881)

WriteBuffer (see page 2990)

TimeOut (see page 18882)

129.1.13.5 TWinSocketStream Properties

The properties of the TWinSocketStream class are listed here.

Public Properties

	Name	Description
	TimeOut (see page 18882)	Specifies the time, in milliseconds, that the socket stream should wait before timing out on a read or write call.

129.1.13.5.1 TWinSocketStream.TimeOut Property

Specifies the time, in milliseconds, that the socket stream should wait before timing out on a read or write call.

Pascal

```
property TimeOut: Longint;
```

C++

```
__property Longint TimeOut;
```

Description

Set TimeOut to the amount of time that should elapse before a read or write operation aborts under the assumption that the socket connection has failed.

See Also

Read (see page 18880)

Write (see page 18881)

129.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	SetErrorProc (see page 18883)	Replaces the exception handler for error messages that are received from a Windows socket connection.

129.2.1 ScktComp.SetErrorProc Function

Replaces the exception handler for error messages that are received from a Windows socket connection.

Pascal

```
function SetErrorProc(ErrorProc: TSocketErrorProc): TSocketErrorProc;
```

C++

```
TSocketErrorProc SetErrorProc(TSocketErrorProc ErrorProc);
```

File

ScktComp

Description

Call SetErrorProc to assign an exception handler for error messages from Windows socket API calls. By default, socket components have no special error handler and simply raise an ESocketError (see page 18739) exception when they receive error messages. If an exception handler is assigned using SetErrorProc, the socket component does not raise this exception.

The ErrorProc parameter specifies the exception handler. It is passed the Windows socket error code. Inside this exception handler an application can compensate for the error or raise an exception. Passing a value of nil (Delphi) or NULL (C++) for the ErrorProc parameter restores the default behavior, where the socket component raises an ESocketError (see page 18739) exception.

SetErrorProc returns the current exception handler. This value is nil (Delphi) or NULL (C++) when SetErrorProc is called for the first time, and is the value of the ErrorProc parameter from the previous invocation of SetErrorProc thereafter.

See Also

ESocketError (see page 18739)

129.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAsyncStyle (see page 18884)	This is record ScktComp.TAsyncStyle.
	TClientType (see page 18885)	This is record ScktComp.TClientType.
	TErrorEvent (see page 18886)	This is record ScktComp.TErrorEvent.
	TLookupState (see page 18887)	This is record ScktComp.TLookupState.
	TServerType (see page 18887)	This is record ScktComp.TServerType.
	TSocketEvent (see page 18887)	TSocketEvent identifies the operation that a socket is performing.

Records

	Name	Description
	TCMLookupComplete (see page 18885)	This is record ScktComp.TCMLookupComplete.
	TCMSocketMessage (see page 18886)	This is record ScktComp.TCMSocketMessage.

129.3.1 ScktComp.TAsyncStyle Enumeration

Pascal

```
TAsyncStyle = (
  asRead,
  asWrite,
  asOOB,
  asAccept,
  asConnect,
  asClose
);
```

C++

```
enum TAsyncStyle {
  asRead,
  asWrite,
  asOOB,
  asAccept,
  asConnect,
  asClose
};
```

File

ScktComp

Description

This is record ScktComp.TAsyncStyle.

129.3.2 ScktComp.TClientType Enumeration

Pascal

```
TClientType = (
  ctNonBlocking,
  ctBlocking
);
```

C++

```
enum TClientType {
  ctNonBlocking,
  ctBlocking
};
```

File

ScktComp

Description

This is record ScktComp.TClientType.

129.3.3 ScktComp.TCMLookupComplete Record

Pascal

```
TCMLookupComplete = record
  Msg: Cardinal;
  LookupHandle: THandle;
  AsyncBufLen: Word;
  AsyncError: Word;
  Result: Longint;
end;
```

C++

```
struct TCMLookupComplete {
  unsigned Msg;
  THandle LookupHandle;
  Word AsyncBufLen;
  Word AsyncError;
  Longint Result;
};
```

File

ScktComp

Description

This is record ScktComp.TCMLookupComplete.

129.3.4 ScktComp.TCMSocketMessage Record

Pascal

```
TCMSocketMessage = record
  Msg: Cardinal;
  Socket: TSocket;
  SelectEvent: Word;
  SelectError: Word;
  Result: Longint;
end;
```

C++

```
struct TCMSocketMessage {
  unsigned Msg;
  TSocket Socket;
  Word SelectEvent;
  Word SelectError;
  Longint Result;
};
```

File

ScktComp

Description

This is record ScktComp.TCMSocketMessage.

129.3.5 ScktComp.TErrorEvent Enumeration

Pascal

```
TErrorEvent = (
  eeGeneral,
  eeSend,
  eeReceive,
  eeConnect,
  eeDisconnect,
  eeAccept,
  eeLookup
);
```

C++

```
enum TErrorEvent {
  eeGeneral,
  eeSend,
  eeReceive,
  eeConnect,
  eeDisconnect,
  eeAccept,
  eeLookup
};
```

File

ScktComp

Description

This is record ScktComp.TErrorEvent.

129.3.6 ScktComp.TLookupState Enumeration

Pascal

```
TLookupState = (
  lsIdle,
  lsLookupAddress,
  lsLookupService
);
```

C++

```
enum TLookupState {
  lsIdle,
  lsLookupAddress,
  lsLookupService
};
```

File

ScktComp

Description

This is record ScktComp.TLookupState.

129.3.7 ScktComp.TServerType Enumeration

Pascal

```
TServerType = (
  stNonBlocking,
  stThreadBlocking
);
```

C++

```
enum TServerType {
  stNonBlocking,
  stThreadBlocking
};
```

File

ScktComp

Description

This is record ScktComp.TServerType.

129.3.8 ScktComp.TSocketEvent Enumeration

TSocketEvent identifies the operation that a socket is performing.

Pascal

```
TSocketEvent = (
  seLookup,
  seConnecting,
  seConnect,
  seDisconnect,
  seListen,
  seAccept,
  seWrite,
  seRead
);
```

C++

```
enum TSocketEvent {
  seLookup,
  seConnecting,
  seConnect,
  seDisconnect,
  seListen,
  seAccept,
  seWrite,
  seRead
};
```

File

ScktComp

Description

TSocketEvent is used to identify what a socket is doing when various methods or event handlers are called. It has one of the following values:

Value	Meaning
seLookup	(client sockets only) The Windows socket object is about to locate the server socket. Changing the properties of the client socket has no effect at this point, but changes to the Windows socket object specified by the Socket parameter will affect the attempted connection.
seConnecting	(client sockets only) The server socket has been located but the connection isn't completed. This is the first opportunity to obtain the actual server port and IP address used for the connection, which may differ from those of the listening socket contacted initially.
seConnect	The socket connection has just been established. This is the point when a socket starts reading or writing over the connection.
seListen	(server sockets only) The Windows socket object has been initialized and is about to open a listening connection. Changing the properties of the server socket has no effect at this point, but changes to the Windows socket object specified by the Socket parameter will the listening connection.
seAccept	(server sockets only) A client connection request has just been accepted. This is the first opportunity to obtain the port and IP address of the individual client connection.
seWrite	The socket is ready for information to be written.
seRead	The socket is receiving information from a socket on the other end of the connection.

129.4 Types

The following table lists types in this documentation.

Types

Name	Description
TAsyncStyles (see page 18889)	This is type ScktComp.TAsyncStyles.
TGetSocketEvent (see page 18889)	This is type ScktComp.TGetSocketEvent.
TGetThreadEvent (see page 18890)	This is type ScktComp.TGetThreadEvent.
TSocketErrorEvent (see page 18890)	TSocketErrorEvent is the type for event handlers that respond when a Windows socket reports an error.
TSocketErrorProc (see page 18891)	This is type ScktComp.TSocketErrorProc.
TSocketEventEvent (see page 18891)	This is type ScktComp.TSocketEventEvent.
TSocketNotifyEvent (see page 18891)	The type for event handlers which respond to events during the expected course of forming or using a socket connection.
TThreadNotifyEvent (see page 18892)	This is type ScktComp.TThreadNotifyEvent.

129.4.1 ScktComp.TAsyncStyles Type

Pascal

```
TAsyncStyles = set of TAsyncStyle;
```

C++

```
TAsyncStyle TAsyncStyles;
```

File

ScktComp

Description

This is type ScktComp.TAsyncStyles.

129.4.2 ScktComp.TGetSocketEvent Type

Pascal

```
TGetSocketEvent = procedure (Sender: TObject; Socket: TSocket; var ClientSocket:
TServerClientWinSocket) of object;
```

C++

```
(Sender: TObject; Socket: TSocket; var ClientSocket: TServerClientWinSocket) (
TGetSocketEvent)();
```

File

ScktComp

Description

This is type ScktComp.TGetSocketEvent.

129.4.3 ScktComp.TGetThreadEvent Type

Pascal

```
TGetThreadEvent = procedure (Sender: TObject; ClientSocket: TServerClientWinSocket; var
SocketThread: TServerClientThread) of object;
```

C++

```
(Sender: TObject; ClientSocket: TServerClientWinSocket; var SocketThread: TServerClientThread)
( TGetThreadEvent)();
```

File

ScktComp

Description

This is type ScktComp.TGetThreadEvent.

129.4.4 ScktComp.TSocketErrorEvent Type

TSocketErrorEvent is the type for event handlers that respond when a Windows socket reports an error.

Pascal

```
TSocketErrorEvent = procedure (Sender: TObject; Socket: TCustomWinSocket; ErrorEvent:
TErrorEvent; var ErrorCode: Integer) of object;
```

C++

```
(Sender: TObject; Socket: TCustomWinSocket; ErrorEvent: TErrorEvent; var ErrorCode: Integer) (
TSocketErrorEvent)();
```

File

ScktComp

Description

The Sender parameter is the socket component that encountered the error.

The Socket parameter is the TCustomWinSocket (see page 18799) object that receives the error notification.

The ErrorCode parameter is the error code returned by the Windows socket API call. Changing this to 0 within an error handler prevents an exception from being raised.

The ErrorEvent parameter indicates what Socket was attempting to do when the error occurred. It is of type TErrorEvent (see page 18886), which can have any of the following values:

Value	Meaning
eeGeneral	The socket received an error message that does not fit into any of the following categories.
eeSend	An error occurred when trying to write to the socket connection.
eeReceive	An error occurred when trying to read from the socket connection.
eeConnect	A connection request that was already accepted could not be completed.
eeDisconnect	An error occurred when trying to close a connection.

eeAccept	A problem occurred when trying to accept a client connection request.

129.4.5 SocktComp.TSocketErrorProc Type

Pascal

```
TSocketErrorProc = procedure (ErrorCode: Integer);
```

C++

```
(ErrorCode: Integer) ( TSocketErrorProc)();
```

File

SocktComp

Description

This is type SocktComp.TSocketErrorProc.

129.4.6 SocktComp.TSocketEventEvent Type

Pascal

```
TSocketEventEvent = procedure (Sender: TObject; Socket: TCustomWinSocket; SocketEvent:
TSocketEvent) of object;
```

C++

```
(Sender: TObject; Socket: TCustomWinSocket; SocketEvent: TSocketEvent) ( TSocketEventEvent)();
```

File

SocktComp

Description

This is type SocktComp.TSocketEventEvent.

129.4.7 SocktComp.TSocketNotifyEvent Type

The type for event handlers which respond to events during the expected course of forming or using a socket connection.

Pascal

```
TSocketNotifyEvent = procedure (Sender: TObject; Socket: TCustomWinSocket) of object;
```

C++

```
(Sender: TObject; Socket: TCustomWinSocket) ( TSocketNotifyEvent)();
```

File

SocktComp

Description

The Sender parameter is the socket component or Windows socket object to which the event occurred.

The Socket parameter is the TCustomWinSocket (see page 18799) object that represents the endpoint of the connection.

When the event handler belongs to a client Windows socket object, these two parameters are the same. For server Windows socket objects, the Sender parameter represents the listening connection while the Socket parameter represents a client connection.

See Also

TCustomSocket (see page 18789)

129.4.8 ScktComp.TThreadNotifyEvent Type

Pascal

```
TThreadNotifyEvent = procedure (Sender: TObject; Thread: TServerClientThread) of object;
```

C++

```
(Sender: TObject; Thread: TServerClientThread) ( TThreadNotifyEvent)();
```

File

ScktComp

Description

This is type ScktComp.TThreadNotifyEvent.

129.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CM_DEFERFREE (see page 18893)	This is constant ScktComp.CM_DEFERFREE.
CM_LOOKUPCOMPLETE (see page 18893)	This is constant ScktComp.CM_LOOKUPCOMPLETE.
CM_SOCKETMESSAGE (see page 18893)	This is constant ScktComp.CM_SOCKETMESSAGE.

129.5.1 ScktComp.CM_DEFERFREE Constant

Pascal

```
CM_DEFERFREE = WM_USER + $0002;
```

C++

```
CM_DEFERFREE = WM_USER + $0002;
```

File

ScktComp

Description

This is constant ScktComp.CM_DEFERFREE.

129.5.2 ScktComp.CM_LOOKUPCOMPLETE Constant

Pascal

```
CM_LOOKUPCOMPLETE = WM_USER + $0003;
```

C++

```
CM_LOOKUPCOMPLETE = WM_USER + $0003;
```

File

ScktComp

Description

This is constant ScktComp.CM_LOOKUPCOMPLETE.

129.5.3 ScktComp.CM_SOCKETMESSAGE Constant

Pascal

```
CM_SOCKETMESSAGE = WM_USER + $0001;
```

C++

```
CM_SOCKETMESSAGE = WM_USER + $0001;
```

File

ScktComp

Description

This is constant ScktComp.CM_SOCKETMESSAGE.

130 SConnect Namespace

This is namespace SConnect.

Topics

Name	Description
Classes (see page 18897)	The following table lists classes in this documentation.
Interfaces (see page 18983)	The following table lists interfaces in this documentation.
Functions (see page 18999)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 19000)	The following table lists structs, records, enums in this documentation.
Types (see page 19001)	The following table lists types in this documentation.
Variables (see page 19003)	The following table lists variables in this documentation.
Constants (see page 19005)	The following table lists constants in this documentation.

Classes

	Name	Description
	EInterpreterError (see page 18897)	EInterpreterError is the exception class for errors that arise when trying to interpret COM calls that have been marshaled to a data block.
	ESocketConnectionError (see page 18898)	ESocketConnectionError is the exception class for errors that arise when sending or receiving messages using TSocketConnection (see page 18928).
	TCustomDataBlockInterpreter (see page 18898)	TCustomDataBlockInterpreter marshals COM interface calls for streamed connection components.
	TDataBlock (see page 18903)	This is class SConnect.TDataBlock.
	TDataBlockInterpreter (see page 18913)	TDataBlockInterpreter marshals COM interface calls for non COM-based connection components.
	TDataDispatch (see page 18921)	This is class SConnect.TDataDispatch.
	TPacketInterceptFactory (see page 18925)	TPacketInterceptFactory is the type of the class factory used to instantiate a data packet interceptor.
	TSocketConnection (see page 18928)	TSocketConnection uses Windows sockets to manage the connection to an application server.
	TSocketTransport (see page 18939)	This is class SConnect.TSocketTransport.
	TStreamedConnection (see page 18945)	TStreamedConnection is the base class for components that handle their own marshaling of interface calls when connecting to application servers.
	TTransportThread (see page 18961)	This is class SConnect.TTransportThread.
	TWebConnection (see page 18968)	TWebConnection uses HTTP to manage the connection to an application server.

Constants

Name	Description
asCreateObject (see page 19005)	This is constant SConnect.asCreateObject.

asError (see page 19005)	This is constant SConnect.asError.
asFreeObject (see page 19006)	This is constant SConnect.asFreeObject.
asGetAppServers (see page 19006)	This is constant SConnect.asGetAppServers.
asGetGUID (see page 19006)	This is constant SConnect.asGetGUID.
asGetID (see page 19007)	This is constant SConnect.asGetID.
asGetServers (see page 19007)	This is constant SConnect.asGetServers.
asInvoke (see page 19007)	This is constant SConnect.asInvoke.
asMask (see page 19008)	This is constant SConnect.asMask.
asSoapCommand (see page 19008)	This is constant SConnect.asSoapCommand.
CallSig (see page 19008)	This is constant SConnect.CallSig.
ResultSig (see page 19009)	This is constant SConnect.ResultSig.
THREAD_EXCEPTION (see page 19009)	This is constant SConnect.THREAD_EXCEPTION.
THREAD_RECEIVEDSTREAM (see page 19009)	This is constant SConnect.THREAD_RECEIVEDSTREAM.
THREAD_REPLACETRANSPORT (see page 19010)	This is constant SConnect.THREAD_REPLACETRANSPORT.
THREAD_SENDNOTIFY (see page 19010)	This is constant SConnect.THREAD_SENDNOTIFY.
THREAD_SENDSTREAM (see page 19010)	This is constant SConnect.THREAD_SENDSTREAM.

Functions

	Name	Description
	GetPacketInterceptorList (see page 18999)	This is function SConnect.GetPacketInterceptorList.
	LoadWinSock2 (see page 18999)	This is function SConnect.LoadWinSock2.

Interfaces

	Name	Description
	IDataBlock (see page 18983)	IDataBlock is the interface used by data block interpreters to access memory buffers.
	IDataIntercept (see page 18991)	IDataIntercept is the interface used by TSocketConnection (see page 18928) components to transform data that is communicated over the connection.
	ISendDataBlock (see page 18993)	ISendDataBlock is the interface used by data block interpreters to send messages to an application server after they are marshaled.
	ITransport (see page 18995)	ITransport is the interface used by TStreamedConnection (see page 18945) to connect to, read from, and write to a remote application server.

Structs, Records, Enums

	Name	Description
	TVarFlag (see page 19000)	This is record SConnect.TVarFlag.

Types

Name	Description
PIntArray (see page 19001)	This is type SConnect.PIntArray.
PVariantArray (see page 19001)	This is type SConnect.PVariantArray.
TIntArray (see page 19002)	This is type SConnect.TIntArray.
TVarFlags (see page 19002)	This is type SConnect.TVarFlags.
TVariantArray (see page 19002)	This is type SConnect.TVariantArray.

Variables

Name	Description
WSACloseEvent (see page 19003)	This is variable SConnect.WSACloseEvent.
WSACreateEvent (see page 19003)	This is variable SConnect.WSACreateEvent.
WSAEventSelect (see page 19004)	This is variable SConnect.WSAEventSelect.
WSAResetEvent (see page 19004)	This is variable SConnect.WSAResetEvent.

130.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EInterpreterError (see page 18897)	EInterpreterError is the exception class for errors that arise when trying to interpret COM calls that have been marshaled to a data block.
	ESocketConnectionError (see page 18898)	ESocketConnectionError is the exception class for errors that arise when sending or receiving messages using TSocketConnection (see page 18928).
	TCustomDataBlockInterpreter (see page 18898)	TCustomDataBlockInterpreter marshals COM interface calls for streamed connection components.
	TDataBlock (see page 18903)	This is class SConnect.TDataBlock.
	TDataBlockInterpreter (see page 18913)	TDataBlockInterpreter marshals COM interface calls for non COM-based connection components.
	TDataDispatch (see page 18921)	This is class SConnect.TDataDispatch.
	TPacketInterceptFactory (see page 18925)	TPacketInterceptFactory is the type of the class factory used to instantiate a data packet interceptor.
	TSocketConnection (see page 18928)	TSocketConnection uses Windows sockets to manage the connection to an application server.
	TSocketTransport (see page 18939)	This is class SConnect.TSocketTransport.
	TStreamedConnection (see page 18945)	TStreamedConnection is the base class for components that handle their own marshaling of interface calls when connecting to application servers.
	TTransportThread (see page 18961)	This is class SConnect.TTransportThread.
	TWebConnection (see page 18968)	TWebConnection uses HTTP to manage the connection to an application server.

130.1.1 EInterpreterError Class

EInterpreterError is the exception class for errors that arise when trying to interpret COM calls that have been marshaled to a data block.

Class Hierarchy

Pascal

```
EInterpreterError = class(Exception);
```

C++

```
class EInterpreterError : public Exception;
```

File

SConnect

Description

Data block interpreters (TCustomDataBlockInterpreter (see page 18898) descendants) raise EInterpreterError when they can't interpret the information in a data block. Streamed connection components such as TSocketConnection (see page 18928) use data block interpreters to send interface calls to and receive interface calls from a remote application server.

See Also

TCustomDataBlockInterpreter (see page 18898)

TSocketConnection (see page 18928)

TSOAPConnection

TWebConnection (see page 18968)

130.1.2 ESocketConnectionError Class

ESocketConnectionError is the exception class for errors that arise when sending or receiving messages using TSocketConnection (see page 18928).

Class Hierarchy

Pascal

```
ESocketConnectionError = class(Exception);
```

C++

```
class ESocketConnectionError : public Exception;
```

File

SConnect

Description

Socket connection components raise ESocketConnectionError when the socket they use to send and receive messages reports an error, or when the information read from the socket is incomplete.

See Also

TSocketConnection (see page 18928)

130.1.3 TCustomDataBlockInterpreter Class

TCustomDataBlockInterpreter marshals COM interface calls for streamed connection components.

Class Hierarchy

Pascal

```
TCustomDataBlockInterpreter = class;
```

C++

```
class TCustomDataBlockInterpreter;
```

File

SConnect

Description

TCustomDataBlockInterpreter introduces the methods needed for marshaling the messages that pass between a client application and an application server in a multi-tiered database application.

Streamed connection components use data block interpreters to marshal of messages sent to and received from an application server. An object that supports the IDataBlock (see page 18983) interface stores the messages themselves.

See Also

TStreamedConnection (see page 18945)

IDataBlock (see page 18983)

130.1.3.1 TCustomDataBlockInterpreter Members

The following tables list the members exposed by TCustomDataBlockInterpreter.

Protected Methods

	Name	Description
	AddDispatch (see page 18900)	This is AddDispatch, a member of class TCustomDataBlockInterpreter.
	CallCreateObject (see page 18900)	This is CallCreateObject, a member of class TCustomDataBlockInterpreter.
	CallFreeObject (see page 18900)	This is CallFreeObject, a member of class TCustomDataBlockInterpreter.
	CallGetIDsOfNames (see page 18900)	This is CallGetIDsOfNames, a member of class TCustomDataBlockInterpreter.
	CallGetServerList (see page 18901)	This is CallGetServerList, a member of class TCustomDataBlockInterpreter.
	CallInvoke (see page 18901)	This is CallInvoke, a member of class TCustomDataBlockInterpreter.
	CanCreateObject (see page 18901)	This is CanCreateObject, a member of class TCustomDataBlockInterpreter.
	CreateObject (see page 18901)	This is CreateObject, a member of class TCustomDataBlockInterpreter.
	InternalCreateObject (see page 18901)	This is InternalCreateObject, a member of class TCustomDataBlockInterpreter.
	LockObject (see page 18902)	This is LockObject, a member of class TCustomDataBlockInterpreter.
	ReleaseObject (see page 18902)	This is ReleaseObject, a member of class TCustomDataBlockInterpreter.
	RemoveDispatch (see page 18902)	This is RemoveDispatch, a member of class TCustomDataBlockInterpreter.
	StoreObject (see page 18903)	This is StoreObject, a member of class TCustomDataBlockInterpreter.
	UnlockObject (see page 18903)	This is UnlockObject, a member of class TCustomDataBlockInterpreter.

Public Methods

	Name	Description
	InterpretData (see page 18902)	This is InterpretData, a member of class TCustomDataBlockInterpreter.

130.1.3.2 TCustomDataBlockInterpreter Methods

The methods of the TCustomDataBlockInterpreter class are listed here.

Protected Methods

	Name	Description
	AddDispatch (see page 18900)	This is AddDispatch, a member of class TCustomDataBlockInterpreter.
	CallCreateObject (see page 18900)	This is CallCreateObject, a member of class TCustomDataBlockInterpreter.
	CallFreeObject (see page 18900)	This is CallFreeObject, a member of class TCustomDataBlockInterpreter.
	CallGetIDsOfNames (see page 18900)	This is CallGetIDsOfNames, a member of class TCustomDataBlockInterpreter.
	CallGetServerList (see page 18901)	This is CallGetServerList, a member of class TCustomDataBlockInterpreter.
	CallInvoke (see page 18901)	This is CallInvoke, a member of class TCustomDataBlockInterpreter.
	CanCreateObject (see page 18901)	This is CanCreateObject, a member of class TCustomDataBlockInterpreter.
	CreateObject (see page 18901)	This is CreateObject, a member of class TCustomDataBlockInterpreter.
	InternalCreateObject (see page 18901)	This is InternalCreateObject, a member of class TCustomDataBlockInterpreter.
	LockObject (see page 18902)	This is LockObject, a member of class TCustomDataBlockInterpreter.
	ReleaseObject (see page 18902)	This is ReleaseObject, a member of class TCustomDataBlockInterpreter.
	RemoveDispatch (see page 18902)	This is RemoveDispatch, a member of class TCustomDataBlockInterpreter.
	StoreObject (see page 18903)	This is StoreObject, a member of class TCustomDataBlockInterpreter.

	UnlockObject (see page 18903)	This is UnlockObject, a member of class TCustomDataBlockInterpreter.

Public Methods

	Name	Description
	InterpretData (see page 18902)	This is InterpretData, a member of class TCustomDataBlockInterpreter.

130.1.3.2.1 TCustomDataBlockInterpreter.AddDispatch Method

Pascal

```
procedure AddDispatch(Value: TDataDispatch); virtual; abstract;
```

C++

```
virtual __fastcall AddDispatch(TDataDispatch Value) = 0;
```

Description

This is AddDispatch, a member of class TCustomDataBlockInterpreter.

130.1.3.2.2 TCustomDataBlockInterpreter.CallCreateObject Method

Pascal

```
function CallCreateObject(Name: string): OleVariant; virtual; abstract;
```

C++

```
virtual __fastcall OleVariant CallCreateObject(AnsiString Name) = 0;
```

Description

This is CallCreateObject, a member of class TCustomDataBlockInterpreter.

130.1.3.2.3 TCustomDataBlockInterpreter.CallFreeObject Method

Pascal

```
procedure CallFreeObject(DispatchIndex: Integer); virtual; abstract;
```

C++

```
virtual __fastcall CallFreeObject(int DispatchIndex) = 0;
```

Description

This is CallFreeObject, a member of class TCustomDataBlockInterpreter.

130.1.3.2.4 TCustomDataBlockInterpreter.CallGetIDsOfNames Method

Pascal

```
function CallGetIDsOfNames(DispatchIndex: Integer; const IID: TGUID; Names: Pointer;
NameCount: Integer; LocaleID: Integer; DispIDs: Pointer): HResult; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT CallGetIDsOfNames(int DispatchIndex, const TGUID IID,
void * Names, int NameCount, int LocaleID, void * DispIDs) = 0;
```

Description

This is CallGetIDsOfNames, a member of class TCustomDataBlockInterpreter.

130.1.3.2.5 TCustomDataBlockInterpreter.CallGetServerList Method

Pascal

```
function CallGetServerList: OleVariant; virtual; abstract;
```

C++

```
virtual __fastcall OleVariant CallGetServerList() = 0;
```

Description

This is CallGetServerList, a member of class TCustomDataBlockInterpreter.

130.1.3.2.6 TCustomDataBlockInterpreter.CallInvoke Method

Pascal

```
function CallInvoke(DispatchIndex: Integer; DispID: Integer; const IID: TGUID; LocaleID:
Integer; Flags: Word; var Params; VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer):
HResult; virtual; abstract; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT CallInvoke(int DispatchIndex, int DispID, const TGUID
IID, int LocaleID, Word Flags,  Params, void * VarResult, void * ExcepInfo, void * ArgErr) = 0;
```

Description

This is CallInvoke, a member of class TCustomDataBlockInterpreter.

130.1.3.2.7 TCustomDataBlockInterpreter.CanCreateObject Method

Pascal

```
function CanCreateObject(const ClassID: TGUID): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean CanCreateObject(const TGUID ClassID) = 0;
```

Description

This is CanCreateObject, a member of class TCustomDataBlockInterpreter.

130.1.3.2.8 TCustomDataBlockInterpreter.CreateObject Method

Pascal

```
function CreateObject(const Name: string): OleVariant; virtual; abstract;
```

C++

```
virtual __fastcall OleVariant CreateObject(const AnsiString Name) = 0;
```

Description

This is CreateObject, a member of class TCustomDataBlockInterpreter.

130.1.3.2.9 TCustomDataBlockInterpreter.InternalCreateObject Method

Pascal

```
function InternalCreateObject(const ClassID: TGUID): OleVariant; virtual; abstract;
```

C++

```
virtual __fastcall OleVariant InternalCreateObject(const TGUID ClassID) = 0;
```

Description

This is InternalCreateObject, a member of class TCustomDataBlockInterpreter.

130.1.3.2.10 TCustomDataBlockInterpreter.InterpretData Method

Pascal

```
procedure InterpretData(const Data: IDataBlock); virtual; abstract;
```

C++

```
virtual __fastcall InterpretData(const IDataBlock Data) = 0;
```

Description

This is InterpretData, a member of class TCustomDataBlockInterpreter.

130.1.3.2.11 TCustomDataBlockInterpreter.LockObject Method

Pascal

```
function LockObject(ID: Integer): IDispatch; virtual; abstract;
```

C++

```
virtual __fastcall IDispatch LockObject(int ID) = 0;
```

Description

This is LockObject, a member of class TCustomDataBlockInterpreter.

130.1.3.2.12 TCustomDataBlockInterpreter.ReleaseObject Method

Pascal

```
procedure ReleaseObject(ID: Integer); virtual; abstract;
```

C++

```
virtual __fastcall ReleaseObject(int ID) = 0;
```

Description

This is ReleaseObject, a member of class TCustomDataBlockInterpreter.

130.1.3.2.13 TCustomDataBlockInterpreter.RemoveDispatch Method

Pascal

```
procedure RemoveDispatch(Value: TDataDispatch); virtual; abstract;
```

C++

```
virtual __fastcall RemoveDispatch(TDataDispatch Value) = 0;
```

Description

This is RemoveDispatch, a member of class TCustomDataBlockInterpreter.

130.1.3.2.14 TCustomDataBlockInterpreter.StoreObject Method

Pascal

```
function StoreObject(const Value: OleVariant): Integer; virtual; abstract;
```

C++

```
virtual __fastcall int StoreObject(const OleVariant Value) = 0;
```

Description

This is StoreObject, a member of class TCustomDataBlockInterpreter.

130.1.3.2.15 TCustomDataBlockInterpreter.UnlockObject Method

Pascal

```
procedure UnlockObject(ID: Integer; const Disp: IDispatch); virtual; abstract;
```

C++

```
virtual __fastcall UnlockObject(int ID, const IDispatch Disp) = 0;
```

Description

This is UnlockObject, a member of class TCustomDataBlockInterpreter.

130.1.4 TDataBlock Class

Class Hierarchy

Pascal

```
TDataBlock = class(TInterfacedObject, IDataBlock);
```

C++

```
class TDataBlock : public TInterfacedObject, public IDataBlock;
```

File

SConnect

Description

This is class SConnect.TDataBlock.

130.1.4.1 TDataBlock Members

The following tables list the members exposed by TDataBlock.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	Clear (see page 18906)	Removes all data from Memory except for the reserved bytes.
	GetBytesReserved (see page 18907)	Returns the value of the BytesReserved property.
	GetMemory (see page 18907)	Returns the value of the Memory property.
	GetSignature (see page 18907)	Returns the value of the Signature property.
	GetSize (see page 18907)	Returns the value of the Size property.
	GetStream (see page 18908)	Returns the value of the Stream property.
	IgnoreStream (see page 18908)	Informs the data block when its stream is invalidated.
	InitData (see page 18908)	Adds data to the data block.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	Read (see page 18909)	Reads a specified number of bytes into a buffer.
	SetSignature (see page 18909)	Sets the value of the Signature property.
	SetSize (see page 18910)	Sets the value of the Size property.
	Write (see page 18910)	Writes a specified number of bytes from a buffer.

Protected Properties

	Name	Description
R	BytesReserved (see page 18911)	Indicates the number of bytes from Memory that are reserved for internal use.
R	Memory (see page 18911)	Points to a buffer from which data is read or to which data is written.
	Signature (see page 18911)	Indicates the contents of the data block.
	Size (see page 18912)	Indicates the size of the data in the memory buffer.
R	Stream (see page 18912)	Provides access to an internal stream that contains the data block's memory.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18905)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18905)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

130.1.4.2 TDataBlock.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TDataBlock();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

130.1.4.3 TDataBlock.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataBlock();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

130.1.4.4 TDataBlock Methods

The methods of the TDataBlock class are listed here.

Protected Methods

	Name	Description
	Clear (see page 18906)	Removes all data from Memory except for the reserved bytes.
	GetBytesReserved (see page 18907)	Returns the value of the BytesReserved property.
	GetMemory (see page 18907)	Returns the value of the Memory property.
	GetSignature (see page 18907)	Returns the value of the Signature property.
	GetSize (see page 18907)	Returns the value of the Size property.
	GetStream (see page 18908)	Returns the value of the Stream property.
	IgnoreStream (see page 18908)	Informs the data block when its stream is invalidated.
	InitData (see page 18908)	Adds data to the data block.
	Read (see page 18909)	Reads a specified number of bytes into a buffer.
	SetSignature (see page 18909)	Sets the value of the Signature property.
	SetSize (see page 18910)	Sets the value of the Size property.
	Write (see page 18910)	Writes a specified number of bytes from a buffer.

130.1.4.4.1 TDataBlock.Clear Method

Removes all data from Memory except for the reserved bytes.

Pascal

```
procedure Clear; stdcall;
```

C++

```
__fastcall __stdcall Clear();
```

Description

Call Clear when finished reading from Memory or when the information written to Memory has been used. Clear reclaims the resources used to store information that is read from or written to the data block.

See Also

BytesReserved (see page 18989)

Memory (see page 18989)

130.1.4.4.2 TDataBlock.GetBytesReserved Method

Returns the value of the BytesReserved property.

Pascal

```
function GetBytesReserved: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetBytesReserved();
```

Description

GetBytesReserved is the read implementer for the BytesReserved property.

See Also

BytesReserved (see page 18989)

130.1.4.4.3 TDataBlock.GetMemory Method

Returns the value of the Memory property.

Pascal

```
function GetMemory: Pointer; stdcall;
```

C++

```
__fastcall __stdcall void * GetMemory();
```

Description

GetMemory is the read implementer for the Memory property.

See Also

Memory (see page 18989)

130.1.4.4.4 TDataBlock.GetSignature Method

Returns the value of the Signature property.

Pascal

```
function GetSignature: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetSignature();
```

Description

GetSignature is the read implementer for the Signature property.

See Also

Signature (see page 18990)

130.1.4.4.5 TDataBlock.GetSize Method

Returns the value of the Size property.

Pascal

```
function GetSize: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetSize();
```

Description

GetSize is the read implementer for the Size property.

See Also

Size (see page 18990)

130.1.4.4.6 TDataBlock.GetStream Method

Returns the value of the Stream property.

Pascal

```
function GetStream: TStream; stdcall;
```

C++

```
__fastcall __stdcall TStream GetStream();
```

Description

GetStream is the read implementer for the Stream property.

See Also

Stream (see page 18991)

130.1.4.4.7 TDataBlock.IgnoreStream Method

Informs the data block when its stream is invalidated.

Pascal

```
procedure IgnoreStream; stdcall;
```

C++

```
__fastcall __stdcall IgnoreStream();
```

Description

Call IgnoreStream after taking responsibility for freeing the component specified by Stream. After a call to IgnoreStream, the data block will not free the memory for its internal Stream component.

See Also

Stream (see page 18991)

130.1.4.4.8 TDataBlock.InitData Method

Adds data to the data block.

Pascal

```
function InitData(Data: Pointer; DataLen: Integer; CheckLen: Boolean): Integer; stdcall;
```

C++

```
__fastcall __stdcall int InitData(void * Data, int DataLen, Boolean CheckLen);
```

Description

Data is the data to be added to the data block. It must include a valid signature or InitData raises an exception.

DataLen is the number of bytes referenced by Data.

CheckLen specifies whether InitData should verify that the signature indicates the same amount of data as is indicated by the DataLen parameter.

See Also

Signature (see page 18990)

130.1.4.4.9 TDataBlock.Read Method

Reads a specified number of bytes into a buffer.

Pascal

```
function Read(var Buffer; Count: Integer): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Read( Buffer, int Count);
```

Description

Call Read to copy the contents stored in the memory buffer to the buffer supplied by the Buffer parameter. Read reads up to Count bytes and returns the number of bytes actually read.

The first call to Read begins reading from Memory at the first position after the reserved bytes. Subsequent calls begin reading at the point where the last call to Read left off.

Note: The Count parameter should specify a value less than or equal to Size - BytesReserved.

See Also

Write (see page 18988)

Memory (see page 18989)

Size (see page 18990)

BytesReserved (see page 18989)

130.1.4.4.10 TDataBlock.SetSignature Method

Sets the value of the Signature property.

Pascal

```
procedure SetSignature(Value: Integer); stdcall;
```

C++

```
__fastcall __stdcall SetSignature(int Value);
```

Description

SetSignature is the write implementer for the Signature property.

See Also

Signature (see page 18990)

130.1.4.4.11 TDataBlock.SetSize Method

Sets the value of the Size property.

Pascal

```
procedure SetSize(Value: Integer); stdcall;
```

C++

```
__fastcall __stdcall SetSize(int Value);
```

Description

SetSize is the write implementer for the Size property.

See Also

Size (see page 18990)

130.1.4.4.12 TDataBlock.Write Method

Writes a specified number of bytes from a buffer.

Pascal

```
function Write(const Buffer; Count: Integer): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Write(const  Buffer, int Count);
```

Description

Call Write to copy the contents of the buffer supplied as the Buffer parameter to the next position in Memory. Write writes up to Count bytes and returns the number of bytes actually written.

The first call to Write begins writing to Memory at the first position after the reserved bytes. Subsequent calls begin writing at the point where the last call to Write left off.

Note: The Count parameter should specify a value less than or equal to Size - BytesReserved.

See Also

Read (see page 18987)

Memory (see page 18989)

Size (see page 18990)

BytesReserved (see page 18989)

130.1.4.5 TDataBlock Properties

The properties of the TDataBlock class are listed here.

Protected Properties

	Name	Description
R	BytesReserved (see page 18911)	Indicates the number of bytes from Memory that are reserved for internal use.

R	Memory (see page 18911)	Points to a buffer from which data is read or to which data is written.
	Signature (see page 18911)	Indicates the contents of the data block.
	Size (see page 18912)	Indicates the size of the data in the memory buffer.
R	Stream (see page 18912)	Provides access to an internal stream that contains the data block's memory.

130.1.4.5.1 TDataBlock.BytesReserved Property

Indicates the number of bytes from Memory that are reserved for internal use.

Pascal

```
property BytesReserved: Integer;
```

C++

```
__property int BytesReserved;
```

Description

BytesReserved indicates how many bytes of Memory can't be used for reading and writing. When interpreting the value of the Size property, use BytesReserved to determine how much buffer space is available for reading and writing data.

See Also

Memory (see page 18989)

Size (see page 18990)

130.1.4.5.2 TDataBlock.Memory Property

Points to a buffer from which data is read or to which data is written.

Pascal

```
property Memory: Pointer;
```

C++

```
__property void * Memory;
```

Description

Memory provides access to the buffer that contains data that is read or written. Memory includes a reserved area (of size BytesReserved) for internal information such as the value of Signature,

Note: When implementing the Receive and Send methods of the ITransport interface, component writers should read directly from and write directly to Memory, rather than using the Read and Write methods. Otherwise, the information in the reserved area will not be sent to or from the application server.

See Also

Size (see page 18990)

ITransport (see page 18995)

BytesReserved (see page 18989)

Signature (see page 18990)

Stream (see page 18991)

130.1.4.5.3 TDataBlock.Signature Property

Indicates the contents of the data block.

Pascal

```
property Signature: Integer;
```

C++

```
__property int Signature;
```

Description

Write Signature values to indicate what type of data is written to the data block. Read Signature to determine what type of data can be read from the data block.

The value of signature is stored somewhere in the first BytesReserved bytes of Memory.

See Also

BytesReserved (see page 18989)

Memory (see page 18989)

130.1.4.5.4 TDataBlock.Size Property

Indicates the size of the data in the memory buffer.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

Size is the number of bytes available in Memory, excluding the reserved bytes. Set Size to ensure that Memory is large enough to contain the data that the data block will read or write.

See Also

BytesReserved (see page 18989)

Memory (see page 18989)

Signature (see page 18990)

130.1.4.5.5 TDataBlock.Stream Property

Provides access to an internal stream that contains the data block's memory.

Pascal

```
property Stream: TStream;
```

C++

```
__property TStream Stream;
```

Description

Stream allows component writers more convenient access to the data block's memory buffer. This memory buffer contains the data that is read or written.

See Also

Memory (see page 18989)

IgnoreStream (see page 18986)

TMemoryStream (see page 2902)

130.1.5 TDataBlockInterpreter Class

TDataBlockInterpreter marshals COM interface calls for non COM-based connection components.

Class Hierarchy

Pascal

```
TDataBlockInterpreter = class(TCustomDataBlockInterpreter);
```

C++

```
class TDataBlockInterpreter : public TCustomDataBlockInterpreter;
```

File

SConnect

Description

Many streamed connection components use TDataBlockInterpreter to handle the marshaling of messages sent to and received from an application server. An object that supports the IDataBlock (see page 18983) interface stores the messages themselves.

See Also

TStreamedConnection (see page 18945)

IDataBlock (see page 18983)

TSocketConnection (see page 18928)

TWebConnection (see page 18968)

130.1.5.1 TDataBlockInterpreter Members

The following tables list the members exposed by TDataBlockInterpreter.

Protected Methods

	Name	Description
	AddDispatch (see page 18915)	This is AddDispatch, a member of class TDataBlockInterpreter.
	CallFreeObject (see page 18916)	This is CallFreeObject, a member of class TDataBlockInterpreter.
	CallGetIDsOfNames (see page 18916)	This is CallGetIDsOfNames, a member of class TDataBlockInterpreter.
	CallGetServerList (see page 18916)	This is CallGetServerList, a member of class TDataBlockInterpreter.
	CallInvoke (see page 18917)	This is CallInvoke, a member of class TDataBlockInterpreter.
	CanCreateObject (see page 18917)	This is CanCreateObject, a member of class TDataBlockInterpreter.
	CreateObject (see page 18917)	This is CreateObject, a member of class TDataBlockInterpreter.
	DoCreateObject (see page 18917)	This is DoCreateObject, a member of class TDataBlockInterpreter.
	DoCustomAction (see page 18917)	This is DoCustomAction, a member of class TDataBlockInterpreter.
	DoFreeObject (see page 18918)	This is DoFreeObject, a member of class TDataBlockInterpreter.
	DoGetAppServerList (see page 18918)	This is DoGetAppServerList, a member of class TDataBlockInterpreter.
	DoGetIDsOfNames (see page 18918)	This is DoGetIDsOfNames, a member of class TDataBlockInterpreter.
	DoGetServerList (see page 18918)	This is DoGetServerList, a member of class TDataBlockInterpreter.
	DoInvoke (see page 18919)	This is DoInvoke, a member of class TDataBlockInterpreter.

	InternalCreateObject (see page 18919)	This is InternalCreateObject, a member of class TDataBlockInterpreter.
	LockObject (see page 18919)	This is LockObject, a member of class TDataBlockInterpreter.
	ReleaseObject (see page 18920)	This is ReleaseObject, a member of class TDataBlockInterpreter.
	RemoveDispatch (see page 18920)	This is RemoveDispatch, a member of class TDataBlockInterpreter.
	StoreObject (see page 18920)	This is StoreObject, a member of class TDataBlockInterpreter.
	UnlockObject (see page 18920)	This is UnlockObject, a member of class TDataBlockInterpreter.

Public Methods

	Name	Description
	CallCreateObject (see page 18915)	Creates a COM object on a remote application server given its class name.
	Create (see page 18914)	Creates and initializes an instance of TDataBlockInterpreter (see page 18913).
	Destroy (see page 18914)	Destroys an instance of TDataBlockInterpreter (see page 18913).
	InterpretData (see page 18919)	Interprets a call received from a remote application server.

130.1.5.2 TDataBlockInterpreter.Create Constructor

Creates and initializes an instance of TDataBlockInterpreter (see page 18913).

Pascal

```
constructor Create(SendDataBlock: ISendDataBlock; CheckRegValue: string);
```

C++

```
__fastcall TDataBlockInterpreter(ISendDataBlock SendDataBlock, AnsiString CheckRegValue);
```

Description

Applications should not need to instantiate data block interpreters. Typically, they are instantiated by the streamed connection components that use them to marshal data. To access a streamed connection component's data block interpreter instance, use its Interpreter property.

Create takes two arguments:

An ISendDataBlock (see page 18993) interface that the data block interpreter can use to send information in a data block to its destination object (usually the remote data module of an application server).

A string that specifies a registry key value which must appear for application servers that can be accessed using the data block interpreter.

See Also

Interpreter (see page 18960)

130.1.5.3 TDataBlockInterpreter.Destroy Destructor

Destroys an instance of TDataBlockInterpreter (see page 18913).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataBlockInterpreter();
```

Description

Applications have no need to free data block interpreters. They are freed by the streamed connection component that uses them to marshal interface calls.

See Also

Free (see page 22300)

130.1.5.4 TDataBlockInterpreter Methods

The methods of the TDataBlockInterpreter class are listed here.

Protected Methods

	Name	Description
	AddDispatch (see page 18915)	This is AddDispatch, a member of class TDataBlockInterpreter.
	CallFreeObject (see page 18916)	This is CallFreeObject, a member of class TDataBlockInterpreter.
	CallGetIDsOfNames (see page 18916)	This is CallGetIDsOfNames, a member of class TDataBlockInterpreter.
	CallGetServerList (see page 18916)	This is CallGetServerList, a member of class TDataBlockInterpreter.
	CallInvoke (see page 18917)	This is CallInvoke, a member of class TDataBlockInterpreter.
	CanCreateObject (see page 18917)	This is CanCreateObject, a member of class TDataBlockInterpreter.
	CreateObject (see page 18917)	This is CreateObject, a member of class TDataBlockInterpreter.
	DoCreateObject (see page 18917)	This is DoCreateObject, a member of class TDataBlockInterpreter.
	DoCustomAction (see page 18917)	This is DoCustomAction, a member of class TDataBlockInterpreter.
	DoFreeObject (see page 18918)	This is DoFreeObject, a member of class TDataBlockInterpreter.
	DoGetAppServerList (see page 18918)	This is DoGetAppServerList, a member of class TDataBlockInterpreter.
	DoGetIDsOfNames (see page 18918)	This is DoGetIDsOfNames, a member of class TDataBlockInterpreter.
	DoGetServerList (see page 18918)	This is DoGetServerList, a member of class TDataBlockInterpreter.
	DoInvoke (see page 18919)	This is DoInvoke, a member of class TDataBlockInterpreter.
	InternalCreateObject (see page 18919)	This is InternalCreateObject, a member of class TDataBlockInterpreter.
	LockObject (see page 18919)	This is LockObject, a member of class TDataBlockInterpreter.
	ReleaseObject (see page 18920)	This is ReleaseObject, a member of class TDataBlockInterpreter.
	RemoveDispatch (see page 18920)	This is RemoveDispatch, a member of class TDataBlockInterpreter.
	StoreObject (see page 18920)	This is StoreObject, a member of class TDataBlockInterpreter.
	UnlockObject (see page 18920)	This is UnlockObject, a member of class TDataBlockInterpreter.

Public Methods

	Name	Description
	CallCreateObject (see page 18915)	Creates a COM object on a remote application server given its class name.
	InterpretData (see page 18919)	Interprets a call received from a remote application server.

130.1.5.4.1 TDataBlockInterpreter.AddDispatch Method

Pascal

```
procedure AddDispatch(Value: TDataDispatch); override;
```

C++

```
virtual __fastcall AddDispatch(TDataDispatch Value);
```

Description

This is AddDispatch, a member of class TDataBlockInterpreter.

130.1.5.4.2 TDataBlockInterpreter.CallCreateObject Method

Creates a COM object on a remote application server given its class name.

Pascal

```
function CallCreateObject(Name: string): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant CallCreateObject(AnsiString Name);
```

Description

CallCreateObject sends a message to the remote application server, telling it to create an object of the class specified by the Name parameter. Name is the string representation of the Class ID (CLSID). CreateObject (see page 18917) returns a reference to an interface that can be used to communicate with the remote COM object.

See Also

CreateOleObject

130.1.5.4.3 TDataBlockInterpreter.CallFreeObject Method

Pascal

```
procedure CallFreeObject(DispatchIndex: Integer); override;
```

C++

```
virtual __fastcall CallFreeObject(int DispatchIndex);
```

Description

This is CallFreeObject, a member of class TDataBlockInterpreter.

130.1.5.4.4 TDataBlockInterpreter.CallGetIDsOfNames Method

Pascal

```
function CallGetIDsOfNames(DispatchIndex: Integer; const IID: TGUID; Names: Pointer;
NameCount: Integer; LocaleID: Integer; DispIDs: Pointer): HResult; override;
```

C++

```
virtual __fastcall HRESULT CallGetIDsOfNames(int DispatchIndex, const TGUID IID, void * Names,
int NameCount, int LocaleID, void * DispIDs);
```

Description

This is CallGetIDsOfNames, a member of class TDataBlockInterpreter.

130.1.5.4.5 TDataBlockInterpreter.CallGetServerList Method

Pascal

```
function CallGetServerList: OleVariant; override;
```

C++

```
virtual __fastcall OleVariant CallGetServerList();
```

Description

This is CallGetServerList, a member of class TDataBlockInterpreter.

130.1.5.4.6 TDataBlockInterpreter.CallInvoke Method

Pascal

```
function CallInvoke(DispatchIndex: Integer; DispID: Integer; const IID: TGUID; LocaleID:
Integer; Flags: Word; var Params; VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer):
HResult; override;
```

C++

```
virtual __fastcall HRESULT CallInvoke(int DispatchIndex, int DispID, const TGUID IID, int
LocaleID, Word Flags,  Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

This is CallInvoke, a member of class TDataBlockInterpreter.

130.1.5.4.7 TDataBlockInterpreter.CanCreateObject Method

Pascal

```
function CanCreateObject(const ClassID: TGUID): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanCreateObject(const TGUID ClassID);
```

Description

This is CanCreateObject, a member of class TDataBlockInterpreter.

130.1.5.4.8 TDataBlockInterpreter.CreateObject Method

Pascal

```
function CreateObject(const Name: string): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant CreateObject(const AnsiString Name);
```

Description

This is CreateObject, a member of class TDataBlockInterpreter.

130.1.5.4.9 TDataBlockInterpreter.DoCreateObject Method

Pascal

```
procedure DoCreateObject(const Data: IDataBlock);
```

C++

```
__fastcall DoCreateObject(const IDataBlock Data);
```

Description

This is DoCreateObject, a member of class TDataBlockInterpreter.

130.1.5.4.10 TDataBlockInterpreter.DoCustomAction Method

Pascal

```
function DoCustomAction(Action: Integer; const Data: IDataBlock): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean DoCustomAction(int Action, const IDataBlock Data);
```

Description

This is DoCustomAction, a member of class TDataBlockInterpreter.

130.1.5.4.11 TDataBlockInterpreter.DoFreeObject Method

Pascal

```
procedure DoFreeObject(const Data: IDataBlock);
```

C++

```
__fastcall DoFreeObject(const IDataBlock Data);
```

Description

This is DoFreeObject, a member of class TDataBlockInterpreter.

130.1.5.4.12 TDataBlockInterpreter.DoGetAppServerList Method

Pascal

```
procedure DoGetAppServerList(const Data: IDataBlock);
```

C++

```
__fastcall DoGetAppServerList(const IDataBlock Data);
```

Description

This is DoGetAppServerList, a member of class TDataBlockInterpreter.

130.1.5.4.13 TDataBlockInterpreter.DoGetIDsOfNames Method

Pascal

```
procedure DoGetIDsOfNames(const Data: IDataBlock);
```

C++

```
__fastcall DoGetIDsOfNames(const IDataBlock Data);
```

Description

This is DoGetIDsOfNames, a member of class TDataBlockInterpreter.

130.1.5.4.14 TDataBlockInterpreter.DoGetServerList Method

Pascal

```
procedure DoGetServerList(const Data: IDataBlock);
```

C++

```
__fastcall DoGetServerList(const IDataBlock Data);
```

Description

This is DoGetServerList, a member of class TDataBlockInterpreter.

130.1.5.4.15 TDataBlockInterpreter.DoInvoke Method

Pascal

```
procedure DoInvoke(const Data: IDataBlock);
```

C++

```
__fastcall DoInvoke(const IDataBlock Data);
```

Description

This is DoInvoke, a member of class TDataBlockInterpreter.

130.1.5.4.16 TDataBlockInterpreter.InternalCreateObject Method

Pascal

```
function InternalCreateObject(const ClassID: TGUID): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalCreateObject(const TGUID ClassID);
```

Description

This is InternalCreateObject, a member of class TDataBlockInterpreter.

130.1.5.4.17 TDataBlockInterpreter.InterpretData Method

Interprets a call received from a remote application server.

Pascal

```
procedure InterpretData(const Data: IDataBlock); override;
```

C++

```
virtual __fastcall InterpretData(const IDataBlock Data);
```

Description

Call InterpretData to respond to a COM interface call that is marshaled to a data block. The Data parameter specifies an IDataBlock (see page 18983) interface that can be used to read the marshaled version of the message.

InterpretData reads the call, interprets it as an IDispatch call, and performs the appropriate actions (such as invoking a local COM interface).

130.1.5.4.18 TDataBlockInterpreter.LockObject Method

Pascal

```
function LockObject(ID: Integer): IDispatch; override;
```

C++

```
virtual __fastcall IDispatch LockObject(int ID);
```

Description

This is LockObject, a member of class TDataBlockInterpreter.

130.1.5.4.19 TDataBlockInterpreter.ReleaseObject Method

Pascal

```
procedure ReleaseObject(ID: Integer); override;
```

C++

```
virtual __fastcall ReleaseObject(int ID);
```

Description

This is ReleaseObject, a member of class TDataBlockInterpreter.

130.1.5.4.20 TDataBlockInterpreter.RemoveDispatch Method

Pascal

```
procedure RemoveDispatch(Value: TDataDispatch); override;
```

C++

```
virtual __fastcall RemoveDispatch(TDataDispatch Value);
```

Description

This is RemoveDispatch, a member of class TDataBlockInterpreter.

130.1.5.4.21 TDataBlockInterpreter.StoreObject Method

Pascal

```
function StoreObject(const Value: OleVariant): Integer; override;
```

C++

```
virtual __fastcall int StoreObject(const OleVariant Value);
```

Description

This is StoreObject, a member of class TDataBlockInterpreter.

130.1.5.4.22 TDataBlockInterpreter.UnlockObject Method

Pascal

```
procedure UnlockObject(ID: Integer; const Disp: IDispatch); override;
```

C++

```
virtual __fastcall UnlockObject(int ID, const IDispatch Disp);
```

Description

This is UnlockObject, a member of class TDataBlockInterpreter.

130.1.6 TDataDispatch Class

Class Hierarchy

Pascal

```
TDataDispatch = class(TInterfacedObject, IDispatch);
```

C++

```
class TDataDispatch : public TInterfacedObject, public IDispatch;
```

File

SConnect

Description

This is class SConnect.TDataDispatch.

130.1.6.1 TDataDispatch Members

The following tables list the members exposed by TDataDispatch.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetIDsOfNames (see page 18923)	This is GetIDsOfNames, a member of class TDataDispatch.
	GetTypeInfo (see page 18924)	This is GetTypeInfo, a member of class TDataDispatch.
	GetTypeInfoCount (see page 18924)	This is GetTypeInfoCount, a member of class TDataDispatch.
	Invoke (see page 18924)	This is Invoke, a member of class TDataDispatch.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Protected Properties

	Name	Description
R	DispatchIndex (see page 18924)	This is DispatchIndex, a member of class TDataDispatch.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18922)	This is Create, a member of class TDataDispatch.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 18922)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

130.1.6.2 TDataDispatch.Create Constructor

Pascal

```
constructor Create(Interpreter: TCustomDataBlockInterpreter; DispatchIndex: Integer);
```

C++

```
__fastcall TDataDispatch(TCustomDataBlockInterpreter Interpreter, int DispatchIndex);
```

Description

This is Create, a member of class TDataDispatch.

130.1.6.3 TDataDispatch.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDataDispatch();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

130.1.6.4 TDataDispatch Methods

The methods of the TDataDispatch class are listed here.

Protected Methods

	Name	Description
	GetIDsOfNames (see page 18923)	This is GetIDsOfNames, a member of class TDataDispatch.
	GetTypeInfo (see page 18924)	This is GetTypeInfo, a member of class TDataDispatch.
	GetTypeInfoCount (see page 18924)	This is GetTypeInfoCount, a member of class TDataDispatch.
	Invoke (see page 18924)	This is Invoke, a member of class TDataDispatch.

130.1.6.4.1 TDataDispatch.GetIDsOfNames Method

Pascal

```
function GetIDsOfNames(const IID: TGUID; Names: Pointer; NameCount: Integer; LocaleID:
Integer; DispIDs: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetIDsOfNames(const TGUID IID, void * Names, int NameCount, int
LocaleID, void * DispIDs);
```

Description

This is GetIDsOfNames, a member of class TDataDispatch.

130.1.6.4.2 TDataDispatch.GetTypeInfo Method

Pascal

```
function GetTypeInfo(Index: Integer; LocaleID: Integer; out TypeInfo): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfo(int Index, int LocaleID,  TypeInfo);
```

Description

This is GetTypeInfo, a member of class TDataDispatch.

130.1.6.4.3 TDataDispatch.GetTypeInfoCount Method

Pascal

```
function GetTypeInfoCount(out Count: Integer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT GetTypeInfoCount(int Count);
```

Description

This is GetTypeInfoCount, a member of class TDataDispatch.

130.1.6.4.4 TDataDispatch.Invoke Method

Pascal

```
function Invoke(DispID: Integer; const IID: TGUID; LocaleID: Integer; Flags: Word; var Params;
VarResult: Pointer; ExcepInfo: Pointer; ArgErr: Pointer): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT Invoke(int DispID, const TGUID IID, int LocaleID, Word Flags,
Params, void * VarResult, void * ExcepInfo, void * ArgErr);
```

Description

This is Invoke, a member of class TDataDispatch.

130.1.6.5 TDataDispatch Properties

The properties of the TDataDispatch class are listed here.

Protected Properties

	Name	Description
R	DispatchIndex (see page 18924)	This is DispatchIndex, a member of class TDataDispatch.

130.1.6.5.1 TDataDispatch.DispatchIndex Property

Pascal

```
property DispatchIndex: Integer;
```

C++

```
__property int DispatchIndex;
```

Description

This is DispatchIndex, a member of class TDataDispatch.

130.1.7 TPacketInterceptFactory Class

TPacketInterceptFactory is the type of the class factory used to instantiate a data packet interceptor.

Class Hierarchy

Pascal

```
TPacketInterceptFactory = class(TComObjectFactory);
```

C++

```
class TPacketInterceptFactory : public TComObjectFactory;
```

File

SConnect

Description

In Delphi, use TPacketInterceptFactory as the class factory for COM objects that implement the IDataIntercept (see page 18991) interface. Data packet interceptors implement the IDataIntercept (see page 18991) interface, which they use in multi-tiered database applications to modify the data that passes between a socket connection component in the client application and scktsrvr.exe on the server. TPacketInterceptFactory registers the data packet interceptor so that can appear in the drop-down list of the Object Inspector when setting the socket connection's InterceptName property and in the corresponding list in the properties dialog of scktsrvr.exe.

TPacketInterceptFactory supports the IUnknown, IClassFactory, and IClassFactory2 interfaces. The IClassFactory interface is implemented by class objects associated with class identifiers (CLSIDs) for the classes that they instantiate. IClassFactory must be implemented for every object definition, so that objects of that type can be created. The IClassFactory2 interface is implemented by class factories for classes that need support for licensing.

130.1.7.1 TPacketInterceptFactory Members

The following tables list the members exposed by TPacketInterceptFactory.

Protected Methods

	Name	Description
	_AddRef (see page 5567)	This is _AddRef, a member of class TComObjectFactory.
	_Release (see page 5567)	This is _Release, a member of class TComObjectFactory.
	CreateInstance (see page 5568)	This is CreateInstance, a member of class TComObjectFactory.
	CreateInstanceLic (see page 5568)	This is CreateInstanceLic, a member of class TComObjectFactory.
V	GetLicenseString (see page 5568)	This is GetLicenseString, a member of class TComObjectFactory.
	GetLicInfo (see page 5568)	This is GetLicInfo, a member of class TComObjectFactory.
V	GetProgID (see page 5569)	This is GetProgID, a member of class TComObjectFactory.
V	HasMachineLicense (see page 5569)	This is HasMachineLicense, a member of class TComObjectFactory.
	LockServer (see page 5569)	This is LockServer, a member of class TComObjectFactory.
	QueryInterface (see page 5569)	This is QueryInterface, a member of class TComObjectFactory.
	RequestLicKey (see page 5570)	This is RequestLicKey, a member of class TComObjectFactory.
V	ValidateUserLicense (see page 5571)	This is ValidateUserLicense, a member of class TComObjectFactory.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 5565)	Instantiates a class factory object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	CreateComObject (see page 5567)	Instantiates a TComObject (see page 5553) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 5566)	Disposes of an instance of a class factory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RegisterClassObject (see page 5569)	Registers the COM class associated with the factory object.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	UpdateRegistry (see page 18927)	Registers or unregisters COM objects created by the factory.

Public Properties

	Name	Description
R	ClassID (see page 5571)	This is ClassID, a member of class TComObjectFactory.
R	ClassName (see page 5572)	Specifies the name of the class that the class factory instantiates.
R	ComClass (see page 5572)	This is ComClass, a member of class TComObjectFactory.
R	ComServer (see page 5572)	This is ComServer, a member of class TComObjectFactory.
R	Description (see page 5572)	Describes the class object.
	ErrorIID (see page 5573)	Indicates the interface of the CoClass in which an error occurred.
R	Instancing (see page 5573)	Indicates the process space of COM object instances.
	LicString (see page 5573)	Contains licensing information about the object.
R	ProgID (see page 5574)	Specifies the name of the class factory.
	ShowErrors (see page 5574)	Indicates whether the COM object factory displays a message box when exceptions are raised.
	SupportsLicensing (see page 5574)	Indicates whether the object being instantiated supports licensing.
R	ThreadingModel (see page 5575)	Indicates the type of thread support provided by objects that the factory creates.

130.1.7.2 TPacketInterceptFactory Methods

The methods of the TPacketInterceptFactory class are listed here.

Public Methods

	Name	Description
V	UpdateRegistry (see page 18927)	Registers or unregisters COM objects created by the factory.

130.1.7.2.1 TPacketInterceptFactory.UpdateRegistry Method

Registers or unregisters COM objects created by the factory.

Pascal

```
procedure UpdateRegistry(Register: Boolean); override;
```

C++

```
virtual __fastcall UpdateRegistry(Boolean Register);
```

Description

UpdateRegistry is called for EXEs when the EXE is run, and for DLLs or EXEs when the routines are called to specifically register or unregister the server.

In addition to the standard COM registration that allows clients to instantiate the data packet interceptor that this factory creates, TPacketInterceptFactory (see page 18925) also registers its associated COM object as a data packet interceptor. This allows the object's ProgID to appear in the drop-down list for a socket connection's InterceptName property, and to appear in the corresponding list on the properties dialog for scktsrvr.exe.

InterceptName (see page 18960)

130.1.8 TSocketConnection Class

TSocketConnection uses Windows sockets to manage the connection to an application server.

Class Hierarchy

Pascal

```
TSocketConnection = class(TStreamedConnection);
```

C++

```
class TSocketConnection : public TStreamedConnection;
```

File

SConnect

Description

TSocketConnection is used in the client portion of a multi-tiered database application to establish and maintain the connection between the client and a remote application server. The Socket connection object can

Establish an initial connection to a remote application server.

Obtain an IAppServer for the application server.

Call into a separate COM object that encodes and decodes the content of messages.

Obtain a list of providers on the application server.

Drop the connection to the remote application server.

TSocketConnection establishes the initial connection between the client application and a remote application server using TCP/IP. To use TSocketConnection, the application server must be running ScktSrvr.exe.

Once the connection is established, the client registers any or all of its client datasets, and these client datasets use the IAppServer interface from the socket connection component to communicate with providers on the application server, or to otherwise call the application server's data module interface.

To connect to remote application servers using DCOM, use the TDCOMConnection component instead. To connect to remote application servers using HTTP, use the TWebConnection (see page 18968) component instead. To connect using SOAP, use the TSoapConnection component.

Specifying a Connection Using Sockets

130.1.8.1 TSocketConnection Members

The following tables list the members exposed by TSocketConnection.

Protected Events

	Name	Description
	OnGetUsername (see page 8533)	This is OnGetUsername, a member of class TCustomRemoteServer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_AddRef (see page 18952)	Increments an internal reference counter.
	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 18952)	Decrements an internal reference counter.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreateTransport (see page 18934)	Returns an ITransport (see page 18995) interface that can be used to connect to and communicate with the application server.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 18934)	Connects to a remote application server.
V	DoDisconnect (see page 6864)	Provides the interface for a method that terminates the connection.
V	DoDisconnect (see page 16023)	Drops a connection to an application server.
V	DoDisconnect (see page 18953)	Disconnects from an application server.
V	DoError (see page 18954)	raises an exception for a specified exception object.
V	GetAppServer (see page 8530)	Returns the value of the AppServer (see page 8532) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetConnected (see page 6865)	Returns the value of the Connected (see page 6868) property.
V	GetConnected (see page 16023)	Returns the value of the Connected (see page 16026) property.
V	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
V	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetInterpreter (see page 18955)	Returns the value of the Interpreter (see page 18960) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetServerCLSID (see page 16024)	Returns the GUID for the application server.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InternalClose (see page 18956)	Terminates a connection to the application server.

V	InternalOpen (see page 18956)	Opens a connection to the application server.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 6866)	Initializes the connection component after all objects in the form or data module have been loaded.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16025)	Responds when other objects are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	QueryInterface (see page 18956)	Implements the IUnknown QueryInterface method.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	RegisterClient (see page 6866)	Registers an object that uses the connection component.
	Send (see page 18957)	Sends an interface call to the application server and returns the response.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAppServer (see page 8531)	Sets the AppServer (see page 8532) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetConnected (see page 6867)	Changes the value of the Connected (see page 6868) property.
V	SetConnected (see page 16025)	Sets the Connected (see page 16026) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	ThreadException (see page 18957)	raises an exception for the thread that communicates with the application server.
	ThreadReceivedStream (see page 18957)	Handles callbacks from the application server.
V	UnRegisterClient (see page 6868)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WndProc (see page 18958)	Dispatches messages from the transport layer.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Handle (see page 18959)	Provides access to an internal window handle that can receive messages from the transport layer.
R	Interpreter (see page 18960)	Provides access to the helper object that marshals interface calls for the streamed connection.
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.

Public Events

	Name	Description
	AfterConnect (see page 6874)	Occurs after a connection is established.
	AfterDisconnect (see page 6875)	Occurs after the connection closes.

	BeforeConnect (see page 6875)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 6875)	Occurs immediately before the connection closes.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.
V	Create (see page 18933)	Creates and initializes an instance of TSocketConnection (see page 18928).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6863)	Destroys the instance of a connection component.
V	Destroy (see page 18951)	Disposes of a TStreamedConnection (see page 18945) instance.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
V	GetInterceptorList (see page 18954)	Retrieves a list of registered interceptors that can be used to transform messages between the connection component and the application server.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetProviderNames (see page 8530)	Executes a callback for all provider objects on the application server.
V	GetServer (see page 8530)	Returns the IAppServer interface of the application server.
V	GetServer (see page 16023)	Returns the IAppServer interface of the application server.
V	GetServerList (see page 8531)	Returns a list of application servers (remote data modules) to which the component can connect.

V	GetServerList (see page 16024)	Returns a list of remote data modules to which the component can connect.
V	GetServerList (see page 18955)	Retrieves a list of registered data brokers from the remote server system.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Send (see page 18994)	Sends information retrieved from an IDataBlock (see page 18983) interface to the application server.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AppServer (see page 8532)	Contains the interface for communicating with the application server.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Connected (see page 6868)	Determines whether a connection has been established to the remote source of data.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 6870)	Lists the datasets currently using this connection component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	LoginPrompt (see page 6872)	Specifies whether a login dialog appears immediately before opening a new connection.
	OnLogin (see page 6873)	Occurs when a communication channel opens to the server.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterConnect (see page 16031)	Occurs after a connection is established.
	AfterDisconnect (see page 16031)	Occurs after the connection closes.
	BeforeConnect (see page 16032)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 16032)	Occurs immediately before the connection closes.
	OnGetUsername (see page 16033)	This is OnGetUsername, a member of class TDispatchConnection.

Published Properties

	Name	Description
	Address (see page 18935)	Specifies the IP address of the server.
	Connected (see page 16026)	Indicates whether the TDispatchConnection (see page 16017) object is connected to an application server.
	Host (see page 18936)	Specifies the host name of the server.
	InterceptGUID (see page 18936)	Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.
	InterceptName (see page 18937)	Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.
	LoginPrompt (see page 16027)	Specifies whether a login dialog appears immediately before opening a new connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ObjectBroker (see page 18937)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	OnLogin (see page 16028)	Occurs when a communication channel opens to the server.
	Port (see page 18938)	Specifies the port number of the socket dispatcher application on the server system.
	ServerGUID (see page 16030)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 16030)	Specifies the name of the application server with which to connect.
	SupportCallbacks (see page 18939)	Determines whether the streamed connection component can handle callbacks in the application server interface.
	Tag (see page 2808)	Stores an integer value as part of a component.

130.1.8.2 TSocketConnection.Create Constructor

Creates and initializes an instance of TSocketConnection (see page 18928).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSocketConnection(TComponent * AOwner);
```

Description

Call Create to instantiate a TSocketConnection (see page 18928) object at runtime. Socket connection components added to forms or data modules at design time are created automatically.

Create overrides the inherited constructor to initialize the Port (see page 18938) property to 211.

See Also

Create (see page 18950)

Port (see page 18938)

130.1.8.3 TSocketConnection Methods

The methods of the TSocketConnection class are listed here.

Protected Methods

	Name	Description
	CreateTransport (see page 18934)	Returns an ITransport (see page 18995) interface that can be used to connect to and communicate with the application server.
	DoConnect (see page 18934)	Connects to a remote application server.

130.1.8.3.1 TSocketConnection.CreateTransport Method

Returns an ITransport (see page 18995) interface that can be used to connect to and communicate with the application server.

Pascal

```
function CreateTransport: ITransport; override;
```

C++

```
virtual __fastcall ITransport CreateTransport();
```

Description

Socket connection components use an ITransport (see page 18995) interface to connect to and communicate with the application server. CreateTransport instantiates the internal helper object that connects to the socket dispatcher on the server and sends or receives messages. CreateTransport passes the values of the Host (see page 18936), Address (see page 18935) and Port (see page 18938) properties to this helper object and returns its ITransport (see page 18995) interface.

See Also

Host (see page 18936)

Address (see page 18935)

Port (see page 18938)

130.1.8.3.2 TSocketConnection.DoConnect Method

Connects to a remote application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is used internally to connect to the application server when the Connected property is set to true. If the Host (see page 18936) or Address (see page 18935) and Port (see page 18938) properties are set, DoConnect uses these to locate the socket on the server machine. Otherwise, if the ObjectBroker (see page 18937) property is set, it obtains these values from the object broker.

Once the server machine is located, DoConnect opens a connection.

Note: When ObjectBroker (see page 18937) is nil (Delphi) or NULL (C++), the values of Host (see page 18936), Address (see page 18935), and Port (see page 18938) are saved with the socket connection component. If ObjectBroker (see page 18937) is not nil (Delphi) or NULL (C++), these values are not saved from design time. However, once these values are set (either by values obtained from the Object Broker or by values specified in code at runtime), they are used every time a connection must be re-established. If these values subsequently fail, the socket connection component fetches new values from the Object Broker.

See Also

Connected (see page 16026)

Host (see page 18936)

Address (see page 18935)

Port (see page 18938)

ObjectBroker (see page 16028)

130.1.8.4 TSocketConnection Properties

The properties of the TSocketConnection class are listed here.

Published Properties

	Name	Description
	Address (see page 18935)	Specifies the IP address of the server.
	Host (see page 18936)	Specifies the host name of the server.
	InterceptGUID (see page 18936)	Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.
	InterceptName (see page 18937)	Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.
	ObjectBroker (see page 18937)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	Port (see page 18938)	Specifies the port number of the socket dispatcher application on the server system.
	SupportCallbacks (see page 18939)	Determines whether the streamed connection component can handle callbacks in the application server interface.

130.1.8.4.1 TSocketConnection.Address Property

Specifies the IP address of the server.

Pascal

```
property Address: string;
```

C++

```
__property AnsiString Address;
```

Description

Use Address to specify the IP address of the application server to which the client application connects. In addition to the address, you must provide a value for the Port (see page 18938) property so that the socket connection component can locate the listening socket on the server system.

Sockets (see page 20039) require either an IP address or a Host (see page 18936) name to locate the server system. You can use the Host (see page 18936) property instead of the Address property to specify the server system using a host name. The Address and Host (see page 18936) properties are mutually exclusive: Setting Address causes Host (see page 18936) to be set to an empty string, and vice versa.

Note: If the socket connection component uses an Object Broker, you do not need to specify the Address property. Instead, the Object Broker supplies an Address for a server that is located dynamically at runtime. Explicitly setting the Address property overrides the value supplied by the Object Broker, but such overridden values are not saved with the socket connection component.

See Also

Host (see page 18936)

Port (see page 18938)

ObjectBroker (see page 16028)

Specifying a Connection Using Sockets

130.1.8.4.2 TSocketConnection.Host Property

Specifies the host name of the server.

Pascal

```
property Host: string;
```

C++

```
__property AnsiString Host;
```

Description

Use Host to specify the host name of the server system to which the client application should connect. In addition to the host name, you must provide a value for the Port (see page 18938) property so that the socket connection component can locate the listening socket on the server system.

Sockets (see page 20039) require either a Host name or an IP address to locate the server system. You can use the Address (see page 18935) property instead of the Host property to specify the server system using an IP address. The Host and Address (see page 18935) properties are mutually exclusive: Setting Host causes Address (see page 18935) to be set to an empty string, and vice versa.

Note: If the socket connection component uses an Object Broker, you do not need to specify the Host property. Instead, the Object Broker supplies a host name for a server that is located dynamically at runtime. Explicitly setting the Host property overrides the value supplied by the Object Broker, but such overridden values are not saved with the socket connection component.

Address (see page 18935)

Port (see page 18938)

ObjectBroker (see page 16028)

Specifying a Connection Using Sockets

130.1.8.4.3 TSocketConnection.InterceptGUID Property

Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.

Pascal

```
property InterceptGUID: string;
```

C++

```
__property AnsiString InterceptGUID;
```

Description

Set InterceptGUID to the GUID of a COM object that intercepts messages between the connection component and an application server before they are sent and after they are received.

The COM object must implement the IDataIntercept interface. Use the IDataIntercept methods to manipulate the data that is communicated using the socket connection. For example, applications can use these methods to encrypt and decrypt data or to compress and decompress data.

Tip: To specify the COM object that intercepts messages using a ProgID instead of a GUID, use the InterceptName property instead.

Note: When using InterceptGUID, the server must use the same COM object to undo the transformation performed by the socket connection component's InterceptGUID. For servers that respond to TSocketConnection, you can set the server's InterceptGUID to the same GUID using the Socket server dialog of ScktSrvr.exe.

See Also

IDataIntercept (see page 18991)

InterceptName (see page 18960)

GetInterceptorList (see page 18954)

Specifying a Connection Using Sockets

130.1.8.4.4 TSocketConnection.InterceptName Property

Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.

Pascal

```
property InterceptName: string;
```

C++

```
__property AnsiString InterceptName;
```

Description

Set InterceptName to the programmatic ID (ProgID) of a COM object that intercepts messages between the connection component and an application server before they are sent and after they are received.

Note: In Delphi, you can choose the ProgID of any COM objects that have been registered to perform this task at Design time, using a drop-down list in the Object Inspector, if they use TPacketInterceptFactory as a class factory.

The COM object must implement the IDataIntercept interface. Use the IDataIntercept methods to manipulate the data that is communicated using the socket connection. For example, applications can use these methods to encrypt and decrypt data or to compress and decompress data.

Tip: To specify the COM object that intercepts messages using a GUID instead of a ProgID, use the InterceptGUID property instead.

Note: When using InterceptName, the server must use the same COM object to undo the transformation performed by the socket connection component's InterceptName. For servers that respond to TSocketConnection, you can set the COM object that the server uses with the Socket server dialog of ScktSrvr.exe.

See Also

IDataIntercept (see page 18991)

InterceptGUID (see page 18959)

GetInterceptorList (see page 18954)

TPacketInterceptFactory (see page 18925)

Specifying a Connection Using Sockets

130.1.8.4.5 TSocketConnection.ObjectBroker Property

Specifies an Object Broker that allows the connection component to choose from several application servers.

Pascal

```
property ObjectBroker: TCustomObjectBroker;
```

C++

```
__property TCustomObjectBroker ObjectBroker;
```

Description

Set ObjectBroker to use a broker that maintains a list of servers that support the application specified by ServerName or ServerGUID. When the connection component needs to open a connection, it requests information to identify a server machine from the Object Broker.

Descendants of TDispatchConnection define properties that specify how to locate server machines. These properties are not saved with the connection component if the ObjectBroker property is set. Instead, the Object Broker provides this information dynamically at runtime from its list of available servers.

Applications can use TSimpleObjectBroker for an object broker, or derive their own object brokers from TCustomObjectBroker.

DoConnect (see page 6864)

ServerName (see page 16030)

ServerGUID (see page 16030)

TSimpleObjectBroker (see page 17877)

Brokering Connections

Specifying a Connection Using HTTP

Specifying a Connection Using DCOM

Specifying a Connection Using Sockets

Using TSimpleObjectBroker

130.1.8.4.6 TSocketConnection.Port Property

Specifies the port number of the socket dispatcher application on the server system.

Pascal

```
property Port: Integer;
```

C++

```
__property int Port;
```

Description

Use Port to specify the port that the socket dispatcher uses to listen for client connection requests. By default, Port is 211, which is the default port number of ScktSrvr.exe (the socket dispatcher application). Change the value of Port if the socket dispatcher is configured to use a different port.

Note: If the socket connection component uses an Object Broker, you do not need to specify the Port property. Instead, the Object Broker supplies a port number for a server that is located dynamically at runtime. Explicitly setting the Port property overrides the value supplied by the Object Broker, but such overridden values are not saved with the socket connection component.

See Also

Address (see page 18935)

Host (see page 18936)

ObjectBroker (see page 16028)

Specifying a Connection Using Sockets

130.1.8.4.7 TSocketConnection.SupportCallbacks Property

Determines whether the streamed connection component can handle callbacks in the application server interface.

Pascal

```
property SupportCallbacks: Boolean;
```

C++

```
__property Boolean SupportCallbacks;
```

Description

Use SupportCallbacks to indicate whether the connection component can marshal callback functions in the application server's interface. When SupportCallbacks is true, the connection component can marshal calls from the application server to the client application over an interface supplied as a callback.

For TSocketConnection, callbacks are optional. Set SupportCallbacks to true if you are using callbacks as part of the application server's interface. When SupportCallbacks is true, the socket connection component requires WinSock2. Set SupportCallbacks to false if you are not using callback functions and want to eliminate the dependency on WinSock2.

TWebConnection can't support callback functions. It initializes SupportCallbacks to false in the constructor and never changes this value.

130.1.9 TSocketTransport Class

Class Hierarchy

Pascal

```
TSocketTransport = class(TInterfacedObject, ITransport);
```

C++

```
class TSocketTransport : public TInterfacedObject, public ITransport;
```

File

SConnect

Description

This is class SConnect.TSocketTransport.

130.1.9.1 TSocketTransport Members

The following tables list the members exposed by TSocketTransport.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetConnected (see page 18942)	Returns the value of the Connected property.
	GetWaitEvent (see page 18943)	Returns the handle for an event object that is managed by the object that implements ITransport.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	Receive (see page 18943)	Returns an IDataBlock interface that can be used to read information received from the application server.
	Send (see page 18943)	Sends information retrieved from an IDataBlock interface to the application server.
	SetConnected (see page 18944)	Sets the value of the Connected property.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 18941)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18941)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Address (see page 18944)	This is Address, a member of class TSocketTransport.
	Connected (see page 18998)	Indicates whether the connection to the application server is established.
	Host (see page 18945)	This is Host, a member of class TSocketTransport.
	InterceptGUID (see page 18945)	This is InterceptGUID, a member of class TSocketTransport.
	Port (see page 18945)	This is Port, a member of class TSocketTransport.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Socket (see page 18945)	This is Socket, a member of class TSocketTransport.

130.1.9.2 TSocketTransport.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TSocketTransport();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

130.1.9.3 TSocketTransport.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSocketTransport();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

130.1.9.4 TSocketTransport Methods

The methods of the TSocketTransport class are listed here.

Protected Methods

	Name	Description
	GetConnected (see page 18942)	Returns the value of the Connected property.
	GetWaitEvent (see page 18943)	Returns the handle for an event object that is managed by the object that implements ITransport.
	Receive (see page 18943)	Returns an IDataBlock interface that can be used to read information received from the application server.
	Send (see page 18943)	Sends information retrieved from an IDataBlock interface to the application server.
	SetConnected (see page 18944)	Sets the value of the Connected property.

130.1.9.4.1 TSocketTransport.GetConnected Method

Returns the value of the Connected property.

Pascal

```
function GetConnected: Boolean; stdcall;
```

C++

```
__fastcall __stdcall Boolean GetConnected();
```

Description

GetConnected is the read property implementer for the Connected property.

See Also

Connected (see page 18998)

130.1.9.4.2 TSocketTransport.GetWaitEvent Method

Returns the handle for an event object that is managed by the object that implements ITransport.

Pascal

```
function GetWaitEvent: THandle; stdcall;
```

C++

```
__fastcall __stdcall THandle GetWaitEvent();
```

Description

Streamed connection components perform all reading from and writing to the application server using a separate execution thread. This limits the impact that communication with the application server has on the speed of the client application, because execution does not need to wait while messages are marshaled and sent or received. The streamed connection component needs to coordinate its use of the communication thread. To do this, it uses an event object that is a member of the object that implements ITransport.

GetWaitEvent returns a handle to this event object. When implementing an object that supports ITransport, create a TEvent object as a member and return its handle as the return value of GetWaitEvent. Do not use the event object for internal purposes or it will interfere with the streamed connection's use of the event.

See Also

TEvent (see page 22063)

130.1.9.4.3 TSocketTransport.Receive Method

Returns an IDataBlock interface that can be used to read information received from the application server.

Pascal

```
function Receive(WaitForInput: Boolean; Context: Integer): IDataBlock; stdcall;
```

C++

```
__fastcall __stdcall IDataBlock Receive(Boolean WaitForInput, int Context);
```

Description

Receive creates a COM object that implements the IDataBlock interface and reads information from the application server into its Memory property.

If WaitForInput is true, Receive halts execution until the application server sends the expected information. If WaitForInput is false, Receive can fail (reading no information) if the application server does not send any information immediately (or after a brief time-out period).

Context is transport-specific data that can be used when implementing a class that supports ITransport. Its value is the return value of the Send method.

See Also

Memory (see page 18989)

Send (see page 18997)

130.1.9.4.4 TSocketTransport.Send Method

Sends information retrieved from an IDataBlock interface to the application server.

Pascal

```
function Send(const Data: IDataBlock): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Send(const IDataBlock Data);
```

Description

Send sends the entire contents of the Data parameter's Memory property to the application server. It returns a transport-specific value that is used by the next call to the Receive method. For example, HTTP transport classes return the handle for the Internet connection.

See Also

Memory (see page 18989)

Receive (see page 18997)

130.1.9.4.5 TSocketTransport.SetConnected Method

Sets the value of the Connected property.

Pascal

```
procedure SetConnected(Value: Boolean); stdcall;
```

C++

```
__fastcall __stdcall SetConnected(Boolean Value);
```

Description

SetConnected is the write implementer for the Connected property.

130.1.9.5 TSocketTransport Properties

The properties of the TSocketTransport class are listed here.

Public Properties

	Name	Description
	Address (see page 18944)	This is Address, a member of class TSocketTransport.
	Host (see page 18945)	This is Host, a member of class TSocketTransport.
	InterceptGUID (see page 18945)	This is InterceptGUID, a member of class TSocketTransport.
	Port (see page 18945)	This is Port, a member of class TSocketTransport.
	Socket (see page 18945)	This is Socket, a member of class TSocketTransport.

130.1.9.5.1 TSocketTransport.Address Property

Pascal

```
property Address: string;
```

C++

```
__property AnsiString Address;
```

Description

This is Address, a member of class TSocketTransport.

130.1.9.5.2 TSocketTransport.Host Property

Pascal

```
property Host: string;
```

C++

```
__property AnsiString Host;
```

Description

This is Host, a member of class TSocketTransport.

130.1.9.5.3 TSocketTransport.InterceptGUID Property

Pascal

```
property InterceptGUID: string;
```

C++

```
__property AnsiString InterceptGUID;
```

Description

This is InterceptGUID, a member of class TSocketTransport.

130.1.9.5.4 TSocketTransport.Port Property

Pascal

```
property Port: Integer;
```

C++

```
__property int Port;
```

Description

This is Port, a member of class TSocketTransport.

130.1.9.5.5 TSocketTransport.Socket Property

Pascal

```
property Socket: TCustomWinSocket;
```

C++

```
__property TCustomWinSocket Socket;
```

Description

This is Socket, a member of class TSocketTransport.

130.1.10 TStreamedConnection Class

TStreamedConnection is the base class for components that handle their own marshaling of interface calls when connecting to application servers.

Class Hierarchy

Pascal

```
TStreamedConnection = class(TDispatchConnection, ISendDataBlock);
```

C++

```
class TStreamedConnection : public TDispatchConnection, public ISendDataBlock;
```

File

SConnect

Description

Do not create instances of TStreamedConnection. Instead, instantiate a descendant of TStreamedConnection such as TSocketConnection (see page 18928) or TWebConnection (see page 18968).

TStreamedConnection handles the marshaling of all COM data types so that the streamed connection component can generate, interpret, and respond to remote COM interface calls without using DCOM. It uses an ITransport (see page 18995) interface to connect to application servers and to send and receive messages.

TStreamedConnection can't actually connect to or communicate with an application server. Descendants of TStreamedConnection override the CreateTransport (see page 18952) method to obtain an ITransport (see page 18995) interface that enables these behaviors.

TStreamedConnection implements the ISendDataBlock (see page 18993) interface.

See Also

TClientDataSet (see page 8289)

TSocketConnection (see page 18928)

TWebConnection (see page 18968)

TStream (see page 2973)

ITransport (see page 18995)

TRemoteDataModule (see page 6585)

IAppServer (see page 16450)

130.1.10.1 TStreamedConnection Members

The following tables list the members exposed by TStreamedConnection.

Protected Events

	Name	Description
	OnGetUsername (see page 8533)	This is OnGetUsername, a member of class TCustomRemoteServer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 18952)	Increments an internal reference counter.
	_Release (see page 18952)	Decrements an internal reference counter.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreateTransport (see page 18952)	Provides the backstop for a method that obtains an ITransport (see page 18995) interface.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 18953)	Connects to an application server.
V	DoDisconnect (see page 18953)	Disconnects from an application server.
V	DoError (see page 18954)	raises an exception for a specified exception object.
V	GetAppServer (see page 8530)	Returns the value of the AppServer (see page 8532) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetConnected (see page 6865)	Returns the value of the Connected (see page 6868) property.
V	GetConnected (see page 16023)	Returns the value of the Connected (see page 16026) property.
V	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
V	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetInterpreter (see page 18955)	Returns the value of the Interpreter (see page 18960) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetServerCLSID (see page 16024)	Returns the GUID for the application server.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InternalClose (see page 18956)	Terminates a connection to the application server.
V	InternalOpen (see page 18956)	Opens a connection to the application server.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 6866)	Initializes the connection component after all objects in the form or data module have been loaded.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16025)	Responds when other objects are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 18956)	Implements the IUnknown QueryInterface method.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	RegisterClient (see page 6866)	Registers an object that uses the connection component.
	Send (see page 18957)	Sends an interface call to the application server and returns the response.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAppServer (see page 8531)	Sets the AppServer (see page 8532) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetConnected (see page 6867)	Changes the value of the Connected (see page 6868) property.
V	SetConnected (see page 16025)	Sets the Connected (see page 16026) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	ThreadException (see page 18957)	raises an exception for the thread that communicates with the application server.
	ThreadReceivedStream (see page 18957)	Handles callbacks from the application server.
V	UnRegisterClient (see page 6868)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WndProc (see page 18958)	Dispatches messages from the transport layer.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Handle (see page 18959)	Provides access to an internal window handle that can receive messages from the transport layer.
	InterceptGUID (see page 18959)	Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.
	InterceptName (see page 18960)	Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.
R	Interpreter (see page 18960)	Provides access to the helper object that marshals interface calls for the streamed connection.
	ObjectBroker (see page 16028)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.
	SupportCallbacks (see page 18961)	Determines whether the streamed connection component can handle callbacks in the application server interface.

Public Events

	Name	Description
	AfterConnect (see page 6874)	Occurs after a connection is established.
	AfterDisconnect (see page 6875)	Occurs after the connection closes.
	BeforeConnect (see page 6875)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 6875)	Occurs immediately before the connection closes.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.
V	Create (see page 18950)	Creates and initializes an instance of TStreamedConnection (see page 18945).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18951)	Disposes of a TStreamedConnection (see page 18945) instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
V	GetInterceptorList (see page 18954)	Retrieves a list of registered interceptors that can be used to transform messages between the connection component and the application server.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetProviderNames (see page 8530)	Executes a callback for all provider objects on the application server.
V	GetServer (see page 8530)	Returns the IAppServer interface of the application server.
V	GetServer (see page 16023)	Returns the IAppServer interface of the application server.
V	GetServerList (see page 18955)	Retrieves a list of registered data brokers from the remote server system.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AppServer (see page 8532)	Contains the interface for communicating with the application server.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Connected (see page 6868)	Determines whether a connection has been established to the remote source of data.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 6870)	Lists the datasets currently using this connection component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	LoginPrompt (see page 6872)	Specifies whether a login dialog appears immediately before opening a new connection.
	OnLogin (see page 6873)	Occurs when a communication channel opens to the server.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterConnect (see page 16031)	Occurs after a connection is established.
	AfterDisconnect (see page 16031)	Occurs after the connection closes.
	BeforeConnect (see page 16032)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 16032)	Occurs immediately before the connection closes.
	OnGetUsername (see page 16033)	This is OnGetUsername, a member of class TDispatchConnection.

Published Properties

	Name	Description
	Connected (see page 16026)	Indicates whether the TDispatchConnection (see page 16017) object is connected to an application server.
	LoginPrompt (see page 16027)	Specifies whether a login dialog appears immediately before opening a new connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OnLogin (see page 16028)	Occurs when a communication channel opens to the server.
	ServerGUID (see page 16030)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 16030)	Specifies the name of the application server with which to connect.
	Tag (see page 2808)	Stores an integer value as part of a component.

130.1.10.2 TStreamedConnection.Create Constructor

Creates and initializes an instance of TStreamedConnection (see page 18945).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TStreamedConnection(TComponent * AOwner);
```

Description

Call Create to instantiate a streamed connection component at runtime. Connection components placed in forms or data

modules at design time are instantiated automatically.

After calling the inherited constructor, Create instantiates the data block interpreter accessed by the Interpreter (see page 18960) property.

See Also

Interpreter (see page 18960)

Create (see page 8529)

130.1.10.3 TStreamedConnection.Destroy Destructor

Disposes of a TStreamedConnection (see page 18945) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TStreamedConnection();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the streamed connection is not nil, and only then calls Destroy.

Destroy ensures that the connection to the server is closed. It then frees all resources and helper objects before calling the inherited destructor.

See Also

Free (see page 22300)

130.1.10.4 TStreamedConnection Methods

The methods of the TStreamedConnection class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 18952)	Increments an internal reference counter.
	_Release (see page 18952)	Decrements an internal reference counter.
V	CreateTransport (see page 18952)	Provides the backstop for a method that obtains an ITransport (see page 18995) interface.
V	DoConnect (see page 18953)	Connects to an application server.
V	DoDisconnect (see page 18953)	Disconnects from an application server.
V	DoError (see page 18954)	raises an exception for a specified exception object.
V	GetInterpreter (see page 18955)	Returns the value of the Interpreter (see page 18960) property.
V	InternalClose (see page 18956)	Terminates a connection to the application server.
V	InternalOpen (see page 18956)	Opens a connection to the application server.
	QueryInterface (see page 18956)	Implements the IUnknown QueryInterface method.
	Send (see page 18957)	Sends an interface call to the application server and returns the response.
	ThreadException (see page 18957)	raises an exception for the thread that communicates with the application server.
	ThreadReceivedStream (see page 18957)	Handles callbacks from the application server.
	WndProc (see page 18958)	Dispatches messages from the transport layer.

Public Methods

	Name	Description
	GetInterceptorList (see page 18954)	Retrieves a list of registered interceptors that can be used to transform messages between the connection component and the application server.
	GetServerList (see page 18955)	Retrieves a list of registered data brokers from the remote server system.

130.1.10.4.1 TStreamedConnection._AddRef Method

Increments an internal reference counter.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

__AddRef implements the IUnknown interface method, _AddRef, by incrementing an internal reference counter. The reference count is decreased by calling _Release (see page 18952).

See Also

_Release (see page 18952)

QueryInterface (see page 18956)

130.1.10.4.2 TStreamedConnection._Release Method

Decrements an internal reference counter.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

__Release implements the IUnknown interface method, _Release, by decrementing an internal reference counter. The reference count is increased by calling _AddRef (see page 18952)

See Also

_AddRef (see page 18952)

QueryInterface (see page 18956)

130.1.10.4.3 TStreamedConnection.CreateTransport Method

Provides the backstop for a method that obtains an ITransport (see page 18995) interface.

Pascal

```
function CreateTransport: ITransport; virtual;
```

C++

```
virtual __fastcall ITransport CreateTransport();
```

Description

Streamed connection components use an ITransport (see page 18995) interface to connect to and communicate with the application server. As implemented in TStreamedConnection (see page 18945), CreateTransport always returns nil (Delphi) or NULL (C++).

Descendants of TStreamedConnection (see page 18945) override CreateTransport to obtain an ITransport (see page 18995) interface that connects to and communicates with the application server.

Component writers wanting to create connection components for specialized transport protocols need only override CreateTransport. Once the streamed connection has a working ITransport (see page 18995) interface, all other functions of the connection component are handled automatically.

See Also

Send (see page 18957)

DoConnect (see page 18953)

DoDisconnect (see page 18953)

ThreadReceivedStream (see page 18957)

130.1.10.4.4 TStreamedConnection.DoConnect Method

Connects to an application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called internally when the Connected property is set to true. DoConnect creates a separate thread for managing the connection so that communication with the application server does not block execution in the client application. Using the ITransport (see page 18995) interface, DoConnect connects to the application server and sets the value of the AppServer property to its interface.

Note: Descendants of TStreamedConnection (see page 18945) override CreateTransport (see page 18952) rather than DoConnect to change the way the client application forms a connection to application servers.

See Also

AfterConnect (see page 6874)

BeforeConnect (see page 6875)

Connected (see page 16026)

AppServer (see page 8532)

CreateTransport (see page 18952)

130.1.10.4.5 TStreamedConnection.DoDisconnect Method

Disconnects from an application server.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

DoDisconnect is called internally when the Connected property is set to false. Using the ITransport (see page 18995) interface, DoDisconnect drops the connection to the application server.

See Also

Connected (see page 16026)

CreateTransport (see page 18952)

130.1.10.4.6 TStreamedConnection.DoError Method

raises an exception for a specified exception object.

Pascal

```
procedure DoError(E: Exception); virtual;
```

C++

```
virtual __fastcall DoError(Exception E);
```

Description

TStreamedConnection (see page 18945) uses a separate thread when making interface calls to the application server. When that thread encounters an exception, it sends a message to the Window handle specified by the Handle (see page 18959) property. The connection component uses DoError to raise those exceptions.

Note: DoError is called by the ThreadException (see page 18957) method, which is the message handler for thread exceptions. It is also called when thread exception messages are taken from the message queue before they are received by the internal window procedure.

See Also

ThreadException (see page 18957)

Handle (see page 18959)

EInterpreterError (see page 18897)

130.1.10.4.7 TStreamedConnection.GetInterceptorList Method

Retrieves a list of registered interceptors that can be used to transform messages between the connection component and the application server.

Pascal

```
function GetInterceptorList: OleVariant; virtual;
```

C++

```
virtual __fastcall OleVariant GetInterceptorList();
```

Description

Call GetInterceptorList to obtain a list of ProgIDs that can be assigned to the InterceptName (see page 18960) property. GetInterceptorList retrieves a list of all COM objects that have been registered by TPacketInterceptFactory (see page 18925)

as data packet interceptors (objects that support the IDataIntercept (see page 18991) interface that can be used to intercept and transform messages passed between a connection component and an application server.)

GetInterceptorList returns a Variant array of strings. Any of these strings can be used as a valid setting for the InterceptName (see page 18960) property.

At design time, TStreamedConnection (see page 18945) uses the GetInterceptorList method to populate the InterceptName (see page 18960) drop-down in the Object Inspector.

See Also

IDataIntercept (see page 18991)

InterceptName (see page 18960)

InterceptGUID (see page 18959)

TPacketInterceptFactory (see page 18925)

130.1.10.4.8 TStreamedConnection.GetInterpreter Method

Returns the value of the Interpreter (see page 18960) property.

Pascal

```
function GetInterpreter: TCustomDataBlockInterpreter; virtual;
```

C++

```
virtual __fastcall TCustomDataBlockInterpreter GetInterpreter();
```

Description

GetInterpreter is the protected read implementation of the Interpreter (see page 18960) property. As implemented in TStreamedConnection (see page 18945), GetInterpreter instantiates a TDataBlockInterpreter (see page 18913) object.

See Also

Interpreter (see page 18960)

TDataBlockInterpreter (see page 18913)

130.1.10.4.9 TStreamedConnection.GetServerList Method

Retrieves a list of registered data brokers from the remote server system.

Pascal

```
function GetServerList: OleVariant; override;
```

C++

```
virtual __fastcall OleVariant GetServerList();
```

Description

Call GetServerList to obtain a list of servers that are registered on the system to which the streamed connection communicates. GetServerList returns a Variant array of strings. Any of these strings can be used as a valid setting for the ServerName property.

At design time, TStreamedConnection (see page 18945) uses the GetServerList method to populate the ServerName drop-down in the Object Inspector. Note that, unlike COM-based connection components (which populate that list with servers that are registered on the client machine), this results in a list of application servers that are registered on the server machine.

See Also

ServerName (see page 16030)

130.1.10.4.10 TStreamedConnection.InternalClose Method

Terminates a connection to the application server.

Pascal

```
procedure InternalClose; virtual;
```

C++

```
virtual __fastcall InternalClose();
```

Description

Streamed connection components use InternalClose to handle the details of closing a connection to the application server. This method is called by the DoDisconnect (see page 18953) method (which implements the Connected property) and at other times when the connection component must terminate a connection.

See Also

Connected (see page 16026)

DoDisconnect (see page 18953)

130.1.10.4.11 TStreamedConnection.InternalOpen Method

Opens a connection to the application server.

Pascal

```
procedure InternalOpen; virtual;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

Streamed connection components use InternalOpen to handle the details of establishing a connection to the application server. This method is called by the DoConnect (see page 18953) method (which implements the Connected property) and at other times when the connection component must establish a connection.

See Also

Connected (see page 16026)

DoConnect (see page 18953)

130.1.10.4.12 TStreamedConnection.QueryInterface Method

Implements the IUnknown QueryInterface method.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; stdcall; reintroduce;
```

C++

```
__fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface returns a reference to the interface specified by the IID parameter as the Obj parameter. It the streamed connection supports the specified interface, QueryInterface returns 0. If the streamed connection does not support the interface, the Obj parameter is nil (Delphi) or NULL (C++) and QueryInterface returns E_NOINTERFACE.

See Also

_AddRef (see page 18952)

ISendDataBlock

130.1.10.4.13 TStreamedConnection.Send Method

Sends an interface call to the application server and returns the response.

Pascal

```
function Send(const Data: IDataBlock; WaitForResult: Boolean): IDataBlock; stdcall;
```

C++

```
__fastcall __stdcall IDataBlock Send(const IDataBlock Data, Boolean WaitForResult);
```

Description

The data block interpreter (specified by the Interpreter (see page 18960) property) calls Send to dispatch interface messages to the application server. It supplies an IDataBlock (see page 18983) interface that encapsulates the interface from the application server.

Communication with the application server occurs on a separate thread. The WaitForResult parameter indicates whether execution on the main thread should halt until the interface call returns a result (WaitForResult == true), or whether the interface call can occur asynchronously (WaitForResult == false). If WaitForResult is true, Send returns an IDataBlock (see page 18983) interface (_di_IDataBlock in C++) that supplies the result.

See Also

Interpreter (see page 18960)

ThreadReceivedStream (see page 18957)

130.1.10.4.14 TStreamedConnection.ThreadException Method

raises an exception for the thread that communicates with the application server.

Pascal

```
procedure ThreadException(var Message: TMessage); message THREAD_EXCEPTION;
```

C++

```
__fastcall ThreadException(TMessage Message);
```

Description

TStreamedConnection (see page 18945) uses a separate thread when making interface calls to the application server. When that thread encounters an exception, it sends a message to the Window handle specified by the Handle (see page 18959) property. ThreadException is the message handler for that Windows message. It raises an exception in the main execution thread.

See Also

Handle (see page 18959)

130.1.10.4.15 TStreamedConnection.ThreadReceivedStream Method

Handles callbacks from the application server.

Pascal

```
procedure ThreadReceivedStream(var Message: TMessage); message THREAD_RECEIVEDSTREAM;
```

C++

```
__fastcall ThreadReceivedStream(TMessage Message);
```

Description

TStreamedConnection (see page 18945) uses a separate thread for interface calls to and from the application server. When the application server calls a client application interface, that thread sends a message to the Window handle specified by the Handle (see page 18959) property. ThreadReceivedStream is the message handler for the Windows message from the application server.

ThreadReceivedStream passes the interface call to the data block interpreter specified by the Interpreter (see page 18960) property.

See Also

Handle (see page 18959)

Interpreter (see page 18960)

130.1.10.4.16 TStreamedConnection.WndProc Method

Dispatches messages from the transport layer.

Pascal

```
procedure WndProc(var Message: TMessage);
```

C++

```
__fastcall WndProc(TMessage Message);
```

Description

TStreamedConnection (see page 18945) uses a separate thread for interface calls to and from the application server. That thread communicates with the streamed connection component by sending Windows messages to the handle specified by the Handle (see page 18959) property. WndProc is the window procedure associated with that Window handle. It dispatches any messages that have message handlers such as ThreadException (see page 18957) or ThreadReceivedStream (see page 18957). All other messages are ignored.

See Also

Handle (see page 18959)

ThreadException (see page 18957)

ThreadReceivedStream (see page 18957)

130.1.10.5 TStreamedConnection Properties

The properties of the TStreamedConnection class are listed here.

Protected Properties

	Name	Description
R	Handle (see page 18959)	Provides access to an internal window handle that can receive messages from the transport layer.
	InterceptGUID (see page 18959)	Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.

	InterceptName (see page 18960)	Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.
R	Interpreter (see page 18960)	Provides access to the helper object that marshals interface calls for the streamed connection.
	SupportCallbacks (see page 18961)	Determines whether the streamed connection component can handle callbacks in the application server interface.

130.1.10.5.1 TStreamedConnection.Handle Property

Provides access to an internal window handle that can receive messages from the transport layer.

Pascal

```
property Handle: THandle;
```

C++

```
__property THandle Handle;
```

Description

Streamed connection components perform all reading from and writing to the application server using a separate execution thread. This limits the impact that communication with the application server has on the speed of the client application, because execution does not need to wait while messages are marshaled and sent or received.

The internal thread that handles these communication tasks uses Windows messages to coordinate events. TStreamedConnection (see page 18945) uses the Handle property to provide this internal thread with a window handle that it can use.

See Also

WndProc (see page 18958)

ThreadReceivedStream (see page 18957)

ThreadException (see page 18957)

130.1.10.5.2 TStreamedConnection.InterceptGUID Property

Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.

Pascal

```
property InterceptGUID: string;
```

C++

```
__property AnsiString InterceptGUID;
```

Description

Set InterceptGUID to the GUID of a COM object that intercepts messages between the connection component and an application server before they are sent and after they are received.

The COM object must implement the IDataIntercept (see page 18991) interface. Use the IDataIntercept (see page 18991) methods to manipulate the data that is communicated using the socket connection. For example, applications can use these methods to encrypt and decrypt data or to compress and decompress data.

Tip: To specify the COM object that intercepts messages using a ProgID instead of a GUID, use the InterceptName (see page 18960) property instead.

Note: When using InterceptGUID, the server must use the same COM object to undo the transformation performed by the

socket connection component's InterceptGUID. For servers that respond to TSocketConnection (see page 18928), you can set the server's InterceptGUID to the same GUID using the Socket server dialog of ScktSrvr.exe.

InterceptName (see page 18960)

GetInterceptorList (see page 18954)

Specifying a Connection Using Sockets

130.1.10.5.3 TStreamedConnection.InterceptName Property

Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.

Pascal

```
property InterceptName: string;
```

C++

```
__property AnsiString InterceptName;
```

Description

Set InterceptName to the programmatic ID (ProgID) of a COM object that intercepts messages between the connection component and an application server before they are sent and after they are received.

Note: In Delphi, you can choose the ProgID of any COM objects that have been registered to perform this task at Design time, using a drop-down list in the Object Inspector, if they use TPacketInterceptFactory (see page 18925) as a class factory.

The COM object must implement the IDataIntercept (see page 18991) interface. Use the IDataIntercept (see page 18991) methods to manipulate the data that is communicated using the socket connection. For example, applications can use these methods to encrypt and decrypt data or to compress and decompress data.

Tip: To specify the COM object that intercepts messages using a GUID instead of a ProgID, use the InterceptGUID (see page 18959) property instead.

Note: When using InterceptName, the server must use the same COM object to undo the transformation performed by the socket connection component's InterceptName. For servers that respond to TSocketConnection (see page 18928), you can set the COM object that the server uses with the Socket server dialog of ScktSrvr.exe.

IDataIntercept (see page 18991)

InterceptGUID (see page 18959)

GetInterceptorList (see page 18954)

TPacketInterceptFactory (see page 18925)

Specifying a Connection Using Sockets

130.1.10.5.4 TStreamedConnection.Interpreter Property

Provides access to the helper object that marshals interface calls for the streamed connection.

Pascal

```
property Interpreter: TCustomDataBlockInterpreter;
```

C++

```
__property TCustomDataBlockInterpreter Interpreter;
```

Description

Streamed connection components use a data block interpreter internally to provide marshaling support.

See Also

Send (see page 18957)

130.1.10.5.5 TStreamedConnection.SupportCallbacks Property

Determines whether the streamed connection component can handle callbacks in the application server interface.

Pascal

```
property SupportCallbacks: Boolean;
```

C++

```
__property Boolean SupportCallbacks;
```

Description

Use SupportCallbacks to indicate whether the connection component can marshal callback functions in the application server's interface. When SupportCallbacks is true, the connection component can marshal calls from the application server to the client application over an interface supplied as a callback.

For TSocketConnection (see page 18928), callbacks are optional. Set SupportCallbacks to true if you are using callbacks as part of the application server's interface. When SupportCallbacks is true, the socket connection component requires WinSock2. Set SupportCallbacks to false if you are not using callback functions and want to eliminate the dependency on WinSock2.

TWebConnection (see page 18968) can't support callback functions. It initializes SupportCallbacks to false in the constructor and never changes this value.

130.1.11 TTransportThread Class

Class Hierarchy

Pascal

```
TTransportThread = class(TThread);
```

C++

```
class TTransportThread : public TThread;
```

File

SConnect

Description

This is class SConnect.TTransportThread.

130.1.11.1 TTransportThread Members

The following tables list the members exposed by TTransportThread.

Protected Methods

	Name	Description
	CheckThreadError (see page 3114)	This is the overview for the CheckThreadError method overload.
V	DoTerminate (see page 3115)	Generates an OnTerminate (see page 3148) event.

Protected Properties

	Name	Description
	ReturnValue (see page 3141)	Specifies the value returned to other waiting threads when the thread finishes executing.
R	Terminated (see page 3142)	Indicates whether the thread has been asked to terminate.

Public Events

	Name	Description
	OnTerminate (see page 3148)	Occurs after the thread's Execute (see page 3115) method has returned and before the thread is destroyed.

Public Methods

	Name	Description
V	AfterConstruction (see page 3114)	Executes the thread when the thread is created with CreateSuspended set to false.
V	Create (see page 18963)	This is Create, a member of class TTransportThread.
V	Destroy (see page 18963)	Destroys the thread object and releases the memory allocated to it.
V	Execute (see page 18963)	Provides an abstract or pure virtual method to contain the code which executes when the thread is run.
	Queue (see page 3119)	This is the overview for the Queue method overload.
	RemoveQueuedEvents (see page 3120)	Remove queued method calls.
	Resume (see page 3120)	Restarts the execution of a suspended thread.
	StaticQueue (see page 3124)	Asynchronously executes a method call within the main thread.
	StaticSynchronize (see page 3125)	Executes a method call within the main thread.
	Suspend (see page 3125)	Pauses a running thread.
	Synchronize (see page 3126)	This is the overview for the Synchronize method overload.
	Terminate (see page 3126)	Signals the thread to terminate by setting the Terminated (see page 3142) property to true.
	WaitFor (see page 3132)	Waits for the thread to terminate and then returns the value of the ReturnValue (see page 3141) property.

Public Properties

	Name	Description
R	FatalException (see page 3133)	Determines whether the thread object is automatically destroyed when the thread terminates.
	FreeOnTerminate (see page 3134)	Determines whether the thread object is automatically destroyed when the thread terminates.
R	Handle (see page 3137)	Indicates the thread's handle (Windows only).
	Priority (see page 3138)	Determines the thread's scheduling priority relative to other threads in the process.
R	Semaphore (see page 18967)	This is Semaphore, a member of class TTransportThread.
	Suspended (see page 3142)	Indicates whether a thread is suspended.
R	ThreadID (see page 3148)	Identifies the thread throughout the system.

130.1.11.2 TTransportThread.Create Constructor

Pascal

```
constructor Create(AHandle: THandle; Transport: ITransport); virtual;
```

C++

```
virtual __fastcall TTransportThread(THandle AHandle, ITransport Transport);
```

Description

This is Create, a member of class TTransportThread.

130.1.11.3 TTransportThread.Destroy Destructor

Destroys the thread object and releases the memory allocated to it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TTransportThread();
```

Description

Do not call Destroy in an application. Instead, use Free to destroy a thread when FreeOnTerminate is False.

Destroy signals the thread to terminate and then waits for the thread to return before calling the inherited Destroy method.

See Also

Create (see page 3110)

Terminate (see page 3126)

WaitFor (see page 3132)

FreeOnTerminate (see page 3134)

Free (see page 22300)

130.1.11.4 TTransportThread Methods

The methods of the TTransportThread class are listed here.

Public Methods

	Name	Description
	Execute (see page 18963)	Provides an abstract or pure virtual method to contain the code which executes when the thread is run.

130.1.11.4.1 TTransportThread.Execute Method

Provides an abstract or pure virtual method to contain the code which executes when the thread is run.

Pascal

```
procedure Execute; override;
```

C++

```
virtual __fastcall Execute();
```

Description

Override Execute and insert the code that should be executed when the thread runs. Execute is responsible for checking the value of the Terminated property to determine if the thread needs to exit.

A thread executes when Create is called if CreateSuspended set to false, or when Resume is first called after the thread is created if CreateSuspended set to true.

Note: Do not use the properties and methods of other objects directly in the Execute method of a thread. Instead, separate the use of other objects into a separate procedure call, and call that procedure by passing it as a parameter to the Synchronize method.

C++ Examples:

```
/*
This example shows how to create a thread and start it
running at a lower priority than the main execution thread.
Set the thread's FreeOnTerminate property is True, so that
there is no need to free the thread when it finishes. To
create the extension choose the
File | New | Other | Thread Object menu.
*/
bool mythreadRunning;
bool youthreadRunning;

class TMyThread : public TThread
{
__published:    // IDE-managed Components
private:    // User declarations
protected:  // User declarations
    void __fastcall Execute();
public:     // User declarations
    __fastcall TMyThread(bool suspended);
};

__fastcall TMyThread::TMyThread(bool suspended)
    : TThread(suspended)
{
}

class TYouThread : public TThread
{
__published:    // IDE-managed Components
private:    // User declarations
protected:  // User declarations
    void __fastcall Execute();
public:     // User declarations
    __fastcall TYouThread(bool suspended);
};

130.1.11.5 TTransportThread Properties

The properties of the TTransportThread class are listed here.

Public Properties

	Name	Description
R	Semaphore (see page 18967)	This is Semaphore, a member of class TTransportThread.

130.1.11.5.1 TTransportThread.Semaphore Property

Pascal

```
property Semaphore: THandle;
```

C++

```
__property THandle Semaphore;
```

Description

This is Semaphore, a member of class TTransportThread.

130.1.12 TWebConnection Class

TWebConnection uses HTTP to manage the connection to an application server.

Class Hierarchy

Pascal

```
TWebConnection = class(TStreamedConnection, ITransport);
```

C++

```
class TWebConnection : public TStreamedConnection, public ITransport;
```

File

SConnect

Description

TWebConnection is used in the client portion of a multi-tiered database application to establish and maintain the connection between the client and a remote application server. The Web connection object can

Establish an initial connection to a remote application server.

Obtain an IAppServer for the application server.

Obtain a list of providers on the application server.

Drop the connection to the remote application server.

TWebConnection establishes the initial connection between the client application and a remote application server using HTTP. To use TWebConnection, you must have the following:

Wininet.dll must be installed on the client system. Wininet.dll is found in the Windows system directory if you have IE3 or higher installed.

The server system must have IIS version 4 or better or Netscape Enterprise version 3.6 or better.

HTTPsrvr.dll must be installed with the Web server to which TWebConnection forms a connection. HTTPsrvr.dll launches the application server and marshals all calls to the application server interface.

Once the connection is established, the client registers any or all of its client datasets, and these client datasets use the IAppServer interface from the Web connection component to communicate with providers on the application server, or to otherwise call the application server's data module interface.

To connect to remote application servers using DCOM, use the TDCOMConnection component instead. To connect to remote application servers using TCP/IP, use the TSocketConnection (see page 18928) component instead. To connect to remote application servers using SOAP, use the TSoapConnection component.

Extending the Interface of the Application Server

Specifying a Connection Using HTTP

130.1.12.1 TWebConnection Members

The following tables list the members exposed by TWebConnection.

Protected Events

	Name	Description
	OnGetUsername (see page 8533)	This is OnGetUsername, a member of class TCustomRemoteServer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_AddRef (see page 18952)	Increments an internal reference counter.
	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 18952)	Decrements an internal reference counter.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreateTransport (see page 18974)	Provides the backstop for a method that obtains an ITransport interface.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 18975)	Connects to an application server.
V	DoDisconnect (see page 6864)	Provides the interface for a method that terminates the connection.
V	DoDisconnect (see page 16023)	Drops a connection to an application server.
V	DoDisconnect (see page 18953)	Disconnects from an application server.
V	DoError (see page 18954)	raises an exception for a specified exception object.
V	GetAppServer (see page 8530)	Returns the value of the AppServer (see page 8532) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetConnected (see page 6865)	Returns the value of the Connected (see page 6868) property.
V	GetConnected (see page 16023)	Returns the value of the Connected (see page 16026) property.
V	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
V	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInterpreter (see page 18975)	Returns the value of the Interpreter property.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetServerCLSID (see page 16024)	Returns the GUID for the application server.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWaitEvent (see page 18976)	Returns the handle for an event object that is managed by the object that implements ITransport.
	InternalClose (see page 18956)	Terminates a connection to the application server.
	InternalOpen (see page 18956)	Opens a connection to the application server.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 6866)	Initializes the connection component after all objects in the form or data module have been loaded.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 16025)	Responds when other objects are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	QueryInterface (see page 18956)	Implements the IUnknown QueryInterface method.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	Receive (see page 18976)	Returns an IDataBlock interface that can be used to read information received from the application server.
	RegisterClient (see page 6866)	Registers an object that uses the connection component.
	Send (see page 18977)	Sends information retrieved from an IDataBlock interface to the application server.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppServer (see page 8531)	Sets the AppServer (see page 8532) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnected (see page 18977)	Sets the Connected property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	ThreadException (see page 18957)	raises an exception for the thread that communicates with the application server.
	ThreadReceivedStream (see page 18957)	Handles callbacks from the application server.
	Transport_GetConnected (see page 18978)	This is Transport_GetConnected, a member of class TWebConnection.
	Transport_SetConnected (see page 18978)	This is Transport_SetConnected, a member of class TWebConnection.
	UnRegisterClient (see page 6868)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
