	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WndProc (see page 18958)	Dispatches messages from the transport layer.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Handle (see page 18959)	Provides access to an internal window handle that can receive messages from the transport layer.
	InterceptGUID (see page 18959)	Specifies the GUID of a COM object that manipulates interface calls before they are sent or after return values are received.
	InterceptName (see page 18960)	Specifies the ProgID of a COM object that manipulates interface calls before they are sent or after return values are received.
R	Interpreter (see page 18960)	Provides access to the helper object that marshals interface calls for the streamed connection.
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.
	SupportCallbacks (see page 18981)	Determines whether the streamed connection component can handle callbacks in the application server interface.

Public Events

	Name	Description
	AfterConnect (see page 6874)	Occurs after a connection is established.
	AfterDisconnect (see page 6875)	Occurs after the connection closes.
	BeforeConnect (see page 6875)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 6875)	Occurs immediately before the connection closes.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.
V	Create (see page 18973)	Creates and initializes an instance of TWebConnection (see page 18968).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 18974)	Destroys an instance of TWebConnection (see page 18968).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.

	GetConnected (see page 18996)	Returns the value of the Connected (see page 18998) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
V	GetInterceptorList (see page 18954)	Retrieves a list of registered interceptors that can be used to transform messages between the connection component and the application server.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetProviderNames (see page 8530)	Executes a callback for all provider objects on the application server.
V	GetServer (see page 8530)	Returns the IAppServer interface of the application server.
V	GetServer (see page 16023)	Returns the IAppServer interface of the application server.
V	GetServerList (see page 8531)	Returns a list of application servers (remote data modules) to which the component can connect.
V	GetServerList (see page 16024)	Returns a list of remote data modules to which the component can connect.
V	GetServerList (see page 18955)	Retrieves a list of registered data brokers from the remote server system.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AppServer (see page 8532)	Contains the interface for communicating with the application server.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Connected (see page 6868)	Determines whether a connection has been established to the remote source of data.
	Connected (see page 18998)	Indicates whether the connection to the application server is established.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 6870)	Lists the datasets currently using this connection component.

	DesignInfo (see page 2805)	Contains information used by the Form designer.
	LoginPrompt (see page 6872)	Specifies whether a login dialog appears immediately before opening a new connection.
	OnLogin (see page 6873)	Occurs when a communication channel opens to the server.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterConnect (see page 16031)	Occurs after a connection is established.
	AfterDisconnect (see page 16031)	Occurs after the connection closes.
	BeforeConnect (see page 16032)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 16032)	Occurs immediately before the connection closes.
	OnGetUsername (see page 16033)	This is OnGetUsername, a member of class TDispatchConnection.

Published Properties

	Name	Description
	Agent (see page 18979)	Provides the value of the User-Agent header for HTTP messages to the server.
	Connected (see page 16026)	Indicates whether the TDispatchConnection (see page 16017) object is connected to an application server.
	LoginPrompt (see page 16027)	Specifies whether a login dialog appears immediately before opening a new connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ObjectBroker (see page 18979)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	OnLogin (see page 16028)	Occurs when a communication channel opens to the server.
	Password (see page 18980)	Specifies the password that allows the client application to log on to the application server.
	Proxy (see page 18980)	Lists any proxy servers that are required to make the connection.
	ProxyByPass (see page 18980)	Lists the host names of locally registered servers that do not require a proxy.
	ServerGUID (see page 16030)	Specifies the GUID of the application server with which to connect.
	ServerName (see page 16030)	Specifies the name of the application server with which to connect.
	Tag (see page 2808)	Stores an integer value as part of a component.
	URL (see page 18981)	Specifies the Uniform Resource Locator for httpsrvr.dll on the server system.
	UserName (see page 18982)	Specifies the user name that allows the client application to log on to the application server.

130.1.12.2 TWebConnection.Create Constructor

Creates and initializes an instance of TWebConnection (see page 18968).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebConnection(TComponent * AOwner);
```

Description

Call Create to instantiate a TWebConnection (see page 18968) object at runtime. Web connection components added to forms or data modules at design time are created automatically.

The AOwner parameter specifies the component (usually a form or data module) that is responsible for freeing the Web connection component.

See Also

Create (see page 18950)

Owner (see page 2807)

130.1.12.3 TWebConnection.Destroy Destructor

Destroys an instance of TWebConnection (see page 18968).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebConnection();
```

Description

Do not call Destroy directly in an application. Instead, use the Free method, which checks that the Web connection is not nil before calling Destroy.

130.1.12.4 TWebConnection Methods

The methods of the TWebConnection class are listed here.

Protected Methods

	Name	Description
	CreateTransport (see page 18974)	Provides the backstop for a method that obtains an ITransport interface.
	DoConnect (see page 18975)	Connects to an application server.
	GetInterpreter (see page 18975)	Returns the value of the Interpreter property.
	GetWaitEvent (see page 18976)	Returns the handle for an event object that is managed by the object that implements ITransport.
	Receive (see page 18976)	Returns an IDataBlock interface that can be used to read information received from the application server.
	Send (see page 18977)	Sends information retrieved from an IDataBlock interface to the application server.
	SetConnected (see page 18977)	Sets the Connected property.
	Transport_GetConnected (see page 18978)	This is Transport_GetConnected, a member of class TWebConnection.
	Transport_SetConnected (see page 18978)	This is Transport_SetConnected, a member of class TWebConnection.

130.1.12.4.1 TWebConnection.CreateTransport Method

Provides the backstop for a method that obtains an ITransport interface.

Pascal

```
function CreateTransport: ITransport; override;
```

C++

```
virtual __fastcall ITransport CreateTransport();
```

Description

Streamed connection components use an ITransport interface to connect to and communicate with the application server. As implemented in TStreamedConnection, CreateTransport always returns nil (Delphi) or NULL (C++).

Descendants of TStreamedConnection override CreateTransport to obtain an ITransport interface that connects to and communicates with the application server.

Component writers wanting to create connection components for specialized transport protocols need only override CreateTransport. Once the streamed connection has a working ITransport interface, all other functions of the connection component are handled automatically.

See Also

Send (see page 18957)

DoConnect (see page 18953)

DoDisconnect (see page 18953)

ThreadReceivedStream (see page 18957)

130.1.12.4.2 TWebConnection.DoConnect Method

Connects to an application server.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

DoConnect is called internally when the Connected property is set to true. DoConnect creates a separate thread for managing the connection so that communication with the application server does not block execution in the client application. Using the ITransport interface, DoConnect connects to the application server and sets the value of the AppServer property to its interface.

Note: Descendants of TStreamedConnection override CreateTransport rather than DoConnect to change the way the client application forms a connection to application servers.

See Also

AfterConnect (see page 6874)

BeforeConnect (see page 6875)

Connected (see page 16026)

AppServer (see page 8532)

CreateTransport (see page 18952)

130.1.12.4.3 TWebConnection.GetInterpreter Method

Returns the value of the Interpreter property.

Pascal

```
function GetInterpreter: TCustomDataBlockInterpreter; override;
```

C++

```
virtual __fastcall TCustomDataBlockInterpreter GetInterpreter();
```

Description

GetInterpreter is the protected read implementation of the Interpreter property. As implemented in TStreamedConnection, GetInterpreter instantiates a TDataBlockInterpreter object.

See Also

Interpreter (see page 18960)

TDataBlockInterpreter (see page 18913)

130.1.12.4.4 TWebConnection.GetWaitEvent Method

Returns the handle for an event object that is managed by the object that implements ITransport.

Pascal

```
function GetWaitEvent: THandle; stdcall;
```

C++

```
__fastcall __stdcall THandle GetWaitEvent();
```

Description

Streamed connection components perform all reading from and writing to the application server using a separate execution thread. This limits the impact that communication with the application server has on the speed of the client application, because execution does not need to wait while messages are marshaled and sent or received. The streamed connection component needs to coordinate its use of the communication thread. To do this, it uses an event object that is a member of the object that implements ITransport.

GetWaitEvent returns a handle to this event object. When implementing an object that supports ITransport, create a TEvent object as a member and return its handle as the return value of GetWaitEvent. Do not use the event object for internal purposes or it will interfere with the streamed connection's use of the event.

See Also

TEvent (see page 22063)

130.1.12.4.5 TWebConnection.Receive Method

Returns an IDataBlock interface that can be used to read information received from the application server.

Pascal

```
function Receive(WaitForInput: Boolean; Context: Integer): IDataBlock; stdcall;
```

C++

```
__fastcall __stdcall IDataBlock Receive(Boolean WaitForInput, int Context);
```

Description

Receive creates a COM object that implements the IDataBlock interface and reads information from the application server into its Memory property.

If WaitForInput is true, Receive halts execution until the application server sends the expected information. If WaitForInput is false, Receive can fail (reading no information) if the application server does not send any information immediately (or after a brief time-out period).

Context is transport-specific data that can be used when implementing a class that supports ITransport. Its value is the return value of the Send method.

See Also

Memory (see page 18989)

Send (see page 18997)

130.1.12.4.6 TWebConnection.Send Method

Sends information retrieved from an IDataBlock interface to the application server.

Pascal

```
function Send(const Data: IDataBlock): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Send(const IDataBlock Data);
```

Description

Send sends the entire contents of the Data parameter's Memory property to the application server. It returns a transport-specific value that is used by the next call to the Receive method. For example, HTTP transport classes return the handle for the Internet connection.

See Also

Memory (see page 18989)

Receive (see page 18997)

130.1.12.4.7 TWebConnection.SetConnected Method

Sets the Connected property.

Pascal

```
procedure SetConnected(Value: Boolean); override;
```

C++

```
virtual __fastcall SetConnected(Boolean Value);
```

Description

SetConnected is the protected implementation of the Connected property. It establishes a connection to the Application server if Value is true, and disconnects from the application server if Value is false.

If Value is false, SetConnected generates a BeforeDisconnect event, closes the connection, and generates an AfterDisconnect event.

If Value is true, SetConnected performs the following actions:

1. If LoginPrompt is true, and the connection is not already open, SetConnected generates an OnGetUsername event, and uses that to initialize a login dialog. It displays the login dialog, and aborts the connection if the user cancels.
2. It generates a BeforeConnect event.
3. It opens the connection.
4. It generates an AfterConnect event.
5. If LoginPrompt is true, and the connection opened successfully, SetConnected generates an OnLogin event.

See Also

Connected (see page 16026)

BeforeConnect (see page 6875)

AfterConnect (see page 6874)

BeforeDisconnect (see page 6875)

AfterDisconnect (see page 6875)

LoginPrompt (see page 6872)

OnGetUserName (see page 8533)

OnLogin (see page 6873)

130.1.12.4.8 TWebConnection.Transport_GetConnected Method

Pascal

```
function Transport_GetConnected: Boolean; stdcall;
```

C++

```
__fastcall __stdcall Boolean Transport_GetConnected();
```

Description

This is Transport_GetConnected, a member of class TWebConnection.

130.1.12.4.9 TWebConnection.Transport_SetConnected Method

Pascal

```
procedure Transport_SetConnected(Value: Boolean); stdcall;
```

C++

```
__fastcall __stdcall Transport_SetConnected(Boolean Value);
```

Description

This is Transport_SetConnected, a member of class TWebConnection.

130.1.12.5 TWebConnection Properties

The properties of the TWebConnection class are listed here.

Protected Properties

	Name	Description
	SupportCallbacks (see page 18981)	Determines whether the streamed connection component can handle callbacks in the application server interface.

Published Properties

	Name	Description
	Agent (see page 18979)	Provides the value of the User-Agent header for HTTP messages to the server.
	ObjectBroker (see page 18979)	Specifies an Object Broker that allows the connection component to choose from several application servers.
	Password (see page 18980)	Specifies the password that allows the client application to log on to the application server.
	Proxy (see page 18980)	Lists any proxy servers that are required to make the connection.
	ProxyByPass (see page 18980)	Lists the host names of locally registered servers that do not require a proxy.
	URL (see page 18981)	Specifies the Uniform Resource Locator for httpsrvr.dll on the server system.
	UserName (see page 18982)	Specifies the user name that allows the client application to log on to the application server.

130.1.12.5.1 TWebConnection.Agent Property

Provides the value of the User-Agent header for HTTP messages to the server.

Pascal

```
property Agent: string;
```

C++

```
__property AnsiString Agent;
```

Description

Use Agent to supply HTTP messages generated by the Web connection component with the name of your application. This name is included as a User-Agent header. The User-Agent header is an optional string that describes the application generating the HTTP message.

See Also

Title (see page 13723)

130.1.12.5.2 TWebConnection.ObjectBroker Property

Specifies an Object Broker that allows the connection component to choose from several application servers.

Pascal

```
property ObjectBroker: TCustomObjectBroker;
```

C++

```
__property TCustomObjectBroker ObjectBroker;
```

Description

Set ObjectBroker to use a broker that maintains a list of servers that support the application specified by ServerName or ServerGUID. When the connection component needs to open a connection, it requests information to identify a server machine from the Object Broker.

Descendants of TDispatchConnection define properties that specify how to locate server machines. These properties are not saved with the connection component if the ObjectBroker property is set. Instead, the Object Broker provides this information dynamically at runtime from its list of available servers.

Applications can use TSimpleObjectBroker for an object broker, or derive their own object brokers from TCustomObjectBroker.

See Also

DoConnect (see page 6864)

ServerName (see page 16030)

ServerGUID (see page 16030)

TSimpleObjectBroker (see page 17877)

Brokering Connections

Specifying a Connection Using HTTP

Specifying a Connection Using DCOM

Specifying a Connection Using Sockets

Using TSimpleObjectBroker

130.1.12.5.3 TWebConnection.Password Property

Specifies the password that allows the client application to log on to the application server.

Pascal

```
property Password: string;
```

C++

```
__property AnsiString Password;
```

Description

When the Web connection component connects to the application server, it supplies the values of the UserName (see page 18982) and Password properties so that it can log on to the host or proxy. The value of Password can be an empty string if neither the host nor proxy requires authentication.

See Also

UserName (see page 18982)

Specifying a Connection Using HTTP

130.1.12.5.4 TWebConnection.Proxy Property

Lists any proxy servers that are required to make the connection.

Pascal

```
property Proxy: string;
```

C++

```
__property AnsiString Proxy;
```

Description

Use Proxy if the Web connection component can't resolve the value of Host locally. If the server is registered locally, Proxy can be a null string. Otherwise, Proxy lists the host names of any proxy servers that can forward request messages on to the intended server machine.

See Also

ProxyByPass (see page 18980)

130.1.12.5.5 TWebConnection.ProxyByPass Property

Lists the host names of locally registered servers that do not require a proxy.

Pascal

```
property ProxyByPass: string;
```

C++

```
__property AnsiString ProxyByPass;
```

Description

Use ProxyByPass to indicate any server systems to which the Web connection component can make a direct connection. When the Host property specifies a server in this list, the Web connection component makes a direct connection even if the Proxy (see page 18980) property is specified.

When ProxyByPass is an empty string, the Web connection component checks the registry for any locally known servers and

bypasses the proxy server if Host refers to a registered local server.

See Also

Proxy (see page 18980)

130.1.12.5.6 TWebConnection.SupportCallbacks Property

Determines whether the streamed connection component can handle callbacks in the application server interface.

Pascal

```
property SupportCallbacks: Boolean;
```

C++

```
__property Boolean SupportCallbacks;
```

Description

Use SupportCallbacks to indicate whether the connection component can marshal callback functions in the application server's interface. When SupportCallbacks is true, the connection component can marshal calls from the application server to the client application over an interface supplied as a callback.

For TSocketConnection, callbacks are optional. Set SupportCallbacks to true if you are using callbacks as part of the application server's interface. When SupportCallbacks is true, the socket connection component requires WinSock2. Set SupportCallbacks to false if you are not using callback functions and want to eliminate the dependency on WinSock2.

TWebConnection can't support callback functions. It initializes SupportCallbacks to false in the constructor and never changes this value.

See Also

Send (see page 18957)

Extending the Interface of the Application Server

130.1.12.5.7 TWebConnection.URL Property

Specifies the Uniform Resource Locator for httpsrvr.dll on the server system.

Pascal

```
property URL: string;
```

C++

```
__property AnsiString URL;
```

Description

Use URL to specify the Uniform Resource Locator that the Web connection component uses to locate httpsrvr.dll. This DLL, which ships in the BIN directory, is deployed on the same machine as the Web server so that it can accept HTTP request messages and convert them into COM calls that communicate with the application server.

URL includes the protocol (http or https), host name, and scriptname for httpsrvr.dll. Typically, it has the form

```
http://DataHost.org/scripts/httpsrvr.dll
```

Note: URL is a standard Uniform Resource Locator. As such, you can also use it to override the port associated with http (80) or https (443) if the Web server is configured differently. The port number follows the host name, preceded by a colon.

See Also

Specifying a Connection Using HTTP

130.1.12.5.8 TWebConnection.UserName Property

Specifies the user name that allows the client application to log on to the application server.

Pascal

```
property UserName: string;
```

C++

```
__property AnsiString UserName;
```

Description

When the Web connection component connects to the application server on a local host or to the proxy server, it supplies the values of the UserName and Password (see page 18980) properties so that it can log in. If neither the host nor the proxy server requires authentication, UserName can be an empty string.

See Also

Password (see page 18980)

Specifying a Connection Using HTTP

130.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IDataBlock (see page 18983)	IDataBlock is the interface used by data block interpreters to access memory buffers.
	IDataIntercept (see page 18991)	IDataIntercept is the interface used by TSocketConnection (see page 18928) components to transform data that is communicated over the connection.
	ISendDataBlock (see page 18993)	ISendDataBlock is the interface used by data block interpreters to send messages to an application server after they are marshaled.
	ITransport (see page 18995)	ITransport is the interface used by TStreamedConnection (see page 18945) to connect to, read from, and write to a remote application server.

130.2.1 IDataBlock Interface

IDataBlock is the interface used by data block interpreters to access memory buffers.

Class Hierarchy

Pascal

```
IDataBlock = interface(IUnknown);
```

C++

```
__interface IDataBlock : public IUnknown;
```

File

SConnect

Description

Data block interpreters uses IDataBlock when marshaling COM interface calls. Streamed connection components send data obtained from IDataBlock to an application server once the data block interpreter has filled its memory by marshaling interface calls. They also read data from the application server into IDataBlock and pass it to a data block interpreter for marshaling.

IDataBlock is an interface, and as such can't be directly instantiated. Instead, objects that implement the IDataBlock properties and methods include IDataBlock in their class definition (Delphi) or be derived from IDataBlock (C++). Such objects can be cast to an IDataBlock so that they can be used by data block interpreters.

Note: C++ method declarations that use IDataBlock use the _di_IDataBlock type instead. This is a DelphiInterface wrapper around the IDataBlock interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IDataBlock >  _di_IDataBlock;
```

TCustomDataBlockInterpreter (see page 18898)

TStreamedConnection (see page 18945)

130.2.1.1 IDataBlock Members

The following tables list the members exposed by IDataBlock.

Public Methods

	Name	Description
	Clear (see page 18984)	Removes all data from Memory (see page 18989) except for the reserved bytes.
	GetBytesReserved (see page 18985)	Returns the value of the BytesReserved (see page 18989) property.
	GetMemory (see page 18985)	Returns the value of the Memory (see page 18989) property.
	GetSignature (see page 18985)	Returns the value of the Signature (see page 18990) property.
	GetSize (see page 18986)	Returns the value of the Size (see page 18990) property.
	GetStream (see page 18986)	Returns the value of the Stream (see page 18991) property.
	IgnoreStream (see page 18986)	Informs the data block when its stream is invalidated.
	InitData (see page 18987)	Adds data to the data block.
	Read (see page 18987)	Reads a specified number of bytes into a buffer.
	SetSignature (see page 18988)	Sets the value of the Signature (see page 18990) property.
	SetSize (see page 18988)	Sets the value of the Size (see page 18990) property.
	Write (see page 18988)	Writes a specified number of bytes from a buffer.

Public Properties

	Name	Description
R	BytesReserved (see page 18989)	Indicates the number of bytes from Memory (see page 18989) that are reserved for internal use.
R	Memory (see page 18989)	Points to a buffer from which data is read or to which data is written.
	Signature (see page 18990)	Indicates the contents of the data block.
	Size (see page 18990)	Indicates the size of the data in the memory buffer.
R	Stream (see page 18991)	Provides access to an internal stream that contains the data block's memory.

130.2.1.2 IDataBlock Methods

The methods of the IDataBlock class are listed here.

Public Methods

	Name	Description
	Clear (see page 18984)	Removes all data from Memory (see page 18989) except for the reserved bytes.
	GetBytesReserved (see page 18985)	Returns the value of the BytesReserved (see page 18989) property.
	GetMemory (see page 18985)	Returns the value of the Memory (see page 18989) property.
	GetSignature (see page 18985)	Returns the value of the Signature (see page 18990) property.
	GetSize (see page 18986)	Returns the value of the Size (see page 18990) property.
	GetStream (see page 18986)	Returns the value of the Stream (see page 18991) property.
	IgnoreStream (see page 18986)	Informs the data block when its stream is invalidated.
	InitData (see page 18987)	Adds data to the data block.
	Read (see page 18987)	Reads a specified number of bytes into a buffer.
	SetSignature (see page 18988)	Sets the value of the Signature (see page 18990) property.
	SetSize (see page 18988)	Sets the value of the Size (see page 18990) property.
	Write (see page 18988)	Writes a specified number of bytes from a buffer.

130.2.1.2.1 IDataBlock.Clear Method

Removes all data from Memory (see page 18989) except for the reserved bytes.

Pascal

```
procedure Clear; stdcall;
```

C++

```
__fastcall __stdcall Clear();
```

Description

Call Clear when finished reading from Memory (see page 18989) or when the information written to Memory (see page 18989) has been used. Clear reclaims the resources used to store information that is read from or written to the data block.

See Also

BytesReserved (see page 18989)

Memory (see page 18989)

130.2.1.2.2 IDataBlock.GetBytesReserved Method

Returns the value of the BytesReserved (see page 18989) property.

Pascal

```
function GetBytesReserved: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetBytesReserved();
```

Description

GetBytesReserved is the read implementer for the BytesReserved (see page 18989) property.

See Also

BytesReserved (see page 18989)

130.2.1.2.3 IDataBlock.GetMemory Method

Returns the value of the Memory (see page 18989) property.

Pascal

```
function GetMemory: Pointer; stdcall;
```

C++

```
__fastcall __stdcall void * GetMemory();
```

Description

GetMemory is the read implementer for the Memory (see page 18989) property.

See Also

Memory (see page 18989)

130.2.1.2.4 IDataBlock.GetSignature Method

Returns the value of the Signature (see page 18990) property.

Pascal

```
function GetSignature: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetSignature();
```

Description

GetSignature is the read implementer for the Signature (see page 18990) property.

See Also

Signature (see page 18990)

130.2.1.2.5 IDataBlock.GetSize Method

Returns the value of the Size (see page 18990) property.

Pascal

```
function GetSize: Integer; stdcall;
```

C++

```
__fastcall __stdcall int GetSize();
```

Description

GetSize is the read implementer for the Size (see page 18990) property.

See Also

Size (see page 18990)

130.2.1.2.6 IDataBlock.GetStream Method

Returns the value of the Stream (see page 18991) property.

Pascal

```
function GetStream: TStream; stdcall;
```

C++

```
__fastcall __stdcall TStream GetStream();
```

Description

GetStream is the read implementer for the Stream (see page 18991) property.

See Also

Stream (see page 18991)

130.2.1.2.7 IDataBlock.IgnoreStream Method

Informs the data block when its stream is invalidated.

Pascal

```
procedure IgnoreStream; stdcall;
```

C++

```
__fastcall __stdcall IgnoreStream();
```

Description

Call IgnoreStream after taking responsibility for freeing the component specified by Stream (see page 18991). After a call to

IgnoreStream, the data block will not free the memory for its internal Stream (see page 18991) component.

See Also

Stream (see page 18991)

130.2.1.2.8 IDataBlock.InitData Method

Adds data to the data block.

Pascal

```
function InitData(Data: Pointer; DataLen: Integer; CheckLen: Boolean): Integer; stdcall;
```

C++

```
__fastcall __stdcall int InitData(void * Data, int DataLen, Boolean CheckLen);
```

Description

Data is the data to be added to the data block. It must include a valid signature or InitData raises an exception.

DataLen is the number of bytes referenced by Data.

CheckLen specifies whether InitData should verify that the signature indicates the same amount of data as is indicated by the DataLen parameter.

See Also

Signature (see page 18990)

130.2.1.2.9 IDataBlock.Read Method

Reads a specified number of bytes into a buffer.

Pascal

```
function Read(var Buffer; Count: Integer): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Read( Buffer, int Count);
```

Description

Call Read to copy the contents stored in the memory buffer to the buffer supplied by the Buffer parameter. Read reads up to Count bytes and returns the number of bytes actually read.

The first call to Read begins reading from Memory (see page 18989) at the first position after the reserved bytes. Subsequent calls begin reading at the point where the last call to Read left off.

Note: The Count parameter should specify a value less than or equal to Size (see page 18990) - BytesReserved (see page 18989).

See Also

Write (see page 18988)

Memory (see page 18989)

Size (see page 18990)

BytesReserved (see page 18989)

130.2.1.2.10 IDataBlock.SetSignature Method

Sets the value of the Signature (see page 18990) property.

Pascal

```
procedure SetSignature(Value: Integer); stdcall;
```

C++

```
__fastcall __stdcall SetSignature(int Value);
```

Description

SetSignature is the write implementer for the Signature (see page 18990) property.

See Also

Signature (see page 18990)

130.2.1.2.11 IDataBlock.SetSize Method

Sets the value of the Size (see page 18990) property.

Pascal

```
procedure SetSize(Value: Integer); stdcall;
```

C++

```
__fastcall __stdcall SetSize(int Value);
```

Description

SetSize is the write implementer for the Size (see page 18990) property.

See Also

Size (see page 18990)

130.2.1.2.12 IDataBlock.Write Method

Writes a specified number of bytes from a buffer.

Pascal

```
function Write(const Buffer; Count: Integer): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Write(const  Buffer, int Count);
```

Description

Call Write to copy the contents of the buffer supplied as the Buffer parameter to the next position in Memory (see page 18989). Write writes up to Count bytes and returns the number of bytes actually written.

The first call to Write begins writing to Memory (see page 18989) at the first position after the reserved bytes. Subsequent calls begin writing at the point where the last call to Write left off.

Note: The Count parameter should specify a value less than or equal to Size (see page 18990) - BytesReserved (see page 18989).

See Also

Read (see page 18987)

Memory (see page 18989)

Size (see page 18990)

BytesReserved (see page 18989)

130.2.1.3 IDataBlock Properties

The properties of the IDataBlock class are listed here.

Public Properties

	Name	Description
R	BytesReserved (see page 18989)	Indicates the number of bytes from Memory (see page 18989) that are reserved for internal use.
R	Memory (see page 18989)	Points to a buffer from which data is read or to which data is written.
	Signature (see page 18990)	Indicates the contents of the data block.
	Size (see page 18990)	Indicates the size of the data in the memory buffer.
R	Stream (see page 18991)	Provides access to an internal stream that contains the data block's memory.

130.2.1.3.1 IDataBlock.BytesReserved Property

Indicates the number of bytes from Memory (see page 18989) that are reserved for internal use.

Pascal

```
property BytesReserved: Integer;
```

C++

```
__property int BytesReserved;
```

Description

BytesReserved indicates how many bytes of Memory (see page 18989) can't be used for reading and writing. When interpreting the value of the Size (see page 18990) property, use BytesReserved to determine how much buffer space is available for reading and writing data.

See Also

Memory (see page 18989)

Size (see page 18990)

130.2.1.3.2 IDataBlock.Memory Property

Points to a buffer from which data is read or to which data is written.

Pascal

```
property Memory: Pointer;
```

C++

```
__property void * Memory;
```

Description

Memory provides access to the buffer that contains data that is read or written. Memory includes a reserved area (of size BytesReserved (see page 18989)) for internal information such as the value of Signature (see page 18990),

Note: When implementing the Receive and Send methods of the ITransport (see page 18995) interface, component writers should read directly from and write directly to Memory, rather than using the Read (see page 18987) and Write (see page

18988) methods. Otherwise, the information in the reserved area will not be sent to or from the application server.

See Also

Size (see page 18990)

ITransport (see page 18995)

BytesReserved (see page 18989)

Signature (see page 18990)

Stream (see page 18991)

130.2.1.3.3 IDataBlock.Signature Property

Indicates the contents of the data block.

Pascal

```
property Signature: Integer;
```

C++

```
__property int Signature;
```

Description

Write (see page 18988) Signature values to indicate what type of data is written to the data block. Read (see page 18987) Signature to determine what type of data can be read from the data block.

The value of signature is stored somewhere in the first BytesReserved (see page 18989) bytes of Memory (see page 18989).

See Also

BytesReserved (see page 18989)

Memory (see page 18989)

130.2.1.3.4 IDataBlock.Size Property

Indicates the size of the data in the memory buffer.

Pascal

```
property Size: Integer;
```

C++

```
__property int Size;
```

Description

Size is the number of bytes available in Memory (see page 18989), excluding the reserved bytes. Set Size to ensure that Memory (see page 18989) is large enough to contain the data that the data block will read or write.

See Also

BytesReserved (see page 18989)

Memory (see page 18989)

Signature (see page 18990)

130.2.1.3.5 IDataBlock.Stream Property

Provides access to an internal stream that contains the data block's memory.

Pascal

```
property Stream: TStream;
```

C++

```
__property TStream Stream;
```

Description

Stream allows component writers more convenient access to the data block's memory buffer. This memory buffer contains the data that is read or written.

See Also

Memory (see page 18989)

IgnoreStream (see page 18986)

TMemoryStream (see page 2902)

130.2.2 IDataIntercept Interface

IDataIntercept is the interface used by TSocketConnection (see page 18928) components to transform data that is communicated over the connection.

Class Hierarchy

Pascal

```
IDataIntercept = interface;
```

C++

```
__interface IDataIntercept;
```

File

SConnect

Description

IDataIntercept is the interface implemented by data packet interceptors. A data packet interceptor is a COM object that implements IDataIntercept to transform data that is accessed through an IDataBlock (see page 18983) interface. TSocketConnection (see page 18928) can use a data packet interceptor before messages are sent and after responses are received.

Developers can create a data packet interceptor to encrypt and decrypt data or to compress and decompress messages. The transformation must leave the reserved bytes of the data blocks unchanged or the socket connection component won't be able to communicate properly.

Note: When creating a data packet interceptor in Delphi, use TPacketInterceptFactory (see page 18925) as its class factory.

Once you have created and registered a data packet interceptor, Set the InterceptName or InterceptGUID property of a socket connection component to identify the data packet interceptor. This tells the socket connection to instantiate the interceptor and use it to transform messages before they are sent and after they are received. On the server side, right click on the Tray Icon for

scktsrvr.exe and assign the interceptor using the properties dialog.

See Also

IDataBlock (see page 18983)

TStreamedConnection (see page 18945)

TStreamedConnection (see page 18945)

TPacketInterceptFactory (see page 18925)

Specifying a Connection Using Sockets

130.2.2.1 IDataIntercept Members

The following tables list the members exposed by IDataIntercept.

Public Methods

	Name	Description
	DataIn (see page 18992)	Undoes the transformation applied by the DataOut (see page 18993) method.
	DataOut (see page 18993)	Returns the value of the BytesReserved property.

130.2.2.2 IDataIntercept Methods

The methods of the IDataIntercept class are listed here.

Public Methods

	Name	Description
	DataIn (see page 18992)	Undoes the transformation applied by the DataOut (see page 18993) method.
	DataOut (see page 18993)	Returns the value of the BytesReserved property.

130.2.2.2.1 IDataIntercept.DataIn Method

Undoes the transformation applied by the DataOut (see page 18993) method.

Pascal

```
procedure DataIn(const Data: IDataBlock); stdcall;
```

C++

```
__fastcall __stdcall DataIn(const IDataBlock Data);
```

Description

Call DataIn to undo any transformations that were applied to information received by the connection. For example, use this method to decrypt or decompress data.

The Data parameter is an IDataBlock (see page 18983) interface to the data that was received by the socket connection component. Use the properties and methods of IDataBlock (see page 18983) to reverse the transformation that was applied by the DataOut (see page 18993) method.

Warning: Do not transform the reserved bytes in the data block.

See Also

DataOut (see page 18993)

BytesReserved (see page 18989)

130.2.2.2.2 IDataIntercept.DataOut Method

Returns the value of the BytesReserved property.

Pascal

```
procedure DataOut(const Data: IDataBlock); stdcall;
```

C++

```
__fastcall __stdcall DataOut(const IDataBlock Data);
```

Description

Call DataOut to transform data before it is sent using a connection component. For example, use this method to encrypt or compress data.

The Data parameter is an IDataBlock (see page 18983) interface to the data that is about to be sent by the socket connection component. Use the properties and methods of IDataBlock (see page 18983) to transform the data.

Warning: Do not transform the reserved bytes in the data block.

See Also

DataIn (see page 18992)

BytesReserved (see page 18989)

130.2.3 ISendDataBlock Interface

ISendDataBlock is the interface used by data block interpreters to send messages to an application server after they are marshaled.

Class Hierarchy

SConnect.ISendDataBlock

Pascal

```
ISendDataBlock = interface;
```

C++

```
__interface ISendDataBlock;
```

File

SConnect

Description

Streamed connection components implement ISendDataBlock to allow a data block interpreter (which handles marshaling of COM interface calls) to send interface calls to the application server.

ISendDataBlock is an interface, and as such can't be directly instantiated. Instead, streamed connection components (which implement ISendDataBlock) can be cast to an ISendDataBlock (Delphi) or have a conversion operator to obtain this interface (C++).

Note: TDataBlockInterpreter (see page 18913) uses _di_ISendDataBlock in place of ISendDataBlock. This is a DelphiInterface wrapper around the ISendDataBlock interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< ISendDataBlock > _di_ISendDataBlock;
```

See Also

TStreamedConnection (see page 18945)

TCustomDataBlockInterpreter (see page 18898)

IDataBlock (see page 18983)

130.2.3.1 ISendDataBlock Members

The following tables list the members exposed by ISendDataBlock.

Public Methods

	Name	Description
	Send (see page 18994)	Sends information retrieved from an IDataBlock (see page 18983) interface to the application server.

130.2.3.2 ISendDataBlock Methods

The methods of the ISendDataBlock class are listed here.

Public Methods

	Name	Description
	Send (see page 18994)	Sends information retrieved from an IDataBlock (see page 18983) interface to the application server.

130.2.3.2.1 ISendDataBlock.Send Method

Sends information retrieved from an IDataBlock (see page 18983) interface to the application server.

Pascal

```
function Send(const Data: IDataBlock; WaitForResult: Boolean): IDataBlock; stdcall;
```

C++

```
__fastcall __stdcall IDataBlock Send(const IDataBlock Data, Boolean WaitForResult);
```

Description

ISendDataBlock (see page 18993) dispatches information to an application server. The information must be available as the Memory property of an IDataBlock (see page 18983) interface.

The WaitForResult parameter indicates whether the caller requires a response when the information is sent. If WaitForResult is true, Send does not return until a response is received from the application server. This response is returned as an IDataBlock (see page 18983) interface (_di_IDataBlock). If WaitForResult is false, Send may still return a response, but only if the application server responds immediately.

See Also

Memory (see page 18989)

Send (see page 18957)

130.2.4 ITransport Interface

ITransport is the interface used by TStreamedConnection (see page 18945) to connect to, read from, and write to a remote application server.

Class Hierarchy

Pascal

```
ITransport = interface(IUnknown);
```

C++

```
__interface ITransport : public IUnknown;
```

File

SConnect

Description

Streamed connection components use ITransport to connect to an application server and to send or receive data over that connection. ITransport is responsible only for managing the communication protocols. It does not provide any support for marshaling or storing information.

ITransport is an interface, and as such can't be directly instantiated. Instead, objects that implement the ITransport properties and methods include ITransport in their class definition (Delphi) or are derived from ITransport (C++). Such objects can be cast to an ITransport so that they can be used by streamed connection components.

Note: C++ method declarations that use ITransport use the _di_ITransport type instead. This is a DelphiInterface wrapper around the ITransport interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< ITransport> _di_ITransport;
```

See Also

TStreamedConnection (see page 18945)

130.2.4.1 ITransport Members

The following tables list the members exposed by ITransport.

Public Methods

	Name	Description
	GetConnected (see page 18996)	Returns the value of the Connected (see page 18998) property.
	GetWaitEvent (see page 18996)	Returns the handle for an event object that is managed by the object that implements ITransport (see page 18995).
	Receive (see page 18997)	Returns an IDataBlock (see page 18983) interface that can be used to read information received from the application server.
	Send (see page 18997)	Sends information retrieved from an IDataBlock (see page 18983) interface to the application server.
	SetConnected (see page 18997)	Sets the value of the Connected (see page 18998) property.

Public Properties

	Name	Description
	Connected (see page 18998)	Indicates whether the connection to the application server is established.

130.2.4.2 ITransport Methods

The methods of the ITransport class are listed here.

Public Methods

	Name	Description
	GetConnected (see page 18996)	Returns the value of the Connected (see page 18998) property.
	GetWaitEvent (see page 18996)	Returns the handle for an event object that is managed by the object that implements ITransport (see page 18995).
	Receive (see page 18997)	Returns an IDataBlock (see page 18983) interface that can be used to read information received from the application server.
	Send (see page 18997)	Sends information retrieved from an IDataBlock (see page 18983) interface to the application server.
	SetConnected (see page 18997)	Sets the value of the Connected (see page 18998) property.

130.2.4.2.1 ITransport.GetConnected Method

Returns the value of the Connected (see page 18998) property.

Pascal

```
function GetConnected: Boolean; stdcall;
```

C++

```
__fastcall __stdcall Boolean GetConnected();
```

Description

GetConnected is the read property implementer for the Connected (see page 18998) property.

See Also

Connected (see page 18998)

130.2.4.2.2 ITransport.GetWaitEvent Method

Returns the handle for an event object that is managed by the object that implements ITransport (see page 18995).

Pascal

```
function GetWaitEvent: THandle; stdcall;
```

C++

```
__fastcall __stdcall THandle GetWaitEvent();
```

Description

Streamed connection components perform all reading from and writing to the application server using a separate execution thread. This limits the impact that communication with the application server has on the speed of the client application, because execution does not need to wait while messages are marshaled and sent or received. The streamed connection component needs to coordinate its use of the communication thread. To do this, it uses an event object that is a member of the object that implements ITransport (see page 18995).

GetWaitEvent returns a handle to this event object. When implementing an object that supports ITransport (see page 18995),

create a TEvent object as a member and return its handle as the return value of GetWaitEvent. Do not use the event object for internal purposes or it will interfere with the streamed connection's use of the event.

See Also

TEvent (see page 22063)

130.2.4.2.3 ITransport.Receive Method

Returns an IDataBlock (see page 18983) interface that can be used to read information received from the application server.

Pascal

```
function Receive(WaitForInput: Boolean; Context: Integer): IDataBlock; stdcall;
```

C++

```
__fastcall __stdcall IDataBlock Receive(Boolean WaitForInput, int Context);
```

Description

Receive creates a COM object that implements the IDataBlock (see page 18983) interface and reads information from the application server into its Memory property.

If WaitForInput is true, Receive halts execution until the application server sends the expected information. If WaitForInput is false, Receive can fail (reading no information) if the application server does not send any information immediately (or after a brief time-out period).

Context is transport-specific data that can be used when implementing a class that supports ITransport (see page 18995). Its value is the return value of the Send (see page 18997) method.

See Also

Memory (see page 18989)

Send (see page 18997)

130.2.4.2.4 ITransport.Send Method

Sends information retrieved from an IDataBlock (see page 18983) interface to the application server.

Pascal

```
function Send(const Data: IDataBlock): Integer; stdcall;
```

C++

```
__fastcall __stdcall int Send(const IDataBlock Data);
```

Description

Send sends the entire contents of the Data parameter's Memory property to the application server. It returns a transport-specific value that is used by the next call to the Receive (see page 18997) method. For example, HTTP transport classes return the handle for the Internet connection.

See Also

Memory (see page 18989)

Receive (see page 18997)

130.2.4.2.5 ITransport.SetConnected Method

Sets the value of the Connected (see page 18998) property.

Pascal

```
procedure SetConnected(Value: Boolean); stdcall;
```

C++

```
__fastcall __stdcall SetConnected(Boolean Value);
```

Description

SetConnected is the write implementer for the Connected (see page 18998) property.

130.2.4.3 ITransport Properties

The properties of the ITransport class are listed here.

Public Properties

	Name	Description
	Connected (see page 18998)	Indicates whether the connection to the application server is established.

130.2.4.3.1 ITransport.Connected Property

Indicates whether the connection to the application server is established.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Set Connected to true to connect to the application server. Set Connected to false to close a connection.

Read the Connected property to verify that the connection is open before reading from or writing to the application server.

See Also

Receive (see page 18997)

Send (see page 18997)

130.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetPacketInterceptorList (see page 18999)	This is function SConnect.GetPacketInterceptorList.
	LoadWinSock2 (see page 18999)	This is function SConnect.LoadWinSock2.

130.3.1 SConnect.GetPacketInterceptorList Function

Pascal

```
procedure GetPacketInterceptorList(List: TStringList);
```

C++

```
GetPacketInterceptorList(TStringList List);
```

File

SConnect

Description

This is function SConnect.GetPacketInterceptorList.

130.3.2 SConnect.LoadWinSock2 Function

Pascal

```
function LoadWinSock2: Boolean;
```

C++

```
Boolean LoadWinSock2();
```

File

SConnect

Description

This is function SConnect.LoadWinSock2.

130.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TVarFlag (see page 19000)	This is record SConnect.TVarFlag.

130.4.1 SConnect.TVarFlag Enumeration

Pascal

```
TVarFlag = (
  vfByRef,
  vfVariant
);
```

C++

```
enum TVarFlag {
  vfByRef,
  vfVariant
};
```

File

SConnect

Description

This is record SConnect.TVarFlag.

130.5 Types

The following table lists types in this documentation.

Types

Name	Description
PIntArray (see page 19001)	This is type SConnect.PIntArray.
PVariantArray (see page 19001)	This is type SConnect.PVariantArray.
TIntArray (see page 19002)	This is type SConnect.TIntArray.
TVarFlags (see page 19002)	This is type SConnect.TVarFlags.
TVariantArray (see page 19002)	This is type SConnect.TVariantArray.

130.5.1 SConnect.PIntArray Type

Pascal

```
PIntArray = ^TIntArray;
```

C++

```
^TIntArray PIntArray;
```

File

SConnect

Description

This is type SConnect.PIntArray.

130.5.2 SConnect.PVariantArray Type

Pascal

```
PVariantArray = ^TVariantArray;
```

C++

```
^TVariantArray PVariantArray;
```

File

SConnect

Description

This is type SConnect.PVariantArray.

130.5.3 SConnect.TIntArray Type

Pascal

```
TIntArray = array[0..0] of Integer;
```

C++

```
array[0..0] of Integer TIntArray;
```

File

SConnect

Description

This is type SConnect.TIntArray.

130.5.4 SConnect.TVarFlags Type

Pascal

```
TVarFlags = set of TVarFlag;
```

C++

```
TVarFlag TVarFlags;
```

File

SConnect

Description

This is type SConnect.TVarFlags.

130.5.5 SConnect.TVariantArray Type

Pascal

```
TVariantArray = array[0..0] of OleVariant;
```

C++

```
array[0..0] of OleVariant TVariantArray;
```

File

SConnect

Description

This is type SConnect.TVariantArray.

130.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
WSACloseEvent (see page 19003)	This is variable SConnect.WSACloseEvent.
WSACreateEvent (see page 19003)	This is variable SConnect.WSACreateEvent.
WSAEventSelect (see page 19004)	This is variable SConnect.WSAEventSelect.
WSAResetEvent (see page 19004)	This is variable SConnect.WSAResetEvent.

130.6.1 SConnect.WSACloseEvent Variable

Pascal

```
WSACloseEvent: function(hEvent: THandle): Boolean stdcall;
```

C++

```
function(hEvent: THandle): Boolean stdcall WSACloseEvent;
```

File

SConnect

Description

This is variable SConnect.WSACloseEvent.

130.6.2 SConnect.WSACreateEvent Variable

Pascal

```
WSACreateEvent: function: THandle stdcall;
```

C++

```
function: THandle stdcall WSACreateEvent;
```

File

SConnect

Description

This is variable SConnect.WSACreateEvent.

130.6.3 SConnect.WSAEventSelect Variable

Pascal

```
WSAEventSelect: function(s: TSocket; hEventObject: THandle; lNetworkEvents: Integer): Integer
stdcall;
```

C++

```
function(s: TSocket; hEventObject: THandle; lNetworkEvents: Integer): Integer stdcall
WSAEventSelect;
```

File

SConnect

Description

This is variable SConnect.WSAEventSelect.

130.6.4 SConnect.WSAResetEvent Variable

Pascal

```
WSAResetEvent: function(hEvent: THandle): Boolean stdcall;
```

C++

```
function(hEvent: THandle): Boolean stdcall WSAResetEvent;
```

File

SConnect

Description

This is variable SConnect.WSAResetEvent.

130.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
asCreateObject (see page 19005)	This is constant SConnect.asCreateObject.
asError (see page 19005)	This is constant SConnect.asError.
asFreeObject (see page 19006)	This is constant SConnect.asFreeObject.
asGetAppServers (see page 19006)	This is constant SConnect.asGetAppServers.
asGetGUID (see page 19006)	This is constant SConnect.asGetGUID.
asGetID (see page 19007)	This is constant SConnect.asGetID.
asGetServers (see page 19007)	This is constant SConnect.asGetServers.
asInvoke (see page 19007)	This is constant SConnect.asInvoke.
asMask (see page 19008)	This is constant SConnect.asMask.
asSoapCommand (see page 19008)	This is constant SConnect.asSoapCommand.
CallSig (see page 19008)	This is constant SConnect.CallSig.
ResultSig (see page 19009)	This is constant SConnect.ResultSig.
THREAD_EXCEPTION (see page 19009)	This is constant SConnect.THREAD_EXCEPTION.
THREAD_RECEIVEDSTREAM (see page 19009)	This is constant SConnect.THREAD_RECEIVEDSTREAM.
THREAD_REPLACETRANSPORT (see page 19010)	This is constant SConnect.THREAD_REPLACETRANSPORT.
THREAD_SENDNOTIFY (see page 19010)	This is constant SConnect.THREAD_SENDNOTIFY.
THREAD_SENDSTREAM (see page 19010)	This is constant SConnect.THREAD_SENDSTREAM.

130.7.1 SConnect.asCreateObject Constant

Pascal

```
asCreateObject = $04;
```

C++

```
asCreateObject = 0x04;
```

File

SConnect

Description

This is constant SConnect.asCreateObject.

130.7.2 SConnect.asError Constant

Pascal

```
asError = $01;
```

C++

```
asError = 0x01;
```

File

SConnect

Description

This is constant SConnect.asError.

130.7.3 SConnect.asFreeObject Constant

Pascal

```
asFreeObject = $05;
```

C++

```
asFreeObject = 0x05;
```

File

SConnect

Description

This is constant SConnect.asFreeObject.

130.7.4 SConnect.asGetAppServers Constant

Pascal

```
asGetAppServers = $12;
```

C++

```
asGetAppServers = 0x12;
```

File

SConnect

Description

This is constant SConnect.asGetAppServers.

130.7.5 SConnect.asGetGUID Constant

Pascal

```
asGetGUID = $11;
```

C++

```
asGetGUID = 0x11;
```

File

SConnect

Description

This is constant SConnect.asGetGUID.

130.7.6 SConnect.asGetID Constant

Pascal

```
asGetID = $03;
```

C++

```
asGetID = 0x03;
```

File

SConnect

Description

This is constant SConnect.asGetID.

130.7.7 SConnect.asGetServers Constant

Pascal

```
asGetServers = $10;
```

C++

```
asGetServers = 0x10;
```

File

SConnect

Description

This is constant SConnect.asGetServers.

130.7.8 SConnect.asInvoke Constant

Pascal

```
asInvoke = $02;
```

C++

```
asInvoke = 0x02;
```

File

SConnect

Description

This is constant SConnect.asInvoke.

130.7.9 SConnect.asMask Constant

Pascal

```
asMask = $FF;
```

C++

```
asMask = 0xFF;
```

File

SConnect

Description

This is constant SConnect.asMask.

130.7.10 SConnect.asSoapCommand Constant

Pascal

```
asSoapCommand = $14;
```

C++

```
asSoapCommand = 0x14;
```

File

SConnect

Description

This is constant SConnect.asSoapCommand.

130.7.11 SConnect.CallSig Constant

Pascal

```
CallSig = $DA00;
```

C++

```
CallSig = 0xDA00;
```

File

SConnect

Description

This is constant SConnect.CallSig.

130.7.12 SConnect.ResultSig Constant

Pascal

```
ResultSig = $DB00;
```

C++

```
ResultSig = 0xDB00;
```

File

SConnect

Description

This is constant SConnect.ResultSig.

130.7.13 SConnect.THREAD_EXCEPTION Constant

Pascal

```
THREAD_EXCEPTION = THREAD_RECEIVEDSTREAM + 1;
```

C++

```
THREAD_EXCEPTION = THREAD_RECEIVEDSTREAM + 1;
```

File

SConnect

Description

This is constant SConnect.THREAD_EXCEPTION.

130.7.14 SConnect.THREAD_RECEIVEDSTREAM Constant

Pascal

```
THREAD_RECEIVEDSTREAM = THREAD_SENDSTREAM + 1;
```

C++

```
THREAD_RECEIVEDSTREAM = THREAD_SENDSTREAM + 1;
```

File

SConnect

Description

This is constant SConnect.THREAD_RECEIVEDSTREAM.

130.7.15 SConnect.THREAD_REPLACETRANSPORT Constant

Pascal

```
THREAD_REPLACETRANSPORT = THREAD_SENDNOTIFY + 1;
```

C++

```
THREAD_REPLACETRANSPORT = THREAD_SENDNOTIFY + 1;
```

File

SConnect

Description

This is constant SConnect.THREAD_REPLACETRANSPORT.

130.7.16 SConnect.THREAD_SENDNOTIFY Constant

Pascal

```
THREAD_SENDNOTIFY = THREAD_EXCEPTION + 1;
```

C++

```
THREAD_SENDNOTIFY = THREAD_EXCEPTION + 1;
```

File

SConnect

Description

This is constant SConnect.THREAD_SENDNOTIFY.

130.7.17 SConnect.THREAD_SENDSTREAM Constant

Pascal

```
THREAD_SENDSTREAM = WM_USER + 1;
```

C++

```
THREAD_SENDSTREAM = WM_USER + 1;
```

File

SConnect

Description

This is constant SConnect.THREAD_SENDSTREAM.

131 SessColn Namespace

This is namespace SessColn.

Topics

Name	Description
Classes (see page 19012)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 19035)	The following table lists structs, records, enums in this documentation.
Types (see page 19036)	The following table lists types in this documentation.
Variables (see page 19037)	The following table lists variables in this documentation.

Classes

	Name	Description
	ESessionsException (see page 19012)	ESessionsException is the exception that is raised when TSessionsService encounters a problem.
	TAbstractSessionIDGen (see page 19012)	This is class SessColn.TAbstractSessionIDGen.
	TAbstractSessionStatusChange (see page 19013)	This is class SessColn.TAbstractSessionStatusChange.
	TSessionIDGen (see page 19015)	This is class SessColn.TSessionIDGen.
	TSessionItem (see page 19016)	This is class SessColn.TSessionItem.
	TSessions (see page 19022)	This is class SessColn.TSessions.

Structs, Records, Enums

	Name	Description
	TSessionStatusFlag (see page 19035)	This is record SessColn.TSessionStatusFlag.

Types

Name	Description
TSessionStatusFlags (see page 19036)	This is type SessColn.TSessionStatusFlags.

Variables

Name	Description
Sessions (see page 19037)	This is variable SessColn.Sessions.

131.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ESessionsException (see page 19012)	ESessionsException is the exception that is raised when TSessionsService encounters a problem.
	TAbstractSessionIDGen (see page 19012)	This is class SessColn.TAbstractSessionIDGen.
	TAbstractSessionStatusChange (see page 19013)	This is class SessColn.TAbstractSessionStatusChange.
	TSessionIDGen (see page 19015)	This is class SessColn.TSessionIDGen.
	TSessionItem (see page 19016)	This is class SessColn.TSessionItem.
	TSessions (see page 19022)	This is class SessColn.TSessions.

131.1.1 ESessionsException Class

ESessionsException is the exception that is raised when TSessionsService encounters a problem.

Class Hierarchy

Pascal

```
ESessionsException = class(EWebBrokerException);
```

C++

```
class ESessionsException : public EWebBrokerException;
```

File

SessColn

Description

ESessionsException represents exceptions that occur when managing the Web sessions in a WebSnap application. For example, this exception is raised when the application tries to create a new session and the sessions service is already storing the maximum allowed number of sessions.

See Also

TSessionsService (see page 25582)

131.1.2 TAbstractSessionIDGen Class

Class Hierarchy

Pascal

```
TAbstractSessionIDGen = class;
```

C++

```
class TAbstractSessionIDGen;
```

File

SessColn

Description

This is class SessColn.TAbstractSessionIDGen.

131.1.2.1 TAbstractSessionIDGen Members

The following tables list the members exposed by TAbstractSessionIDGen.

Public Methods

	Name	Description
	NextID (see page 19013)	This is NextID, a member of class TAbstractSessionIDGen.

131.1.2.2 TAbstractSessionIDGen Methods

The methods of the TAbstractSessionIDGen class are listed here.

Public Methods

	Name	Description
	NextID (see page 19013)	This is NextID, a member of class TAbstractSessionIDGen.

131.1.2.2.1 TAbstractSessionIDGen.NextID Method

Pascal

```
function NextID: string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString NextID() = 0;
```

Description

This is NextID, a member of class TAbstractSessionIDGen.

131.1.3 TAbstractSessionStatusChange Class

Class Hierarchy

Pascal

```
TAbstractSessionStatusChange = class;
```

C++

```
class TAbstractSessionStatusChange;
```

File

SessColn

Description

This is class SessColn.TAbstractSessionStatusChange.

131.1.3.1 TAbstractSessionStatusChange Members

The following tables list the members exposed by TAbstractSessionStatusChange.

Protected Methods

	Name	Description
	SessionStarted (see page 19014)	This is SessionStarted, a member of class TAbstractSessionStatusChange.
	SessionTerminated (see page 19014)	This is SessionTerminated, a member of class TAbstractSessionStatusChange.
	SessionTimeout (see page 19015)	This is SessionTimeout, a member of class TAbstractSessionStatusChange.

131.1.3.2 TAbstractSessionStatusChange Methods

The methods of the TAbstractSessionStatusChange class are listed here.

Protected Methods

	Name	Description
	SessionStarted (see page 19014)	This is SessionStarted, a member of class TAbstractSessionStatusChange.
	SessionTerminated (see page 19014)	This is SessionTerminated, a member of class TAbstractSessionStatusChange.
	SessionTimeout (see page 19015)	This is SessionTimeout, a member of class TAbstractSessionStatusChange.

131.1.3.2.1 TAbstractSessionStatusChange.SessionStarted Method

Pascal

```
procedure SessionStarted(AID: TSessionID; var AHandled: Boolean); virtual; abstract;
```

C++

```
virtual __fastcall SessionStarted(TSessionID AID, Boolean AHandled) = 0;
```

Description

This is SessionStarted, a member of class TAbstractSessionStatusChange.

131.1.3.2.2 TAbstractSessionStatusChange.SessionTerminated Method

Pascal

```
procedure SessionTerminated(AID: TSessionID; var AHandled: Boolean); virtual; abstract;
```

C++

```
virtual __fastcall SessionTerminated(TSessionID AID, Boolean AHandled) = 0;
```

Description

This is SessionTerminated, a member of class TAbstractSessionStatusChange.

131.1.3.2.3 TAbstractSessionStatusChange.SessionTimeout Method

Pascal

```
procedure SessionTimeout(AID: TSessionID; var AHandled: Boolean); virtual; abstract;
```

C++

```
virtual __fastcall SessionTimeout(TSessionID AID, Boolean AHandled) = 0;
```

Description

This is SessionTimeout, a member of class TAbstractSessionStatusChange.

131.1.4 TSessionIDGen Class

Class Hierarchy

Pascal

```
TSessionIDGen = class(TAbstractSessionIDGen);
```

C++

```
class TSessionIDGen : public TAbstractSessionIDGen;
```

File

SessColn

Description

This is class SessColn.TSessionIDGen.

131.1.4.1 TSessionIDGen Members

The following tables list the members exposed by TSessionIDGen.

Public Methods

	Name	Description
	Create (see page 19015)	This is Create, a member of class TSessionIDGen.
V	NextID (see page 19016)	This is NextID, a member of class TSessionIDGen.

131.1.4.2 TSessionIDGen.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TSessionIDGen();
```

Description

This is Create, a member of class TSessionIDGen.

131.1.4.3 TSessionIDGen Methods

The methods of the TSessionIDGen class are listed here.

Public Methods

	Name	Description
	NextID (see page 19016)	This is NextID, a member of class TSessionIDGen.

131.1.4.3.1 TSessionIDGen.NextID Method

Pascal

```
function NextID: string; override;
```

C++

```
virtual __fastcall AnsiString NextID();
```

Description

This is NextID, a member of class TSessionIDGen.

131.1.5 TSessionItem Class

Class Hierarchy

Pascal

```
TSessionItem = class(TCollectionItem);
```

C++

```
class TSessionItem : public TCollectionItem;
```

File

SessColn

Description

This is class SessColn.TSessionItem.

131.1.5.1 TSessionItem Members

The following tables list the members exposed by TSessionItem.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.

	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 19019)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 19018)	Creates and initializes a TCollectionItem instance.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 19018)	Destroys the TCollectionItem instance and frees its memory.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActive (see page 19019)	This is IsActive, a member of class TSessionItem.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ExpirationTime (see page 19020)	This is ExpirationTime, a member of class TSessionItem.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).

Published Properties

	Name	Description
	Expired (see page 19020)	This is Expired, a member of class TSessionItem.
	ID (see page 19020)	A unique, permanent index for the item.
	Items (see page 19021)	This is Items, a member of class TSessionItem.

	StartTime (see page 19021)	This is StartTime, a member of class TSessionItem.
	StatusFlags (see page 19021)	This is StatusFlags, a member of class TSessionItem.
	Terminated (see page 19021)	This is Terminated, a member of class TSessionItem.
	TimeoutMinutes (see page 19022)	This is TimeoutMinutes, a member of class TSessionItem.
	TouchTime (see page 19022)	This is TouchTime, a member of class TSessionItem.

131.1.5.2 TSessionItem.Create Constructor

Creates and initializes a TCollectionItem instance.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TSessionItem(TCollection Collection);
```

Description

Do not call Create to instantiate a collection item. Instead, call the Add method of the collection to which the item should belong.

Collection identifies the TCollection instance to which the new item belongs.

See Also

Add (see page 2736)

Collection (see page 2761)

131.1.5.3 TSessionItem.Destroy Destructor

Destroys the TCollectionItem instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSessionItem();
```

Description

Destroy is called indirectly by TCollection's Clear or Delete method.

See Also

Clear (see page 2741)

Delete (see page 2741)

Free (see page 22300)

131.1.5.4 TSessionItem Methods

The methods of the TSessionItem class are listed here.

Public Methods

	Name	Description
	Assign (see page 19019)	Copies the contents of another, similar object.

	IsActive (see page 19019)	This is IsActive, a member of class TSessionItem.

131.1.5.4.1 TSessionItem.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo (see page 2931)

EConvertError (see page 22724)

131.1.5.4.2 TSessionItem.IsActive Method

Pascal

```
function IsActive: Boolean;
```

C++

```
__fastcall Boolean IsActive();
```

Description

This is IsActive, a member of class TSessionItem.

131.1.5.5 TSessionItem Properties

The properties of the TSessionItem class are listed here.

Public Properties

	Name	Description
R	ExpirationTime (see page 19020)	This is ExpirationTime, a member of class TSessionItem.

Published Properties

	Name	Description
	Expired (see page 19020)	This is Expired, a member of class TSessionItem.
	ID (see page 19020)	A unique, permanent index for the item.
	Items (see page 19021)	This is Items, a member of class TSessionItem.
	StartTime (see page 19021)	This is StartTime, a member of class TSessionItem.
	StatusFlags (see page 19021)	This is StatusFlags, a member of class TSessionItem.
	Terminated (see page 19021)	This is Terminated, a member of class TSessionItem.
	TimeoutMinutes (see page 19022)	This is TimeoutMinutes, a member of class TSessionItem.
	TouchTime (see page 19022)	This is TouchTime, a member of class TSessionItem.

131.1.5.5.1 TSessionItem.ExpirationTime Property

Pascal

```
property ExpirationTime: TDateTime;
```

C++

```
__property TDateTime ExpirationTime;
```

Description

This is ExpirationTime, a member of class TSessionItem.

131.1.5.5.2 TSessionItem.Expired Property

Pascal

```
property Expired: Boolean;
```

C++

```
__property Boolean Expired;
```

Description

This is Expired, a member of class TSessionItem.

131.1.5.5.3 TSessionItem.ID Property

A unique, permanent index for the item.

Pascal

```
property ID: string;
```

C++

```
__property AnsiString ID;
```

Description

In most cases, ID is the value of the item's Index property when it was first added to the collection. But, unlike Index values, ID values are never changed or reassigned. If an item is removed from a collection, its ID not used again.

An item's Index may change when other items are deleted from the collection or when items are rearranged. ID provides a unique identifier for each item that is unchanged for the life of the collection.

See Also

Index (see page 2762)

131.1.5.5.4 TSessionItem.Items Property

Pascal

```
property Items: TAbstractNamedVariants;
```

C++

```
__property TAbstractNamedVariants Items;
```

Description

This is Items, a member of class TSessionItem.

131.1.5.5.5 TSessionItem.StartTime Property

Pascal

```
property StartTime: TDateTime;
```

C++

```
__property TDateTime StartTime;
```

Description

This is StartTime, a member of class TSessionItem.

131.1.5.5.6 TSessionItem.StatusFlags Property

Pascal

```
property StatusFlags: TSessionStatusFlags;
```

C++

```
__property TSessionStatusFlags StatusFlags;
```

Description

This is StatusFlags, a member of class TSessionItem.

131.1.5.5.7 TSessionItem.Terminated Property

Pascal

```
property Terminated: Boolean;
```

C++

```
__property Boolean Terminated;
```

Description

This is Terminated, a member of class TSessionItem.

131.1.5.5.8 TSessionItem.TimeoutMinutes Property

Pascal

```
property TimeoutMinutes: Integer;
```

C++

```
__property int TimeoutMinutes;
```

Description

This is TimeoutMinutes, a member of class TSessionItem.

131.1.5.5.9 TSessionItem.TouchTime Property

Pascal

```
property TouchTime: TDateTime;
```

C++

```
__property TDateTime TouchTime;
```

Description

This is TouchTime, a member of class TSessionItem.

131.1.6 TSessions Class

Class Hierarchy

Pascal

```
TSessions = class(TCollection);
```

C++

```
class TSessions : public TCollection;
```

File

SessColn

Description

This is class SessColn.TSessions.

131.1.6.1 TSessions Members

The following tables list the members exposed by TSessions.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2736)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	CheckStatusChange (see page 19026)	This is CheckStatusChange, a member of class TSessions.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	ConnectActiveSession (see page 19026)	This is ConnectActiveSession, a member of class TSessions.
	ConnectSession (see page 19027)	This is ConnectSession, a member of class TSessions.
	Create (see page 19025)	Constructs an object and initializes its data before the object is first used.
V	CreateSessionIDGen (see page 19027)	This is CreateSessionIDGen, a member of class TSessions.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 19025)	Destroys the collection and each item in it.
	DisconnectSession (see page 19027)	This is DisconnectSession, a member of class TSessions.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.

V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetExpirationTime (see page 19027)	This is GetExpirationTime, a member of class TSessions.
	GetExpired (see page 19027)	This is GetExpired, a member of class TSessions.
	GetIDCount (see page 19028)	This is GetIDCount, a member of class TSessions.
	GetIDs (see page 19028)	This is GetIDs, a member of class TSessions.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsActive (see page 19028)	This is GetIsActive, a member of class TSessions.
	GetItemCount (see page 19028)	This is GetItemCount, a member of class TSessions.
	GetItems (see page 19029)	This is GetItems, a member of class TSessions.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetSession (see page 19029)	This is GetSession, a member of class TSessions.
	GetSessionIDGen (see page 19029)	This is GetSessionIDGen, a member of class TSessions.
	GetStartTime (see page 19029)	This is GetStartTime, a member of class TSessions.
	GetTerminated (see page 19029)	This is GetTerminated, a member of class TSessions.
	GetTimeoutMinutes (see page 19030)	This is GetTimeoutMinutes, a member of class TSessions.
	GetTouchTime (see page 19030)	This is GetTouchTime, a member of class TSessions.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	ItemValue (see page 19030)	This is ItemValue, a member of class TSessions.
	LoadFromFile (see page 19030)	This is LoadFromFile, a member of class TSessions.
	LoadFromStream (see page 19031)	This is LoadFromStream, a member of class TSessions.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NotifyStatusChange (see page 19031)	This is NotifyStatusChange, a member of class TSessions.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 19031)	This is SaveToFile, a member of class TSessions.
	SaveToStream (see page 19031)	This is SaveToStream, a member of class TSessions.
	SessionExists (see page 19031)	This is SessionExists, a member of class TSessions.
	SetItemValue (see page 19032)	This is SetItemValue, a member of class TSessions.
	SetTimeoutMinutes (see page 19032)	This is SetTimeoutMinutes, a member of class TSessions.
	StartSession (see page 19032)	This is StartSession, a member of class TSessions.
	TerminateSession (see page 19032)	This is TerminateSession, a member of class TSessions.
	TouchSession (see page 19033)	This is TouchSession, a member of class TSessions.

Public Properties

	Name	Description
R	ActiveCount (see page 19033)	This is ActiveCount, a member of class TSessions.
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.

	FileName (see page 19033)	This is FileName, a member of class TSessions.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 2751)	Lists the items in the collection.
	MaxSessions (see page 19033)	This is MaxSessions, a member of class TSessions.

131.1.6.2 TSessions.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TSessions();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

131.1.6.3 TSessions.Destroy Destructor

Destroys the collection and each item in it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSessions();
```

Description

Destroy calls the Clear method to free each item referenced in the Items array, then destroys the collection itself.

See Also

Clear (see page 2741)

Free (see page 22300)

131.1.6.4 TSessions Methods

The methods of the TSessions class are listed here.

Public Methods

	Name	Description
	CheckStatusChange (see page 19026)	This is CheckStatusChange, a member of class TSessions.

	ConnectActiveSession (see page 19026)	This is ConnectActiveSession, a member of class TSessions.
	ConnectSession (see page 19027)	This is ConnectSession, a member of class TSessions.
V	CreateSessionIDGen (see page 19027)	This is CreateSessionIDGen, a member of class TSessions.
	DisconnectSession (see page 19027)	This is DisconnectSession, a member of class TSessions.
	GetExpirationTime (see page 19027)	This is GetExpirationTime, a member of class TSessions.
	GetExpired (see page 19027)	This is GetExpired, a member of class TSessions.
	GetIDCount (see page 19028)	This is GetIDCount, a member of class TSessions.
	GetIDs (see page 19028)	This is GetIDs, a member of class TSessions.
	GetIsActive (see page 19028)	This is GetIsActive, a member of class TSessions.
	GetItemCount (see page 19028)	This is GetItemCount, a member of class TSessions.
	GetItems (see page 19029)	This is GetItems, a member of class TSessions.
	GetSession (see page 19029)	This is GetSession, a member of class TSessions.
	GetSessionIDGen (see page 19029)	This is GetSessionIDGen, a member of class TSessions.
	GetStartTime (see page 19029)	This is GetStartTime, a member of class TSessions.
	GetTerminated (see page 19029)	This is GetTerminated, a member of class TSessions.
	GetTimeoutMinutes (see page 19030)	This is GetTimeoutMinutes, a member of class TSessions.
	GetTouchTime (see page 19030)	This is GetTouchTime, a member of class TSessions.
	ItemValue (see page 19030)	This is ItemValue, a member of class TSessions.
	LoadFromFile (see page 19030)	This is LoadFromFile, a member of class TSessions.
	LoadFromStream (see page 19031)	This is LoadFromStream, a member of class TSessions.
	NotifyStatusChange (see page 19031)	This is NotifyStatusChange, a member of class TSessions.
	SaveToFile (see page 19031)	This is SaveToFile, a member of class TSessions.
	SaveToStream (see page 19031)	This is SaveToStream, a member of class TSessions.
	SessionExists (see page 19031)	This is SessionExists, a member of class TSessions.
	SetItemValue (see page 19032)	This is SetItemValue, a member of class TSessions.
	SetTimeoutMinutes (see page 19032)	This is SetTimeoutMinutes, a member of class TSessions.
	StartSession (see page 19032)	This is StartSession, a member of class TSessions.
	TerminateSession (see page 19032)	This is TerminateSession, a member of class TSessions.
	TouchSession (see page 19033)	This is TouchSession, a member of class TSessions.

131.1.6.4.1 TSessions.CheckStatusChange Method

Pascal

```
function CheckStatusChange: Boolean;
```

C++

```
__fastcall Boolean CheckStatusChange();
```

Description

This is CheckStatusChange, a member of class TSessions.

131.1.6.4.2 TSessions.ConnectActiveSession Method

Pascal

```
function ConnectActiveSession(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean ConnectActiveSession(TSessionID AID);
```

Description

This is ConnectActiveSession, a member of class TSessions.

131.1.6.4.3 TSessions.ConnectSession Method

Pascal

```
function ConnectSession(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean ConnectSession(TSessionID AID);
```

Description

This is ConnectSession, a member of class TSessions.

131.1.6.4.4 TSessions.CreateSessionIDGen Method

Pascal

```
function CreateSessionIDGen: TAbstractSessionIDGen; virtual;
```

C++

```
virtual __fastcall TAbstractSessionIDGen CreateSessionIDGen();
```

Description

This is CreateSessionIDGen, a member of class TSessions.

131.1.6.4.5 TSessions.DisconnectSession Method

Pascal

```
procedure DisconnectSession(AID: TSessionID);
```

C++

```
__fastcall DisconnectSession(TSessionID AID);
```

Description

This is DisconnectSession, a member of class TSessions.

131.1.6.4.6 TSessions.GetExpirationTime Method

Pascal

```
function GetExpirationTime(AID: TSessionID): TDateTime;
```

C++

```
__fastcall TDateTime GetExpirationTime(TSessionID AID);
```

Description

This is GetExpirationTime, a member of class TSessions.

131.1.6.4.7 TSessions.GetExpired Method

Pascal

```
function GetExpired(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean GetExpired(TSessionID AID);
```

Description

This is GetExpired, a member of class TSessions.

131.1.6.4.8 TSessions.GetIDCount Method

Pascal

```
function GetIDCount: Integer;
```

C++

```
__fastcall int GetIDCount();
```

Description

This is GetIDCount, a member of class TSessions.

131.1.6.4.9 TSessions.GetIDs Method

Pascal

```
procedure GetIDs(var AList: TList);
```

C++

```
__fastcall GetIDs(TList AList);
```

Description

This is GetIDs, a member of class TSessions.

131.1.6.4.10 TSessions.GetIsActive Method

Pascal

```
function GetIsActive(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean GetIsActive(TSessionID AID);
```

Description

This is GetIsActive, a member of class TSessions.

131.1.6.4.11 TSessions.GetItemCount Method

Pascal

```
function GetItemCount(AID: TSessionID): Integer;
```

C++

```
__fastcall int GetItemCount(TSessionID AID);
```

Description

This is GetItemCount, a member of class TSessions.

131.1.6.4.12 TSessions.GetItems Method

Pascal

```
procedure GetItems(AID: TSessionID; var AItems: TAbstractNamedVariants);
```

C++

```
__fastcall GetItems(TSessionID AID, TAbstractNamedVariants AItems);
```

Description

This is GetItems, a member of class TSessions.

131.1.6.4.13 TSessions.GetSession Method

Pascal

```
function GetSession(AID: TSessionID; var AItem: TSessionItem): Boolean;
```

C++

```
__fastcall Boolean GetSession(TSessionID AID, TSessionItem AItem);
```

Description

This is GetSession, a member of class TSessions.

131.1.6.4.14 TSessions.GetSessionIDGen Method

Pascal

```
function GetSessionIDGen: TAbstractSessionIDGen;
```

C++

```
__fastcall TAbstractSessionIDGen GetSessionIDGen();
```

Description

This is GetSessionIDGen, a member of class TSessions.

131.1.6.4.15 TSessions.GetStartTime Method

Pascal

```
function GetStartTime(AID: TSessionID): TDateTime;
```

C++

```
__fastcall TDateTime GetStartTime(TSessionID AID);
```

Description

This is GetStartTime, a member of class TSessions.

131.1.6.4.16 TSessions.GetTerminated Method

Pascal

```
function GetTerminated(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean GetTerminated(TSessionID AID);
```

Description

This is GetTerminated, a member of class TSessions.

131.1.6.4.17 TSessions.GetTimeoutMinutes Method

Pascal

```
function GetTimeoutMinutes(AID: TSessionID): Integer;
```

C++

```
__fastcall int GetTimeoutMinutes(TSessionID AID);
```

Description

This is GetTimeoutMinutes, a member of class TSessions.

131.1.6.4.18 TSessions.GetTouchTime Method

Pascal

```
function GetTouchTime(AID: TSessionID): TDateTime;
```

C++

```
__fastcall TDateTime GetTouchTime(TSessionID AID);
```

Description

This is GetTouchTime, a member of class TSessions.

131.1.6.4.19 TSessions.ItemValue Method

Pascal

```
function ItemValue(AID: TSessionID; const AName: string): Variant;
```

C++

```
__fastcall Variant ItemValue(TSessionID AID, const AnsiString AName);
```

Description

This is ItemValue, a member of class TSessions.

131.1.6.4.20 TSessions.LoadFromFile Method

Pascal

```
procedure LoadFromFile(const Filename: string);
```

C++

```
__fastcall LoadFromFile(const AnsiString Filename);
```

Description

This is LoadFromFile, a member of class TSessions.

131.1.6.4.21 TSessions.LoadFromStream Method

Pascal

```
procedure LoadFromStream(S: TStream);
```

C++

```
__fastcall LoadFromStream(TStream S);
```

Description

This is LoadFromStream, a member of class TSessions.

131.1.6.4.22 TSessions.NotifyStatusChange Method

Pascal

```
procedure NotifyStatusChange(AStatusChange: TAbstractSessionStatusChange);
```

C++

```
__fastcall NotifyStatusChange(TAbstractSessionStatusChange AStatusChange);
```

Description

This is NotifyStatusChange, a member of class TSessions.

131.1.6.4.23 TSessions.SaveToFile Method

Pascal

```
procedure SaveToFile(const Filename: string);
```

C++

```
__fastcall SaveToFile(const AnsiString Filename);
```

Description

This is SaveToFile, a member of class TSessions.

131.1.6.4.24 TSessions.SaveToStream Method

Pascal

```
procedure SaveToStream(S: TStream);
```

C++

```
__fastcall SaveToStream(TStream S);
```

Description

This is SaveToStream, a member of class TSessions.

131.1.6.4.25 TSessions.SessionExists Method

Pascal

```
function SessionExists(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean SessionExists(TSessionID AID);
```

Description

This is SessionExists, a member of class TSessions.

131.1.6.4.26 TSessions.SetItemValue Method

Pascal

```
procedure SetItemValue(AID: TSessionID; const AName: string; const AValue: Variant);
```

C++

```
__fastcall SetItemValue(TSessionID AID, const AnsiString AName, const Variant AValue);
```

Description

This is SetItemValue, a member of class TSessions.

131.1.6.4.27 TSessions.SetTimeoutMinutes Method

Pascal

```
procedure SetTimeoutMinutes(AID: TSessionID; AValue: Integer);
```

C++

```
__fastcall SetTimeoutMinutes(TSessionID AID, int AValue);
```

Description

This is SetTimeoutMinutes, a member of class TSessions.

131.1.6.4.28 TSessions.StartSession Method

Pascal

```
function StartSession: TSessionID;
```

C++

```
__fastcall TSessionID StartSession();
```

Description

This is StartSession, a member of class TSessions.

131.1.6.4.29 TSessions.TerminateSession Method

Pascal

```
function TerminateSession(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean TerminateSession(TSessionID AID);
```

Description

This is TerminateSession, a member of class TSessions.

131.1.6.4.30 TSessions.TouchSession Method

Pascal

```
function TouchSession(AID: TSessionID): Boolean;
```

C++

```
__fastcall Boolean TouchSession(TSessionID AID);
```

Description

This is TouchSession, a member of class TSessions.

131.1.6.5 TSessions Properties

The properties of the TSessions class are listed here.

Public Properties

	Name	Description
R	ActiveCount (see page 19033)	This is ActiveCount, a member of class TSessions.
	FileName (see page 19033)	This is FileName, a member of class TSessions.
	MaxSessions (see page 19033)	This is MaxSessions, a member of class TSessions.

131.1.6.5.1 TSessions.ActiveCount Property

Pascal

```
property ActiveCount: Integer;
```

C++

```
__property int ActiveCount;
```

Description

This is ActiveCount, a member of class TSessions.

131.1.6.5.2 TSessions.FileName Property

Pascal

```
property FileName: string;
```

C++

```
__property AnsiString FileName;
```

Description

This is FileName, a member of class TSessions.

131.1.6.5.3 TSessions.MaxSessions Property

Pascal

```
property MaxSessions: Integer;
```

C++

```
__property int MaxSessions;
```

Description

This is MaxSessions, a member of class TSessions.

131.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TSessionStatusFlag (see page 19035)	This is record SessColn.TSessionStatusFlag.

131.2.1 SessColn.TSessionStatusFlag Enumeration

Pascal

```
TSessionStatusFlag = (
  ssStarted,
  ssTerminated,
  ssTimeOut
);
```

C++

```
enum TSessionStatusFlag {
  ssStarted,
  ssTerminated,
  ssTimeOut
};
```

File

SessColn

Description

This is record SessColn.TSessionStatusFlag.

131.3 Types

The following table lists types in this documentation.

Types

Name	Description
TSessionStatusFlags (see page 19036)	This is type SessColn.TSessionStatusFlags.

131.3.1 SessColn.TSessionStatusFlags Type

Pascal

```
TSessionStatusFlags = set of TSessionStatusFlag;
```

C++

```
TSessionStatusFlag TSessionStatusFlags;
```

File

SessColn

Description

This is type SessColn.TSessionStatusFlags.

131.4 Variables

The following table lists variables in this documentation.

Variables

Name	Description
Sessions (see page 19037)	This is variable SessColn.Sessions.

131.4.1 SessColn.Sessions Variable

Pascal

```
Sessions: TSessions;
```

C++

```
TSessions Sessions;
```

File

SessColn

Description

This is variable SessColn.Sessions.

132 SHDocVw Namespace

This is namespace SHDocVw.

Topics

Name	Description
Classes (see page 19045)	The following table lists classes in this documentation.
Interfaces (see page 19276)	The following table lists interfaces in this documentation.
Types (see page 19451)	The following table lists types in this documentation.
Constants (see page 19486)	The following table lists constants in this documentation.

Classes

	Name	Description
	CoCScriptErrorList (see page 19045)	This is class SHDocVw.CoCScriptErrorList.
	CoInternetExplorer (see page 19046)	This is class SHDocVw.CoInternetExplorer.
	CoSearchAssistantOC (see page 19047)	This is class SHDocVw.CoSearchAssistantOC.
	CoShellBrowserWindow (see page 19049)	This is class SHDocVw.CoShellBrowserWindow.
	CoShellNameSpace (see page 19050)	This is class SHDocVw.CoShellNameSpace.
	CoShellUIHelper (see page 19051)	This is class SHDocVw.CoShellUIHelper.
	CoShellWindows (see page 19052)	This is class SHDocVw.CoShellWindows.
	TInternetExplorer (see page 19053)	This is class SHDocVw.TInternetExplorer.
	TShellNameSpace (see page 19101)	This is class SHDocVw.TShellNameSpace.
	TShellUIHelper (see page 19121)	This is class SHDocVw.TShellUIHelper.
	TShellWindows (see page 19135)	This is class SHDocVw.TShellWindows.
	TWebBrowser (see page 19147)	TWebBrowser provides access to the Web browser functionality of Microsoft's Shell Doc Object and Control Library (SHDOCVW.DLL).
	TWebBrowser_V1 (see page 19221)	This is class SHDocVw.TWebBrowser_V1.

Constants

Name	Description
CGID_IWebBrowser (see page 19488)	This is constant SHDocVw.CGID_IWebBrowser.
CLASS_CScriptErrorList (see page 19489)	This is constant SHDocVw.CLASS_CScriptErrorList.
CLASS_InternetExplorer (see page 19489)	This is constant SHDocVw.CLASS_InternetExplorer.
CLASS_SearchAssistantOC (see page 19489)	This is constant SHDocVw.CLASS_SearchAssistantOC.
CLASS_ShellBrowserWindow (see page 19490)	This is constant SHDocVw.CLASS_ShellBrowserWindow.
CLASS_ShellNameSpace (see page 19490)	This is constant SHDocVw.CLASS_ShellNameSpace.
CLASS_ShellUIHelper (see page 19490)	This is constant SHDocVw.CLASS_ShellUIHelper.

CLASS_ShellWindows (see page 19491)	This is constant SHDocVw.CLASS_ShellWindows.
CLASS_WebBrowser (see page 19491)	This is constant SHDocVw.CLASS_WebBrowser.
CLASS_WebBrowser_V1 (see page 19491)	This is constant SHDocVw.CLASS_WebBrowser_V1.
CSC_NAVIGATEBACK (see page 19492)	This is constant SHDocVw.CSC_NAVIGATEBACK.
CSC_NAVIGATEFORWARD (see page 19492)	This is constant SHDocVw.CSC_NAVIGATEFORWARD.
CSC_UPDATECOMMANDS (see page 19492)	This is constant SHDocVw.CSC_UPDATECOMMANDS.
DIID__SearchAssistantEvents (see page 19493)	This is constant SHDocVw.DIID__SearchAssistantEvents.
DIID_DShellNameSpaceEvents (see page 19493)	This is constant SHDocVw.DIID_DShellNameSpaceEvents.
DIID_DShellWindowsEvents (see page 19493)	This is constant SHDocVw.DIID_DShellWindowsEvents.
DIID_DWebBrowserEvents (see page 19494)	This is constant SHDocVw.DIID_DWebBrowserEvents.
DIID_DWebBrowserEvents2 (see page 19494)	This is constant SHDocVw.DIID_DWebBrowserEvents2.
dtlOcxPage (see page 19494)	This is constant SHDocVw.dtlOcxPage.
dtlServerPage (see page 19495)	This is constant SHDocVw.dtlServerPage.
HTMLID_FIND (see page 19495)	This is constant SHDocVw.HTMLID_FIND.
HTMLID_OPTIONS (see page 19495)	This is constant SHDocVw.HTMLID_OPTIONS.
HTMLID_VIEWSOURCE (see page 19496)	This is constant SHDocVw.HTMLID_VIEWSOURCE.
IID_IScriptErrorList (see page 19496)	This is constant SHDocVw.IID_IScriptErrorList.
IID_ISearch (see page 19496)	This is constant SHDocVw.IID_ISearch.
IID_ISearchAssistantOC (see page 19497)	This is constant SHDocVw.IID_ISearchAssistantOC.
IID_ISearchAssistantOC2 (see page 19497)	This is constant SHDocVw.IID_ISearchAssistantOC2.
IID_ISearchAssistantOC3 (see page 19497)	This is constant SHDocVw.IID_ISearchAssistantOC3.
IID_ISearches (see page 19498)	This is constant SHDocVw.IID_ISearches.
IID_IShellFavoritesNameSpace (see page 19498)	This is constant SHDocVw.IID_IShellFavoritesNameSpace.
IID_IShellNameSpace (see page 19498)	This is constant SHDocVw.IID_IShellNameSpace.
IID_IShellUIHelper (see page 19499)	This is constant SHDocVw.IID_IShellUIHelper.
IID_IShellWindows (see page 19499)	This is constant SHDocVw.IID_IShellWindows.
IID_IWebBrowser (see page 19499)	This is constant SHDocVw.IID_IWebBrowser.
IID_IWebBrowser2 (see page 19500)	This is constant SHDocVw.IID_IWebBrowser2.
IID_IWebBrowserApp (see page 19500)	This is constant SHDocVw.IID_IWebBrowserApp.
LIBID_SHDocVw (see page 19500)	This is constant SHDocVw.LIBID_SHDocVw.
navAllowAutosearch (see page 19501)	This is constant SHDocVw.navAllowAutosearch.
navBrowserBar (see page 19501)	This is constant SHDocVw.navBrowserBar.
navNoHistory (see page 19501)	This is constant SHDocVw.navNoHistory.
navNoReadFromCache (see page 19502)	This is constant SHDocVw.navNoReadFromCache.
navNoWriteToCache (see page 19502)	This is constant SHDocVw.navNoWriteToCache.
navOpenInNewWindow (see page 19502)	This is constant SHDocVw.navOpenInNewWindow.
OLECMDEXECOPT_DODEFAULT (see page 19503)	This is constant SHDocVw.OLECMDEXECOPT_DODEFAULT.
OLECMDEXECOPT_DONTPROMPTUSER (see page 19503)	This is constant SHDocVw.OLECMDEXECOPT_DONTPROMPTUSER.
OLECMDEXECOPT_PROMPTUSER (see page 19503)	This is constant SHDocVw.OLECMDEXECOPT_PROMPTUSER.
OLECMDEXECOPT_SHOWHELP (see page 19504)	This is constant SHDocVw.OLECMDEXECOPT_SHOWHELP.
OLECMDF_DEFHIDEONCTXTMENU (see page 19504)	This is constant SHDocVw.OLECMDF_DEFHIDEONCTXTMENU.
OLECMDF_ENABLED (see page 19504)	This is constant SHDocVw.OLECMDF_ENABLED.
OLECMDF_INVISIBLE (see page 19505)	This is constant SHDocVw.OLECMDF_INVISIBLE.
OLECMDF_LATCHED (see page 19505)	This is constant SHDocVw.OLECMDF_LATCHED.
OLECMDF_NINCHED (see page 19505)	This is constant SHDocVw.OLECMDF_NINCHED.
OLECMDF_SUPPORTED (see page 19506)	This is constant SHDocVw.OLECMDF_SUPPORTED.
OLECMDID_ALLOWUILESSSAVEAS (see page 19506)	This is constant SHDocVw.OLECMDID_ALLOWUILESSSAVEAS.
OLECMDID_CLEARSELECTION (see page 19506)	This is constant SHDocVw.OLECMDID_CLEARSELECTION.
OLECMDID_CLOSE (see page 19507)	This is constant SHDocVw.OLECMDID_CLOSE.
OLECMDID_COPY (see page 19507)	This is constant SHDocVw.OLECMDID_COPY.
OLECMDID_CUT (see page 19507)	This is constant SHDocVw.OLECMDID_CUT.
OLECMDID_DELETE (see page 19508)	This is constant SHDocVw.OLECMDID_DELETE.
OLECMDID_DONTDOWNLOADCSS (see page 19508)	This is constant SHDocVw.OLECMDID_DONTDOWNLOADCSS.
OLECMDID_ENABLE_INTERACTION (see page 19508)	This is constant SHDocVw.OLECMDID_ENABLE_INTERACTION.

OLECMDID_FIND (see page 19509)	This is constant SHDocVw.OLECMDID_FIND.
OLECMDID_GETPRINTTEMPLATE (see page 19509)	This is constant SHDocVw.OLECMDID_GETPRINTTEMPLATE.
OLECMDID_GETZOOMRANGE (see page 19509)	This is constant SHDocVw.OLECMDID_GETZOOMRANGE.
OLECMDID_HIDETOOLBARS (see page 19510)	This is constant SHDocVw.OLECMDID_HIDETOOLBARS.
OLECMDID_HTTPEQUIV (see page 19510)	This is constant SHDocVw.OLECMDID_HTTPEQUIV.
OLECMDID_HTTPEQUIV_DONE (see page 19510)	This is constant SHDocVw.OLECMDID_HTTPEQUIV_DONE.
OLECMDID_NEW (see page 19511)	This is constant SHDocVw.OLECMDID_NEW.
OLECMDID_ONTOOLBARACTIVATED (see page 19511)	This is constant SHDocVw.OLECMDID_ONTOOLBARACTIVATED.
OLECMDID_ONUNLOAD (see page 19511)	This is constant SHDocVw.OLECMDID_ONUNLOAD.
OLECMDID_OPEN (see page 19512)	This is constant SHDocVw.OLECMDID_OPEN.
OLECMDID_PAGESETUP (see page 19512)	This is constant SHDocVw.OLECMDID_PAGESETUP.
OLECMDID_PASTE (see page 19512)	This is constant SHDocVw.OLECMDID_PASTE.
OLECMDID_PASTESPECIAL (see page 19513)	This is constant SHDocVw.OLECMDID_PASTESPECIAL.
OLECMDID_PREREFRESH (see page 19513)	This is constant SHDocVw.OLECMDID_PREREFRESH.
OLECMDID_PRINT (see page 19513)	This is constant SHDocVw.OLECMDID_PRINT.
OLECMDID_PRINT2 (see page 19514)	This is constant SHDocVw.OLECMDID_PRINT2.
OLECMDID_PRINTPREVIEW (see page 19514)	This is constant SHDocVw.OLECMDID_PRINTPREVIEW.
OLECMDID_PRINTPREVIEW2 (see page 19514)	This is constant SHDocVw.OLECMDID_PRINTPREVIEW2.
OLECMDID_PROPERTIES (see page 19515)	This is constant SHDocVw.OLECMDID_PROPERTIES.
OLECMDID_PROPERTYBAG2 (see page 19515)	This is constant SHDocVw.OLECMDID_PROPERTYBAG2.
OLECMDID_REDO (see page 19515)	This is constant SHDocVw.OLECMDID_REDO.
OLECMDID_REFRESH (see page 19516)	This is constant SHDocVw.OLECMDID_REFRESH.
OLECMDID_SAVE (see page 19516)	This is constant SHDocVw.OLECMDID_SAVE.
OLECMDID_SAVEAS (see page 19516)	This is constant SHDocVw.OLECMDID_SAVEAS.
OLECMDID_SAVECOPYAS (see page 19517)	This is constant SHDocVw.OLECMDID_SAVECOPYAS.
OLECMDID_SELECTALL (see page 19517)	This is constant SHDocVw.OLECMDID_SELECTALL.
OLECMDID_SETDOWNLOADSTATE (see page 19517)	This is constant SHDocVw.OLECMDID_SETDOWNLOADSTATE.
OLECMDID_SETPRINTTEMPLATE (see page 19518)	This is constant SHDocVw.OLECMDID_SETPRINTTEMPLATE.
OLECMDID_SETPROGRESSMAX (see page 19518)	This is constant SHDocVw.OLECMDID_SETPROGRESSMAX.
OLECMDID_SETPROGRESSPOS (see page 19518)	This is constant SHDocVw.OLECMDID_SETPROGRESSPOS.
OLECMDID_SETPROGRESSTEXT (see page 19519)	This is constant SHDocVw.OLECMDID_SETPROGRESSTEXT.
OLECMDID_SETTITLE (see page 19519)	This is constant SHDocVw.OLECMDID_SETTITLE.
OLECMDID_SHOWFIND (see page 19519)	This is constant SHDocVw.OLECMDID_SHOWFIND.
OLECMDID_SHOWMESSAGE (see page 19520)	This is constant SHDocVw.OLECMDID_SHOWMESSAGE.
OLECMDID_SHOWPAGESETUP (see page 19520)	This is constant SHDocVw.OLECMDID_SHOWPAGESETUP.
OLECMDID_SHOWPRINT (see page 19520)	This is constant SHDocVw.OLECMDID_SHOWPRINT.
OLECMDID_SHOWSCRIPTERROR (see page 19521)	This is constant SHDocVw.OLECMDID_SHOWSCRIPTERROR.
OLECMDID_SPELL (see page 19521)	This is constant SHDocVw.OLECMDID_SPELL.
OLECMDID_STOP (see page 19521)	This is constant SHDocVw.OLECMDID_STOP.
OLECMDID_STOPDOWNLOAD (see page 19522)	This is constant SHDocVw.OLECMDID_STOPDOWNLOAD.
OLECMDID_UNDO (see page 19522)	This is constant SHDocVw.OLECMDID_UNDO.
OLECMDID_UPDATECOMMANDS (see page 19522)	This is constant SHDocVw.OLECMDID_UPDATECOMMANDS.
OLECMDID_UPDATEPAGESTATUS (see page 19523)	This is constant SHDocVw.OLECMDID_UPDATEPAGESTATUS.
OLECMDID_ZOOM (see page 19523)	This is constant SHDocVw.OLECMDID_ZOOM.
READYSTATE_COMPLETE (see page 19523)	This is constant SHDocVw.READYSTATE_COMPLETE.
READYSTATE_INTERACTIVE (see page 19524)	This is constant SHDocVw.READYSTATE_INTERACTIVE.
READYSTATE_LOADED (see page 19524)	This is constant SHDocVw.READYSTATE_LOADED.
READYSTATE_LOADING (see page 19524)	This is constant SHDocVw.READYSTATE_LOADING.
READYSTATE_UNINITIALIZED (see page 19525)	This is constant SHDocVw.READYSTATE_UNINITIALIZED.
REFRESH_COMPLETELY (see page 19525)	This is constant SHDocVw.REFRESH_COMPLETELY.
REFRESH_CONTINUE (see page 19525)	This is constant SHDocVw.REFRESH_CONTINUE.
REFRESH_IFEXPIRED (see page 19526)	This is constant SHDocVw.REFRESH_IFEXPIRED.
REFRESH_NORMAL (see page 19526)	This is constant SHDocVw.REFRESH_NORMAL.
secureLockIconMixed (see page 19526)	This is constant SHDocVw.secureLockIconMixed.

secureLockIconSecure128Bit (see page 19527)	This is constant SHDocVw.secureLockIconSecure128Bit.
secureLockIconSecure40Bit (see page 19527)	This is constant SHDocVw.secureLockIconSecure40Bit.
secureLockIconSecure56Bit (see page 19527)	This is constant SHDocVw.secureLockIconSecure56Bit.
secureLockIconSecureFortezza (see page 19528)	This is constant SHDocVw.secureLockIconSecureFortezza.
secureLockIconSecureUnknownBits (see page 19528)	This is constant SHDocVw.secureLockIconSecureUnknownBits.
secureLockIconUnsecure (see page 19528)	This is constant SHDocVw.secureLockIconUnsecure.
SHDocVwMajorVersion (see page 19529)	This is constant SHDocVw.SHDocVwMajorVersion.
SHDocVwMinorVersion (see page 19529)	This is constant SHDocVw.SHDocVwMinorVersion.
SWC_3RDPARTY (see page 19529)	This is constant SHDocVw.SWC_3RDPARTY.
SWC_BROWSER (see page 19530)	This is constant SHDocVw.SWC_BROWSER.
SWC_CALLBACK (see page 19530)	This is constant SHDocVw.SWC_CALLBACK.
SWC_EXPLORER (see page 19530)	This is constant SHDocVw.SWC_EXPLORER.
SWFO_COOKIEPASSED (see page 19531)	This is constant SHDocVw.SWFO_COOKIEPASSED.
SWFO_INCLUDEPENDING (see page 19531)	This is constant SHDocVw.SWFO_INCLUDEPENDING.
SWFO_NEEDDISPATCH (see page 19531)	This is constant SHDocVw.SWFO_NEEDDISPATCH.

Interfaces

	Name	Description
	_SearchAssistantEvents (see page 19276)	This is class SHDocVw._SearchAssistantEvents.
	DShellNameSpaceEvents (see page 19278)	This is class SHDocVw.DShellNameSpaceEvents.
	DShellWindowsEvents (see page 19279)	This is class SHDocVw.DShellWindowsEvents.
	DWebBrowserEvents (see page 19281)	This is class SHDocVw.DWebBrowserEvents.
	DWebBrowserEvents2 (see page 19286)	This is class SHDocVw.DWebBrowserEvents2.
	IScriptErrorList (see page 19295)	This is class SHDocVw.IScriptErrorList.
	IScriptErrorListDisp (see page 19299)	This is class SHDocVw.IScriptErrorListDisp.
	ISearch (see page 19303)	This is class SHDocVw.ISearch.
	ISearchAssistantOC (see page 19306)	This is class SHDocVw.ISearchAssistantOC.
	ISearchAssistantOC2 (see page 19316)	This is class SHDocVw.ISearchAssistantOC2.
	ISearchAssistantOC2Disp (see page 19318)	This is class SHDocVw.ISearchAssistantOC2Disp.
	ISearchAssistantOC3 (see page 19326)	This is class SHDocVw.ISearchAssistantOC3.
	ISearchAssistantOC3Disp (see page 19329)	This is class SHDocVw.ISearchAssistantOC3Disp.
	ISearchAssistantOCDisp (see page 19337)	This is class SHDocVw.ISearchAssistantOCDisp.
	ISearchDisp (see page 19344)	This is class SHDocVw.ISearchDisp.
	ISearches (see page 19346)	This is class SHDocVw.ISearches.
	ISearchesDisp (see page 19348)	This is class SHDocVw.ISearchesDisp.
	IShellFavoritesNameSpace (see page 19350)	This is class SHDocVw.IShellFavoritesNameSpace.
	IShellFavoritesNameSpaceDisp (see page 19355)	This is class SHDocVw.IShellFavoritesNameSpaceDisp.
	IShellNameSpace (see page 19359)	This is class SHDocVw.IShellNameSpace.
	IShellNameSpaceDisp (see page 19368)	This is class SHDocVw.IShellNameSpaceDisp.
	IShellUIHelper (see page 19376)	This is class SHDocVw.IShellUIHelper.
	IShellUIHelperDisp (see page 19380)	This is class SHDocVw.IShellUIHelperDisp.
	IShellWindows (see page 19384)	This is class SHDocVw.IShellWindows.
	IShellWindowsDisp (see page 19388)	This is class SHDocVw.IShellWindowsDisp.
	IWebBrowser (see page 19392)	This is class SHDocVw.IWebBrowser.
	IWebBrowser2 (see page 19403)	This is class SHDocVw.IWebBrowser2.
	IWebBrowser2Disp (see page 19412)	This is class SHDocVw.IWebBrowser2Disp.
	IWebBrowserApp (see page 19425)	This is class SHDocVw.IWebBrowserApp.
	IWebBrowserAppDisp (see page 19434)	This is class SHDocVw.IWebBrowserAppDisp.
	IWebBrowserDisp (see page 19444)	This is class SHDocVw.IWebBrowserDisp.

Types

Name	Description
BrowserNavConstants (see page 19453)	This is type SHDocVw.BrowserNavConstants.
CommandStateChangeConstants (see page 19453)	This is type SHDocVw.CommandStateChangeConstants.
CScriptErrorList (see page 19453)	This is type SHDocVw.CScriptErrorList.

InternetExplorer (see page 19454)	This is type SHDocVw.InternetExplorer.
OLECMDEXECOPT (see page 19454)	OLECMDF (see page 19455) influences the way in which an OLECMDID (see page 19455) command is executed.
OLECMDF (see page 19455)	OLECMDF represents the type of support an Automation object provides for a specific command at a specific time.
OLECMDID (see page 19455)	OLECMDID represents a command that can be executed by an Automation object.
POleVariant1 (see page 19456)	This is type SHDocVw.POleVariant1.
RefreshConstants (see page 19456)	This is type SHDocVw.RefreshConstants.
SearchAssistantOC (see page 19456)	This is type SHDocVw.SearchAssistantOC.
SecureLockIconConstants (see page 19457)	This is type SHDocVw.SecureLockIconConstants.
ShellBrowserWindow (see page 19457)	This is type SHDocVw.ShellBrowserWindow.
ShellNameSpace (see page 19457)	This is type SHDocVw.ShellNameSpace.
ShellUIHelper (see page 19458)	This is type SHDocVw.ShellUIHelper.
ShellWindowFindWindowOptions (see page 19458)	This is type SHDocVw.ShellWindowFindWindowOptions.
ShellWindows (see page 19458)	This is type SHDocVw.ShellWindows.
ShellWindowTypeConstants (see page 19459)	This is type SHDocVw.ShellWindowTypeConstants.
tagREADYSTATE (see page 19459)	This is type SHDocVw.tagREADYSTATE.
TInternetExplorerBeforeNavigate2 (see page 19459)	This is type SHDocVw.TInternetExplorerBeforeNavigate2.
TInternetExplorerClientToHostWindow (see page 19460)	This is type SHDocVw.TInternetExplorerClientToHostWindow.
TInternetExplorerCommandStateChange (see page 19460)	This is type SHDocVw.TInternetExplorerCommandStateChange.
TInternetExplorerDocumentComplete (see page 19460)	This is type SHDocVw.TInternetExplorerDocumentComplete.
TInternetExplorerFileDownload (see page 19461)	This is type SHDocVw.TInternetExplorerFileDownload.
TInternetExplorerNavigateComplete2 (see page 19461)	This is type SHDocVw.TInternetExplorerNavigateComplete2.
TInternetExplorerNavigateError (see page 19461)	This is type SHDocVw.TInternetExplorerNavigateError.
TInternetExplorerNewWindow2 (see page 19462)	This is type SHDocVw.TInternetExplorerNewWindow2.
TInternetExplorerOnFullScreen (see page 19462)	This is type SHDocVw.TInternetExplorerOnFullScreen.
TInternetExplorerOnMenuBar (see page 19462)	This is type SHDocVw.TInternetExplorerOnMenuBar.
TInternetExplorerOnStatusBar (see page 19463)	This is type SHDocVw.TInternetExplorerOnStatusBar.
TInternetExplorerOnTheaterMode (see page 19463)	This is type SHDocVw.TInternetExplorerOnTheaterMode.
TInternetExplorerOnToolBar (see page 19463)	This is type SHDocVw.TInternetExplorerOnToolBar.
TInternetExplorerOnVisible (see page 19464)	This is type SHDocVw.TInternetExplorerOnVisible.
TInternetExplorerPrintTemplateInstantiation (see page 19464)	This is type SHDocVw.TInternetExplorerPrintTemplateInstantiation.
TInternetExplorerPrintTemplateTeardown (see page 19464)	This is type SHDocVw.TInternetExplorerPrintTemplateTeardown.
TInternetExplorerPrivacyImpactedStateChange (see page 19465)	This is type SHDocVw.TInternetExplorerPrivacyImpactedStateChange.
TInternetExplorerProgressChange (see page 19465)	This is type SHDocVw.TInternetExplorerProgressChange.
TInternetExplorerPropertyChange (see page 19465)	This is type SHDocVw.TInternetExplorerPropertyChange.
TInternetExplorerSetSecureLockIcon (see page 19466)	This is type SHDocVw.TInternetExplorerSetSecureLockIcon.
TInternetExplorerStatusTextChange (see page 19466)	This is type SHDocVw.TInternetExplorerStatusTextChange.
TInternetExplorerTitleChange (see page 19466)	This is type SHDocVw.TInternetExplorerTitleChange.
TInternetExplorerUpdatePageStatus (see page 19467)	This is type SHDocVw.TInternetExplorerUpdatePageStatus.
TInternetExplorerWindowClosing (see page 19467)	This is type SHDocVw.TInternetExplorerWindowClosing.
TInternetExplorerWindowSetHeight (see page 19467)	This is type SHDocVw.TInternetExplorerWindowSetHeight.
TInternetExplorerWindowSetLeft (see page 19468)	This is type SHDocVw.TInternetExplorerWindowSetLeft.
TInternetExplorerWindowSetResizable (see page 19468)	This is type SHDocVw.TInternetExplorerWindowSetResizable.
TInternetExplorerWindowSetTop (see page 19468)	This is type SHDocVw.TInternetExplorerWindowSetTop.
TInternetExplorerWindowSetWidth (see page 19469)	This is type SHDocVw.TInternetExplorerWindowSetWidth.
TShellNameSpaceFavoritesSelectionChange (see page 19469)	This is type SHDocVw.TShellNameSpaceFavoritesSelectionChange.
TShellWindowsWindowRegistered (see page 19470)	This is type SHDocVw.TShellWindowsWindowRegistered.
TShellWindowsWindowRevoked (see page 19470)	This is type SHDocVw.TShellWindowsWindowRevoked.
TWebBrowser_V1BeforeNavigate (see page 19470)	This is type SHDocVw.TWebBrowser_V1BeforeNavigate.
TWebBrowser_V1CommandStateChange (see page 19471)	This is type SHDocVw.TWebBrowser_V1CommandStateChange.
TWebBrowser_V1FrameBeforeNavigate (see page 19471)	This is type SHDocVw.TWebBrowser_V1FrameBeforeNavigate.
TWebBrowser_V1FrameNavigateComplete (see page 19471)	This is type SHDocVw.TWebBrowser_V1FrameNavigateComplete.
TWebBrowser_V1FrameNewWindow (see page 19472)	This is type SHDocVw.TWebBrowser_V1FrameNewWindow.

TWebBrowser_V1NavigateComplete (see page 19472)	This is type SHDocVw.TWebBrowser_V1NavigateComplete.
TWebBrowser_V1NewWindow (see page 19472)	This is type SHDocVw.TWebBrowser_V1NewWindow.
TWebBrowser_V1ProgressChange (see page 19473)	This is type SHDocVw.TWebBrowser_V1ProgressChange.
TWebBrowser_V1PropertyChange (see page 19473)	This is type SHDocVw.TWebBrowser_V1PropertyChange.
TWebBrowser_V1Quit (see page 19474)	This is type SHDocVw.TWebBrowser_V1Quit.
TWebBrowser_V1StatusTextChange (see page 19474)	This is type SHDocVw.TWebBrowser_V1StatusTextChange.
TWebBrowser_V1TitleChange (see page 19474)	This is type SHDocVw.TWebBrowser_V1TitleChange.
TWebBrowserBeforeNavigate2 (see page 19475)	This is type SHDocVw.TWebBrowserBeforeNavigate2.
TWebBrowserClientToHostWindow (see page 19475)	This is type SHDocVw.TWebBrowserClientToHostWindow.
TWebBrowserCommandStateChange (see page 19475)	This is type SHDocVw.TWebBrowserCommandStateChange.
TWebBrowserDocumentComplete (see page 19476)	This is type SHDocVw.TWebBrowserDocumentComplete.
TWebBrowserFileDownload (see page 19476)	This is type SHDocVw.TWebBrowserFileDownload.
TWebBrowserNavigateComplete2 (see page 19476)	This is type SHDocVw.TWebBrowserNavigateComplete2.
TWebBrowserNavigateError (see page 19477)	This is type SHDocVw.TWebBrowserNavigateError.
TWebBrowserNewWindow2 (see page 19477)	This is type SHDocVw.TWebBrowserNewWindow2.
TWebBrowserOnFullScreen (see page 19477)	This is type SHDocVw.TWebBrowserOnFullScreen.
TWebBrowserOnMenuBar (see page 19478)	This is type SHDocVw.TWebBrowserOnMenuBar.
TWebBrowserOnStatusBar (see page 19478)	This is type SHDocVw.TWebBrowserOnStatusBar.
TWebBrowserOnTheaterMode (see page 19478)	This is type SHDocVw.TWebBrowserOnTheaterMode.
TWebBrowserOnToolBar (see page 19479)	This is type SHDocVw.TWebBrowserOnToolBar.
TWebBrowserOnVisible (see page 19479)	This is type SHDocVw.TWebBrowserOnVisible.
TWebBrowserPrintTemplateInstantiation (see page 19479)	This is type SHDocVw.TWebBrowserPrintTemplateInstantiation.
TWebBrowserPrintTemplateTeardown (see page 19480)	This is type SHDocVw.TWebBrowserPrintTemplateTeardown.
TWebBrowserPrivacyImpactedStateChange (see page 19480)	This is type SHDocVw.TWebBrowserPrivacyImpactedStateChange.
TWebBrowserProgressChange (see page 19480)	This is type SHDocVw.TWebBrowserProgressChange.
TWebBrowserPropertyChange (see page 19481)	This is type SHDocVw.TWebBrowserPropertyChange.
TWebBrowserSetSecureLockIcon (see page 19481)	This is type SHDocVw.TWebBrowserSetSecureLockIcon.
TWebBrowserStatusTextChange (see page 19481)	This is type SHDocVw.TWebBrowserStatusTextChange.
TWebBrowserTitleChange (see page 19482)	This is type SHDocVw.TWebBrowserTitleChange.
TWebBrowserUpdatePageStatus (see page 19482)	This is type SHDocVw.TWebBrowserUpdatePageStatus.
TWebBrowserWindowClosing (see page 19482)	This is type SHDocVw.TWebBrowserWindowClosing.
TWebBrowserWindowSetHeight (see page 19483)	This is type SHDocVw.TWebBrowserWindowSetHeight.
TWebBrowserWindowSetLeft (see page 19483)	This is type SHDocVw.TWebBrowserWindowSetLeft.
TWebBrowserWindowSetResizable (see page 19483)	This is type SHDocVw.TWebBrowserWindowSetResizable.
TWebBrowserWindowSetTop (see page 19484)	This is type SHDocVw.TWebBrowserWindowSetTop.
TWebBrowserWindowSetWidth (see page 19484)	This is type SHDocVw.TWebBrowserWindowSetWidth.
WebBrowser (see page 19484)	This is type SHDocVw.WebBrowser.
WebBrowser_V1 (see page 19485)	This is type SHDocVw.WebBrowser_V1.

132.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	CoCScriptErrorList (see page 19045)	This is class SHDocVw.CoCScriptErrorList.
	CoInternetExplorer (see page 19046)	This is class SHDocVw.CoInternetExplorer.
	CoSearchAssistantOC (see page 19047)	This is class SHDocVw.CoSearchAssistantOC.
	CoShellBrowserWindow (see page 19049)	This is class SHDocVw.CoShellBrowserWindow.
	CoShellNameSpace (see page 19050)	This is class SHDocVw.CoShellNameSpace.
	CoShellUIHelper (see page 19051)	This is class SHDocVw.CoShellUIHelper.
	CoShellWindows (see page 19052)	This is class SHDocVw.CoShellWindows.
	TInternetExplorer (see page 19053)	This is class SHDocVw.TInternetExplorer.
	TShellNameSpace (see page 19101)	This is class SHDocVw.TShellNameSpace.
	TShellUIHelper (see page 19121)	This is class SHDocVw.TShellUIHelper.
	TShellWindows (see page 19135)	This is class SHDocVw.TShellWindows.
	TWebBrowser (see page 19147)	TWebBrowser provides access to the Web browser functionality of Microsoft's Shell Doc Object and Control Library (SHDOCVW.DLL).
	TWebBrowser_V1 (see page 19221)	This is class SHDocVw.TWebBrowser_V1.

132.1.1 CoCScriptErrorList Class

Class Hierarchy

SHDocVw.CoCScriptErrorList

Pascal

```
CoCScriptErrorList = class;
```

C++

```
class CoCScriptErrorList;
```

File

SHDocVw

Description

This is class SHDocVw.CoCScriptErrorList.

132.1.1.1 CoCScriptErrorList Members

The following tables list the members exposed by CoCScriptErrorList.

Public Methods

	Name	Description
	Create (see page 19046)	This is Create, a member of class CoCScriptErrorList.
	CreateRemote (see page 19046)	This is CreateRemote, a member of class CoCScriptErrorList.

132.1.1.2 CoCScriptErrorList Methods

The methods of the CoCScriptErrorList class are listed here.

Public Methods

	Name	Description
	Create (see page 19046)	This is Create, a member of class CoCScriptErrorList.
	CreateRemote (see page 19046)	This is CreateRemote, a member of class CoCScriptErrorList.

132.1.1.2.1 CoCScriptErrorList.Create Method

Pascal

```
class function Create: IScriptErrorList;
```

C++

```
__fastcall IScriptErrorList Create();
```

Description

This is Create, a member of class CoCScriptErrorList.

132.1.1.2.2 CoCScriptErrorList.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): IScriptErrorList;
```

C++

```
__fastcall IScriptErrorList CreateRemote(const AnsiString MachineName);
```

Description

This is CreateRemote, a member of class CoCScriptErrorList.

132.1.2 CoInternetExplorer Class

Class Hierarchy

Pascal

```
CoInternetExplorer = class;
```

C++

```
class CoInternetExplorer;
```

File

SHDocVw

Description

This is class SHDocVw.CoInternetExplorer.

132.1.2.1 CoInternetExplorer Members

The following tables list the members exposed by CoInternetExplorer.

Public Methods

	Name	Description
	Create (see page 19047)	This is Create, a member of class CoInternetExplorer.
	CreateRemote (see page 19047)	This is CreateRemote, a member of class CoInternetExplorer.

132.1.2.2 CoInternetExplorer Methods

The methods of the CoInternetExplorer class are listed here.

Public Methods

	Name	Description
	Create (see page 19047)	This is Create, a member of class CoInternetExplorer.
	CreateRemote (see page 19047)	This is CreateRemote, a member of class CoInternetExplorer.

132.1.2.2.1 CoInternetExplorer.Create Method

Pascal

```
class function Create: IWebBrowser2;
```

C++

```
__fastcall IWebBrowser2 Create();
```

Description

This is Create, a member of class CoInternetExplorer.

132.1.2.2.2 CoInternetExplorer.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): IWebBrowser2;
```

C++

```
__fastcall IWebBrowser2 CreateRemote(const AnsiString MachineName);
```

Description

This is CreateRemote, a member of class CoInternetExplorer.

132.1.3 CoSearchAssistantOC Class

Class Hierarchy

SHDocVw.CoSearchAssistantOC

Pascal

```
CoSearchAssistantOC = class;
```

C++

```
class CoSearchAssistantOC;
```

File

SHDocVw

Description

This is class SHDocVw.CoSearchAssistantOC.

132.1.3.1 CoSearchAssistantOC Members

The following tables list the members exposed by CoSearchAssistantOC.

Public Methods

	Name	Description
	Create (see page 19048)	This is Create, a member of class CoSearchAssistantOC.
	CreateRemote (see page 19048)	This is CreateRemote, a member of class CoSearchAssistantOC.

132.1.3.2 CoSearchAssistantOC Methods

The methods of the CoSearchAssistantOC class are listed here.

Public Methods

	Name	Description
	Create (see page 19048)	This is Create, a member of class CoSearchAssistantOC.
	CreateRemote (see page 19048)	This is CreateRemote, a member of class CoSearchAssistantOC.

132.1.3.2.1 CoSearchAssistantOC.Create Method

Pascal

```
class function Create: ISearchAssistantOC3;
```

C++

```
__fastcall ISearchAssistantOC3 Create();
```

Description

This is Create, a member of class CoSearchAssistantOC.

132.1.3.2.2 CoSearchAssistantOC.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): ISearchAssistantOC3;
```

C++

```
__fastcall ISearchAssistantOC3 CreateRemote(const AnsiString MachineName);
```

Description

This is CreateRemote, a member of class CoSearchAssistantOC.

132.1.4 CoShellBrowserWindow Class

Class Hierarchy

SHDocVw.CoShellBrowserWindow

Pascal

```
CoShellBrowserWindow = class;
```

C++

```
class CoShellBrowserWindow;
```

File

SHDocVw

Description

This is class SHDocVw.CoShellBrowserWindow.

132.1.4.1 CoShellBrowserWindow Members

The following tables list the members exposed by CoShellBrowserWindow.

Public Methods

	Name	Description
	Create (see page 19049)	This is Create, a member of class CoShellBrowserWindow.
	CreateRemote (see page 19050)	This is CreateRemote, a member of class CoShellBrowserWindow.

132.1.4.2 CoShellBrowserWindow Methods

The methods of the CoShellBrowserWindow class are listed here.

Public Methods

	Name	Description
	Create (see page 19049)	This is Create, a member of class CoShellBrowserWindow.
	CreateRemote (see page 19050)	This is CreateRemote, a member of class CoShellBrowserWindow.

132.1.4.2.1 CoShellBrowserWindow.Create Method

Pascal

```
class function Create: IWebBrowser2;
```

C++

```
__fastcall IWebBrowser2 Create();
```

Description

This is Create, a member of class CoShellBrowserWindow.

132.1.4.2.2 CoShellBrowserWindow.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): IWebBrowser2;
```

C++

```
__fastcall IWebBrowser2 CreateRemote(const AnsiString MachineName);
```

Description

This is CreateRemote, a member of class CoShellBrowserWindow.

132.1.5 CoShellNameSpace Class

Class Hierarchy

Pascal

```
CoShellNameSpace = class;
```

C++

```
class CoShellNameSpace;
```

File

SHDocVw

Description

This is class SHDocVw.CoShellNameSpace.

132.1.5.1 CoShellNameSpace Members

The following tables list the members exposed by CoShellNameSpace.

Public Methods

	Name	Description
	Create (see page 19051)	This is Create, a member of class CoShellNameSpace.
	CreateRemote (see page 19051)	This is CreateRemote, a member of class CoShellNameSpace.

132.1.5.2 CoShellNameSpace Methods

The methods of the CoShellNameSpace class are listed here.

Public Methods

	Name	Description
	Create (see page 19051)	This is Create, a member of class CoShellNameSpace.
	CreateRemote (see page 19051)	This is CreateRemote, a member of class CoShellNameSpace.

132.1.5.2.1 CoShellNameSpace.Create Method

Pascal

```
class function Create: IShellNameSpace;
```

C++

```
__fastcall IShellNameSpace Create();
```

Description

This is Create, a member of class CoShellNameSpace.

132.1.5.2.2 CoShellNameSpace.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): IShellNameSpace;
```

C++

```
__fastcall IShellNameSpace CreateRemote(const AnsiString MachineName);
```

Description

This is CreateRemote, a member of class CoShellNameSpace.

132.1.6 CoShellUIHelper Class

Class Hierarchy

SHDocVw.CoShellUIHelper

Pascal

```
CoShellUIHelper = class;
```

C++

```
class CoShellUIHelper;
```

File

SHDocVw

Description

This is class SHDocVw.CoShellUIHelper.

132.1.6.1 CoShellUIHelper Members

The following tables list the members exposed by CoShellUIHelper.

Public Methods

	Name	Description
	Create (see page 19052)	This is Create, a member of class CoShellUIHelper.
	CreateRemote (see page 19052)	This is CreateRemote, a member of class CoShellUIHelper.

132.1.6.2 CoShellUIHelper Methods

The methods of the CoShellUIHelper class are listed here.

Public Methods

	Name	Description
	Create (see page 19052)	This is Create, a member of class CoShellUIHelper.
	CreateRemote (see page 19052)	This is CreateRemote, a member of class CoShellUIHelper.

132.1.6.2.1 CoShellUIHelper.Create Method

Pascal

```
class function Create: IShellUIHelper;
```

C++

```
__fastcall IShellUIHelper Create();
```

Description

This is Create, a member of class CoShellUIHelper.

132.1.6.2.2 CoShellUIHelper.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): IShellUIHelper;
```

C++

```
__fastcall IShellUIHelper CreateRemote(const AnsiString MachineName);
```

Description

This is CreateRemote, a member of class CoShellUIHelper.

132.1.7 CoShellWindows Class

Class Hierarchy

SHDocVw.CoShellWindows

Pascal

```
CoShellWindows = class;
```

C++

```
class CoShellWindows;
```

File

SHDocVw

Description

This is class SHDocVw.CoShellWindows.

132.1.7.1 CoShellWindows Members

The following tables list the members exposed by CoShellWindows.

Public Methods

	Name	Description
	Create (see page 19053)	This is Create, a member of class CoShellWindows.
	CreateRemote (see page 19053)	This is CreateRemote, a member of class CoShellWindows.

132.1.7.2 CoShellWindows Methods

The methods of the CoShellWindows class are listed here.

Public Methods

	Name	Description
	Create (see page 19053)	This is Create, a member of class CoShellWindows.
	CreateRemote (see page 19053)	This is CreateRemote, a member of class CoShellWindows.

132.1.7.2.1 CoShellWindows.Create Method

Pascal

```
class function Create: IShellWindows;
```

C++

```
__fastcall IShellWindows Create();
```

Description

This is Create, a member of class CoShellWindows.

132.1.7.2.2 CoShellWindows.CreateRemote Method

Pascal

```
class function CreateRemote(const MachineName: string): IShellWindows;
```

C++

```
__fastcall IShellWindows CreateRemote(const AnsiString MachineName);
```

Description

This is CreateRemote, a member of class CoShellWindows.

132.1.8 TInternetExplorer Class

Class Hierarchy

Pascal

```
TInternetExplorer = class(TOleServer);
```

C++

```
class TInternetExplorer : public TOleServer;
```

File

SHDocVw

Description

This is class SHDocVw.TInternetExplorer.

132.1.8.1 TInternetExplorer Members

The following tables list the members exposed by TInternetExplorer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_AddRef (see page 18104)	Increments the reference count for the number of interface references dependent on the OLE server.
	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 18104)	Decrements the reference count for the calling interface on a object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ConnectEvents (see page 18105)	Establishes a connection using the EventDispatch (see page 18111) property as an event sink.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DisconnectEvents (see page 18106)	Terminates a connection that was established using the ConnectEvents (see page 18105) method.
	Get_AddressBar (see page 19065)	This is Get_AddressBar, a member of class TInternetExplorer.
	Get_Application (see page 19065)	This is Get_Application, a member of class TInternetExplorer.
	Get_Busy (see page 19065)	This is Get_Busy, a member of class TInternetExplorer.
	Get_Container (see page 19065)	This is Get_Container, a member of class TInternetExplorer.
	Get_Document (see page 19065)	This is Get_Document, a member of class TInternetExplorer.
	Get_FullName (see page 19066)	This is Get_FullName, a member of class TInternetExplorer.
	Get_FullScreen (see page 19066)	This is Get_FullScreen, a member of class TInternetExplorer.
	Get_Height (see page 19066)	This is Get_Height, a member of class TInternetExplorer.
	Get_HWnd (see page 19066)	This is Get_HWnd, a member of class TInternetExplorer.
	Get_Left (see page 19067)	This is Get_Left, a member of class TInternetExplorer.
	Get_LocationName (see page 19067)	This is Get_LocationName, a member of class TInternetExplorer.
	Get_LocationURL (see page 19067)	This is Get_LocationURL, a member of class TInternetExplorer.
	Get_MenuBar (see page 19067)	This is Get_MenuBar, a member of class TInternetExplorer.
	Get_Name (see page 19067)	This is Get_Name, a member of class TInternetExplorer.
	Get_Offline (see page 19068)	This is Get_Offline, a member of class TInternetExplorer.
	Get_Parent (see page 19068)	This is Get_Parent, a member of class TInternetExplorer.
	Get_Path (see page 19068)	This is Get_Path, a member of class TInternetExplorer.

	Get_ReadyState (see page 19068)	This is Get_ReadyState, a member of class TInternetExplorer.
	Get_RegisterAsBrowser (see page 19069)	This is Get_RegisterAsBrowser, a member of class TInternetExplorer.
	Get_RegisterAsDropTarget (see page 19069)	This is Get_RegisterAsDropTarget, a member of class TInternetExplorer.
	Get_Resizable (see page 19069)	This is Get_Resizable, a member of class TInternetExplorer.
	Get_Silent (see page 19069)	This is Get_Silent, a member of class TInternetExplorer.
	Get_StatusBar (see page 19069)	This is Get_StatusBar, a member of class TInternetExplorer.
	Get_StatusText (see page 19070)	This is Get_StatusText, a member of class TInternetExplorer.
	Get_TheaterMode (see page 19070)	This is Get_TheaterMode, a member of class TInternetExplorer.
	Get_ToolBar (see page 19070)	This is Get_ToolBar, a member of class TInternetExplorer.
	Get_Top (see page 19070)	This is Get_Top, a member of class TInternetExplorer.
	Get_TopLevelContainer (see page 19071)	This is Get_TopLevelContainer, a member of class TInternetExplorer.
	Get_type_ (see page 19071)	This is Get_type_, a member of class TInternetExplorer.
	Get_Visible (see page 19071)	This is Get_Visible, a member of class TInternetExplorer.
	Get_Width (see page 19071)	This is Get_Width, a member of class TInternetExplorer.
	GetAutoConnect (see page 18106)	Returns the value of the AutoConnect (see page 18110) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetConnectKind (see page 18106)	Returns the value of the ConnectKind (see page 18110) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetServer (see page 18107)	Returns an interface for the COM server.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitServerData (see page 19072)	Initializes the ServerData property to reflect the type library information of the COM server.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	InvokeEvent (see page 19073)	Dispatches an event from the COM server to the appropriate event handler.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 18108)	Connects to the COM server when the Loaded object is first loaded into memory if AutoConnect (see page 18110) is True true.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	QueryInterface (see page 18108)	Returns a reference to a specified interface if the OLE server supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	Set_AddressBar (see page 19078)	This is Set_AddressBar, a member of class TInternetExplorer.
	Set_FullScreen (see page 19078)	This is Set_FullScreen, a member of class TInternetExplorer.
	Set_Height (see page 19079)	This is Set_Height, a member of class TInternetExplorer.
	Set_Left (see page 19079)	This is Set_Left, a member of class TInternetExplorer.
	Set_MenuBar (see page 19079)	This is Set_MenuBar, a member of class TInternetExplorer.
	Set_Offline (see page 19079)	This is Set_Offline, a member of class TInternetExplorer.
	Set_RegisterAsBrowser (see page 19079)	This is Set_RegisterAsBrowser, a member of class TInternetExplorer.
	Set_RegisterAsDropTarget (see page 19080)	This is Set_RegisterAsDropTarget, a member of class TInternetExplorer.
	Set_Resizable (see page 19080)	This is Set_Resizable, a member of class TInternetExplorer.
	Set_Silent (see page 19080)	This is Set_Silent, a member of class TInternetExplorer.
	Set_StatusBar (see page 19080)	This is Set_StatusBar, a member of class TInternetExplorer.
	Set_StatusText (see page 19081)	This is Set_StatusText, a member of class TInternetExplorer.
	Set_TheaterMode (see page 19081)	This is Set_TheaterMode, a member of class TInternetExplorer.
	Set_ToolBar (see page 19081)	This is Set_ToolBar, a member of class TInternetExplorer.

	Set_Top (see page 19081)	This is Set_Top, a member of class TInternetExplorer.
	Set_Visible (see page 19081)	This is Set_Visible, a member of class TInternetExplorer.
	Set_Width (see page 19082)	This is Set_Width, a member of class TInternetExplorer.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoConnect (see page 18109)	Sets the value of the AutoConnect (see page 18110) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnectKind (see page 18109)	Sets the value of the ConnectKind (see page 18110) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	EventDispatch (see page 18111)	This is EventDispatch, a member of class TOleServer.
	ServerData (see page 18111)	Encodes information about the COM server to which ServerData connects.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToWindow (see page 19062)	This is ClientToWindow, a member of class TInternetExplorer.
V	Connect (see page 19062)	Establishes a connection to the COM server.
	ConnectTo (see page 19063)	This is ConnectTo, a member of class TInternetExplorer.
V	Create (see page 19059)	Allocates memory and constructs a safely initialized instance of a component.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 19060)	Disposes of the component and its owned components.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Disconnect (see page 19063)	Terminates the connection to the COM server.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecWB (see page 19064)	This is the overview for the ExecWB method overload.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProperty (see page 19071)	This is GetProperty, a member of class TInternetExplorer.
	GoBack (see page 19072)	This is GoBack, a member of class TInternetExplorer.
	GoForward (see page 19072)	This is GoForward, a member of class TInternetExplorer.
	GoHome (see page 19072)	This is GoHome, a member of class TInternetExplorer.
	GoSearch (see page 19072)	This is GoSearch, a member of class TInternetExplorer.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	Navigate (see page 19073)	This is the overview for the Navigate method overload.
	Navigate2 (see page 19075)	This is the overview for the Navigate2 method overload.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PutProperty (see page 19077)	This is PutProperty, a member of class TInternetExplorer.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	QueryStatusWB (see page 19077)	This is QueryStatusWB, a member of class TInternetExplorer.
	Quit (see page 19077)	This is Quit, a member of class TInternetExplorer.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 19077)	This is Refresh, a member of class TInternetExplorer.
	Refresh2 (see page 19077)	This is the overview for the Refresh2 method overload.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	ShowBrowserBar (see page 19082)	This is the overview for the ShowBrowserBar method overload.
	Stop (see page 19083)	This is Stop, a member of class TInternetExplorer.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	AddressBar (see page 19084)	This is AddressBar, a member of class TInternetExplorer.
R	Application (see page 19084)	This is Application, a member of class TInternetExplorer.
R	Busy (see page 19084)	This is Busy, a member of class TInternetExplorer.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Container (see page 19084)	This is Container, a member of class TInternetExplorer.
R	DefaultInterface (see page 19085)	This is DefaultInterface, a member of class TInternetExplorer.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Document (see page 19085)	This is Document, a member of class TInternetExplorer.
R	FullName (see page 19085)	This is FullName, a member of class TInternetExplorer.
	FullScreen (see page 19085)	This is FullScreen, a member of class TInternetExplorer.
	Height (see page 19086)	This is Height, a member of class TInternetExplorer.
R	HWnd (see page 19086)	This is HWnd, a member of class TInternetExplorer.
	Left (see page 19086)	This is Left, a member of class TInternetExplorer.
R	LocationName (see page 19086)	This is LocationName, a member of class TInternetExplorer.
R	LocationURL (see page 19086)	This is LocationURL, a member of class TInternetExplorer.
	MenuBar (see page 19087)	This is MenuBar, a member of class TInternetExplorer.
R	Name (see page 19087)	Specifies the name of the component as referenced in code.
	Offline (see page 19089)	This is Offline, a member of class TInternetExplorer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Parent (see page 19089)	This is Parent, a member of class TInternetExplorer.
R	Path (see page 19089)	This is Path, a member of class TInternetExplorer.
R	ReadyState (see page 19090)	This is ReadyState, a member of class TInternetExplorer.
	RegisterAsBrowser (see page 19090)	This is RegisterAsBrowser, a member of class TInternetExplorer.
	RegisterAsDropTarget (see page 19090)	This is RegisterAsDropTarget, a member of class TInternetExplorer.
	Resizable (see page 19090)	This is Resizable, a member of class TInternetExplorer.
	Silent (see page 19091)	This is Silent, a member of class TInternetExplorer.
	StatusBar (see page 19091)	This is StatusBar, a member of class TInternetExplorer.
	StatusText (see page 19091)	This is StatusText, a member of class TInternetExplorer.
	TheaterMode (see page 19091)	This is TheaterMode, a member of class TInternetExplorer.
	ToolBar (see page 19091)	This is ToolBar, a member of class TInternetExplorer.
	Top (see page 19092)	This is Top, a member of class TInternetExplorer.
R	TopLevelContainer (see page 19092)	This is TopLevelContainer, a member of class TInternetExplorer.
R	type_ (see page 19092)	This is type_, a member of class TInternetExplorer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 19092)	This is Visible, a member of class TInternetExplorer.
	Width (see page 19093)	This is Width, a member of class TInternetExplorer.

Published Events

	Name	Description
	OnBeforeNavigate2 (see page 19094)	This is OnBeforeNavigate2, a member of class TInternetExplorer.
	OnClientToHostWindow (see page 19094)	This is OnClientToHostWindow, a member of class TInternetExplorer.
	OnCommandStateChange (see page 19094)	This is OnCommandStateChange, a member of class TInternetExplorer.
	OnDocumentComplete (see page 19094)	This is OnDocumentComplete, a member of class TInternetExplorer.
	OnDownloadBegin (see page 19094)	This is OnDownloadBegin, a member of class TInternetExplorer.
	OnDownloadComplete (see page 19095)	This is OnDownloadComplete, a member of class TInternetExplorer.

	OnFileDownload (see page 19095)	This is OnFileDownload, a member of class TInternetExplorer.
	OnFullScreen (see page 19095)	This is OnFullScreen, a member of class TInternetExplorer.
	OnMenuBar (see page 19095)	This is OnMenuBar, a member of class TInternetExplorer.
	OnNavigateComplete2 (see page 19096)	This is OnNavigateComplete2, a member of class TInternetExplorer.
	OnNavigateError (see page 19096)	This is OnNavigateError, a member of class TInternetExplorer.
	OnNewWindow2 (see page 19096)	This is OnNewWindow2, a member of class TInternetExplorer.
	OnPrintTemplateInstantiation (see page 19096)	This is OnPrintTemplateInstantiation, a member of class TInternetExplorer.
	OnPrintTemplateTeardown (see page 19096)	This is OnPrintTemplateTeardown, a member of class TInternetExplorer.
	OnPrivacyImpactedStateChange (see page 19097)	This is OnPrivacyImpactedStateChange, a member of class TInternetExplorer.
	OnProgressChange (see page 19097)	This is OnProgressChange, a member of class TInternetExplorer.
	OnPropertyChange (see page 19097)	This is OnPropertyChange, a member of class TInternetExplorer.
	OnQuit (see page 19097)	This is OnQuit, a member of class TInternetExplorer.
	OnSetSecureLockIcon (see page 19098)	This is OnSetSecureLockIcon, a member of class TInternetExplorer.
	OnStatusBar (see page 19098)	This is OnStatusBar, a member of class TInternetExplorer.
	OnStatusTextChange (see page 19098)	This is OnStatusTextChange, a member of class TInternetExplorer.
	OnTheaterMode (see page 19098)	This is OnTheaterMode, a member of class TInternetExplorer.
	OnTitleChange (see page 19098)	This is OnTitleChange, a member of class TInternetExplorer.
	OnToolBar (see page 19099)	This is OnToolBar, a member of class TInternetExplorer.
	OnUpdatePageStatus (see page 19099)	This is OnUpdatePageStatus, a member of class TInternetExplorer.
	OnVisible (see page 19099)	This is OnVisible, a member of class TInternetExplorer.
	OnWindowClosing (see page 19099)	This is OnWindowClosing, a member of class TInternetExplorer.
	OnWindowSetHeight (see page 19100)	This is OnWindowSetHeight, a member of class TInternetExplorer.
	OnWindowSetLeft (see page 19100)	This is OnWindowSetLeft, a member of class TInternetExplorer.
	OnWindowSetResizable (see page 19100)	This is OnWindowSetResizable, a member of class TInternetExplorer.
	OnWindowSetTop (see page 19100)	This is OnWindowSetTop, a member of class TInternetExplorer.
	OnWindowSetWidth (see page 19100)	This is OnWindowSetWidth, a member of class TInternetExplorer.

Published Properties

	Name	Description
	AutoConnect (see page 18110)	Specifies whether the component automatically connects to the server.
	ConnectKind (see page 18110)	Indicates the type of process to which the ConnectKind component establishes a connection.
	RemoteMachineName (see page 18111)	Specifies the machine running the COM server when ConnectKind (see page 18110) is ckRemote.
	Tag (see page 2808)	Stores an integer value as part of a component.

132.1.8.2 TInternetExplorer.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TInternetExplorer(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

ComponentStyle (see page 2805)

Create (see page 22287)

Destroy (see page 2766)

Free (see page 22300)

Owner (see page 2807)

132.1.8.3 TInternetExplorer.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TInternetExplorer();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

132.1.8.4 TInternetExplorer Methods

The methods of the TInternetExplorer class are listed here.

Protected Methods

	Name	Description
	Get_AddressBar (see page 19065)	This is Get_AddressBar, a member of class TInternetExplorer.
	Get_Application (see page 19065)	This is Get_Application, a member of class TInternetExplorer.
	Get_Busy (see page 19065)	This is Get_Busy, a member of class TInternetExplorer.
	Get_Container (see page 19065)	This is Get_Container, a member of class TInternetExplorer.
	Get_Document (see page 19065)	This is Get_Document, a member of class TInternetExplorer.
	Get_FullName (see page 19066)	This is Get_FullName, a member of class TInternetExplorer.
	Get_FullScreen (see page 19066)	This is Get_FullScreen, a member of class TInternetExplorer.
	Get_Height (see page 19066)	This is Get_Height, a member of class TInternetExplorer.
	Get_HWnd (see page 19066)	This is Get_HWnd, a member of class TInternetExplorer.
	Get_Left (see page 19067)	This is Get_Left, a member of class TInternetExplorer.
	Get_LocationName (see page 19067)	This is Get_LocationName, a member of class TInternetExplorer.
	Get_LocationURL (see page 19067)	This is Get_LocationURL, a member of class TInternetExplorer.
	Get_MenuBar (see page 19067)	This is Get_MenuBar, a member of class TInternetExplorer.
	Get_Name (see page 19067)	This is Get_Name, a member of class TInternetExplorer.
	Get_Offline (see page 19068)	This is Get_Offline, a member of class TInternetExplorer.
	Get_Parent (see page 19068)	This is Get_Parent, a member of class TInternetExplorer.
	Get_Path (see page 19068)	This is Get_Path, a member of class TInternetExplorer.
	Get_ReadyState (see page 19068)	This is Get_ReadyState, a member of class TInternetExplorer.
	Get_RegisterAsBrowser (see page 19069)	This is Get_RegisterAsBrowser, a member of class TInternetExplorer.
	Get_RegisterAsDropTarget (see page 19069)	This is Get_RegisterAsDropTarget, a member of class TInternetExplorer.
	Get_Resizable (see page 19069)	This is Get_Resizable, a member of class TInternetExplorer.
	Get_Silent (see page 19069)	This is Get_Silent, a member of class TInternetExplorer.
	Get_StatusBar (see page 19069)	This is Get_StatusBar, a member of class TInternetExplorer.
	Get_StatusText (see page 19070)	This is Get_StatusText, a member of class TInternetExplorer.
	Get_TheaterMode (see page 19070)	This is Get_TheaterMode, a member of class TInternetExplorer.
	Get_ToolBar (see page 19070)	This is Get_ToolBar, a member of class TInternetExplorer.
	Get_Top (see page 19070)	This is Get_Top, a member of class TInternetExplorer.
	Get_TopLevelContainer (see page 19071)	This is Get_TopLevelContainer, a member of class TInternetExplorer.
	Get_type_ (see page 19071)	This is Get_type_, a member of class TInternetExplorer.
	Get_Visible (see page 19071)	This is Get_Visible, a member of class TInternetExplorer.
	Get_Width (see page 19071)	This is Get_Width, a member of class TInternetExplorer.
V	InitServerData (see page 19072)	Initializes the ServerData property to reflect the type library information of the COM server.
V	InvokeEvent (see page 19073)	Dispatches an event from the COM server to the appropriate event handler.
	Set_AddressBar (see page 19078)	This is Set_AddressBar, a member of class TInternetExplorer.
	Set_FullScreen (see page 19078)	This is Set_FullScreen, a member of class TInternetExplorer.
	Set_Height (see page 19079)	This is Set_Height, a member of class TInternetExplorer.
	Set_Left (see page 19079)	This is Set_Left, a member of class TInternetExplorer.
	Set_MenuBar (see page 19079)	This is Set_MenuBar, a member of class TInternetExplorer.

	Set_Offline (see page 19079)	This is Set_Offline, a member of class TInternetExplorer.
	Set_RegisterAsBrowser (see page 19079)	This is Set_RegisterAsBrowser, a member of class TInternetExplorer.
	Set_RegisterAsDropTarget (see page 19080)	This is Set_RegisterAsDropTarget, a member of class TInternetExplorer.
	Set_Resizable (see page 19080)	This is Set_Resizable, a member of class TInternetExplorer.
	Set_Silent (see page 19080)	This is Set_Silent, a member of class TInternetExplorer.
	Set_StatusBar (see page 19080)	This is Set_StatusBar, a member of class TInternetExplorer.
	Set_StatusText (see page 19081)	This is Set_StatusText, a member of class TInternetExplorer.
	Set_TheaterMode (see page 19081)	This is Set_TheaterMode, a member of class TInternetExplorer.
	Set_ToolBar (see page 19081)	This is Set_ToolBar, a member of class TInternetExplorer.
	Set_Top (see page 19081)	This is Set_Top, a member of class TInternetExplorer.
	Set_Visible (see page 19081)	This is Set_Visible, a member of class TInternetExplorer.
	Set_Width (see page 19082)	This is Set_Width, a member of class TInternetExplorer.

Public Methods

	Name	Description
	ClientToWindow (see page 19062)	This is ClientToWindow, a member of class TInternetExplorer.
V	Connect (see page 19062)	Establishes a connection to the COM server.
	ConnectTo (see page 19063)	This is ConnectTo, a member of class TInternetExplorer.
V	Disconnect (see page 19063)	Terminates the connection to the COM server.
	ExecWB (see page 19064)	This is the overview for the ExecWB method overload.
	GetProperty (see page 19071)	This is GetProperty, a member of class TInternetExplorer.
	GoBack (see page 19072)	This is GoBack, a member of class TInternetExplorer.
	GoForward (see page 19072)	This is GoForward, a member of class TInternetExplorer.
	GoHome (see page 19072)	This is GoHome, a member of class TInternetExplorer.
	GoSearch (see page 19072)	This is GoSearch, a member of class TInternetExplorer.
	Navigate (see page 19073)	This is the overview for the Navigate method overload.
	Navigate2 (see page 19075)	This is the overview for the Navigate2 method overload.
	PutProperty (see page 19077)	This is PutProperty, a member of class TInternetExplorer.
	QueryStatusWB (see page 19077)	This is QueryStatusWB, a member of class TInternetExplorer.
	Quit (see page 19077)	This is Quit, a member of class TInternetExplorer.
	Refresh (see page 19077)	This is Refresh, a member of class TInternetExplorer.
	Refresh2 (see page 19077)	This is the overview for the Refresh2 method overload.
	ShowBrowserBar (see page 19082)	This is the overview for the ShowBrowserBar method overload.
	Stop (see page 19083)	This is Stop, a member of class TInternetExplorer.

132.1.8.4.1 TInternetExplorer.ClientToWindow Method

Pascal

```
procedure ClientToWindow(var pcx: SYSINT; var pcy: SYSINT);
```

C++

```
__fastcall ClientToWindow(SYSINT pcx, SYSINT pcy);
```

Description

This is ClientToWindow, a member of class TInternetExplorer.

132.1.8.4.2 TInternetExplorer.Connect Method

Establishes a connection to the COM server.

Pascal

```
procedure Connect; override;
```

C++

```
virtual __fastcall Connect();
```

Description

Call Connect to connect the Connect component to the COM server it represents. If the AutoConnect property is True true, the Connect component automatically calls Connect when the application is first run.

Do not use Connect if the value of ConnectKind is ckAttachToInterface. When attaching to an interface, use the ConnectTo method, which is introduced by descendant classes, instead.

If the value of ConnectKind is ckRemote, the RemoteMachineName property must be set before calling Connect.

Connect introduces Connect as an abstract a pure virtual method. Descendant classes must override this method to let the Connect component connect to a specific type of COM server.

See Also

AutoConnect (see page 18110)

ConnectKind (see page 18110)

RemoteMachineName (see page 18111)

Disconnect (see page 18105)

Using Component Wrappers

132.1.8.4.3 TInternetExplorer.ConnectTo Method

Pascal

```
procedure ConnectTo(svrIntf: IWebBrowser2);
```

C++

```
__fastcall ConnectTo(IWebBrowser2 svrIntf);
```

Description

This is ConnectTo, a member of class TInternetExplorer.

132.1.8.4.4 TInternetExplorer.Disconnect Method

Terminates the connection to the COM server.

Pascal

```
procedure Disconnect; override;
```

C++

```
virtual __fastcall Disconnect();
```

Description

Call Disconnect to terminate a connection formed using the Connect method.

Disconnect introduces Disconnect as an abstract a pure virtual method. Descendant classes must override this method to let the Disconnect component disconnect from a specific type of COM server.

See Also

Connect (see page 18104)

Using Component Wrappers

132.1.8.4.5 ExecWB Method

This is the overview for the ExecWB method overload.

Overload List

	Name	Description
	TInternetExplorer.ExecWB (OLECMDID, OLECMDEXECOPT) (see page 19064)	This is ExecWB, a member of class TInternetExplorer.
	TInternetExplorer.ExecWB (OLECMDID, OLECMDEXECOPT, OleVariant) (see page 19064)	This is ExecWB, a member of class TInternetExplorer.
	TInternetExplorer.ExecWB (OLECMDID, OLECMDEXECOPT, OleVariant, OleVariant) (see page 19064)	This is ExecWB, a member of class TInternetExplorer.

132.1.8.4.5.1 TInternetExplorer.ExecWB Method (OLECMDID, OLECMDEXECOPT)

Pascal

```
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT); overload;
```

C++

```
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt);
```

Description

This is ExecWB, a member of class TInternetExplorer.

132.1.8.4.5.2 TInternetExplorer.ExecWB Method (OLECMDID, OLECMDEXECOPT, OleVariant)

Pascal

```
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT; var pvaIn: OleVariant); overload;
```

C++

```
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt, OleVariant pvaIn);
```

Description

This is ExecWB, a member of class TInternetExplorer.

132.1.8.4.5.3 TInternetExplorer.ExecWB Method (OLECMDID, OLECMDEXECOPT, OleVariant, OleVariant)

Pascal

```
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT; var pvaIn: OleVariant; var
pvaOut: OleVariant); overload;
```

C++

```
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt, OleVariant pvaIn, OleVariant
pvaOut);
```

Description

This is ExecWB, a member of class TInternetExplorer.

132.1.8.4.6 TInternetExplorer.Get_AddressBar Method

Pascal

```
function Get_AddressBar: WordBool;
```

C++

```
__fastcall WordBool Get_AddressBar();
```

Description

This is Get_AddressBar, a member of class TInternetExplorer.

132.1.8.4.7 TInternetExplorer.Get_Application Method

Pascal

```
function Get_Application: IDispatch;
```

C++

```
__fastcall IDispatch Get_Application();
```

Description

This is Get_Application, a member of class TInternetExplorer.

132.1.8.4.8 TInternetExplorer.Get_Busy Method

Pascal

```
function Get_Busy: WordBool;
```

C++

```
__fastcall WordBool Get_Busy();
```

Description

This is Get_Busy, a member of class TInternetExplorer.

132.1.8.4.9 TInternetExplorer.Get_Container Method

Pascal

```
function Get_Container: IDispatch;
```

C++

```
__fastcall IDispatch Get_Container();
```

Description

This is Get_Container, a member of class TInternetExplorer.

132.1.8.4.10 TInternetExplorer.Get_Document Method

Pascal

```
function Get_Document: IDispatch;
```

C++

```
__fastcall IDispatch Get_Document();
```

Description

This is Get_Document, a member of class TInternetExplorer.

132.1.8.4.11 TInternetExplorer.Get_FullName Method

Pascal

```
function Get_FullName: WideString;
```

C++

```
__fastcall BSTR Get_FullName();
```

Description

This is Get_FullName, a member of class TInternetExplorer.

132.1.8.4.12 TInternetExplorer.Get_FullScreen Method

Pascal

```
function Get_FullScreen: WordBool;
```

C++

```
__fastcall WordBool Get_FullScreen();
```

Description

This is Get_FullScreen, a member of class TInternetExplorer.

132.1.8.4.13 TInternetExplorer.Get_Height Method

Pascal

```
function Get_Height: Integer;
```

C++

```
__fastcall int Get_Height();
```

Description

This is Get_Height, a member of class TInternetExplorer.

132.1.8.4.14 TInternetExplorer.Get_HWnd Method

Pascal

```
function Get_HWnd: Integer;
```

C++

```
__fastcall int Get_HWnd();
```

Description

This is Get_HWnd, a member of class TInternetExplorer.

132.1.8.4.15 TInternetExplorer.Get_Left Method

Pascal

```
function Get_Left: Integer;
```

C++

```
__fastcall int Get_Left();
```

Description

This is Get_Left, a member of class TInternetExplorer.

132.1.8.4.16 TInternetExplorer.Get_LocationName Method

Pascal

```
function Get_LocationName: WideString;
```

C++

```
__fastcall BSTR Get_LocationName();
```

Description

This is Get_LocationName, a member of class TInternetExplorer.

132.1.8.4.17 TInternetExplorer.Get_LocationURL Method

Pascal

```
function Get_LocationURL: WideString;
```

C++

```
__fastcall BSTR Get_LocationURL();
```

Description

This is Get_LocationURL, a member of class TInternetExplorer.

132.1.8.4.18 TInternetExplorer.Get_MenuBar Method

Pascal

```
function Get_MenuBar: WordBool;
```

C++

```
__fastcall WordBool Get_MenuBar();
```

Description

This is Get_MenuBar, a member of class TInternetExplorer.

132.1.8.4.19 TInternetExplorer.Get_Name Method

Pascal

```
function Get_Name: WideString;
```

C++

```
__fastcall BSTR Get_Name();
```

Description

This is Get_Name, a member of class TInternetExplorer.

132.1.8.4.20 TInternetExplorer.Get_Offline Method

Pascal

```
function Get_Offline: WordBool;
```

C++

```
__fastcall WordBool Get_Offline();
```

Description

This is Get_Offline, a member of class TInternetExplorer.

132.1.8.4.21 TInternetExplorer.Get_Parent Method

Pascal

```
function Get_Parent: IDispatch;
```

C++

```
__fastcall IDispatch Get_Parent();
```

Description

This is Get_Parent, a member of class TInternetExplorer.

132.1.8.4.22 TInternetExplorer.Get_Path Method

Pascal

```
function Get_Path: WideString;
```

C++

```
__fastcall BSTR Get_Path();
```

Description

This is Get_Path, a member of class TInternetExplorer.

132.1.8.4.23 TInternetExplorer.Get_ReadyState Method

Pascal

```
function Get_ReadyState: tagREADYSTATE;
```

C++

```
__fastcall tagREADYSTATE Get_ReadyState();
```

Description

This is Get_ReadyState, a member of class TInternetExplorer.

132.1.8.4.24 TInternetExplorer.Get_RegisterAsBrowser Method

Pascal

```
function Get_RegisterAsBrowser: WordBool;
```

C++

```
__fastcall WordBool Get_RegisterAsBrowser();
```

Description

This is Get_RegisterAsBrowser, a member of class TInternetExplorer.

132.1.8.4.25 TInternetExplorer.Get_RegisterAsDropTarget Method

Pascal

```
function Get_RegisterAsDropTarget: WordBool;
```

C++

```
__fastcall WordBool Get_RegisterAsDropTarget();
```

Description

This is Get_RegisterAsDropTarget, a member of class TInternetExplorer.

132.1.8.4.26 TInternetExplorer.Get_Resizable Method

Pascal

```
function Get_Resizable: WordBool;
```

C++

```
__fastcall WordBool Get_Resizable();
```

Description

This is Get_Resizable, a member of class TInternetExplorer.

132.1.8.4.27 TInternetExplorer.Get_Silent Method

Pascal

```
function Get_Silent: WordBool;
```

C++

```
__fastcall WordBool Get_Silent();
```

Description

This is Get_Silent, a member of class TInternetExplorer.

132.1.8.4.28 TInternetExplorer.Get_StatusBar Method

Pascal

```
function Get_StatusBar: WordBool;
```

C++

```
__fastcall WordBool Get_StatusBar();
```

Description

This is Get_StatusBar, a member of class TInternetExplorer.

132.1.8.4.29 TInternetExplorer.Get_StatusText Method

Pascal

```
function Get_StatusText: WideString;
```

C++

```
__fastcall BSTR Get_StatusText();
```

Description

This is Get_StatusText, a member of class TInternetExplorer.

132.1.8.4.30 TInternetExplorer.Get_TheaterMode Method

Pascal

```
function Get_TheaterMode: WordBool;
```

C++

```
__fastcall WordBool Get_TheaterMode();
```

Description

This is Get_TheaterMode, a member of class TInternetExplorer.

132.1.8.4.31 TInternetExplorer.Get_ToolBar Method

Pascal

```
function Get_ToolBar: SYSINT;
```

C++

```
__fastcall SYSINT Get_ToolBar();
```

Description

This is Get_ToolBar, a member of class TInternetExplorer.

132.1.8.4.32 TInternetExplorer.Get_Top Method

Pascal

```
function Get_Top: Integer;
```

C++

```
__fastcall int Get_Top();
```

Description

This is Get_Top, a member of class TInternetExplorer.

132.1.8.4.33 TInternetExplorer.Get_TopLevelContainer Method

Pascal

```
function Get_TopLevelContainer: WordBool;
```

C++

```
__fastcall WordBool Get_TopLevelContainer();
```

Description

This is Get_TopLevelContainer, a member of class TInternetExplorer.

132.1.8.4.34 TInternetExplorer.Get_type_ Method

Pascal

```
function Get_type_: WideString;
```

C++

```
__fastcall BSTR Get_type_();
```

Description

This is Get_type_, a member of class TInternetExplorer.

132.1.8.4.35 TInternetExplorer.Get_Visible Method

Pascal

```
function Get_Visible: WordBool;
```

C++

```
__fastcall WordBool Get_Visible();
```

Description

This is Get_Visible, a member of class TInternetExplorer.

132.1.8.4.36 TInternetExplorer.Get_Width Method

Pascal

```
function Get_Width: Integer;
```

C++

```
__fastcall int Get_Width();
```

Description

This is Get_Width, a member of class TInternetExplorer.

132.1.8.4.37 TInternetExplorer.GetProperty Method

Pascal

```
function GetProperty(const Property_: WideString): OleVariant;
```

C++

```
__fastcall OleVariant GetProperty(const BSTR Property_);
```

Description

This is GetProperty, a member of class TInternetExplorer.

132.1.8.4.38 TInternetExplorer.GoBack Method

Pascal

```
procedure GoBack;
```

C++

```
__fastcall GoBack();
```

Description

This is GoBack, a member of class TInternetExplorer.

132.1.8.4.39 TInternetExplorer.GoForward Method

Pascal

```
procedure GoForward;
```

C++

```
__fastcall GoForward();
```

Description

This is GoForward, a member of class TInternetExplorer.

132.1.8.4.40 TInternetExplorer.GoHome Method

Pascal

```
procedure GoHome;
```

C++

```
__fastcall GoHome();
```

Description

This is GoHome, a member of class TInternetExplorer.

132.1.8.4.41 TInternetExplorer.GoSearch Method

Pascal

```
procedure GoSearch;
```

C++

```
__fastcall GoSearch();
```

Description

This is GoSearch, a member of class TInternetExplorer.

132.1.8.4.42 TInternetExplorer.InitServerData Method

Initializes the ServerData property to reflect the type library information of the COM server.

Pascal

```
procedure InitServerData; override;
```

C++

```
virtual __fastcall InitServerData();
```

Description

The InitServerData constructor calls InitServerData to initialize ServerData with information from the COM server's type library.

InitServerData is an abstract a pure virtual method in InitServerData. Each InitServerData descendant implements this method so that the ServerData property reflects its particular COM server.

See Also

ServerData (see page 18111)

Create (see page 18101)

132.1.8.4.43 TInternetExplorer.InvokeEvent Method

Dispatches an event from the COM server to the appropriate event handler.

Pascal

```
procedure InvokeEvent(DispID: TDispID; var Params: TVariantArray); override;
```

C++

```
virtual __fastcall InvokeEvent(TDispID DispID, TVariantArray Params);
```

Description

InvokeEvent descendants use InvokeEvent internally to link their event handlers to events on the COM server.

DispID is the dispatch ID for the appropriate event handler.

Params passes the parameters of the event handler as an array of OleVariants.

As implemented in InvokeEvent, InvokeEvent does nothing, because InvokeEvent has no events. Descendants that surface events from a COM server override this method so that the event sink specified by EventDispatch can pass events on to the appropriate event handlers.

See Also

EventDispatch (see page 18111)

132.1.8.4.44 Navigate Method

This is the overview for the Navigate method overload.

Overload List

	Name	Description
	TInternetExplorer.Navigate (WideString) (see page 19074)	This is Navigate, a member of class TInternetExplorer.
	TInternetExplorer.Navigate (WideString, OleVariant) (see page 19074)	This is Navigate, a member of class TInternetExplorer.
	TInternetExplorer.Navigate (WideString, OleVariant, OleVariant) (see page 19074)	This is Navigate, a member of class TInternetExplorer.

	TInternetExplorer.Navigate (WideString, OleVariant, OleVariant, OleVariant) (see page 19074)	This is Navigate, a member of class TInternetExplorer.
	TInternetExplorer.Navigate (WideString, OleVariant, OleVariant, OleVariant, OleVariant) (see page 19075)	This is Navigate, a member of class TInternetExplorer.

132.1.8.4.44.1 TInternetExplorer.Navigate Method (WideString)

Pascal

```
procedure Navigate(const URL: WideString); overload;
```

C++

```
__fastcall Navigate(const BSTR URL);
```

Description

This is Navigate, a member of class TInternetExplorer.

132.1.8.4.44.2 TInternetExplorer.Navigate Method (WideString, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags);
```

Description

This is Navigate, a member of class TInternetExplorer.

132.1.8.4.44.3 TInternetExplorer.Navigate Method (WideString, OleVariant, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName);
```

Description

This is Navigate, a member of class TInternetExplorer.

132.1.8.4.44.4 TInternetExplorer.Navigate Method (WideString, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData);
```

Description

This is Navigate, a member of class TInternetExplorer.

132.1.8.4.44.5 TInternetExplorer.Navigate Method (WideString, OleVariant, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate, a member of class TInternetExplorer.

132.1.8.4.45 Navigate2 Method

This is the overview for the Navigate2 method overload.

Overload List

	Name	Description
	TInternetExplorer.Navigate2 (OleVariant) (see page 19075)	This is Navigate2, a member of class TInternetExplorer.
	TInternetExplorer.Navigate2 (OleVariant, OleVariant) (see page 19076)	This is Navigate2, a member of class TInternetExplorer.
	TInternetExplorer.Navigate2 (OleVariant, OleVariant, OleVariant) (see page 19076)	This is Navigate2, a member of class TInternetExplorer.
	TInternetExplorer.Navigate2 (OleVariant, OleVariant, OleVariant, OleVariant) (see page 19076)	This is Navigate2, a member of class TInternetExplorer.
	TInternetExplorer.Navigate2 (OleVariant, OleVariant, OleVariant, OleVariant, OleVariant) (see page 19076)	This is Navigate2, a member of class TInternetExplorer.

132.1.8.4.45.1 TInternetExplorer.Navigate2 Method (OleVariant)

Pascal

```
procedure Navigate2(var URL: OleVariant); overload;
```

C++

```
__fastcall Navigate2(OleVariant URL);
```

Description

This is Navigate2, a member of class TInternetExplorer.

132.1.8.4.45.2 TInternetExplorer.Navigate2 Method (OleVariant, OleVariant)

Pascal

```
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant); overload;
```

C++

```
__fastcall Navigate2(OleVariant URL, OleVariant Flags);
```

Description

This is Navigate2, a member of class TInternetExplorer.

132.1.8.4.45.3 TInternetExplorer.Navigate2 Method (OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant; var TargetFrameName:
OleVariant); overload;
```

C++

```
__fastcall Navigate2(OleVariant URL, OleVariant Flags, OleVariant TargetFrameName);
```

Description

This is Navigate2, a member of class TInternetExplorer.

132.1.8.4.45.4 TInternetExplorer.Navigate2 Method (OleVariant, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant; var TargetFrameName:
OleVariant; var PostData: OleVariant); overload;
```

C++

```
__fastcall Navigate2(OleVariant URL, OleVariant Flags, OleVariant TargetFrameName, OleVariant
PostData);
```

Description

This is Navigate2, a member of class TInternetExplorer.

132.1.8.4.45.5 TInternetExplorer.Navigate2 Method (OleVariant, OleVariant, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant; var TargetFrameName:
OleVariant; var PostData: OleVariant; var Headers: OleVariant); overload;
```

C++

```
__fastcall Navigate2(OleVariant URL, OleVariant Flags, OleVariant TargetFrameName, OleVariant
PostData, OleVariant Headers);
```

Description

This is Navigate2, a member of class TInternetExplorer.

132.1.8.4.46 TInternetExplorer.PutProperty Method

Pascal

```
procedure PutProperty(const Property_: WideString; vtValue: OleVariant);
```

C++

```
__fastcall PutProperty(const BSTR Property_, OleVariant vtValue);
```

Description

This is PutProperty, a member of class TInternetExplorer.

132.1.8.4.47 TInternetExplorer.QueryStatusWB Method

Pascal

```
function QueryStatusWB(cmdID: OLECMDID): OLECMDF;
```

C++

```
__fastcall OLECMDF QueryStatusWB(OLECMDID cmdID);
```

Description

This is QueryStatusWB, a member of class TInternetExplorer.

132.1.8.4.48 TInternetExplorer.Quit Method

Pascal

```
procedure Quit;
```

C++

```
__fastcall Quit();
```

Description

This is Quit, a member of class TInternetExplorer.

132.1.8.4.49 TInternetExplorer.Refresh Method

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

This is Refresh, a member of class TInternetExplorer.

132.1.8.4.50 Refresh2 Method

This is the overview for the Refresh2 method overload.

Overload List

	Name	Description
	TInternetExplorer.Refresh2 () (see page 19078)	This is Refresh2, a member of class TInternetExplorer.
	TInternetExplorer.Refresh2 (OleVariant) (see page 19078)	This is Refresh2, a member of class TInternetExplorer.

132.1.8.4.50.1 TInternetExplorer.Refresh2 Method ()

Pascal

```
procedure Refresh2; overload;
```

C++

```
__fastcall Refresh2();
```

Description

This is Refresh2, a member of class TInternetExplorer.

132.1.8.4.50.2 TInternetExplorer.Refresh2 Method (OleVariant)

Pascal

```
procedure Refresh2(var Level: OleVariant); overload;
```

C++

```
__fastcall Refresh2(OleVariant Level);
```

Description

This is Refresh2, a member of class TInternetExplorer.

132.1.8.4.51 TInternetExplorer.Set_AddressBar Method

Pascal

```
procedure Set_AddressBar(Value: WordBool);
```

C++

```
__fastcall Set_AddressBar(WordBool Value);
```

Description

This is Set_AddressBar, a member of class TInternetExplorer.

132.1.8.4.52 TInternetExplorer.Set_FullScreen Method

Pascal

```
procedure Set_FullScreen(pbFullScreen: WordBool);
```

C++

```
__fastcall Set_FullScreen(WordBool pbFullScreen);
```

Description

This is Set_FullScreen, a member of class TInternetExplorer.

132.1.8.4.53 TInternetExplorer.Set_Height Method

Pascal

```
procedure Set_Height(pl: Integer);
```

C++

```
__fastcall Set_Height(int pl);
```

Description

This is Set_Height, a member of class TInternetExplorer.

132.1.8.4.54 TInternetExplorer.Set_Left Method

Pascal

```
procedure Set_Left(pl: Integer);
```

C++

```
__fastcall Set_Left(int pl);
```

Description

This is Set_Left, a member of class TInternetExplorer.

132.1.8.4.55 TInternetExplorer.Set_MenuBar Method

Pascal

```
procedure Set_MenuBar(Value: WordBool);
```

C++

```
__fastcall Set_MenuBar(WordBool Value);
```

Description

This is Set_MenuBar, a member of class TInternetExplorer.

132.1.8.4.56 TInternetExplorer.Set_Offline Method

Pascal

```
procedure Set_Offline(pbOffline: WordBool);
```

C++

```
__fastcall Set_Offline(WordBool pbOffline);
```

Description

This is Set_Offline, a member of class TInternetExplorer.

132.1.8.4.57 TInternetExplorer.Set_RegisterAsBrowser Method

Pascal

```
procedure Set_RegisterAsBrowser(pbRegister: WordBool);
```

C++

```
__fastcall Set_RegisterAsBrowser(WordBool pbRegister);
```

Description

This is Set_RegisterAsBrowser, a member of class TInternetExplorer.

132.1.8.4.58 TInternetExplorer.Set_RegisterAsDropTarget Method

Pascal

```
procedure Set_RegisterAsDropTarget(pbRegister: WordBool);
```

C++

```
__fastcall Set_RegisterAsDropTarget(WordBool pbRegister);
```

Description

This is Set_RegisterAsDropTarget, a member of class TInternetExplorer.

132.1.8.4.59 TInternetExplorer.Set_Resizable Method

Pascal

```
procedure Set_Resizable(Value: WordBool);
```

C++

```
__fastcall Set_Resizable(WordBool Value);
```

Description

This is Set_Resizable, a member of class TInternetExplorer.

132.1.8.4.60 TInternetExplorer.Set_Silent Method

Pascal

```
procedure Set_Silent(pbSilent: WordBool);
```

C++

```
__fastcall Set_Silent(WordBool pbSilent);
```

Description

This is Set_Silent, a member of class TInternetExplorer.

132.1.8.4.61 TInternetExplorer.Set_StatusBar Method

Pascal

```
procedure Set_StatusBar(pBool: WordBool);
```

C++

```
__fastcall Set_StatusBar(WordBool pBool);
```

Description

This is Set_StatusBar, a member of class TInternetExplorer.

132.1.8.4.62 TInternetExplorer.Set_StatusText Method

Pascal

```
procedure Set_StatusText(const StatusText: WideString);
```

C++

```
__fastcall Set_StatusText(const BSTR StatusText);
```

Description

This is Set_StatusText, a member of class TInternetExplorer.

132.1.8.4.63 TInternetExplorer.Set_TheaterMode Method

Pascal

```
procedure Set_TheaterMode(pbRegister: WordBool);
```

C++

```
__fastcall Set_TheaterMode(WordBool pbRegister);
```

Description

This is Set_TheaterMode, a member of class TInternetExplorer.

132.1.8.4.64 TInternetExplorer.Set_ToolBar Method

Pascal

```
procedure Set_ToolBar(Value: SYSINT);
```

C++

```
__fastcall Set_ToolBar(SYSINT Value);
```

Description

This is Set_ToolBar, a member of class TInternetExplorer.

132.1.8.4.65 TInternetExplorer.Set_Top Method

Pascal

```
procedure Set_Top(pl: Integer);
```

C++

```
__fastcall Set_Top(int pl);
```

Description

This is Set_Top, a member of class TInternetExplorer.

132.1.8.4.66 TInternetExplorer.Set_Visible Method

Pascal

```
procedure Set_Visible(pBool: WordBool);
```

C++

```
__fastcall Set_Visible(WordBool pBool);
```

Description

This is Set_Visible, a member of class TInternetExplorer.

132.1.8.4.67 TInternetExplorer.Set_Width Method

Pascal

```
procedure Set_Width(pl: Integer);
```

C++

```
__fastcall Set_Width(int pl);
```

Description

This is Set_Width, a member of class TInternetExplorer.

132.1.8.4.68 ShowBrowserBar Method

This is the overview for the ShowBrowserBar method overload.

Overload List

	Name	Description
	TInternetExplorer.ShowBrowserBar (OleVariant) (see page 19082)	This is ShowBrowserBar, a member of class TInternetExplorer.
	TInternetExplorer.ShowBrowserBar (OleVariant, OleVariant) (see page 19082)	This is ShowBrowserBar, a member of class TInternetExplorer.
	TInternetExplorer.ShowBrowserBar (OleVariant, OleVariant, OleVariant) (see page 19083)	This is ShowBrowserBar, a member of class TInternetExplorer.

132.1.8.4.68.1 TInternetExplorer.ShowBrowserBar Method (OleVariant)

Pascal

```
procedure ShowBrowserBar(var pvaClsid: OleVariant); overload;
```

C++

```
__fastcall ShowBrowserBar(OleVariant pvaClsid);
```

Description

This is ShowBrowserBar, a member of class TInternetExplorer.

132.1.8.4.68.2 TInternetExplorer.ShowBrowserBar Method (OleVariant, OleVariant)

Pascal

```
procedure ShowBrowserBar(var pvaClsid: OleVariant; var pvarShow: OleVariant); overload;
```

C++

```
__fastcall ShowBrowserBar(OleVariant pvaClsid, OleVariant pvarShow);
```

Description

This is ShowBrowserBar, a member of class TInternetExplorer.

132.1.8.4.68.3 TInternetExplorer.ShowBrowserBar Method (OleVariant, OleVariant, OleVariant)

Pascal

```
procedure ShowBrowserBar(var pvaClsid: OleVariant; var pvarShow: OleVariant; var pvarSize:
OleVariant); overload;
```

C++

```
__fastcall ShowBrowserBar(OleVariant pvaClsid, OleVariant pvarShow, OleVariant pvarSize);
```

Description

This is ShowBrowserBar, a member of class TInternetExplorer.

132.1.8.4.69 TInternetExplorer.Stop Method

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

This is Stop, a member of class TInternetExplorer.

132.1.8.5 TInternetExplorer Properties

The properties of the TInternetExplorer class are listed here.

Public Properties

	Name	Description
	AddressBar (see page 19084)	This is AddressBar, a member of class TInternetExplorer.
R	Application (see page 19084)	This is Application, a member of class TInternetExplorer.
R	Busy (see page 19084)	This is Busy, a member of class TInternetExplorer.
R	Container (see page 19084)	This is Container, a member of class TInternetExplorer.
R	DefaultInterface (see page 19085)	This is DefaultInterface, a member of class TInternetExplorer.
R	Document (see page 19085)	This is Document, a member of class TInternetExplorer.
R	FullName (see page 19085)	This is FullName, a member of class TInternetExplorer.
	FullScreen (see page 19085)	This is FullScreen, a member of class TInternetExplorer.
	Height (see page 19086)	This is Height, a member of class TInternetExplorer.
R	HWnd (see page 19086)	This is HWnd, a member of class TInternetExplorer.
	Left (see page 19086)	This is Left, a member of class TInternetExplorer.
R	LocationName (see page 19086)	This is LocationName, a member of class TInternetExplorer.
R	LocationURL (see page 19086)	This is LocationURL, a member of class TInternetExplorer.
	MenuBar (see page 19087)	This is MenuBar, a member of class TInternetExplorer.
R	Name (see page 19087)	Specifies the name of the component as referenced in code.
	Offline (see page 19089)	This is Offline, a member of class TInternetExplorer.
R	Parent (see page 19089)	This is Parent, a member of class TInternetExplorer.
R	Path (see page 19089)	This is Path, a member of class TInternetExplorer.
R	ReadyState (see page 19090)	This is ReadyState, a member of class TInternetExplorer.
	RegisterAsBrowser (see page 19090)	This is RegisterAsBrowser, a member of class TInternetExplorer.
	RegisterAsDropTarget (see page 19090)	This is RegisterAsDropTarget, a member of class TInternetExplorer.
	Resizable (see page 19090)	This is Resizable, a member of class TInternetExplorer.

	Silent (see page 19091)	This is Silent, a member of class TInternetExplorer.
	StatusBar (see page 19091)	This is StatusBar, a member of class TInternetExplorer.
	StatusText (see page 19091)	This is StatusText, a member of class TInternetExplorer.
	TheaterMode (see page 19091)	This is TheaterMode, a member of class TInternetExplorer.
	ToolBar (see page 19091)	This is ToolBar, a member of class TInternetExplorer.
	Top (see page 19092)	This is Top, a member of class TInternetExplorer.
R	TopLevelContainer (see page 19092)	This is TopLevelContainer, a member of class TInternetExplorer.
R	type_ (see page 19092)	This is type_, a member of class TInternetExplorer.
	Visible (see page 19092)	This is Visible, a member of class TInternetExplorer.
	Width (see page 19093)	This is Width, a member of class TInternetExplorer.

132.1.8.5.1 TInternetExplorer.AddressBar Property

Pascal

```
property AddressBar: WordBool;
```

C++

```
__property WordBool AddressBar;
```

Description

This is AddressBar, a member of class TInternetExplorer.

132.1.8.5.2 TInternetExplorer.Application Property

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

This is Application, a member of class TInternetExplorer.

132.1.8.5.3 TInternetExplorer.Busy Property

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

This is Busy, a member of class TInternetExplorer.

132.1.8.5.4 TInternetExplorer.Container Property

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

This is Container, a member of class TInternetExplorer.

132.1.8.5.5 TInternetExplorer.DefaultInterface Property

Pascal

```
property DefaultInterface: IWebBrowser2;
```

C++

```
__property IWebBrowser2 DefaultInterface;
```

Description

This is DefaultInterface, a member of class TInternetExplorer.

132.1.8.5.6 TInternetExplorer.Document Property

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

This is Document, a member of class TInternetExplorer.

132.1.8.5.7 TInternetExplorer.FullName Property

Pascal

```
property FullName: WideString;
```

C++

```
__property BSTR FullName;
```

Description

This is FullName, a member of class TInternetExplorer.

132.1.8.5.8 TInternetExplorer.FullScreen Property

Pascal

```
property FullScreen: WordBool;
```

C++

```
__property WordBool FullScreen;
```

Description

This is FullScreen, a member of class TInternetExplorer.

132.1.8.5.9 TInternetExplorer.Height Property

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

This is Height, a member of class TInternetExplorer.

132.1.8.5.10 TInternetExplorer.HWnd Property

Pascal

```
property HWnd: Integer;
```

C++

```
__property int HWnd;
```

Description

This is HWnd, a member of class TInternetExplorer.

132.1.8.5.11 TInternetExplorer.Left Property

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

This is Left, a member of class TInternetExplorer.

132.1.8.5.12 TInternetExplorer.LocationName Property

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

This is LocationName, a member of class TInternetExplorer.

132.1.8.5.13 TInternetExplorer.LocationURL Property

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

This is LocationURL, a member of class TInternetExplorer.

132.1.8.5.14 TInternetExplorer.MenuBar Property

Pascal

```
property MenuBar: WordBool;
```

C++

```
__property WordBool MenuBar;
```

Description

This is MenuBar, a member of class TInternetExplorer.

132.1.8.5.15 TInternetExplorer.Name Property

Specifies the name of the component as referenced in code.

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

Use Name to change the name of a component to reflect its purpose in the current application. By default, the IDE assigns sequential names based on the type of the component, such as 'Button1', 'Button2', and so on.

Use Name to refer to the component in code.

Warning: Changing Name at runtime causes any references to the old name to become undefined. Any subsequent code that uses the old name will cause an exception.

C++ Examples:

```
/*
For the following example, add a button, a status bar, and a
list box to the form. Set the SimplePanel property of the
status bar to true, using the object inspector. Also, populate
the OnMouseUp event handler for the list box.  The following
code fills a list box with the names of all components on the
form when the user clicks the button. References to the
components themselves are inserted along with the names. The
components are all inserted at the front of the list, so that
the last component added to the form is the first component
in the list.  When the user right-clicks the name of an
object in the list, the component's coordinates are displayed
on the status bar. Note that because we are using the right-
click, the item need not be selected.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < ComponentCount; i++)
    ListBox1->Items->InsertObject(0,
                                  Components[i]->Name,
                                  (TObject *)Components[i]);
}
```

```
void __fastcall TForm1::ListBox1MouseUp(TObject *Sender, TMouseButton Button,
      TShiftState Shift, int X, int Y)
{
  if (Button == mbRight)
  {
    TClass ClassRef;
    int Index = ListBox1->ItemAtPos(Point(X,Y), true);
    // only components that are controls have a position
    // make sure the component is a control
    for (ClassRef = ListBox1->Items->Objects[Index]->ClassType();
         ClassRef != NULL;
         ClassRef = ClassRef->ClassParent())
      if (String(ClassRef->ClassName()) == "TControl")
      {
        TControl *TheObject = (TControl *)ListBox1->Items->Objects[Index];
        StatusBar1->SimpleText =
          TheObject->Name + " is at (" +
          IntToStr(TheObject->Left) + ", " +
          IntToStr(TheObject->Top) + ")";
         break;
      }
    if (ClassRef == NULL) // if it wasn't a control
      MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
For the following example, add a button, a status bar, and a
list box to the form. Set the SimplePanel property of the
status bar to true, using the object inspector. Also, populate
the OnMouseUp event handler for the list box.  The following
code fills a list box with the names of all components on the
form when the user clicks the button. References to the
components themselves are inserted along with the names. The
components are all inserted at the front of the list, so that
the last component added to the form is the first component
in the list.  When the user right-clicks the name of an
object in the list, the component's coordinates are displayed
on the status bar. Note that because we are using the right-
click, the item need not be selected.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to Form1.ComponentCount-1 do
    ListBox1.Items.InsertObject(
      0, Form1.Components[I].Name,
      Form1.Components[I] as TObject);
end;

procedure TForm1.ListBox1MouseUp(
  Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X,Y: integer);
var
  APoint: TPoint;
  Index: integer;
  TheObject: TControl;
begin
  if Button = mbRight then
  begin
  APoint.X := X;
  APoint.Y := Y;
  Index := ListBox1.ItemAtPos(APoint, True);
```

```
    if (ListBox1.Items.Objects[Index] is TControl) then
    begin
      TheObject :=
        (ListBox1.Items.Objects[Index] as TControl);
      StatusBar1.SimpleText := TheObject.Name + ' is at (' +
                               IntToStr(TheObject.Left) + ', ' +
                               IntToStr(TheObject.Top) + ') ';
    end
    else
      Beep;
    end;
  end;
```

132.1.8.5.16 TInternetExplorer.Offline Property

Pascal

```
property Offline: WordBool;
```

C++

```
__property WordBool Offline;
```

Description

This is Offline, a member of class TInternetExplorer.

132.1.8.5.17 TInternetExplorer.Parent Property

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

This is Parent, a member of class TInternetExplorer.

132.1.8.5.18 TInternetExplorer.Path Property

Pascal

```
property Path: WideString;
```

C++

```
__property BSTR Path;
```

Description

This is Path, a member of class TInternetExplorer.

132.1.8.5.19 TInternetExplorer.ReadyState Property

Pascal

```
property ReadyState: tagREADYSTATE;
```

C++

```
__property tagREADYSTATE ReadyState;
```

Description

This is ReadyState, a member of class TInternetExplorer.

132.1.8.5.20 TInternetExplorer.RegisterAsBrowser Property

Pascal

```
property RegisterAsBrowser: WordBool;
```

C++

```
__property WordBool RegisterAsBrowser;
```

Description

This is RegisterAsBrowser, a member of class TInternetExplorer.

132.1.8.5.21 TInternetExplorer.RegisterAsDropTarget Property

Pascal

```
property RegisterAsDropTarget: WordBool;
```

C++

```
__property WordBool RegisterAsDropTarget;
```

Description

This is RegisterAsDropTarget, a member of class TInternetExplorer.

132.1.8.5.22 TInternetExplorer.Resizable Property

Pascal

```
property Resizable: WordBool;
```

C++

```
__property WordBool Resizable;
```

Description

This is Resizable, a member of class TInternetExplorer.

132.1.8.5.23 TInternetExplorer.Silent Property

Pascal

```
property Silent: WordBool;
```

C++

```
__property WordBool Silent;
```

Description

This is Silent, a member of class TInternetExplorer.

132.1.8.5.24 TInternetExplorer.StatusBar Property

Pascal

```
property StatusBar: WordBool;
```

C++

```
__property WordBool StatusBar;
```

Description

This is StatusBar, a member of class TInternetExplorer.

132.1.8.5.25 TInternetExplorer.StatusText Property

Pascal

```
property StatusText: WideString;
```

C++

```
__property BSTR StatusText;
```

Description

This is StatusText, a member of class TInternetExplorer.

132.1.8.5.26 TInternetExplorer.TheaterMode Property

Pascal

```
property TheaterMode: WordBool;
```

C++

```
__property WordBool TheaterMode;
```

Description

This is TheaterMode, a member of class TInternetExplorer.

132.1.8.5.27 TInternetExplorer.ToolBar Property

Pascal

```
property ToolBar: SYSINT;
```

C++

```
__property SYSINT ToolBar;
```

Description

This is ToolBar, a member of class TInternetExplorer.

132.1.8.5.28 TInternetExplorer.Top Property

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

This is Top, a member of class TInternetExplorer.

132.1.8.5.29 TInternetExplorer.TopLevelContainer Property

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

This is TopLevelContainer, a member of class TInternetExplorer.

132.1.8.5.30 TInternetExplorer.type_ Property

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

This is type_, a member of class TInternetExplorer.

132.1.8.5.31 TInternetExplorer.Visible Property

Pascal

```
property Visible: WordBool;
```

C++

```
__property WordBool Visible;
```

Description

This is Visible, a member of class TInternetExplorer.

132.1.8.5.32 TInternetExplorer.Width Property

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

This is Width, a member of class TInternetExplorer.

132.1.8.6 TInternetExplorer Events

The events of the TInternetExplorer class are listed here.

Published Events

	Name	Description
	OnBeforeNavigate2 (see page 19094)	This is OnBeforeNavigate2, a member of class TInternetExplorer.
	OnClientToHostWindow (see page 19094)	This is OnClientToHostWindow, a member of class TInternetExplorer.
	OnCommandStateChange (see page 19094)	This is OnCommandStateChange, a member of class TInternetExplorer.
	OnDocumentComplete (see page 19094)	This is OnDocumentComplete, a member of class TInternetExplorer.
	OnDownloadBegin (see page 19094)	This is OnDownloadBegin, a member of class TInternetExplorer.
	OnDownloadComplete (see page 19095)	This is OnDownloadComplete, a member of class TInternetExplorer.
	OnFileDownload (see page 19095)	This is OnFileDownload, a member of class TInternetExplorer.
	OnFullScreen (see page 19095)	This is OnFullScreen, a member of class TInternetExplorer.
	OnMenuBar (see page 19095)	This is OnMenuBar, a member of class TInternetExplorer.
	OnNavigateComplete2 (see page 19096)	This is OnNavigateComplete2, a member of class TInternetExplorer.
	OnNavigateError (see page 19096)	This is OnNavigateError, a member of class TInternetExplorer.
	OnNewWindow2 (see page 19096)	This is OnNewWindow2, a member of class TInternetExplorer.
	OnPrintTemplateInstantiation (see page 19096)	This is OnPrintTemplateInstantiation, a member of class TInternetExplorer.
	OnPrintTemplateTeardown (see page 19096)	This is OnPrintTemplateTeardown, a member of class TInternetExplorer.
	OnPrivacyImpactedStateChange (see page 19097)	This is OnPrivacyImpactedStateChange, a member of class TInternetExplorer.
	OnProgressChange (see page 19097)	This is OnProgressChange, a member of class TInternetExplorer.
	OnPropertyChange (see page 19097)	This is OnPropertyChange, a member of class TInternetExplorer.
	OnQuit (see page 19097)	This is OnQuit, a member of class TInternetExplorer.
	OnSetSecureLockIcon (see page 19098)	This is OnSetSecureLockIcon, a member of class TInternetExplorer.
	OnStatusBar (see page 19098)	This is OnStatusBar, a member of class TInternetExplorer.
	OnStatusTextChange (see page 19098)	This is OnStatusTextChange, a member of class TInternetExplorer.
	OnTheaterMode (see page 19098)	This is OnTheaterMode, a member of class TInternetExplorer.
	OnTitleChange (see page 19098)	This is OnTitleChange, a member of class TInternetExplorer.
	OnToolBar (see page 19099)	This is OnToolBar, a member of class TInternetExplorer.
	OnUpdatePageStatus (see page 19099)	This is OnUpdatePageStatus, a member of class TInternetExplorer.
	OnVisible (see page 19099)	This is OnVisible, a member of class TInternetExplorer.
	OnWindowClosing (see page 19099)	This is OnWindowClosing, a member of class TInternetExplorer.
	OnWindowSetHeight (see page 19100)	This is OnWindowSetHeight, a member of class TInternetExplorer.
	OnWindowSetLeft (see page 19100)	This is OnWindowSetLeft, a member of class TInternetExplorer.
	OnWindowSetResizable (see page 19100)	This is OnWindowSetResizable, a member of class TInternetExplorer.
	OnWindowSetTop (see page 19100)	This is OnWindowSetTop, a member of class TInternetExplorer.
	OnWindowSetWidth (see page 19100)	This is OnWindowSetWidth, a member of class TInternetExplorer.

132.1.8.6.1 TInternetExplorer.OnBeforeNavigate2 Event

Pascal

```
property OnBeforeNavigate2: TInternetExplorerBeforeNavigate2;
```

C++

```
__property TInternetExplorerBeforeNavigate2 OnBeforeNavigate2;
```

Description

This is OnBeforeNavigate2, a member of class TInternetExplorer.

132.1.8.6.2 TInternetExplorer.OnClientToHostWindow Event

Pascal

```
property OnClientToHostWindow: TInternetExplorerClientToHostWindow;
```

C++

```
__property TInternetExplorerClientToHostWindow OnClientToHostWindow;
```

Description

This is OnClientToHostWindow, a member of class TInternetExplorer.

132.1.8.6.3 TInternetExplorer.OnCommandStateChange Event

Pascal

```
property OnCommandStateChange: TInternetExplorerCommandStateChange;
```

C++

```
__property TInternetExplorerCommandStateChange OnCommandStateChange;
```

Description

This is OnCommandStateChange, a member of class TInternetExplorer.

132.1.8.6.4 TInternetExplorer.OnDocumentComplete Event

Pascal

```
property OnDocumentComplete: TInternetExplorerDocumentComplete;
```

C++

```
__property TInternetExplorerDocumentComplete OnDocumentComplete;
```

Description

This is OnDocumentComplete, a member of class TInternetExplorer.

132.1.8.6.5 TInternetExplorer.OnDownloadBegin Event

Pascal

```
property OnDownloadBegin: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownloadBegin;
```

Description

This is OnDownloadBegin, a member of class TInternetExplorer.

132.1.8.6.6 TInternetExplorer.OnDownloadComplete Event

Pascal

```
property OnDownloadComplete: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownloadComplete;
```

Description

This is OnDownloadComplete, a member of class TInternetExplorer.

132.1.8.6.7 TInternetExplorer.OnFileDownload Event

Pascal

```
property OnFileDownload: TInternetExplorerFileDownload;
```

C++

```
__property TInternetExplorerFileDownload OnFileDownload;
```

Description

This is OnFileDownload, a member of class TInternetExplorer.

132.1.8.6.8 TInternetExplorer.OnFullScreen Event

Pascal

```
property OnFullScreen: TInternetExplorerOnFullScreen;
```

C++

```
__property TInternetExplorerOnFullScreen OnFullScreen;
```

Description

This is OnFullScreen, a member of class TInternetExplorer.

132.1.8.6.9 TInternetExplorer.OnMenuBar Event

Pascal

```
property OnMenuBar: TInternetExplorerOnMenuBar;
```

C++

```
__property TInternetExplorerOnMenuBar OnMenuBar;
```

Description

This is OnMenuBar, a member of class TInternetExplorer.

132.1.8.6.10 TInternetExplorer.OnNavigateComplete2 Event

Pascal

```
property OnNavigateComplete2: TInternetExplorerNavigateComplete2;
```

C++

```
__property TInternetExplorerNavigateComplete2 OnNavigateComplete2;
```

Description

This is OnNavigateComplete2, a member of class TInternetExplorer.

132.1.8.6.11 TInternetExplorer.OnNavigateError Event

Pascal

```
property OnNavigateError: TInternetExplorerNavigateError;
```

C++

```
__property TInternetExplorerNavigateError OnNavigateError;
```

Description

This is OnNavigateError, a member of class TInternetExplorer.

132.1.8.6.12 TInternetExplorer.OnNewWindow2 Event

Pascal

```
property OnNewWindow2: TInternetExplorerNewWindow2;
```

C++

```
__property TInternetExplorerNewWindow2 OnNewWindow2;
```

Description

This is OnNewWindow2, a member of class TInternetExplorer.

132.1.8.6.13 TInternetExplorer.OnPrintTemplateInstantiation Event

Pascal

```
property OnPrintTemplateInstantiation: TInternetExplorerPrintTemplateInstantiation;
```

C++

```
__property TInternetExplorerPrintTemplateInstantiation OnPrintTemplateInstantiation;
```

Description

This is OnPrintTemplateInstantiation, a member of class TInternetExplorer.

132.1.8.6.14 TInternetExplorer.OnPrintTemplateTeardown Event

Pascal

```
property OnPrintTemplateTeardown: TInternetExplorerPrintTemplateTeardown;
```

C++

```
__property TInternetExplorerPrintTemplateTeardown OnPrintTemplateTeardown;
```

Description

This is OnPrintTemplateTeardown, a member of class TInternetExplorer.

132.1.8.6.15 TInternetExplorer.OnPrivacyImpactedStateChange Event

Pascal

```
property OnPrivacyImpactedStateChange: TInternetExplorerPrivacyImpactedStateChange;
```

C++

```
__property TInternetExplorerPrivacyImpactedStateChange OnPrivacyImpactedStateChange;
```

Description

This is OnPrivacyImpactedStateChange, a member of class TInternetExplorer.

132.1.8.6.16 TInternetExplorer.OnProgressChange Event

Pascal

```
property OnProgressChange: TInternetExplorerProgressChange;
```

C++

```
__property TInternetExplorerProgressChange OnProgressChange;
```

Description

This is OnProgressChange, a member of class TInternetExplorer.

132.1.8.6.17 TInternetExplorer.OnPropertyChange Event

Pascal

```
property OnPropertyChange: TInternetExplorerPropertyChange;
```

C++

```
__property TInternetExplorerPropertyChange OnPropertyChange;
```

Description

This is OnPropertyChange, a member of class TInternetExplorer.

132.1.8.6.18 TInternetExplorer.OnQuit Event

Pascal

```
property OnQuit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnQuit;
```

Description

This is OnQuit, a member of class TInternetExplorer.

132.1.8.6.19 TInternetExplorer.OnSetSecureLockIcon Event

Pascal

```
property OnSetSecureLockIcon: TInternetExplorerSetSecureLockIcon;
```

C++

```
__property TInternetExplorerSetSecureLockIcon OnSetSecureLockIcon;
```

Description

This is OnSetSecureLockIcon, a member of class TInternetExplorer.

132.1.8.6.20 TInternetExplorer.OnStatusBar Event

Pascal

```
property OnStatusBar: TInternetExplorerOnStatusBar;
```

C++

```
__property TInternetExplorerOnStatusBar OnStatusBar;
```

Description

This is OnStatusBar, a member of class TInternetExplorer.

132.1.8.6.21 TInternetExplorer.OnStatusTextChange Event

Pascal

```
property OnStatusTextChange: TInternetExplorerStatusTextChange;
```

C++

```
__property TInternetExplorerStatusTextChange OnStatusTextChange;
```

Description

This is OnStatusTextChange, a member of class TInternetExplorer.

132.1.8.6.22 TInternetExplorer.OnTheaterMode Event

Pascal

```
property OnTheaterMode: TInternetExplorerOnTheaterMode;
```

C++

```
__property TInternetExplorerOnTheaterMode OnTheaterMode;
```

Description

This is OnTheaterMode, a member of class TInternetExplorer.

132.1.8.6.23 TInternetExplorer.OnTitleChange Event

Pascal

```
property OnTitleChange: TInternetExplorerTitleChange;
```

C++

```
__property TInternetExplorerTitleChange OnTitleChange;
```

Description

This is OnTitleChange, a member of class TInternetExplorer.

132.1.8.6.24 TInternetExplorer.OnToolBar Event

Pascal

```
property OnToolBar: TInternetExplorerOnToolBar;
```

C++

```
__property TInternetExplorerOnToolBar OnToolBar;
```

Description

This is OnToolBar, a member of class TInternetExplorer.

132.1.8.6.25 TInternetExplorer.OnUpdatePageStatus Event

Pascal

```
property OnUpdatePageStatus: TInternetExplorerUpdatePageStatus;
```

C++

```
__property TInternetExplorerUpdatePageStatus OnUpdatePageStatus;
```

Description

This is OnUpdatePageStatus, a member of class TInternetExplorer.

132.1.8.6.26 TInternetExplorer.OnVisible Event

Pascal

```
property OnVisible: TInternetExplorerOnVisible;
```

C++

```
__property TInternetExplorerOnVisible OnVisible;
```

Description

This is OnVisible, a member of class TInternetExplorer.

132.1.8.6.27 TInternetExplorer.OnWindowClosing Event

Pascal

```
property OnWindowClosing: TInternetExplorerWindowClosing;
```

C++

```
__property TInternetExplorerWindowClosing OnWindowClosing;
```

Description

This is OnWindowClosing, a member of class TInternetExplorer.

132.1.8.6.28 TInternetExplorer.OnWindowSetHeight Event

Pascal

```
property OnWindowSetHeight: TInternetExplorerWindowSetHeight;
```

C++

```
__property TInternetExplorerWindowSetHeight OnWindowSetHeight;
```

Description

This is OnWindowSetHeight, a member of class TInternetExplorer.

132.1.8.6.29 TInternetExplorer.OnWindowSetLeft Event

Pascal

```
property OnWindowSetLeft: TInternetExplorerWindowSetLeft;
```

C++

```
__property TInternetExplorerWindowSetLeft OnWindowSetLeft;
```

Description

This is OnWindowSetLeft, a member of class TInternetExplorer.

132.1.8.6.30 TInternetExplorer.OnWindowSetResizable Event

Pascal

```
property OnWindowSetResizable: TInternetExplorerWindowSetResizable;
```

C++

```
__property TInternetExplorerWindowSetResizable OnWindowSetResizable;
```

Description

This is OnWindowSetResizable, a member of class TInternetExplorer.

132.1.8.6.31 TInternetExplorer.OnWindowSetTop Event

Pascal

```
property OnWindowSetTop: TInternetExplorerWindowSetTop;
```

C++

```
__property TInternetExplorerWindowSetTop OnWindowSetTop;
```

Description

This is OnWindowSetTop, a member of class TInternetExplorer.

132.1.8.6.32 TInternetExplorer.OnWindowSetWidth Event

Pascal

```
property OnWindowSetWidth: TInternetExplorerWindowSetWidth;
```

C++

```
__property TInternetExplorerWindowSetWidth OnWindowSetWidth;
```

Description

This is OnWindowSetWidth, a member of class TInternetExplorer.

132.1.9 TShellNameSpace Class

Class Hierarchy

Pascal

```
TShellNameSpace = class(TOleServer);
```

C++

```
class TShellNameSpace : public TOleServer;
```

File

SHDocVw

Description

This is class SHDocVw.TShellNameSpace.

132.1.9.1 TShellNameSpace Members

The following tables list the members exposed by TShellNameSpace.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_AddRef (see page 18104)	Increments the reference count for the number of interface references dependent on the OLE server.
	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 18104)	Decrements the reference count for the calling interface on a object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ConnectEvents (see page 18105)	Establishes a connection using the EventDispatch (see page 18111) property as an event sink.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DisconnectEvents (see page 18106)	Terminates a connection that was established using the ConnectEvents (see page 18105) method.
	Get_Columns (see page 19110)	This is Get_Columns, a member of class TShellNameSpace.

	Get_CountViewTypes (see page 19110)	This is Get_CountViewTypes, a member of class TShellNameSpace.
	Get_Depth (see page 19110)	This is Get_Depth, a member of class TShellNameSpace.
	Get_EnumOptions (see page 19110)	This is Get_EnumOptions, a member of class TShellNameSpace.
	Get_Flags (see page 19110)	This is Get_Flags, a member of class TShellNameSpace.
	Get_Mode (see page 19111)	This is Get_Mode, a member of class TShellNameSpace.
	Get_Root (see page 19111)	This is Get_Root, a member of class TShellNameSpace.
	Get_SelectedItem (see page 19111)	This is Get_SelectedItem, a member of class TShellNameSpace.
	Get_SubscriptionsEnabled (see page 19111)	This is Get_SubscriptionsEnabled, a member of class TShellNameSpace.
	Get_TVFlags (see page 19112)	This is Get_TVFlags, a member of class TShellNameSpace.
	GetAutoConnect (see page 18106)	Returns the value of the AutoConnect (see page 18110) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetConnectKind (see page 18106)	Returns the value of the ConnectKind (see page 18110) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetServer (see page 18107)	Returns an interface for the COM server.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitServerData (see page 19112)	Initializes the ServerData property to reflect the type library information of the COM server.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	InvokeEvent (see page 19113)	Dispatches an event from the COM server to the appropriate event handler.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 18108)	Connects to the COM server when the Loaded object is first loaded into memory if AutoConnect (see page 18110) is True true.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	QueryInterface (see page 18108)	Returns a reference to a specified interface if the OLE server supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	Set_Columns (see page 19114)	This is Set_Columns, a member of class TShellNameSpace.
	Set_Depth (see page 19115)	This is Set_Depth, a member of class TShellNameSpace.
	Set_EnumOptions (see page 19115)	This is Set_EnumOptions, a member of class TShellNameSpace.
	Set_Flags (see page 19115)	This is Set_Flags, a member of class TShellNameSpace.
	Set_Mode (see page 19115)	This is Set_Mode, a member of class TShellNameSpace.
	Set_Root (see page 19115)	This is Set_Root, a member of class TShellNameSpace.
	Set_SelectedItem (see page 19116)	This is Set_SelectedItem, a member of class TShellNameSpace.
	Set_TVFlags (see page 19116)	This is Set_TVFlags, a member of class TShellNameSpace.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoConnect (see page 18109)	Sets the value of the AutoConnect (see page 18110) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnectKind (see page 18109)	Sets the value of the ConnectKind (see page 18110) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	EventDispatch (see page 18111)	This is EventDispatch, a member of class TOleServer.
	ServerData (see page 18111)	Encodes information about the COM server to which ServerData connects.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Connect (see page 19107)	Establishes a connection to the COM server.
	ConnectTo (see page 19108)	This is ConnectTo, a member of class TShellNameSpace.
	Create (see page 19105)	Allocates memory and constructs a safely initialized instance of a component.
	CreateSubscriptionForSelection (see page 19108)	This is CreateSubscriptionForSelection, a member of class TShellNameSpace.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DeleteSubscriptionForSelection (see page 19108)	This is DeleteSubscriptionForSelection, a member of class TShellNameSpace.
	Destroy (see page 19106)	Disposes of the component and its owned components.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Disconnect (see page 19109)	Terminates the connection to the COM server.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	Expand (see page 19109)	This is Expand, a member of class TShellNameSpace.
	Export (see page 19109)	This is Export, a member of class TShellNameSpace.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.

	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	Import (see page 19112)	This is Import, a member of class TShellNameSpace.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InvokeContextMenuCommand (see page 19112)	This is InvokeContextMenuCommand, a member of class TShellNameSpace.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveSelectionDown (see page 19113)	This is MoveSelectionDown, a member of class TShellNameSpace.
	MoveSelectionTo (see page 19113)	This is MoveSelectionTo, a member of class TShellNameSpace.
	MoveSelectionUp (see page 19113)	This is MoveSelectionUp, a member of class TShellNameSpace.
	NewFolder (see page 19114)	This is NewFolder, a member of class TShellNameSpace.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	ResetSort (see page 19114)	This is ResetSort, a member of class TShellNameSpace.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SelectedItems (see page 19114)	This is SelectedItems, a member of class TShellNameSpace.
	SetRoot (see page 19116)	This is SetRoot, a member of class TShellNameSpace.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetViewType (see page 19116)	This is SetViewType, a member of class TShellNameSpace.
	Synchronize (see page 19117)	This is Synchronize, a member of class TShellNameSpace.
	UnselectAll (see page 19117)	This is UnselectAll, a member of class TShellNameSpace.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Columns (see page 19117)	This is Columns, a member of class TShellNameSpace.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	CountViewTypes (see page 19118)	This is CountViewTypes, a member of class TShellNameSpace.
R	DefaultInterface (see page 19118)	This is DefaultInterface, a member of class TShellNameSpace.
	Depth (see page 19118)	This is Depth, a member of class TShellNameSpace.

	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EnumOptions (see page 19118)	This is EnumOptions, a member of class TShellNameSpace.
	Flags (see page 19118)	This is Flags, a member of class TShellNameSpace.
	Mode (see page 19119)	This is Mode, a member of class TShellNameSpace.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Root (see page 19119)	This is Root, a member of class TShellNameSpace.
	SelectedItem (see page 19119)	This is SelectedItem, a member of class TShellNameSpace.
R	SubscriptionsEnabled (see page 19119)	This is SubscriptionsEnabled, a member of class TShellNameSpace.
	TVFlags (see page 19120)	This is TVFlags, a member of class TShellNameSpace.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnDoubleClick (see page 19120)	This is OnDoubleClick, a member of class TShellNameSpace.
	OnFavoritesSelectionChange (see page 19120)	This is OnFavoritesSelectionChange, a member of class TShellNameSpace.
	OnInitialized (see page 19120)	This is OnInitialized, a member of class TShellNameSpace.
	OnSelectionChange (see page 19121)	This is OnSelectionChange, a member of class TShellNameSpace.

Published Properties

	Name	Description
	AutoConnect (see page 18110)	Specifies whether the component automatically connects to the server.
	ConnectKind (see page 18110)	Indicates the type of process to which the ConnectKind component establishes a connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RemoteMachineName (see page 18111)	Specifies the machine running the COM server when ConnectKind (see page 18110) is ckRemote.
	Tag (see page 2808)	Stores an integer value as part of a component.

132.1.9.2 TShellNameSpace.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TShellNameSpace(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

Components (see page 2799)

ComponentStyle (see page 2805)

Create (see page 22287)

Destroy (see page 2766)

Free (see page 22300)

Owner (see page 2807)

132.1.9.3 TShellNameSpace.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TShellNameSpace();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

132.1.9.4 TShellNameSpace Methods

The methods of the TShellNameSpace class are listed here.

Protected Methods

	Name	Description
	Get_Columns (see page 19110)	This is Get_Columns, a member of class TShellNameSpace.
	Get_CountViewTypes (see page 19110)	This is Get_CountViewTypes, a member of class TShellNameSpace.
	Get_Depth (see page 19110)	This is Get_Depth, a member of class TShellNameSpace.
	Get_EnumOptions (see page 19110)	This is Get_EnumOptions, a member of class TShellNameSpace.
	Get_Flags (see page 19110)	This is Get_Flags, a member of class TShellNameSpace.
	Get_Mode (see page 19111)	This is Get_Mode, a member of class TShellNameSpace.
	Get_Root (see page 19111)	This is Get_Root, a member of class TShellNameSpace.
	Get_SelectedItem (see page 19111)	This is Get_SelectedItem, a member of class TShellNameSpace.
	Get_SubscriptionsEnabled (see page 19111)	This is Get_SubscriptionsEnabled, a member of class TShellNameSpace.
	Get_TVFlags (see page 19112)	This is Get_TVFlags, a member of class TShellNameSpace.
V	InitServerData (see page 19112)	Initializes the ServerData property to reflect the type library information of the COM server.
V	InvokeEvent (see page 19113)	Dispatches an event from the COM server to the appropriate event handler.
	Set_Columns (see page 19114)	This is Set_Columns, a member of class TShellNameSpace.
	Set_Depth (see page 19115)	This is Set_Depth, a member of class TShellNameSpace.
	Set_EnumOptions (see page 19115)	This is Set_EnumOptions, a member of class TShellNameSpace.
	Set_Flags (see page 19115)	This is Set_Flags, a member of class TShellNameSpace.
	Set_Mode (see page 19115)	This is Set_Mode, a member of class TShellNameSpace.
	Set_Root (see page 19115)	This is Set_Root, a member of class TShellNameSpace.
	Set_SelectedItem (see page 19116)	This is Set_SelectedItem, a member of class TShellNameSpace.
	Set_TVFlags (see page 19116)	This is Set_TVFlags, a member of class TShellNameSpace.

Public Methods

	Name	Description
V	Connect (see page 19107)	Establishes a connection to the COM server.
	ConnectTo (see page 19108)	This is ConnectTo, a member of class TShellNameSpace.
	CreateSubscriptionForSelection (see page 19108)	This is CreateSubscriptionForSelection, a member of class TShellNameSpace.
	DeleteSubscriptionForSelection (see page 19108)	This is DeleteSubscriptionForSelection, a member of class TShellNameSpace.
V	Disconnect (see page 19109)	Terminates the connection to the COM server.
	Expand (see page 19109)	This is Expand, a member of class TShellNameSpace.
	Export (see page 19109)	This is Export, a member of class TShellNameSpace.
	Import (see page 19112)	This is Import, a member of class TShellNameSpace.
	InvokeContextMenuCommand (see page 19112)	This is InvokeContextMenuCommand, a member of class TShellNameSpace.
	MoveSelectionDown (see page 19113)	This is MoveSelectionDown, a member of class TShellNameSpace.
	MoveSelectionTo (see page 19113)	This is MoveSelectionTo, a member of class TShellNameSpace.
	MoveSelectionUp (see page 19113)	This is MoveSelectionUp, a member of class TShellNameSpace.
	NewFolder (see page 19114)	This is NewFolder, a member of class TShellNameSpace.
	ResetSort (see page 19114)	This is ResetSort, a member of class TShellNameSpace.
	SelectedItems (see page 19114)	This is SelectedItems, a member of class TShellNameSpace.
	SetRoot (see page 19116)	This is SetRoot, a member of class TShellNameSpace.
	SetViewType (see page 19116)	This is SetViewType, a member of class TShellNameSpace.
	Synchronize (see page 19117)	This is Synchronize, a member of class TShellNameSpace.
	UnselectAll (see page 19117)	This is UnselectAll, a member of class TShellNameSpace.

132.1.9.4.1 TShellNameSpace.Connect Method

Establishes a connection to the COM server.

Pascal

```
procedure Connect; override;
```

C++

```
virtual __fastcall Connect();
```

Description

Call Connect to connect the Connect component to the COM server it represents. If the AutoConnect property is True true, the Connect component automatically calls Connect when the application is first run.

Do not use Connect if the value of ConnectKind is ckAttachToInterface. When attaching to an interface, use the ConnectTo method, which is introduced by descendant classes, instead.

If the value of ConnectKind is ckRemote, the RemoteMachineName property must be set before calling Connect.

Connect introduces Connect as an abstract a pure virtual method. Descendant classes must override this method to let the Connect component connect to a specific type of COM server.

See Also

AutoConnect (see page 18110)

ConnectKind (see page 18110)

RemoteMachineName (see page 18111)

Disconnect (see page 18105)

Using Component Wrappers

132.1.9.4.2 TShellNameSpace.ConnectTo Method

Pascal

```
procedure ConnectTo(svrIntf: IShellNameSpace);
```

C++

```
__fastcall ConnectTo(IShellNameSpace svrIntf);
```

Description

This is ConnectTo, a member of class TShellNameSpace.

132.1.9.4.3 TShellNameSpace.CreateSubscriptionForSelection Method

Pascal

```
function CreateSubscriptionForSelection: WordBool;
```

C++

```
__fastcall WordBool CreateSubscriptionForSelection();
```

Description

This is CreateSubscriptionForSelection, a member of class TShellNameSpace.

132.1.9.4.4 TShellNameSpace.DeleteSubscriptionForSelection Method

Pascal

```
function DeleteSubscriptionForSelection: WordBool;
```

C++

```
__fastcall WordBool DeleteSubscriptionForSelection();
```

Description

This is DeleteSubscriptionForSelection, a member of class TShellNameSpace.

132.1.9.4.5 TShellNameSpace.Disconnect Method

Terminates the connection to the COM server.

Pascal

```
procedure Disconnect; override;
```

C++

```
virtual __fastcall Disconnect();
```

Description

Call Disconnect to terminate a connection formed using the Connect method.

Disconnect introduces Disconnect as an abstract a pure virtual method. Descendant classes must override this method to let the Disconnect component disconnect from a specific type of COM server.

See Also

Connect (see page 18104)

Using Component Wrappers

132.1.9.4.6 TShellNameSpace.Expand Method

Pascal

```
procedure Expand(var_: OleVariant; iDepth: SYSINT);
```

C++

```
__fastcall Expand(OleVariant var_, SYSINT iDepth);
```

Description

This is Expand, a member of class TShellNameSpace.

132.1.9.4.7 TShellNameSpace.Export Method

Pascal

```
procedure Export;
```

C++

```
__fastcall Export();
```

Description

This is Export, a member of class TShellNameSpace.

132.1.9.4.8 TShellNameSpace.Get_Columns Method

Pascal

```
function Get_Columns: WideString;
```

C++

```
__fastcall BSTR Get_Columns();
```

Description

This is Get_Columns, a member of class TShellNameSpace.

132.1.9.4.9 TShellNameSpace.Get_CountViewTypes Method

Pascal

```
function Get_CountViewTypes: SYSINT;
```

C++

```
__fastcall SYSINT Get_CountViewTypes();
```

Description

This is Get_CountViewTypes, a member of class TShellNameSpace.

132.1.9.4.10 TShellNameSpace.Get_Depth Method

Pascal

```
function Get_Depth: SYSINT;
```

C++

```
__fastcall SYSINT Get_Depth();
```

Description

This is Get_Depth, a member of class TShellNameSpace.

132.1.9.4.11 TShellNameSpace.Get_EnumOptions Method

Pascal

```
function Get_EnumOptions: Integer;
```

C++

```
__fastcall int Get_EnumOptions();
```

Description

This is Get_EnumOptions, a member of class TShellNameSpace.

132.1.9.4.12 TShellNameSpace.Get_Flags Method

Pascal

```
function Get_Flags: LongWord;
```

C++

```
__fastcall LongWord Get_Flags();
```

Description

This is Get_Flags, a member of class TShellNameSpace.

132.1.9.4.13 TShellNameSpace.Get_Mode Method

Pascal

```
function Get_Mode: SYSUINT;
```

C++

```
__fastcall SYSUINT Get_Mode();
```

Description

This is Get_Mode, a member of class TShellNameSpace.

132.1.9.4.14 TShellNameSpace.Get_Root Method

Pascal

```
function Get_Root: OleVariant;
```

C++

```
__fastcall OleVariant Get_Root();
```

Description

This is Get_Root, a member of class TShellNameSpace.

132.1.9.4.15 TShellNameSpace.Get_SelectedItem Method

Pascal

```
function Get_SelectedItem: IDispatch;
```

C++

```
__fastcall IDispatch Get_SelectedItem();
```

Description

This is Get_SelectedItem, a member of class TShellNameSpace.

132.1.9.4.16 TShellNameSpace.Get_SubscriptionsEnabled Method

Pascal

```
function Get_SubscriptionsEnabled: WordBool;
```

C++

```
__fastcall WordBool Get_SubscriptionsEnabled();
```

Description

This is Get_SubscriptionsEnabled, a member of class TShellNameSpace.

132.1.9.4.17 TShellNameSpace.Get_TVFlags Method

Pascal

```
function Get_TVFlags: LongWord;
```

C++

```
__fastcall LongWord Get_TVFlags();
```

Description

This is Get_TVFlags, a member of class TShellNameSpace.

132.1.9.4.18 TShellNameSpace.Import Method

Pascal

```
procedure Import;
```

C++

```
__fastcall Import();
```

Description

This is Import, a member of class TShellNameSpace.

132.1.9.4.19 TShellNameSpace.InitServerData Method

Initializes the ServerData property to reflect the type library information of the COM server.

Pascal

```
procedure InitServerData; override;
```

C++

```
virtual __fastcall InitServerData();
```

Description

The InitServerData constructor calls InitServerData to initialize ServerData with information from the COM server's type library.

InitServerData is an abstract a pure virtual method in InitServerData. Each InitServerData descendant implements this method so that the ServerData property reflects its particular COM server.

See Also

ServerData (see page 18111)

Create (see page 18101)

132.1.9.4.20 TShellNameSpace.InvokeContextMenuCommand Method

Pascal

```
procedure InvokeContextMenuCommand(const strCommand: WideString);
```

C++

```
__fastcall InvokeContextMenuCommand(const BSTR strCommand);
```

Description

This is InvokeContextMenuCommand, a member of class TShellNameSpace.

132.1.9.4.21 TShellNameSpace.InvokeEvent Method

Dispatches an event from the COM server to the appropriate event handler.

Pascal

```
procedure InvokeEvent(DispID: TDispID; var Params: TVariantArray); override;
```

C++

```
virtual __fastcall InvokeEvent(TDispID DispID, TVariantArray Params);
```

Description

InvokeEvent descendants use InvokeEvent internally to link their event handlers to events on the COM server.

DispID is the dispatch ID for the appropriate event handler.

Params passes the parameters of the event handler as an array of OleVariants.

As implemented in InvokeEvent, InvokeEvent does nothing, because InvokeEvent has no events. Descendants that surface events from a COM server override this method so that the event sink specified by EventDispatch can pass events on to the appropriate event handlers.

See Also

EventDispatch (see page 18111)

132.1.9.4.22 TShellNameSpace.MoveSelectionDown Method

Pascal

```
procedure MoveSelectionDown;
```

C++

```
__fastcall MoveSelectionDown();
```

Description

This is MoveSelectionDown, a member of class TShellNameSpace.

132.1.9.4.23 TShellNameSpace.MoveSelectionTo Method

Pascal

```
procedure MoveSelectionTo;
```

C++

```
__fastcall MoveSelectionTo();
```

Description

This is MoveSelectionTo, a member of class TShellNameSpace.

132.1.9.4.24 TShellNameSpace.MoveSelectionUp Method

Pascal

```
procedure MoveSelectionUp;
```

C++

```
__fastcall MoveSelectionUp();
```

Description

This is MoveSelectionUp, a member of class TShellNameSpace.

132.1.9.4.25 TShellNameSpace.NewFolder Method

Pascal

```
procedure NewFolder;
```

C++

```
__fastcall NewFolder();
```

Description

This is NewFolder, a member of class TShellNameSpace.

132.1.9.4.26 TShellNameSpace.ResetSort Method

Pascal

```
procedure ResetSort;
```

C++

```
__fastcall ResetSort();
```

Description

This is ResetSort, a member of class TShellNameSpace.

132.1.9.4.27 TShellNameSpace.SelectedItems Method

Pascal

```
function SelectedItems: IDispatch;
```

C++

```
__fastcall IDispatch SelectedItems();
```

Description

This is SelectedItems, a member of class TShellNameSpace.

132.1.9.4.28 TShellNameSpace.Set_Columns Method

Pascal

```
procedure Set_Columns(const bstrColumns: WideString);
```

C++

```
__fastcall Set_Columns(const BSTR bstrColumns);
```

Description

This is Set_Columns, a member of class TShellNameSpace.

132.1.9.4.29 TShellNameSpace.Set_Depth Method

Pascal

```
procedure Set_Depth(piDepth: SYSINT);
```

C++

```
__fastcall Set_Depth(SYSINT piDepth);
```

Description

This is Set_Depth, a member of class TShellNameSpace.

132.1.9.4.30 TShellNameSpace.Set_EnumOptions Method

Pascal

```
procedure Set_EnumOptions(pgrfEnumFlags: Integer);
```

C++

```
__fastcall Set_EnumOptions(int pgrfEnumFlags);
```

Description

This is Set_EnumOptions, a member of class TShellNameSpace.

132.1.9.4.31 TShellNameSpace.Set_Flags Method

Pascal

```
procedure Set_Flags(pdwFlags: LongWord);
```

C++

```
__fastcall Set_Flags(LongWord pdwFlags);
```

Description

This is Set_Flags, a member of class TShellNameSpace.

132.1.9.4.32 TShellNameSpace.Set_Mode Method

Pascal

```
procedure Set_Mode(puMode: SYSUINT);
```

C++

```
__fastcall Set_Mode(SYSUINT puMode);
```

Description

This is Set_Mode, a member of class TShellNameSpace.

132.1.9.4.33 TShellNameSpace.Set_Root Method

Pascal

```
procedure Set_Root(pvar: OleVariant);
```

C++

```
__fastcall Set_Root(OleVariant pvar);
```

Description

This is Set_Root, a member of class TShellNameSpace.

132.1.9.4.34 TShellNameSpace.Set_SelectedItem Method

Pascal

```
procedure Set_SelectedItem(const pItem: IDispatch);
```

C++

```
__fastcall Set_SelectedItem(const IDispatch pItem);
```

Description

This is Set_SelectedItem, a member of class TShellNameSpace.

132.1.9.4.35 TShellNameSpace.Set_TVFlags Method

Pascal

```
procedure Set_TVFlags(dwFlags: LongWord);
```

C++

```
__fastcall Set_TVFlags(LongWord dwFlags);
```

Description

This is Set_TVFlags, a member of class TShellNameSpace.

132.1.9.4.36 TShellNameSpace.SetRoot Method

Pascal

```
procedure SetRoot(const bstrFullPath: WideString);
```

C++

```
__fastcall SetRoot(const BSTR bstrFullPath);
```

Description

This is SetRoot, a member of class TShellNameSpace.

132.1.9.4.37 TShellNameSpace.SetViewType Method

Pascal

```
procedure SetViewType(iType: SYSINT);
```

C++

```
__fastcall SetViewType(SYSINT iType);
```

Description

This is SetViewType, a member of class TShellNameSpace.

132.1.9.4.38 TShellNameSpace.Synchronize Method

Pascal

```
procedure Synchronize;
```

C++

```
__fastcall Synchronize();
```

Description

This is Synchronize, a member of class TShellNameSpace.

132.1.9.4.39 TShellNameSpace.UnselectAll Method

Pascal

```
procedure UnselectAll;
```

C++

```
__fastcall UnselectAll();
```

Description

This is UnselectAll, a member of class TShellNameSpace.

132.1.9.5 TShellNameSpace Properties

The properties of the TShellNameSpace class are listed here.

Public Properties

	Name	Description
	Columns (see page 19117)	This is Columns, a member of class TShellNameSpace.
R	CountViewTypes (see page 19118)	This is CountViewTypes, a member of class TShellNameSpace.
R	DefaultInterface (see page 19118)	This is DefaultInterface, a member of class TShellNameSpace.
	Depth (see page 19118)	This is Depth, a member of class TShellNameSpace.
	EnumOptions (see page 19118)	This is EnumOptions, a member of class TShellNameSpace.
	Flags (see page 19118)	This is Flags, a member of class TShellNameSpace.
	Mode (see page 19119)	This is Mode, a member of class TShellNameSpace.
	Root (see page 19119)	This is Root, a member of class TShellNameSpace.
	SelectedItem (see page 19119)	This is SelectedItem, a member of class TShellNameSpace.
R	SubscriptionsEnabled (see page 19119)	This is SubscriptionsEnabled, a member of class TShellNameSpace.
	TVFlags (see page 19120)	This is TVFlags, a member of class TShellNameSpace.

132.1.9.5.1 TShellNameSpace.Columns Property

Pascal

```
property Columns: WideString;
```

C++

```
__property BSTR Columns;
```

Description

This is Columns, a member of class TShellNameSpace.

132.1.9.5.2 TShellNameSpace.CountViewTypes Property

Pascal

```
property CountViewTypes: SYSINT;
```

C++

```
__property SYSINT CountViewTypes;
```

Description

This is CountViewTypes, a member of class TShellNameSpace.

132.1.9.5.3 TShellNameSpace.DefaultInterface Property

Pascal

```
property DefaultInterface: IShellNameSpace;
```

C++

```
__property IShellNameSpace DefaultInterface;
```

Description

This is DefaultInterface, a member of class TShellNameSpace.

132.1.9.5.4 TShellNameSpace.Depth Property

Pascal

```
property Depth: SYSINT;
```

C++

```
__property SYSINT Depth;
```

Description

This is Depth, a member of class TShellNameSpace.

132.1.9.5.5 TShellNameSpace.EnumOptions Property

Pascal

```
property EnumOptions: Integer;
```

C++

```
__property int EnumOptions;
```

Description

This is EnumOptions, a member of class TShellNameSpace.

132.1.9.5.6 TShellNameSpace.Flags Property

Pascal

```
property Flags: LongWord;
```

C++

```
__property LongWord Flags;
```

Description

This is Flags, a member of class TShellNameSpace.

132.1.9.5.7 TShellNameSpace.Mode Property

Pascal

```
property Mode: SYSUINT;
```

C++

```
__property SYSUINT Mode;
```

Description

This is Mode, a member of class TShellNameSpace.

132.1.9.5.8 TShellNameSpace.Root Property

Pascal

```
property Root: OleVariant;
```

C++

```
__property OleVariant Root;
```

Description

This is Root, a member of class TShellNameSpace.

132.1.9.5.9 TShellNameSpace.SelectedItem Property

Pascal

```
property SelectedItem: IDispatch;
```

C++

```
__property IDispatch SelectedItem;
```

Description

This is SelectedItem, a member of class TShellNameSpace.

132.1.9.5.10 TShellNameSpace.SubscriptionsEnabled Property

Pascal

```
property SubscriptionsEnabled: WordBool;
```

C++

```
__property WordBool SubscriptionsEnabled;
```

Description

This is SubscriptionsEnabled, a member of class TShellNameSpace.

132.1.9.5.11 TShellNameSpace.TVFlags Property

Pascal

```
property TVFlags: LongWord;
```

C++

```
__property LongWord TVFlags;
```

Description

This is TVFlags, a member of class TShellNameSpace.

132.1.9.6 TShellNameSpace Events

The events of the TShellNameSpace class are listed here.

Published Events

	Name	Description
	OnDoubleClick (see page 19120)	This is OnDoubleClick, a member of class TShellNameSpace.
	OnFavoritesSelectionChange (see page 19120)	This is OnFavoritesSelectionChange, a member of class TShellNameSpace.
	OnInitialized (see page 19120)	This is OnInitialized, a member of class TShellNameSpace.
	OnSelectionChange (see page 19121)	This is OnSelectionChange, a member of class TShellNameSpace.

132.1.9.6.1 TShellNameSpace.OnDoubleClick Event

Pascal

```
property OnDoubleClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDoubleClick;
```

Description

This is OnDoubleClick, a member of class TShellNameSpace.

132.1.9.6.2 TShellNameSpace.OnFavoritesSelectionChange Event

Pascal

```
property OnFavoritesSelectionChange: TShellNameSpaceFavoritesSelectionChange;
```

C++

```
__property TShellNameSpaceFavoritesSelectionChange OnFavoritesSelectionChange;
```

Description

This is OnFavoritesSelectionChange, a member of class TShellNameSpace.

132.1.9.6.3 TShellNameSpace.OnInitialized Event

Pascal

```
property OnInitialized: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnInitialized;
```

Description

This is OnInitialized, a member of class TShellNameSpace.

132.1.9.6.4 TShellNameSpace.OnSelectionChange Event

Pascal

```
property OnSelectionChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSelectionChange;
```

Description

This is OnSelectionChange, a member of class TShellNameSpace.

132.1.10 TShellUIHelper Class

Class Hierarchy

Pascal

```
TShellUIHelper = class(TOleServer);
```

C++

```
class TShellUIHelper : public TOleServer;
```

File

SHDocVw

Description

This is class SHDocVw.TShellUIHelper.

132.1.10.1 TShellUIHelper Members

The following tables list the members exposed by TShellUIHelper.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.

	_AddRef (see page 18104)	Increments the reference count for the number of interface references dependent on the OLE server.
	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 18104)	Decrements the reference count for the calling interface on a object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ConnectEvents (see page 18105)	Establishes a connection using the EventDispatch (see page 18111) property as an event sink.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DisconnectEvents (see page 18106)	Terminates a connection that was established using the ConnectEvents (see page 18105) method.
	GetAutoConnect (see page 18106)	Returns the value of the AutoConnect (see page 18110) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetConnectKind (see page 18106)	Returns the value of the ConnectKind (see page 18110) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetServer (see page 18107)	Returns an interface for the COM server.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitServerData (see page 19133)	Initializes the ServerData property to reflect the type library information of the COM server.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	InvokeEvent (see page 18107)	Dispatches an event from the COM server to the appropriate event handler.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 18108)	Connects to the COM server when the Loaded object is first loaded into memory if AutoConnect (see page 18110) is True true.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	QueryInterface (see page 18108)	Returns a reference to a specified interface if the OLE server supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoConnect (see page 18109)	Sets the value of the AutoConnect (see page 18110) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnectKind (see page 18109)	Sets the value of the ConnectKind (see page 18110) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	EventDispatch (see page 18111)	This is EventDispatch, a member of class TOleServer.
	ServerData (see page 18111)	Encodes information about the COM server to which ServerData connects.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChannel (see page 19127)	This is AddChannel, a member of class TShellUIHelper.
	AddDesktopComponent (see page 19127)	This is the overview for the AddDesktopComponent method overload.
	AddFavorite (see page 19129)	This is the overview for the AddFavorite method overload.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
	AutoCompleteAttach (see page 19129)	This is the overview for the AutoCompleteAttach method overload.
	AutoCompleteSaveForm (see page 19130)	This is the overview for the AutoCompleteSaveForm method overload.
	AutoScan (see page 19131)	This is the overview for the AutoScan method overload.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Connect (see page 19131)	Establishes a connection to the COM server.
	ConnectTo (see page 19132)	This is ConnectTo, a member of class TShellUIHelper.
V	Create (see page 19125)	Allocates memory and constructs a safely initialized instance of a component.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 19125)	Disposes of the component and its owned components.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Disconnect (see page 19132)	Terminates the connection to the COM server.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	ImportExportFavorites (see page 19132)	This is ImportExportFavorites, a member of class TShellUIHelper.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsSubscribed (see page 19133)	This is IsSubscribed, a member of class TShellUIHelper.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NavigateAndFind (see page 19133)	This is NavigateAndFind, a member of class TShellUIHelper.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RefreshOfflineDesktop (see page 19133)	This is RefreshOfflineDesktop, a member of class TShellUIHelper.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	ResetFirstBootMode (see page 19134)	This is ResetFirstBootMode, a member of class TShellUIHelper.
	ResetSafeMode (see page 19134)	This is ResetSafeMode, a member of class TShellUIHelper.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	ShowBrowserUI (see page 19134)	This is ShowBrowserUI, a member of class TShellUIHelper.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	DefaultInterface (see page 19135)	This is DefaultInterface, a member of class TShellUIHelper.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	AutoConnect (see page 18110)	Specifies whether the component automatically connects to the server.
	ConnectKind (see page 18110)	Indicates the type of process to which the ConnectKind component establishes a connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	RemoteMachineName (see page 18111)	Specifies the machine running the COM server when ConnectKind (see page 18110) is ckRemote.
	Tag (see page 2808)	Stores an integer value as part of a component.

132.1.10.2 TShellUIHelper.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TShellUIHelper(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

See Also

Components (see page 2799)

ComponentStyle (see page 2805)

Create (see page 22287)

Destroy (see page 2766)

Free (see page 22300)

Owner (see page 2807)

132.1.10.3 TShellUIHelper.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TShellUIHelper();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

132.1.10.4 TShellUIHelper Methods

The methods of the TShellUIHelper class are listed here.

Protected Methods

	Name	Description
	InitServerData (see page 19133)	Initializes the ServerData property to reflect the type library information of the COM server.

Public Methods

	Name	Description
	AddChannel (see page 19127)	This is AddChannel, a member of class TShellUIHelper.
	AddDesktopComponent (see page 19127)	This is the overview for the AddDesktopComponent method overload.
	AddFavorite (see page 19129)	This is the overview for the AddFavorite method overload.
	AutoCompleteAttach (see page 19129)	This is the overview for the AutoCompleteAttach method overload.
	AutoCompleteSaveForm (see page 19130)	This is the overview for the AutoCompleteSaveForm method overload.
	AutoScan (see page 19131)	This is the overview for the AutoScan method overload.
	Connect (see page 19131)	Establishes a connection to the COM server.
	ConnectTo (see page 19132)	This is ConnectTo, a member of class TShellUIHelper.
	Disconnect (see page 19132)	Terminates the connection to the COM server.
	ImportExportFavorites (see page 19132)	This is ImportExportFavorites, a member of class TShellUIHelper.
	IsSubscribed (see page 19133)	This is IsSubscribed, a member of class TShellUIHelper.

	NavigateAndFind (see page 19133)	This is NavigateAndFind, a member of class TShellUIHelper.
	RefreshOfflineDesktop (see page 19133)	This is RefreshOfflineDesktop, a member of class TShellUIHelper.
	ResetFirstBootMode (see page 19134)	This is ResetFirstBootMode, a member of class TShellUIHelper.
	ResetSafeMode (see page 19134)	This is ResetSafeMode, a member of class TShellUIHelper.
	ShowBrowserUI (see page 19134)	This is ShowBrowserUI, a member of class TShellUIHelper.

132.1.10.4.1 TShellUIHelper.AddChannel Method

Pascal

```
procedure AddChannel(const URL: WideString);
```

C++

```
__fastcall AddChannel(const BSTR URL);
```

Description

This is AddChannel, a member of class TShellUIHelper.

132.1.10.4.2 AddDesktopComponent Method

This is the overview for the AddDesktopComponent method overload.

Overload List

	Name	Description
	TShellUIHelper.AddDesktopComponent (WideString, WideString) (see page 19127)	This is AddDesktopComponent, a member of class TShellUIHelper.
	TShellUIHelper.AddDesktopComponent (WideString, WideString, OleVariant) (see page 19128)	This is AddDesktopComponent, a member of class TShellUIHelper.
	TShellUIHelper.AddDesktopComponent (WideString, WideString, OleVariant, OleVariant) (see page 19128)	This is AddDesktopComponent, a member of class TShellUIHelper.
	TShellUIHelper.AddDesktopComponent (WideString, WideString, OleVariant, OleVariant, OleVariant) (see page 19128)	This is AddDesktopComponent, a member of class TShellUIHelper.
	TShellUIHelper.AddDesktopComponent (WideString, WideString, OleVariant, OleVariant, OleVariant, OleVariant) (see page 19128)	This is AddDesktopComponent, a member of class TShellUIHelper.

132.1.10.4.2.1 TShellUIHelper.AddDesktopComponent Method (WideString, WideString)

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString); overload;
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_);
```

Description

This is AddDesktopComponent, a member of class TShellUIHelper.

132.1.10.4.2.2 TShellUIHelper.AddDesktopComponent Method (WideString, WideString, OleVariant)

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString; var Left:
OleVariant); overload;
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_, OleVariant Left);
```

Description

This is AddDesktopComponent, a member of class TShellUIHelper.

132.1.10.4.2.3 TShellUIHelper.AddDesktopComponent Method (WideString, WideString, OleVariant, OleVariant)

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString; var Left:
OleVariant; var Top: OleVariant); overload;
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_, OleVariant Left, OleVariant
Top);
```

Description

This is AddDesktopComponent, a member of class TShellUIHelper.

132.1.10.4.2.4 TShellUIHelper.AddDesktopComponent Method (WideString, WideString, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString; var Left:
OleVariant; var Top: OleVariant; var Width: OleVariant); overload;
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_, OleVariant Left, OleVariant
Top, OleVariant Width);
```

Description

This is AddDesktopComponent, a member of class TShellUIHelper.

132.1.10.4.2.5 TShellUIHelper.AddDesktopComponent Method (WideString, WideString, OleVariant, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString; var Left:
OleVariant; var Top: OleVariant; var Width: OleVariant; var Height: OleVariant); overload;
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_, OleVariant Left, OleVariant
Top, OleVariant Width, OleVariant Height);
```

Description

This is AddDesktopComponent, a member of class TShellUIHelper.

132.1.10.4.3 AddFavorite Method

This is the overview for the AddFavorite method overload.

Overload List

	Name	Description
	TShellUIHelper.AddFavorite (WideString) (see page 19129)	This is AddFavorite, a member of class TShellUIHelper.
	TShellUIHelper.AddFavorite (WideString, OleVariant) (see page 19129)	This is AddFavorite, a member of class TShellUIHelper.

132.1.10.4.3.1 TShellUIHelper.AddFavorite Method (WideString)

Pascal

```
procedure AddFavorite(const URL: WideString); overload;
```

C++

```
__fastcall AddFavorite(const BSTR URL);
```

Description

This is AddFavorite, a member of class TShellUIHelper.

132.1.10.4.3.2 TShellUIHelper.AddFavorite Method (WideString, OleVariant)

Pascal

```
procedure AddFavorite(const URL: WideString; var Title: OleVariant); overload;
```

C++

```
__fastcall AddFavorite(const BSTR URL, OleVariant Title);
```

Description

This is AddFavorite, a member of class TShellUIHelper.

132.1.10.4.4 AutoCompleteAttach Method

This is the overview for the AutoCompleteAttach method overload.

Overload List

	Name	Description
	TShellUIHelper.AutoCompleteAttach () (see page 19129)	This is AutoCompleteAttach, a member of class TShellUIHelper.
	TShellUIHelper.AutoCompleteAttach (OleVariant) (see page 19130)	This is AutoCompleteAttach, a member of class TShellUIHelper.

132.1.10.4.4.1 TShellUIHelper.AutoCompleteAttach Method ()

Pascal

```
procedure AutoCompleteAttach; overload;
```

C++

```
__fastcall AutoCompleteAttach();
```

Description

This is AutoCompleteAttach, a member of class TShellUIHelper.

132.1.10.4.4.2 TShellUIHelper.AutoCompleteAttach Method (OleVariant)

Pascal

```
procedure AutoCompleteAttach(var Reserved: OleVariant); overload;
```

C++

```
__fastcall AutoCompleteAttach(OleVariant Reserved);
```

Description

This is AutoCompleteAttach, a member of class TShellUIHelper.

132.1.10.4.5 AutoCompleteSaveForm Method

This is the overview for the AutoCompleteSaveForm method overload.

Overload List

	Name	Description
	TShellUIHelper.AutoCompleteSaveForm () (see page 19130)	This is AutoCompleteSaveForm, a member of class TShellUIHelper.
	TShellUIHelper.AutoCompleteSaveForm (OleVariant) (see page 19130)	This is AutoCompleteSaveForm, a member of class TShellUIHelper.

132.1.10.4.5.1 TShellUIHelper.AutoCompleteSaveForm Method ()

Pascal

```
procedure AutoCompleteSaveForm; overload;
```

C++

```
__fastcall AutoCompleteSaveForm();
```

Description

This is AutoCompleteSaveForm, a member of class TShellUIHelper.

132.1.10.4.5.2 TShellUIHelper.AutoCompleteSaveForm Method (OleVariant)

Pascal

```
procedure AutoCompleteSaveForm(var Form: OleVariant); overload;
```

C++

```
__fastcall AutoCompleteSaveForm(OleVariant Form);
```

Description

This is AutoCompleteSaveForm, a member of class TShellUIHelper.

132.1.10.4.6 AutoScan Method

This is the overview for the AutoScan method overload.

Overload List

	Name	Description
	TShellUIHelper.AutoScan (WideString, WideString) (see page 19131)	This is AutoScan, a member of class TShellUIHelper.
	TShellUIHelper.AutoScan (WideString, WideString, OleVariant) (see page 19131)	This is AutoScan, a member of class TShellUIHelper.

132.1.10.4.6.1 TShellUIHelper.AutoScan Method (WideString, WideString)

Pascal

```
procedure AutoScan(const strSearch: WideString; const strFailureUrl: WideString); overload;
```

C++

```
__fastcall AutoScan(const BSTR strSearch, const BSTR strFailureUrl);
```

Description

This is AutoScan, a member of class TShellUIHelper.

132.1.10.4.6.2 TShellUIHelper.AutoScan Method (WideString, WideString, OleVariant)

Pascal

```
procedure AutoScan(const strSearch: WideString; const strFailureUrl: WideString; var
pvarTargetFrame: OleVariant); overload;
```

C++

```
__fastcall AutoScan(const BSTR strSearch, const BSTR strFailureUrl, OleVariant
pvarTargetFrame);
```

Description

This is AutoScan, a member of class TShellUIHelper.

132.1.10.4.7 TShellUIHelper.Connect Method

Establishes a connection to the COM server.

Pascal

```
procedure Connect; override;
```

C++

```
virtual __fastcall Connect();
```

Description

Call Connect to connect the Connect component to the COM server it represents. If the AutoConnect property is True true, the Connect component automatically calls Connect when the application is first run.

Do not use Connect if the value of ConnectKind is ckAttachToInterface. When attaching to an interface, use the ConnectTo method, which is introduced by descendant classes, instead.

If the value of ConnectKind is ckRemote, the RemoteMachineName property must be set before calling Connect.

Connect introduces Connect as an abstract a pure virtual method. Descendant classes must override this method to let the Connect component connect to a specific type of COM server.

See Also

AutoConnect (see page 18110)

ConnectKind (see page 18110)

RemoteMachineName (see page 18111)

Disconnect (see page 18105)

Using Component Wrappers

132.1.10.4.8 TShellUIHelper.ConnectTo Method

Pascal

```
procedure ConnectTo(svrIntf: IShellUIHelper);
```

C++

```
__fastcall ConnectTo(IShellUIHelper svrIntf);
```

Description

This is ConnectTo, a member of class TShellUIHelper.

132.1.10.4.9 TShellUIHelper.Disconnect Method

Terminates the connection to the COM server.

Pascal

```
procedure Disconnect; override;
```

C++

```
virtual __fastcall Disconnect();
```

Description

Call Disconnect to terminate a connection formed using the Connect method.

Disconnect introduces Disconnect as an abstract a pure virtual method. Descendant classes must override this method to let the Disconnect component disconnect from a specific type of COM server.

See Also

Connect (see page 18104)

Using Component Wrappers

132.1.10.4.10 TShellUIHelper.ImportExportFavorites Method

Pascal

```
procedure ImportExportFavorites(fImport: WordBool; const strImpExpPath: WideString);
```

C++

```
__fastcall ImportExportFavorites(WordBool fImport, const BSTR strImpExpPath);
```

Description

This is ImportExportFavorites, a member of class TShellUIHelper.

132.1.10.4.11 TShellUIHelper.InitServerData Method

Initializes the ServerData property to reflect the type library information of the COM server.

Pascal

```
procedure InitServerData; override;
```

C++

```
virtual __fastcall InitServerData();
```

Description

The InitServerData constructor calls InitServerData to initialize ServerData with information from the COM server's type library.

InitServerData is an abstract a pure virtual method in InitServerData. Each InitServerData descendant implements this method so that the ServerData property reflects its particular COM server.

See Also

ServerData (see page 18111)

Create (see page 18101)

132.1.10.4.12 TShellUIHelper.IsSubscribed Method

Pascal

```
function IsSubscribed(const URL: WideString): WordBool;
```

C++

```
__fastcall WordBool IsSubscribed(const BSTR URL);
```

Description

This is IsSubscribed, a member of class TShellUIHelper.

132.1.10.4.13 TShellUIHelper.NavigateAndFind Method

Pascal

```
procedure NavigateAndFind(const URL: WideString; const strQuery: WideString; var
varTargetFrame: OleVariant);
```

C++

```
__fastcall NavigateAndFind(const BSTR URL, const BSTR strQuery, OleVariant varTargetFrame);
```

Description

This is NavigateAndFind, a member of class TShellUIHelper.

132.1.10.4.14 TShellUIHelper.RefreshOfflineDesktop Method

Pascal

```
procedure RefreshOfflineDesktop;
```

C++

```
__fastcall RefreshOfflineDesktop();
```

Description

This is RefreshOfflineDesktop, a member of class TShellUIHelper.

132.1.10.4.15 TShellUIHelper.ResetFirstBootMode Method

Pascal

```
procedure ResetFirstBootMode;
```

C++

```
__fastcall ResetFirstBootMode();
```

Description

This is ResetFirstBootMode, a member of class TShellUIHelper.

132.1.10.4.16 TShellUIHelper.ResetSafeMode Method

Pascal

```
procedure ResetSafeMode;
```

C++

```
__fastcall ResetSafeMode();
```

Description

This is ResetSafeMode, a member of class TShellUIHelper.

132.1.10.4.17 TShellUIHelper.ShowBrowserUI Method

Pascal

```
function ShowBrowserUI(const bstrName: WideString; var pvarIn: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant ShowBrowserUI(const BSTR bstrName, OleVariant pvarIn);
```

Description

This is ShowBrowserUI, a member of class TShellUIHelper.

132.1.10.5 TShellUIHelper Properties

The properties of the TShellUIHelper class are listed here.

Public Properties

	Name	Description
R	DefaultInterface (see page 19135)	This is DefaultInterface, a member of class TShellUIHelper.

132.1.10.5.1 TShellUIHelper.DefaultInterface Property

Pascal

```
property DefaultInterface: IShellUIHelper;
```

C++

```
__property IShellUIHelper DefaultInterface;
```

Description

This is DefaultInterface, a member of class TShellUIHelper.

132.1.11 TShellWindows Class

Class Hierarchy

Pascal

```
TShellWindows = class(TOleServer);
```

C++

```
class TShellWindows : public TOleServer;
```

File

SHDocVw

Description

This is class SHDocVw.TShellWindows.

132.1.11.1 TShellWindows Members

The following tables list the members exposed by TShellWindows.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_AddRef (see page 18104)	Increments the reference count for the number of interface references dependent on the OLE server.
	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 18104)	Decrements the reference count for the calling interface on a object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.

	ConnectEvents (see page 18105)	Establishes a connection using the EventDispatch (see page 18111) property as an event sink.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DisconnectEvents (see page 18106)	Terminates a connection that was established using the ConnectEvents (see page 18105) method.
	Get_Count (see page 19142)	This is Get_Count, a member of class TShellWindows.
	GetAutoConnect (see page 18106)	Returns the value of the AutoConnect (see page 18110) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetConnectKind (see page 18106)	Returns the value of the ConnectKind (see page 18110) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetServer (see page 18107)	Returns an interface for the COM server.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InitServerData (see page 19142)	Initializes the ServerData property to reflect the type library information of the COM server.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	InvokeEvent (see page 19143)	Dispatches an event from the COM server to the appropriate event handler.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 18108)	Connects to the COM server when the Loaded object is first loaded into memory if AutoConnect (see page 18110) is True true.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	QueryInterface (see page 18108)	Returns a reference to a specified interface if the OLE server supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoConnect (see page 18109)	Sets the value of the AutoConnect (see page 18110) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnectKind (see page 18109)	Sets the value of the ConnectKind (see page 18110) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	EventDispatch (see page 18111)	This is EventDispatch, a member of class TOleServer.
	ServerData (see page 18111)	Encodes information about the COM server to which ServerData connects.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_NewEnum (see page 19141)	This is _NewEnum, a member of class TShellWindows.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Connect (see page 19141)	Establishes a connection to the COM server.
	ConnectTo (see page 19141)	This is ConnectTo, a member of class TShellWindows.
V	Create (see page 19139)	Allocates memory and constructs a safely initialized instance of a component.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 19139)	Disposes of the component and its owned components.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Disconnect (see page 19142)	Terminates the connection to the COM server.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindWindowSW (see page 19142)	This is FindWindowSW, a member of class TShellWindows.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	Item (see page 19143)	This is the overview for the Item method overload.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	OnActivated (see page 19144)	This is OnActivated, a member of class TShellWindows.
	OnCreated (see page 19144)	This is OnCreated, a member of class TShellWindows.
	OnNavigate (see page 19144)	This is OnNavigate, a member of class TShellWindows.
	ProcessAttachDetach (see page 19145)	This is ProcessAttachDetach, a member of class TShellWindows.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Register (see page 19145)	This is Register, a member of class TShellWindows.
	RegisterPending (see page 19145)	This is RegisterPending, a member of class TShellWindows.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Revoke (see page 19145)	This is Revoke, a member of class TShellWindows.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Count (see page 19146)	This is Count, a member of class TShellWindows.
R	DefaultInterface (see page 19146)	This is DefaultInterface, a member of class TShellWindows.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnWindowRegistered (see page 19146)	This is OnWindowRegistered, a member of class TShellWindows.
	OnWindowRevoked (see page 19147)	This is OnWindowRevoked, a member of class TShellWindows.

Published Properties

	Name	Description
	AutoConnect (see page 18110)	Specifies whether the component automatically connects to the server.
	ConnectKind (see page 18110)	Indicates the type of process to which the ConnectKind component establishes a connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RemoteMachineName (see page 18111)	Specifies the machine running the COM server when ConnectKind (see page 18110) is ckRemote.

	Tag (see page 2808)	Stores an integer value as part of a component.

132.1.11.2 TShellWindows.Create Constructor

Allocates memory and constructs a safely initialized instance of a component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TShellWindows(TComponent * AOwner);
```

Description

All objects have a Create method that constructs the object. TComponent redefines Create so that, for components, Create also:

establishes the relationship of a component and its Owner, as indicated by the AOwner parameter

sets the ComponentStyle property to csInheritable, meaning that the component can be inherited by a descendant form type

It is not necessary to explicitly create components added in the form designer. These components are created automatically when the application is run, and they are destroyed when the application is closed.

For components created programmatically, that is, not created in the form designer, call Create and pass in an owner component as the AOwner parameter. The owner disposes of the component when it is destroyed. If the component is not owned, then use Free when it needs to be destroyed.

Tip: When passing in Self as the Owner parameter, consider what Self references. If a component creates another component in one of its methods, then Self refers to the first component and not the component being created, which is then owned by the first component.

Note: The TComponent constructor is virtual in part to allow polymorphic instantiation of class references. This is critical to the streaming system and to the form designer. Do not forget to use the override directive when declaring a new component's Create constructor.

ComponentStyle (see page 2805)

Create (see page 22287)

Destroy (see page 2766)

Free (see page 22300)

Owner (see page 2807)

132.1.11.3 TShellWindows.Destroy Destructor

Disposes of the component and its owned components.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TShellWindows();
```

Description

Do not call Destroy directly. Call Free instead. Free verifies that the component is not nil, and only then calls Destroy.

Never explicitly free a component in one of its own event handlers, nor free a component from the event handler of a component that it owns or contains.

To destroy a form, call its Release method. Release waits for all the form's event handlers and the event handlers of the form's components to finish executing before destroying the form.

Note: A form owns all the controls and non-visual components that are placed on it in design mode. When it is freed, all of these components are automatically freed as well. By default, all forms are owned by the global Application object. When an application terminates, it frees the global Application object, which frees all forms. For objects that are not components, and for components created with a nil owner, be sure to call Free after finishing with the object; otherwise the memory allocated for the object will be lost until the application terminates.

132.1.11.4 TShellWindows Methods

The methods of the TShellWindows class are listed here.

Protected Methods

	Name	Description
	Get_Count (see page 19142)	This is Get_Count, a member of class TShellWindows.
V	InitServerData (see page 19142)	Initializes the ServerData property to reflect the type library information of the COM server.
V	InvokeEvent (see page 19143)	Dispatches an event from the COM server to the appropriate event handler.

Public Methods

	Name	Description
	_NewEnum (see page 19141)	This is _NewEnum, a member of class TShellWindows.
V	Connect (see page 19141)	Establishes a connection to the COM server.
	ConnectTo (see page 19141)	This is ConnectTo, a member of class TShellWindows.
V	Disconnect (see page 19142)	Terminates the connection to the COM server.
	FindWindowSW (see page 19142)	This is FindWindowSW, a member of class TShellWindows.
	Item (see page 19143)	This is the overview for the Item method overload.
	OnActivated (see page 19144)	This is OnActivated, a member of class TShellWindows.
	OnCreated (see page 19144)	This is OnCreated, a member of class TShellWindows.
	OnNavigate (see page 19144)	This is OnNavigate, a member of class TShellWindows.

	ProcessAttachDetach (see page 19145)	This is ProcessAttachDetach, a member of class TShellWindows.
	Register (see page 19145)	This is Register, a member of class TShellWindows.
	RegisterPending (see page 19145)	This is RegisterPending, a member of class TShellWindows.
	Revoke (see page 19145)	This is Revoke, a member of class TShellWindows.

132.1.11.4.1 TShellWindows._NewEnum Method

Pascal

```
function _NewEnum: IUnknown;
```

C++

```
__fastcall IUnknown _NewEnum();
```

Description

This is _NewEnum, a member of class TShellWindows.

132.1.11.4.2 TShellWindows.Connect Method

Establishes a connection to the COM server.

Pascal

```
procedure Connect; override;
```

C++

```
virtual __fastcall Connect();
```

Description

Call Connect to connect the Connect component to the COM server it represents. If the AutoConnect property is True true, the Connect component automatically calls Connect when the application is first run.

Do not use Connect if the value of ConnectKind is ckAttachToInterface. When attaching to an interface, use the ConnectTo method, which is introduced by descendant classes, instead.

If the value of ConnectKind is ckRemote, the RemoteMachineName property must be set before calling Connect.

Connect introduces Connect as an abstract a pure virtual method. Descendant classes must override this method to let the Connect component connect to a specific type of COM server.

See Also

AutoConnect (see page 18110)

ConnectKind (see page 18110)

RemoteMachineName (see page 18111)

Disconnect (see page 18105)

Using Component Wrappers

132.1.11.4.3 TShellWindows.ConnectTo Method

Pascal

```
procedure ConnectTo(svrIntf: IShellWindows);
```

C++

```
__fastcall ConnectTo(IShellWindows svrIntf);
```

Description

This is ConnectTo, a member of class TShellWindows.

132.1.11.4.4 TShellWindows.Disconnect Method

Terminates the connection to the COM server.

Pascal

```
procedure Disconnect; override;
```

C++

```
virtual __fastcall Disconnect();
```

Description

Call Disconnect to terminate a connection formed using the Connect method.

Disconnect introduces Disconnect as an abstract a pure virtual method. Descendant classes must override this method to let the Disconnect component disconnect from a specific type of COM server.

See Also

Connect (see page 18104)

Using Component Wrappers

132.1.11.4.5 TShellWindows.FindWindowSW Method

Pascal

```
function FindWindowSW(var pvarloc: OleVariant; var pvarlocRoot: OleVariant; swClass: SYSINT;
out pHWND: Integer; swfwOptions: SYSINT): IDispatch;
```

C++

```
__fastcall IDispatch FindWindowSW(OleVariant pvarloc, OleVariant pvarlocRoot, SYSINT swClass,
int pHWND, SYSINT swfwOptions);
```

Description

This is FindWindowSW, a member of class TShellWindows.

132.1.11.4.6 TShellWindows.Get_Count Method

Pascal

```
function Get_Count: Integer;
```

C++

```
__fastcall int Get_Count();
```

Description

This is Get_Count, a member of class TShellWindows.

132.1.11.4.7 TShellWindows.InitServerData Method

Initializes the ServerData property to reflect the type library information of the COM server.

Pascal

```
procedure InitServerData; override;
```

C++

```
virtual __fastcall InitServerData();
```

Description

The InitServerData constructor calls InitServerData to initialize ServerData with information from the COM server's type library.

InitServerData is an abstract a pure virtual method in InitServerData. Each InitServerData descendant implements this method so that the ServerData property reflects its particular COM server.

See Also

ServerData (see page 18111)

Create (see page 18101)

132.1.11.4.8 TShellWindows.InvokeEvent Method

Dispatches an event from the COM server to the appropriate event handler.

Pascal

```
procedure InvokeEvent(DispID: TDispID; var Params: TVariantArray); override;
```

C++

```
virtual __fastcall InvokeEvent(TDispID DispID, TVariantArray Params);
```

Description

InvokeEvent descendants use InvokeEvent internally to link their event handlers to events on the COM server.

DispID is the dispatch ID for the appropriate event handler.

Params passes the parameters of the event handler as an array of OleVariants.

As implemented in InvokeEvent, InvokeEvent does nothing, because InvokeEvent has no events. Descendants that surface events from a COM server override this method so that the event sink specified by EventDispatch can pass events on to the appropriate event handlers.

See Also

EventDispatch (see page 18111)

132.1.11.4.9 Item Method

This is the overview for the Item method overload.

Overload List

	Name	Description
	TShellWindows.Item () (see page 19144)	This is Item, a member of class TShellWindows.
	TShellWindows.Item (OleVariant) (see page 19144)	This is Item, a member of class TShellWindows.

132.1.11.4.9.1 TShellWindows.Item Method ()

Pascal

```
function Item: IDispatch; overload;
```

C++

```
__fastcall IDispatch Item();
```

Description

This is Item, a member of class TShellWindows.

132.1.11.4.9.2 TShellWindows.Item Method (OleVariant)

Pascal

```
function Item(index: OleVariant): IDispatch; overload;
```

C++

```
__fastcall IDispatch Item(OleVariant index);
```

Description

This is Item, a member of class TShellWindows.

132.1.11.4.10 TShellWindows.OnActivated Method

Pascal

```
procedure OnActivated(lCookie: Integer; fActive: WordBool);
```

C++

```
__fastcall OnActivated(int lCookie, WordBool fActive);
```

Description

This is OnActivated, a member of class TShellWindows.

132.1.11.4.11 TShellWindows.OnCreated Method

Pascal

```
procedure OnCreated(lCookie: Integer; const punk: IUnknown);
```

C++

```
__fastcall OnCreated(int lCookie, const IUnknown punk);
```

Description

This is OnCreated, a member of class TShellWindows.

132.1.11.4.12 TShellWindows.OnNavigate Method

Pascal

```
procedure OnNavigate(lCookie: Integer; var pvarloc: OleVariant);
```

C++

```
__fastcall OnNavigate(int lCookie, OleVariant pvarloc);
```

Description

This is OnNavigate, a member of class TShellWindows.

132.1.11.4.13 TShellWindows.ProcessAttachDetach Method

Pascal

```
procedure ProcessAttachDetach(fAttach: WordBool);
```

C++

```
__fastcall ProcessAttachDetach(WordBool fAttach);
```

Description

This is ProcessAttachDetach, a member of class TShellWindows.

132.1.11.4.14 TShellWindows.Register Method

Pascal

```
procedure Register(const pid: IDispatch; HWND: Integer; swClass: SYSINT; out plCookie:
Integer);
```

C++

```
__fastcall Register(const IDispatch pid, int HWND, SYSINT swClass, int plCookie);
```

Description

This is Register, a member of class TShellWindows.

132.1.11.4.15 TShellWindows.RegisterPending Method

Pascal

```
procedure RegisterPending(lThreadId: Integer; var pvarloc: OleVariant; var pvarlocRoot:
OleVariant; swClass: SYSINT; out plCookie: Integer);
```

C++

```
__fastcall RegisterPending(int lThreadId, OleVariant pvarloc, OleVariant pvarlocRoot, SYSINT
swClass, int plCookie);
```

Description

This is RegisterPending, a member of class TShellWindows.

132.1.11.4.16 TShellWindows.Revoke Method

Pascal

```
procedure Revoke(lCookie: Integer);
```

C++

```
__fastcall Revoke(int lCookie);
```

Description

This is Revoke, a member of class TShellWindows.

132.1.11.5 TShellWindows Properties

The properties of the TShellWindows class are listed here.

Public Properties

	Name	Description
R	Count (see page 19146)	This is Count, a member of class TShellWindows.
R	DefaultInterface (see page 19146)	This is DefaultInterface, a member of class TShellWindows.

132.1.11.5.1 TShellWindows.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TShellWindows.

132.1.11.5.2 TShellWindows.DefaultInterface Property

Pascal

```
property DefaultInterface: IShellWindows;
```

C++

```
__property IShellWindows DefaultInterface;
```

Description

This is DefaultInterface, a member of class TShellWindows.

132.1.11.6 TShellWindows Events

The events of the TShellWindows class are listed here.

Published Events

	Name	Description
	OnWindowRegistered (see page 19146)	This is OnWindowRegistered, a member of class TShellWindows.
	OnWindowRevoked (see page 19147)	This is OnWindowRevoked, a member of class TShellWindows.

132.1.11.6.1 TShellWindows.OnWindowRegistered Event

Pascal

```
property OnWindowRegistered: TShellWindowsWindowRegistered;
```

C++

```
__property TShellWindowsWindowRegistered OnWindowRegistered;
```

Description

This is OnWindowRegistered, a member of class TShellWindows.

132.1.11.6.2 TShellWindows.OnWindowRevoked Event

Pascal

```
property OnWindowRevoked: TShellWindowsWindowRevoked;
```

C++

```
__property TShellWindowsWindowRevoked OnWindowRevoked;
```

Description

This is OnWindowRevoked, a member of class TShellWindows.

132.1.12 TWebBrowser Class

TWebBrowser provides access to the Web browser functionality of Microsoft's Shell Doc Object and Control Library (SHDOCVW.DLL).

Class Hierarchy

Pascal

```
TWebBrowser = class(TOleControl);
```

C++

```
class TWebBrowser : public TOleControl;
```

File

SHDocVw

Description

TWebBrowser wraps the IWebBrowser2 (see page 19403) interface from Microsoft's Shell Doc Object and Control Library (SHDOCVW.DLL) to allow you to create a customized Web browsing application or to add Internet, file and network browsing, document viewing, and data downloading capabilities to your applications.

Note: Because TWebBrowser wraps the SHDOCVW.DLL, you must have SHDOCVW.DLL installed to use this component. This DLL ships with Internet Explorer 4 and later.

132.1.12.1 TWebBrowser Members

The following tables list the members exposed by TWebBrowser.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.

	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_AddRef (see page 18046)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 18047)	Called when an application releases a component interface.
	_SetColorProp (see page 18047)	This is _SetColorProp, a member of class TOleControl.
	_SetTColorProp (see page 18048)	This is _SetTColorProp, a member of class TOleControl.
	_SetTFontProp (see page 18048)	This is _SetTFontProp, a member of class TOleControl.
	_SetTOleEnumProp (see page 18048)	This is _SetTOleEnumProp, a member of class TOleControl.
	_SetTPictureProp (see page 18048)	This is _SetTPictureProp, a member of class TOleControl.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanInPlaceActivate (see page 18049)	This is CanInPlaceActivate, a member of class TOleControl.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ContextSensitiveHelp (see page 18049)	This is ContextSensitiveHelp, a member of class TOleControl.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateControl (see page 19163)	This is CreateControl, a member of class TWebBrowser.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CreateWnd (see page 18049)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.

	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DeactivateAndUndo (see page 18050)	This is DeactivateAndUndo, a member of class TOleControl.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
V	DefineProperties (see page 18050)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWindowHandle (see page 18051)	Destroys the window created in the CreateWindowHandle method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DiscardUndoState (see page 18051)	This is DiscardUndoState, a member of class TOleControl.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EnableModeless (see page 18052)	This is EnableModeless, a member of class TOleControl.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	Get_Application (see page 19164)	This is Get_Application, a member of class TWebBrowser.
	Get_Container (see page 19164)	This is Get_Container, a member of class TWebBrowser.
	Get_Document (see page 19164)	This is Get_Document, a member of class TWebBrowser.
	Get_Parent (see page 19165)	This is Get_Parent, a member of class TWebBrowser.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.

	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetBorder (see page 18052)	This is GetBorder, a member of class TOleControl.
	GetByteProp (see page 18052)	This is GetByteProp, a member of class TOleControl.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetColorProp (see page 18053)	This is GetColorProp, a member of class TOleControl.
	GetCompProp (see page 18053)	This is GetCompProp, a member of class TOleControl.
	GetContainer (see page 18053)	This is GetContainer, a member of class TOleControl.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetCurrencyProp (see page 18053)	This is GetCurrencyProp, a member of class TOleControl.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDoubleProp (see page 18053)	This is GetDoubleProp, a member of class TOleControl.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetExtendedControl (see page 18054)	This is GetExtendedControl, a member of class TOleControl.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDispatchProp (see page 18055)	This is GetIDispatchProp, a member of class TOleControl.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIDsOfNames (see page 18055)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIntegerProp (see page 18055)	This is GetIntegerProp, a member of class TOleControl.
	GetIUnknownProp (see page 18055)	This is GetIUnknownProp, a member of class TOleControl.
	GetMoniker (see page 18056)	This is GetMoniker, a member of class TOleControl.
	GetOleBoolProp (see page 18056)	This is GetOleBoolProp, a member of class TOleControl.
	GetOleDateProp (see page 18056)	This is GetOleDateProp, a member of class TOleControl.
	GetOleEnumProp (see page 18057)	This is GetOleEnumProp, a member of class TOleControl.
	GetOleVariantProp (see page 18057)	This is GetOleVariantProp, a member of class TOleControl.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetShortIntProp (see page 18058)	This is GetShortIntProp, a member of class TOleControl.
	GetSingleProp (see page 18058)	This is GetSingleProp, a member of class TOleControl.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetSmallintProp (see page 18058)	This is GetSmallintProp, a member of class TOleControl.
	GetStringProp (see page 18059)	This is GetStringProp, a member of class TOleControl.
	GetTColorProp (see page 18059)	This is GetTColorProp, a member of class TOleControl.
	GetTDateTimeProp (see page 18059)	This is GetTDateTimeProp, a member of class TOleControl.
	GetTFontProp (see page 18059)	This is GetTFontProp, a member of class TOleControl.
	GetTOleEnumProp (see page 18059)	This is GetTOleEnumProp, a member of class TOleControl.

	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTPictureProp (see page 18060)	This is GetTPictureProp, a member of class TOleControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfo (see page 18060)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetTypeInfoCount (see page 18060)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariantProp (see page 18061)	This is GetVariantProp, a member of class TOleControl.
	GetWideStringProp (see page 18061)	This is GetWideStringProp, a member of class TOleControl.
	GetWindowContext (see page 18061)	This is GetWindowContext, a member of class TOleControl.
	GetWordBoolProp (see page 18061)	This is GetWordBoolProp, a member of class TOleControl.
	GetWordProp (see page 18062)	This is GetWordProp, a member of class TOleControl.
V	InitControlData (see page 19167)	This is InitControlData, a member of class TWebBrowser.
V	InitControlInterface (see page 18062)	This is InitControlInterface, a member of class TOleControl.
	InsertMenus (see page 18062)	This is InsertMenus, a member of class TOleControl.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Invoke (see page 18062)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	InvokeEvent (see page 18063)	This is InvokeEvent, a member of class TOleControl.
	InvokeMethod (see page 18063)	This is InvokeMethod, a member of class TOleControl.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	LockInPlaceActive (see page 18064)	This is LockInPlaceActive, a member of class TOleControl.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	OleControlSite_TranslateAccelerator (see page 18064)	This is OleControlSite_TranslateAccelerator, a member of class TOleControl.
	OleInPlaceFrame_GetWindow (see page 18064)	This is OleInPlaceFrame_GetWindow, a member of class TOleControl.
	OleInPlaceFrame_TranslateAccelerator (see page 18065)	This is OleInPlaceFrame_TranslateAccelerator, a member of class TOleControl.
	OleInPlaceSite_GetWindow (see page 18065)	This is OleInPlaceSite_GetWindow, a member of class TOleControl.
V	OnChanged (see page 18065)	This is OnChanged, a member of class TOleControl.
	OnControlInfoChanged (see page 18065)	This is OnControlInfoChanged, a member of class TOleControl.
	OnFocus (see page 18066)	This is OnFocus, a member of class TOleControl.
	OnInPlaceActivate (see page 18066)	This is OnInPlaceActivate, a member of class TOleControl.
	OnInPlaceDeactivate (see page 18066)	This is OnInPlaceDeactivate, a member of class TOleControl.
	OnPosRectChange (see page 18066)	This is OnPosRectChange, a member of class TOleControl.
V	OnRequestEdit (see page 18066)	This is OnRequestEdit, a member of class TOleControl.
	OnShowWindow (see page 18067)	This is OnShowWindow, a member of class TOleControl.
	OnUIActivate (see page 18067)	This is OnUIActivate, a member of class TOleControl.

	OnUIDeactivate (see page 18067)	This is OnUIDeactivate, a member of class TOleControl.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
V	PaletteChanged (see page 18067)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PictureChanged (see page 18068)	This is PictureChanged, a member of class TOleControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	PostMessageFilter (see page 18068)	This is PostMessageFilter, a member of class TOleControl.
	PreMessageFilter (see page 18069)	This is PreMessageFilter, a member of class TOleControl.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	QueryInterface (see page 18069)	Returns a reference to a specified interface if the object supports that interface.
	QueryService (see page 18069)	This is QueryService, a member of class TOleControl.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveMenus (see page 18070)	This is RemoveMenus, a member of class TOleControl.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	RequestBorderSpace (see page 18070)	This is RequestBorderSpace, a member of class TOleControl.
	RequestNewObjectLayout (see page 18070)	This is RequestNewObjectLayout, a member of class TOleControl.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	SaveObject (see page 18070)	This is SaveObject, a member of class TOleControl.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Scroll (see page 18070)	This is Scroll, a member of class TOleControl.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActiveObject (see page 18071)	This is SetActiveObject, a member of class TOleControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetBorderSpace (see page 18071)	This is SetBorderSpace, a member of class TOleControl.
	SetByteProp (see page 18071)	This is SetByteProp, a member of class TOleControl.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetColorProp (see page 18072)	This is SetColorProp, a member of class TOleControl.
	SetCompProp (see page 18072)	This is SetCompProp, a member of class TOleControl.
	SetCurrencyProp (see page 18072)	This is SetCurrencyProp, a member of class TOleControl.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDoubleProp (see page 18072)	This is SetDoubleProp, a member of class TOleControl.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIDispatchProp (see page 18073)	This is SetIDispatchProp, a member of class TOleControl.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetIntegerProp (see page 18073)	This is SetIntegerProp, a member of class TOleControl.
	SetIUnknownProp (see page 18073)	This is SetIUnknownProp, a member of class TOleControl.
	SetMenu (see page 18073)	This is SetMenu, a member of class TOleControl.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetName (see page 18073)	Sets the name of the control.
	SetOleBoolProp (see page 18074)	This is SetOleBoolProp, a member of class TOleControl.
	SetOleDateProp (see page 18074)	This is SetOleDateProp, a member of class TOleControl.
	SetOleEnumProp (see page 18074)	This is SetOleEnumProp, a member of class TOleControl.
	SetOleVariantProp (see page 18075)	This is SetOleVariantProp, a member of class TOleControl.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParent (see page 18075)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetProperty (see page 18076)	This is SetProperty, a member of class TOleControl.
	SetShortIntProp (see page 18076)	This is SetShortIntProp, a member of class TOleControl.
	SetSingleProp (see page 18076)	This is SetSingleProp, a member of class TOleControl.
	SetSmallintProp (see page 18076)	This is SetSmallintProp, a member of class TOleControl.
	SetStatusText (see page 18077)	This is SetStatusText, a member of class TOleControl.
	SetStringProp (see page 18077)	This is SetStringProp, a member of class TOleControl.
	SetTColorProp (see page 18077)	This is SetTColorProp, a member of class TOleControl.
	SetTDateTimeProp (see page 18077)	This is SetTDateTimeProp, a member of class TOleControl.
	SetTFontProp (see page 18077)	This is SetTFontProp, a member of class TOleControl.
	SetTOleEnumProp (see page 18078)	This is SetTOleEnumProp, a member of class TOleControl.
	SetTPictureProp (see page 18078)	This is SetTPictureProp, a member of class TOleControl.
	SetVariantProp (see page 18078)	This is SetVariantProp, a member of class TOleControl.
	SetWideStringProp (see page 18078)	This is SetWideStringProp, a member of class TOleControl.
	SetWordBoolProp (see page 18079)	This is SetWordBoolProp, a member of class TOleControl.
	SetWordProp (see page 18079)	This is SetWordProp, a member of class TOleControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	ShowObject (see page 18079)	This is ShowObject, a member of class TOleControl.
	ShowPropertyFrame (see page 18079)	This is ShowPropertyFrame, a member of class TOleControl.
V	StandardEvent (see page 18080)	This is StandardEvent, a member of class TOleControl.
V	SuppressException (see page 18080)	This is SuppressException, a member of class TOleControl.
	TransformCoords (see page 18080)	This is TransformCoords, a member of class TOleControl.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WndProc (see page 18080)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	ControlData (see page 18086)	This is ControlData, a member of class TOleControl.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	ServiceQuery (see page 18087)	This is ServiceQuery, a member of class TOleControl.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	BrowseProperties (see page 18048)	Notifies the ActiveX control to display its Properties dialog box.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ClientToWindow (see page 19163)	Not used in TWebBrowser (see page 19147).
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 18043)	Creates a new instance of TOleControl (see page 18030).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 18050)	Handles all otherwise-unhandled messages.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 18043)	Frees the memory associated with this instance of TOleControl (see page 18030).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.

	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DoObjectVerb (see page 18051)	Notifies the ActiveX control to perform one of its actions.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecWB (see page 19163)	This is the overview for the ExecWB method overload.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetEnumPropDesc (see page 18054)	Returns descriptions of the ActiveX control's properties.
	GetHelpContext (see page 18054)	Retrieves the Help context of a member of the ActiveX control.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetObjectVerbs (see page 18056)	Retrieves the names of the verbs implemented by the ActiveX control.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetPropDisplayString (see page 18057)	Returns the display string for an interface for the ActiveX control.
	GetPropDisplayStrings (see page 18057)	Returns the display strings for an interface for the ActiveX control.
	GetProperty (see page 19165)	Not used in TWebBrowser (see page 19147).
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	GoBack (see page 19165)	Navigates to the previous item in the history list.
	GoForward (see page 19166)	Navigates to the next item in the history list.
	GoHome (see page 19166)	Navigates to the current start page.
	GoSearch (see page 19167)	Navigates to the current search page.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	IsCustomProperty (see page 18063)	Indicates whether an interface for the ActiveX control is a custom property.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsPropPageProperty (see page 18064)	Indicates whether an interface for the OCX control is a property page property.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	Navigate (see page 19167)	This is the overview for the Navigate method overload.
	Navigate2 (see page 19169)	This is the overview for the Navigate2 method overload.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	PutProperty (see page 19171)	Not used in TWebBrowser (see page 19147).
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	QueryStatusWB (see page 19171)	Returns information about what commands the Web browser supports.
	Quit (see page 19171)	Not used in TWebBrowser (see page 19147).
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 19172)	Reloads the current document.
	Refresh2 (see page 19172)	This is the overview for the Refresh2 method overload.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.

V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
V	SetBounds (see page 18071)	Sets the boundaries of the ActiveX control.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetPropDisplayString (see page 18075)	Sets the display string for an interface for the ActiveX control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	ShowAboutBox (see page 18079)	Notifies the ActiveX control to display its About box.
	ShowBrowserBar (see page 19173)	This is the overview for the ShowBrowserBar method overload.
	Stop (see page 19174)	Stops the current operation.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
R	Application (see page 19179)	Provides access to the Automation interface for the application that contains the WebBrowser (see page 19484) control, or, if that is unavailable, the interface for the WebBrowser (see page 19484) control.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Busy (see page 19180)	Indicates whether the WebBrowser (see page 19484) control is in the middle of a navigation or downloading operation.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	Container (see page 19180)	Provides access to the automation interface of the Web browser's container.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	ControlInterface (see page 19181)	Provides access to the interface for this Web browser component.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
R	DefaultDispatch (see page 18086)	The default dispatch interface.
R	DefaultInterface (see page 19181)	Provides access to the default interface for the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.

R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
R	Document (see page 19182)	Provides access to the Automation interface of the active document.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	FullName (see page 19184)	Indicates the fully qualified path name for the executable that hosts the Web Browser component.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
R	HWnd (see page 19185)	This is HWnd, a member of class TWebBrowser.
R	LocationName (see page 19185)	Identifies the short (UI-friendly) name of the URL or file currently displayed.
R	LocationURL (see page 19185)	Identifies the URL or path of the document or folder currently displayed.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Name (see page 19186)	Indicates the name for the executable that hosts the Web Browser component.
R	OleObject (see page 18086)	The ActiveX control associated with the TOleControl (see page 18030) object.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
R	Parent (see page 19187)	Provides access to the Automation interface of the Web browser's container.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Path (see page 19188)	Indicates the name for the executable that hosts the Web Browser component.
R	PerPropBrowsing (see page 18086)	Provides access to information about the property page properties of the OleControl.
R	ReadyState (see page 19193)	Indicates the state of the Web browser component.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
R	TopLevelContainer (see page 19198)	Indicates whether the Web browser is a top-level Automation object.
R	type_ (see page 19199)	This is type_, a member of class TWebBrowser.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnBeforeNavigate2 (see page 19200)	Occurs immediately before the Web browser navigates to a new resource.
	OnClientToHostWindow (see page 19200)	This is OnClientToHostWindow, a member of class TWebBrowser.
	OnCommandStateChange (see page 19201)	Occurs when the ability to execute certain TWebBrowser (see page 19147) methods changes.
	OnDocumentComplete (see page 19201)	Occurs when the document being navigated to reaches ReadyState_Complete.
	OnDownloadBegin (see page 19202)	Occurs when the Web browser starts downloading a document.

	OnDownloadComplete (see page 19202)	Occurs when a navigation operation finishes, is halted, or fails.
	OnDragDrop (see page 19203)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 19205)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 19207)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 19208)	Occurs when a control receives the input focus.
	OnExit (see page 19211)	Occurs when the input focus shifts away from one control to another.
	OnFileDownload (see page 19212)	This is OnFileDownload, a member of class TWebBrowser.
	OnFullScreen (see page 19213)	Not used in TWebBrowser (see page 19147).
	OnMenuBar (see page 19213)	Not used in TWebBrowser (see page 19147).
	OnNavigateComplete2 (see page 19213)	Occurs immediately after the Web browser successfully navigates to a new location.
	OnNavigateError (see page 19214)	This is OnNavigateError, a member of class TWebBrowser.
	OnNewWindow2 (see page 19214)	Occurs when a new, hidden, non-navigated Web browser window is needed.
	OnPrintTemplateInstantiation (see page 19214)	This is OnPrintTemplateInstantiation, a member of class TWebBrowser.
	OnPrintTemplateTeardown (see page 19215)	This is OnPrintTemplateTeardown, a member of class TWebBrowser.
	OnPrivacyImpactedStateChange (see page 19215)	This is OnPrivacyImpactedStateChange, a member of class TWebBrowser.
	OnProgressChange (see page 19215)	Occurs when the progress of a download operation is updated.
	OnPropertyChange (see page 19215)	Not used in TWebBrowser (see page 19147).
	OnQuit (see page 19216)	Not used in TWebBrowser (see page 19147).
	OnSetSecureLockIcon (see page 19216)	This is OnSetSecureLockIcon, a member of class TWebBrowser.
	OnStartDrag (see page 19216)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnStatusBar (see page 19217)	Not used in TWebBrowser (see page 19147).
	OnStatusTextChange (see page 19217)	Not used in TWebBrowser (see page 19147).
	OnTheaterMode (see page 19217)	Not used in TWebBrowser (see page 19147).
	OnTitleChange (see page 19218)	Occurs when the title of a document in the WebBrowser (see page 19484) control becomes available or changes.
	OnToolBar (see page 19218)	Not used in TWebBrowser (see page 19147).
	OnUpdatePageStatus (see page 19218)	This is OnUpdatePageStatus, a member of class TWebBrowser.
	OnVisible (see page 19219)	Occurs when the Web browser window is about to be shown or hidden.
	OnWindowClosing (see page 19219)	This is OnWindowClosing, a member of class TWebBrowser.
	OnWindowSetHeight (see page 19219)	This is OnWindowSetHeight, a member of class TWebBrowser.
	OnWindowSetLeft (see page 19219)	This is OnWindowSetLeft, a member of class TWebBrowser.
	OnWindowSetResizable (see page 19220)	This is OnWindowSetResizable, a member of class TWebBrowser.
	OnWindowSetTop (see page 19220)	This is OnWindowSetTop, a member of class TWebBrowser.
	OnWindowSetWidth (see page 19220)	This is OnWindowSetWidth, a member of class TWebBrowser.

Published Properties

	Name	Description
	AddressBar (see page 19175)	Not used in TWebBrowser (see page 19147).
	Align (see page 19175)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 19179)	Specifies how the control is anchored to its parent.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 19182)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 19182)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	FullScreen (see page 19184)	Not used in TWebBrowser (see page 19147).
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.

	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	MenuBar (see page 19186)	Not used in TWebBrowser (see page 19147).
	Offline (see page 19186)	Indicates whether the Web browser gets its document from the local cache.
	ParentShowHint (see page 19187)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 19188)	Identifies the pop-up menu associated with the control.
	RegisterAsBrowser (see page 19193)	Registers the control as a top-level browser for target name resolution.
	RegisterAsDropTarget (see page 19194)	Specifies whether users can load a document using drag-and-drop.
	Resizable (see page 19194)	Not used in TWebBrowser (see page 19147).
	ShowHint (see page 19194)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Silent (see page 19196)	Specifies whether the Web browser can display dialog boxes.
	StatusBar (see page 19196)	Not used in TWebBrowser (see page 19147).
	StatusText (see page 19196)	Not used in TWebBrowser (see page 19147).
	TabOrder (see page 19197)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 19197)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	TheaterMode (see page 19198)	Not used in TWebBrowser (see page 19147).
	ToolBar (see page 19198)	Not used in TWebBrowser (see page 19147).
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 19199)	Specifies whether the Web browser component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

132.1.12.2 TWebBrowser Methods

The methods of the TWebBrowser class are listed here.

Protected Methods

	Name	Description
	CreateControl (see page 19163)	This is CreateControl, a member of class TWebBrowser.
	Get_Application (see page 19164)	This is Get_Application, a member of class TWebBrowser.
	Get_Container (see page 19164)	This is Get_Container, a member of class TWebBrowser.
	Get_Document (see page 19164)	This is Get_Document, a member of class TWebBrowser.
	Get_Parent (see page 19165)	This is Get_Parent, a member of class TWebBrowser.
V	InitControlData (see page 19167)	This is InitControlData, a member of class TWebBrowser.

Public Methods

	Name	Description
	ClientToWindow (see page 19163)	Not used in TWebBrowser (see page 19147).
	ExecWB (see page 19163)	This is the overview for the ExecWB method overload.
	GetProperty (see page 19165)	Not used in TWebBrowser (see page 19147).
	GoBack (see page 19165)	Navigates to the previous item in the history list.
	GoForward (see page 19166)	Navigates to the next item in the history list.
	GoHome (see page 19166)	Navigates to the current start page.
	GoSearch (see page 19167)	Navigates to the current search page.
	Navigate (see page 19167)	This is the overview for the Navigate method overload.
	Navigate2 (see page 19169)	This is the overview for the Navigate2 method overload.
	PutProperty (see page 19171)	Not used in TWebBrowser (see page 19147).
	QueryStatusWB (see page 19171)	Returns information about what commands the Web browser supports.
	Quit (see page 19171)	Not used in TWebBrowser (see page 19147).
	Refresh (see page 19172)	Reloads the current document.
	Refresh2 (see page 19172)	This is the overview for the Refresh2 method overload.

	ShowBrowserBar (see page 19173)	This is the overview for the ShowBrowserBar method overload.
	Stop (see page 19174)	Stops the current operation.

132.1.12.2.1 TWebBrowser.ClientToWindow Method

Not used in TWebBrowser (see page 19147).

Pascal

```
procedure ClientToWindow(var pcx: SYSINT; var pcy: SYSINT);
```

C++

```
__fastcall ClientToWindow(SYSINT pcx, SYSINT pcy);
```

Description

Do not use this method. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. Internet Explorer uses ClientToWindow to convert between client coordinates and window coordinates.

132.1.12.2.2 TWebBrowser.CreateControl Method

Pascal

```
procedure CreateControl;
```

C++

```
__fastcall CreateControl();
```

Description

This is CreateControl, a member of class TWebBrowser.

132.1.12.2.3 ExecWB Method

This is the overview for the ExecWB method overload.

Overload List

	Name	Description
	TWebBrowser.ExecWB (OLECMDID, OLECMDEXECOPT) (see page 19163)	Executes a command.
	TWebBrowser.ExecWB (OLECMDID, OLECMDEXECOPT, OleVariant) (see page 19163)	Executes a command.
	TWebBrowser.ExecWB (OLECMDID, OLECMDEXECOPT, OleVariant, OleVariant) (see page 19163)	Executes a command.

132.1.12.2.3.1 TWebBrowser.ExecWB Method (OLECMDID, OLECMDEXECOPT)

Executes a command.

Pascal

```
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT); overload;
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT; var pvaIn: OleVariant); overload;
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT; var pvaIn: OleVariant; var
```

```
pvaOut: OleVariant); overload;
```

C++

```
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt);
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt, OleVariant pvaIn);
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt, OleVariant pvaIn, OleVariant
pvaOut);
```

Description

ExecWB lets you use the IOleCommandTarget interface to pass a command to the Web browser control. For more information, see the Microsoft documentation of IOleCommandTarget.

cmdID specifies the command to execute. The Web Browser does not support all of the commands for which Microsoft providesconstants. Use the QueryStatusWB (see page 19171) method to determine what commands can be used.

cmdexecopt modifies how the command is executed.

pvaIn specifies a Variant array that contains any input arguments. This value can be omitted if there are not input arguments.

pvaOutspecifies a Variant that receives the results of the command, if any. This value can be omitted if there are no results.

See Also

QueryStatusWB (see page 19171)

DoObjectVerb (see page 18051)

GetObjectVerbs (see page 18056)

132.1.12.2.4 TWebBrowser.Get_Application Method

Pascal

```
function Get_Application: IDispatch;
```

C++

```
__fastcall IDispatch Get_Application();
```

Description

This is Get_Application, a member of class TWebBrowser.

132.1.12.2.5 TWebBrowser.Get_Container Method

Pascal

```
function Get_Container: IDispatch;
```

C++

```
__fastcall IDispatch Get_Container();
```

Description

This is Get_Container, a member of class TWebBrowser.

132.1.12.2.6 TWebBrowser.Get_Document Method

Pascal

```
function Get_Document: IDispatch;
```

C++

```
__fastcall IDispatch Get_Document();
```

Description

This is Get_Document, a member of class TWebBrowser.

132.1.12.2.7 TWebBrowser.Get_Parent Method

Pascal

```
function Get_Parent: IDispatch;
```

C++

```
__fastcall IDispatch Get_Parent();
```

Description

This is Get_Parent, a member of class TWebBrowser.

132.1.12.2.8 TWebBrowser.GetProperty Method

Not used in TWebBrowser (see page 19147).

Pascal

```
function GetProperty(const Property_: WideString): OleVariant;
```

C++

```
__fastcall OleVariant GetProperty(const BSTR Property_);
```

Description

Do not use this method. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. Internet Explorer uses GetProperty to return a property value.

132.1.12.2.9 TWebBrowser.GoBack Method

Navigates to the previous item in the history list.

Pascal

```
procedure GoBack;
```

C++

```
__fastcall GoBack();
```

Description

Call GoBack to return to the last document in the history list. GoBack has no effect unless the history list contains additional documents.

Note: The Navigate (see page 19168) or Navigate2 (see page 19169) command can change the history list, depending on the specified flags.

See Also

OnCommandStateChange (see page 19201)

GoForward (see page 19166)

GoHome (see page 19166)

GoSearch (see page 19167)

Navigate (see page 19168)

Navigate2 (see page 19169)

132.1.12.2.10 TWebBrowser.GoForward Method

Navigates to the next item in the history list.

Pascal

```
procedure GoForward;
```

C++

```
__fastcall GoForward();
```

Description

Call GoForward to return to the next document in the history list. GoForward reverses the effect of the last GoBack (see page 19165) command.

See Also

OnCommandStateChange (see page 19201)

GoBack (see page 19165)

GoHome (see page 19166)

GoSearch (see page 19167)

132.1.12.2.11 TWebBrowser.GoHome Method

Navigates to the current start page.

Pascal

```
procedure GoHome;
```

C++

```
__fastcall GoHome();
```

Description

Call GoHome to navigate to the registered home or start page. The URL for this page is specified in the Registry (see page 18633) at

`HKEY_CURRENT_USER\Software\Microsoft\Internet Explorer\Main`

under the name Startpage. You can change this value using the TRegistry or TRegistryIniFile object, or using Navigation tab of the Internet Explorer's Options dialog.

See Also

GoBack (see page 19165)

GoForward (see page 19166)

GoSearch (see page 19167)

TRegistry (see page 18645)

TRegistryIniFile (see page 18675)

132.1.12.2.12 TWebBrowser.GoSearch Method

Navigates to the current search page.

Pascal

```
procedure GoSearch;
```

C++

```
__fastcall GoSearch();
```

Description

Call GoSearch to navigate to the registered search page. The URL for this page is specified in the Registry (see page 18633) at

`HKEY_CURRENT_USER\Software\Microsoft\Internet Explorer\Main`

under the name SearchPage. You can change this value using the TRegistry or TRegistryIniFile object, or using Navigation tab of the Internet Explorer's Options dialog.

See Also

GoBack (see page 19165)

GoForward (see page 19166)

GoHome (see page 19166)

TRegistry (see page 18645)

TRegistryIniFile (see page 18675)

132.1.12.2.13 TWebBrowser.InitControlData Method

Pascal

```
procedure InitControlData; override;
```

C++

```
virtual __fastcall InitControlData();
```

Description

This is InitControlData, a member of class TWebBrowser.

132.1.12.2.14 Navigate Method

This is the overview for the Navigate method overload.

Overload List

	Name	Description
	TWebBrowser.Navigate (WideString) (see page 19168)	Navigates to a resource identified by a path name or URL.
	TWebBrowser.Navigate (WideString, OleVariant) (see page 19168)	Navigates to a resource identified by a path name or URL.
	TWebBrowser.Navigate (WideString, OleVariant, OleVariant) (see page 19168)	Navigates to a resource identified by a path name or URL.

	TWebBrowser.Navigate (WideString, OleVariant, OleVariant, OleVariant) (see page 19168)	Navigates to a resource identified by a path name or URL.
	TWebBrowser.Navigate (WideString, OleVariant, OleVariant, OleVariant, OleVariant) (see page 19168)	Navigates to a resource identified by a path name or URL.

132.1.12.2.14.1 TWebBrowser.Navigate Method (WideString)

Navigates to a resource identified by a path name or URL.

Pascal

```
procedure Navigate(const URL: WideString); overload;
procedure Navigate(const URL: WideString; const Flags: OleVariant); overload;
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant); overload;
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant); overload;
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL);
__fastcall Navigate(const BSTR URL, const OleVariant Flags);
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName);
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData);
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

Use Navigate to locate and download a specific resource. Navigate can send an HTTP message to a specified URL and display the results or simply display the results of a specified file.

URL specifies the UNC path name of a file or the Uniform Resource Locator of an Internet resource that the Web browser should display.

Flags is a set of values that specify whether to add the resource to the history list, whether to read from or write to the cache, and whether to display the resource in a new window. It can be a sum of zero or more of the following:

Constant	Value	Meaning
navOpenInNewWindow (see page 19502)	1	Open the resource or file in a new window.
navNoHistory (see page 19501)	2	Do not add the resource or file to the history list. The new page replaces the current page in the list.
navNoReadFromCache (see page 19502)	4	Do not read from the disk cache for this navigation.
navNoWriteToCache (see page 19502)	8	Do not write the results of this navigation to the disk cache.
navAllowAutosearch (see page 19501)	16	If the navigation fails, the Web browser attempts to navigate common root domains (.com, .edu, and so on). If this still fails, the URL is passed to a search engine.

TargetFrameName is the name of the frame in which the resource will be displayed, or NULL if the resource should not be displayed in a named frame.

PostData contains the data sent to the server when using Navigate to generate an HTTP POST message. If PostData is NULL,

Navigate generates an HTTP GET message. PostData is ignored if URL does not specify an HTTP URL.

Headers contains any headers sent to the servers when the URL represents an HTTP URL. HTTP headers specify such things as the intended action required of the server, the type of data, and so on. (See TWebRequest object, whose properties represent many of the more common headers).

Note: To navigate to a location that can't be expressed as an URL (for example, to an item identifier list), use the Navigate2 (see page 19169) method instead.

132.1.12.2.15 Navigate2 Method

This is the overview for the Navigate2 method overload.

Overload List

	Name	Description
	TWebBrowser.Navigate2 (OleVariant) (see page 19169)	Navigates to a specified resource.
	TWebBrowser.Navigate2 (OleVariant, OleVariant) (see page 19169)	Navigates to a specified resource.
	TWebBrowser.Navigate2 (OleVariant, OleVariant, OleVariant) (see page 19169)	Navigates to a specified resource.
	TWebBrowser.Navigate2 (OleVariant, OleVariant, OleVariant, OleVariant) (see page 19169)	Navigates to a specified resource.
	TWebBrowser.Navigate2 (OleVariant, OleVariant, OleVariant, OleVariant, OleVariant) (see page 19169)	Navigates to a specified resource.

132.1.12.2.15.1 TWebBrowser.Navigate2 Method (OleVariant)

Navigates to a specified resource.

Pascal

```
procedure Navigate2(var URL: OleVariant); overload;
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant); overload;
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant; var TargetFrameName:
OleVariant); overload;
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant; var TargetFrameName:
OleVariant; var PostData: OleVariant); overload;
procedure Navigate2(var URL: OleVariant; var Flags: OleVariant; var TargetFrameName:
```

```
OleVariant; var PostData: OleVariant; var Headers: OleVariant); overload;
```

C++

```
__fastcall Navigate2(OleVariant URL);
__fastcall Navigate2(OleVariant URL, OleVariant Flags);
__fastcall Navigate2(OleVariant URL, OleVariant Flags, OleVariant TargetFrameName);
__fastcall Navigate2(OleVariant URL, OleVariant Flags, OleVariant TargetFrameName, OleVariant
PostData);
__fastcall Navigate2(OleVariant URL, OleVariant Flags, OleVariant TargetFrameName, OleVariant
PostData, OleVariant Headers);
```

Description

Use Navigate2 to locate and download a specific resource. Navigate (see page 19168) can send an HTTP message to a specified URL and display the results, display the results of a specified file, or navigate to a resource that can't be expressed as an URL such as an item identifier list.

URL specifies the UNC path name of a file, the Uniform Resource Locator of an Internet resource, or a pointer to an item identifier list (PIDL).

Flags is a set of values that specify whether to add the resource to the history list, whether to read from or write to the cache, and whether to display the resource in a new window. It can be a sum of zero or more of the following:

Constant	Value	Meaning
navOpenInNewWindow (see page 19502)	1	Open the resource or file in a new window.
navNoHistory (see page 19501)	2	Do not add the resource or file to the history list. The new page replaces the current page in the list.
navNoReadFromCache (see page 19502)	4	Do not read from the disk cache for this navigation.
navNoWriteToCache (see page 19502)	8	Do not write the results of this navigation to the disk cache.
navAllowAutosearch (see page 19501)	16	If the navigation fails, the Web browser attempts to navigate common root domains (.com, .edu, and so on). If this still fails, the URL is passed to a search engine.

TargetFrameName is the name of the frame in which the resource will be displayed, or NULL if the resource should not be displayed in a named frame.

PostData contains the data sent to the server when using Navigate (see page 19168) to generate an HTTP POST message. If PostData is NULL, Navigate (see page 19168) generates an HTTP GET message. PostData is ignored if URL does not specify an HTTP URL.

Headers contains any headers sent to the servers when the URL represents an HTTP URL. HTTP headers specify such things as the intended action required of the server, the type of data, and so on. (See TWebRequest object, whose properties represent many of the more common headers).

TWebRequest (see page 15161)

132.1.12.2.16 TWebBrowser.PutProperty Method

Not used in TWebBrowser (see page 19147).

Pascal

```
procedure PutProperty(const Property_: WideString; vtValue: OleVariant);
```

C++

```
__fastcall PutProperty(const BSTR Property_, OleVariant vtValue);
```

Description

Do not use this method. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. Internet Explorer uses PutProperty to set a property value.

132.1.12.2.17 TWebBrowser.QueryStatusWB Method

Returns information about what commands the Web browser supports.

Pascal

```
function QueryStatusWB(cmdID: OLECMDID): OLECMDF;
```

C++

```
__fastcall OLECMDF QueryStatusWB(OLECMDID cmdID);
```

Description

Use QueryStatusWB to determine what commands can be executed using the ExecWB (see page 19163) method. QueryStatusWB uses the QueryStatus method of the IOleCommandTarget interface to obtain information about the status of commands. For more information, see the Microsoft documentation of IOleCommandTarget.

cmdID specifies the command about which you want information.

QueryStatusWB returns a value made by adding together flags that indicate the status of the command.

See Also

ExecWB (see page 19163)

132.1.12.2.18 TWebBrowser.Quit Method

Not used in TWebBrowser (see page 19147).

Pascal

```
procedure Quit;
```

C++

```
__fastcall Quit();
```

Description

Do not use this method. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. Internet Explorer responds to Quit by shutting down.

132.1.12.2.19 TWebBrowser.Refresh Method

Reloads the current document.

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

Call Refresh to reload the current document. This is useful when the Web browser is displaying the resource at an URL that may have changed.

Refresh always sends a pragma:nocache header, telling the server not to return a cached copy. This can cause problems with some servers. To prevent the pragma:nocache header, or to refresh only expired pages, use the Refresh2 (see page 19172) method instead.

See Also

Refresh2 (see page 19172)

Document (see page 19182)

132.1.12.2.20 Refresh2 Method

This is the overview for the Refresh2 method overload.

Overload List

	Name	Description
	TWebBrowser.Refresh2 () (see page 19172)	Reloads the current document if necessary.
	TWebBrowser.Refresh2 (OleVariant) (see page 19172)	Reloads the current document if necessary.

132.1.12.2.20.1 TWebBrowser.Refresh2 Method ()

Reloads the current document if necessary.

Pascal

```
procedure Refresh2; overload;
procedure Refresh2(var Level: OleVariant); overload;
```

C++

```
__fastcall Refresh2();
__fastcall Refresh2(OleVariant Level);
```

Description

Call Refresh2 to reload the current document. Unlike the Refresh (see page 19172) method, Refresh2 lets you specify what level of refresh to perform.

Level indicates what type of information is refreshed. The following table lists the possible values:

Constant	Value	Meaning
REFRESH_NORMAL (see page 19526)	0	Perform a lightweight refresh that does not include the pragma:nocache header. The pragma:nocache header tells the server not to return a cached copy. This can cause problems with some servers.
REFRESH_IFEXPIRED (see page 19526)	1	Only refresh if the page has expired. Do not include the pragma:nocache header.
REFRESH_CONTINUE (see page 19525)	2	For internal use only.
REFRESH_COMPLETELY (see page 19525)	3	Perform a full refresh, including the pragma:nocache header. Using this option is the same as calling the Refresh (see page 19172) method.

When Level is omitted, a value of REFRESH_COMPLETELY (see page 19525) is assumed.

See Also

Refresh (see page 19172)

132.1.12.2.21 ShowBrowserBar Method

This is the overview for the ShowBrowserBar method overload.

Overload List

	Name	Description
	TWebBrowser.ShowBrowserBar (OleVariant) (see page 19173)	Not used in TWebBrowser (see page 19147)
	TWebBrowser.ShowBrowserBar (OleVariant, OleVariant) (see page 19173)	Not used in TWebBrowser (see page 19147)
	TWebBrowser.ShowBrowserBar (OleVariant, OleVariant, OleVariant) (see page 19173)	Not used in TWebBrowser (see page 19147)

132.1.12.2.21.1 TWebBrowser.ShowBrowserBar Method (OleVariant)

Not used in TWebBrowser (see page 19147)

Pascal

```
procedure ShowBrowserBar(var pvaClsid: OleVariant); overload;
procedure ShowBrowserBar(var pvaClsid: OleVariant; var pvarShow: OleVariant); overload;
procedure ShowBrowserBar(var pvaClsid: OleVariant; var pvarShow: OleVariant; var pvarSize:
OleVariant); overload;
```

C++

```
__fastcall ShowBrowserBar(OleVariant pvaClsid);
__fastcall ShowBrowserBar(OleVariant pvaClsid, OleVariant pvarShow);
__fastcall ShowBrowserBar(OleVariant pvaClsid, OleVariant pvarShow, OleVariant pvarSize);
```

Description

Do not use this method. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. Internet Explorer uses ShowBrowserBar to show or hide a specified browser bar.

132.1.12.2.22 TWebBrowser.Stop Method

Stops the current operation.

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

Stop cancels any pending navigation or download operation and terminates any dynamic page elements, such as background sounds and animations.

132.1.12.3 TWebBrowser Properties

The properties of the TWebBrowser class are listed here.

Public Properties

	Name	Description
R	Application (see page 19179)	Provides access to the Automation interface for the application that contains the WebBrowser (see page 19484) control, or, if that is unavailable, the interface for the WebBrowser (see page 19484) control.
R	Busy (see page 19180)	Indicates whether the WebBrowser (see page 19484) control is in the middle of a navigation or downloading operation.
R	Container (see page 19180)	Provides access to the automation interface of the Web browser's container.
R	ControlInterface (see page 19181)	Provides access to the interface for this Web browser component.
R	DefaultInterface (see page 19181)	Provides access to the default interface for the component.
R	Document (see page 19182)	Provides access to the Automation interface of the active document.
R	FullName (see page 19184)	Indicates the fully qualified path name for the executable that hosts the Web Browser component.
R	HWnd (see page 19185)	This is HWnd, a member of class TWebBrowser.
R	LocationName (see page 19185)	Identifies the short (UI-friendly) name of the URL or file currently displayed.
R	LocationURL (see page 19185)	Identifies the URL or path of the document or folder currently displayed.
R	Name (see page 19186)	Indicates the name for the executable that hosts the Web Browser component.
R	Parent (see page 19187)	Provides access to the Automation interface of the Web browser's container.
R	Path (see page 19188)	Indicates the name for the executable that hosts the Web Browser component.
R	ReadyState (see page 19193)	Indicates the state of the Web browser component.
R	TopLevelContainer (see page 19198)	Indicates whether the Web browser is a top-level Automation object.
R	type_ (see page 19199)	This is type_, a member of class TWebBrowser.

Published Properties

	Name	Description
	AddressBar (see page 19175)	Not used in TWebBrowser (see page 19147).
	Align (see page 19175)	Determines how the control aligns within its container (parent control).
	Anchors (see page 19179)	Specifies how the control is anchored to its parent.
	DragCursor (see page 19182)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 19182)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	FullScreen (see page 19184)	Not used in TWebBrowser (see page 19147).
	MenuBar (see page 19186)	Not used in TWebBrowser (see page 19147).
	Offline (see page 19186)	Indicates whether the Web browser gets its document from the local cache.
	ParentShowHint (see page 19187)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 19188)	Identifies the pop-up menu associated with the control.
	RegisterAsBrowser (see page 19193)	Registers the control as a top-level browser for target name resolution.
	RegisterAsDropTarget (see page 19194)	Specifies whether users can load a document using drag-and-drop.
	Resizable (see page 19194)	Not used in TWebBrowser (see page 19147).
	ShowHint (see page 19194)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Silent (see page 19196)	Specifies whether the Web browser can display dialog boxes.
	StatusBar (see page 19196)	Not used in TWebBrowser (see page 19147).
	StatusText (see page 19196)	Not used in TWebBrowser (see page 19147).
	TabOrder (see page 19197)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 19197)	Determines if the user can tab to a control.
	TheaterMode (see page 19198)	Not used in TWebBrowser (see page 19147).
	ToolBar (see page 19198)	Not used in TWebBrowser (see page 19147).
	Visible (see page 19199)	Specifies whether the Web browser component appears onscreen.

132.1.12.3.1 TWebBrowser.AddressBar Property

Not used in TWebBrowser (see page 19147).

Pascal

```
property AddressBar: WordBool;
```

C++

```
__property WordBool AddressBar;
```

Description

Do not use AddressBar. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. AddressBar shows or hides the URL address bar on Internet Explorer. TWebBrowser (see page 19147) does not have an address bar.

132.1.12.3.2 TWebBrowser.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form,

panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/
```

```
#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
```

```
    Dirs.Parent := Form1;
    Dirs.Align := alLeft;
    Dirs.Width := Form1.ClientWidth div 3;
  { now add the splitter to divide the directory pane from the file pane }
    Split := TSplitter.Create(Form1);
    Split.Parent := Form1;
    { make sure the splitter is to the right of the directory list box! }
    Split.Left := Dirs.Left + Dirs.Width + 1;
    Split.Align := Dirs.Align; { give it the same alignment as the directory }
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane – a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
  end;
  {
  Dynamically create a TProgressBar control and align it to
  the bottom of the form.
  }

  var
    I: Integer;

Parent (see page 5832)

Anchors (see page 5802)

132.1.12.3.3 TWebBrowser.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

132.1.12.3.4 TWebBrowser.Application Property

Provides access to the Automation interface for the application that contains the WebBrowser (see page 19484) control, or, if that is unavailable, the interface for the WebBrowser (see page 19484) control.

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

Use Application to access the interface for the application containing the WebBrowser (see page 19484) control. If the application does not have an Automation interface, or if the interface is not accessible, Application provides access to the Automation interface of the Web browser control.

See Also

Container (see page 19180)

Parent (see page 19187)

ControlInterface (see page 19181)

132.1.12.3.5 TWebBrowser.Busy Property

Indicates whether the WebBrowser (see page 19484) control is in the middle of a navigation or downloading operation.

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

Read Busy to determine whether the Web browser component is currently navigating to a new URL or downloading a document. If Busy is true, you can interrupt the current operation using the Stop (see page 19174) method before starting a new operation.

Note: The Web browser receives events at the beginning and end of each operation, as well as at discrete points during a download operation.

See Also

ReadyState (see page 19193)

OnDocumentComplete (see page 19201)

OnBeforeNavigate2 (see page 19200)

OnNavigateComplete2 (see page 19213)

OnDownloadComplete (see page 19202)

OnDownloadBegin (see page 19202)

OnProgressChange (see page 19215)

Stop (see page 19174)

132.1.12.3.6 TWebBrowser.Container Property

Provides access to the automation interface of the Web browser's container.

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

Use Container to access the interface for the Web browser's parent or container. If the Web browser does not have a container with an Automation interface, Container is nil.

See Also

Application (see page 19179)

Parent (see page 19187)

ControlInterface (see page 19181)

TopLevelContainer (see page 19198)

132.1.12.3.7 TWebBrowser.ControlInterface Property

Provides access to the interface for this Web browser component.

Pascal

```
property ControlInterface: IWebBrowser2;
```

C++

```
__property IWebBrowser2 ControlInterface;
```

Description

Use ControlInterface to access the interface for the WebBrowser (see page 19484) component. This interface lets an Automation controller access the properties, methods, and events of the Web browser.

See Also

Application (see page 19179)

Document (see page 19182)

Parent (see page 19187)

DefaultInterface (see page 19181)

132.1.12.3.8 TWebBrowser.DefaultInterface Property

Provides access to the default interface for the component.

Pascal

```
property DefaultInterface: IWebBrowser2;
```

C++

```
__property IWebBrowser2 DefaultInterface;
```

Description

Use DefaultInterface to access the default interface for the component. As implemented in TWebBrowser (see page 19147), this is the same as the ControlInterface (see page 19181) property.

See Also

ControlInterface (see page 19181)

132.1.12.3.9 TWebBrowser.Document Property

Provides access to the Automation interface of the active document.

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

Use Document to access an IDispatch interface for manipulating the contents of the HTML document through the COM object model. If there is no active document, Document is nil. That is, you must first load a document using the Navigate (see page 19168) or Navigate2 (see page 19169) method before you can manipulate it using the Document interface.

For more information about this interface, see the document object section of Microsoft's Dynamic HTML reference.

See Also

ControlInterface (see page 19181)

Navigate (see page 19168)

Navigate2 (see page 19169)

132.1.12.3.10 TWebBrowser.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

132.1.12.3.11 TWebBrowser.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
```

```
    end;
  end;

  procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TTreeView;
  end;
```

OnEndDrag (see page 5860)

OnStartDrag (see page 5871)

DragKind (see page 5819)

Arranging the Order of Persistent Columns

132.1.12.3.12 TWebBrowser.FullName Property

Indicates the fully qualified path name for the executable that hosts the Web Browser component.

Pascal

```
property FullName: WideString;
```

C++

```
__property BSTR FullName;
```

Description

Read FullName to obtain the name of the executable as a WideString. Unlike the Name (see page 19186) property, FullName specifies a fully qualified path name.

See Also

Application (see page 19179)

ExeName (see page 13709)

Name (see page 19186)

Path (see page 19188)

132.1.12.3.13 TWebBrowser.FullScreen Property

Not used in TWebBrowser (see page 19147).

Pascal

```
property FullScreen: WordBool;
```

C++

```
__property WordBool FullScreen;
```

Description

Do not use FullScreen. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. FullScreen determines whether Internet Explorer is maximized.

132.1.12.3.14 TWebBrowser.HWnd Property

Pascal

```
property HWnd: Integer;
```

C++

```
__property int HWnd;
```

Description

This is HWnd, a member of class TWebBrowser.

132.1.12.3.15 TWebBrowser.LocationName Property

Identifies the short (UI-friendly) name of the URL or file currently displayed.

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

Read LocationName to get the name of the resource currently displayed in the Web browser control. If the resource is an HTML page from the Web, LocationName is the title of that page. If the resource is a folder or file on the local network or on a disk, LocationName is the full UNC name of the folder or file.

See Also

LocationURL (see page 19185)

OnTitleChange (see page 19218)

132.1.12.3.16 TWebBrowser.LocationURL Property

Identifies the URL or path of the document or folder currently displayed.

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

Read LocationURL to get the name of the resource currently displayed in the Web browser control. If the resource is an HTML page from the Web, LocationName (see page 19185) is its URL. If the resource is a folder or file on the local network or on a disk, LocationName (see page 19185) is the full UNC name of the folder or file.

Note: LocationURL is a read-only property. To direct the Web browser to display the resource at a specific URL, folder, or file, use the Navigate (see page 19168) or Navigate2 (see page 19169) method.

See Also

LocationName (see page 19185)

Navigate (see page 19168)

Navigate2 (see page 19169)

132.1.12.3.17 TWebBrowser.MenuBar Property

Not used in TWebBrowser (see page 19147).

Pascal

```
property MenuBar: WordBool;
```

C++

```
__property WordBool MenuBar;
```

Description

Do not use MenuBar. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. MenuBar shows or hides the menu bar in Internet Explorer. TWebBrowser (see page 19147) does not have a menu bar.

132.1.12.3.18 TWebBrowser.Name Property

Indicates the name for the executable that hosts the Web Browser component.

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

Read Name to obtain the name of the executable that hosts the Web browser. Unlike the FullName (see page 19184) property, Name does not include the path.

See Also

Application (see page 19179)

FullName (see page 19184)

Path (see page 19188)

132.1.12.3.19 TWebBrowser.Offline Property

Indicates whether the Web browser gets its document from the local cache.

Pascal

```
property Offline: WordBool;
```

C++

```
__property WordBool Offline;
```

Description

Set Offline to true to work offline with the Web browser. When the Web browser is offline, it can't read HTML pages using an Internet connection. Instead, you must specify a source document as a UNC filename.

Note: You can use Internet Explorer to save HTML pages to a local cache so that they are available for offline work.

See Also

Navigate (see page 19168)

Navigate2 (see page 19169)

132.1.12.3.20 TWebBrowser.Parent Property

Provides access to the Automation interface of the Web browser's container.

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

Use Parent to access the interface for the Web browser's parent or container. If the Web browser does not have a container with an Automation interface, the value of Parent is the same as ControlInterface (see page 19181).

Use the TopLevelContainer (see page 19198) property to determine which interface is the value of Parent.

See Also

Container (see page 19180)

ControlInterface (see page 19181)

Application (see page 19179)

TopLevelContainer (see page 19198)

132.1.12.3.21 TWebBrowser.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

132.1.12.3.22 TWebBrowser.Path Property

Indicates the name for the executable that hosts the Web Browser component.

Pascal

```
property Path: WideString;
```

C++

```
__property BSTR Path;
```

Description

Read Path to obtain the path of the executable that hosts the Web browser.

See Also

FullName (see page 19184)

Name (see page 19186)

132.1.12.3.23 TWebBrowser.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}
```

```
/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
```

```
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
```

```
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

132.1.12.3.24 TWebBrowser.ReadyState Property

Indicates the state of the Web browser component.

Pascal

```
property ReadyState: TOleEnum;
```

C++

```
__property TOleEnum ReadyState;
```

Description

Read ReadyState to obtain state information specific to the Web browser control. Use this information to avoid attempting to use the Web browser control when it is not ready to perform an action.

The following table lists the possible values:

Constant	Value	Meaning
READYSTATE_UNINITIALIZED (see page 19525)	0	Default initialization state. The Control has not begun loading any properties.
READYSTATE_LOADING (see page 19524)	1	The control is loading its properties.
READYSTATE_LOADED (see page 19524)	2	The control has initialized its properties but is not yet interactive.
READYSTATE_INTERACTIVE (see page 19524)	3	The control is interactive, but not all of its data is available. (It is downloading a document or frame).
READYSTATE_COMPLETE (see page 19523)	4	The control is interactive and all of its data is available. (The current document is fully downloaded).

Busy (see page 19180)

132.1.12.3.25 TWebBrowser.RegisterAsBrowser Property

Registers the control as a top-level browser for target name resolution.

Pascal

```
property RegisterAsBrowser: WordBool;
```

C++

```
__property WordBool RegisterAsBrowser;
```

Description

Set RegisterAsBrowser to true when using the Web browser control to implement a top-level browser.

132.1.12.3.26 TWebBrowser.RegisterAsDropTarget Property

Specifies whether users can load a document using drag-and-drop.

Pascal

```
property RegisterAsDropTarget: WordBool;
```

C++

```
__property WordBool RegisterAsDropTarget;
```

Description

Set RegisterAsDropTarget to true to allow users to drop HTML documents onto the Web browser. When RegisterAsDropTarget is true, users can load a document by dragging it onto the Web browser. When RegisterAsDropTarget is false, dragging a document onto the Web browser has no effect.

132.1.12.3.27 TWebBrowser.Resizable Property

Not used in TWebBrowser (see page 19147).

Pascal

```
property Resizable: WordBool;
```

C++

```
__property WordBool Resizable;
```

Description

Do not use Resizable. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. Resizable determines whether the Internet Explorer window can be resized.

132.1.12.3.28 TWebBrowser.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

ShowHint (see page 13721)

Displaying Fly-over Help

132.1.12.3.29 TWebBrowser.Silent Property

Specifies whether the Web browser can display dialog boxes.

Pascal

```
property Silent: WordBool;
```

C++

```
__property WordBool Silent;
```

Description

Set Silent to true to prevent the Web browser control from displaying dialog boxes.

132.1.12.3.30 TWebBrowser.StatusBar Property

Not used in TWebBrowser (see page 19147).

Pascal

```
property StatusBar: WordBool;
```

C++

```
__property WordBool StatusBar;
```

Description

Do not use StatusBar. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. StatusBar shows or hides the status bar in Internet Explorer. TWebBrowser (see page 19147) does not have a status bar.

132.1.12.3.31 TWebBrowser.StatusText Property

Not used in TWebBrowser (see page 19147).

Pascal

```
property StatusText: WideString;
```

C++

```
__property BSTR StatusText;
```

Description

Do not use StatusText. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. StatusText specifies the text that appears on the status bar in Internet Explorer. TWebBrowser (see page 19147) does not have a status bar.

132.1.12.3.32 TWebBrowser.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

132.1.12.3.33 TWebBrowser.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

132.1.12.3.34 TWebBrowser.TheaterMode Property

Not used in TWebBrowser (see page 19147).

Pascal

```
property TheaterMode: WordBool;
```

C++

```
__property WordBool TheaterMode;
```

Description

Do not use TheaterMode. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. TheaterMode changes the display of Internet Explorer to use theater or normal mode.

132.1.12.3.35 TWebBrowser.ToolBar Property

Not used in TWebBrowser (see page 19147).

Pascal

```
property ToolBar: Integer;
```

C++

```
__property int ToolBar;
```

Description

Do not use ToolBar. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. ToolBar determines which toolbar is displayed in Internet Explorer. TWebBrowser (see page 19147) does not have any tool bars.

132.1.12.3.36 TWebBrowser.TopLevelContainer Property

Indicates whether the Web browser is a top-level Automation object.

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

Read TopLevelContainer to determine whether the Web browser has a parent with an Automation interface. When TopLevelContainer is false, the Container (see page 19180) and Parent (see page 19187) properties provide access to the parent's interface. When TopLevelContainer is true, the value of Container (see page 19180) is nil and the value of Parent (see page 19187) is the Web browser's own interface.

See Also

Container (see page 19180)

Parent (see page 19187)

132.1.12.3.37 TWebBrowser.type_ Property

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

This is type_, a member of class TWebBrowser.

132.1.12.3.38 TWebBrowser.Visible Property

Specifies whether the Web browser component appears onscreen.

Pascal

```
property Visible: WordBool;
```

C++

```
__property WordBool Visible;
```

Description

Use Visible to show or hide the Web browser control.

See Also

Enabled (see page 5821)

132.1.12.4 TWebBrowser Events

The events of the TWebBrowser class are listed here.

Published Events

	Name	Description
	OnBeforeNavigate2 (see page 19200)	Occurs immediately before the Web browser navigates to a new resource.
	OnClientToHostWindow (see page 19200)	This is OnClientToHostWindow, a member of class TWebBrowser.
	OnCommandStateChange (see page 19201)	Occurs when the ability to execute certain TWebBrowser (see page 19147) methods changes.
	OnDocumentComplete (see page 19201)	Occurs when the document being navigated to reaches ReadyState_Complete.
	OnDownloadBegin (see page 19202)	Occurs when the Web browser starts downloading a document.
	OnDownloadComplete (see page 19202)	Occurs when a navigation operation finishes, is halted, or fails.
	OnDragDrop (see page 19203)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 19205)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 19207)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 19208)	Occurs when a control receives the input focus.
	OnExit (see page 19211)	Occurs when the input focus shifts away from one control to another.
	OnFileDownload (see page 19212)	This is OnFileDownload, a member of class TWebBrowser.
	OnFullScreen (see page 19213)	Not used in TWebBrowser (see page 19147).
	OnMenuBar (see page 19213)	Not used in TWebBrowser (see page 19147).
	OnNavigateComplete2 (see page 19213)	Occurs immediately after the Web browser successfully navigates to a new location.
	OnNavigateError (see page 19214)	This is OnNavigateError, a member of class TWebBrowser.
	OnNewWindow2 (see page 19214)	Occurs when a new, hidden, non-navigated Web browser window is needed.

	OnPrintTemplateInstantiation (see page 19214)	This is OnPrintTemplateInstantiation, a member of class TWebBrowser.
	OnPrintTemplateTeardown (see page 19215)	This is OnPrintTemplateTeardown, a member of class TWebBrowser.
	OnPrivacyImpactedStateChange (see page 19215)	This is OnPrivacyImpactedStateChange, a member of class TWebBrowser.
	OnProgressChange (see page 19215)	Occurs when the progress of a download operation is updated.
	OnPropertyChange (see page 19215)	Not used in TWebBrowser (see page 19147).
	OnQuit (see page 19216)	Not used in TWebBrowser (see page 19147).
	OnSetSecureLockIcon (see page 19216)	This is OnSetSecureLockIcon, a member of class TWebBrowser.
	OnStartDrag (see page 19216)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnStatusBar (see page 19217)	Not used in TWebBrowser (see page 19147).
	OnStatusTextChange (see page 19217)	Not used in TWebBrowser (see page 19147).
	OnTheaterMode (see page 19217)	Not used in TWebBrowser (see page 19147).
	OnTitleChange (see page 19218)	Occurs when the title of a document in the WebBrowser (see page 19484) control becomes available or changes.
	OnToolBar (see page 19218)	Not used in TWebBrowser (see page 19147).
	OnUpdatePageStatus (see page 19218)	This is OnUpdatePageStatus, a member of class TWebBrowser.
	OnVisible (see page 19219)	Occurs when the Web browser window is about to be shown or hidden.
	OnWindowClosing (see page 19219)	This is OnWindowClosing, a member of class TWebBrowser.
	OnWindowSetHeight (see page 19219)	This is OnWindowSetHeight, a member of class TWebBrowser.
	OnWindowSetLeft (see page 19219)	This is OnWindowSetLeft, a member of class TWebBrowser.
	OnWindowSetResizable (see page 19220)	This is OnWindowSetResizable, a member of class TWebBrowser.
	OnWindowSetTop (see page 19220)	This is OnWindowSetTop, a member of class TWebBrowser.
	OnWindowSetWidth (see page 19220)	This is OnWindowSetWidth, a member of class TWebBrowser.

132.1.12.4.1 TWebBrowser.OnBeforeNavigate2 Event

Occurs immediately before the Web browser navigates to a new resource.

Pascal

```
property OnBeforeNavigate2: TWebBrowserBeforeNavigate2;
```

C++

```
__property TWebBrowserBeforeNavigate2 OnBeforeNavigate2;
```

Description

Write an OnBeforeNavigate2 event handler to redirect or cancel a change to a different URL. This event may occur as the result of a call to the Navigate (see page 19168) or Navigate2 (see page 19169) method, or the user clicking a link.

See Also

Navigate (see page 19168)

Navigate2 (see page 19169)

OnNavigateComplete2 (see page 19213)

TWebRequest (see page 15161)

132.1.12.4.2 TWebBrowser.OnClientToHostWindow Event

Pascal

```
property OnClientToHostWindow: TWebBrowserClientToHostWindow;
```

C++

```
__property TWebBrowserClientToHostWindow OnClientToHostWindow;
```

Description

This is OnClientToHostWindow, a member of class TWebBrowser.

132.1.12.4.3 TWebBrowser.OnCommandStateChange Event

Occurs when the ability to execute certain TWebBrowser (see page 19147) methods changes.

Pascal

```
property OnCommandStateChange: TWebBrowserCommandStateChange;
```

C++

```
__property TWebBrowserCommandStateChange OnCommandStateChange;
```

Description

Write an OnCommandStateChange to update any controls in the application whose state depends on the ability to execute the Web browser's methods.

See Also

Stop (see page 19174)

GoBack (see page 19165)

GoForward (see page 19166)

Busy (see page 19180)

QueryStatusWB (see page 19171)

132.1.12.4.4 TWebBrowser.OnDocumentComplete Event

Occurs when the document being navigated to reaches ReadyState_Complete.

Pascal

```
property OnDocumentComplete: TWebBrowserDocumentComplete;
```

C++

```
__property TWebBrowserDocumentComplete OnDocumentComplete;
```

Description

Write an OnDocumentComplete event handler to take specific action when a frame or document is fully loaded into the Web browser .For a document without frames, this event occurs once when the document finishes loading. On a document containing multiple frames, this event occurs once for each frame. When the multiple-frame document finishes loading, the Web browser fires the event one final time.

See Also

ReadyState (see page 19193)

OnDownloadBegin (see page 19202)

OnDownloadComplete (see page 19202)

Busy (see page 19180)

Navigate (see page 19168)

Navigate2 (see page 19169)

OnBeforeNavigate2 (see page 19200)

132.1.12.4.5 TWebBrowser.OnDownloadBegin Event

Occurs when the Web browser starts downloading a document.

Pascal

```
property OnDownloadBegin: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownloadBegin;
```

Description

Write an OnDownloadBegin event handler to take specific action after the Web browser has located a document and immediately before it starts downloading the document. For example, use the OnDownloadBegin event to launch an animation control the represents downloading or a progress bar that is updated by an OnProgressChange (see page 19215) event handler. The control can then be stopped in an OnDownloadComplete (see page 19202) event handler.

Note: To take specific action when the Web browser looks up the resource, rather than when it begins downloading, use the OnBeforeNavigate2 (see page 19200) event. OnDownloadBegin occurs shortly after OnBeforeNavigate2 (see page 19200).

See Also

OnDocumentComplete (see page 19201)

OnDownloadComplete (see page 19202)

Navigate (see page 19168)

Navigate2 (see page 19169)

OnBeforeNavigate2 (see page 19200)

TAnimate (see page 3422)

OnNavigateComplete2 (see page 19213)

OnProgressChange (see page 19215)

132.1.12.4.6 TWebBrowser.OnDownloadComplete Event

Occurs when a navigation operation finishes, is halted, or fails.

Pascal

```
property OnDownloadComplete: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownloadComplete;
```

Description

Write an OnDownLoadComplete event handler to take specific action after the Web browser stops a downloading operation. For example, use the OnDownloadComplete event to stop an download indication that is started in an OnDownloadBegin (see page 19202) event handler.

Note: Unlike the OnNavigateComplete2 (see page 19213) event, OnDownloadComplete occurs even if the Web browser does not successfully navigate to an URL.

See Also

OnDocumentComplete (see page 19201)

OnDownloadBegin (see page 19202)

Navigate (see page 19168)

Navigate2 (see page 19169)

OnNavigateComplete2 (see page 19213)

132.1.12.4.7 TWebBrowser.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
```

```
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

132.1.12.4.8 TWebBrowser.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
```

```
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
```

```
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

132.1.12.4.9 TWebBrowser.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

132.1.12.4.10 TWebBrowser.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
```

```
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;
```

```
procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

132.1.12.4.11 TWebBrowser.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
```

```
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

132.1.12.4.12 TWebBrowser.OnFileDownload Event

Pascal

```
property OnFileDownload: TWebBrowserFileDownload;
```

C++

```
__property TWebBrowserFileDownload OnFileDownload;
```

Description

This is OnFileDownload, a member of class TWebBrowser.

132.1.12.4.13 TWebBrowser.OnFullScreen Event

Not used in TWebBrowser (see page 19147).

Pascal

```
property OnFullScreen: TWebBrowserOnFullScreen;
```

C++

```
__property TWebBrowserOnFullScreen OnFullScreen;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. OnFullScreen occurs with Internet Explorer when the application is maximized or restored from a maximized state.

132.1.12.4.14 TWebBrowser.OnMenuBar Event

Not used in TWebBrowser (see page 19147).

Pascal

```
property OnMenuBar: TWebBrowserOnMenuBar;
```

C++

```
__property TWebBrowserOnMenuBar OnMenuBar;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. OnMenuBar occurs with Internet Explorer when the menu bar is hidden or shown.

132.1.12.4.15 TWebBrowser.OnNavigateComplete2 Event

Occurs immediately after the Web browser successfully navigates to a new location.

Pascal

```
property OnNavigateComplete2: TWebBrowserNavigateComplete2;
```

C++

```
__property TWebBrowserNavigateComplete2 OnNavigateComplete2;
```

Description

Write an OnNavigateComplete2 event handler to take specific action when the Web browser successfully navigates to a new resource. The event can occur before the document is fully downloaded, but when it occurs at least part of the document must be received and a viewer for the document created.

Note: Unlike the OnDownloadComplete (see page 19202) event, OnNavigateComplete2 does not occur if the operation is not successful.

See Also

OnDocumentComplete (see page 19201)

OnDownloadBegin (see page 19202)

Navigate (see page 19168)

Navigate2 (see page 19169)

OnDownloadComplete (see page 19202)

OnBeforeNavigate2 (see page 19200)

132.1.12.4.16 TWebBrowser.OnNavigateError Event

Pascal

```
property OnNavigateError: TWebBrowserNavigateError;
```

C++

```
__property TWebBrowserNavigateError OnNavigateError;
```

Description

This is OnNavigateError, a member of class TWebBrowser.

132.1.12.4.17 TWebBrowser.OnNewWindow2 Event

Occurs when a new, hidden, non-navigated Web browser window is needed.

Pascal

```
property OnNewWindow2: TWebBrowserNewWindow2;
```

C++

```
__property TWebBrowserNewWindow2 OnNewWindow2;
```

Description

Write an OnNewWindow2 to take specific action immediately before the Web browser creates a new window for displaying a resource. This window may be needed because the user shift-clicked on a link, the user right-clicked on a link and chose "open in new window", the frame for the target URL does not yet exist, or the Navigate (see page 19168) or Navigate2 (see page 19169) requested that the target document appear in a new window.

See Also

OnBeforeNavigate2 (see page 19200)

132.1.12.4.18 TWebBrowser.OnPrintTemplateInstantiation Event

Pascal

```
property OnPrintTemplateInstantiation: TWebBrowserPrintTemplateInstantiation;
```

C++

```
__property TWebBrowserPrintTemplateInstantiation OnPrintTemplateInstantiation;
```

Description

This is OnPrintTemplateInstantiation, a member of class TWebBrowser.

132.1.12.4.19 TWebBrowser.OnPrintTemplateTeardown Event

Pascal

```
property OnPrintTemplateTeardown: TWebBrowserPrintTemplateTeardown;
```

C++

```
__property TWebBrowserPrintTemplateTeardown OnPrintTemplateTeardown;
```

Description

This is OnPrintTemplateTeardown, a member of class TWebBrowser.

132.1.12.4.20 TWebBrowser.OnPrivacyImpactedStateChange Event

Pascal

```
property OnPrivacyImpactedStateChange: TWebBrowserPrivacyImpactedStateChange;
```

C++

```
__property TWebBrowserPrivacyImpactedStateChange OnPrivacyImpactedStateChange;
```

Description

This is OnPrivacyImpactedStateChange, a member of class TWebBrowser.

132.1.12.4.21 TWebBrowser.OnProgressChange Event

Occurs when the progress of a download operation is updated.

Pascal

```
property OnProgressChange: TWebBrowserProgressChange;
```

C++

```
__property TWebBrowserProgressChange OnProgressChange;
```

Description

Write an OnProgressChange event handler to provide visual feedback about the download process. For example, an OnProgressChange event handler can update a TProgressBar component or display the number of bytes downloaded so far.

See Also

OnDocumentComplete (see page 19201)

OnDownloadBegin (see page 19202)

Navigate (see page 19168)

Navigate2 (see page 19169)

OnDownloadComplete (see page 19202)

TProgressBar (see page 4615)

132.1.12.4.22 TWebBrowser.OnPropertyChange Event

Not used in TWebBrowser (see page 19147).

Pascal

```
property OnPropertyChange: TWebBrowserPropertyChange;
```

C++

```
__property TWebBrowserPropertyChange OnPropertyChange;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. OnPropertyChange occurs with Internet Explorer when a property is modified using the PutProperty (see page 19171) method.

132.1.12.4.23 TWebBrowser.OnQuit Event

Not used in TWebBrowser (see page 19147).

Pascal

```
property OnQuit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnQuit;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. OnQuit occurs when the Internet Explorer is about to shut down.

132.1.12.4.24 TWebBrowser.OnSetSecureLockIcon Event

Pascal

```
property OnSetSecureLockIcon: TWebBrowserSetSecureLockIcon;
```

C++

```
__property TWebBrowserSetSecureLockIcon OnSetSecureLockIcon;
```

Description

This is OnSetSecureLockIcon, a member of class TWebBrowser.

132.1.12.4.25 TWebBrowser.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag

cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

See Also

OnEndDrag (see page 5860)

TDragControlObjectEx (see page 6007)

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDragDrop (see page 5855)

132.1.12.4.26 TWebBrowser.OnStatusBar Event

Not used in TWebBrowser (see page 19147).

Pascal

```
property OnStatusBar: TWebBrowserOnStatusBar;
```

C++

```
__property TWebBrowserOnStatusBar OnStatusBar;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. OnStatusBar occurs when the Internet Explorer first shows or hides its status bar.

132.1.12.4.27 TWebBrowser.OnStatusTextChange Event

Not used in TWebBrowser (see page 19147).

Pascal

```
property OnStatusTextChange: TWebBrowserStatusTextChange;
```

C++

```
__property TWebBrowserStatusTextChange OnStatusTextChange;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. OnStatusTextChange occurs when the text displayed in the Internet Explorer's status bar changes.

132.1.12.4.28 TWebBrowser.OnTheaterMode Event

Not used in TWebBrowser (see page 19147).

Pascal

```
property OnTheaterMode: TWebBrowserOnTheaterMode;
```

C++

```
__property TWebBrowserOnTheaterMode OnTheaterMode;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. OnTheaterMode occurs when the Internet Explorer changes into or out of theater mode.

132.1.12.4.29 TWebBrowser.OnTitleChange Event

Occurs when the title of a document in the WebBrowser (see page 19484) control becomes available or changes.

Pascal

```
property OnTitleChange: TWebBrowserTitleChange;
```

C++

```
__property TWebBrowserTitleChange OnTitleChange;
```

Description

Write an OnTitleChange event handler to respond when the Web browser obtains information about the document title. Because the title can change while an HTML page is downloading, LocationName (see page 19185) is originally set to the URL of the document. After the title specified in the HTML page, if any, becomes available, LocationName (see page 19185) is changed to reflect the actual title.

See Also

LocationName (see page 19185)

132.1.12.4.30 TWebBrowser.OnToolBar Event

Not used in TWebBrowser (see page 19147).

Pascal

```
property OnToolBar: TWebBrowserOnToolBar;
```

C++

```
__property TWebBrowserOnToolBar OnToolBar;
```

Description

Do not use this event. It is included in the TWebBrowser (see page 19147) interface because the IWebBrowser2 (see page 19403) interface is shared with Internet Explorer. OnToolBar occurs when the Internet Explorer changes which tool bars are visible.

132.1.12.4.31 TWebBrowser.OnUpdatePageStatus Event

Pascal

```
property OnUpdatePageStatus: TWebBrowserUpdatePageStatus;
```

C++

```
__property TWebBrowserUpdatePageStatus OnUpdatePageStatus;
```

Description

This is OnUpdatePageStatus, a member of class TWebBrowser.

132.1.12.4.32 TWebBrowser.OnVisible Event

Occurs when the Web browser window is about to be shown or hidden.

Pascal

```
property OnVisible: TWebBrowserOnVisible;
```

C++

```
__property TWebBrowserOnVisible OnVisible;
```

Description

Write an OnVisible event handler to make adjustments to compensate for the appearance or disappearance of the Web browser window.

See Also

Visible (see page 19199)

132.1.12.4.33 TWebBrowser.OnWindowClosing Event

Pascal

```
property OnWindowClosing: TWebBrowserWindowClosing;
```

C++

```
__property TWebBrowserWindowClosing OnWindowClosing;
```

Description

This is OnWindowClosing, a member of class TWebBrowser.

132.1.12.4.34 TWebBrowser.OnWindowSetHeight Event

Pascal

```
property OnWindowSetHeight: TWebBrowserWindowSetHeight;
```

C++

```
__property TWebBrowserWindowSetHeight OnWindowSetHeight;
```

Description

This is OnWindowSetHeight, a member of class TWebBrowser.

132.1.12.4.35 TWebBrowser.OnWindowSetLeft Event

Pascal

```
property OnWindowSetLeft: TWebBrowserWindowSetLeft;
```

C++

```
__property TWebBrowserWindowSetLeft OnWindowSetLeft;
```

Description

This is OnWindowSetLeft, a member of class TWebBrowser.

132.1.12.4.36 TWebBrowser.OnWindowSetResizable Event

Pascal

```
property OnWindowSetResizable: TWebBrowserWindowSetResizable;
```

C++

```
__property TWebBrowserWindowSetResizable OnWindowSetResizable;
```

Description

This is OnWindowSetResizable, a member of class TWebBrowser.

132.1.12.4.37 TWebBrowser.OnWindowSetTop Event

Pascal

```
property OnWindowSetTop: TWebBrowserWindowSetTop;
```

C++

```
__property TWebBrowserWindowSetTop OnWindowSetTop;
```

Description

This is OnWindowSetTop, a member of class TWebBrowser.

132.1.12.4.38 TWebBrowser.OnWindowSetWidth Event

Pascal

```
property OnWindowSetWidth: TWebBrowserWindowSetWidth;
```

C++

```
__property TWebBrowserWindowSetWidth OnWindowSetWidth;
```

Description

This is OnWindowSetWidth, a member of class TWebBrowser.

132.1.13 TWebBrowser_V1 Class

Class Hierarchy

Pascal

```
TWebBrowser_V1 = class(TOleControl);
```

C++

```
class TWebBrowser_V1 : public TOleControl;
```

File

SHDocVw

Description

This is class SHDocVw.TWebBrowser_V1.

132.1.13.1 TWebBrowser_V1 Members

The following tables list the members exposed by TWebBrowser_V1.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.

	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_AddRef (see page 18046)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 18047)	Called when an application releases a component interface.
	_SetColorProp (see page 18047)	This is _SetColorProp, a member of class TOleControl.
	_SetTColorProp (see page 18048)	This is _SetTColorProp, a member of class TOleControl.
	_SetTFontProp (see page 18048)	This is _SetTFontProp, a member of class TOleControl.
	_SetTOleEnumProp (see page 18048)	This is _SetTOleEnumProp, a member of class TOleControl.
	_SetTPictureProp (see page 18048)	This is _SetTPictureProp, a member of class TOleControl.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.

	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanInPlaceActivate (see page 18049)	This is CanInPlaceActivate, a member of class TOleControl.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ContextSensitiveHelp (see page 18049)	This is ContextSensitiveHelp, a member of class TOleControl.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateControl (see page 19235)	This is CreateControl, a member of class TWebBrowser_V1.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CreateWnd (see page 18049)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DeactivateAndUndo (see page 18050)	This is DeactivateAndUndo, a member of class TOleControl.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DefineProperties (see page 18050)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWindowHandle (see page 18051)	Destroys the window created in the CreateWindowHandle method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DiscardUndoState (see page 18051)	This is DiscardUndoState, a member of class TOleControl.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.

	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EnableModeless (see page 18052)	This is EnableModeless, a member of class TOleControl.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	Get_Application (see page 19236)	This is Get_Application, a member of class TWebBrowser_V1.
	Get_Container (see page 19236)	This is Get_Container, a member of class TWebBrowser_V1.
	Get_Document (see page 19236)	This is Get_Document, a member of class TWebBrowser_V1.
	Get_Parent (see page 19236)	This is Get_Parent, a member of class TWebBrowser_V1.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetBorder (see page 18052)	This is GetBorder, a member of class TOleControl.
	GetByteProp (see page 18052)	This is GetByteProp, a member of class TOleControl.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetColorProp (see page 18053)	This is GetColorProp, a member of class TOleControl.
	GetCompProp (see page 18053)	This is GetCompProp, a member of class TOleControl.
	GetContainer (see page 18053)	This is GetContainer, a member of class TOleControl.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetCurrencyProp (see page 18053)	This is GetCurrencyProp, a member of class TOleControl.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.

	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDoubleProp (see page 18053)	This is GetDoubleProp, a member of class TOleControl.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetExtendedControl (see page 18054)	This is GetExtendedControl, a member of class TOleControl.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDispatchProp (see page 18055)	This is GetIDispatchProp, a member of class TOleControl.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIDsOfNames (see page 18055)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIntegerProp (see page 18055)	This is GetIntegerProp, a member of class TOleControl.
	GetIUnknownProp (see page 18055)	This is GetIUnknownProp, a member of class TOleControl.
	GetMoniker (see page 18056)	This is GetMoniker, a member of class TOleControl.
	GetOleBoolProp (see page 18056)	This is GetOleBoolProp, a member of class TOleControl.
	GetOleDateProp (see page 18056)	This is GetOleDateProp, a member of class TOleControl.
	GetOleEnumProp (see page 18057)	This is GetOleEnumProp, a member of class TOleControl.
	GetOleVariantProp (see page 18057)	This is GetOleVariantProp, a member of class TOleControl.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetProperty (see page 18058)	This is GetProperty, a member of class TOleControl.
	GetShortIntProp (see page 18058)	This is GetShortIntProp, a member of class TOleControl.
	GetSingleProp (see page 18058)	This is GetSingleProp, a member of class TOleControl.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetSmallintProp (see page 18058)	This is GetSmallintProp, a member of class TOleControl.
	GetStringProp (see page 18059)	This is GetStringProp, a member of class TOleControl.
	GetTColorProp (see page 18059)	This is GetTColorProp, a member of class TOleControl.
	GetTDateTimeProp (see page 18059)	This is GetTDateTimeProp, a member of class TOleControl.
	GetTFontProp (see page 18059)	This is GetTFontProp, a member of class TOleControl.
	GetTOleEnumProp (see page 18059)	This is GetTOleEnumProp, a member of class TOleControl.
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTPictureProp (see page 18060)	This is GetTPictureProp, a member of class TOleControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfo (see page 18060)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetTypeInfoCount (see page 18060)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariantProp (see page 18061)	This is GetVariantProp, a member of class TOleControl.
	GetWideStringProp (see page 18061)	This is GetWideStringProp, a member of class TOleControl.
	GetWindowContext (see page 18061)	This is GetWindowContext, a member of class TOleControl.
	GetWordBoolProp (see page 18061)	This is GetWordBoolProp, a member of class TOleControl.
	GetWordProp (see page 18062)	This is GetWordProp, a member of class TOleControl.
V	InitControlData (see page 19237)	This is InitControlData, a member of class TWebBrowser_V1.
V	InitControlInterface (see page 18062)	This is InitControlInterface, a member of class TOleControl.
	InsertMenus (see page 18062)	This is InsertMenus, a member of class TOleControl.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

	Invoke (see page 18062)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	InvokeEvent (see page 18063)	This is InvokeEvent, a member of class TOleControl.
	InvokeMethod (see page 18063)	This is InvokeMethod, a member of class TOleControl.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	LockInPlaceActive (see page 18064)	This is LockInPlaceActive, a member of class TOleControl.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	OleControlSite_TranslateAccelerator (see page 18064)	This is OleControlSite_TranslateAccelerator, a member of class TOleControl.
	OleInPlaceFrame_GetWindow (see page 18064)	This is OleInPlaceFrame_GetWindow, a member of class TOleControl.
	OleInPlaceFrame_TranslateAccelerator (see page 18065)	This is OleInPlaceFrame_TranslateAccelerator, a member of class TOleControl.
	OleInPlaceSite_GetWindow (see page 18065)	This is OleInPlaceSite_GetWindow, a member of class TOleControl.
V	OnChanged (see page 18065)	This is OnChanged, a member of class TOleControl.
	OnControlInfoChanged (see page 18065)	This is OnControlInfoChanged, a member of class TOleControl.
	OnFocus (see page 18066)	This is OnFocus, a member of class TOleControl.
	OnInPlaceActivate (see page 18066)	This is OnInPlaceActivate, a member of class TOleControl.
	OnInPlaceDeactivate (see page 18066)	This is OnInPlaceDeactivate, a member of class TOleControl.
	OnPosRectChange (see page 18066)	This is OnPosRectChange, a member of class TOleControl.
V	OnRequestEdit (see page 18066)	This is OnRequestEdit, a member of class TOleControl.
	OnShowWindow (see page 18067)	This is OnShowWindow, a member of class TOleControl.
	OnUIActivate (see page 18067)	This is OnUIActivate, a member of class TOleControl.
	OnUIDeactivate (see page 18067)	This is OnUIDeactivate, a member of class TOleControl.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
V	PaletteChanged (see page 18067)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PictureChanged (see page 18068)	This is PictureChanged, a member of class TOleControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	PostMessageFilter (see page 18068)	This is PostMessageFilter, a member of class TOleControl.
	PreMessageFilter (see page 18069)	This is PreMessageFilter, a member of class TOleControl.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	QueryInterface (see page 18069)	Returns a reference to a specified interface if the object supports that interface.
	QueryService (see page 18069)	This is QueryService, a member of class TOleControl.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.

	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveMenus (see page 18070)	This is RemoveMenus, a member of class TOleControl.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	RequestBorderSpace (see page 18070)	This is RequestBorderSpace, a member of class TOleControl.
	RequestNewObjectLayout (see page 18070)	This is RequestNewObjectLayout, a member of class TOleControl.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	SaveObject (see page 18070)	This is SaveObject, a member of class TOleControl.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Scroll (see page 18070)	This is Scroll, a member of class TOleControl.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActiveObject (see page 18071)	This is SetActiveObject, a member of class TOleControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetBorderSpace (see page 18071)	This is SetBorderSpace, a member of class TOleControl.
	SetByteProp (see page 18071)	This is SetByteProp, a member of class TOleControl.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetColorProp (see page 18072)	This is SetColorProp, a member of class TOleControl.
	SetCompProp (see page 18072)	This is SetCompProp, a member of class TOleControl.
	SetCurrencyProp (see page 18072)	This is SetCurrencyProp, a member of class TOleControl.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDoubleProp (see page 18072)	This is SetDoubleProp, a member of class TOleControl.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIDispatchProp (see page 18073)	This is SetIDispatchProp, a member of class TOleControl.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetIntegerProp (see page 18073)	This is SetIntegerProp, a member of class TOleControl.
	SetIUnknownProp (see page 18073)	This is SetIUnknownProp, a member of class TOleControl.
	SetMenu (see page 18073)	This is SetMenu, a member of class TOleControl.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetName (see page 18073)	Sets the name of the control.
	SetOleBoolProp (see page 18074)	This is SetOleBoolProp, a member of class TOleControl.
	SetOleDateProp (see page 18074)	This is SetOleDateProp, a member of class TOleControl.
	SetOleEnumProp (see page 18074)	This is SetOleEnumProp, a member of class TOleControl.
	SetOleVariantProp (see page 18075)	This is SetOleVariantProp, a member of class TOleControl.

	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParent (see page 18075)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetProperty (see page 18076)	This is SetProperty, a member of class TOleControl.
	SetShortIntProp (see page 18076)	This is SetShortIntProp, a member of class TOleControl.
	SetSingleProp (see page 18076)	This is SetSingleProp, a member of class TOleControl.
	SetSmallintProp (see page 18076)	This is SetSmallintProp, a member of class TOleControl.
	SetStatusText (see page 18077)	This is SetStatusText, a member of class TOleControl.
	SetStringProp (see page 18077)	This is SetStringProp, a member of class TOleControl.
	SetTColorProp (see page 18077)	This is SetTColorProp, a member of class TOleControl.
	SetTDateTimeProp (see page 18077)	This is SetTDateTimeProp, a member of class TOleControl.
	SetTFontProp (see page 18077)	This is SetTFontProp, a member of class TOleControl.
	SetTOleEnumProp (see page 18078)	This is SetTOleEnumProp, a member of class TOleControl.
	SetTPictureProp (see page 18078)	This is SetTPictureProp, a member of class TOleControl.
	SetVariantProp (see page 18078)	This is SetVariantProp, a member of class TOleControl.
	SetWideStringProp (see page 18078)	This is SetWideStringProp, a member of class TOleControl.
	SetWordBoolProp (see page 18079)	This is SetWordBoolProp, a member of class TOleControl.
	SetWordProp (see page 18079)	This is SetWordProp, a member of class TOleControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	ShowObject (see page 18079)	This is ShowObject, a member of class TOleControl.
	ShowPropertyFrame (see page 18079)	This is ShowPropertyFrame, a member of class TOleControl.
	StandardEvent (see page 18080)	This is StandardEvent, a member of class TOleControl.
	SuppressException (see page 18080)	This is SuppressException, a member of class TOleControl.
	TransformCoords (see page 18080)	This is TransformCoords, a member of class TOleControl.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WndProc (see page 18080)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	ControlData (see page 18086)	This is ControlData, a member of class TOleControl.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	ServiceQuery (see page 18087)	This is ServiceQuery, a member of class TOleControl.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	BrowseProperties (see page 18048)	Notifies the ActiveX control to display its Properties dialog box.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 18043)	Creates a new instance of TOleControl (see page 18030).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 18050)	Handles all otherwise-unhandled messages.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 18043)	Frees the memory associated with this instance of TOleControl (see page 18030).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DoObjectVerb (see page 18051)	Notifies the ActiveX control to perform one of its actions.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetEnumPropDesc (see page 18054)	Returns descriptions of the ActiveX control's properties.
	GetHelpContext (see page 18054)	Retrieves the Help context of a member of the ActiveX control.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetObjectVerbs (see page 18056)	Retrieves the names of the verbs implemented by the ActiveX control.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetPropDisplayString (see page 18057)	Returns the display string for an interface for the ActiveX control.
	GetPropDisplayStrings (see page 18057)	Returns the display strings for an interface for the ActiveX control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	GoBack (see page 19236)	This is GoBack, a member of class TWebBrowser_V1.
	GoForward (see page 19237)	This is GoForward, a member of class TWebBrowser_V1.
	GoHome (see page 19237)	This is GoHome, a member of class TWebBrowser_V1.
	GoSearch (see page 19237)	This is GoSearch, a member of class TWebBrowser_V1.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	IsCustomProperty (see page 18063)	Indicates whether an interface for the ActiveX control is a custom property.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsPropPageProperty (see page 18064)	Indicates whether an interface for the OCX control is a property page property.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	Navigate (see page 19237)	This is the overview for the Navigate method overload.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 19239)	Repaints the control on the screen.
	Refresh2 (see page 19239)	This is the overview for the Refresh2 method overload.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
V	SetBounds (see page 18071)	Sets the boundaries of the ActiveX control.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetPropDisplayString (see page 18075)	Sets the display string for an interface for the ActiveX control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	ShowAboutBox (see page 18079)	Notifies the ActiveX control to display its About box.
	Stop (see page 19240)	This is Stop, a member of class TWebBrowser_V1.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
R	Application (see page 19245)	This is Application, a member of class TWebBrowser_V1.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.

	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Busy (see page 19245)	This is Busy, a member of class TWebBrowser_V1.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	Container (see page 19246)	This is Container, a member of class TWebBrowser_V1.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	ControlInterface (see page 19246)	This is ControlInterface, a member of class TWebBrowser_V1.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
R	DefaultDispatch (see page 18086)	The default dispatch interface.
R	DefaultInterface (see page 19246)	This is DefaultInterface, a member of class TWebBrowser_V1.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
R	Document (see page 19246)	This is Document, a member of class TWebBrowser_V1.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
R	LocationName (see page 19248)	This is LocationName, a member of class TWebBrowser_V1.
R	LocationURL (see page 19249)	This is LocationURL, a member of class TWebBrowser_V1.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	OleObject (see page 18086)	The ActiveX control associated with the TOleControl (see page 18030) object.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
R	Parent (see page 19249)	Indicates the parent of the control.

	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	PerPropBrowsing (see page 18086)	Provides access to information about the property page properties of the OleControl.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
R	TopLevelContainer (see page 19258)	This is TopLevelContainer, a member of class TWebBrowser_V1.
R	type_ (see page 19258)	This is type_, a member of class TWebBrowser_V1.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnBeforeNavigate (see page 19261)	This is OnBeforeNavigate, a member of class TWebBrowser_V1.
	OnCommandStateChange (see page 19261)	This is OnCommandStateChange, a member of class TWebBrowser_V1.
	OnDownloadBegin (see page 19261)	This is OnDownloadBegin, a member of class TWebBrowser_V1.
	OnDownloadComplete (see page 19261)	This is OnDownloadComplete, a member of class TWebBrowser_V1.
	OnDragDrop (see page 19261)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 19264)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 19266)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 19267)	Occurs when a control receives the input focus.
	OnExit (see page 19270)	Occurs when the input focus shifts away from one control to another.
	OnFrameBeforeNavigate (see page 19271)	This is OnFrameBeforeNavigate, a member of class TWebBrowser_V1.
	OnFrameNavigateComplete (see page 19271)	This is OnFrameNavigateComplete, a member of class TWebBrowser_V1.
	OnFrameNewWindow (see page 19272)	This is OnFrameNewWindow, a member of class TWebBrowser_V1.
	OnNavigateComplete (see page 19272)	This is OnNavigateComplete, a member of class TWebBrowser_V1.
	OnNewWindow (see page 19272)	This is OnNewWindow, a member of class TWebBrowser_V1.
	OnProgressChange (see page 19272)	This is OnProgressChange, a member of class TWebBrowser_V1.
	OnPropertyChange (see page 19272)	This is OnPropertyChange, a member of class TWebBrowser_V1.
	OnQuit (see page 19273)	This is OnQuit, a member of class TWebBrowser_V1.
	OnStartDrag (see page 19273)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnStatusTextChange (see page 19274)	This is OnStatusTextChange, a member of class TWebBrowser_V1.
	OnTitleChange (see page 19274)	This is OnTitleChange, a member of class TWebBrowser_V1.
	OnWindowActivate (see page 19274)	This is OnWindowActivate, a member of class TWebBrowser_V1.
	OnWindowMove (see page 19274)	This is OnWindowMove, a member of class TWebBrowser_V1.
	OnWindowResize (see page 19274)	This is OnWindowResize, a member of class TWebBrowser_V1.

Published Properties

	Name	Description
	Align (see page 19241)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 19245)	Specifies how the control is anchored to its parent.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 19246)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 19247)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.

	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentShowHint (see page 19250)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 19251)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 19256)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 19257)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 19258)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 19258)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

132.1.13.2 TWebBrowser_V1 Methods

The methods of the TWebBrowser_V1 class are listed here.

Protected Methods

	Name	Description
	CreateControl (see page 19235)	This is CreateControl, a member of class TWebBrowser_V1.
	Get_Application (see page 19236)	This is Get_Application, a member of class TWebBrowser_V1.
	Get_Container (see page 19236)	This is Get_Container, a member of class TWebBrowser_V1.
	Get_Document (see page 19236)	This is Get_Document, a member of class TWebBrowser_V1.
	Get_Parent (see page 19236)	This is Get_Parent, a member of class TWebBrowser_V1.
V	InitControlData (see page 19237)	This is InitControlData, a member of class TWebBrowser_V1.

Public Methods

	Name	Description
	GoBack (see page 19236)	This is GoBack, a member of class TWebBrowser_V1.
	GoForward (see page 19237)	This is GoForward, a member of class TWebBrowser_V1.
	GoHome (see page 19237)	This is GoHome, a member of class TWebBrowser_V1.
	GoSearch (see page 19237)	This is GoSearch, a member of class TWebBrowser_V1.
	Navigate (see page 19237)	This is the overview for the Navigate method overload.
	Refresh (see page 19239)	Repaints the control on the screen.
	Refresh2 (see page 19239)	This is the overview for the Refresh2 method overload.
	Stop (see page 19240)	This is Stop, a member of class TWebBrowser_V1.

132.1.13.2.1 TWebBrowser_V1.CreateControl Method

Pascal

```
procedure CreateControl;
```

C++

```
__fastcall CreateControl();
```

Description

This is CreateControl, a member of class TWebBrowser_V1.

132.1.13.2.2 TWebBrowser_V1.Get_Application Method

Pascal

```
function Get_Application: IDispatch;
```

C++

```
__fastcall IDispatch Get_Application();
```

Description

This is Get_Application, a member of class TWebBrowser_V1.

132.1.13.2.3 TWebBrowser_V1.Get_Container Method

Pascal

```
function Get_Container: IDispatch;
```

C++

```
__fastcall IDispatch Get_Container();
```

Description

This is Get_Container, a member of class TWebBrowser_V1.

132.1.13.2.4 TWebBrowser_V1.Get_Document Method

Pascal

```
function Get_Document: IDispatch;
```

C++

```
__fastcall IDispatch Get_Document();
```

Description

This is Get_Document, a member of class TWebBrowser_V1.

132.1.13.2.5 TWebBrowser_V1.Get_Parent Method

Pascal

```
function Get_Parent: IDispatch;
```

C++

```
__fastcall IDispatch Get_Parent();
```

Description

This is Get_Parent, a member of class TWebBrowser_V1.

132.1.13.2.6 TWebBrowser_V1.GoBack Method

Pascal

```
procedure GoBack;
```

C++

```
__fastcall GoBack();
```

Description

This is GoBack, a member of class TWebBrowser_V1.

132.1.13.2.7 TWebBrowser_V1.GoForward Method

Pascal

```
procedure GoForward;
```

C++

```
__fastcall GoForward();
```

Description

This is GoForward, a member of class TWebBrowser_V1.

132.1.13.2.8 TWebBrowser_V1.GoHome Method

Pascal

```
procedure GoHome;
```

C++

```
__fastcall GoHome();
```

Description

This is GoHome, a member of class TWebBrowser_V1.

132.1.13.2.9 TWebBrowser_V1.GoSearch Method

Pascal

```
procedure GoSearch;
```

C++

```
__fastcall GoSearch();
```

Description

This is GoSearch, a member of class TWebBrowser_V1.

132.1.13.2.10 TWebBrowser_V1.InitControlData Method

Pascal

```
procedure InitControlData; override;
```

C++

```
virtual __fastcall InitControlData();
```

Description

This is InitControlData, a member of class TWebBrowser_V1.

132.1.13.2.11 Navigate Method

This is the overview for the Navigate method overload.

Overload List

	Name	Description
	TWebBrowser_V1.Navigate (WideString) (see page 19238)	This is Navigate, a member of class TWebBrowser_V1.
	TWebBrowser_V1.Navigate (WideString, OleVariant) (see page 19238)	This is Navigate, a member of class TWebBrowser_V1.
	TWebBrowser_V1.Navigate (WideString, OleVariant, OleVariant) (see page 19238)	This is Navigate, a member of class TWebBrowser_V1.
	TWebBrowser_V1.Navigate (WideString, OleVariant, OleVariant, OleVariant) (see page 19239)	This is Navigate, a member of class TWebBrowser_V1.
	TWebBrowser_V1.Navigate (WideString, OleVariant, OleVariant, OleVariant, OleVariant) (see page 19239)	This is Navigate, a member of class TWebBrowser_V1.

132.1.13.2.11.1 TWebBrowser_V1.Navigate Method (WideString)

Pascal

```
procedure Navigate(const URL: WideString); overload;
```

C++

```
__fastcall Navigate(const BSTR URL);
```

Description

This is Navigate, a member of class TWebBrowser_V1.

132.1.13.2.11.2 TWebBrowser_V1.Navigate Method (WideString, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags);
```

Description

This is Navigate, a member of class TWebBrowser_V1.

132.1.13.2.11.3 TWebBrowser_V1.Navigate Method (WideString, OleVariant, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName);
```

Description

This is Navigate, a member of class TWebBrowser_V1.

132.1.13.2.11.4 TWebBrowser_V1.Navigate Method (WideString, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData);
```

Description

This is Navigate, a member of class TWebBrowser_V1.

132.1.13.2.11.5 TWebBrowser_V1.Navigate Method (WideString, OleVariant, OleVariant, OleVariant, OleVariant)

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant); overload;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate, a member of class TWebBrowser_V1.

132.1.13.2.12 TWebBrowser_V1.Refresh Method

Repaints the control on the screen.

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

Call Refresh method to repaint the control immediately. Refresh calls the Repaint method. Use the Refresh and Repaint methods interchangeably.

See Also

Invalidate (see page 5770)

Parent (see page 5832)

Repaint (see page 5779)

Update (see page 5789)

132.1.13.2.13 Refresh2 Method

This is the overview for the Refresh2 method overload.

Overload List

	Name	Description
	TWebBrowser_V1.Refresh2 () (see page 19240)	This is Refresh2, a member of class TWebBrowser_V1.
	TWebBrowser_V1.Refresh2 (OleVariant) (see page 19240)	This is Refresh2, a member of class TWebBrowser_V1.

132.1.13.2.13.1 TWebBrowser_V1.Refresh2 Method ()

Pascal

```
procedure Refresh2; overload;
```

C++

```
__fastcall Refresh2();
```

Description

This is Refresh2, a member of class TWebBrowser_V1.

132.1.13.2.13.2 TWebBrowser_V1.Refresh2 Method (OleVariant)

Pascal

```
procedure Refresh2(var Level: OleVariant); overload;
```

C++

```
__fastcall Refresh2(OleVariant Level);
```

Description

This is Refresh2, a member of class TWebBrowser_V1.

132.1.13.2.14 TWebBrowser_V1.Stop Method

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

This is Stop, a member of class TWebBrowser_V1.

132.1.13.3 TWebBrowser_V1 Properties

The properties of the TWebBrowser_V1 class are listed here.

Public Properties

	Name	Description
R	Application (see page 19245)	This is Application, a member of class TWebBrowser_V1.
R	Busy (see page 19245)	This is Busy, a member of class TWebBrowser_V1.
R	Container (see page 19246)	This is Container, a member of class TWebBrowser_V1.
R	ControlInterface (see page 19246)	This is ControlInterface, a member of class TWebBrowser_V1.

R	DefaultInterface (see page 19246)	This is DefaultInterface, a member of class TWebBrowser_V1.
R	Document (see page 19246)	This is Document, a member of class TWebBrowser_V1.
R	LocationName (see page 19248)	This is LocationName, a member of class TWebBrowser_V1.
R	LocationURL (see page 19249)	This is LocationURL, a member of class TWebBrowser_V1.
R	Parent (see page 19249)	Indicates the parent of the control.
R	TopLevelContainer (see page 19258)	This is TopLevelContainer, a member of class TWebBrowser_V1.
R	type_ (see page 19258)	This is type_, a member of class TWebBrowser_V1.

Published Properties

	Name	Description
	Align (see page 19241)	Determines how the control aligns within its container (parent control).
	Anchors (see page 19245)	Specifies how the control is anchored to its parent.
	DragCursor (see page 19246)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 19247)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	ParentShowHint (see page 19250)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 19251)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 19256)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 19257)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 19258)	Determines if the user can tab to a control.
	Visible (see page 19258)	Determines whether the component appears onscreen.

132.1.13.3.1 TWebBrowser_V1.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this);
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }

Parent (see page 5832)

Anchors (see page 5802)

132.1.13.3.2 TWebBrowser_V1.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Parent (see page 5832)

Align (see page 5798)

132.1.13.3.3 TWebBrowser_V1.Application Property

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

This is Application, a member of class TWebBrowser_V1.

132.1.13.3.4 TWebBrowser_V1.Busy Property

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

This is Busy, a member of class TWebBrowser_V1.

132.1.13.3.5 TWebBrowser_V1.Container Property

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

This is Container, a member of class TWebBrowser_V1.

132.1.13.3.6 TWebBrowser_V1.ControlInterface Property

Pascal

```
property ControlInterface: IWebBrowser;
```

C++

```
__property IWebBrowser ControlInterface;
```

Description

This is ControlInterface, a member of class TWebBrowser_V1.

132.1.13.3.7 TWebBrowser_V1.DefaultInterface Property

Pascal

```
property DefaultInterface: IWebBrowser;
```

C++

```
__property IWebBrowser DefaultInterface;
```

Description

This is DefaultInterface, a member of class TWebBrowser_V1.

132.1.13.3.8 TWebBrowser_V1.Document Property

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

This is Document, a member of class TWebBrowser_V1.

132.1.13.3.9 TWebBrowser_V1.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

132.1.13.3.10 TWebBrowser_V1.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
```

```
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;

132.1.13.3.11 TWebBrowser_V1.LocationName Property

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

This is LocationName, a member of class TWebBrowser_V1.

132.1.13.3.12 TWebBrowser_V1.LocationURL Property

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

This is LocationURL, a member of class TWebBrowser_V1.

132.1.13.3.13 TWebBrowser_V1.Parent Property

Indicates the parent of the control.

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

Use the Parent property to get or set the parent of this control. The parent of a control is the control that contains the control. For example, if an application includes three radio buttons in a group box, the group box is the parent of the three radio buttons, and the radio buttons are the child controls of the group box.

To serve as a parent, a control must be an instance of a descendant of TWinControl.

When creating a new control at runtime, assign a Parent property value for the new control. Usually, this is a form, panel, group box, or some control that is designed to contain another. Changing the parent of a control moves the control onscreen so that it is displayed within the new parent. When the parent control moves, the child moves with the parent.

Some controls (such as ActiveX controls) are contained in native windows rather than in a parent VCL control. For these controls, the value of Parent is nil (Delphi) or NULL (C++) and the ParentWindow property specifies the window.

Note: The Parent property declared in TControl is similar to the Owner property declared in TComponent, in that the Parent of a control frees the control just as the Owner of a component frees that Component. However, the Parent of a control is always a windowed control that visually contains the control, and is responsible for writing the control to a stream when the form is saved. The Owner of a component is the component that was passed as a parameter in the constructor and, if assigned, initiates the process of saving all objects (including the control and its parent) when the form is saved.

C++ Examples:

```
/*
This example uses a button placed next to a group box. When the
user clicks the button, the group box becomes the parent of the
button, so the button moves inside the group box.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (Button1->Parent != GroupBox1) // second click?
```

```
    {
      RemoveControl(Button1);
      GroupBox1->InsertControl(Button1);
    }
  }

  /*
  Note that it was necessary to remove the button from the Controls
  property of the form before the button actually moves into the
  group box. This code accomplishes the same thing:
  */

  void __fastcall TForm1::Button2Click(TObject *Sender)
  {
    Button2->Parent = GroupBox1;
  }
```

Delphi Examples:

```
  {
  This example uses a button placed next to a group box. When the
  user clicks the button, the group box becomes the parent of the
  button, so the button moves inside the group box.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    if (Button1.Parent <> GroupBox1) then // second click?
    begin
      RemoveControl(Button1);
      GroupBox1.InsertControl(Button1);
    end;
  end;

  {
  Note that it was necessary to remove the button from the Controls
  property of the form before the button actually moves into the
  group box. This code accomplishes the same thing:
  }

  procedure TForm1.Button2Click(Sender: TObject);
  begin
    Button2.Parent := GroupBox1;
  end;
```

132.1.13.3.14 TWebBrowser_V1.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
  property ParentShowHint: Boolean;
```

C++

```
  __property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

132.1.13.3.15 TWebBrowser_V1.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
```

```
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
```

```
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
```

```
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.

132.1.13.3.16 TWebBrowser_V1.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
```

```
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

132.1.13.3.17 TWebBrowser_V1.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

132.1.13.3.18 TWebBrowser_V1.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

132.1.13.3.19 TWebBrowser_V1.TopLevelContainer Property

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

This is TopLevelContainer, a member of class TWebBrowser_V1.

132.1.13.3.20 TWebBrowser_V1.type_ Property

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

This is type_, a member of class TWebBrowser_V1.

132.1.13.3.21 TWebBrowser_V1.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;
```

```
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

132.1.13.4 TWebBrowser_V1 Events

The events of the TWebBrowser_V1 class are listed here.

Published Events

	Name	Description
	OnBeforeNavigate (see page 19261)	This is OnBeforeNavigate, a member of class TWebBrowser_V1.
	OnCommandStateChange (see page 19261)	This is OnCommandStateChange, a member of class TWebBrowser_V1.
	OnDownloadBegin (see page 19261)	This is OnDownloadBegin, a member of class TWebBrowser_V1.
	OnDownloadComplete (see page 19261)	This is OnDownloadComplete, a member of class TWebBrowser_V1.
	OnDragDrop (see page 19261)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 19264)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 19266)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 19267)	Occurs when a control receives the input focus.
	OnExit (see page 19270)	Occurs when the input focus shifts away from one control to another.
	OnFrameBeforeNavigate (see page 19271)	This is OnFrameBeforeNavigate, a member of class TWebBrowser_V1.
	OnFrameNavigateComplete (see page 19271)	This is OnFrameNavigateComplete, a member of class TWebBrowser_V1.
	OnFrameNewWindow (see page 19272)	This is OnFrameNewWindow, a member of class TWebBrowser_V1.
	OnNavigateComplete (see page 19272)	This is OnNavigateComplete, a member of class TWebBrowser_V1.
	OnNewWindow (see page 19272)	This is OnNewWindow, a member of class TWebBrowser_V1.
	OnProgressChange (see page 19272)	This is OnProgressChange, a member of class TWebBrowser_V1.
	OnPropertyChange (see page 19272)	This is OnPropertyChange, a member of class TWebBrowser_V1.
	OnQuit (see page 19273)	This is OnQuit, a member of class TWebBrowser_V1.
	OnStartDrag (see page 19273)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnStatusTextChange (see page 19274)	This is OnStatusTextChange, a member of class TWebBrowser_V1.
	OnTitleChange (see page 19274)	This is OnTitleChange, a member of class TWebBrowser_V1.
	OnWindowActivate (see page 19274)	This is OnWindowActivate, a member of class TWebBrowser_V1.
	OnWindowMove (see page 19274)	This is OnWindowMove, a member of class TWebBrowser_V1.

	OnWindowResize (see page 19274)	This is OnWindowResize, a member of class TWebBrowser_V1.

132.1.13.4.1 TWebBrowser_V1.OnBeforeNavigate Event

Pascal

```
property OnBeforeNavigate: TWebBrowser_V1BeforeNavigate;
```

C++

```
__property TWebBrowser_V1BeforeNavigate OnBeforeNavigate;
```

Description

This is OnBeforeNavigate, a member of class TWebBrowser_V1.

132.1.13.4.2 TWebBrowser_V1.OnCommandStateChange Event

Pascal

```
property OnCommandStateChange: TWebBrowser_V1CommandStateChange;
```

C++

```
__property TWebBrowser_V1CommandStateChange OnCommandStateChange;
```

Description

This is OnCommandStateChange, a member of class TWebBrowser_V1.

132.1.13.4.3 TWebBrowser_V1.OnDownloadBegin Event

Pascal

```
property OnDownloadBegin: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownloadBegin;
```

Description

This is OnDownloadBegin, a member of class TWebBrowser_V1.

132.1.13.4.4 TWebBrowser_V1.OnDownloadComplete Event

Pascal

```
property OnDownloadComplete: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownloadComplete;
```

Description

This is OnDownloadComplete, a member of class TWebBrowser_V1.

132.1.13.4.5 TWebBrowser_V1.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
```

```
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

132.1.13.4.6 TWebBrowser_V1.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
```

```
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
```

```
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

132.1.13.4.7 TWebBrowser_V1.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
```

```
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

132.1.13.4.8 TWebBrowser_V1.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter

event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

Using a Single Navigator for Multiple Datasets

132.1.13.4.9 TWebBrowser_V1.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
```

```
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

ActiveControl (see page 13896)

132.1.13.4.10 TWebBrowser_V1.OnFrameBeforeNavigate Event

Pascal

```
property OnFrameBeforeNavigate: TWebBrowser_V1FrameBeforeNavigate;
```

C++

```
__property TWebBrowser_V1FrameBeforeNavigate OnFrameBeforeNavigate;
```

Description

This is OnFrameBeforeNavigate, a member of class TWebBrowser_V1.

132.1.13.4.11 TWebBrowser_V1.OnFrameNavigateComplete Event

Pascal

```
property OnFrameNavigateComplete: TWebBrowser_V1FrameNavigateComplete;
```

C++

```
__property TWebBrowser_V1FrameNavigateComplete OnFrameNavigateComplete;
```

Description

This is OnFrameNavigateComplete, a member of class TWebBrowser_V1.

132.1.13.4.12 TWebBrowser_V1.OnFrameNewWindow Event

Pascal

```
property OnFrameNewWindow: TWebBrowser_V1FrameNewWindow;
```

C++

```
__property TWebBrowser_V1FrameNewWindow OnFrameNewWindow;
```

Description

This is OnFrameNewWindow, a member of class TWebBrowser_V1.

132.1.13.4.13 TWebBrowser_V1.OnNavigateComplete Event

Pascal

```
property OnNavigateComplete: TWebBrowser_V1NavigateComplete;
```

C++

```
__property TWebBrowser_V1NavigateComplete OnNavigateComplete;
```

Description

This is OnNavigateComplete, a member of class TWebBrowser_V1.

132.1.13.4.14 TWebBrowser_V1.OnNewWindow Event

Pascal

```
property OnNewWindow: TWebBrowser_V1NewWindow;
```

C++

```
__property TWebBrowser_V1NewWindow OnNewWindow;
```

Description

This is OnNewWindow, a member of class TWebBrowser_V1.

132.1.13.4.15 TWebBrowser_V1.OnProgressChange Event

Pascal

```
property OnProgressChange: TWebBrowser_V1ProgressChange;
```

C++

```
__property TWebBrowser_V1ProgressChange OnProgressChange;
```

Description

This is OnProgressChange, a member of class TWebBrowser_V1.

132.1.13.4.16 TWebBrowser_V1.OnPropertyChange Event

Pascal

```
property OnPropertyChange: TWebBrowser_V1PropertyChange;
```

C++

```
__property TWebBrowser_V1PropertyChange OnPropertyChange;
```

Description

This is OnPropertyChange, a member of class TWebBrowser_V1.

132.1.13.4.17 TWebBrowser_V1.OnQuit Event

Pascal

```
property OnQuit: TWebBrowser_V1Quit;
```

C++

```
__property TWebBrowser_V1Quit OnQuit;
```

Description

This is OnQuit, a member of class TWebBrowser_V1.

132.1.13.4.18 TWebBrowser_V1.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

See Also

OnEndDrag (see page 5860)

TDragControlObjectEx (see page 6007)

DragKind (see page 5819)

OnDragOver (see page 5857)

132.1.13.4.19 TWebBrowser_V1.OnStatusTextChange Event

Pascal

```
property OnStatusTextChange: TWebBrowser_V1StatusTextChange;
```

C++

```
__property TWebBrowser_V1StatusTextChange OnStatusTextChange;
```

Description

This is OnStatusTextChange, a member of class TWebBrowser_V1.

132.1.13.4.20 TWebBrowser_V1.OnTitleChange Event

Pascal

```
property OnTitleChange: TWebBrowser_V1TitleChange;
```

C++

```
__property TWebBrowser_V1TitleChange OnTitleChange;
```

Description

This is OnTitleChange, a member of class TWebBrowser_V1.

132.1.13.4.21 TWebBrowser_V1.OnWindowActivate Event

Pascal

```
property OnWindowActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnWindowActivate;
```

Description

This is OnWindowActivate, a member of class TWebBrowser_V1.

132.1.13.4.22 TWebBrowser_V1.OnWindowMove Event

Pascal

```
property OnWindowMove: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnWindowMove;
```

Description

This is OnWindowMove, a member of class TWebBrowser_V1.

132.1.13.4.23 TWebBrowser_V1.OnWindowResize Event

Pascal

```
property OnWindowResize: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnWindowResize;
```

Description

This is OnWindowResize, a member of class TWebBrowser_V1.

132.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	_SearchAssistantEvents (see page 19276)	This is class SHDocVw._SearchAssistantEvents.
	DShellNameSpaceEvents (see page 19278)	This is class SHDocVw.DShellNameSpaceEvents.
	DShellWindowsEvents (see page 19279)	This is class SHDocVw.DShellWindowsEvents.
	DWebBrowserEvents (see page 19281)	This is class SHDocVw.DWebBrowserEvents.
	DWebBrowserEvents2 (see page 19286)	This is class SHDocVw.DWebBrowserEvents2.
	IScriptErrorList (see page 19295)	This is class SHDocVw.IScriptErrorList.
	IScriptErrorListDisp (see page 19299)	This is class SHDocVw.IScriptErrorListDisp.
	ISearch (see page 19303)	This is class SHDocVw.ISearch.
	ISearchAssistantOC (see page 19306)	This is class SHDocVw.ISearchAssistantOC.
	ISearchAssistantOC2 (see page 19316)	This is class SHDocVw.ISearchAssistantOC2.
	ISearchAssistantOC2Disp (see page 19318)	This is class SHDocVw.ISearchAssistantOC2Disp.
	ISearchAssistantOC3 (see page 19326)	This is class SHDocVw.ISearchAssistantOC3.
	ISearchAssistantOC3Disp (see page 19329)	This is class SHDocVw.ISearchAssistantOC3Disp.
	ISearchAssistantOCDisp (see page 19337)	This is class SHDocVw.ISearchAssistantOCDisp.
	ISearchDisp (see page 19344)	This is class SHDocVw.ISearchDisp.
	ISearches (see page 19346)	This is class SHDocVw.ISearches.
	ISearchesDisp (see page 19348)	This is class SHDocVw.ISearchesDisp.
	IShellFavoritesNameSpace (see page 19350)	This is class SHDocVw.IShellFavoritesNameSpace.
	IShellFavoritesNameSpaceDisp (see page 19355)	This is class SHDocVw.IShellFavoritesNameSpaceDisp.
	IShellNameSpace (see page 19359)	This is class SHDocVw.IShellNameSpace.
	IShellNameSpaceDisp (see page 19368)	This is class SHDocVw.IShellNameSpaceDisp.
	IShellUIHelper (see page 19376)	This is class SHDocVw.IShellUIHelper.
	IShellUIHelperDisp (see page 19380)	This is class SHDocVw.IShellUIHelperDisp.
	IShellWindows (see page 19384)	This is class SHDocVw.IShellWindows.
	IShellWindowsDisp (see page 19388)	This is class SHDocVw.IShellWindowsDisp.
	IWebBrowser (see page 19392)	This is class SHDocVw.IWebBrowser.
	IWebBrowser2 (see page 19403)	This is class SHDocVw.IWebBrowser2.
	IWebBrowser2Disp (see page 19412)	This is class SHDocVw.IWebBrowser2Disp.
	IWebBrowserApp (see page 19425)	This is class SHDocVw.IWebBrowserApp.
	IWebBrowserAppDisp (see page 19434)	This is class SHDocVw.IWebBrowserAppDisp.
	IWebBrowserDisp (see page 19444)	This is class SHDocVw.IWebBrowserDisp.

132.2.1 _SearchAssistantEvents Interface

Class Hierarchy

SHDocVw._SearchAssistantEvents

Pascal

```
_SearchAssistantEvents = dispinterface;
```

C++

```
class _SearchAssistantEvents;
```

File

SHDocVw

Description

This is class SHDocVw._SearchAssistantEvents.

132.2.1.1 _SearchAssistantEvents Members

The following tables list the members exposed by _SearchAssistantEvents.

Public Methods

	Name	Description
	OnNewSearch (see page 19277)	This is OnNewSearch, a member of class _SearchAssistantEvents.
	OnNextMenuSelect (see page 19277)	This is OnNextMenuSelect, a member of class _SearchAssistantEvents.

132.2.1.2 _SearchAssistantEvents Methods

The methods of the _SearchAssistantEvents class are listed here.

Public Methods

	Name	Description
	OnNewSearch (see page 19277)	This is OnNewSearch, a member of class _SearchAssistantEvents.
	OnNextMenuSelect (see page 19277)	This is OnNextMenuSelect, a member of class _SearchAssistantEvents.

132.2.1.2.1 _SearchAssistantEvents.OnNewSearch Method

Pascal

```
procedure OnNewSearch;
```

C++

```
__fastcall OnNewSearch();
```

Description

This is OnNewSearch, a member of class _SearchAssistantEvents.

132.2.1.2.2 _SearchAssistantEvents.OnNextMenuSelect Method

Pascal

```
procedure OnNextMenuSelect(idItem: Integer);
```

C++

```
__fastcall OnNextMenuSelect(int idItem);
```

Description

This is OnNextMenuSelect, a member of class _SearchAssistantEvents.

132.2.2 DShellNameSpaceEvents Interface

Class Hierarchy

SHDocVw.DShellNameSpaceEvents

Pascal

```
DShellNameSpaceEvents = dispinterface;
```

C++

```
class DShellNameSpaceEvents;
```

File

SHDocVw

Description

This is class SHDocVw.DShellNameSpaceEvents.

132.2.2.1 DShellNameSpaceEvents Members

The following tables list the members exposed by DShellNameSpaceEvents.

Public Methods

	Name	Description
	DoubleClick (see page 19278)	This is DoubleClick, a member of class DShellNameSpaceEvents.
	FavoritesSelectionChange (see page 19279)	This is FavoritesSelectionChange, a member of class DShellNameSpaceEvents.
	Initialized (see page 19279)	This is Initialized, a member of class DShellNameSpaceEvents.
	SelectionChange (see page 19279)	This is SelectionChange, a member of class DShellNameSpaceEvents.

132.2.2.2 DShellNameSpaceEvents Methods

The methods of the DShellNameSpaceEvents class are listed here.

Public Methods

	Name	Description
	DoubleClick (see page 19278)	This is DoubleClick, a member of class DShellNameSpaceEvents.
	FavoritesSelectionChange (see page 19279)	This is FavoritesSelectionChange, a member of class DShellNameSpaceEvents.
	Initialized (see page 19279)	This is Initialized, a member of class DShellNameSpaceEvents.
	SelectionChange (see page 19279)	This is SelectionChange, a member of class DShellNameSpaceEvents.

132.2.2.2.1 DShellNameSpaceEvents.DoubleClick Method

Pascal

```
procedure DoubleClick;
```

C++

```
__fastcall DoubleClick();
```

Description

This is DoubleClick, a member of class DShellNameSpaceEvents.

132.2.2.2.2 DShellNameSpaceEvents.FavoritesSelectionChange Method

Pascal

```
procedure FavoritesSelectionChange(cItems: Integer; hItem: Integer; const strName: WideString;
const strUrl: WideString; cVisits: Integer; const strDate: WideString; fAvailableOffline:
Integer);
```

C++

```
__fastcall FavoritesSelectionChange(int cItems, int hItem, const BSTR strName, const BSTR
strUrl, int cVisits, const BSTR strDate, int fAvailableOffline);
```

Description

This is FavoritesSelectionChange, a member of class DShellNameSpaceEvents.

132.2.2.2.3 DShellNameSpaceEvents.Initialized Method

Pascal

```
procedure Initialized;
```

C++

```
__fastcall Initialized();
```

Description

This is Initialized, a member of class DShellNameSpaceEvents.

132.2.2.2.4 DShellNameSpaceEvents.SelectionChange Method

Pascal

```
procedure SelectionChange;
```

C++

```
__fastcall SelectionChange();
```

Description

This is SelectionChange, a member of class DShellNameSpaceEvents.

132.2.3 DShellWindowsEvents Interface

Class Hierarchy

SHDocVw.DShellWindowsEvents

Pascal

```
DShellWindowsEvents = dispinterface;
```

C++

```
class DShellWindowsEvents;
```

File

SHDocVw

Description

This is class SHDocVw.DShellWindowsEvents.

132.2.3.1 DShellWindowsEvents Members

The following tables list the members exposed by DShellWindowsEvents.

Public Methods

	Name	Description
	WindowRegistered (see page 19280)	This is WindowRegistered, a member of class DShellWindowsEvents.
	WindowRevoked (see page 19280)	This is WindowRevoked, a member of class DShellWindowsEvents.

132.2.3.2 DShellWindowsEvents Methods

The methods of the DShellWindowsEvents class are listed here.

Public Methods

	Name	Description
	WindowRegistered (see page 19280)	This is WindowRegistered, a member of class DShellWindowsEvents.
	WindowRevoked (see page 19280)	This is WindowRevoked, a member of class DShellWindowsEvents.

132.2.3.2.1 DShellWindowsEvents.WindowRegistered Method

Pascal

```
procedure WindowRegistered(lCookie: Integer);
```

C++

```
__fastcall WindowRegistered(int lCookie);
```

Description

This is WindowRegistered, a member of class DShellWindowsEvents.

132.2.3.2.2 DShellWindowsEvents.WindowRevoked Method

Pascal

```
procedure WindowRevoked(lCookie: Integer);
```

C++

```
__fastcall WindowRevoked(int lCookie);
```

Description

This is WindowRevoked, a member of class DShellWindowsEvents.

132.2.4 DWebBrowserEvents Interface

Class Hierarchy

SHDocVw.DWebBrowserEvents

Pascal

```
DWebBrowserEvents = dispinterface;
```

C++

```
class DWebBrowserEvents;
```

File

SHDocVw

Description

This is class SHDocVw.DWebBrowserEvents.

132.2.4.1 DWebBrowserEvents Members

The following tables list the members exposed by DWebBrowserEvents.

Public Methods

	Name	Description
	BeforeNavigate (see page 19282)	This is BeforeNavigate, a member of class DWebBrowserEvents.
	CommandStateChange (see page 19282)	This is CommandStateChange, a member of class DWebBrowserEvents.
	DownloadBegin (see page 19282)	This is DownloadBegin, a member of class DWebBrowserEvents.
	DownloadComplete (see page 19283)	This is DownloadComplete, a member of class DWebBrowserEvents.
	FrameBeforeNavigate (see page 19283)	This is FrameBeforeNavigate, a member of class DWebBrowserEvents.
	FrameNavigateComplete (see page 19283)	This is FrameNavigateComplete, a member of class DWebBrowserEvents.
	FrameNewWindow (see page 19283)	This is FrameNewWindow, a member of class DWebBrowserEvents.
	NavigateComplete (see page 19284)	This is NavigateComplete, a member of class DWebBrowserEvents.
	NewWindow (see page 19284)	This is NewWindow, a member of class DWebBrowserEvents.
	ProgressChange (see page 19284)	This is ProgressChange, a member of class DWebBrowserEvents.
	PropertyChange (see page 19284)	This is PropertyChange, a member of class DWebBrowserEvents.
	Quit (see page 19284)	This is Quit, a member of class DWebBrowserEvents.
	StatusTextChange (see page 19285)	This is StatusTextChange, a member of class DWebBrowserEvents.
	TitleChange (see page 19285)	This is TitleChange, a member of class DWebBrowserEvents.
	WindowActivate (see page 19285)	This is WindowActivate, a member of class DWebBrowserEvents.
	WindowMove (see page 19285)	This is WindowMove, a member of class DWebBrowserEvents.
	WindowResize (see page 19286)	This is WindowResize, a member of class DWebBrowserEvents.

132.2.4.2 DWebBrowserEvents Methods

The methods of the DWebBrowserEvents class are listed here.

Public Methods

	Name	Description
	BeforeNavigate (see page 19282)	This is BeforeNavigate, a member of class DWebBrowserEvents.

	CommandStateChange (see page 19282)	This is CommandStateChange, a member of class DWebBrowserEvents.
	DownloadBegin (see page 19282)	This is DownloadBegin, a member of class DWebBrowserEvents.
	DownloadComplete (see page 19283)	This is DownloadComplete, a member of class DWebBrowserEvents.
	FrameBeforeNavigate (see page 19283)	This is FrameBeforeNavigate, a member of class DWebBrowserEvents.
	FrameNavigateComplete (see page 19283)	This is FrameNavigateComplete, a member of class DWebBrowserEvents.
	FrameNewWindow (see page 19283)	This is FrameNewWindow, a member of class DWebBrowserEvents.
	NavigateComplete (see page 19284)	This is NavigateComplete, a member of class DWebBrowserEvents.
	NewWindow (see page 19284)	This is NewWindow, a member of class DWebBrowserEvents.
	ProgressChange (see page 19284)	This is ProgressChange, a member of class DWebBrowserEvents.
	PropertyChange (see page 19284)	This is PropertyChange, a member of class DWebBrowserEvents.
	Quit (see page 19284)	This is Quit, a member of class DWebBrowserEvents.
	StatusTextChange (see page 19285)	This is StatusTextChange, a member of class DWebBrowserEvents.
	TitleChange (see page 19285)	This is TitleChange, a member of class DWebBrowserEvents.
	WindowActivate (see page 19285)	This is WindowActivate, a member of class DWebBrowserEvents.
	WindowMove (see page 19285)	This is WindowMove, a member of class DWebBrowserEvents.
	WindowResize (see page 19286)	This is WindowResize, a member of class DWebBrowserEvents.

132.2.4.2.1 DWebBrowserEvents.BeforeNavigate Method

Pascal

```
procedure BeforeNavigate(const URL: WideString; Flags: Integer; const TargetFrameName:
WideString; var PostData: OleVariant; const Headers: WideString; var Cancel: WordBool);
```

C++

```
__fastcall BeforeNavigate(const BSTR URL, int Flags, const BSTR TargetFrameName, OleVariant
PostData, const BSTR Headers, WordBool Cancel);
```

Description

This is BeforeNavigate, a member of class DWebBrowserEvents.

132.2.4.2.2 DWebBrowserEvents.CommandStateChange Method

Pascal

```
procedure CommandStateChange(Command: Integer; Enable: WordBool);
```

C++

```
__fastcall CommandStateChange(int Command, WordBool Enable);
```

Description

This is CommandStateChange, a member of class DWebBrowserEvents.

132.2.4.2.3 DWebBrowserEvents.DownloadBegin Method

Pascal

```
procedure DownloadBegin;
```

C++

```
__fastcall DownloadBegin();
```

Description

This is DownloadBegin, a member of class DWebBrowserEvents.

132.2.4.2.4 DWebBrowserEvents.DownloadComplete Method

Pascal

```
procedure DownloadComplete;
```

C++

```
__fastcall DownloadComplete();
```

Description

This is DownloadComplete, a member of class DWebBrowserEvents.

132.2.4.2.5 DWebBrowserEvents.FrameBeforeNavigate Method

Pascal

```
procedure FrameBeforeNavigate(const URL: WideString; Flags: Integer; const TargetFrameName:
WideString; var PostData: OleVariant; const Headers: WideString; var Cancel: WordBool);
```

C++

```
__fastcall FrameBeforeNavigate(const BSTR URL, int Flags, const BSTR TargetFrameName,
OleVariant PostData, const BSTR Headers, WordBool Cancel);
```

Description

This is FrameBeforeNavigate, a member of class DWebBrowserEvents.

132.2.4.2.6 DWebBrowserEvents.FrameNavigateComplete Method

Pascal

```
procedure FrameNavigateComplete(const URL: WideString);
```

C++

```
__fastcall FrameNavigateComplete(const BSTR URL);
```

Description

This is FrameNavigateComplete, a member of class DWebBrowserEvents.

132.2.4.2.7 DWebBrowserEvents.FrameNewWindow Method

Pascal

```
procedure FrameNewWindow(const URL: WideString; Flags: Integer; const TargetFrameName:
WideString; var PostData: OleVariant; const Headers: WideString; var Processed: WordBool);
```

C++

```
__fastcall FrameNewWindow(const BSTR URL, int Flags, const BSTR TargetFrameName, OleVariant
PostData, const BSTR Headers, WordBool Processed);
```

Description

This is FrameNewWindow, a member of class DWebBrowserEvents.

132.2.4.2.8 DWebBrowserEvents.NavigateComplete Method

Pascal

```
procedure NavigateComplete(const URL: WideString);
```

C++

```
__fastcall NavigateComplete(const BSTR URL);
```

Description

This is NavigateComplete, a member of class DWebBrowserEvents.

132.2.4.2.9 DWebBrowserEvents.NewWindow Method

Pascal

```
procedure NewWindow(const URL: WideString; Flags: Integer; const TargetFrameName: WideString;
var PostData: OleVariant; const Headers: WideString; var Processed: WordBool);
```

C++

```
__fastcall NewWindow(const BSTR URL, int Flags, const BSTR TargetFrameName, OleVariant
PostData, const BSTR Headers, WordBool Processed);
```

Description

This is NewWindow, a member of class DWebBrowserEvents.

132.2.4.2.10 DWebBrowserEvents.ProgressChange Method

Pascal

```
procedure ProgressChange(Progress: Integer; ProgressMax: Integer);
```

C++

```
__fastcall ProgressChange(int Progress, int ProgressMax);
```

Description

This is ProgressChange, a member of class DWebBrowserEvents.

132.2.4.2.11 DWebBrowserEvents.PropertyChange Method

Pascal

```
procedure PropertyChange(const Property_: WideString);
```

C++

```
__fastcall PropertyChange(const BSTR Property_);
```

Description

This is PropertyChange, a member of class DWebBrowserEvents.

132.2.4.2.12 DWebBrowserEvents.Quit Method

Pascal

```
procedure Quit(var Cancel: WordBool);
```

C++

```
__fastcall Quit(WordBool Cancel);
```

Description

This is Quit, a member of class DWebBrowserEvents.

132.2.4.2.13 DWebBrowserEvents.StatusTextChange Method

Pascal

```
procedure StatusTextChange(const Text: WideString);
```

C++

```
__fastcall StatusTextChange(const BSTR Text);
```

Description

This is StatusTextChange, a member of class DWebBrowserEvents.

132.2.4.2.14 DWebBrowserEvents.TitleChange Method

Pascal

```
procedure TitleChange(const Text: WideString);
```

C++

```
__fastcall TitleChange(const BSTR Text);
```

Description

This is TitleChange, a member of class DWebBrowserEvents.

132.2.4.2.15 DWebBrowserEvents.WindowActivate Method

Pascal

```
procedure WindowActivate;
```

C++

```
__fastcall WindowActivate();
```

Description

This is WindowActivate, a member of class DWebBrowserEvents.

132.2.4.2.16 DWebBrowserEvents.WindowMove Method

Pascal

```
procedure WindowMove;
```

C++

```
__fastcall WindowMove();
```

Description

This is WindowMove, a member of class DWebBrowserEvents.

132.2.4.2.17 DWebBrowserEvents.WindowResize Method

Pascal

```
procedure WindowResize;
```

C++

```
__fastcall WindowResize();
```

Description

This is WindowResize, a member of class DWebBrowserEvents.

132.2.5 DWebBrowserEvents2 Interface

Class Hierarchy

SHDocVw.DWebBrowserEvents2

Pascal

```
DWebBrowserEvents2 = dispinterface;
```

C++

```
class DWebBrowserEvents2;
```

File

SHDocVw

Description

This is class SHDocVw.DWebBrowserEvents2.

132.2.5.1 DWebBrowserEvents2 Members

The following tables list the members exposed by DWebBrowserEvents2.

Public Methods

	Name	Description
	BeforeNavigate2 (see page 19288)	This is BeforeNavigate2, a member of class DWebBrowserEvents2.
	ClientToHostWindow (see page 19288)	This is ClientToHostWindow, a member of class DWebBrowserEvents2.
	CommandStateChange (see page 19288)	This is CommandStateChange, a member of class DWebBrowserEvents2.
	DocumentComplete (see page 19288)	This is DocumentComplete, a member of class DWebBrowserEvents2.
	DownloadBegin (see page 19289)	This is DownloadBegin, a member of class DWebBrowserEvents2.
	DownloadComplete (see page 19289)	This is DownloadComplete, a member of class DWebBrowserEvents2.
	FileDownload (see page 19289)	This is FileDownload, a member of class DWebBrowserEvents2.
	NavigateComplete2 (see page 19289)	This is NavigateComplete2, a member of class DWebBrowserEvents2.
	NavigateError (see page 19289)	This is NavigateError, a member of class DWebBrowserEvents2.
	NewWindow2 (see page 19290)	This is NewWindow2, a member of class DWebBrowserEvents2.
	OnFullScreen (see page 19290)	This is OnFullScreen, a member of class DWebBrowserEvents2.
	OnMenuBar (see page 19290)	This is OnMenuBar, a member of class DWebBrowserEvents2.
	OnQuit (see page 19290)	This is OnQuit, a member of class DWebBrowserEvents2.
	OnStatusBar (see page 19291)	This is OnStatusBar, a member of class DWebBrowserEvents2.
	OnTheaterMode (see page 19291)	This is OnTheaterMode, a member of class DWebBrowserEvents2.

	OnToolBar (see page 19291)	This is OnToolBar, a member of class DWebBrowserEvents2.
	OnVisible (see page 19291)	This is OnVisible, a member of class DWebBrowserEvents2.
	PrintTemplateInstantiation (see page 19291)	This is PrintTemplateInstantiation, a member of class DWebBrowserEvents2.
	PrintTemplateTeardown (see page 19292)	This is PrintTemplateTeardown, a member of class DWebBrowserEvents2.
	PrivacyImpactedStateChange (see page 19292)	This is PrivacyImpactedStateChange, a member of class DWebBrowserEvents2.
	ProgressChange (see page 19292)	This is ProgressChange, a member of class DWebBrowserEvents2.
	PropertyChange (see page 19292)	This is PropertyChange, a member of class DWebBrowserEvents2.
	SetSecureLockIcon (see page 19293)	This is SetSecureLockIcon, a member of class DWebBrowserEvents2.
	StatusTextChange (see page 19293)	This is StatusTextChange, a member of class DWebBrowserEvents2.
	TitleChange (see page 19293)	This is TitleChange, a member of class DWebBrowserEvents2.
	UpdatePageStatus (see page 19293)	This is UpdatePageStatus, a member of class DWebBrowserEvents2.
	WindowClosing (see page 19293)	This is WindowClosing, a member of class DWebBrowserEvents2.
	WindowSetHeight (see page 19294)	This is WindowSetHeight, a member of class DWebBrowserEvents2.
	WindowSetLeft (see page 19294)	This is WindowSetLeft, a member of class DWebBrowserEvents2.
	WindowSetResizable (see page 19294)	This is WindowSetResizable, a member of class DWebBrowserEvents2.
	WindowSetTop (see page 19294)	This is WindowSetTop, a member of class DWebBrowserEvents2.
	WindowSetWidth (see page 19295)	This is WindowSetWidth, a member of class DWebBrowserEvents2.

132.2.5.2 DWebBrowserEvents2 Methods

The methods of the DWebBrowserEvents2 class are listed here.

Public Methods

	Name	Description
	BeforeNavigate2 (see page 19288)	This is BeforeNavigate2, a member of class DWebBrowserEvents2.
	ClientToHostWindow (see page 19288)	This is ClientToHostWindow, a member of class DWebBrowserEvents2.
	CommandStateChange (see page 19288)	This is CommandStateChange, a member of class DWebBrowserEvents2.
	DocumentComplete (see page 19288)	This is DocumentComplete, a member of class DWebBrowserEvents2.
	DownloadBegin (see page 19289)	This is DownloadBegin, a member of class DWebBrowserEvents2.
	DownloadComplete (see page 19289)	This is DownloadComplete, a member of class DWebBrowserEvents2.
	FileDownload (see page 19289)	This is FileDownload, a member of class DWebBrowserEvents2.
	NavigateComplete2 (see page 19289)	This is NavigateComplete2, a member of class DWebBrowserEvents2.
	NavigateError (see page 19289)	This is NavigateError, a member of class DWebBrowserEvents2.
	NewWindow2 (see page 19290)	This is NewWindow2, a member of class DWebBrowserEvents2.
	OnFullScreen (see page 19290)	This is OnFullScreen, a member of class DWebBrowserEvents2.
	OnMenuBar (see page 19290)	This is OnMenuBar, a member of class DWebBrowserEvents2.
	OnQuit (see page 19290)	This is OnQuit, a member of class DWebBrowserEvents2.
	OnStatusBar (see page 19291)	This is OnStatusBar, a member of class DWebBrowserEvents2.
	OnTheaterMode (see page 19291)	This is OnTheaterMode, a member of class DWebBrowserEvents2.
	OnToolBar (see page 19291)	This is OnToolBar, a member of class DWebBrowserEvents2.
	OnVisible (see page 19291)	This is OnVisible, a member of class DWebBrowserEvents2.
	PrintTemplateInstantiation (see page 19291)	This is PrintTemplateInstantiation, a member of class DWebBrowserEvents2.
	PrintTemplateTeardown (see page 19292)	This is PrintTemplateTeardown, a member of class DWebBrowserEvents2.
	PrivacyImpactedStateChange (see page 19292)	This is PrivacyImpactedStateChange, a member of class DWebBrowserEvents2.
	ProgressChange (see page 19292)	This is ProgressChange, a member of class DWebBrowserEvents2.
	PropertyChange (see page 19292)	This is PropertyChange, a member of class DWebBrowserEvents2.
	SetSecureLockIcon (see page 19293)	This is SetSecureLockIcon, a member of class DWebBrowserEvents2.
	StatusTextChange (see page 19293)	This is StatusTextChange, a member of class DWebBrowserEvents2.
	TitleChange (see page 19293)	This is TitleChange, a member of class DWebBrowserEvents2.
	UpdatePageStatus (see page 19293)	This is UpdatePageStatus, a member of class DWebBrowserEvents2.
	WindowClosing (see page 19293)	This is WindowClosing, a member of class DWebBrowserEvents2.
	WindowSetHeight (see page 19294)	This is WindowSetHeight, a member of class DWebBrowserEvents2.
	WindowSetLeft (see page 19294)	This is WindowSetLeft, a member of class DWebBrowserEvents2.

	WindowSetResizable (see page 19294)	This is WindowSetResizable, a member of class DWebBrowserEvents2.
	WindowSetTop (see page 19294)	This is WindowSetTop, a member of class DWebBrowserEvents2.
	WindowSetWidth (see page 19295)	This is WindowSetWidth, a member of class DWebBrowserEvents2.

132.2.5.2.1 DWebBrowserEvents2.BeforeNavigate2 Method

Pascal

```
procedure BeforeNavigate2(const pDisp: IDispatch; const URL: OleVariant; const Flags:
OleVariant; const TargetFrameName: OleVariant; const PostData: OleVariant; const Headers:
OleVariant; var Cancel: WordBool);
```

C++

```
__fastcall BeforeNavigate2(const IDispatch pDisp, const OleVariant URL, const OleVariant
Flags, const OleVariant TargetFrameName, const OleVariant PostData, const OleVariant Headers,
WordBool Cancel);
```

Description

This is BeforeNavigate2, a member of class DWebBrowserEvents2.

132.2.5.2.2 DWebBrowserEvents2.ClientToHostWindow Method

Pascal

```
procedure ClientToHostWindow(var CX: Integer; var CY: Integer);
```

C++

```
__fastcall ClientToHostWindow(int CX, int CY);
```

Description

This is ClientToHostWindow, a member of class DWebBrowserEvents2.

132.2.5.2.3 DWebBrowserEvents2.CommandStateChange Method

Pascal

```
procedure CommandStateChange(Command: Integer; Enable: WordBool);
```

C++

```
__fastcall CommandStateChange(int Command, WordBool Enable);
```

Description

This is CommandStateChange, a member of class DWebBrowserEvents2.

132.2.5.2.4 DWebBrowserEvents2.DocumentComplete Method

Pascal

```
procedure DocumentComplete(const pDisp: IDispatch; var URL: OleVariant);
```

C++

```
__fastcall DocumentComplete(const IDispatch pDisp, OleVariant URL);
```

Description

This is DocumentComplete, a member of class DWebBrowserEvents2.

132.2.5.2.5 DWebBrowserEvents2.DownloadBegin Method

Pascal

```
procedure DownloadBegin;
```

C++

```
__fastcall DownloadBegin();
```

Description

This is DownloadBegin, a member of class DWebBrowserEvents2.

132.2.5.2.6 DWebBrowserEvents2.DownloadComplete Method

Pascal

```
procedure DownloadComplete;
```

C++

```
__fastcall DownloadComplete();
```

Description

This is DownloadComplete, a member of class DWebBrowserEvents2.

132.2.5.2.7 DWebBrowserEvents2.FileDownload Method

Pascal

```
procedure FileDownload(var Cancel: WordBool);
```

C++

```
__fastcall FileDownload(WordBool Cancel);
```

Description

This is FileDownload, a member of class DWebBrowserEvents2.

132.2.5.2.8 DWebBrowserEvents2.NavigateComplete2 Method

Pascal

```
procedure NavigateComplete2(const pDisp: IDispatch; var URL: OleVariant);
```

C++

```
__fastcall NavigateComplete2(const IDispatch pDisp, OleVariant URL);
```

Description

This is NavigateComplete2, a member of class DWebBrowserEvents2.

132.2.5.2.9 DWebBrowserEvents2.NavigateError Method

Pascal

```
procedure NavigateError(const pDisp: IDispatch; var URL: OleVariant; var Frame: OleVariant;
var StatusCode: OleVariant; var Cancel: WordBool);
```

C++

```
__fastcall NavigateError(const IDispatch pDisp, OleVariant URL, OleVariant Frame, OleVariant
StatusCode, WordBool Cancel);
```

Description

This is NavigateError, a member of class DWebBrowserEvents2.

132.2.5.2.10 DWebBrowserEvents2.NewWindow2 Method

Pascal

```
procedure NewWindow2(var ppDisp: IDispatch; var Cancel: WordBool);
```

C++

```
__fastcall NewWindow2(IDispatch ppDisp, WordBool Cancel);
```

Description

This is NewWindow2, a member of class DWebBrowserEvents2.

132.2.5.2.11 DWebBrowserEvents2.OnFullScreen Method

Pascal

```
procedure OnFullScreen(FullScreen: WordBool);
```

C++

```
__fastcall OnFullScreen(WordBool FullScreen);
```

Description

This is OnFullScreen, a member of class DWebBrowserEvents2.

132.2.5.2.12 DWebBrowserEvents2.OnMenuBar Method

Pascal

```
procedure OnMenuBar(MenuBar: WordBool);
```

C++

```
__fastcall OnMenuBar(WordBool MenuBar);
```

Description

This is OnMenuBar, a member of class DWebBrowserEvents2.

132.2.5.2.13 DWebBrowserEvents2.OnQuit Method

Pascal

```
procedure OnQuit;
```

C++

```
__fastcall OnQuit();
```

Description

This is OnQuit, a member of class DWebBrowserEvents2.

132.2.5.2.14 DWebBrowserEvents2.OnStatusBar Method

Pascal

```
procedure OnStatusBar(StatusBar: WordBool);
```

C++

```
__fastcall OnStatusBar(WordBool StatusBar);
```

Description

This is OnStatusBar, a member of class DWebBrowserEvents2.

132.2.5.2.15 DWebBrowserEvents2.OnTheaterMode Method

Pascal

```
procedure OnTheaterMode(TheaterMode: WordBool);
```

C++

```
__fastcall OnTheaterMode(WordBool TheaterMode);
```

Description

This is OnTheaterMode, a member of class DWebBrowserEvents2.

132.2.5.2.16 DWebBrowserEvents2.OnToolBar Method

Pascal

```
procedure OnToolBar(ToolBar: WordBool);
```

C++

```
__fastcall OnToolBar(WordBool ToolBar);
```

Description

This is OnToolBar, a member of class DWebBrowserEvents2.

132.2.5.2.17 DWebBrowserEvents2.OnVisible Method

Pascal

```
procedure OnVisible(Visible: WordBool);
```

C++

```
__fastcall OnVisible(WordBool Visible);
```

Description

This is OnVisible, a member of class DWebBrowserEvents2.

132.2.5.2.18 DWebBrowserEvents2.PrintTemplateInstantiation Method

Pascal

```
procedure PrintTemplateInstantiation(const pDisp: IDispatch);
```

C++

```
__fastcall PrintTemplateInstantiation(const IDispatch pDisp);
```

Description

This is PrintTemplateInstantiation, a member of class DWebBrowserEvents2.

132.2.5.2.19 DWebBrowserEvents2.PrintTemplateTeardown Method

Pascal

```
procedure PrintTemplateTeardown(const pDisp: IDispatch);
```

C++

```
__fastcall PrintTemplateTeardown(const IDispatch pDisp);
```

Description

This is PrintTemplateTeardown, a member of class DWebBrowserEvents2.

132.2.5.2.20 DWebBrowserEvents2.PrivacyImpactedStateChange Method

Pascal

```
procedure PrivacyImpactedStateChange(bImpacted: WordBool);
```

C++

```
__fastcall PrivacyImpactedStateChange(WordBool bImpacted);
```

Description

This is PrivacyImpactedStateChange, a member of class DWebBrowserEvents2.

132.2.5.2.21 DWebBrowserEvents2.ProgressChange Method

Pascal

```
procedure ProgressChange(Progress: Integer; ProgressMax: Integer);
```

C++

```
__fastcall ProgressChange(int Progress, int ProgressMax);
```

Description

This is ProgressChange, a member of class DWebBrowserEvents2.

132.2.5.2.22 DWebBrowserEvents2.PropertyChange Method

Pascal

```
procedure PropertyChange(const szProperty: WideString);
```

C++

```
__fastcall PropertyChange(const BSTR szProperty);
```

Description

This is PropertyChange, a member of class DWebBrowserEvents2.

132.2.5.2.23 DWebBrowserEvents2.SetSecureLockIcon Method

Pascal

```
procedure SetSecureLockIcon(SecureLockIcon: Integer);
```

C++

```
__fastcall SetSecureLockIcon(int SecureLockIcon);
```

Description

This is SetSecureLockIcon, a member of class DWebBrowserEvents2.

132.2.5.2.24 DWebBrowserEvents2.StatusTextChange Method

Pascal

```
procedure StatusTextChange(const Text: WideString);
```

C++

```
__fastcall StatusTextChange(const BSTR Text);
```

Description

This is StatusTextChange, a member of class DWebBrowserEvents2.

132.2.5.2.25 DWebBrowserEvents2.TitleChange Method

Pascal

```
procedure TitleChange(const Text: WideString);
```

C++

```
__fastcall TitleChange(const BSTR Text);
```

Description

This is TitleChange, a member of class DWebBrowserEvents2.

132.2.5.2.26 DWebBrowserEvents2.UpdatePageStatus Method

Pascal

```
procedure UpdatePageStatus(const pDisp: IDispatch; var nPage: OleVariant; var fDone:
OleVariant);
```

C++

```
__fastcall UpdatePageStatus(const IDispatch pDisp, OleVariant nPage, OleVariant fDone);
```

Description

This is UpdatePageStatus, a member of class DWebBrowserEvents2.

132.2.5.2.27 DWebBrowserEvents2.WindowClosing Method

Pascal

```
procedure WindowClosing(IsChildWindow: WordBool; var Cancel: WordBool);
```

C++

```
__fastcall WindowClosing(WordBool IsChildWindow, WordBool Cancel);
```

Description

This is WindowClosing, a member of class DWebBrowserEvents2.

132.2.5.2.28 DWebBrowserEvents2.WindowSetHeight Method

Pascal

```
procedure WindowSetHeight(Height: Integer);
```

C++

```
__fastcall WindowSetHeight(int Height);
```

Description

This is WindowSetHeight, a member of class DWebBrowserEvents2.

132.2.5.2.29 DWebBrowserEvents2.WindowSetLeft Method

Pascal

```
procedure WindowSetLeft(Left: Integer);
```

C++

```
__fastcall WindowSetLeft(int Left);
```

Description

This is WindowSetLeft, a member of class DWebBrowserEvents2.

132.2.5.2.30 DWebBrowserEvents2.WindowSetResizable Method

Pascal

```
procedure WindowSetResizable(Resizable: WordBool);
```

C++

```
__fastcall WindowSetResizable(WordBool Resizable);
```

Description

This is WindowSetResizable, a member of class DWebBrowserEvents2.

132.2.5.2.31 DWebBrowserEvents2.WindowSetTop Method

Pascal

```
procedure WindowSetTop(Top: Integer);
```

C++

```
__fastcall WindowSetTop(int Top);
```

Description

This is WindowSetTop, a member of class DWebBrowserEvents2.

132.2.5.2.32 DWebBrowserEvents2.WindowSetWidth Method

Pascal

```
procedure WindowSetWidth(Width: Integer);
```

C++

```
__fastcall WindowSetWidth(int Width);
```

Description

This is WindowSetWidth, a member of class DWebBrowserEvents2.

132.2.6 IScriptErrorList Interface

Class Hierarchy

Pascal

```
IScriptErrorList = interface(IDispatch);
```

C++

```
__interface IScriptErrorList : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.IScriptErrorList.

132.2.6.1 IScriptErrorList Members

The following tables list the members exposed by IScriptErrorList.

Public Methods

	Name	Description
	advanceError (see page 19296)	This is advanceError, a member of class IScriptErrorList.
	canAdvanceError (see page 19296)	This is canAdvanceError, a member of class IScriptErrorList.
	canRetreatError (see page 19296)	This is canRetreatError, a member of class IScriptErrorList.
	getAlwaysShowLockState (see page 19297)	This is getAlwaysShowLockState, a member of class IScriptErrorList.
	getDetailsPaneOpen (see page 19297)	This is getDetailsPaneOpen, a member of class IScriptErrorList.
	getErrorChar (see page 19297)	This is getErrorChar, a member of class IScriptErrorList.
	getErrorCode (see page 19297)	This is getErrorCode, a member of class IScriptErrorList.
	getErrorLine (see page 19298)	This is getErrorLine, a member of class IScriptErrorList.
	getErrorMsg (see page 19298)	This is getErrorMsg, a member of class IScriptErrorList.
	getErrorUrl (see page 19298)	This is getErrorUrl, a member of class IScriptErrorList.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	getPerErrorDisplay (see page 19298)	This is getPerErrorDisplay, a member of class IScriptErrorList.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.

	retreatError (see page 19298)	This is retreatError, a member of class IScriptErrorList.
	setDetailsPaneOpen (see page 19299)	This is setDetailsPaneOpen, a member of class IScriptErrorList.
	setPerErrorDisplay (see page 19299)	This is setPerErrorDisplay, a member of class IScriptErrorList.

132.2.6.2 IScriptErrorList Methods

The methods of the IScriptErrorList class are listed here.

Public Methods

	Name	Description
	advanceError (see page 19296)	This is advanceError, a member of class IScriptErrorList.
	canAdvanceError (see page 19296)	This is canAdvanceError, a member of class IScriptErrorList.
	canRetreatError (see page 19296)	This is canRetreatError, a member of class IScriptErrorList.
	getAlwaysShowLockState (see page 19297)	This is getAlwaysShowLockState, a member of class IScriptErrorList.
	getDetailsPaneOpen (see page 19297)	This is getDetailsPaneOpen, a member of class IScriptErrorList.
	getErrorChar (see page 19297)	This is getErrorChar, a member of class IScriptErrorList.
	getErrorCode (see page 19297)	This is getErrorCode, a member of class IScriptErrorList.
	getErrorLine (see page 19298)	This is getErrorLine, a member of class IScriptErrorList.
	getErrorMsg (see page 19298)	This is getErrorMsg, a member of class IScriptErrorList.
	getErrorUrl (see page 19298)	This is getErrorUrl, a member of class IScriptErrorList.
	getPerErrorDisplay (see page 19298)	This is getPerErrorDisplay, a member of class IScriptErrorList.
	retreatError (see page 19298)	This is retreatError, a member of class IScriptErrorList.
	setDetailsPaneOpen (see page 19299)	This is setDetailsPaneOpen, a member of class IScriptErrorList.
	setPerErrorDisplay (see page 19299)	This is setPerErrorDisplay, a member of class IScriptErrorList.

132.2.6.2.1 IScriptErrorList.advanceError Method

Pascal

```
procedure advanceError; safecall;
```

C++

```
__fastcall advanceError();
```

Description

This is advanceError, a member of class IScriptErrorList.

132.2.6.2.2 IScriptErrorList.canAdvanceError Method

Pascal

```
function canAdvanceError: Integer; safecall;
```

C++

```
__fastcall int canAdvanceError();
```

Description

This is canAdvanceError, a member of class IScriptErrorList.

132.2.6.2.3 IScriptErrorList.canRetreatError Method

Pascal

```
function canRetreatError: Integer; safecall;
```

C++

```
__fastcall int canRetreatError();
```

Description

This is canRetreatError, a member of class IScriptErrorList.

132.2.6.2.4 IScriptErrorList.getAlwaysShowLockState Method

Pascal

```
function getAlwaysShowLockState: Integer; safecall;
```

C++

```
__fastcall int getAlwaysShowLockState();
```

Description

This is getAlwaysShowLockState, a member of class IScriptErrorList.

132.2.6.2.5 IScriptErrorList.getDetailsPaneOpen Method

Pascal

```
function getDetailsPaneOpen: Integer; safecall;
```

C++

```
__fastcall int getDetailsPaneOpen();
```

Description

This is getDetailsPaneOpen, a member of class IScriptErrorList.

132.2.6.2.6 IScriptErrorList.getErrorChar Method

Pascal

```
function getErrorChar: Integer; safecall;
```

C++

```
__fastcall int getErrorChar();
```

Description

This is getErrorChar, a member of class IScriptErrorList.

132.2.6.2.7 IScriptErrorList.getErrorCode Method

Pascal

```
function getErrorCode: Integer; safecall;
```

C++

```
__fastcall int getErrorCode();
```

Description

This is getErrorCode, a member of class IScriptErrorList.

132.2.6.2.8 IScriptErrorList.getErrorLine Method

Pascal

```
function getErrorLine: Integer; safecall;
```

C++

```
__fastcall int getErrorLine();
```

Description

This is getErrorLine, a member of class IScriptErrorList.

132.2.6.2.9 IScriptErrorList.getErrorMsg Method

Pascal

```
function getErrorMsg: WideString; safecall;
```

C++

```
__fastcall BSTR getErrorMsg();
```

Description

This is getErrorMsg, a member of class IScriptErrorList.

132.2.6.2.10 IScriptErrorList.getErrorUrl Method

Pascal

```
function getErrorUrl: WideString; safecall;
```

C++

```
__fastcall BSTR getErrorUrl();
```

Description

This is getErrorUrl, a member of class IScriptErrorList.

132.2.6.2.11 IScriptErrorList.getPerErrorDisplay Method

Pascal

```
function getPerErrorDisplay: Integer; safecall;
```

C++

```
__fastcall int getPerErrorDisplay();
```

Description

This is getPerErrorDisplay, a member of class IScriptErrorList.

132.2.6.2.12 IScriptErrorList.retreatError Method

Pascal

```
procedure retreatError; safecall;
```

C++

```
__fastcall retreatError();
```

Description

This is retreatError, a member of class IScriptErrorList.

132.2.6.2.13 IScriptErrorList.setDetailsPaneOpen Method

Pascal

```
procedure setDetailsPaneOpen(fDetailsPaneOpen: Integer); safecall;
```

C++

```
__fastcall setDetailsPaneOpen(int fDetailsPaneOpen);
```

Description

This is setDetailsPaneOpen, a member of class IScriptErrorList.

132.2.6.2.14 IScriptErrorList.setPerErrorDisplay Method

Pascal

```
procedure setPerErrorDisplay(fPerErrorDisplay: Integer); safecall;
```

C++

```
__fastcall setPerErrorDisplay(int fPerErrorDisplay);
```

Description

This is setPerErrorDisplay, a member of class IScriptErrorList.

132.2.7 IScriptErrorListDisp Interface

Class Hierarchy

SHDocVw.IScriptErrorListDisp

Pascal

```
IScriptErrorListDisp = dispinterface;
```

C++

```
class IScriptErrorListDisp;
```

File

SHDocVw

Description

This is class SHDocVw.IScriptErrorListDisp.

132.2.7.1 IScriptErrorListDisp Members

The following tables list the members exposed by IScriptErrorListDisp.

Public Methods

	Name	Description
	advanceError (see page 19300)	This is advanceError, a member of class IScriptErrorListDisp.
	canAdvanceError (see page 19301)	This is canAdvanceError, a member of class IScriptErrorListDisp.
	canRetreatError (see page 19301)	This is canRetreatError, a member of class IScriptErrorListDisp.
	getAlwaysShowLockState (see page 19301)	This is getAlwaysShowLockState, a member of class IScriptErrorListDisp.
	getDetailsPaneOpen (see page 19301)	This is getDetailsPaneOpen, a member of class IScriptErrorListDisp.
	getErrorChar (see page 19301)	This is getErrorChar, a member of class IScriptErrorListDisp.
	getErrorCode (see page 19302)	This is getErrorCode, a member of class IScriptErrorListDisp.
	getErrorLine (see page 19302)	This is getErrorLine, a member of class IScriptErrorListDisp.
	getErrorMsg (see page 19302)	This is getErrorMsg, a member of class IScriptErrorListDisp.
	getErrorUrl (see page 19302)	This is getErrorUrl, a member of class IScriptErrorListDisp.
	getPerErrorDisplay (see page 19303)	This is getPerErrorDisplay, a member of class IScriptErrorListDisp.
	retreatError (see page 19303)	This is retreatError, a member of class IScriptErrorListDisp.
	setDetailsPaneOpen (see page 19303)	This is setDetailsPaneOpen, a member of class IScriptErrorListDisp.
	setPerErrorDisplay (see page 19303)	This is setPerErrorDisplay, a member of class IScriptErrorListDisp.

132.2.7.2 IScriptErrorListDisp Methods

The methods of the IScriptErrorListDisp class are listed here.

Public Methods

	Name	Description
	advanceError (see page 19300)	This is advanceError, a member of class IScriptErrorListDisp.
	canAdvanceError (see page 19301)	This is canAdvanceError, a member of class IScriptErrorListDisp.
	canRetreatError (see page 19301)	This is canRetreatError, a member of class IScriptErrorListDisp.
	getAlwaysShowLockState (see page 19301)	This is getAlwaysShowLockState, a member of class IScriptErrorListDisp.
	getDetailsPaneOpen (see page 19301)	This is getDetailsPaneOpen, a member of class IScriptErrorListDisp.
	getErrorChar (see page 19301)	This is getErrorChar, a member of class IScriptErrorListDisp.
	getErrorCode (see page 19302)	This is getErrorCode, a member of class IScriptErrorListDisp.
	getErrorLine (see page 19302)	This is getErrorLine, a member of class IScriptErrorListDisp.
	getErrorMsg (see page 19302)	This is getErrorMsg, a member of class IScriptErrorListDisp.
	getErrorUrl (see page 19302)	This is getErrorUrl, a member of class IScriptErrorListDisp.
	getPerErrorDisplay (see page 19303)	This is getPerErrorDisplay, a member of class IScriptErrorListDisp.
	retreatError (see page 19303)	This is retreatError, a member of class IScriptErrorListDisp.
	setDetailsPaneOpen (see page 19303)	This is setDetailsPaneOpen, a member of class IScriptErrorListDisp.
	setPerErrorDisplay (see page 19303)	This is setPerErrorDisplay, a member of class IScriptErrorListDisp.

132.2.7.2.1 IScriptErrorListDisp.advanceError Method

Pascal

```
procedure advanceError;
```

C++

```
__fastcall advanceError();
```

Description

This is advanceError, a member of class IScriptErrorListDisp.

132.2.7.2.2 IScriptErrorListDisp.canAdvanceError Method

Pascal

```
function canAdvanceError: Integer;
```

C++

```
__fastcall int canAdvanceError();
```

Description

This is canAdvanceError, a member of class IScriptErrorListDisp.

132.2.7.2.3 IScriptErrorListDisp.canRetreatError Method

Pascal

```
function canRetreatError: Integer;
```

C++

```
__fastcall int canRetreatError();
```

Description

This is canRetreatError, a member of class IScriptErrorListDisp.

132.2.7.2.4 IScriptErrorListDisp.getAlwaysShowLockState Method

Pascal

```
function getAlwaysShowLockState: Integer;
```

C++

```
__fastcall int getAlwaysShowLockState();
```

Description

This is getAlwaysShowLockState, a member of class IScriptErrorListDisp.

132.2.7.2.5 IScriptErrorListDisp.getDetailsPaneOpen Method

Pascal

```
function getDetailsPaneOpen: Integer;
```

C++

```
__fastcall int getDetailsPaneOpen();
```

Description

This is getDetailsPaneOpen, a member of class IScriptErrorListDisp.

132.2.7.2.6 IScriptErrorListDisp.getErrorChar Method

Pascal

```
function getErrorChar: Integer;
```

C++

```
__fastcall int getErrorChar();
```

Description

This is getErrorChar, a member of class IScriptErrorListDisp.

132.2.7.2.7 IScriptErrorListDisp.getErrorCode Method

Pascal

```
function getErrorCode: Integer;
```

C++

```
__fastcall int getErrorCode();
```

Description

This is getErrorCode, a member of class IScriptErrorListDisp.

132.2.7.2.8 IScriptErrorListDisp.getErrorLine Method

Pascal

```
function getErrorLine: Integer;
```

C++

```
__fastcall int getErrorLine();
```

Description

This is getErrorLine, a member of class IScriptErrorListDisp.

132.2.7.2.9 IScriptErrorListDisp.getErrorMsg Method

Pascal

```
function getErrorMsg: WideString;
```

C++

```
__fastcall BSTR getErrorMsg();
```

Description

This is getErrorMsg, a member of class IScriptErrorListDisp.

132.2.7.2.10 IScriptErrorListDisp.getErrorUrl Method

Pascal

```
function getErrorUrl: WideString;
```

C++

```
__fastcall BSTR getErrorUrl();
```

Description

This is getErrorUrl, a member of class IScriptErrorListDisp.

132.2.7.2.11 IScriptErrorListDisp.getPerErrorDisplay Method

Pascal

```
function getPerErrorDisplay: Integer;
```

C++

```
__fastcall int getPerErrorDisplay();
```

Description

This is getPerErrorDisplay, a member of class IScriptErrorListDisp.

132.2.7.2.12 IScriptErrorListDisp.retreatError Method

Pascal

```
procedure retreatError;
```

C++

```
__fastcall retreatError();
```

Description

This is retreatError, a member of class IScriptErrorListDisp.

132.2.7.2.13 IScriptErrorListDisp.setDetailsPaneOpen Method

Pascal

```
procedure setDetailsPaneOpen(fDetailsPaneOpen: Integer);
```

C++

```
__fastcall setDetailsPaneOpen(int fDetailsPaneOpen);
```

Description

This is setDetailsPaneOpen, a member of class IScriptErrorListDisp.

132.2.7.2.14 IScriptErrorListDisp.setPerErrorDisplay Method

Pascal

```
procedure setPerErrorDisplay(fPerErrorDisplay: Integer);
```

C++

```
__fastcall setPerErrorDisplay(int fPerErrorDisplay);
```

Description

This is setPerErrorDisplay, a member of class IScriptErrorListDisp.

132.2.8 ISearch Interface

Class Hierarchy

Pascal

```
ISearch = interface(IDispatch);
```

C++

```
__interface ISearch : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.ISearch.

132.2.8.1 ISearch Members

The following tables list the members exposed by ISearch.

Public Methods

	Name	Description
	Get_Id (see page 19304)	This is Get_Id, a member of class ISearch.
	Get_Title (see page 19305)	This is Get_Title, a member of class ISearch.
	Get_URL (see page 19305)	This is Get_URL, a member of class ISearch.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.

Public Properties

	Name	Description
R	Id (see page 19305)	This is Id, a member of class ISearch.
R	Title (see page 19305)	This is Title, a member of class ISearch.
R	URL (see page 19306)	This is URL, a member of class ISearch.

132.2.8.2 ISearch Methods

The methods of the ISearch class are listed here.

Public Methods

	Name	Description
	Get_Id (see page 19304)	This is Get_Id, a member of class ISearch.
	Get_Title (see page 19305)	This is Get_Title, a member of class ISearch.
	Get_URL (see page 19305)	This is Get_URL, a member of class ISearch.

132.2.8.2.1 ISearch.Get_Id Method

Pascal

```
function Get_Id: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Id();
```

Description

This is Get_Id, a member of class ISearch.

132.2.8.2.2 ISearch.Get_Title Method

Pascal

```
function Get_Title: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Title();
```

Description

This is Get_Title, a member of class ISearch.

132.2.8.2.3 ISearch.Get_URL Method

Pascal

```
function Get_URL: WideString; safecall;
```

C++

```
__fastcall BSTR Get_URL();
```

Description

This is Get_URL, a member of class ISearch.

132.2.8.3 ISearch Properties

The properties of the ISearch class are listed here.

Public Properties

	Name	Description
R	Id (see page 19305)	This is Id, a member of class ISearch.
R	Title (see page 19305)	This is Title, a member of class ISearch.
R	URL (see page 19306)	This is URL, a member of class ISearch.

132.2.8.3.1 ISearch.Id Property

Pascal

```
property Id: WideString;
```

C++

```
__property BSTR Id;
```

Description

This is Id, a member of class ISearch.

132.2.8.3.2 ISearch.Title Property

Pascal

```
property Title: WideString;
```

C++

```
__property BSTR Title;
```

Description

This is Title, a member of class ISearch.

132.2.8.3.3 ISearch.URL Property

Pascal

```
property URL: WideString;
```

C++

```
__property BSTR URL;
```

Description

This is URL, a member of class ISearch.

132.2.9 ISearchAssistantOC Interface

Class Hierarchy

Pascal

```
ISearchAssistantOC = interface(IDispatch);
```

C++

```
__interface ISearchAssistantOC : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchAssistantOC.

132.2.9.1 ISearchAssistantOC Members

The following tables list the members exposed by ISearchAssistantOC.

Public Methods

	Name	Description
	AddNextMenuItem (see page 19308)	This is AddNextMenuItem, a member of class ISearchAssistantOC.
	EncodeString (see page 19308)	This is EncodeString, a member of class ISearchAssistantOC.
	FindComputer (see page 19308)	This is FindComputer, a member of class ISearchAssistantOC.
	FindFilesOrFolders (see page 19309)	This is FindFilesOrFolders, a member of class ISearchAssistantOC.
	FindOnWeb (see page 19309)	This is FindOnWeb, a member of class ISearchAssistantOC.
	FindPeople (see page 19309)	This is FindPeople, a member of class ISearchAssistantOC.
	FindPrinter (see page 19309)	This is FindPrinter, a member of class ISearchAssistantOC.
	Get_ASProvider (see page 19309)	This is Get_ASProvider, a member of class ISearchAssistantOC.
	Get_ASSetting (see page 19310)	This is Get_ASSetting, a member of class ISearchAssistantOC.

	Get_InWebFolder (see page 19310)	This is Get_InWebFolder, a member of class ISearchAssistantOC.
	Get_SearchAssistantDefault (see page 19310)	This is Get_SearchAssistantDefault, a member of class ISearchAssistantOC.
	Get_Searches (see page 19310)	This is Get_Searches, a member of class ISearchAssistantOC.
	Get_ShellFeaturesEnabled (see page 19311)	This is Get_ShellFeaturesEnabled, a member of class ISearchAssistantOC.
	Get_Version (see page 19311)	This is Get_Version, a member of class ISearchAssistantOC.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetProperty (see page 19311)	This is GetProperty, a member of class ISearchAssistantOC.
	GetSearchAssistantURL (see page 19311)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	IsRestricted (see page 19311)	This is IsRestricted, a member of class ISearchAssistantOC.
	NavigateToDefaultSearch (see page 19312)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC.
	NETDetectNextNavigate (see page 19312)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC.
	NotifySearchSettingsChanged (see page 19312)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC.
	PutFindText (see page 19312)	This is PutFindText, a member of class ISearchAssistantOC.
	PutProperty (see page 19313)	This is PutProperty, a member of class ISearchAssistantOC.
	ResetNextMenu (see page 19313)	This is ResetNextMenu, a member of class ISearchAssistantOC.
	Set_ASProvider (see page 19313)	This is Set_ASProvider, a member of class ISearchAssistantOC.
	Set_ASSetting (see page 19313)	This is Set_ASSetting, a member of class ISearchAssistantOC.
	Set_EventHandled (see page 19313)	This is Set_EventHandled, a member of class ISearchAssistantOC.
	SetDefaultSearchUrl (see page 19314)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC.

Public Properties

	Name	Description
	ASProvider (see page 19314)	This is ASProvider, a member of class ISearchAssistantOC.
	ASSetting (see page 19314)	This is ASSetting, a member of class ISearchAssistantOC.
W	EventHandled (see page 19315)	This is EventHandled, a member of class ISearchAssistantOC.
R	InWebFolder (see page 19315)	This is InWebFolder, a member of class ISearchAssistantOC.
R	SearchAssistantDefault (see page 19315)	This is SearchAssistantDefault, a member of class ISearchAssistantOC.
R	Searches (see page 19315)	This is Searches, a member of class ISearchAssistantOC.
R	ShellFeaturesEnabled (see page 19316)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC.
R	Version (see page 19316)	This is Version, a member of class ISearchAssistantOC.

132.2.9.2 ISearchAssistantOC Methods

The methods of the ISearchAssistantOC class are listed here.

Public Methods

	Name	Description
	AddNextMenuItem (see page 19308)	This is AddNextMenuItem, a member of class ISearchAssistantOC.
	EncodeString (see page 19308)	This is EncodeString, a member of class ISearchAssistantOC.
	FindComputer (see page 19308)	This is FindComputer, a member of class ISearchAssistantOC.
	FindFilesOrFolders (see page 19309)	This is FindFilesOrFolders, a member of class ISearchAssistantOC.
	FindOnWeb (see page 19309)	This is FindOnWeb, a member of class ISearchAssistantOC.
	FindPeople (see page 19309)	This is FindPeople, a member of class ISearchAssistantOC.
	FindPrinter (see page 19309)	This is FindPrinter, a member of class ISearchAssistantOC.
	Get_ASProvider (see page 19309)	This is Get_ASProvider, a member of class ISearchAssistantOC.
	Get_ASSetting (see page 19310)	This is Get_ASSetting, a member of class ISearchAssistantOC.
	Get_InWebFolder (see page 19310)	This is Get_InWebFolder, a member of class ISearchAssistantOC.
	Get_SearchAssistantDefault (see page 19310)	This is Get_SearchAssistantDefault, a member of class ISearchAssistantOC.
	Get_Searches (see page 19310)	This is Get_Searches, a member of class ISearchAssistantOC.
	Get_ShellFeaturesEnabled (see page 19311)	This is Get_ShellFeaturesEnabled, a member of class ISearchAssistantOC.

	Get_Version (see page 19311)	This is Get_Version, a member of class ISearchAssistantOC.
	GetProperty (see page 19311)	This is GetProperty, a member of class ISearchAssistantOC.
	GetSearchAssistantURL (see page 19311)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC.
	IsRestricted (see page 19311)	This is IsRestricted, a member of class ISearchAssistantOC.
	NavigateToDefaultSearch (see page 19312)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC.
	NETDetectNextNavigate (see page 19312)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC.
	NotifySearchSettingsChanged (see page 19312)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC.
	PutFindText (see page 19312)	This is PutFindText, a member of class ISearchAssistantOC.
	PutProperty (see page 19313)	This is PutProperty, a member of class ISearchAssistantOC.
	ResetNextMenu (see page 19313)	This is ResetNextMenu, a member of class ISearchAssistantOC.
	Set_ASProvider (see page 19313)	This is Set_ASProvider, a member of class ISearchAssistantOC.
	Set_ASSetting (see page 19313)	This is Set_ASSetting, a member of class ISearchAssistantOC.
	Set_EventHandled (see page 19313)	This is Set_EventHandled, a member of class ISearchAssistantOC.
	SetDefaultSearchUrl (see page 19314)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC.

132.2.9.2.1 ISearchAssistantOC.AddNextMenuItem Method

Pascal

```
procedure AddNextMenuItem(const bstrText: WideString; idItem: Integer); safecall;
```

C++

```
__fastcall AddNextMenuItem(const BSTR bstrText, int idItem);
```

Description

This is AddNextMenuItem, a member of class ISearchAssistantOC.

132.2.9.2.2 ISearchAssistantOC.EncodeString Method

Pascal

```
function EncodeString(const bstrValue: WideString; const bstrCharSet: WideString; bUseUTF8:
WordBool): WideString; safecall;
```

C++

```
__fastcall BSTR EncodeString(const BSTR bstrValue, const BSTR bstrCharSet, WordBool bUseUTF8);
```

Description

This is EncodeString, a member of class ISearchAssistantOC.

132.2.9.2.3 ISearchAssistantOC.FindComputer Method

Pascal

```
procedure FindComputer; safecall;
```

C++

```
__fastcall FindComputer();
```

Description

This is FindComputer, a member of class ISearchAssistantOC.

132.2.9.2.4 ISearchAssistantOC.FindFilesOrFolders Method

Pascal

```
procedure FindFilesOrFolders; safecall;
```

C++

```
__fastcall FindFilesOrFolders();
```

Description

This is FindFilesOrFolders, a member of class ISearchAssistantOC.

132.2.9.2.5 ISearchAssistantOC.FindOnWeb Method

Pascal

```
procedure FindOnWeb; safecall;
```

C++

```
__fastcall FindOnWeb();
```

Description

This is FindOnWeb, a member of class ISearchAssistantOC.

132.2.9.2.6 ISearchAssistantOC.FindPeople Method

Pascal

```
procedure FindPeople; safecall;
```

C++

```
__fastcall FindPeople();
```

Description

This is FindPeople, a member of class ISearchAssistantOC.

132.2.9.2.7 ISearchAssistantOC.FindPrinter Method

Pascal

```
procedure FindPrinter; safecall;
```

C++

```
__fastcall FindPrinter();
```

Description

This is FindPrinter, a member of class ISearchAssistantOC.

132.2.9.2.8 ISearchAssistantOC.Get_ASProvider Method

Pascal

```
function Get_ASProvider: WideString; safecall;
```

C++

```
__fastcall BSTR Get_ASProvider();
```

Description

This is Get_ASProvider, a member of class ISearchAssistantOC.

132.2.9.2.9 ISearchAssistantOC.Get_ASSetting Method

Pascal

```
function Get_ASSetting: SYSINT; safecall;
```

C++

```
__fastcall SYSINT Get_ASSetting();
```

Description

This is Get_ASSetting, a member of class ISearchAssistantOC.

132.2.9.2.10 ISearchAssistantOC.Get_InWebFolder Method

Pascal

```
function Get_InWebFolder: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_InWebFolder();
```

Description

This is Get_InWebFolder, a member of class ISearchAssistantOC.

132.2.9.2.11 ISearchAssistantOC.Get_SearchAssistantDefault Method

Pascal

```
function Get_SearchAssistantDefault: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_SearchAssistantDefault();
```

Description

This is Get_SearchAssistantDefault, a member of class ISearchAssistantOC.

132.2.9.2.12 ISearchAssistantOC.Get_Searches Method

Pascal

```
function Get_Searches: ISearches; safecall;
```

C++

```
__fastcall ISearches Get_Searches();
```

Description

This is Get_Searches, a member of class ISearchAssistantOC.

132.2.9.2.13 ISearchAssistantOC.Get_ShellFeaturesEnabled Method

Pascal

```
function Get_ShellFeaturesEnabled: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_ShellFeaturesEnabled();
```

Description

This is Get_ShellFeaturesEnabled, a member of class ISearchAssistantOC.

132.2.9.2.14 ISearchAssistantOC.Get_Version Method

Pascal

```
function Get_Version: SYSINT; safecall;
```

C++

```
__fastcall SYSINT Get_Version();
```

Description

This is Get_Version, a member of class ISearchAssistantOC.

132.2.9.2.15 ISearchAssistantOC.GetProperty Method

Pascal

```
function GetProperty(bPerLocale: WordBool; const bstrName: WideString): WideString; safecall;
```

C++

```
__fastcall BSTR GetProperty(WordBool bPerLocale, const BSTR bstrName);
```

Description

This is GetProperty, a member of class ISearchAssistantOC.

132.2.9.2.16 ISearchAssistantOC.GetSearchAssistantURL Method

Pascal

```
function GetSearchAssistantURL(bSubstitute: WordBool; bCustomize: WordBool): WideString;
safecall;
```

C++

```
__fastcall BSTR GetSearchAssistantURL(WordBool bSubstitute, WordBool bCustomize);
```

Description

This is GetSearchAssistantURL, a member of class ISearchAssistantOC.

132.2.9.2.17 ISearchAssistantOC.IsRestricted Method

Pascal

```
function IsRestricted(const bstrGuid: WideString): WordBool; safecall;
```

C++

```
__fastcall WordBool IsRestricted(const BSTR bstrGuid);
```

Description

This is IsRestricted, a member of class ISearchAssistantOC.

132.2.9.2.18 ISearchAssistantOC.NavigateToDefaultSearch Method

Pascal

```
procedure NavigateToDefaultSearch; safecall;
```

C++

```
__fastcall NavigateToDefaultSearch();
```

Description

This is NavigateToDefaultSearch, a member of class ISearchAssistantOC.

132.2.9.2.19 ISearchAssistantOC.NETDetectNextNavigate Method

Pascal

```
procedure NETDetectNextNavigate; safecall;
```

C++

```
__fastcall NETDetectNextNavigate();
```

Description

This is NETDetectNextNavigate, a member of class ISearchAssistantOC.

132.2.9.2.20 ISearchAssistantOC.NotifySearchSettingsChanged Method

Pascal

```
procedure NotifySearchSettingsChanged; safecall;
```

C++

```
__fastcall NotifySearchSettingsChanged();
```

Description

This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC.

132.2.9.2.21 ISearchAssistantOC.PutFindText Method

Pascal

```
procedure PutFindText(const FindText: WideString); safecall;
```

C++

```
__fastcall PutFindText(const BSTR FindText);
```

Description

This is PutFindText, a member of class ISearchAssistantOC.

132.2.9.2.22 ISearchAssistantOC.PutProperty Method

Pascal

```
procedure PutProperty(bPerLocale: WordBool; const bstrName: WideString; const bstrValue:
WideString); safecall;
```

C++

```
__fastcall PutProperty(WordBool bPerLocale, const BSTR bstrName, const BSTR bstrValue);
```

Description

This is PutProperty, a member of class ISearchAssistantOC.

132.2.9.2.23 ISearchAssistantOC.ResetNextMenu Method

Pascal

```
procedure ResetNextMenu; safecall;
```

C++

```
__fastcall ResetNextMenu();
```

Description

This is ResetNextMenu, a member of class ISearchAssistantOC.

132.2.9.2.24 ISearchAssistantOC.Set_ASProvider Method

Pascal

```
procedure Set_ASProvider(const pProvider: WideString); safecall;
```

C++

```
__fastcall Set_ASProvider(const BSTR pProvider);
```

Description

This is Set_ASProvider, a member of class ISearchAssistantOC.

132.2.9.2.25 ISearchAssistantOC.Set_ASSetting Method

Pascal

```
procedure Set_ASSetting(pSetting: SYSINT); safecall;
```

C++

```
__fastcall Set_ASSetting(SYSINT pSetting);
```

Description

This is Set_ASSetting, a member of class ISearchAssistantOC.

132.2.9.2.26 ISearchAssistantOC.Set_EventHandled Method

Pascal

```
procedure Set_EventHandled(Param1: WordBool); safecall;
```

C++

```
__fastcall Set_EventHandled(WordBool Param1);
```

Description

This is Set_EventHandled, a member of class ISearchAssistantOC.

132.2.9.2.27 ISearchAssistantOC.SetDefaultSearchUrl Method

Pascal

```
procedure SetDefaultSearchUrl(const bstrUrl: WideString); safecall;
```

C++

```
__fastcall SetDefaultSearchUrl(const BSTR bstrUrl);
```

Description

This is SetDefaultSearchUrl, a member of class ISearchAssistantOC.

132.2.9.3 ISearchAssistantOC Properties

The properties of the ISearchAssistantOC class are listed here.

Public Properties

	Name	Description
	ASProvider (see page 19314)	This is ASProvider, a member of class ISearchAssistantOC.
	ASSetting (see page 19314)	This is ASSetting, a member of class ISearchAssistantOC.
W	EventHandled (see page 19315)	This is EventHandled, a member of class ISearchAssistantOC.
R	InWebFolder (see page 19315)	This is InWebFolder, a member of class ISearchAssistantOC.
R	SearchAssistantDefault (see page 19315)	This is SearchAssistantDefault, a member of class ISearchAssistantOC.
R	Searches (see page 19315)	This is Searches, a member of class ISearchAssistantOC.
R	ShellFeaturesEnabled (see page 19316)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC.
R	Version (see page 19316)	This is Version, a member of class ISearchAssistantOC.

132.2.9.3.1 ISearchAssistantOC.ASProvider Property

Pascal

```
property ASProvider: WideString;
```

C++

```
__property BSTR ASProvider;
```

Description

This is ASProvider, a member of class ISearchAssistantOC.

132.2.9.3.2 ISearchAssistantOC.ASSetting Property

Pascal

```
property ASSetting: SYSINT;
```

C++

```
__property SYSINT ASSetting;
```

Description

This is ASSetting, a member of class ISearchAssistantOC.

132.2.9.3.3 ISearchAssistantOC.EventHandled Property

Pascal

```
property EventHandled: WordBool;
```

C++

```
__property WordBool EventHandled;
```

Description

This is EventHandled, a member of class ISearchAssistantOC.

132.2.9.3.4 ISearchAssistantOC.InWebFolder Property

Pascal

```
property InWebFolder: WordBool;
```

C++

```
__property WordBool InWebFolder;
```

Description

This is InWebFolder, a member of class ISearchAssistantOC.

132.2.9.3.5 ISearchAssistantOC.SearchAssistantDefault Property

Pascal

```
property SearchAssistantDefault: WordBool;
```

C++

```
__property WordBool SearchAssistantDefault;
```

Description

This is SearchAssistantDefault, a member of class ISearchAssistantOC.

132.2.9.3.6 ISearchAssistantOC.Searches Property

Pascal

```
property Searches: ISearches;
```

C++

```
__property ISearches Searches;
```

Description

This is Searches, a member of class ISearchAssistantOC.

132.2.9.3.7 ISearchAssistantOC.ShellFeaturesEnabled Property

Pascal

```
property ShellFeaturesEnabled: WordBool;
```

C++

```
__property WordBool ShellFeaturesEnabled;
```

Description

This is ShellFeaturesEnabled, a member of class ISearchAssistantOC.

132.2.9.3.8 ISearchAssistantOC.Version Property

Pascal

```
property Version: SYSINT;
```

C++

```
__property SYSINT Version;
```

Description

This is Version, a member of class ISearchAssistantOC.

132.2.10 ISearchAssistantOC2 Interface

Class Hierarchy

Pascal

```
ISearchAssistantOC2 = interface(ISearchAssistantOC);
```

C++

```
__interface ISearchAssistantOC2 : public ISearchAssistantOC;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchAssistantOC2.

132.2.10.1 ISearchAssistantOC2 Members

The following tables list the members exposed by ISearchAssistantOC2.

Public Methods

	Name	Description
	AddNextMenuItem (see page 19308)	This is AddNextMenuItem, a member of class ISearchAssistantOC.
	EncodeString (see page 19308)	This is EncodeString, a member of class ISearchAssistantOC.
	FindComputer (see page 19308)	This is FindComputer, a member of class ISearchAssistantOC.

	FindFilesOrFolders (see page 19309)	This is FindFilesOrFolders, a member of class ISearchAssistantOC.
	FindOnWeb (see page 19309)	This is FindOnWeb, a member of class ISearchAssistantOC.
	FindPeople (see page 19309)	This is FindPeople, a member of class ISearchAssistantOC.
	FindPrinter (see page 19309)	This is FindPrinter, a member of class ISearchAssistantOC.
	Get_ASProvider (see page 19309)	This is Get_ASProvider, a member of class ISearchAssistantOC.
	Get_ASSetting (see page 19310)	This is Get_ASSetting, a member of class ISearchAssistantOC.
	Get_InWebFolder (see page 19310)	This is Get_InWebFolder, a member of class ISearchAssistantOC.
	Get_SearchAssistantDefault (see page 19310)	This is Get_SearchAssistantDefault, a member of class ISearchAssistantOC.
	Get_Searches (see page 19310)	This is Get_Searches, a member of class ISearchAssistantOC.
	Get_ShellFeaturesEnabled (see page 19311)	This is Get_ShellFeaturesEnabled, a member of class ISearchAssistantOC.
	Get_ShowFindPrinter (see page 19318)	This is Get_ShowFindPrinter, a member of class ISearchAssistantOC2.
	Get_Version (see page 19311)	This is Get_Version, a member of class ISearchAssistantOC.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetProperty (see page 19311)	This is GetProperty, a member of class ISearchAssistantOC.
	GetSearchAssistantURL (see page 19311)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	IsRestricted (see page 19311)	This is IsRestricted, a member of class ISearchAssistantOC.
	NavigateToDefaultSearch (see page 19312)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC.
	NETDetectNextNavigate (see page 19312)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC.
	NotifySearchSettingsChanged (see page 19312)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC.
	PutFindText (see page 19312)	This is PutFindText, a member of class ISearchAssistantOC.
	PutProperty (see page 19313)	This is PutProperty, a member of class ISearchAssistantOC.
	ResetNextMenu (see page 19313)	This is ResetNextMenu, a member of class ISearchAssistantOC.
	Set_ASProvider (see page 19313)	This is Set_ASProvider, a member of class ISearchAssistantOC.
	Set_ASSetting (see page 19313)	This is Set_ASSetting, a member of class ISearchAssistantOC.
	Set_EventHandled (see page 19313)	This is Set_EventHandled, a member of class ISearchAssistantOC.
	SetDefaultSearchUrl (see page 19314)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC.

Public Properties

	Name	Description
	ASProvider (see page 19314)	This is ASProvider, a member of class ISearchAssistantOC.
	ASSetting (see page 19314)	This is ASSetting, a member of class ISearchAssistantOC.
W	EventHandled (see page 19315)	This is EventHandled, a member of class ISearchAssistantOC.
R	InWebFolder (see page 19315)	This is InWebFolder, a member of class ISearchAssistantOC.
R	SearchAssistantDefault (see page 19315)	This is SearchAssistantDefault, a member of class ISearchAssistantOC.
R	Searches (see page 19315)	This is Searches, a member of class ISearchAssistantOC.
R	ShellFeaturesEnabled (see page 19316)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC.
R	ShowFindPrinter (see page 19318)	This is ShowFindPrinter, a member of class ISearchAssistantOC2.
R	Version (see page 19316)	This is Version, a member of class ISearchAssistantOC.

132.2.10.2 ISearchAssistantOC2 Methods

The methods of the ISearchAssistantOC2 class are listed here.

Public Methods

	Name	Description
	Get_ShowFindPrinter (see page 19318)	This is Get_ShowFindPrinter, a member of class ISearchAssistantOC2.

132.2.10.2.1 ISearchAssistantOC2.Get_ShowFindPrinter Method

Pascal

```
function Get_ShowFindPrinter: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_ShowFindPrinter();
```

Description

This is Get_ShowFindPrinter, a member of class ISearchAssistantOC2.

132.2.10.3 ISearchAssistantOC2 Properties

The properties of the ISearchAssistantOC2 class are listed here.

Public Properties

	Name	Description
R	ShowFindPrinter (see page 19318)	This is ShowFindPrinter, a member of class ISearchAssistantOC2.

132.2.10.3.1 ISearchAssistantOC2.ShowFindPrinter Property

Pascal

```
property ShowFindPrinter: WordBool;
```

C++

```
__property WordBool ShowFindPrinter;
```

Description

This is ShowFindPrinter, a member of class ISearchAssistantOC2.

132.2.11 ISearchAssistantOC2Disp Interface

Class Hierarchy

SHDocVw.ISearchAssistantOC2Disp

Pascal

```
ISearchAssistantOC2Disp = dispinterface;
```

C++

```
class ISearchAssistantOC2Disp;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchAssistantOC2Disp.

132.2.11.1 ISearchAssistantOC2Disp Members

The following tables list the members exposed by ISearchAssistantOC2Disp.

Public Methods

	Name	Description
	AddNextMenuItem (see page 19320)	This is AddNextMenuItem, a member of class ISearchAssistantOC2Disp.
	EncodeString (see page 19320)	This is EncodeString, a member of class ISearchAssistantOC2Disp.
	FindComputer (see page 19320)	This is FindComputer, a member of class ISearchAssistantOC2Disp.
	FindFilesOrFolders (see page 19320)	This is FindFilesOrFolders, a member of class ISearchAssistantOC2Disp.
	FindOnWeb (see page 19321)	This is FindOnWeb, a member of class ISearchAssistantOC2Disp.
	FindPeople (see page 19321)	This is FindPeople, a member of class ISearchAssistantOC2Disp.
	FindPrinter (see page 19321)	This is FindPrinter, a member of class ISearchAssistantOC2Disp.
	GetProperty (see page 19321)	This is GetProperty, a member of class ISearchAssistantOC2Disp.
	GetSearchAssistantURL (see page 19322)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC2Disp.
	IsRestricted (see page 19322)	This is IsRestricted, a member of class ISearchAssistantOC2Disp.
	NavigateToDefaultSearch (see page 19322)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC2Disp.
	NETDetectNextNavigate (see page 19322)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC2Disp.
	NotifySearchSettingsChanged (see page 19322)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC2Disp.
	PutFindText (see page 19323)	This is PutFindText, a member of class ISearchAssistantOC2Disp.
	PutProperty (see page 19323)	This is PutProperty, a member of class ISearchAssistantOC2Disp.
	ResetNextMenu (see page 19323)	This is ResetNextMenu, a member of class ISearchAssistantOC2Disp.
	SetDefaultSearchUrl (see page 19323)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC2Disp.

Public Properties

	Name	Description
	ASProvider (see page 19324)	This is ASProvider, a member of class ISearchAssistantOC2Disp.
	ASSetting (see page 19324)	This is ASSetting, a member of class ISearchAssistantOC2Disp.
	EventHandled (see page 19324)	This is EventHandled, a member of class ISearchAssistantOC2Disp.
	InWebFolder (see page 19325)	This is InWebFolder, a member of class ISearchAssistantOC2Disp.
	SearchAssistantDefault (see page 19325)	This is SearchAssistantDefault, a member of class ISearchAssistantOC2Disp.
	Searches (see page 19325)	This is Searches, a member of class ISearchAssistantOC2Disp.
	ShellFeaturesEnabled (see page 19325)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC2Disp.
	ShowFindPrinter (see page 19325)	This is ShowFindPrinter, a member of class ISearchAssistantOC2Disp.
	Version (see page 19326)	This is Version, a member of class ISearchAssistantOC2Disp.

132.2.11.2 ISearchAssistantOC2Disp Methods

The methods of the ISearchAssistantOC2Disp class are listed here.

Public Methods

	Name	Description
	AddNextMenuItem (see page 19320)	This is AddNextMenuItem, a member of class ISearchAssistantOC2Disp.
	EncodeString (see page 19320)	This is EncodeString, a member of class ISearchAssistantOC2Disp.
	FindComputer (see page 19320)	This is FindComputer, a member of class ISearchAssistantOC2Disp.
	FindFilesOrFolders (see page 19320)	This is FindFilesOrFolders, a member of class ISearchAssistantOC2Disp.
	FindOnWeb (see page 19321)	This is FindOnWeb, a member of class ISearchAssistantOC2Disp.
	FindPeople (see page 19321)	This is FindPeople, a member of class ISearchAssistantOC2Disp.
	FindPrinter (see page 19321)	This is FindPrinter, a member of class ISearchAssistantOC2Disp.
	GetProperty (see page 19321)	This is GetProperty, a member of class ISearchAssistantOC2Disp.
	GetSearchAssistantURL (see page 19322)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC2Disp.

	IsRestricted (see page 19322)	This is IsRestricted, a member of class ISearchAssistantOC2Disp.
	NavigateToDefaultSearch (see page 19322)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC2Disp.
	NETDetectNextNavigate (see page 19322)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC2Disp.
	NotifySearchSettingsChanged (see page 19322)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC2Disp.
	PutFindText (see page 19323)	This is PutFindText, a member of class ISearchAssistantOC2Disp.
	PutProperty (see page 19323)	This is PutProperty, a member of class ISearchAssistantOC2Disp.
	ResetNextMenu (see page 19323)	This is ResetNextMenu, a member of class ISearchAssistantOC2Disp.
	SetDefaultSearchUrl (see page 19323)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC2Disp.

132.2.11.2.1 ISearchAssistantOC2Disp.AddNextMenuItem Method

Pascal

```
procedure AddNextMenuItem(const bstrText: WideString; idItem: Integer);
```

C++

```
__fastcall AddNextMenuItem(const BSTR bstrText, int idItem);
```

Description

This is AddNextMenuItem, a member of class ISearchAssistantOC2Disp.

132.2.11.2.2 ISearchAssistantOC2Disp.EncodeString Method

Pascal

```
function EncodeString(const bstrValue: WideString; const bstrCharSet: WideString; bUseUTF8:
WordBool): WideString;
```

C++

```
__fastcall BSTR EncodeString(const BSTR bstrValue, const BSTR bstrCharSet, WordBool bUseUTF8);
```

Description

This is EncodeString, a member of class ISearchAssistantOC2Disp.

132.2.11.2.3 ISearchAssistantOC2Disp.FindComputer Method

Pascal

```
procedure FindComputer;
```

C++

```
__fastcall FindComputer();
```

Description

This is FindComputer, a member of class ISearchAssistantOC2Disp.

132.2.11.2.4 ISearchAssistantOC2Disp.FindFilesOrFolders Method

Pascal

```
procedure FindFilesOrFolders;
```

C++

```
__fastcall FindFilesOrFolders();
```

Description

This is FindFilesOrFolders, a member of class ISearchAssistantOC2Disp.

132.2.11.2.5 ISearchAssistantOC2Disp.FindOnWeb Method

Pascal

```
procedure FindOnWeb;
```

C++

```
__fastcall FindOnWeb();
```

Description

This is FindOnWeb, a member of class ISearchAssistantOC2Disp.

132.2.11.2.6 ISearchAssistantOC2Disp.FindPeople Method

Pascal

```
procedure FindPeople;
```

C++

```
__fastcall FindPeople();
```

Description

This is FindPeople, a member of class ISearchAssistantOC2Disp.

132.2.11.2.7 ISearchAssistantOC2Disp.FindPrinter Method

Pascal

```
procedure FindPrinter;
```

C++

```
__fastcall FindPrinter();
```

Description

This is FindPrinter, a member of class ISearchAssistantOC2Disp.

132.2.11.2.8 ISearchAssistantOC2Disp.GetProperty Method

Pascal

```
function GetProperty(bPerLocale: WordBool; const bstrName: WideString): WideString;
```

C++

```
__fastcall BSTR GetProperty(WordBool bPerLocale, const BSTR bstrName);
```

Description

This is GetProperty, a member of class ISearchAssistantOC2Disp.

132.2.11.2.9 ISearchAssistantOC2Disp.GetSearchAssistantURL Method

Pascal

```
function GetSearchAssistantURL(bSubstitute: WordBool; bCustomize: WordBool): WideString;
```

C++

```
__fastcall BSTR GetSearchAssistantURL(WordBool bSubstitute, WordBool bCustomize);
```

Description

This is GetSearchAssistantURL, a member of class ISearchAssistantOC2Disp.

132.2.11.2.10 ISearchAssistantOC2Disp.IsRestricted Method

Pascal

```
function IsRestricted(const bstrGuid: WideString): WordBool;
```

C++

```
__fastcall WordBool IsRestricted(const BSTR bstrGuid);
```

Description

This is IsRestricted, a member of class ISearchAssistantOC2Disp.

132.2.11.2.11 ISearchAssistantOC2Disp.NavigateToDefaultSearch Method

Pascal

```
procedure NavigateToDefaultSearch;
```

C++

```
__fastcall NavigateToDefaultSearch();
```

Description

This is NavigateToDefaultSearch, a member of class ISearchAssistantOC2Disp.

132.2.11.2.12 ISearchAssistantOC2Disp.NETDetectNextNavigate Method

Pascal

```
procedure NETDetectNextNavigate;
```

C++

```
__fastcall NETDetectNextNavigate();
```

Description

This is NETDetectNextNavigate, a member of class ISearchAssistantOC2Disp.

132.2.11.2.13 ISearchAssistantOC2Disp.NotifySearchSettingsChanged Method

Pascal

```
procedure NotifySearchSettingsChanged;
```

C++

```
__fastcall NotifySearchSettingsChanged();
```

Description

This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC2Disp.

132.2.11.2.14 ISearchAssistantOC2Disp.PutFindText Method

Pascal

```
procedure PutFindText(const FindText: WideString);
```

C++

```
__fastcall PutFindText(const BSTR FindText);
```

Description

This is PutFindText, a member of class ISearchAssistantOC2Disp.

132.2.11.2.15 ISearchAssistantOC2Disp.PutProperty Method

Pascal

```
procedure PutProperty(bPerLocale: WordBool; const bstrName: WideString; const bstrValue:
WideString);
```

C++

```
__fastcall PutProperty(WordBool bPerLocale, const BSTR bstrName, const BSTR bstrValue);
```

Description

This is PutProperty, a member of class ISearchAssistantOC2Disp.

132.2.11.2.16 ISearchAssistantOC2Disp.ResetNextMenu Method

Pascal

```
procedure ResetNextMenu;
```

C++

```
__fastcall ResetNextMenu();
```

Description

This is ResetNextMenu, a member of class ISearchAssistantOC2Disp.

132.2.11.2.17 ISearchAssistantOC2Disp.SetDefaultSearchUrl Method

Pascal

```
procedure SetDefaultSearchUrl(const bstrUrl: WideString);
```

C++

```
__fastcall SetDefaultSearchUrl(const BSTR bstrUrl);
```

Description

This is SetDefaultSearchUrl, a member of class ISearchAssistantOC2Disp.

132.2.11.3 ISearchAssistantOC2Disp Properties

The properties of the ISearchAssistantOC2Disp class are listed here.

Public Properties

	Name	Description
	ASProvider (see page 19324)	This is ASProvider, a member of class ISearchAssistantOC2Disp.
	ASSetting (see page 19324)	This is ASSetting, a member of class ISearchAssistantOC2Disp.
	EventHandled (see page 19324)	This is EventHandled, a member of class ISearchAssistantOC2Disp.
	InWebFolder (see page 19325)	This is InWebFolder, a member of class ISearchAssistantOC2Disp.
	SearchAssistantDefault (see page 19325)	This is SearchAssistantDefault, a member of class ISearchAssistantOC2Disp.
	Searches (see page 19325)	This is Searches, a member of class ISearchAssistantOC2Disp.
	ShellFeaturesEnabled (see page 19325)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC2Disp.
	ShowFindPrinter (see page 19325)	This is ShowFindPrinter, a member of class ISearchAssistantOC2Disp.
	Version (see page 19326)	This is Version, a member of class ISearchAssistantOC2Disp.

132.2.11.3.1 ISearchAssistantOC2Disp.ASProvider Property

Pascal

```
property ASProvider: WideString;
```

C++

```
__property BSTR ASProvider;
```

Description

This is ASProvider, a member of class ISearchAssistantOC2Disp.

132.2.11.3.2 ISearchAssistantOC2Disp.ASSetting Property

Pascal

```
property ASSetting: SYSINT;
```

C++

```
__property SYSINT ASSetting;
```

Description

This is ASSetting, a member of class ISearchAssistantOC2Disp.

132.2.11.3.3 ISearchAssistantOC2Disp.EventHandled Property

Pascal

```
property EventHandled: WordBool;
```

C++

```
__property WordBool EventHandled;
```

Description

This is EventHandled, a member of class ISearchAssistantOC2Disp.

132.2.11.3.4 ISearchAssistantOC2Disp.InWebFolder Property

Pascal

```
property InWebFolder: WordBool;
```

C++

```
__property WordBool InWebFolder;
```

Description

This is InWebFolder, a member of class ISearchAssistantOC2Disp.

132.2.11.3.5 ISearchAssistantOC2Disp.SearchAssistantDefault Property

Pascal

```
property SearchAssistantDefault: WordBool;
```

C++

```
__property WordBool SearchAssistantDefault;
```

Description

This is SearchAssistantDefault, a member of class ISearchAssistantOC2Disp.

132.2.11.3.6 ISearchAssistantOC2Disp.Searches Property

Pascal

```
property Searches: ISearches;
```

C++

```
__property ISearches Searches;
```

Description

This is Searches, a member of class ISearchAssistantOC2Disp.

132.2.11.3.7 ISearchAssistantOC2Disp.ShellFeaturesEnabled Property

Pascal

```
property ShellFeaturesEnabled: WordBool;
```

C++

```
__property WordBool ShellFeaturesEnabled;
```

Description

This is ShellFeaturesEnabled, a member of class ISearchAssistantOC2Disp.

132.2.11.3.8 ISearchAssistantOC2Disp.ShowFindPrinter Property

Pascal

```
property ShowFindPrinter: WordBool;
```

C++

```
__property WordBool ShowFindPrinter;
```

Description

This is ShowFindPrinter, a member of class ISearchAssistantOC2Disp.

132.2.11.3.9 ISearchAssistantOC2Disp.Version Property

Pascal

```
property Version: SYSINT;
```

C++

```
__property SYSINT Version;
```

Description

This is Version, a member of class ISearchAssistantOC2Disp.

132.2.12 ISearchAssistantOC3 Interface

Class Hierarchy

Pascal

```
ISearchAssistantOC3 = interface(ISearchAssistantOC2);
```

C++

```
__interface ISearchAssistantOC3 : public ISearchAssistantOC2;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchAssistantOC3.

132.2.12.1 ISearchAssistantOC3 Members

The following tables list the members exposed by ISearchAssistantOC3.

Public Methods

	Name	Description
	AddNextMenuItem (see page 19308)	This is AddNextMenuItem, a member of class ISearchAssistantOC.
	EncodeString (see page 19308)	This is EncodeString, a member of class ISearchAssistantOC.
	FindComputer (see page 19308)	This is FindComputer, a member of class ISearchAssistantOC.
	FindFilesOrFolders (see page 19309)	This is FindFilesOrFolders, a member of class ISearchAssistantOC.
	FindOnWeb (see page 19309)	This is FindOnWeb, a member of class ISearchAssistantOC.
	FindPeople (see page 19309)	This is FindPeople, a member of class ISearchAssistantOC.
	FindPrinter (see page 19309)	This is FindPrinter, a member of class ISearchAssistantOC.
	Get_ASProvider (see page 19309)	This is Get_ASProvider, a member of class ISearchAssistantOC.
	Get_ASSetting (see page 19310)	This is Get_ASSetting, a member of class ISearchAssistantOC.
	Get_InWebFolder (see page 19310)	This is Get_InWebFolder, a member of class ISearchAssistantOC.
	Get_SearchAssistantDefault (see page 19310)	This is Get_SearchAssistantDefault, a member of class ISearchAssistantOC.

	Get_SearchCompanionAvailable (see page 19328)	This is Get_SearchCompanionAvailable, a member of class ISearchAssistantOC3.
	Get_Searches (see page 19310)	This is Get_Searches, a member of class ISearchAssistantOC.
	Get_ShellFeaturesEnabled (see page 19311)	This is Get_ShellFeaturesEnabled, a member of class ISearchAssistantOC.
	Get_ShowFindPrinter (see page 19318)	This is Get_ShowFindPrinter, a member of class ISearchAssistantOC2.
	Get_UseSearchCompanion (see page 19328)	This is Get_UseSearchCompanion, a member of class ISearchAssistantOC3.
	Get_Version (see page 19311)	This is Get_Version, a member of class ISearchAssistantOC.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetProperty (see page 19311)	This is GetProperty, a member of class ISearchAssistantOC.
	GetSearchAssistantURL (see page 19311)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	IsRestricted (see page 19311)	This is IsRestricted, a member of class ISearchAssistantOC.
	NavigateToDefaultSearch (see page 19312)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC.
	NETDetectNextNavigate (see page 19312)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC.
	NotifySearchSettingsChanged (see page 19312)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC.
	PutFindText (see page 19312)	This is PutFindText, a member of class ISearchAssistantOC.
	PutProperty (see page 19313)	This is PutProperty, a member of class ISearchAssistantOC.
	ResetNextMenu (see page 19313)	This is ResetNextMenu, a member of class ISearchAssistantOC.
	Set_ASProvider (see page 19313)	This is Set_ASProvider, a member of class ISearchAssistantOC.
	Set_ASSetting (see page 19313)	This is Set_ASSetting, a member of class ISearchAssistantOC.
	Set_EventHandled (see page 19313)	This is Set_EventHandled, a member of class ISearchAssistantOC.
	Set_UseSearchCompanion (see page 19328)	This is Set_UseSearchCompanion, a member of class ISearchAssistantOC3.
	SetDefaultSearchUrl (see page 19314)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC.

Public Properties

	Name	Description
	ASProvider (see page 19314)	This is ASProvider, a member of class ISearchAssistantOC.
	ASSetting (see page 19314)	This is ASSetting, a member of class ISearchAssistantOC.
W	EventHandled (see page 19315)	This is EventHandled, a member of class ISearchAssistantOC.
R	InWebFolder (see page 19315)	This is InWebFolder, a member of class ISearchAssistantOC.
R	SearchAssistantDefault (see page 19315)	This is SearchAssistantDefault, a member of class ISearchAssistantOC.
R	SearchCompanionAvailable (see page 19328)	This is SearchCompanionAvailable, a member of class ISearchAssistantOC3.
R	Searches (see page 19315)	This is Searches, a member of class ISearchAssistantOC.
R	ShellFeaturesEnabled (see page 19316)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC.
R	ShowFindPrinter (see page 19318)	This is ShowFindPrinter, a member of class ISearchAssistantOC2.
	UseSearchCompanion (see page 19329)	This is UseSearchCompanion, a member of class ISearchAssistantOC3.
R	Version (see page 19316)	This is Version, a member of class ISearchAssistantOC.

132.2.12.2 ISearchAssistantOC3 Methods

The methods of the ISearchAssistantOC3 class are listed here.

Public Methods

	Name	Description
	Get_SearchCompanionAvailable (see page 19328)	This is Get_SearchCompanionAvailable, a member of class ISearchAssistantOC3.
	Get_UseSearchCompanion (see page 19328)	This is Get_UseSearchCompanion, a member of class ISearchAssistantOC3.
	Set_UseSearchCompanion (see page 19328)	This is Set_UseSearchCompanion, a member of class ISearchAssistantOC3.

132.2.12.2.1 ISearchAssistantOC3.Get_SearchCompanionAvailable Method

Pascal

```
function Get_SearchCompanionAvailable: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_SearchCompanionAvailable();
```

Description

This is Get_SearchCompanionAvailable, a member of class ISearchAssistantOC3.

132.2.12.2.2 ISearchAssistantOC3.Get_UseSearchCompanion Method

Pascal

```
function Get_UseSearchCompanion: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_UseSearchCompanion();
```

Description

This is Get_UseSearchCompanion, a member of class ISearchAssistantOC3.

132.2.12.2.3 ISearchAssistantOC3.Set_UseSearchCompanion Method

Pascal

```
procedure Set_UseSearchCompanion(pbUseSC: WordBool); safecall;
```

C++

```
__fastcall Set_UseSearchCompanion(WordBool pbUseSC);
```

Description

This is Set_UseSearchCompanion, a member of class ISearchAssistantOC3.

132.2.12.3 ISearchAssistantOC3 Properties

The properties of the ISearchAssistantOC3 class are listed here.

Public Properties

	Name	Description
R	SearchCompanionAvailable (see page 19328)	This is SearchCompanionAvailable, a member of class ISearchAssistantOC3.
	UseSearchCompanion (see page 19329)	This is UseSearchCompanion, a member of class ISearchAssistantOC3.

132.2.12.3.1 ISearchAssistantOC3.SearchCompanionAvailable Property

Pascal

```
property SearchCompanionAvailable: WordBool;
```

C++

```
__property WordBool SearchCompanionAvailable;
```

Description

This is SearchCompanionAvailable, a member of class ISearchAssistantOC3.

132.2.12.3.2 ISearchAssistantOC3.UseSearchCompanion Property

Pascal

```
property UseSearchCompanion: WordBool;
```

C++

```
__property WordBool UseSearchCompanion;
```

Description

This is UseSearchCompanion, a member of class ISearchAssistantOC3.

132.2.13 ISearchAssistantOC3Disp Interface

Class Hierarchy

SHDocVw.ISearchAssistantOC3Disp

Pascal

```
ISearchAssistantOC3Disp = dispinterface;
```

C++

```
class ISearchAssistantOC3Disp;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchAssistantOC3Disp.

132.2.13.1 ISearchAssistantOC3Disp Members

The following tables list the members exposed by ISearchAssistantOC3Disp.

Public Methods

	Name	Description
	AddNextMenuItem (see page 19330)	This is AddNextMenuItem, a member of class ISearchAssistantOC3Disp.
	EncodeString (see page 19331)	This is EncodeString, a member of class ISearchAssistantOC3Disp.
	FindComputer (see page 19331)	This is FindComputer, a member of class ISearchAssistantOC3Disp.
	FindFilesOrFolders (see page 19331)	This is FindFilesOrFolders, a member of class ISearchAssistantOC3Disp.
	FindOnWeb (see page 19331)	This is FindOnWeb, a member of class ISearchAssistantOC3Disp.
	FindPeople (see page 19332)	This is FindPeople, a member of class ISearchAssistantOC3Disp.
	FindPrinter (see page 19332)	This is FindPrinter, a member of class ISearchAssistantOC3Disp.
	GetProperty (see page 19332)	This is GetProperty, a member of class ISearchAssistantOC3Disp.
	GetSearchAssistantURL (see page 19332)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC3Disp.
	IsRestricted (see page 19332)	This is IsRestricted, a member of class ISearchAssistantOC3Disp.
	NavigateToDefaultSearch (see page 19333)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC3Disp.

	NETDetectNextNavigate (see page 19333)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC3Disp.
	NotifySearchSettingsChanged (see page 19333)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC3Disp.
	PutFindText (see page 19333)	This is PutFindText, a member of class ISearchAssistantOC3Disp.
	PutProperty (see page 19334)	This is PutProperty, a member of class ISearchAssistantOC3Disp.
	ResetNextMenu (see page 19334)	This is ResetNextMenu, a member of class ISearchAssistantOC3Disp.
	SetDefaultSearchUrl (see page 19334)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC3Disp.

Public Properties

	Name	Description
	ASProvider (see page 19335)	This is ASProvider, a member of class ISearchAssistantOC3Disp.
	ASSetting (see page 19335)	This is ASSetting, a member of class ISearchAssistantOC3Disp.
	EventHandled (see page 19335)	This is EventHandled, a member of class ISearchAssistantOC3Disp.
	InWebFolder (see page 19335)	This is InWebFolder, a member of class ISearchAssistantOC3Disp.
	SearchAssistantDefault (see page 19335)	This is SearchAssistantDefault, a member of class ISearchAssistantOC3Disp.
	SearchCompanionAvailable (see page 19336)	This is SearchCompanionAvailable, a member of class ISearchAssistantOC3Disp.
	Searches (see page 19336)	This is Searches, a member of class ISearchAssistantOC3Disp.
	ShellFeaturesEnabled (see page 19336)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC3Disp.
	ShowFindPrinter (see page 19336)	This is ShowFindPrinter, a member of class ISearchAssistantOC3Disp.
	UseSearchCompanion (see page 19337)	This is UseSearchCompanion, a member of class ISearchAssistantOC3Disp.
	Version (see page 19337)	This is Version, a member of class ISearchAssistantOC3Disp.

132.2.13.2 ISearchAssistantOC3Disp Methods

The methods of the ISearchAssistantOC3Disp class are listed here.

Public Methods

	Name	Description
	AddNextMenuItem (see page 19330)	This is AddNextMenuItem, a member of class ISearchAssistantOC3Disp.
	EncodeString (see page 19331)	This is EncodeString, a member of class ISearchAssistantOC3Disp.
	FindComputer (see page 19331)	This is FindComputer, a member of class ISearchAssistantOC3Disp.
	FindFilesOrFolders (see page 19331)	This is FindFilesOrFolders, a member of class ISearchAssistantOC3Disp.
	FindOnWeb (see page 19331)	This is FindOnWeb, a member of class ISearchAssistantOC3Disp.
	FindPeople (see page 19332)	This is FindPeople, a member of class ISearchAssistantOC3Disp.
	FindPrinter (see page 19332)	This is FindPrinter, a member of class ISearchAssistantOC3Disp.
	GetProperty (see page 19332)	This is GetProperty, a member of class ISearchAssistantOC3Disp.
	GetSearchAssistantURL (see page 19332)	This is GetSearchAssistantURL, a member of class ISearchAssistantOC3Disp.
	IsRestricted (see page 19332)	This is IsRestricted, a member of class ISearchAssistantOC3Disp.
	NavigateToDefaultSearch (see page 19333)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOC3Disp.
	NETDetectNextNavigate (see page 19333)	This is NETDetectNextNavigate, a member of class ISearchAssistantOC3Disp.
	NotifySearchSettingsChanged (see page 19333)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC3Disp.
	PutFindText (see page 19333)	This is PutFindText, a member of class ISearchAssistantOC3Disp.
	PutProperty (see page 19334)	This is PutProperty, a member of class ISearchAssistantOC3Disp.
	ResetNextMenu (see page 19334)	This is ResetNextMenu, a member of class ISearchAssistantOC3Disp.
	SetDefaultSearchUrl (see page 19334)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOC3Disp.

132.2.13.2.1 ISearchAssistantOC3Disp.AddNextMenuItem Method

Pascal

```
procedure AddNextMenuItem(const bstrText: WideString; idItem: Integer);
```

C++

```
__fastcall AddNextMenuItem(const BSTR bstrText, int idItem);
```

Description

This is AddNextMenuItem, a member of class ISearchAssistantOC3Disp.

132.2.13.2.2 ISearchAssistantOC3Disp.EncodeString Method

Pascal

```
function EncodeString(const bstrValue: WideString; const bstrCharSet: WideString; bUseUTF8:
WordBool): WideString;
```

C++

```
__fastcall BSTR EncodeString(const BSTR bstrValue, const BSTR bstrCharSet, WordBool bUseUTF8);
```

Description

This is EncodeString, a member of class ISearchAssistantOC3Disp.

132.2.13.2.3 ISearchAssistantOC3Disp.FindComputer Method

Pascal

```
procedure FindComputer;
```

C++

```
__fastcall FindComputer();
```

Description

This is FindComputer, a member of class ISearchAssistantOC3Disp.

132.2.13.2.4 ISearchAssistantOC3Disp.FindFilesOrFolders Method

Pascal

```
procedure FindFilesOrFolders;
```

C++

```
__fastcall FindFilesOrFolders();
```

Description

This is FindFilesOrFolders, a member of class ISearchAssistantOC3Disp.

132.2.13.2.5 ISearchAssistantOC3Disp.FindOnWeb Method

Pascal

```
procedure FindOnWeb;
```

C++

```
__fastcall FindOnWeb();
```

Description

This is FindOnWeb, a member of class ISearchAssistantOC3Disp.

132.2.13.2.6 ISearchAssistantOC3Disp.FindPeople Method

Pascal

```
procedure FindPeople;
```

C++

```
__fastcall FindPeople();
```

Description

This is FindPeople, a member of class ISearchAssistantOC3Disp.

132.2.13.2.7 ISearchAssistantOC3Disp.FindPrinter Method

Pascal

```
procedure FindPrinter;
```

C++

```
__fastcall FindPrinter();
```

Description

This is FindPrinter, a member of class ISearchAssistantOC3Disp.

132.2.13.2.8 ISearchAssistantOC3Disp.GetProperty Method

Pascal

```
function GetProperty(bPerLocale: WordBool; const bstrName: WideString): WideString;
```

C++

```
__fastcall BSTR GetProperty(WordBool bPerLocale, const BSTR bstrName);
```

Description

This is GetProperty, a member of class ISearchAssistantOC3Disp.

132.2.13.2.9 ISearchAssistantOC3Disp.GetSearchAssistantURL Method

Pascal

```
function GetSearchAssistantURL(bSubstitute: WordBool; bCustomize: WordBool): WideString;
```

C++

```
__fastcall BSTR GetSearchAssistantURL(WordBool bSubstitute, WordBool bCustomize);
```

Description

This is GetSearchAssistantURL, a member of class ISearchAssistantOC3Disp.

132.2.13.2.10 ISearchAssistantOC3Disp.IsRestricted Method

Pascal

```
function IsRestricted(const bstrGuid: WideString): WordBool;
```

C++

```
__fastcall WordBool IsRestricted(const BSTR bstrGuid);
```

Description

This is IsRestricted, a member of class ISearchAssistantOC3Disp.

132.2.13.2.11 ISearchAssistantOC3Disp.NavigateToDefaultSearch Method

Pascal

```
procedure NavigateToDefaultSearch;
```

C++

```
__fastcall NavigateToDefaultSearch();
```

Description

This is NavigateToDefaultSearch, a member of class ISearchAssistantOC3Disp.

132.2.13.2.12 ISearchAssistantOC3Disp.NETDetectNextNavigate Method

Pascal

```
procedure NETDetectNextNavigate;
```

C++

```
__fastcall NETDetectNextNavigate();
```

Description

This is NETDetectNextNavigate, a member of class ISearchAssistantOC3Disp.

132.2.13.2.13 ISearchAssistantOC3Disp.NotifySearchSettingsChanged Method

Pascal

```
procedure NotifySearchSettingsChanged;
```

C++

```
__fastcall NotifySearchSettingsChanged();
```

Description

This is NotifySearchSettingsChanged, a member of class ISearchAssistantOC3Disp.

132.2.13.2.14 ISearchAssistantOC3Disp.PutFindText Method

Pascal

```
procedure PutFindText(const FindText: WideString);
```

C++

```
__fastcall PutFindText(const BSTR FindText);
```

Description

This is PutFindText, a member of class ISearchAssistantOC3Disp.

132.2.13.2.15 ISearchAssistantOC3Disp.PutProperty Method

Pascal

```
procedure PutProperty(bPerLocale: WordBool; const bstrName: WideString; const bstrValue:
WideString);
```

C++

```
__fastcall PutProperty(WordBool bPerLocale, const BSTR bstrName, const BSTR bstrValue);
```

Description

This is PutProperty, a member of class ISearchAssistantOC3Disp.

132.2.13.2.16 ISearchAssistantOC3Disp.ResetNextMenu Method

Pascal

```
procedure ResetNextMenu;
```

C++

```
__fastcall ResetNextMenu();
```

Description

This is ResetNextMenu, a member of class ISearchAssistantOC3Disp.

132.2.13.2.17 ISearchAssistantOC3Disp.SetDefaultSearchUrl Method

Pascal

```
procedure SetDefaultSearchUrl(const bstrUrl: WideString);
```

C++

```
__fastcall SetDefaultSearchUrl(const BSTR bstrUrl);
```

Description

This is SetDefaultSearchUrl, a member of class ISearchAssistantOC3Disp.

132.2.13.3 ISearchAssistantOC3Disp Properties

The properties of the ISearchAssistantOC3Disp class are listed here.

Public Properties

	Name	Description
	ASProvider (see page 19335)	This is ASProvider, a member of class ISearchAssistantOC3Disp.
	ASSetting (see page 19335)	This is ASSetting, a member of class ISearchAssistantOC3Disp.
	EventHandled (see page 19335)	This is EventHandled, a member of class ISearchAssistantOC3Disp.
	InWebFolder (see page 19335)	This is InWebFolder, a member of class ISearchAssistantOC3Disp.
	SearchAssistantDefault (see page 19335)	This is SearchAssistantDefault, a member of class ISearchAssistantOC3Disp.
	SearchCompanionAvailable (see page 19336)	This is SearchCompanionAvailable, a member of class ISearchAssistantOC3Disp.
	Searches (see page 19336)	This is Searches, a member of class ISearchAssistantOC3Disp.
	ShellFeaturesEnabled (see page 19336)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOC3Disp.
	ShowFindPrinter (see page 19336)	This is ShowFindPrinter, a member of class ISearchAssistantOC3Disp.
	UseSearchCompanion (see page 19337)	This is UseSearchCompanion, a member of class ISearchAssistantOC3Disp.

	Version (see page 19337)	This is Version, a member of class ISearchAssistantOC3Disp.

132.2.13.3.1 ISearchAssistantOC3Disp.ASProvider Property

Pascal

```
property ASProvider: WideString;
```

C++

```
__property BSTR ASProvider;
```

Description

This is ASProvider, a member of class ISearchAssistantOC3Disp.

132.2.13.3.2 ISearchAssistantOC3Disp.ASSetting Property

Pascal

```
property ASSetting: SYSINT;
```

C++

```
__property SYSINT ASSetting;
```

Description

This is ASSetting, a member of class ISearchAssistantOC3Disp.

132.2.13.3.3 ISearchAssistantOC3Disp.EventHandled Property

Pascal

```
property EventHandled: WordBool;
```

C++

```
__property WordBool EventHandled;
```

Description

This is EventHandled, a member of class ISearchAssistantOC3Disp.

132.2.13.3.4 ISearchAssistantOC3Disp.InWebFolder Property

Pascal

```
property InWebFolder: WordBool;
```

C++

```
__property WordBool InWebFolder;
```

Description

This is InWebFolder, a member of class ISearchAssistantOC3Disp.

132.2.13.3.5 ISearchAssistantOC3Disp.SearchAssistantDefault Property

Pascal

```
property SearchAssistantDefault: WordBool;
```

C++

```
__property WordBool SearchAssistantDefault;
```

Description

This is SearchAssistantDefault, a member of class ISearchAssistantOC3Disp.

132.2.13.3.6 ISearchAssistantOC3Disp.SearchCompanionAvailable Property

Pascal

```
property SearchCompanionAvailable: WordBool;
```

C++

```
__property WordBool SearchCompanionAvailable;
```

Description

This is SearchCompanionAvailable, a member of class ISearchAssistantOC3Disp.

132.2.13.3.7 ISearchAssistantOC3Disp.Searches Property

Pascal

```
property Searches: ISearches;
```

C++

```
__property ISearches Searches;
```

Description

This is Searches, a member of class ISearchAssistantOC3Disp.

132.2.13.3.8 ISearchAssistantOC3Disp.ShellFeaturesEnabled Property

Pascal

```
property ShellFeaturesEnabled: WordBool;
```

C++

```
__property WordBool ShellFeaturesEnabled;
```

Description

This is ShellFeaturesEnabled, a member of class ISearchAssistantOC3Disp.

132.2.13.3.9 ISearchAssistantOC3Disp.ShowFindPrinter Property

Pascal

```
property ShowFindPrinter: WordBool;
```

C++

```
__property WordBool ShowFindPrinter;
```

Description

This is ShowFindPrinter, a member of class ISearchAssistantOC3Disp.

132.2.13.3.10 ISearchAssistantOC3Disp.UseSearchCompanion Property

Pascal

```
property UseSearchCompanion: WordBool;
```

C++

```
__property WordBool UseSearchCompanion;
```

Description

This is UseSearchCompanion, a member of class ISearchAssistantOC3Disp.

132.2.13.3.11 ISearchAssistantOC3Disp.Version Property

Pascal

```
property Version: SYSINT;
```

C++

```
__property SYSINT Version;
```

Description

This is Version, a member of class ISearchAssistantOC3Disp.

132.2.14 ISearchAssistantOCDisp Interface

Class Hierarchy

Pascal

```
ISearchAssistantOCDisp = dispinterface;
```

C++

```
class ISearchAssistantOCDisp;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchAssistantOCDisp.

132.2.14.1 ISearchAssistantOCDisp Members

The following tables list the members exposed by ISearchAssistantOCDisp.

Public Methods

	Name	Description
	AddNextMenuItem (see page 19339)	This is AddNextMenuItem, a member of class ISearchAssistantOCDisp.
	EncodeString (see page 19339)	This is EncodeString, a member of class ISearchAssistantOCDisp.
	FindComputer (see page 19339)	This is FindComputer, a member of class ISearchAssistantOCDisp.

	FindFilesOrFolders (see page 19339)	This is FindFilesOrFolders, a member of class ISearchAssistantOCDisp.
	FindOnWeb (see page 19339)	This is FindOnWeb, a member of class ISearchAssistantOCDisp.
	FindPeople (see page 19340)	This is FindPeople, a member of class ISearchAssistantOCDisp.
	FindPrinter (see page 19340)	This is FindPrinter, a member of class ISearchAssistantOCDisp.
	GetProperty (see page 19340)	This is GetProperty, a member of class ISearchAssistantOCDisp.
	GetSearchAssistantURL (see page 19340)	This is GetSearchAssistantURL, a member of class ISearchAssistantOCDisp.
	IsRestricted (see page 19341)	This is IsRestricted, a member of class ISearchAssistantOCDisp.
	NavigateToDefaultSearch (see page 19341)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOCDisp.
	NETDetectNextNavigate (see page 19341)	This is NETDetectNextNavigate, a member of class ISearchAssistantOCDisp.
	NotifySearchSettingsChanged (see page 19341)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOCDisp.
	PutFindText (see page 19341)	This is PutFindText, a member of class ISearchAssistantOCDisp.
	PutProperty (see page 19342)	This is PutProperty, a member of class ISearchAssistantOCDisp.
	ResetNextMenu (see page 19342)	This is ResetNextMenu, a member of class ISearchAssistantOCDisp.
	SetDefaultSearchUrl (see page 19342)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOCDisp.

Public Properties

	Name	Description
	ASProvider (see page 19343)	This is ASProvider, a member of class ISearchAssistantOCDisp.
	ASSetting (see page 19343)	This is ASSetting, a member of class ISearchAssistantOCDisp.
	EventHandled (see page 19343)	This is EventHandled, a member of class ISearchAssistantOCDisp.
	InWebFolder (see page 19343)	This is InWebFolder, a member of class ISearchAssistantOCDisp.
	SearchAssistantDefault (see page 19343)	This is SearchAssistantDefault, a member of class ISearchAssistantOCDisp.
	Searches (see page 19344)	This is Searches, a member of class ISearchAssistantOCDisp.
	ShellFeaturesEnabled (see page 19344)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOCDisp.
	Version (see page 19344)	This is Version, a member of class ISearchAssistantOCDisp.

132.2.14.2 ISearchAssistantOCDisp Methods

The methods of the ISearchAssistantOCDisp class are listed here.

Public Methods

	Name	Description
	AddNextMenuItem (see page 19339)	This is AddNextMenuItem, a member of class ISearchAssistantOCDisp.
	EncodeString (see page 19339)	This is EncodeString, a member of class ISearchAssistantOCDisp.
	FindComputer (see page 19339)	This is FindComputer, a member of class ISearchAssistantOCDisp.
	FindFilesOrFolders (see page 19339)	This is FindFilesOrFolders, a member of class ISearchAssistantOCDisp.
	FindOnWeb (see page 19339)	This is FindOnWeb, a member of class ISearchAssistantOCDisp.
	FindPeople (see page 19340)	This is FindPeople, a member of class ISearchAssistantOCDisp.
	FindPrinter (see page 19340)	This is FindPrinter, a member of class ISearchAssistantOCDisp.
	GetProperty (see page 19340)	This is GetProperty, a member of class ISearchAssistantOCDisp.
	GetSearchAssistantURL (see page 19340)	This is GetSearchAssistantURL, a member of class ISearchAssistantOCDisp.
	IsRestricted (see page 19341)	This is IsRestricted, a member of class ISearchAssistantOCDisp.
	NavigateToDefaultSearch (see page 19341)	This is NavigateToDefaultSearch, a member of class ISearchAssistantOCDisp.
	NETDetectNextNavigate (see page 19341)	This is NETDetectNextNavigate, a member of class ISearchAssistantOCDisp.
	NotifySearchSettingsChanged (see page 19341)	This is NotifySearchSettingsChanged, a member of class ISearchAssistantOCDisp.
	PutFindText (see page 19341)	This is PutFindText, a member of class ISearchAssistantOCDisp.
	PutProperty (see page 19342)	This is PutProperty, a member of class ISearchAssistantOCDisp.
	ResetNextMenu (see page 19342)	This is ResetNextMenu, a member of class ISearchAssistantOCDisp.
	SetDefaultSearchUrl (see page 19342)	This is SetDefaultSearchUrl, a member of class ISearchAssistantOCDisp.

132.2.14.2.1 ISearchAssistantOCDisp.AddNextMenuItem Method

Pascal

```
procedure AddNextMenuItem(const bstrText: WideString; idItem: Integer);
```

C++

```
__fastcall AddNextMenuItem(const BSTR bstrText, int idItem);
```

Description

This is AddNextMenuItem, a member of class ISearchAssistantOCDisp.

132.2.14.2.2 ISearchAssistantOCDisp.EncodeString Method

Pascal

```
function EncodeString(const bstrValue: WideString; const bstrCharSet: WideString; bUseUTF8:
WordBool): WideString;
```

C++

```
__fastcall BSTR EncodeString(const BSTR bstrValue, const BSTR bstrCharSet, WordBool bUseUTF8);
```

Description

This is EncodeString, a member of class ISearchAssistantOCDisp.

132.2.14.2.3 ISearchAssistantOCDisp.FindComputer Method

Pascal

```
procedure FindComputer;
```

C++

```
__fastcall FindComputer();
```

Description

This is FindComputer, a member of class ISearchAssistantOCDisp.

132.2.14.2.4 ISearchAssistantOCDisp.FindFilesOrFolders Method

Pascal

```
procedure FindFilesOrFolders;
```

C++

```
__fastcall FindFilesOrFolders();
```

Description

This is FindFilesOrFolders, a member of class ISearchAssistantOCDisp.

132.2.14.2.5 ISearchAssistantOCDisp.FindOnWeb Method

Pascal

```
procedure FindOnWeb;
```

C++

```
__fastcall FindOnWeb();
```

Description

This is FindOnWeb, a member of class ISearchAssistantOCDisp.

132.2.14.2.6 ISearchAssistantOCDisp.FindPeople Method

Pascal

```
procedure FindPeople;
```

C++

```
__fastcall FindPeople();
```

Description

This is FindPeople, a member of class ISearchAssistantOCDisp.

132.2.14.2.7 ISearchAssistantOCDisp.FindPrinter Method

Pascal

```
procedure FindPrinter;
```

C++

```
__fastcall FindPrinter();
```

Description

This is FindPrinter, a member of class ISearchAssistantOCDisp.

132.2.14.2.8 ISearchAssistantOCDisp.GetProperty Method

Pascal

```
function GetProperty(bPerLocale: WordBool; const bstrName: WideString): WideString;
```

C++

```
__fastcall BSTR GetProperty(WordBool bPerLocale, const BSTR bstrName);
```

Description

This is GetProperty, a member of class ISearchAssistantOCDisp.

132.2.14.2.9 ISearchAssistantOCDisp.GetSearchAssistantURL Method

Pascal

```
function GetSearchAssistantURL(bSubstitute: WordBool; bCustomize: WordBool): WideString;
```

C++

```
__fastcall BSTR GetSearchAssistantURL(WordBool bSubstitute, WordBool bCustomize);
```

Description

This is GetSearchAssistantURL, a member of class ISearchAssistantOCDisp.

132.2.14.2.10 ISearchAssistantOCDisp.IsRestricted Method

Pascal

```
function IsRestricted(const bstrGuid: WideString): WordBool;
```

C++

```
__fastcall WordBool IsRestricted(const BSTR bstrGuid);
```

Description

This is IsRestricted, a member of class ISearchAssistantOCDisp.

132.2.14.2.11 ISearchAssistantOCDisp.NavigateToDefaultSearch Method

Pascal

```
procedure NavigateToDefaultSearch;
```

C++

```
__fastcall NavigateToDefaultSearch();
```

Description

This is NavigateToDefaultSearch, a member of class ISearchAssistantOCDisp.

132.2.14.2.12 ISearchAssistantOCDisp.NETDetectNextNavigate Method

Pascal

```
procedure NETDetectNextNavigate;
```

C++

```
__fastcall NETDetectNextNavigate();
```

Description

This is NETDetectNextNavigate, a member of class ISearchAssistantOCDisp.

132.2.14.2.13 ISearchAssistantOCDisp.NotifySearchSettingsChanged Method

Pascal

```
procedure NotifySearchSettingsChanged;
```

C++

```
__fastcall NotifySearchSettingsChanged();
```

Description

This is NotifySearchSettingsChanged, a member of class ISearchAssistantOCDisp.

132.2.14.2.14 ISearchAssistantOCDisp.PutFindText Method

Pascal

```
procedure PutFindText(const FindText: WideString);
```

C++

```
__fastcall PutFindText(const BSTR FindText);
```

Description

This is PutFindText, a member of class ISearchAssistantOCDisp.

132.2.14.2.15 ISearchAssistantOCDisp.PutProperty Method

Pascal

```
procedure PutProperty(bPerLocale: WordBool; const bstrName: WideString; const bstrValue:
WideString);
```

C++

```
__fastcall PutProperty(WordBool bPerLocale, const BSTR bstrName, const BSTR bstrValue);
```

Description

This is PutProperty, a member of class ISearchAssistantOCDisp.

132.2.14.2.16 ISearchAssistantOCDisp.ResetNextMenu Method

Pascal

```
procedure ResetNextMenu;
```

C++

```
__fastcall ResetNextMenu();
```

Description

This is ResetNextMenu, a member of class ISearchAssistantOCDisp.

132.2.14.2.17 ISearchAssistantOCDisp.SetDefaultSearchUrl Method

Pascal

```
procedure SetDefaultSearchUrl(const bstrUrl: WideString);
```

C++

```
__fastcall SetDefaultSearchUrl(const BSTR bstrUrl);
```

Description

This is SetDefaultSearchUrl, a member of class ISearchAssistantOCDisp.

132.2.14.3 ISearchAssistantOCDisp Properties

The properties of the ISearchAssistantOCDisp class are listed here.

Public Properties

	Name	Description
	ASProvider (see page 19343)	This is ASProvider, a member of class ISearchAssistantOCDisp.
	ASSetting (see page 19343)	This is ASSetting, a member of class ISearchAssistantOCDisp.
	EventHandled (see page 19343)	This is EventHandled, a member of class ISearchAssistantOCDisp.
	InWebFolder (see page 19343)	This is InWebFolder, a member of class ISearchAssistantOCDisp.
	SearchAssistantDefault (see page 19343)	This is SearchAssistantDefault, a member of class ISearchAssistantOCDisp.
	Searches (see page 19344)	This is Searches, a member of class ISearchAssistantOCDisp.
	ShellFeaturesEnabled (see page 19344)	This is ShellFeaturesEnabled, a member of class ISearchAssistantOCDisp.

	Version (see page 19344)	This is Version, a member of class ISearchAssistantOCDisp.

132.2.14.3.1 ISearchAssistantOCDisp.ASProvider Property

Pascal

```
property ASProvider: WideString;
```

C++

```
__property BSTR ASProvider;
```

Description

This is ASProvider, a member of class ISearchAssistantOCDisp.

132.2.14.3.2 ISearchAssistantOCDisp.ASSetting Property

Pascal

```
property ASSetting: SYSINT;
```

C++

```
__property SYSINT ASSetting;
```

Description

This is ASSetting, a member of class ISearchAssistantOCDisp.

132.2.14.3.3 ISearchAssistantOCDisp.EventHandled Property

Pascal

```
property EventHandled: WordBool;
```

C++

```
__property WordBool EventHandled;
```

Description

This is EventHandled, a member of class ISearchAssistantOCDisp.

132.2.14.3.4 ISearchAssistantOCDisp.InWebFolder Property

Pascal

```
property InWebFolder: WordBool;
```

C++

```
__property WordBool InWebFolder;
```

Description

This is InWebFolder, a member of class ISearchAssistantOCDisp.

132.2.14.3.5 ISearchAssistantOCDisp.SearchAssistantDefault Property

Pascal

```
property SearchAssistantDefault: WordBool;
```

C++

```
__property WordBool SearchAssistantDefault;
```

Description

This is SearchAssistantDefault, a member of class ISearchAssistantOCDisp.

132.2.14.3.6 ISearchAssistantOCDisp.Searches Property

Pascal

```
property Searches: ISearches;
```

C++

```
__property ISearches Searches;
```

Description

This is Searches, a member of class ISearchAssistantOCDisp.

132.2.14.3.7 ISearchAssistantOCDisp.ShellFeaturesEnabled Property

Pascal

```
property ShellFeaturesEnabled: WordBool;
```

C++

```
__property WordBool ShellFeaturesEnabled;
```

Description

This is ShellFeaturesEnabled, a member of class ISearchAssistantOCDisp.

132.2.14.3.8 ISearchAssistantOCDisp.Version Property

Pascal

```
property Version: SYSINT;
```

C++

```
__property SYSINT Version;
```

Description

This is Version, a member of class ISearchAssistantOCDisp.

132.2.15 ISearchDisp Interface

Class Hierarchy

Pascal

```
ISearchDisp = dispinterface;
```

C++

```
class ISearchDisp;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchDisp.

132.2.15.1 ISearchDisp Members

The following tables list the members exposed by ISearchDisp.

Public Properties

	Name	Description
	Id (see page 19345)	This is Id, a member of class ISearchDisp.
	Title (see page 19345)	This is Title, a member of class ISearchDisp.
	URL (see page 19346)	This is URL, a member of class ISearchDisp.

132.2.15.2 ISearchDisp Properties

The properties of the ISearchDisp class are listed here.

Public Properties

	Name	Description
	Id (see page 19345)	This is Id, a member of class ISearchDisp.
	Title (see page 19345)	This is Title, a member of class ISearchDisp.
	URL (see page 19346)	This is URL, a member of class ISearchDisp.

132.2.15.2.1 ISearchDisp.Id Property

Pascal

```
property Id: WideString;
```

C++

```
__property BSTR Id;
```

Description

This is Id, a member of class ISearchDisp.

132.2.15.2.2 ISearchDisp.Title Property

Pascal

```
property Title: WideString;
```

C++

```
__property BSTR Title;
```

Description

This is Title, a member of class ISearchDisp.

132.2.15.2.3 ISearchDisp.URL Property

Pascal

```
property URL: WideString;
```

C++

```
__property BSTR URL;
```

Description

This is URL, a member of class ISearchDisp.

132.2.16 ISearches Interface

Class Hierarchy

Pascal

```
ISearches = interface(IDispatch);
```

C++

```
__interface ISearches : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.ISearches.

132.2.16.1 ISearches Members

The following tables list the members exposed by ISearches.

Public Methods

	Name	Description
	_NewEnum (see page 19347)	This is _NewEnum, a member of class ISearches.
	Get_Count (see page 19347)	This is Get_Count, a member of class ISearches.
	Get_Default (see page 19347)	This is Get_Default, a member of class ISearches.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	Item (see page 19347)	This is Item, a member of class ISearches.

Public Properties

	Name	Description
R	Count (see page 19348)	This is Count, a member of class ISearches.
R	Default (see page 19348)	This is Default, a member of class ISearches.

132.2.16.2 ISearches Methods

The methods of the ISearches class are listed here.

Public Methods

	Name	Description
	_NewEnum (see page 19347)	This is _NewEnum, a member of class ISearches.
	Get_Count (see page 19347)	This is Get_Count, a member of class ISearches.
	Get_Default (see page 19347)	This is Get_Default, a member of class ISearches.
	Item (see page 19347)	This is Item, a member of class ISearches.

132.2.16.2.1 ISearches._NewEnum Method

Pascal

```
function _NewEnum: IUnknown; safecall;
```

C++

```
__fastcall IUnknown _NewEnum();
```

Description

This is _NewEnum, a member of class ISearches.

132.2.16.2.2 ISearches.Get_Count Method

Pascal

```
function Get_Count: Integer; safecall;
```

C++

```
__fastcall int Get_Count();
```

Description

This is Get_Count, a member of class ISearches.

132.2.16.2.3 ISearches.Get_Default Method

Pascal

```
function Get_Default: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Default();
```

Description

This is Get_Default, a member of class ISearches.

132.2.16.2.4 ISearches.Item Method

Pascal

```
function Item(index: OleVariant): ISearch; safecall;
```

C++

```
__fastcall ISearch Item(OleVariant index);
```

Description

This is Item, a member of class ISearches.

132.2.16.3 ISearches Properties

The properties of the ISearches class are listed here.

Public Properties

	Name	Description
R	Count (see page 19348)	This is Count, a member of class ISearches.
R	Default (see page 19348)	This is Default, a member of class ISearches.

132.2.16.3.1 ISearches.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class ISearches.

132.2.16.3.2 ISearches.Default Property

Pascal

```
property Default: WideString;
```

C++

```
__property BSTR Default;
```

Description

This is Default, a member of class ISearches.

132.2.17 ISearchesDisp Interface

Class Hierarchy

SHDocVw.ISearchesDisp

Pascal

```
ISearchesDisp = dispinterface;
```

C++

```
class ISearchesDisp;
```

File

SHDocVw

Description

This is class SHDocVw.ISearchesDisp.

132.2.17.1 ISearchesDisp Members

The following tables list the members exposed by ISearchesDisp.

Public Methods

	Name	Description
	_NewEnum (see page 19349)	This is _NewEnum, a member of class ISearchesDisp.
	Item (see page 19349)	This is Item, a member of class ISearchesDisp.

Public Properties

	Name	Description
	Count (see page 19350)	This is Count, a member of class ISearchesDisp.
	Default (see page 19350)	This is Default, a member of class ISearchesDisp.

132.2.17.2 ISearchesDisp Methods

The methods of the ISearchesDisp class are listed here.

Public Methods

	Name	Description
	_NewEnum (see page 19349)	This is _NewEnum, a member of class ISearchesDisp.
	Item (see page 19349)	This is Item, a member of class ISearchesDisp.

132.2.17.2.1 ISearchesDisp._NewEnum Method

Pascal

```
function _NewEnum: IUnknown;
```

C++

```
__fastcall IUnknown _NewEnum();
```

Description

This is _NewEnum, a member of class ISearchesDisp.

132.2.17.2.2 ISearchesDisp.Item Method

Pascal

```
function Item(index: OleVariant): ISearch;
```

C++

```
__fastcall ISearch Item(OleVariant index);
```

Description

This is Item, a member of class ISearchesDisp.

132.2.17.3 ISearchesDisp Properties

The properties of the ISearchesDisp class are listed here.

Public Properties

	Name	Description
	Count (see page 19350)	This is Count, a member of class ISearchesDisp.
	Default (see page 19350)	This is Default, a member of class ISearchesDisp.

132.2.17.3.1 ISearchesDisp.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class ISearchesDisp.

132.2.17.3.2 ISearchesDisp.Default Property

Pascal

```
property Default: WideString;
```

C++

```
__property BSTR Default;
```

Description

This is Default, a member of class ISearchesDisp.

132.2.18 IShellFavoritesNameSpace Interface

Class Hierarchy

Pascal

```
IShellFavoritesNameSpace = interface(IDispatch);
```

C++

```
__interface IShellFavoritesNameSpace : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.IShellFavoritesNameSpace.

132.2.18.1 IShellFavoritesNameSpace Members

The following tables list the members exposed by IShellFavoritesNameSpace.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 19352)	This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpace.
	DeleteSubscriptionForSelection (see page 19352)	This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpace.
	Export (see page 19352)	This is Export, a member of class IShellFavoritesNameSpace.
	Get_SubscriptionsEnabled (see page 19352)	This is Get_SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Import (see page 19353)	This is Import, a member of class IShellFavoritesNameSpace.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	InvokeContextMenuCommand (see page 19353)	This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpace.
	MoveSelectionDown (see page 19353)	This is MoveSelectionDown, a member of class IShellFavoritesNameSpace.
	MoveSelectionTo (see page 19353)	This is MoveSelectionTo, a member of class IShellFavoritesNameSpace.
	MoveSelectionUp (see page 19353)	This is MoveSelectionUp, a member of class IShellFavoritesNameSpace.
	NewFolder (see page 19354)	This is NewFolder, a member of class IShellFavoritesNameSpace.
	ResetSort (see page 19354)	This is ResetSort, a member of class IShellFavoritesNameSpace.
	SetRoot (see page 19354)	This is SetRoot, a member of class IShellFavoritesNameSpace.
	Synchronize (see page 19354)	This is Synchronize, a member of class IShellFavoritesNameSpace.

Public Properties

	Name	Description
R	SubscriptionsEnabled (see page 19355)	This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.

132.2.18.2 IShellFavoritesNameSpace Methods

The methods of the IShellFavoritesNameSpace class are listed here.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 19352)	This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpace.
	DeleteSubscriptionForSelection (see page 19352)	This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpace.
	Export (see page 19352)	This is Export, a member of class IShellFavoritesNameSpace.
	Get_SubscriptionsEnabled (see page 19352)	This is Get_SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.
	Import (see page 19353)	This is Import, a member of class IShellFavoritesNameSpace.
	InvokeContextMenuCommand (see page 19353)	This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpace.
	MoveSelectionDown (see page 19353)	This is MoveSelectionDown, a member of class IShellFavoritesNameSpace.
	MoveSelectionTo (see page 19353)	This is MoveSelectionTo, a member of class IShellFavoritesNameSpace.
	MoveSelectionUp (see page 19353)	This is MoveSelectionUp, a member of class IShellFavoritesNameSpace.
	NewFolder (see page 19354)	This is NewFolder, a member of class IShellFavoritesNameSpace.
	ResetSort (see page 19354)	This is ResetSort, a member of class IShellFavoritesNameSpace.
	SetRoot (see page 19354)	This is SetRoot, a member of class IShellFavoritesNameSpace.

	Synchronize (see page 19354)	This is Synchronize, a member of class IShellFavoritesNameSpace.

132.2.18.2.1 IShellFavoritesNameSpace.CreateSubscriptionForSelection Method

Pascal

```
function CreateSubscriptionForSelection: WordBool; safecall;
```

C++

```
__fastcall WordBool CreateSubscriptionForSelection();
```

Description

This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpace.

132.2.18.2.2 IShellFavoritesNameSpace.DeleteSubscriptionForSelection Method

Pascal

```
function DeleteSubscriptionForSelection: WordBool; safecall;
```

C++

```
__fastcall WordBool DeleteSubscriptionForSelection();
```

Description

This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpace.

132.2.18.2.3 IShellFavoritesNameSpace.Export Method

Pascal

```
procedure Export; safecall;
```

C++

```
__fastcall Export();
```

Description

This is Export, a member of class IShellFavoritesNameSpace.

132.2.18.2.4 IShellFavoritesNameSpace.Get_SubscriptionsEnabled Method

Pascal

```
function Get_SubscriptionsEnabled: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_SubscriptionsEnabled();
```

Description

This is Get_SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.

132.2.18.2.5 IShellFavoritesNameSpace.Import Method

Pascal

```
procedure Import; safecall;
```

C++

```
__fastcall Import();
```

Description

This is Import, a member of class IShellFavoritesNameSpace.

132.2.18.2.6 IShellFavoritesNameSpace.InvokeContextMenuCommand Method

Pascal

```
procedure InvokeContextMenuCommand(const strCommand: WideString); safecall;
```

C++

```
__fastcall InvokeContextMenuCommand(const BSTR strCommand);
```

Description

This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpace.

132.2.18.2.7 IShellFavoritesNameSpace.MoveSelectionDown Method

Pascal

```
procedure MoveSelectionDown; safecall;
```

C++

```
__fastcall MoveSelectionDown();
```

Description

This is MoveSelectionDown, a member of class IShellFavoritesNameSpace.

132.2.18.2.8 IShellFavoritesNameSpace.MoveSelectionTo Method

Pascal

```
procedure MoveSelectionTo; safecall;
```

C++

```
__fastcall MoveSelectionTo();
```

Description

This is MoveSelectionTo, a member of class IShellFavoritesNameSpace.

132.2.18.2.9 IShellFavoritesNameSpace.MoveSelectionUp Method

Pascal

```
procedure MoveSelectionUp; safecall;
```

C++

```
__fastcall MoveSelectionUp();
```

Description

This is MoveSelectionUp, a member of class IShellFavoritesNameSpace.

132.2.18.2.10 IShellFavoritesNameSpace.NewFolder Method

Pascal

```
procedure NewFolder; safecall;
```

C++

```
__fastcall NewFolder();
```

Description

This is NewFolder, a member of class IShellFavoritesNameSpace.

132.2.18.2.11 IShellFavoritesNameSpace.ResetSort Method

Pascal

```
procedure ResetSort; safecall;
```

C++

```
__fastcall ResetSort();
```

Description

This is ResetSort, a member of class IShellFavoritesNameSpace.

132.2.18.2.12 IShellFavoritesNameSpace.SetRoot Method

Pascal

```
procedure SetRoot(const bstrFullPath: WideString); safecall;
```

C++

```
__fastcall SetRoot(const BSTR bstrFullPath);
```

Description

This is SetRoot, a member of class IShellFavoritesNameSpace.

132.2.18.2.13 IShellFavoritesNameSpace.Synchronize Method

Pascal

```
procedure Synchronize; safecall;
```

C++

```
__fastcall Synchronize();
```

Description

This is Synchronize, a member of class IShellFavoritesNameSpace.

132.2.18.3 IShellFavoritesNameSpace Properties

The properties of the IShellFavoritesNameSpace class are listed here.

Public Properties

	Name	Description
	SubscriptionsEnabled (see page 19355)	This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.

132.2.18.3.1 IShellFavoritesNameSpace.SubscriptionsEnabled Property

Pascal

```
property SubscriptionsEnabled: WordBool;
```

C++

```
__property WordBool SubscriptionsEnabled;
```

Description

This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.

132.2.19 IShellFavoritesNameSpaceDisp Interface

Class Hierarchy

SHDocVw.IShellFavoritesNameSpaceDisp

Pascal

```
IShellFavoritesNameSpaceDisp = dispinterface;
```

C++

```
class IShellFavoritesNameSpaceDisp;
```

File

SHDocVw

Description

This is class SHDocVw.IShellFavoritesNameSpaceDisp.

132.2.19.1 IShellFavoritesNameSpaceDisp Members

The following tables list the members exposed by IShellFavoritesNameSpaceDisp.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 19356)	This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpaceDisp.
	DeleteSubscriptionForSelection (see page 19356)	This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpaceDisp.
	Export (see page 19357)	This is Export, a member of class IShellFavoritesNameSpaceDisp.
	Import (see page 19357)	This is Import, a member of class IShellFavoritesNameSpaceDisp.
	InvokeContextMenuCommand (see page 19357)	This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpaceDisp.
	MoveSelectionDown (see page 19357)	This is MoveSelectionDown, a member of class IShellFavoritesNameSpaceDisp.
	MoveSelectionTo (see page 19358)	This is MoveSelectionTo, a member of class IShellFavoritesNameSpaceDisp.
	MoveSelectionUp (see page 19358)	This is MoveSelectionUp, a member of class IShellFavoritesNameSpaceDisp.
	NewFolder (see page 19358)	This is NewFolder, a member of class IShellFavoritesNameSpaceDisp.

	ResetSort (see page 19358)	This is ResetSort, a member of class IShellFavoritesNameSpaceDisp.
	SetRoot (see page 19358)	This is SetRoot, a member of class IShellFavoritesNameSpaceDisp.
	Synchronize (see page 19359)	This is Synchronize, a member of class IShellFavoritesNameSpaceDisp.

Public Properties

	Name	Description
	SubscriptionsEnabled (see page 19359)	This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.2 IShellFavoritesNameSpaceDisp Methods

The methods of the IShellFavoritesNameSpaceDisp class are listed here.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 19356)	This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpaceDisp.
	DeleteSubscriptionForSelection (see page 19356)	This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpaceDisp.
	Export (see page 19357)	This is Export, a member of class IShellFavoritesNameSpaceDisp.
	Import (see page 19357)	This is Import, a member of class IShellFavoritesNameSpaceDisp.
	InvokeContextMenuCommand (see page 19357)	This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpaceDisp.
	MoveSelectionDown (see page 19357)	This is MoveSelectionDown, a member of class IShellFavoritesNameSpaceDisp.
	MoveSelectionTo (see page 19358)	This is MoveSelectionTo, a member of class IShellFavoritesNameSpaceDisp.
	MoveSelectionUp (see page 19358)	This is MoveSelectionUp, a member of class IShellFavoritesNameSpaceDisp.
	NewFolder (see page 19358)	This is NewFolder, a member of class IShellFavoritesNameSpaceDisp.
	ResetSort (see page 19358)	This is ResetSort, a member of class IShellFavoritesNameSpaceDisp.
	SetRoot (see page 19358)	This is SetRoot, a member of class IShellFavoritesNameSpaceDisp.
	Synchronize (see page 19359)	This is Synchronize, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.2.1 IShellFavoritesNameSpaceDisp.CreateSubscriptionForSelection Method

Pascal

```
function CreateSubscriptionForSelection: WordBool;
```

C++

```
__fastcall WordBool CreateSubscriptionForSelection();
```

Description

This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.2.2 IShellFavoritesNameSpaceDisp.DeleteSubscriptionForSelection Method

Pascal

```
function DeleteSubscriptionForSelection: WordBool;
```

C++

```
__fastcall WordBool DeleteSubscriptionForSelection();
```

Description

This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.2.3 IShellFavoritesNameSpaceDisp.Export Method

Pascal

```
procedure Export;
```

C++

```
__fastcall Export();
```

Description

This is Export, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.2.4 IShellFavoritesNameSpaceDisp.Import Method

Pascal

```
procedure Import;
```

C++

```
__fastcall Import();
```

Description

This is Import, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.2.5 IShellFavoritesNameSpaceDisp.InvokeContextMenuCommand Method

Pascal

```
procedure InvokeContextMenuCommand(const strCommand: WideString);
```

C++

```
__fastcall InvokeContextMenuCommand(const BSTR strCommand);
```

Description

This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.2.6 IShellFavoritesNameSpaceDisp.MoveSelectionDown Method

Pascal

```
procedure MoveSelectionDown;
```

C++

```
__fastcall MoveSelectionDown();
```

Description

This is MoveSelectionDown, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.2.7 IShellFavoritesNameSpaceDisp.MoveSelectionTo Method

Pascal

```
procedure MoveSelectionTo;
```

C++

```
__fastcall MoveSelectionTo();
```

Description

This is MoveSelectionTo, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.2.8 IShellFavoritesNameSpaceDisp.MoveSelectionUp Method

Pascal

```
procedure MoveSelectionUp;
```

C++

```
__fastcall MoveSelectionUp();
```

Description

This is MoveSelectionUp, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.2.9 IShellFavoritesNameSpaceDisp.NewFolder Method

Pascal

```
procedure NewFolder;
```

C++

```
__fastcall NewFolder();
```

Description

This is NewFolder, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.2.10 IShellFavoritesNameSpaceDisp.ResetSort Method

Pascal

```
procedure ResetSort;
```

C++

```
__fastcall ResetSort();
```

Description

This is ResetSort, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.2.11 IShellFavoritesNameSpaceDisp.SetRoot Method

Pascal

```
procedure SetRoot(const bstrFullPath: WideString);
```

C++

```
__fastcall SetRoot(const BSTR bstrFullPath);
```

Description

This is SetRoot, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.2.12 IShellFavoritesNameSpaceDisp.Synchronize Method

Pascal

```
procedure Synchronize;
```

C++

```
__fastcall Synchronize();
```

Description

This is Synchronize, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.3 IShellFavoritesNameSpaceDisp Properties

The properties of the IShellFavoritesNameSpaceDisp class are listed here.

Public Properties

	Name	Description
	SubscriptionsEnabled (see page 19359)	This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpaceDisp.

132.2.19.3.1 IShellFavoritesNameSpaceDisp.SubscriptionsEnabled Property

Pascal

```
property SubscriptionsEnabled: WordBool;
```

C++

```
__property WordBool SubscriptionsEnabled;
```

Description

This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpaceDisp.

132.2.20 IShellNameSpace Interface

Class Hierarchy

Pascal

```
IShellNameSpace = interface(IShellFavoritesNameSpace);
```

C++

```
__interface IShellNameSpace : public IShellFavoritesNameSpace;
```

File

SHDocVw

Description

This is class SHDocVw.IShellNameSpace.

132.2.20.1 IShellNameSpace Members

The following tables list the members exposed by IShellNameSpace.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 19352)	This is CreateSubscriptionForSelection, a member of class IShellFavoritesNameSpace.
	DeleteSubscriptionForSelection (see page 19352)	This is DeleteSubscriptionForSelection, a member of class IShellFavoritesNameSpace.
	Expand (see page 19361)	This is Expand, a member of class IShellNameSpace.
	Export (see page 19352)	This is Export, a member of class IShellFavoritesNameSpace.
	Get_Columns (see page 19362)	This is Get_Columns, a member of class IShellNameSpace.
	Get_CountViewTypes (see page 19362)	This is Get_CountViewTypes, a member of class IShellNameSpace.
	Get_Depth (see page 19362)	This is Get_Depth, a member of class IShellNameSpace.
	Get_EnumOptions (see page 19362)	This is Get_EnumOptions, a member of class IShellNameSpace.
	Get_Flags (see page 19362)	This is Get_Flags, a member of class IShellNameSpace.
	Get_Mode (see page 19363)	This is Get_Mode, a member of class IShellNameSpace.
	Get_Root (see page 19363)	This is Get_Root, a member of class IShellNameSpace.
	Get_SelectedItem (see page 19363)	This is Get_SelectedItem, a member of class IShellNameSpace.
	Get_SubscriptionsEnabled (see page 19352)	This is Get_SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.
	Get_TVFlags (see page 19363)	This is Get_TVFlags, a member of class IShellNameSpace.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Import (see page 19353)	This is Import, a member of class IShellFavoritesNameSpace.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	InvokeContextMenuCommand (see page 19353)	This is InvokeContextMenuCommand, a member of class IShellFavoritesNameSpace.
	MoveSelectionDown (see page 19353)	This is MoveSelectionDown, a member of class IShellFavoritesNameSpace.
	MoveSelectionTo (see page 19353)	This is MoveSelectionTo, a member of class IShellFavoritesNameSpace.
	MoveSelectionUp (see page 19353)	This is MoveSelectionUp, a member of class IShellFavoritesNameSpace.
	NewFolder (see page 19354)	This is NewFolder, a member of class IShellFavoritesNameSpace.
	ResetSort (see page 19354)	This is ResetSort, a member of class IShellFavoritesNameSpace.
	SelectedItems (see page 19364)	This is SelectedItems, a member of class IShellNameSpace.
	Set_Columns (see page 19364)	This is Set_Columns, a member of class IShellNameSpace.
	Set_Depth (see page 19364)	This is Set_Depth, a member of class IShellNameSpace.
	Set_EnumOptions (see page 19364)	This is Set_EnumOptions, a member of class IShellNameSpace.
	Set_Flags (see page 19364)	This is Set_Flags, a member of class IShellNameSpace.
	Set_Mode (see page 19365)	This is Set_Mode, a member of class IShellNameSpace.
	Set_Root (see page 19365)	This is Set_Root, a member of class IShellNameSpace.
	Set_SelectedItem (see page 19365)	This is Set_SelectedItem, a member of class IShellNameSpace.
	Set_TVFlags (see page 19365)	This is Set_TVFlags, a member of class IShellNameSpace.
	SetRoot (see page 19354)	This is SetRoot, a member of class IShellFavoritesNameSpace.
	SetViewType (see page 19366)	This is SetViewType, a member of class IShellNameSpace.
	Synchronize (see page 19354)	This is Synchronize, a member of class IShellFavoritesNameSpace.
	UnselectAll (see page 19366)	This is UnselectAll, a member of class IShellNameSpace.

Public Properties

	Name	Description
	Columns (see page 19366)	This is Columns, a member of class IShellNameSpace.
R	CountViewTypes (see page 19367)	This is CountViewTypes, a member of class IShellNameSpace.
	Depth (see page 19367)	This is Depth, a member of class IShellNameSpace.
	EnumOptions (see page 19367)	This is EnumOptions, a member of class IShellNameSpace.
	Flags (see page 19367)	This is Flags, a member of class IShellNameSpace.
	Mode (see page 19367)	This is Mode, a member of class IShellNameSpace.
	Root (see page 19368)	This is Root, a member of class IShellNameSpace.
	SelectedItem (see page 19368)	This is SelectedItem, a member of class IShellNameSpace.
R	SubscriptionsEnabled (see page 19355)	This is SubscriptionsEnabled, a member of class IShellFavoritesNameSpace.
	TVFlags (see page 19368)	This is TVFlags, a member of class IShellNameSpace.

132.2.20.2 IShellNameSpace Methods

The methods of the IShellNameSpace class are listed here.

Public Methods

	Name	Description
	Expand (see page 19361)	This is Expand, a member of class IShellNameSpace.
	Get_Columns (see page 19362)	This is Get_Columns, a member of class IShellNameSpace.
	Get_CountViewTypes (see page 19362)	This is Get_CountViewTypes, a member of class IShellNameSpace.
	Get_Depth (see page 19362)	This is Get_Depth, a member of class IShellNameSpace.
	Get_EnumOptions (see page 19362)	This is Get_EnumOptions, a member of class IShellNameSpace.
	Get_Flags (see page 19362)	This is Get_Flags, a member of class IShellNameSpace.
	Get_Mode (see page 19363)	This is Get_Mode, a member of class IShellNameSpace.
	Get_Root (see page 19363)	This is Get_Root, a member of class IShellNameSpace.
	Get_SelectedItem (see page 19363)	This is Get_SelectedItem, a member of class IShellNameSpace.
	Get_TVFlags (see page 19363)	This is Get_TVFlags, a member of class IShellNameSpace.
	SelectedItems (see page 19364)	This is SelectedItems, a member of class IShellNameSpace.
	Set_Columns (see page 19364)	This is Set_Columns, a member of class IShellNameSpace.
	Set_Depth (see page 19364)	This is Set_Depth, a member of class IShellNameSpace.
	Set_EnumOptions (see page 19364)	This is Set_EnumOptions, a member of class IShellNameSpace.
	Set_Flags (see page 19364)	This is Set_Flags, a member of class IShellNameSpace.
	Set_Mode (see page 19365)	This is Set_Mode, a member of class IShellNameSpace.
	Set_Root (see page 19365)	This is Set_Root, a member of class IShellNameSpace.
	Set_SelectedItem (see page 19365)	This is Set_SelectedItem, a member of class IShellNameSpace.
	Set_TVFlags (see page 19365)	This is Set_TVFlags, a member of class IShellNameSpace.
	SetViewType (see page 19366)	This is SetViewType, a member of class IShellNameSpace.
	UnselectAll (see page 19366)	This is UnselectAll, a member of class IShellNameSpace.

132.2.20.2.1 IShellNameSpace.Expand Method

Pascal

```
procedure Expand(var_: OleVariant; iDepth: SYSINT); safecall;
```

C++

```
__fastcall Expand(OleVariant var_, SYSINT iDepth);
```

Description

This is Expand, a member of class IShellNameSpace.

132.2.20.2.2 IShellNameSpace.Get_Columns Method

Pascal

```
function Get_Columns: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Columns();
```

Description

This is Get_Columns, a member of class IShellNameSpace.

132.2.20.2.3 IShellNameSpace.Get_CountViewTypes Method

Pascal

```
function Get_CountViewTypes: SYSINT; safecall;
```

C++

```
__fastcall SYSINT Get_CountViewTypes();
```

Description

This is Get_CountViewTypes, a member of class IShellNameSpace.

132.2.20.2.4 IShellNameSpace.Get_Depth Method

Pascal

```
function Get_Depth: SYSINT; safecall;
```

C++

```
__fastcall SYSINT Get_Depth();
```

Description

This is Get_Depth, a member of class IShellNameSpace.

132.2.20.2.5 IShellNameSpace.Get_EnumOptions Method

Pascal

```
function Get_EnumOptions: Integer; safecall;
```

C++

```
__fastcall int Get_EnumOptions();
```

Description

This is Get_EnumOptions, a member of class IShellNameSpace.

132.2.20.2.6 IShellNameSpace.Get_Flags Method

Pascal

```
function Get_Flags: LongWord; safecall;
```

C++

```
__fastcall LongWord Get_Flags();
```

Description

This is Get_Flags, a member of class IShellNameSpace.

132.2.20.2.7 IShellNameSpace.Get_Mode Method

Pascal

```
function Get_Mode: SYSUINT; safecall;
```

C++

```
__fastcall SYSUINT Get_Mode();
```

Description

This is Get_Mode, a member of class IShellNameSpace.

132.2.20.2.8 IShellNameSpace.Get_Root Method

Pascal

```
function Get_Root: OleVariant; safecall;
```

C++

```
__fastcall OleVariant Get_Root();
```

Description

This is Get_Root, a member of class IShellNameSpace.

132.2.20.2.9 IShellNameSpace.Get_SelectedItem Method

Pascal

```
function Get_SelectedItem: IDispatch; safecall;
```

C++

```
__fastcall IDispatch Get_SelectedItem();
```

Description

This is Get_SelectedItem, a member of class IShellNameSpace.

132.2.20.2.10 IShellNameSpace.Get_TVFlags Method

Pascal

```
function Get_TVFlags: LongWord; safecall;
```

C++

```
__fastcall LongWord Get_TVFlags();
```

Description

This is Get_TVFlags, a member of class IShellNameSpace.

132.2.20.2.11 IShellNameSpace.SelectedItems Method

Pascal

```
function SelectedItems: IDispatch; safecall;
```

C++

```
__fastcall IDispatch SelectedItems();
```

Description

This is SelectedItems, a member of class IShellNameSpace.

132.2.20.2.12 IShellNameSpace.Set_Columns Method

Pascal

```
procedure Set_Columns(const bstrColumns: WideString); safecall;
```

C++

```
__fastcall Set_Columns(const BSTR bstrColumns);
```

Description

This is Set_Columns, a member of class IShellNameSpace.

132.2.20.2.13 IShellNameSpace.Set_Depth Method

Pascal

```
procedure Set_Depth(piDepth: SYSINT); safecall;
```

C++

```
__fastcall Set_Depth(SYSINT piDepth);
```

Description

This is Set_Depth, a member of class IShellNameSpace.

132.2.20.2.14 IShellNameSpace.Set_EnumOptions Method

Pascal

```
procedure Set_EnumOptions(pgrfEnumFlags: Integer); safecall;
```

C++

```
__fastcall Set_EnumOptions(int pgrfEnumFlags);
```

Description

This is Set_EnumOptions, a member of class IShellNameSpace.

132.2.20.2.15 IShellNameSpace.Set_Flags Method

Pascal

```
procedure Set_Flags(pdwFlags: LongWord); safecall;
```

C++

```
__fastcall Set_Flags(LongWord pdwFlags);
```

Description

This is Set_Flags, a member of class IShellNameSpace.

132.2.20.2.16 IShellNameSpace.Set_Mode Method

Pascal

```
procedure Set_Mode(puMode: SYSUINT); safecall;
```

C++

```
__fastcall Set_Mode(SYSUINT puMode);
```

Description

This is Set_Mode, a member of class IShellNameSpace.

132.2.20.2.17 IShellNameSpace.Set_Root Method

Pascal

```
procedure Set_Root(pvar: OleVariant); safecall;
```

C++

```
__fastcall Set_Root(OleVariant pvar);
```

Description

This is Set_Root, a member of class IShellNameSpace.

132.2.20.2.18 IShellNameSpace.Set_SelectedItem Method

Pascal

```
procedure Set_SelectedItem(const pItem: IDispatch); safecall;
```

C++

```
__fastcall Set_SelectedItem(const IDispatch pItem);
```

Description

This is Set_SelectedItem, a member of class IShellNameSpace.

132.2.20.2.19 IShellNameSpace.Set_TVFlags Method

Pascal

```
procedure Set_TVFlags(dwFlags: LongWord); safecall;
```

C++

```
__fastcall Set_TVFlags(LongWord dwFlags);
```

Description

This is Set_TVFlags, a member of class IShellNameSpace.

132.2.20.2.20 IShellNameSpace.SetViewType Method

Pascal

```
procedure SetViewType(iType: SYSINT); safecall;
```

C++

```
__fastcall SetViewType(SYSINT iType);
```

Description

This is SetViewType, a member of class IShellNameSpace.

132.2.20.2.21 IShellNameSpace.UnselectAll Method

Pascal

```
procedure UnselectAll; safecall;
```

C++

```
__fastcall UnselectAll();
```

Description

This is UnselectAll, a member of class IShellNameSpace.

132.2.20.3 IShellNameSpace Properties

The properties of the IShellNameSpace class are listed here.

Public Properties

	Name	Description
	Columns (see page 19366)	This is Columns, a member of class IShellNameSpace.
R	CountViewTypes (see page 19367)	This is CountViewTypes, a member of class IShellNameSpace.
	Depth (see page 19367)	This is Depth, a member of class IShellNameSpace.
	EnumOptions (see page 19367)	This is EnumOptions, a member of class IShellNameSpace.
	Flags (see page 19367)	This is Flags, a member of class IShellNameSpace.
	Mode (see page 19367)	This is Mode, a member of class IShellNameSpace.
	Root (see page 19368)	This is Root, a member of class IShellNameSpace.
	SelectedItem (see page 19368)	This is SelectedItem, a member of class IShellNameSpace.
	TVFlags (see page 19368)	This is TVFlags, a member of class IShellNameSpace.

132.2.20.3.1 IShellNameSpace.Columns Property

Pascal

```
property Columns: WideString;
```

C++

```
__property BSTR Columns;
```

Description

This is Columns, a member of class IShellNameSpace.

132.2.20.3.2 IShellNameSpace.CountViewTypes Property

Pascal

```
property CountViewTypes: SYSINT;
```

C++

```
__property SYSINT CountViewTypes;
```

Description

This is CountViewTypes, a member of class IShellNameSpace.

132.2.20.3.3 IShellNameSpace.Depth Property

Pascal

```
property Depth: SYSINT;
```

C++

```
__property SYSINT Depth;
```

Description

This is Depth, a member of class IShellNameSpace.

132.2.20.3.4 IShellNameSpace.EnumOptions Property

Pascal

```
property EnumOptions: Integer;
```

C++

```
__property int EnumOptions;
```

Description

This is EnumOptions, a member of class IShellNameSpace.

132.2.20.3.5 IShellNameSpace.Flags Property

Pascal

```
property Flags: LongWord;
```

C++

```
__property LongWord Flags;
```

Description

This is Flags, a member of class IShellNameSpace.

132.2.20.3.6 IShellNameSpace.Mode Property

Pascal

```
property Mode: SYSUINT;
```

C++

```
__property SYSUINT Mode;
```

Description

This is Mode, a member of class IShellNameSpace.

132.2.20.3.7 IShellNameSpace.Root Property

Pascal

```
property Root: OleVariant;
```

C++

```
__property OleVariant Root;
```

Description

This is Root, a member of class IShellNameSpace.

132.2.20.3.8 IShellNameSpace.SelectedItem Property

Pascal

```
property SelectedItem: IDispatch;
```

C++

```
__property IDispatch SelectedItem;
```

Description

This is SelectedItem, a member of class IShellNameSpace.

132.2.20.3.9 IShellNameSpace.TVFlags Property

Pascal

```
property TVFlags: LongWord;
```

C++

```
__property LongWord TVFlags;
```

Description

This is TVFlags, a member of class IShellNameSpace.

132.2.21 IShellNameSpaceDisp Interface

Class Hierarchy

Pascal

```
IShellNameSpaceDisp = dispinterface;
```

C++

```
class IShellNameSpaceDisp;
```

File

SHDocVw

Description

This is class SHDocVw.IShellNameSpaceDisp.

132.2.21.1 IShellNameSpaceDisp Members

The following tables list the members exposed by IShellNameSpaceDisp.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 19370)	This is CreateSubscriptionForSelection, a member of class IShellNameSpaceDisp.
	DeleteSubscriptionForSelection (see page 19370)	This is DeleteSubscriptionForSelection, a member of class IShellNameSpaceDisp.
	Expand (see page 19370)	This is Expand, a member of class IShellNameSpaceDisp.
	Export (see page 19370)	This is Export, a member of class IShellNameSpaceDisp.
	Import (see page 19371)	This is Import, a member of class IShellNameSpaceDisp.
	InvokeContextMenuCommand (see page 19371)	This is InvokeContextMenuCommand, a member of class IShellNameSpaceDisp.
	MoveSelectionDown (see page 19371)	This is MoveSelectionDown, a member of class IShellNameSpaceDisp.
	MoveSelectionTo (see page 19371)	This is MoveSelectionTo, a member of class IShellNameSpaceDisp.
	MoveSelectionUp (see page 19372)	This is MoveSelectionUp, a member of class IShellNameSpaceDisp.
	NewFolder (see page 19372)	This is NewFolder, a member of class IShellNameSpaceDisp.
	ResetSort (see page 19372)	This is ResetSort, a member of class IShellNameSpaceDisp.
	SelectedItems (see page 19372)	This is SelectedItems, a member of class IShellNameSpaceDisp.
	SetRoot (see page 19372)	This is SetRoot, a member of class IShellNameSpaceDisp.
	SetViewType (see page 19373)	This is SetViewType, a member of class IShellNameSpaceDisp.
	Synchronize (see page 19373)	This is Synchronize, a member of class IShellNameSpaceDisp.
	UnselectAll (see page 19373)	This is UnselectAll, a member of class IShellNameSpaceDisp.

Public Properties

	Name	Description
	Columns (see page 19374)	This is Columns, a member of class IShellNameSpaceDisp.
	CountViewTypes (see page 19374)	This is CountViewTypes, a member of class IShellNameSpaceDisp.
	Depth (see page 19374)	This is Depth, a member of class IShellNameSpaceDisp.
	EnumOptions (see page 19374)	This is EnumOptions, a member of class IShellNameSpaceDisp.
	Flags (see page 19374)	This is Flags, a member of class IShellNameSpaceDisp.
	Mode (see page 19375)	This is Mode, a member of class IShellNameSpaceDisp.
	Root (see page 19375)	This is Root, a member of class IShellNameSpaceDisp.
	SelectedItem (see page 19375)	This is SelectedItem, a member of class IShellNameSpaceDisp.
	SubscriptionsEnabled (see page 19375)	This is SubscriptionsEnabled, a member of class IShellNameSpaceDisp.
	TVFlags (see page 19376)	This is TVFlags, a member of class IShellNameSpaceDisp.

132.2.21.2 IShellNameSpaceDisp Methods

The methods of the IShellNameSpaceDisp class are listed here.

Public Methods

	Name	Description
	CreateSubscriptionForSelection (see page 19370)	This is CreateSubscriptionForSelection, a member of class IShellNameSpaceDisp.
	DeleteSubscriptionForSelection (see page 19370)	This is DeleteSubscriptionForSelection, a member of class IShellNameSpaceDisp.
	Expand (see page 19370)	This is Expand, a member of class IShellNameSpaceDisp.

	Export (see page 19370)	This is Export, a member of class IShellNameSpaceDisp.
	Import (see page 19371)	This is Import, a member of class IShellNameSpaceDisp.
	InvokeContextMenuCommand (see page 19371)	This is InvokeContextMenuCommand, a member of class IShellNameSpaceDisp.
	MoveSelectionDown (see page 19371)	This is MoveSelectionDown, a member of class IShellNameSpaceDisp.
	MoveSelectionTo (see page 19371)	This is MoveSelectionTo, a member of class IShellNameSpaceDisp.
	MoveSelectionUp (see page 19372)	This is MoveSelectionUp, a member of class IShellNameSpaceDisp.
	NewFolder (see page 19372)	This is NewFolder, a member of class IShellNameSpaceDisp.
	ResetSort (see page 19372)	This is ResetSort, a member of class IShellNameSpaceDisp.
	SelectedItems (see page 19372)	This is SelectedItems, a member of class IShellNameSpaceDisp.
	SetRoot (see page 19372)	This is SetRoot, a member of class IShellNameSpaceDisp.
	SetViewType (see page 19373)	This is SetViewType, a member of class IShellNameSpaceDisp.
	Synchronize (see page 19373)	This is Synchronize, a member of class IShellNameSpaceDisp.
	UnselectAll (see page 19373)	This is UnselectAll, a member of class IShellNameSpaceDisp.

132.2.21.2.1 IShellNameSpaceDisp.CreateSubscriptionForSelection Method

Pascal

```
function CreateSubscriptionForSelection: WordBool;
```

C++

```
__fastcall WordBool CreateSubscriptionForSelection();
```

Description

This is CreateSubscriptionForSelection, a member of class IShellNameSpaceDisp.

132.2.21.2.2 IShellNameSpaceDisp.DeleteSubscriptionForSelection Method

Pascal

```
function DeleteSubscriptionForSelection: WordBool;
```

C++

```
__fastcall WordBool DeleteSubscriptionForSelection();
```

Description

This is DeleteSubscriptionForSelection, a member of class IShellNameSpaceDisp.

132.2.21.2.3 IShellNameSpaceDisp.Expand Method

Pascal

```
procedure Expand(var_: OleVariant; iDepth: SYSINT);
```

C++

```
__fastcall Expand(OleVariant var_, SYSINT iDepth);
```

Description

This is Expand, a member of class IShellNameSpaceDisp.

132.2.21.2.4 IShellNameSpaceDisp.Export Method

Pascal

```
procedure Export;
```

C++

```
__fastcall Export();
```

Description

This is Export, a member of class IShellNameSpaceDisp.

132.2.21.2.5 IShellNameSpaceDisp.Import Method

Pascal

```
procedure Import;
```

C++

```
__fastcall Import();
```

Description

This is Import, a member of class IShellNameSpaceDisp.

132.2.21.2.6 IShellNameSpaceDisp.InvokeContextMenuCommand Method

Pascal

```
procedure InvokeContextMenuCommand(const strCommand: WideString);
```

C++

```
__fastcall InvokeContextMenuCommand(const BSTR strCommand);
```

Description

This is InvokeContextMenuCommand, a member of class IShellNameSpaceDisp.

132.2.21.2.7 IShellNameSpaceDisp.MoveSelectionDown Method

Pascal

```
procedure MoveSelectionDown;
```

C++

```
__fastcall MoveSelectionDown();
```

Description

This is MoveSelectionDown, a member of class IShellNameSpaceDisp.

132.2.21.2.8 IShellNameSpaceDisp.MoveSelectionTo Method

Pascal

```
procedure MoveSelectionTo;
```

C++

```
__fastcall MoveSelectionTo();
```

Description

This is MoveSelectionTo, a member of class IShellNameSpaceDisp.

132.2.21.2.9 IShellNameSpaceDisp.MoveSelectionUp Method

Pascal

```
procedure MoveSelectionUp;
```

C++

```
__fastcall MoveSelectionUp();
```

Description

This is MoveSelectionUp, a member of class IShellNameSpaceDisp.

132.2.21.2.10 IShellNameSpaceDisp.NewFolder Method

Pascal

```
procedure NewFolder;
```

C++

```
__fastcall NewFolder();
```

Description

This is NewFolder, a member of class IShellNameSpaceDisp.

132.2.21.2.11 IShellNameSpaceDisp.ResetSort Method

Pascal

```
procedure ResetSort;
```

C++

```
__fastcall ResetSort();
```

Description

This is ResetSort, a member of class IShellNameSpaceDisp.

132.2.21.2.12 IShellNameSpaceDisp.SelectedItems Method

Pascal

```
function SelectedItems: IDispatch;
```

C++

```
__fastcall IDispatch SelectedItems();
```

Description

This is SelectedItems, a member of class IShellNameSpaceDisp.

132.2.21.2.13 IShellNameSpaceDisp.SetRoot Method

Pascal

```
procedure SetRoot(const bstrFullPath: WideString);
```

C++

```
__fastcall SetRoot(const BSTR bstrFullPath);
```

Description

This is SetRoot, a member of class IShellNameSpaceDisp.

132.2.21.2.14 IShellNameSpaceDisp.SetViewType Method

Pascal

```
procedure SetViewType(iType: SYSINT);
```

C++

```
__fastcall SetViewType(SYSINT iType);
```

Description

This is SetViewType, a member of class IShellNameSpaceDisp.

132.2.21.2.15 IShellNameSpaceDisp.Synchronize Method

Pascal

```
procedure Synchronize;
```

C++

```
__fastcall Synchronize();
```

Description

This is Synchronize, a member of class IShellNameSpaceDisp.

132.2.21.2.16 IShellNameSpaceDisp.UnselectAll Method

Pascal

```
procedure UnselectAll;
```

C++

```
__fastcall UnselectAll();
```

Description

This is UnselectAll, a member of class IShellNameSpaceDisp.

132.2.21.3 IShellNameSpaceDisp Properties

The properties of the IShellNameSpaceDisp class are listed here.

Public Properties

	Name	Description
	Columns (see page 19374)	This is Columns, a member of class IShellNameSpaceDisp.
	CountViewTypes (see page 19374)	This is CountViewTypes, a member of class IShellNameSpaceDisp.
	Depth (see page 19374)	This is Depth, a member of class IShellNameSpaceDisp.
	EnumOptions (see page 19374)	This is EnumOptions, a member of class IShellNameSpaceDisp.
	Flags (see page 19374)	This is Flags, a member of class IShellNameSpaceDisp.
	Mode (see page 19375)	This is Mode, a member of class IShellNameSpaceDisp.
	Root (see page 19375)	This is Root, a member of class IShellNameSpaceDisp.
	SelectedItem (see page 19375)	This is SelectedItem, a member of class IShellNameSpaceDisp.

	SubscriptionsEnabled (see page 19375)	This is SubscriptionsEnabled, a member of class IShellNameSpaceDisp.
	TVFlags (see page 19376)	This is TVFlags, a member of class IShellNameSpaceDisp.

132.2.21.3.1 IShellNameSpaceDisp.Columns Property

Pascal

```
property Columns: WideString;
```

C++

```
__property BSTR Columns;
```

Description

This is Columns, a member of class IShellNameSpaceDisp.

132.2.21.3.2 IShellNameSpaceDisp.CountViewTypes Property

Pascal

```
property CountViewTypes: SYSINT;
```

C++

```
__property SYSINT CountViewTypes;
```

Description

This is CountViewTypes, a member of class IShellNameSpaceDisp.

132.2.21.3.3 IShellNameSpaceDisp.Depth Property

Pascal

```
property Depth: SYSINT;
```

C++

```
__property SYSINT Depth;
```

Description

This is Depth, a member of class IShellNameSpaceDisp.

132.2.21.3.4 IShellNameSpaceDisp.EnumOptions Property

Pascal

```
property EnumOptions: Integer;
```

C++

```
__property int EnumOptions;
```

Description

This is EnumOptions, a member of class IShellNameSpaceDisp.

132.2.21.3.5 IShellNameSpaceDisp.Flags Property

Pascal

```
property Flags: LongWord;
```

C++

```
__property LongWord Flags;
```

Description

This is Flags, a member of class IShellNameSpaceDisp.

132.2.21.3.6 IShellNameSpaceDisp.Mode Property

Pascal

```
property Mode: SYSUINT;
```

C++

```
__property SYSUINT Mode;
```

Description

This is Mode, a member of class IShellNameSpaceDisp.

132.2.21.3.7 IShellNameSpaceDisp.Root Property

Pascal

```
property Root: OleVariant;
```

C++

```
__property OleVariant Root;
```

Description

This is Root, a member of class IShellNameSpaceDisp.

132.2.21.3.8 IShellNameSpaceDisp.SelectedItem Property

Pascal

```
property SelectedItem: IDispatch;
```

C++

```
__property IDispatch SelectedItem;
```

Description

This is SelectedItem, a member of class IShellNameSpaceDisp.

132.2.21.3.9 IShellNameSpaceDisp.SubscriptionsEnabled Property

Pascal

```
property SubscriptionsEnabled: WordBool;
```

C++

```
__property WordBool SubscriptionsEnabled;
```

Description

This is SubscriptionsEnabled, a member of class IShellNameSpaceDisp.

132.2.21.3.10 IShellNameSpaceDisp.TVFlags Property

Pascal

```
property TVFlags: LongWord;
```

C++

```
__property LongWord TVFlags;
```

Description

This is TVFlags, a member of class IShellNameSpaceDisp.

132.2.22 IShellUIHelper Interface

Class Hierarchy

Pascal

```
IShellUIHelper = interface(IDispatch);
```

C++

```
__interface IShellUIHelper : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.IShellUIHelper.

132.2.22.1 IShellUIHelper Members

The following tables list the members exposed by IShellUIHelper.

Public Methods

	Name	Description
	AddChannel (see page 19377)	This is AddChannel, a member of class IShellUIHelper.
	AddDesktopComponent (see page 19377)	This is AddDesktopComponent, a member of class IShellUIHelper.
	AddFavorite (see page 19377)	This is AddFavorite, a member of class IShellUIHelper.
	AutoCompleteAttach (see page 19378)	This is AutoCompleteAttach, a member of class IShellUIHelper.
	AutoCompleteSaveForm (see page 19378)	This is AutoCompleteSaveForm, a member of class IShellUIHelper.
	AutoScan (see page 19378)	This is AutoScan, a member of class IShellUIHelper.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	ImportExportFavorites (see page 19378)	This is ImportExportFavorites, a member of class IShellUIHelper.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	IsSubscribed (see page 19379)	This is IsSubscribed, a member of class IShellUIHelper.
	NavigateAndFind (see page 19379)	This is NavigateAndFind, a member of class IShellUIHelper.
	RefreshOfflineDesktop (see page 19379)	This is RefreshOfflineDesktop, a member of class IShellUIHelper.
	ResetFirstBootMode (see page 19379)	This is ResetFirstBootMode, a member of class IShellUIHelper.

	ResetSafeMode (see page 19379)	This is ResetSafeMode, a member of class IShellUIHelper.
	ShowBrowserUI (see page 19380)	This is ShowBrowserUI, a member of class IShellUIHelper.

132.2.22.2 IShellUIHelper Methods

The methods of the IShellUIHelper class are listed here.

Public Methods

	Name	Description
	AddChannel (see page 19377)	This is AddChannel, a member of class IShellUIHelper.
	AddDesktopComponent (see page 19377)	This is AddDesktopComponent, a member of class IShellUIHelper.
	AddFavorite (see page 19377)	This is AddFavorite, a member of class IShellUIHelper.
	AutoCompleteAttach (see page 19378)	This is AutoCompleteAttach, a member of class IShellUIHelper.
	AutoCompleteSaveForm (see page 19378)	This is AutoCompleteSaveForm, a member of class IShellUIHelper.
	AutoScan (see page 19378)	This is AutoScan, a member of class IShellUIHelper.
	ImportExportFavorites (see page 19378)	This is ImportExportFavorites, a member of class IShellUIHelper.
	IsSubscribed (see page 19379)	This is IsSubscribed, a member of class IShellUIHelper.
	NavigateAndFind (see page 19379)	This is NavigateAndFind, a member of class IShellUIHelper.
	RefreshOfflineDesktop (see page 19379)	This is RefreshOfflineDesktop, a member of class IShellUIHelper.
	ResetFirstBootMode (see page 19379)	This is ResetFirstBootMode, a member of class IShellUIHelper.
	ResetSafeMode (see page 19379)	This is ResetSafeMode, a member of class IShellUIHelper.
	ShowBrowserUI (see page 19380)	This is ShowBrowserUI, a member of class IShellUIHelper.

132.2.22.2.1 IShellUIHelper.AddChannel Method

Pascal

```
procedure AddChannel(const URL: WideString); safecall;
```

C++

```
__fastcall AddChannel(const BSTR URL);
```

Description

This is AddChannel, a member of class IShellUIHelper.

132.2.22.2.2 IShellUIHelper.AddDesktopComponent Method

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString; var Left:
OleVariant; var Top: OleVariant; var Width: OleVariant; var Height: OleVariant); safecall;
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_, OleVariant Left, OleVariant
Top, OleVariant Width, OleVariant Height);
```

Description

This is AddDesktopComponent, a member of class IShellUIHelper.

132.2.22.2.3 IShellUIHelper.AddFavorite Method

Pascal

```
procedure AddFavorite(const URL: WideString; var Title: OleVariant); safecall;
```

C++

```
__fastcall AddFavorite(const BSTR URL, OleVariant Title);
```

Description

This is AddFavorite, a member of class IShellUIHelper.

132.2.22.2.4 IShellUIHelper.AutoCompleteAttach Method

Pascal

```
procedure AutoCompleteAttach(var Reserved: OleVariant); safecall;
```

C++

```
__fastcall AutoCompleteAttach(OleVariant Reserved);
```

Description

This is AutoCompleteAttach, a member of class IShellUIHelper.

132.2.22.2.5 IShellUIHelper.AutoCompleteSaveForm Method

Pascal

```
procedure AutoCompleteSaveForm(var Form: OleVariant); safecall;
```

C++

```
__fastcall AutoCompleteSaveForm(OleVariant Form);
```

Description

This is AutoCompleteSaveForm, a member of class IShellUIHelper.

132.2.22.2.6 IShellUIHelper.AutoScan Method

Pascal

```
procedure AutoScan(const strSearch: WideString; const strFailureUrl: WideString; var
pvarTargetFrame: OleVariant); safecall;
```

C++

```
__fastcall AutoScan(const BSTR strSearch, const BSTR strFailureUrl, OleVariant
pvarTargetFrame);
```

Description

This is AutoScan, a member of class IShellUIHelper.

132.2.22.2.7 IShellUIHelper.ImportExportFavorites Method

Pascal

```
procedure ImportExportFavorites(fImport: WordBool; const strImpExpPath: WideString); safecall;
```

C++

```
__fastcall ImportExportFavorites(WordBool fImport, const BSTR strImpExpPath);
```

Description

This is ImportExportFavorites, a member of class IShellUIHelper.

132.2.22.2.8 IShellUIHelper.IsSubscribed Method

Pascal

```
function IsSubscribed(const URL: WideString): WordBool; safecall;
```

C++

```
__fastcall WordBool IsSubscribed(const BSTR URL);
```

Description

This is IsSubscribed, a member of class IShellUIHelper.

132.2.22.2.9 IShellUIHelper.NavigateAndFind Method

Pascal

```
procedure NavigateAndFind(const URL: WideString; const strQuery: WideString; var
varTargetFrame: OleVariant); safecall;
```

C++

```
__fastcall NavigateAndFind(const BSTR URL, const BSTR strQuery, OleVariant varTargetFrame);
```

Description

This is NavigateAndFind, a member of class IShellUIHelper.

132.2.22.2.10 IShellUIHelper.RefreshOfflineDesktop Method

Pascal

```
procedure RefreshOfflineDesktop; safecall;
```

C++

```
__fastcall RefreshOfflineDesktop();
```

Description

This is RefreshOfflineDesktop, a member of class IShellUIHelper.

132.2.22.2.11 IShellUIHelper.ResetFirstBootMode Method

Pascal

```
procedure ResetFirstBootMode; safecall;
```

C++

```
__fastcall ResetFirstBootMode();
```

Description

This is ResetFirstBootMode, a member of class IShellUIHelper.

132.2.22.2.12 IShellUIHelper.ResetSafeMode Method

Pascal

```
procedure ResetSafeMode; safecall;
```

C++

```
__fastcall ResetSafeMode();
```

Description

This is ResetSafeMode, a member of class IShellUIHelper.

132.2.22.2.13 IShellUIHelper.ShowBrowserUI Method

Pascal

```
function ShowBrowserUI(const bstrName: WideString; var pvarIn: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant ShowBrowserUI(const BSTR bstrName, OleVariant pvarIn);
```

Description

This is ShowBrowserUI, a member of class IShellUIHelper.

132.2.23 IShellUIHelperDisp Interface

Class Hierarchy

Pascal

```
IShellUIHelperDisp = dispinterface;
```

C++

```
class IShellUIHelperDisp;
```

File

SHDocVw

Description

This is class SHDocVw.IShellUIHelperDisp.

132.2.23.1 IShellUIHelperDisp Members

The following tables list the members exposed by IShellUIHelperDisp.

Public Methods

	Name	Description
	AddChannel (see page 19381)	This is AddChannel, a member of class IShellUIHelperDisp.
	AddDesktopComponent (see page 19381)	This is AddDesktopComponent, a member of class IShellUIHelperDisp.
	AddFavorite (see page 19382)	This is AddFavorite, a member of class IShellUIHelperDisp.
	AutoCompleteAttach (see page 19382)	This is AutoCompleteAttach, a member of class IShellUIHelperDisp.
	AutoCompleteSaveForm (see page 19382)	This is AutoCompleteSaveForm, a member of class IShellUIHelperDisp.
	AutoScan (see page 19382)	This is AutoScan, a member of class IShellUIHelperDisp.
	ImportExportFavorites (see page 19382)	This is ImportExportFavorites, a member of class IShellUIHelperDisp.
	IsSubscribed (see page 19383)	This is IsSubscribed, a member of class IShellUIHelperDisp.

	NavigateAndFind (see page 19383)	This is NavigateAndFind, a member of class IShellUIHelperDisp.
	RefreshOfflineDesktop (see page 19383)	This is RefreshOfflineDesktop, a member of class IShellUIHelperDisp.
	ResetFirstBootMode (see page 19383)	This is ResetFirstBootMode, a member of class IShellUIHelperDisp.
	ResetSafeMode (see page 19384)	This is ResetSafeMode, a member of class IShellUIHelperDisp.
	ShowBrowserUI (see page 19384)	This is ShowBrowserUI, a member of class IShellUIHelperDisp.

132.2.23.2 IShellUIHelperDisp Methods

The methods of the IShellUIHelperDisp class are listed here.

Public Methods

	Name	Description
	AddChannel (see page 19381)	This is AddChannel, a member of class IShellUIHelperDisp.
	AddDesktopComponent (see page 19381)	This is AddDesktopComponent, a member of class IShellUIHelperDisp.
	AddFavorite (see page 19382)	This is AddFavorite, a member of class IShellUIHelperDisp.
	AutoCompleteAttach (see page 19382)	This is AutoCompleteAttach, a member of class IShellUIHelperDisp.
	AutoCompleteSaveForm (see page 19382)	This is AutoCompleteSaveForm, a member of class IShellUIHelperDisp.
	AutoScan (see page 19382)	This is AutoScan, a member of class IShellUIHelperDisp.
	ImportExportFavorites (see page 19382)	This is ImportExportFavorites, a member of class IShellUIHelperDisp.
	IsSubscribed (see page 19383)	This is IsSubscribed, a member of class IShellUIHelperDisp.
	NavigateAndFind (see page 19383)	This is NavigateAndFind, a member of class IShellUIHelperDisp.
	RefreshOfflineDesktop (see page 19383)	This is RefreshOfflineDesktop, a member of class IShellUIHelperDisp.
	ResetFirstBootMode (see page 19383)	This is ResetFirstBootMode, a member of class IShellUIHelperDisp.
	ResetSafeMode (see page 19384)	This is ResetSafeMode, a member of class IShellUIHelperDisp.
	ShowBrowserUI (see page 19384)	This is ShowBrowserUI, a member of class IShellUIHelperDisp.

132.2.23.2.1 IShellUIHelperDisp.AddChannel Method

Pascal

```
procedure AddChannel(const URL: WideString);
```

C++

```
__fastcall AddChannel(const BSTR URL);
```

Description

This is AddChannel, a member of class IShellUIHelperDisp.

132.2.23.2.2 IShellUIHelperDisp.AddDesktopComponent Method

Pascal

```
procedure AddDesktopComponent(const URL: WideString; const Type_: WideString; var Left:
OleVariant; var Top: OleVariant; var Width: OleVariant; var Height: OleVariant);
```

C++

```
__fastcall AddDesktopComponent(const BSTR URL, const BSTR Type_, OleVariant Left, OleVariant
Top, OleVariant Width, OleVariant Height);
```

Description

This is AddDesktopComponent, a member of class IShellUIHelperDisp.

132.2.23.2.3 IShellUIHelperDisp.AddFavorite Method

Pascal

```
procedure AddFavorite(const URL: WideString; var Title: OleVariant);
```

C++

```
__fastcall AddFavorite(const BSTR URL, OleVariant Title);
```

Description

This is AddFavorite, a member of class IShellUIHelperDisp.

132.2.23.2.4 IShellUIHelperDisp.AutoCompleteAttach Method

Pascal

```
procedure AutoCompleteAttach(var Reserved: OleVariant);
```

C++

```
__fastcall AutoCompleteAttach(OleVariant Reserved);
```

Description

This is AutoCompleteAttach, a member of class IShellUIHelperDisp.

132.2.23.2.5 IShellUIHelperDisp.AutoCompleteSaveForm Method

Pascal

```
procedure AutoCompleteSaveForm(var Form: OleVariant);
```

C++

```
__fastcall AutoCompleteSaveForm(OleVariant Form);
```

Description

This is AutoCompleteSaveForm, a member of class IShellUIHelperDisp.

132.2.23.2.6 IShellUIHelperDisp.AutoScan Method

Pascal

```
procedure AutoScan(const strSearch: WideString; const strFailureUrl: WideString; var
pvarTargetFrame: OleVariant);
```

C++

```
__fastcall AutoScan(const BSTR strSearch, const BSTR strFailureUrl, OleVariant
pvarTargetFrame);
```

Description

This is AutoScan, a member of class IShellUIHelperDisp.

132.2.23.2.7 IShellUIHelperDisp.ImportExportFavorites Method

Pascal

```
procedure ImportExportFavorites(fImport: WordBool; const strImpExpPath: WideString);
```

C++

```
__fastcall ImportExportFavorites(WordBool fImport, const BSTR strImpExpPath);
```

Description

This is ImportExportFavorites, a member of class IShellUIHelperDisp.

132.2.23.2.8 IShellUIHelperDisp.IsSubscribed Method

Pascal

```
function IsSubscribed(const URL: WideString): WordBool;
```

C++

```
__fastcall WordBool IsSubscribed(const BSTR URL);
```

Description

This is IsSubscribed, a member of class IShellUIHelperDisp.

132.2.23.2.9 IShellUIHelperDisp.NavigateAndFind Method

Pascal

```
procedure NavigateAndFind(const URL: WideString; const strQuery: WideString; var
varTargetFrame: OleVariant);
```

C++

```
__fastcall NavigateAndFind(const BSTR URL, const BSTR strQuery, OleVariant varTargetFrame);
```

Description

This is NavigateAndFind, a member of class IShellUIHelperDisp.

132.2.23.2.10 IShellUIHelperDisp.RefreshOfflineDesktop Method

Pascal

```
procedure RefreshOfflineDesktop;
```

C++

```
__fastcall RefreshOfflineDesktop();
```

Description

This is RefreshOfflineDesktop, a member of class IShellUIHelperDisp.

132.2.23.2.11 IShellUIHelperDisp.ResetFirstBootMode Method

Pascal

```
procedure ResetFirstBootMode;
```

C++

```
__fastcall ResetFirstBootMode();
```

Description

This is ResetFirstBootMode, a member of class IShellUIHelperDisp.

132.2.23.2.12 IShellUIHelperDisp.ResetSafeMode Method

Pascal

```
procedure ResetSafeMode;
```

C++

```
__fastcall ResetSafeMode();
```

Description

This is ResetSafeMode, a member of class IShellUIHelperDisp.

132.2.23.2.13 IShellUIHelperDisp.ShowBrowserUI Method

Pascal

```
function ShowBrowserUI(const bstrName: WideString; var pvarIn: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant ShowBrowserUI(const BSTR bstrName, OleVariant pvarIn);
```

Description

This is ShowBrowserUI, a member of class IShellUIHelperDisp.

132.2.24 IShellWindows Interface

Class Hierarchy

Pascal

```
IShellWindows = interface(IDispatch);
```

C++

```
__interface IShellWindows : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.IShellWindows.

132.2.24.1 IShellWindows Members

The following tables list the members exposed by IShellWindows.

Public Methods

	Name	Description
	_NewEnum (see page 19385)	This is _NewEnum, a member of class IShellWindows.
	FindWindowSW (see page 19385)	This is FindWindowSW, a member of class IShellWindows.
	Get_Count (see page 19386)	This is Get_Count, a member of class IShellWindows.

	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	Item (see page 19386)	This is Item, a member of class IShellWindows.
	OnActivated (see page 19386)	This is OnActivated, a member of class IShellWindows.
	OnCreated (see page 19386)	This is OnCreated, a member of class IShellWindows.
	OnNavigate (see page 19387)	This is OnNavigate, a member of class IShellWindows.
	ProcessAttachDetach (see page 19387)	This is ProcessAttachDetach, a member of class IShellWindows.
	Register (see page 19387)	This is Register, a member of class IShellWindows.
	RegisterPending (see page 19387)	This is RegisterPending, a member of class IShellWindows.
	Revoke (see page 19387)	This is Revoke, a member of class IShellWindows.

Public Properties

	Name	Description
R	Count (see page 19388)	This is Count, a member of class IShellWindows.

132.2.24.2 IShellWindows Methods

The methods of the IShellWindows class are listed here.

Public Methods

	Name	Description
	_NewEnum (see page 19385)	This is _NewEnum, a member of class IShellWindows.
	FindWindowSW (see page 19385)	This is FindWindowSW, a member of class IShellWindows.
	Get_Count (see page 19386)	This is Get_Count, a member of class IShellWindows.
	Item (see page 19386)	This is Item, a member of class IShellWindows.
	OnActivated (see page 19386)	This is OnActivated, a member of class IShellWindows.
	OnCreated (see page 19386)	This is OnCreated, a member of class IShellWindows.
	OnNavigate (see page 19387)	This is OnNavigate, a member of class IShellWindows.
	ProcessAttachDetach (see page 19387)	This is ProcessAttachDetach, a member of class IShellWindows.
	Register (see page 19387)	This is Register, a member of class IShellWindows.
	RegisterPending (see page 19387)	This is RegisterPending, a member of class IShellWindows.
	Revoke (see page 19387)	This is Revoke, a member of class IShellWindows.

132.2.24.2.1 IShellWindows._NewEnum Method

Pascal

```
function _NewEnum: IUnknown; safecall;
```

C++

```
__fastcall IUnknown _NewEnum();
```

Description

This is _NewEnum, a member of class IShellWindows.

132.2.24.2.2 IShellWindows.FindWindowSW Method

Pascal

```
function FindWindowSW(var pvarloc: OleVariant; var pvarlocRoot: OleVariant; swClass: SYSINT;
out pHWND: Integer; swfwOptions: SYSINT): IDispatch; safecall;
```

C++

```
__fastcall IDispatch FindWindowSW(OleVariant pvarloc, OleVariant pvarlocRoot, SYSINT swClass,
int pHWND, SYSINT swfwOptions);
```

Description

This is FindWindowSW, a member of class IShellWindows.

132.2.24.2.3 IShellWindows.Get_Count Method

Pascal

```
function Get_Count: Integer; safecall;
```

C++

```
__fastcall int Get_Count();
```

Description

This is Get_Count, a member of class IShellWindows.

132.2.24.2.4 IShellWindows.Item Method

Pascal

```
function Item(index: OleVariant): IDispatch; safecall;
```

C++

```
__fastcall IDispatch Item(OleVariant index);
```

Description

This is Item, a member of class IShellWindows.

132.2.24.2.5 IShellWindows.OnActivated Method

Pascal

```
procedure OnActivated(lCookie: Integer; fActive: WordBool); safecall;
```

C++

```
__fastcall OnActivated(int lCookie, WordBool fActive);
```

Description

This is OnActivated, a member of class IShellWindows.

132.2.24.2.6 IShellWindows.OnCreated Method

Pascal

```
procedure OnCreated(lCookie: Integer; const punk: IUnknown); safecall;
```

C++

```
__fastcall OnCreated(int lCookie, const IUnknown punk);
```

Description

This is OnCreated, a member of class IShellWindows.

132.2.24.2.7 IShellWindows.OnNavigate Method

Pascal

```
procedure OnNavigate(lCookie: Integer; var pvarloc: OleVariant); safecall;
```

C++

```
__fastcall OnNavigate(int lCookie, OleVariant pvarloc);
```

Description

This is OnNavigate, a member of class IShellWindows.

132.2.24.2.8 IShellWindows.ProcessAttachDetach Method

Pascal

```
procedure ProcessAttachDetach(fAttach: WordBool); safecall;
```

C++

```
__fastcall ProcessAttachDetach(WordBool fAttach);
```

Description

This is ProcessAttachDetach, a member of class IShellWindows.

132.2.24.2.9 IShellWindows.Register Method

Pascal

```
procedure Register(const pid: IDispatch; hWnd: Integer; swClass: SYSINT; out plCookie:
Integer); safecall;
```

C++

```
__fastcall Register(const IDispatch pid, int hWnd, SYSINT swClass, int plCookie);
```

Description

This is Register, a member of class IShellWindows.

132.2.24.2.10 IShellWindows.RegisterPending Method

Pascal

```
procedure RegisterPending(lThreadId: Integer; var pvarloc: OleVariant; var pvarlocRoot:
OleVariant; swClass: SYSINT; out plCookie: Integer); safecall;
```

C++

```
__fastcall RegisterPending(int lThreadId, OleVariant pvarloc, OleVariant pvarlocRoot, SYSINT
swClass, int plCookie);
```

Description

This is RegisterPending, a member of class IShellWindows.

132.2.24.2.11 IShellWindows.Revoke Method

Pascal

```
procedure Revoke(lCookie: Integer); safecall;
```

C++

```
__fastcall Revoke(int lCookie);
```

Description

This is Revoke, a member of class IShellWindows.

132.2.24.3 IShellWindows Properties

The properties of the IShellWindows class are listed here.

Public Properties

	Name	Description
R	Count (see page 19388)	This is Count, a member of class IShellWindows.

132.2.24.3.1 IShellWindows.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class IShellWindows.

132.2.25 IShellWindowsDisp Interface

Class Hierarchy

SHDocVw.IShellWindowsDisp

Pascal

```
IShellWindowsDisp = dispinterface;
```

C++

```
class IShellWindowsDisp;
```

File

SHDocVw

Description

This is class SHDocVw.IShellWindowsDisp.

132.2.25.1 IShellWindowsDisp Members

The following tables list the members exposed by IShellWindowsDisp.

Public Methods

	Name	Description
	_NewEnum (see page 19389)	This is _NewEnum, a member of class IShellWindowsDisp.
	FindWindowSW (see page 19389)	This is FindWindowSW, a member of class IShellWindowsDisp.
	Item (see page 19390)	This is Item, a member of class IShellWindowsDisp.
	OnActivated (see page 19390)	This is OnActivated, a member of class IShellWindowsDisp.
	OnCreated (see page 19390)	This is OnCreated, a member of class IShellWindowsDisp.
	OnNavigate (see page 19390)	This is OnNavigate, a member of class IShellWindowsDisp.
	ProcessAttachDetach (see page 19391)	This is ProcessAttachDetach, a member of class IShellWindowsDisp.
	Register (see page 19391)	This is Register, a member of class IShellWindowsDisp.
	RegisterPending (see page 19391)	This is RegisterPending, a member of class IShellWindowsDisp.
	Revoke (see page 19391)	This is Revoke, a member of class IShellWindowsDisp.

Public Properties

	Name	Description
	Count (see page 19392)	This is Count, a member of class IShellWindowsDisp.

132.2.25.2 IShellWindowsDisp Methods

The methods of the IShellWindowsDisp class are listed here.

Public Methods

	Name	Description
	_NewEnum (see page 19389)	This is _NewEnum, a member of class IShellWindowsDisp.
	FindWindowSW (see page 19389)	This is FindWindowSW, a member of class IShellWindowsDisp.
	Item (see page 19390)	This is Item, a member of class IShellWindowsDisp.
	OnActivated (see page 19390)	This is OnActivated, a member of class IShellWindowsDisp.
	OnCreated (see page 19390)	This is OnCreated, a member of class IShellWindowsDisp.
	OnNavigate (see page 19390)	This is OnNavigate, a member of class IShellWindowsDisp.
	ProcessAttachDetach (see page 19391)	This is ProcessAttachDetach, a member of class IShellWindowsDisp.
	Register (see page 19391)	This is Register, a member of class IShellWindowsDisp.
	RegisterPending (see page 19391)	This is RegisterPending, a member of class IShellWindowsDisp.
	Revoke (see page 19391)	This is Revoke, a member of class IShellWindowsDisp.

132.2.25.2.1 IShellWindowsDisp._NewEnum Method

Pascal

```
function _NewEnum: IUnknown;
```

C++

```
__fastcall IUnknown _NewEnum();
```

Description

This is _NewEnum, a member of class IShellWindowsDisp.

132.2.25.2.2 IShellWindowsDisp.FindWindowSW Method

Pascal

```
function FindWindowSW(var pvarloc: OleVariant; var pvarlocRoot: OleVariant; swClass: SYSINT;
out pHWND: Integer; swfwOptions: SYSINT): IDispatch;
```

C++

```
__fastcall IDispatch FindWindowSW(OleVariant pvarloc, OleVariant pvarlocRoot, SYSINT swClass,
int pHWND, SYSINT swfwOptions);
```

Description

This is FindWindowSW, a member of class IShellWindowsDisp.

132.2.25.2.3 IShellWindowsDisp.Item Method

Pascal

```
function Item(index: OleVariant): IDispatch;
```

C++

```
__fastcall IDispatch Item(OleVariant index);
```

Description

This is Item, a member of class IShellWindowsDisp.

132.2.25.2.4 IShellWindowsDisp.OnActivated Method

Pascal

```
procedure OnActivated(lCookie: Integer; fActive: WordBool);
```

C++

```
__fastcall OnActivated(int lCookie, WordBool fActive);
```

Description

This is OnActivated, a member of class IShellWindowsDisp.

132.2.25.2.5 IShellWindowsDisp.OnCreated Method

Pascal

```
procedure OnCreated(lCookie: Integer; const punk: IUnknown);
```

C++

```
__fastcall OnCreated(int lCookie, const IUnknown punk);
```

Description

This is OnCreated, a member of class IShellWindowsDisp.

132.2.25.2.6 IShellWindowsDisp.OnNavigate Method

Pascal

```
procedure OnNavigate(lCookie: Integer; var pvarloc: OleVariant);
```

C++

```
__fastcall OnNavigate(int lCookie, OleVariant pvarloc);
```

Description

This is OnNavigate, a member of class IShellWindowsDisp.

132.2.25.2.7 IShellWindowsDisp.ProcessAttachDetach Method

Pascal

```
procedure ProcessAttachDetach(fAttach: WordBool);
```

C++

```
__fastcall ProcessAttachDetach(WordBool fAttach);
```

Description

This is ProcessAttachDetach, a member of class IShellWindowsDisp.

132.2.25.2.8 IShellWindowsDisp.Register Method

Pascal

```
procedure Register(const pid: IDispatch; hWnd: Integer; swClass: SYSINT; out plCookie:
Integer);
```

C++

```
__fastcall Register(const IDispatch pid, int hWnd, SYSINT swClass, int plCookie);
```

Description

This is Register, a member of class IShellWindowsDisp.

132.2.25.2.9 IShellWindowsDisp.RegisterPending Method

Pascal

```
procedure RegisterPending(lThreadId: Integer; var pvarloc: OleVariant; var pvarlocRoot:
OleVariant; swClass: SYSINT; out plCookie: Integer);
```

C++

```
__fastcall RegisterPending(int lThreadId, OleVariant pvarloc, OleVariant pvarlocRoot, SYSINT
swClass, int plCookie);
```

Description

This is RegisterPending, a member of class IShellWindowsDisp.

132.2.25.2.10 IShellWindowsDisp.Revoke Method

Pascal

```
procedure Revoke(lCookie: Integer);
```

C++

```
__fastcall Revoke(int lCookie);
```

Description

This is Revoke, a member of class IShellWindowsDisp.

132.2.25.3 IShellWindowsDisp Properties

The properties of the IShellWindowsDisp class are listed here.

Public Properties

	Name	Description
	Count (see page 19392)	This is Count, a member of class IShellWindowsDisp.

132.2.25.3.1 IShellWindowsDisp.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class IShellWindowsDisp.

132.2.26 IWebBrowser Interface

Class Hierarchy

Pascal

```
IWebBrowser = interface(IDispatch);
```

C++

```
__interface IWebBrowser : public IDispatch;
```

File

SHDocVw

Description

This is class SHDocVw.IWebBrowser.

132.2.26.1 IWebBrowser Members

The following tables list the members exposed by IWebBrowser.

Public Methods

	Name	Description
	Get_Application (see page 19394)	This is Get_Application, a member of class IWebBrowser.
	Get_Busy (see page 19394)	This is Get_Busy, a member of class IWebBrowser.
	Get_Container (see page 19394)	This is Get_Container, a member of class IWebBrowser.
	Get_Document (see page 19394)	This is Get_Document, a member of class IWebBrowser.
	Get_Height (see page 19395)	This is Get_Height, a member of class IWebBrowser.
	Get_Left (see page 19395)	This is Get_Left, a member of class IWebBrowser.
	Get_LocationName (see page 19395)	This is Get_LocationName, a member of class IWebBrowser.
	Get_LocationURL (see page 19395)	This is Get_LocationURL, a member of class IWebBrowser.
	Get_Parent (see page 19396)	This is Get_Parent, a member of class IWebBrowser.
	Get_Top (see page 19396)	This is Get_Top, a member of class IWebBrowser.
	Get_TopLevelContainer (see page 19396)	This is Get_TopLevelContainer, a member of class IWebBrowser.

	Get_type_ (see page 19396)	This is Get_type_, a member of class IWebBrowser.
	Get_Width (see page 19396)	This is Get_Width, a member of class IWebBrowser.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	GoBack (see page 19397)	This is GoBack, a member of class IWebBrowser.
	GoForward (see page 19397)	This is GoForward, a member of class IWebBrowser.
	GoHome (see page 19397)	This is GoHome, a member of class IWebBrowser.
	GoSearch (see page 19397)	This is GoSearch, a member of class IWebBrowser.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	Navigate (see page 19398)	This is Navigate, a member of class IWebBrowser.
	Refresh (see page 19398)	This is Refresh, a member of class IWebBrowser.
	Refresh2 (see page 19398)	This is Refresh2, a member of class IWebBrowser.
	Set_Height (see page 19398)	This is Set_Height, a member of class IWebBrowser.
	Set_Left (see page 19398)	This is Set_Left, a member of class IWebBrowser.
	Set_Top (see page 19399)	This is Set_Top, a member of class IWebBrowser.
	Set_Width (see page 19399)	This is Set_Width, a member of class IWebBrowser.
	Stop (see page 19399)	This is Stop, a member of class IWebBrowser.

Public Properties

	Name	Description
R	Application (see page 19400)	This is Application, a member of class IWebBrowser.
R	Busy (see page 19400)	This is Busy, a member of class IWebBrowser.
R	Container (see page 19400)	This is Container, a member of class IWebBrowser.
R	Document (see page 19400)	This is Document, a member of class IWebBrowser.
	Height (see page 19401)	This is Height, a member of class IWebBrowser.
	Left (see page 19401)	This is Left, a member of class IWebBrowser.
R	LocationName (see page 19401)	This is LocationName, a member of class IWebBrowser.
R	LocationURL (see page 19401)	This is LocationURL, a member of class IWebBrowser.
R	Parent (see page 19401)	This is Parent, a member of class IWebBrowser.
	Top (see page 19402)	This is Top, a member of class IWebBrowser.
R	TopLevelContainer (see page 19402)	This is TopLevelContainer, a member of class IWebBrowser.
R	type_ (see page 19402)	This is type_, a member of class IWebBrowser.
	Width (see page 19402)	This is Width, a member of class IWebBrowser.

132.2.26.2 IWebBrowser Methods

The methods of the IWebBrowser class are listed here.

Public Methods

	Name	Description
	Get_Application (see page 19394)	This is Get_Application, a member of class IWebBrowser.
	Get_Busy (see page 19394)	This is Get_Busy, a member of class IWebBrowser.
	Get_Container (see page 19394)	This is Get_Container, a member of class IWebBrowser.
	Get_Document (see page 19394)	This is Get_Document, a member of class IWebBrowser.
	Get_Height (see page 19395)	This is Get_Height, a member of class IWebBrowser.
	Get_Left (see page 19395)	This is Get_Left, a member of class IWebBrowser.
	Get_LocationName (see page 19395)	This is Get_LocationName, a member of class IWebBrowser.
	Get_LocationURL (see page 19395)	This is Get_LocationURL, a member of class IWebBrowser.
	Get_Parent (see page 19396)	This is Get_Parent, a member of class IWebBrowser.
	Get_Top (see page 19396)	This is Get_Top, a member of class IWebBrowser.
	Get_TopLevelContainer (see page 19396)	This is Get_TopLevelContainer, a member of class IWebBrowser.
	Get_type_ (see page 19396)	This is Get_type_, a member of class IWebBrowser.

	Get_Width (see page 19396)	This is Get_Width, a member of class IWebBrowser.
	GoBack (see page 19397)	This is GoBack, a member of class IWebBrowser.
	GoForward (see page 19397)	This is GoForward, a member of class IWebBrowser.
	GoHome (see page 19397)	This is GoHome, a member of class IWebBrowser.
	GoSearch (see page 19397)	This is GoSearch, a member of class IWebBrowser.
	Navigate (see page 19398)	This is Navigate, a member of class IWebBrowser.
	Refresh (see page 19398)	This is Refresh, a member of class IWebBrowser.
	Refresh2 (see page 19398)	This is Refresh2, a member of class IWebBrowser.
	Set_Height (see page 19398)	This is Set_Height, a member of class IWebBrowser.
	Set_Left (see page 19398)	This is Set_Left, a member of class IWebBrowser.
	Set_Top (see page 19399)	This is Set_Top, a member of class IWebBrowser.
	Set_Width (see page 19399)	This is Set_Width, a member of class IWebBrowser.
	Stop (see page 19399)	This is Stop, a member of class IWebBrowser.

132.2.26.2.1 IWebBrowser.Get_Application Method

Pascal

```
function Get_Application: IDispatch; safecall;
```

C++

```
__fastcall IDispatch Get_Application();
```

Description

This is Get_Application, a member of class IWebBrowser.

132.2.26.2.2 IWebBrowser.Get_Busy Method

Pascal

```
function Get_Busy: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_Busy();
```

Description

This is Get_Busy, a member of class IWebBrowser.

132.2.26.2.3 IWebBrowser.Get_Container Method

Pascal

```
function Get_Container: IDispatch; safecall;
```

C++

```
__fastcall IDispatch Get_Container();
```

Description

This is Get_Container, a member of class IWebBrowser.

132.2.26.2.4 IWebBrowser.Get_Document Method

Pascal

```
function Get_Document: IDispatch; safecall;
```

C++

```
__fastcall IDispatch Get_Document();
```

Description

This is Get_Document, a member of class IWebBrowser.

132.2.26.2.5 IWebBrowser.Get_Height Method

Pascal

```
function Get_Height: Integer; safecall;
```

C++

```
__fastcall int Get_Height();
```

Description

This is Get_Height, a member of class IWebBrowser.

132.2.26.2.6 IWebBrowser.Get_Left Method

Pascal

```
function Get_Left: Integer; safecall;
```

C++

```
__fastcall int Get_Left();
```

Description

This is Get_Left, a member of class IWebBrowser.

132.2.26.2.7 IWebBrowser.Get_LocationName Method

Pascal

```
function Get_LocationName: WideString; safecall;
```

C++

```
__fastcall BSTR Get_LocationName();
```

Description

This is Get_LocationName, a member of class IWebBrowser.

132.2.26.2.8 IWebBrowser.Get_LocationURL Method

Pascal

```
function Get_LocationURL: WideString; safecall;
```

C++

```
__fastcall BSTR Get_LocationURL();
```

Description

This is Get_LocationURL, a member of class IWebBrowser.

132.2.26.2.9 IWebBrowser.Get_Parent Method

Pascal

```
function Get_Parent: IDispatch; safecall;
```

C++

```
__fastcall IDispatch Get_Parent();
```

Description

This is Get_Parent, a member of class IWebBrowser.

132.2.26.2.10 IWebBrowser.Get_Top Method

Pascal

```
function Get_Top: Integer; safecall;
```

C++

```
__fastcall int Get_Top();
```

Description

This is Get_Top, a member of class IWebBrowser.

132.2.26.2.11 IWebBrowser.Get_TopLevelContainer Method

Pascal

```
function Get_TopLevelContainer: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_TopLevelContainer();
```

Description

This is Get_TopLevelContainer, a member of class IWebBrowser.

132.2.26.2.12 IWebBrowser.Get_type_ Method

Pascal

```
function Get_type_: WideString; safecall;
```

C++

```
__fastcall BSTR Get_type_();
```

Description

This is Get_type_, a member of class IWebBrowser.

132.2.26.2.13 IWebBrowser.Get_Width Method

Pascal

```
function Get_Width: Integer; safecall;
```

C++

```
__fastcall int Get_Width();
```

Description

This is Get_Width, a member of class IWebBrowser.

132.2.26.2.14 IWebBrowser.GoBack Method

Pascal

```
procedure GoBack; safecall;
```

C++

```
__fastcall GoBack();
```

Description

This is GoBack, a member of class IWebBrowser.

132.2.26.2.15 IWebBrowser.GoForward Method

Pascal

```
procedure GoForward; safecall;
```

C++

```
__fastcall GoForward();
```

Description

This is GoForward, a member of class IWebBrowser.

132.2.26.2.16 IWebBrowser.GoHome Method

Pascal

```
procedure GoHome; safecall;
```

C++

```
__fastcall GoHome();
```

Description

This is GoHome, a member of class IWebBrowser.

132.2.26.2.17 IWebBrowser.GoSearch Method

Pascal

```
procedure GoSearch; safecall;
```

C++

```
__fastcall GoSearch();
```

Description

This is GoSearch, a member of class IWebBrowser.

132.2.26.2.18 IWebBrowser.Navigate Method

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant); safecall;
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate, a member of class IWebBrowser.

132.2.26.2.19 IWebBrowser.Refresh Method

Pascal

```
procedure Refresh; safecall;
```

C++

```
__fastcall Refresh();
```

Description

This is Refresh, a member of class IWebBrowser.

132.2.26.2.20 IWebBrowser.Refresh2 Method

Pascal

```
procedure Refresh2(var Level: OleVariant); safecall;
```

C++

```
__fastcall Refresh2(OleVariant Level);
```

Description

This is Refresh2, a member of class IWebBrowser.

132.2.26.2.21 IWebBrowser.Set_Height Method

Pascal

```
procedure Set_Height(pl: Integer); safecall;
```

C++

```
__fastcall Set_Height(int pl);
```

Description

This is Set_Height, a member of class IWebBrowser.

132.2.26.2.22 IWebBrowser.Set_Left Method

Pascal

```
procedure Set_Left(pl: Integer); safecall;
```

C++

```
__fastcall Set_Left(int pl);
```

Description

This is Set_Left, a member of class IWebBrowser.

132.2.26.2.23 IWebBrowser.Set_Top Method

Pascal

```
procedure Set_Top(pl: Integer); safecall;
```

C++

```
__fastcall Set_Top(int pl);
```

Description

This is Set_Top, a member of class IWebBrowser.

132.2.26.2.24 IWebBrowser.Set_Width Method

Pascal

```
procedure Set_Width(pl: Integer); safecall;
```

C++

```
__fastcall Set_Width(int pl);
```

Description

This is Set_Width, a member of class IWebBrowser.

132.2.26.2.25 IWebBrowser.Stop Method

Pascal

```
procedure Stop; safecall;
```

C++

```
__fastcall Stop();
```

Description

This is Stop, a member of class IWebBrowser.

132.2.26.3 IWebBrowser Properties

The properties of the IWebBrowser class are listed here.

Public Properties

	Name	Description
R	Application (see page 19400)	This is Application, a member of class IWebBrowser.
R	Busy (see page 19400)	This is Busy, a member of class IWebBrowser.
R	Container (see page 19400)	This is Container, a member of class IWebBrowser.
R	Document (see page 19400)	This is Document, a member of class IWebBrowser.
	Height (see page 19401)	This is Height, a member of class IWebBrowser.

	Left (see page 19401)	This is Left, a member of class IWebBrowser.
R	LocationName (see page 19401)	This is LocationName, a member of class IWebBrowser.
R	LocationURL (see page 19401)	This is LocationURL, a member of class IWebBrowser.
R	Parent (see page 19401)	This is Parent, a member of class IWebBrowser.
	Top (see page 19402)	This is Top, a member of class IWebBrowser.
R	TopLevelContainer (see page 19402)	This is TopLevelContainer, a member of class IWebBrowser.
R	type_ (see page 19402)	This is type_, a member of class IWebBrowser.
	Width (see page 19402)	This is Width, a member of class IWebBrowser.

132.2.26.3.1 IWebBrowser.Application Property

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

This is Application, a member of class IWebBrowser.

132.2.26.3.2 IWebBrowser.Busy Property

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

This is Busy, a member of class IWebBrowser.

132.2.26.3.3 IWebBrowser.Container Property

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

This is Container, a member of class IWebBrowser.

132.2.26.3.4 IWebBrowser.Document Property

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

This is Document, a member of class IWebBrowser.

132.2.26.3.5 IWebBrowser.Height Property

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

This is Height, a member of class IWebBrowser.

132.2.26.3.6 IWebBrowser.Left Property

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

This is Left, a member of class IWebBrowser.

132.2.26.3.7 IWebBrowser.LocationName Property

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

This is LocationName, a member of class IWebBrowser.

132.2.26.3.8 IWebBrowser.LocationURL Property

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

This is LocationURL, a member of class IWebBrowser.

132.2.26.3.9 IWebBrowser.Parent Property

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

This is Parent, a member of class IWebBrowser.

132.2.26.3.10 IWebBrowser.Top Property

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

This is Top, a member of class IWebBrowser.

132.2.26.3.11 IWebBrowser.TopLevelContainer Property

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

This is TopLevelContainer, a member of class IWebBrowser.

132.2.26.3.12 IWebBrowser.type_ Property

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

This is type_, a member of class IWebBrowser.

132.2.26.3.13 IWebBrowser.Width Property

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

This is Width, a member of class IWebBrowser.

132.2.27 IWebBrowser2 Interface

Class Hierarchy

Pascal

```
IWebBrowser2 = interface(IWebBrowserApp);
```

C++

```
__interface IWebBrowser2 : public IWebBrowserApp;
```

File

SHDocVw

Description

This is class SHDocVw.IWebBrowser2.

132.2.27.1 IWebBrowser2 Members

The following tables list the members exposed by IWebBrowser2.

Public Methods

	Name	Description
	ClientToWindow (see page 19427)	This is ClientToWindow, a member of class IWebBrowserApp.
	ExecWB (see page 19405)	This is ExecWB, a member of class IWebBrowser2.
	Get_AddressBar (see page 19406)	This is Get_AddressBar, a member of class IWebBrowser2.
	Get_Application (see page 19394)	This is Get_Application, a member of class IWebBrowser.
	Get_Busy (see page 19394)	This is Get_Busy, a member of class IWebBrowser.
	Get_Container (see page 19394)	This is Get_Container, a member of class IWebBrowser.
	Get_Document (see page 19394)	This is Get_Document, a member of class IWebBrowser.
	Get_FullName (see page 19427)	This is Get_FullName, a member of class IWebBrowserApp.
	Get_FullScreen (see page 19428)	This is Get_FullScreen, a member of class IWebBrowserApp.
	Get_Height (see page 19395)	This is Get_Height, a member of class IWebBrowser.
	Get_HWnd (see page 19428)	This is Get_HWnd, a member of class IWebBrowserApp.
	Get_Left (see page 19395)	This is Get_Left, a member of class IWebBrowser.
	Get_LocationName (see page 19395)	This is Get_LocationName, a member of class IWebBrowser.
	Get_LocationURL (see page 19395)	This is Get_LocationURL, a member of class IWebBrowser.
	Get_MenuBar (see page 19428)	This is Get_MenuBar, a member of class IWebBrowserApp.
	Get_Name (see page 19428)	This is Get_Name, a member of class IWebBrowserApp.
	Get_Offline (see page 19406)	This is Get_Offline, a member of class IWebBrowser2.
	Get_Parent (see page 19396)	This is Get_Parent, a member of class IWebBrowser.
	Get_Path (see page 19429)	This is Get_Path, a member of class IWebBrowserApp.
	Get_ReadyState (see page 19406)	This is Get_ReadyState, a member of class IWebBrowser2.
	Get_RegisterAsBrowser (see page 19406)	This is Get_RegisterAsBrowser, a member of class IWebBrowser2.
	Get_RegisterAsDropTarget (see page 19407)	This is Get_RegisterAsDropTarget, a member of class IWebBrowser2.
	Get_Resizable (see page 19407)	This is Get_Resizable, a member of class IWebBrowser2.
	Get_Silent (see page 19407)	This is Get_Silent, a member of class IWebBrowser2.
	Get_StatusBar (see page 19429)	This is Get_StatusBar, a member of class IWebBrowserApp.
	Get_StatusText (see page 19429)	This is Get_StatusText, a member of class IWebBrowserApp.
	Get_TheaterMode (see page 19407)	This is Get_TheaterMode, a member of class IWebBrowser2.

	Get_ToolBar (see page 19429)	This is Get_ToolBar, a member of class IWebBrowserApp.
	Get_Top (see page 19396)	This is Get_Top, a member of class IWebBrowser.
	Get_TopLevelContainer (see page 19396)	This is Get_TopLevelContainer, a member of class IWebBrowser.
	Get_type_ (see page 19396)	This is Get_type_, a member of class IWebBrowser.
	Get_Visible (see page 19429)	This is Get_Visible, a member of class IWebBrowserApp.
	Get_Width (see page 19396)	This is Get_Width, a member of class IWebBrowser.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetProperty (see page 19430)	This is GetProperty, a member of class IWebBrowserApp.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	GoBack (see page 19397)	This is GoBack, a member of class IWebBrowser.
	GoForward (see page 19397)	This is GoForward, a member of class IWebBrowser.
	GoHome (see page 19397)	This is GoHome, a member of class IWebBrowser.
	GoSearch (see page 19397)	This is GoSearch, a member of class IWebBrowser.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	Navigate (see page 19398)	This is Navigate, a member of class IWebBrowser.
	Navigate2 (see page 19407)	This is Navigate2, a member of class IWebBrowser2.
	PutProperty (see page 19430)	This is PutProperty, a member of class IWebBrowserApp.
	QueryStatusWB (see page 19408)	This is QueryStatusWB, a member of class IWebBrowser2.
	Quit (see page 19430)	This is Quit, a member of class IWebBrowserApp.
	Refresh (see page 19398)	This is Refresh, a member of class IWebBrowser.
	Refresh2 (see page 19398)	This is Refresh2, a member of class IWebBrowser.
	Set_AddressBar (see page 19408)	This is Set_AddressBar, a member of class IWebBrowser2.
	Set_FullScreen (see page 19430)	This is Set_FullScreen, a member of class IWebBrowserApp.
	Set_Height (see page 19398)	This is Set_Height, a member of class IWebBrowser.
	Set_Left (see page 19398)	This is Set_Left, a member of class IWebBrowser.
	Set_MenuBar (see page 19431)	This is Set_MenuBar, a member of class IWebBrowserApp.
	Set_Offline (see page 19408)	This is Set_Offline, a member of class IWebBrowser2.
	Set_RegisterAsBrowser (see page 19408)	This is Set_RegisterAsBrowser, a member of class IWebBrowser2.
	Set_RegisterAsDropTarget (see page 19409)	This is Set_RegisterAsDropTarget, a member of class IWebBrowser2.
	Set_Resizable (see page 19409)	This is Set_Resizable, a member of class IWebBrowser2.
	Set_Silent (see page 19409)	This is Set_Silent, a member of class IWebBrowser2.
	Set_StatusBar (see page 19431)	This is Set_StatusBar, a member of class IWebBrowserApp.
	Set_StatusText (see page 19431)	This is Set_StatusText, a member of class IWebBrowserApp.
	Set_TheaterMode (see page 19409)	This is Set_TheaterMode, a member of class IWebBrowser2.
	Set_ToolBar (see page 19431)	This is Set_ToolBar, a member of class IWebBrowserApp.
	Set_Top (see page 19399)	This is Set_Top, a member of class IWebBrowser.
	Set_Visible (see page 19431)	This is Set_Visible, a member of class IWebBrowserApp.
	Set_Width (see page 19399)	This is Set_Width, a member of class IWebBrowser.
	ShowBrowserBar (see page 19409)	This is ShowBrowserBar, a member of class IWebBrowser2.
	Stop (see page 19399)	This is Stop, a member of class IWebBrowser.

Public Properties

	Name	Description
	AddressBar (see page 19410)	This is AddressBar, a member of class IWebBrowser2.
R	Application (see page 19400)	This is Application, a member of class IWebBrowser.
R	Busy (see page 19400)	This is Busy, a member of class IWebBrowser.
R	Container (see page 19400)	This is Container, a member of class IWebBrowser.
R	Document (see page 19400)	This is Document, a member of class IWebBrowser.
R	FullName (see page 19432)	This is FullName, a member of class IWebBrowserApp.
	FullScreen (see page 19432)	This is FullScreen, a member of class IWebBrowserApp.
	Height (see page 19401)	This is Height, a member of class IWebBrowser.
R	HWnd (see page 19432)	This is HWnd, a member of class IWebBrowserApp.
	Left (see page 19401)	This is Left, a member of class IWebBrowser.

R	LocationName (see page 19401)	This is LocationName, a member of class IWebBrowser.
R	LocationURL (see page 19401)	This is LocationURL, a member of class IWebBrowser.
	MenuBar (see page 19433)	This is MenuBar, a member of class IWebBrowserApp.
R	Name (see page 19433)	This is Name, a member of class IWebBrowserApp.
	Offline (see page 19410)	This is Offline, a member of class IWebBrowser2.
R	Parent (see page 19401)	This is Parent, a member of class IWebBrowser.
R	Path (see page 19433)	This is Path, a member of class IWebBrowserApp.
R	ReadyState (see page 19410)	This is ReadyState, a member of class IWebBrowser2.
	RegisterAsBrowser (see page 19411)	This is RegisterAsBrowser, a member of class IWebBrowser2.
	RegisterAsDropTarget (see page 19411)	This is RegisterAsDropTarget, a member of class IWebBrowser2.
	Resizable (see page 19411)	This is Resizable, a member of class IWebBrowser2.
	Silent (see page 19411)	This is Silent, a member of class IWebBrowser2.
	StatusBar (see page 19433)	This is StatusBar, a member of class IWebBrowserApp.
	StatusText (see page 19434)	This is StatusText, a member of class IWebBrowserApp.
	TheaterMode (see page 19412)	This is TheaterMode, a member of class IWebBrowser2.
	ToolBar (see page 19434)	This is ToolBar, a member of class IWebBrowserApp.
	Top (see page 19402)	This is Top, a member of class IWebBrowser.
R	TopLevelContainer (see page 19402)	This is TopLevelContainer, a member of class IWebBrowser.
R	type_ (see page 19402)	This is type_, a member of class IWebBrowser.
	Visible (see page 19434)	This is Visible, a member of class IWebBrowserApp.
	Width (see page 19402)	This is Width, a member of class IWebBrowser.

132.2.27.2 IWebBrowser2 Methods

The methods of the IWebBrowser2 class are listed here.

Public Methods

	Name	Description
	ExecWB (see page 19405)	This is ExecWB, a member of class IWebBrowser2.
	Get_AddressBar (see page 19406)	This is Get_AddressBar, a member of class IWebBrowser2.
	Get_Offline (see page 19406)	This is Get_Offline, a member of class IWebBrowser2.
	Get_ReadyState (see page 19406)	This is Get_ReadyState, a member of class IWebBrowser2.
	Get_RegisterAsBrowser (see page 19406)	This is Get_RegisterAsBrowser, a member of class IWebBrowser2.
	Get_RegisterAsDropTarget (see page 19407)	This is Get_RegisterAsDropTarget, a member of class IWebBrowser2.
	Get_Resizable (see page 19407)	This is Get_Resizable, a member of class IWebBrowser2.
	Get_Silent (see page 19407)	This is Get_Silent, a member of class IWebBrowser2.
	Get_TheaterMode (see page 19407)	This is Get_TheaterMode, a member of class IWebBrowser2.
	Navigate2 (see page 19407)	This is Navigate2, a member of class IWebBrowser2.
	QueryStatusWB (see page 19408)	This is QueryStatusWB, a member of class IWebBrowser2.
	Set_AddressBar (see page 19408)	This is Set_AddressBar, a member of class IWebBrowser2.
	Set_Offline (see page 19408)	This is Set_Offline, a member of class IWebBrowser2.
	Set_RegisterAsBrowser (see page 19408)	This is Set_RegisterAsBrowser, a member of class IWebBrowser2.
	Set_RegisterAsDropTarget (see page 19409)	This is Set_RegisterAsDropTarget, a member of class IWebBrowser2.
	Set_Resizable (see page 19409)	This is Set_Resizable, a member of class IWebBrowser2.
	Set_Silent (see page 19409)	This is Set_Silent, a member of class IWebBrowser2.
	Set_TheaterMode (see page 19409)	This is Set_TheaterMode, a member of class IWebBrowser2.
	ShowBrowserBar (see page 19409)	This is ShowBrowserBar, a member of class IWebBrowser2.

132.2.27.2.1 IWebBrowser2.ExecWB Method

Pascal

```
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT; var pvaIn: OleVariant; var
pvaOut: OleVariant); safecall;
```

C++

```
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt, OleVariant pvaIn, OleVariant
pvaOut);
```

Description

This is ExecWB, a member of class IWebBrowser2.

132.2.27.2.2 IWebBrowser2.Get_AddressBar Method

Pascal

```
function Get_AddressBar: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_AddressBar();
```

Description

This is Get_AddressBar, a member of class IWebBrowser2.

132.2.27.2.3 IWebBrowser2.Get_Offline Method

Pascal

```
function Get_Offline: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_Offline();
```

Description

This is Get_Offline, a member of class IWebBrowser2.

132.2.27.2.4 IWebBrowser2.Get_ReadyState Method

Pascal

```
function Get_ReadyState: tagREADYSTATE; safecall;
```

C++

```
__fastcall tagREADYSTATE Get_ReadyState();
```

Description

This is Get_ReadyState, a member of class IWebBrowser2.

132.2.27.2.5 IWebBrowser2.Get_RegisterAsBrowser Method

Pascal

```
function Get_RegisterAsBrowser: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_RegisterAsBrowser();
```

Description

This is Get_RegisterAsBrowser, a member of class IWebBrowser2.

132.2.27.2.6 IWebBrowser2.Get_RegisterAsDropTarget Method

Pascal

```
function Get_RegisterAsDropTarget: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_RegisterAsDropTarget();
```

Description

This is Get_RegisterAsDropTarget, a member of class IWebBrowser2.

132.2.27.2.7 IWebBrowser2.Get_Resizable Method

Pascal

```
function Get_Resizable: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_Resizable();
```

Description

This is Get_Resizable, a member of class IWebBrowser2.

132.2.27.2.8 IWebBrowser2.Get_Silent Method

Pascal

```
function Get_Silent: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_Silent();
```

Description

This is Get_Silent, a member of class IWebBrowser2.

132.2.27.2.9 IWebBrowser2.Get_TheaterMode Method

Pascal

```
function Get_TheaterMode: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_TheaterMode();
```

Description

This is Get_TheaterMode, a member of class IWebBrowser2.

132.2.27.2.10 IWebBrowser2.Navigate2 Method

Pascal

```
procedure Navigate2(const URL: OleVariant; const Flags: OleVariant; const TargetFrameName:
OleVariant; const PostData: OleVariant; const Headers: OleVariant); safecall;
```

C++

```
__fastcall Navigate2(const OleVariant URL, const OleVariant Flags, const OleVariant
TargetFrameName, const OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate2, a member of class IWebBrowser2.

132.2.27.2.11 IWebBrowser2.QueryStatusWB Method

Pascal

```
function QueryStatusWB(cmdID: OLECMDID): OLECMDF; safecall;
```

C++

```
__fastcall OLECMDF QueryStatusWB(OLECMDID cmdID);
```

Description

This is QueryStatusWB, a member of class IWebBrowser2.

132.2.27.2.12 IWebBrowser2.Set_AddressBar Method

Pascal

```
procedure Set_AddressBar(Value: WordBool); safecall;
```

C++

```
__fastcall Set_AddressBar(WordBool Value);
```

Description

This is Set_AddressBar, a member of class IWebBrowser2.

132.2.27.2.13 IWebBrowser2.Set_Offline Method

Pascal

```
procedure Set_Offline(pbOffline: WordBool); safecall;
```

C++

```
__fastcall Set_Offline(WordBool pbOffline);
```

Description

This is Set_Offline, a member of class IWebBrowser2.

132.2.27.2.14 IWebBrowser2.Set_RegisterAsBrowser Method

Pascal

```
procedure Set_RegisterAsBrowser(pbRegister: WordBool); safecall;
```

C++

```
__fastcall Set_RegisterAsBrowser(WordBool pbRegister);
```

Description

This is Set_RegisterAsBrowser, a member of class IWebBrowser2.

132.2.27.2.15 IWebBrowser2.Set_RegisterAsDropTarget Method

Pascal

```
procedure Set_RegisterAsDropTarget(pbRegister: WordBool); safecall;
```

C++

```
__fastcall Set_RegisterAsDropTarget(WordBool pbRegister);
```

Description

This is Set_RegisterAsDropTarget, a member of class IWebBrowser2.

132.2.27.2.16 IWebBrowser2.Set_Resizable Method

Pascal

```
procedure Set_Resizable(Value: WordBool); safecall;
```

C++

```
__fastcall Set_Resizable(WordBool Value);
```

Description

This is Set_Resizable, a member of class IWebBrowser2.

132.2.27.2.17 IWebBrowser2.Set_Silent Method

Pascal

```
procedure Set_Silent(pbSilent: WordBool); safecall;
```

C++

```
__fastcall Set_Silent(WordBool pbSilent);
```

Description

This is Set_Silent, a member of class IWebBrowser2.

132.2.27.2.18 IWebBrowser2.Set_TheaterMode Method

Pascal

```
procedure Set_TheaterMode(pbRegister: WordBool); safecall;
```

C++

```
__fastcall Set_TheaterMode(WordBool pbRegister);
```

Description

This is Set_TheaterMode, a member of class IWebBrowser2.

132.2.27.2.19 IWebBrowser2.ShowBrowserBar Method

Pascal

```
procedure ShowBrowserBar(var pvaClsid: OleVariant; var pvarShow: OleVariant; var pvarSize:
OleVariant); safecall;
```

C++

```
__fastcall ShowBrowserBar(OleVariant pvaClsid, OleVariant pvarShow, OleVariant pvarSize);
```

Description

This is ShowBrowserBar, a member of class IWebBrowser2.

132.2.27.3 IWebBrowser2 Properties

The properties of the IWebBrowser2 class are listed here.

Public Properties

	Name	Description
	AddressBar (see page 19410)	This is AddressBar, a member of class IWebBrowser2.
	Offline (see page 19410)	This is Offline, a member of class IWebBrowser2.
R	ReadyState (see page 19410)	This is ReadyState, a member of class IWebBrowser2.
	RegisterAsBrowser (see page 19411)	This is RegisterAsBrowser, a member of class IWebBrowser2.
	RegisterAsDropTarget (see page 19411)	This is RegisterAsDropTarget, a member of class IWebBrowser2.
	Resizable (see page 19411)	This is Resizable, a member of class IWebBrowser2.
	Silent (see page 19411)	This is Silent, a member of class IWebBrowser2.
	TheaterMode (see page 19412)	This is TheaterMode, a member of class IWebBrowser2.

132.2.27.3.1 IWebBrowser2.AddressBar Property

Pascal

```
property AddressBar: WordBool;
```

C++

```
__property WordBool AddressBar;
```

Description

This is AddressBar, a member of class IWebBrowser2.

132.2.27.3.2 IWebBrowser2.Offline Property

Pascal

```
property Offline: WordBool;
```

C++

```
__property WordBool Offline;
```

Description

This is Offline, a member of class IWebBrowser2.

132.2.27.3.3 IWebBrowser2.ReadyState Property

Pascal

```
property ReadyState: tagREADYSTATE;
```

C++

```
__property tagREADYSTATE ReadyState;
```

Description

This is ReadyState, a member of class IWebBrowser2.

132.2.27.3.4 IWebBrowser2.RegisterAsBrowser Property

Pascal

```
property RegisterAsBrowser: WordBool;
```

C++

```
__property WordBool RegisterAsBrowser;
```

Description

This is RegisterAsBrowser, a member of class IWebBrowser2.

132.2.27.3.5 IWebBrowser2.RegisterAsDropTarget Property

Pascal

```
property RegisterAsDropTarget: WordBool;
```

C++

```
__property WordBool RegisterAsDropTarget;
```

Description

This is RegisterAsDropTarget, a member of class IWebBrowser2.

132.2.27.3.6 IWebBrowser2.Resizable Property

Pascal

```
property Resizable: WordBool;
```

C++

```
__property WordBool Resizable;
```

Description

This is Resizable, a member of class IWebBrowser2.

132.2.27.3.7 IWebBrowser2.Silent Property

Pascal

```
property Silent: WordBool;
```

C++

```
__property WordBool Silent;
```

Description

This is Silent, a member of class IWebBrowser2.

132.2.27.3.8 IWebBrowser2.TheaterMode Property

Pascal

```
property TheaterMode: WordBool;
```

C++

```
__property WordBool TheaterMode;
```

Description

This is TheaterMode, a member of class IWebBrowser2.

132.2.28 IWebBrowser2Disp Interface

Class Hierarchy

SHDocVw.IWebBrowser2Disp

Pascal

```
IWebBrowser2Disp = dispinterface;
```

C++

```
class IWebBrowser2Disp;
```

File

SHDocVw

Description

This is class SHDocVw.IWebBrowser2Disp.

132.2.28.1 IWebBrowser2Disp Members

The following tables list the members exposed by IWebBrowser2Disp.

Public Methods

	Name	Description
	ClientToWindow (see page 19414)	This is ClientToWindow, a member of class IWebBrowser2Disp.
	ExecWB (see page 19414)	This is ExecWB, a member of class IWebBrowser2Disp.
	GetProperty (see page 19414)	This is GetProperty, a member of class IWebBrowser2Disp.
	GoBack (see page 19414)	This is GoBack, a member of class IWebBrowser2Disp.
	GoForward (see page 19415)	This is GoForward, a member of class IWebBrowser2Disp.
	GoHome (see page 19415)	This is GoHome, a member of class IWebBrowser2Disp.
	GoSearch (see page 19415)	This is GoSearch, a member of class IWebBrowser2Disp.
	Navigate (see page 19415)	This is Navigate, a member of class IWebBrowser2Disp.
	Navigate2 (see page 19415)	This is Navigate2, a member of class IWebBrowser2Disp.
	PutProperty (see page 19416)	This is PutProperty, a member of class IWebBrowser2Disp.
	QueryStatusWB (see page 19416)	This is QueryStatusWB, a member of class IWebBrowser2Disp.
	Quit (see page 19416)	This is Quit, a member of class IWebBrowser2Disp.
	Refresh (see page 19416)	This is Refresh, a member of class IWebBrowser2Disp.
	Refresh2 (see page 19417)	This is Refresh2, a member of class IWebBrowser2Disp.
	ShowBrowserBar (see page 19417)	This is ShowBrowserBar, a member of class IWebBrowser2Disp.

	Stop (see page 19417)	This is Stop, a member of class IWebBrowser2Disp.

Public Properties

	Name	Description
	AddressBar (see page 19418)	This is AddressBar, a member of class IWebBrowser2Disp.
	Application (see page 19418)	This is Application, a member of class IWebBrowser2Disp.
	Busy (see page 19418)	This is Busy, a member of class IWebBrowser2Disp.
	Container (see page 19419)	This is Container, a member of class IWebBrowser2Disp.
	Document (see page 19419)	This is Document, a member of class IWebBrowser2Disp.
	FullName (see page 19419)	This is FullName, a member of class IWebBrowser2Disp.
	FullScreen (see page 19419)	This is FullScreen, a member of class IWebBrowser2Disp.
	Height (see page 19419)	This is Height, a member of class IWebBrowser2Disp.
	HWnd (see page 19420)	This is HWnd, a member of class IWebBrowser2Disp.
	Left (see page 19420)	This is Left, a member of class IWebBrowser2Disp.
	LocationName (see page 19420)	This is LocationName, a member of class IWebBrowser2Disp.
	LocationURL (see page 19420)	This is LocationURL, a member of class IWebBrowser2Disp.
	MenuBar (see page 19421)	This is MenuBar, a member of class IWebBrowser2Disp.
	Name (see page 19421)	This is Name, a member of class IWebBrowser2Disp.
	Offline (see page 19421)	This is Offline, a member of class IWebBrowser2Disp.
	Parent (see page 19421)	This is Parent, a member of class IWebBrowser2Disp.
	Path (see page 19421)	This is Path, a member of class IWebBrowser2Disp.
	ReadyState (see page 19422)	This is ReadyState, a member of class IWebBrowser2Disp.
	RegisterAsBrowser (see page 19422)	This is RegisterAsBrowser, a member of class IWebBrowser2Disp.
	RegisterAsDropTarget (see page 19422)	This is RegisterAsDropTarget, a member of class IWebBrowser2Disp.
	Resizable (see page 19422)	This is Resizable, a member of class IWebBrowser2Disp.
	Silent (see page 19423)	This is Silent, a member of class IWebBrowser2Disp.
	StatusBar (see page 19423)	This is StatusBar, a member of class IWebBrowser2Disp.
	StatusText (see page 19423)	This is StatusText, a member of class IWebBrowser2Disp.
	TheaterMode (see page 19423)	This is TheaterMode, a member of class IWebBrowser2Disp.
	ToolBar (see page 19423)	This is ToolBar, a member of class IWebBrowser2Disp.
	Top (see page 19424)	This is Top, a member of class IWebBrowser2Disp.
	TopLevelContainer (see page 19424)	This is TopLevelContainer, a member of class IWebBrowser2Disp.
	type_ (see page 19424)	This is type_, a member of class IWebBrowser2Disp.
	Visible (see page 19424)	This is Visible, a member of class IWebBrowser2Disp.
	Width (see page 19425)	This is Width, a member of class IWebBrowser2Disp.

132.2.28.2 IWebBrowser2Disp Methods

The methods of the IWebBrowser2Disp class are listed here.

Public Methods

	Name	Description
	ClientToWindow (see page 19414)	This is ClientToWindow, a member of class IWebBrowser2Disp.
	ExecWB (see page 19414)	This is ExecWB, a member of class IWebBrowser2Disp.
	GetProperty (see page 19414)	This is GetProperty, a member of class IWebBrowser2Disp.
	GoBack (see page 19414)	This is GoBack, a member of class IWebBrowser2Disp.
	GoForward (see page 19415)	This is GoForward, a member of class IWebBrowser2Disp.
	GoHome (see page 19415)	This is GoHome, a member of class IWebBrowser2Disp.
	GoSearch (see page 19415)	This is GoSearch, a member of class IWebBrowser2Disp.
	Navigate (see page 19415)	This is Navigate, a member of class IWebBrowser2Disp.
	Navigate2 (see page 19415)	This is Navigate2, a member of class IWebBrowser2Disp.
	PutProperty (see page 19416)	This is PutProperty, a member of class IWebBrowser2Disp.
	QueryStatusWB (see page 19416)	This is QueryStatusWB, a member of class IWebBrowser2Disp.

	Quit (see page 19416)	This is Quit, a member of class IWebBrowser2Disp.
	Refresh (see page 19416)	This is Refresh, a member of class IWebBrowser2Disp.
	Refresh2 (see page 19417)	This is Refresh2, a member of class IWebBrowser2Disp.
	ShowBrowserBar (see page 19417)	This is ShowBrowserBar, a member of class IWebBrowser2Disp.
	Stop (see page 19417)	This is Stop, a member of class IWebBrowser2Disp.

132.2.28.2.1 IWebBrowser2Disp.ClientToWindow Method

Pascal

```
procedure ClientToWindow(var pcx: SYSINT; var pcy: SYSINT);
```

C++

```
__fastcall ClientToWindow(SYSINT pcx, SYSINT pcy);
```

Description

This is ClientToWindow, a member of class IWebBrowser2Disp.

132.2.28.2.2 IWebBrowser2Disp.ExecWB Method

Pascal

```
procedure ExecWB(cmdID: OLECMDID; cmdexecopt: OLECMDEXECOPT; var pvaIn: OleVariant; var
pvaOut: OleVariant);
```

C++

```
__fastcall ExecWB(OLECMDID cmdID, OLECMDEXECOPT cmdexecopt, OleVariant pvaIn, OleVariant
pvaOut);
```

Description

This is ExecWB, a member of class IWebBrowser2Disp.

132.2.28.2.3 IWebBrowser2Disp.GetProperty Method

Pascal

```
function GetProperty(const Property_: WideString): OleVariant;
```

C++

```
__fastcall OleVariant GetProperty(const BSTR Property_);
```

Description

This is GetProperty, a member of class IWebBrowser2Disp.

132.2.28.2.4 IWebBrowser2Disp.GoBack Method

Pascal

```
procedure GoBack;
```

C++

```
__fastcall GoBack();
```

Description

This is GoBack, a member of class IWebBrowser2Disp.

132.2.28.2.5 IWebBrowser2Disp.GoForward Method

Pascal

```
procedure GoForward;
```

C++

```
__fastcall GoForward();
```

Description

This is GoForward, a member of class IWebBrowser2Disp.

132.2.28.2.6 IWebBrowser2Disp.GoHome Method

Pascal

```
procedure GoHome;
```

C++

```
__fastcall GoHome();
```

Description

This is GoHome, a member of class IWebBrowser2Disp.

132.2.28.2.7 IWebBrowser2Disp.GoSearch Method

Pascal

```
procedure GoSearch;
```

C++

```
__fastcall GoSearch();
```

Description

This is GoSearch, a member of class IWebBrowser2Disp.

132.2.28.2.8 IWebBrowser2Disp.Navigate Method

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant);
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate, a member of class IWebBrowser2Disp.

132.2.28.2.9 IWebBrowser2Disp.Navigate2 Method

Pascal

```
procedure Navigate2(const URL: OleVariant; const Flags: OleVariant; const TargetFrameName:
OleVariant; const PostData: OleVariant; const Headers: OleVariant);
```

C++

```
__fastcall Navigate2(const OleVariant URL, const OleVariant Flags, const OleVariant
TargetFrameName, const OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate2, a member of class IWebBrowser2Disp.

132.2.28.2.10 IWebBrowser2Disp.PutProperty Method

Pascal

```
procedure PutProperty(const Property_: WideString; vtValue: OleVariant);
```

C++

```
__fastcall PutProperty(const BSTR Property_, OleVariant vtValue);
```

Description

This is PutProperty, a member of class IWebBrowser2Disp.

132.2.28.2.11 IWebBrowser2Disp.QueryStatusWB Method

Pascal

```
function QueryStatusWB(cmdID: OLECMDID): OLECMDF;
```

C++

```
__fastcall OLECMDF QueryStatusWB(OLECMDID cmdID);
```

Description

This is QueryStatusWB, a member of class IWebBrowser2Disp.

132.2.28.2.12 IWebBrowser2Disp.Quit Method

Pascal

```
procedure Quit;
```

C++

```
__fastcall Quit();
```

Description

This is Quit, a member of class IWebBrowser2Disp.

132.2.28.2.13 IWebBrowser2Disp.Refresh Method

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

This is Refresh, a member of class IWebBrowser2Disp.

132.2.28.2.14 IWebBrowser2Disp.Refresh2 Method

Pascal

```
procedure Refresh2(var Level: OleVariant);
```

C++

```
__fastcall Refresh2(OleVariant Level);
```

Description

This is Refresh2, a member of class IWebBrowser2Disp.

132.2.28.2.15 IWebBrowser2Disp.ShowBrowserBar Method

Pascal

```
procedure ShowBrowserBar(var pvaClsid: OleVariant; var pvarShow: OleVariant; var pvarSize:
OleVariant);
```

C++

```
__fastcall ShowBrowserBar(OleVariant pvaClsid, OleVariant pvarShow, OleVariant pvarSize);
```

Description

This is ShowBrowserBar, a member of class IWebBrowser2Disp.

132.2.28.2.16 IWebBrowser2Disp.Stop Method

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

This is Stop, a member of class IWebBrowser2Disp.

132.2.28.3 IWebBrowser2Disp Properties

The properties of the IWebBrowser2Disp class are listed here.

Public Properties

	Name	Description
	AddressBar (see page 19418)	This is AddressBar, a member of class IWebBrowser2Disp.
	Application (see page 19418)	This is Application, a member of class IWebBrowser2Disp.
	Busy (see page 19418)	This is Busy, a member of class IWebBrowser2Disp.
	Container (see page 19419)	This is Container, a member of class IWebBrowser2Disp.
	Document (see page 19419)	This is Document, a member of class IWebBrowser2Disp.
	FullName (see page 19419)	This is FullName, a member of class IWebBrowser2Disp.
	FullScreen (see page 19419)	This is FullScreen, a member of class IWebBrowser2Disp.
	Height (see page 19419)	This is Height, a member of class IWebBrowser2Disp.
	HWnd (see page 19420)	This is HWnd, a member of class IWebBrowser2Disp.
	Left (see page 19420)	This is Left, a member of class IWebBrowser2Disp.
	LocationName (see page 19420)	This is LocationName, a member of class IWebBrowser2Disp.

	LocationURL (see page 19420)	This is LocationURL, a member of class IWebBrowser2Disp.
	MenuBar (see page 19421)	This is MenuBar, a member of class IWebBrowser2Disp.
	Name (see page 19421)	This is Name, a member of class IWebBrowser2Disp.
	Offline (see page 19421)	This is Offline, a member of class IWebBrowser2Disp.
	Parent (see page 19421)	This is Parent, a member of class IWebBrowser2Disp.
	Path (see page 19421)	This is Path, a member of class IWebBrowser2Disp.
	ReadyState (see page 19422)	This is ReadyState, a member of class IWebBrowser2Disp.
	RegisterAsBrowser (see page 19422)	This is RegisterAsBrowser, a member of class IWebBrowser2Disp.
	RegisterAsDropTarget (see page 19422)	This is RegisterAsDropTarget, a member of class IWebBrowser2Disp.
	Resizable (see page 19422)	This is Resizable, a member of class IWebBrowser2Disp.
	Silent (see page 19423)	This is Silent, a member of class IWebBrowser2Disp.
	StatusBar (see page 19423)	This is StatusBar, a member of class IWebBrowser2Disp.
	StatusText (see page 19423)	This is StatusText, a member of class IWebBrowser2Disp.
	TheaterMode (see page 19423)	This is TheaterMode, a member of class IWebBrowser2Disp.
	ToolBar (see page 19423)	This is ToolBar, a member of class IWebBrowser2Disp.
	Top (see page 19424)	This is Top, a member of class IWebBrowser2Disp.
	TopLevelContainer (see page 19424)	This is TopLevelContainer, a member of class IWebBrowser2Disp.
	type_ (see page 19424)	This is type_, a member of class IWebBrowser2Disp.
	Visible (see page 19424)	This is Visible, a member of class IWebBrowser2Disp.
	Width (see page 19425)	This is Width, a member of class IWebBrowser2Disp.

132.2.28.3.1 IWebBrowser2Disp.AddressBar Property

Pascal

```
property AddressBar: WordBool;
```

C++

```
__property WordBool AddressBar;
```

Description

This is AddressBar, a member of class IWebBrowser2Disp.

132.2.28.3.2 IWebBrowser2Disp.Application Property

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

This is Application, a member of class IWebBrowser2Disp.

132.2.28.3.3 IWebBrowser2Disp.Busy Property

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

This is Busy, a member of class IWebBrowser2Disp.

132.2.28.3.4 IWebBrowser2Disp.Container Property

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

This is Container, a member of class IWebBrowser2Disp.

132.2.28.3.5 IWebBrowser2Disp.Document Property

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

This is Document, a member of class IWebBrowser2Disp.

132.2.28.3.6 IWebBrowser2Disp.FullName Property

Pascal

```
property FullName: WideString;
```

C++

```
__property BSTR FullName;
```

Description

This is FullName, a member of class IWebBrowser2Disp.

132.2.28.3.7 IWebBrowser2Disp.FullScreen Property

Pascal

```
property FullScreen: WordBool;
```

C++

```
__property WordBool FullScreen;
```

Description

This is FullScreen, a member of class IWebBrowser2Disp.

132.2.28.3.8 IWebBrowser2Disp.Height Property

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

This is Height, a member of class IWebBrowser2Disp.

132.2.28.3.9 IWebBrowser2Disp.HWnd Property

Pascal

```
property HWnd: Integer;
```

C++

```
__property int HWnd;
```

Description

This is HWnd, a member of class IWebBrowser2Disp.

132.2.28.3.10 IWebBrowser2Disp.Left Property

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

This is Left, a member of class IWebBrowser2Disp.

132.2.28.3.11 IWebBrowser2Disp.LocationName Property

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

This is LocationName, a member of class IWebBrowser2Disp.

132.2.28.3.12 IWebBrowser2Disp.LocationURL Property

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

This is LocationURL, a member of class IWebBrowser2Disp.

132.2.28.3.13 IWebBrowser2Disp.MenuBar Property

Pascal

```
property MenuBar: WordBool;
```

C++

```
__property WordBool MenuBar;
```

Description

This is MenuBar, a member of class IWebBrowser2Disp.

132.2.28.3.14 IWebBrowser2Disp.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IWebBrowser2Disp.

132.2.28.3.15 IWebBrowser2Disp.Offline Property

Pascal

```
property Offline: WordBool;
```

C++

```
__property WordBool Offline;
```

Description

This is Offline, a member of class IWebBrowser2Disp.

132.2.28.3.16 IWebBrowser2Disp.Parent Property

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

This is Parent, a member of class IWebBrowser2Disp.

132.2.28.3.17 IWebBrowser2Disp.Path Property

Pascal

```
property Path: WideString;
```

C++

```
__property BSTR Path;
```

Description

This is Path, a member of class IWebBrowser2Disp.

132.2.28.3.18 IWebBrowser2Disp.ReadyState Property

Pascal

```
property ReadyState: tagREADYSTATE;
```

C++

```
__property tagREADYSTATE ReadyState;
```

Description

This is ReadyState, a member of class IWebBrowser2Disp.

132.2.28.3.19 IWebBrowser2Disp.RegisterAsBrowser Property

Pascal

```
property RegisterAsBrowser: WordBool;
```

C++

```
__property WordBool RegisterAsBrowser;
```

Description

This is RegisterAsBrowser, a member of class IWebBrowser2Disp.

132.2.28.3.20 IWebBrowser2Disp.RegisterAsDropTarget Property

Pascal

```
property RegisterAsDropTarget: WordBool;
```

C++

```
__property WordBool RegisterAsDropTarget;
```

Description

This is RegisterAsDropTarget, a member of class IWebBrowser2Disp.

132.2.28.3.21 IWebBrowser2Disp.Resizable Property

Pascal

```
property Resizable: WordBool;
```

C++

```
__property WordBool Resizable;
```

Description

This is Resizable, a member of class IWebBrowser2Disp.

132.2.28.3.22 IWebBrowser2Disp.Silent Property

Pascal

```
property Silent: WordBool;
```

C++

```
__property WordBool Silent;
```

Description

This is Silent, a member of class IWebBrowser2Disp.

132.2.28.3.23 IWebBrowser2Disp.StatusBar Property

Pascal

```
property StatusBar: WordBool;
```

C++

```
__property WordBool StatusBar;
```

Description

This is StatusBar, a member of class IWebBrowser2Disp.

132.2.28.3.24 IWebBrowser2Disp.StatusText Property

Pascal

```
property StatusText: WideString;
```

C++

```
__property BSTR StatusText;
```

Description

This is StatusText, a member of class IWebBrowser2Disp.

132.2.28.3.25 IWebBrowser2Disp.TheaterMode Property

Pascal

```
property TheaterMode: WordBool;
```

C++

```
__property WordBool TheaterMode;
```

Description

This is TheaterMode, a member of class IWebBrowser2Disp.

132.2.28.3.26 IWebBrowser2Disp.ToolBar Property

Pascal

```
property ToolBar: SYSINT;
```

C++

```
__property SYSINT ToolBar;
```

Description

This is ToolBar, a member of class IWebBrowser2Disp.

132.2.28.3.27 IWebBrowser2Disp.Top Property

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

This is Top, a member of class IWebBrowser2Disp.

132.2.28.3.28 IWebBrowser2Disp.TopLevelContainer Property

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

This is TopLevelContainer, a member of class IWebBrowser2Disp.

132.2.28.3.29 IWebBrowser2Disp.type_ Property

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

This is type_, a member of class IWebBrowser2Disp.

132.2.28.3.30 IWebBrowser2Disp.Visible Property

Pascal

```
property Visible: WordBool;
```

C++

```
__property WordBool Visible;
```

Description

This is Visible, a member of class IWebBrowser2Disp.

132.2.28.3.31 IWebBrowser2Disp.Width Property

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

This is Width, a member of class IWebBrowser2Disp.

132.2.29 IWebBrowserApp Interface

Class Hierarchy

Pascal

```
IWebBrowserApp = interface(IWebBrowser);
```

C++

```
__interface IWebBrowserApp : public IWebBrowser;
```

File

SHDocVw

Description

This is class SHDocVw.IWebBrowserApp.

132.2.29.1 IWebBrowserApp Members

The following tables list the members exposed by IWebBrowserApp.

Public Methods

	Name	Description
	ClientToWindow (see page 19427)	This is ClientToWindow, a member of class IWebBrowserApp.
	Get_Application (see page 19394)	This is Get_Application, a member of class IWebBrowser.
	Get_Busy (see page 19394)	This is Get_Busy, a member of class IWebBrowser.
	Get_Container (see page 19394)	This is Get_Container, a member of class IWebBrowser.
	Get_Document (see page 19394)	This is Get_Document, a member of class IWebBrowser.
	Get_FullName (see page 19427)	This is Get_FullName, a member of class IWebBrowserApp.
	Get_FullScreen (see page 19428)	This is Get_FullScreen, a member of class IWebBrowserApp.
	Get_Height (see page 19395)	This is Get_Height, a member of class IWebBrowser.
	Get_HWnd (see page 19428)	This is Get_HWnd, a member of class IWebBrowserApp.
	Get_Left (see page 19395)	This is Get_Left, a member of class IWebBrowser.
	Get_LocationName (see page 19395)	This is Get_LocationName, a member of class IWebBrowser.
	Get_LocationURL (see page 19395)	This is Get_LocationURL, a member of class IWebBrowser.
	Get_MenuBar (see page 19428)	This is Get_MenuBar, a member of class IWebBrowserApp.
	Get_Name (see page 19428)	This is Get_Name, a member of class IWebBrowserApp.
	Get_Parent (see page 19396)	This is Get_Parent, a member of class IWebBrowser.

	Get_Path (see page 19429)	This is Get_Path, a member of class IWebBrowserApp.
	Get_StatusBar (see page 19429)	This is Get_StatusBar, a member of class IWebBrowserApp.
	Get_StatusText (see page 19429)	This is Get_StatusText, a member of class IWebBrowserApp.
	Get_ToolBar (see page 19429)	This is Get_ToolBar, a member of class IWebBrowserApp.
	Get_Top (see page 19396)	This is Get_Top, a member of class IWebBrowser.
	Get_TopLevelContainer (see page 19396)	This is Get_TopLevelContainer, a member of class IWebBrowser.
	Get_type_ (see page 19396)	This is Get_type_, a member of class IWebBrowser.
	Get_Visible (see page 19429)	This is Get_Visible, a member of class IWebBrowserApp.
	Get_Width (see page 19396)	This is Get_Width, a member of class IWebBrowser.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetProperty (see page 19430)	This is GetProperty, a member of class IWebBrowserApp.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	GoBack (see page 19397)	This is GoBack, a member of class IWebBrowser.
	GoForward (see page 19397)	This is GoForward, a member of class IWebBrowser.
	GoHome (see page 19397)	This is GoHome, a member of class IWebBrowser.
	GoSearch (see page 19397)	This is GoSearch, a member of class IWebBrowser.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	Navigate (see page 19398)	This is Navigate, a member of class IWebBrowser.
	PutProperty (see page 19430)	This is PutProperty, a member of class IWebBrowserApp.
	Quit (see page 19430)	This is Quit, a member of class IWebBrowserApp.
	Refresh (see page 19398)	This is Refresh, a member of class IWebBrowser.
	Refresh2 (see page 19398)	This is Refresh2, a member of class IWebBrowser.
	Set_FullScreen (see page 19430)	This is Set_FullScreen, a member of class IWebBrowserApp.
	Set_Height (see page 19398)	This is Set_Height, a member of class IWebBrowser.
	Set_Left (see page 19398)	This is Set_Left, a member of class IWebBrowser.
	Set_MenuBar (see page 19431)	This is Set_MenuBar, a member of class IWebBrowserApp.
	Set_StatusBar (see page 19431)	This is Set_StatusBar, a member of class IWebBrowserApp.
	Set_StatusText (see page 19431)	This is Set_StatusText, a member of class IWebBrowserApp.
	Set_ToolBar (see page 19431)	This is Set_ToolBar, a member of class IWebBrowserApp.
	Set_Top (see page 19399)	This is Set_Top, a member of class IWebBrowser.
	Set_Visible (see page 19431)	This is Set_Visible, a member of class IWebBrowserApp.
	Set_Width (see page 19399)	This is Set_Width, a member of class IWebBrowser.
	Stop (see page 19399)	This is Stop, a member of class IWebBrowser.

Public Properties

	Name	Description
R	Application (see page 19400)	This is Application, a member of class IWebBrowser.
R	Busy (see page 19400)	This is Busy, a member of class IWebBrowser.
R	Container (see page 19400)	This is Container, a member of class IWebBrowser.
R	Document (see page 19400)	This is Document, a member of class IWebBrowser.
R	FullName (see page 19432)	This is FullName, a member of class IWebBrowserApp.
	FullScreen (see page 19432)	This is FullScreen, a member of class IWebBrowserApp.
	Height (see page 19401)	This is Height, a member of class IWebBrowser.
R	HWnd (see page 19432)	This is HWnd, a member of class IWebBrowserApp.
	Left (see page 19401)	This is Left, a member of class IWebBrowser.
R	LocationName (see page 19401)	This is LocationName, a member of class IWebBrowser.
R	LocationURL (see page 19401)	This is LocationURL, a member of class IWebBrowser.
	MenuBar (see page 19433)	This is MenuBar, a member of class IWebBrowserApp.
R	Name (see page 19433)	This is Name, a member of class IWebBrowserApp.
R	Parent (see page 19401)	This is Parent, a member of class IWebBrowser.
R	Path (see page 19433)	This is Path, a member of class IWebBrowserApp.
	StatusBar (see page 19433)	This is StatusBar, a member of class IWebBrowserApp.
	StatusText (see page 19434)	This is StatusText, a member of class IWebBrowserApp.

	ToolBar (see page 19434)	This is ToolBar, a member of class IWebBrowserApp.
	Top (see page 19402)	This is Top, a member of class IWebBrowser.
R	TopLevelContainer (see page 19402)	This is TopLevelContainer, a member of class IWebBrowser.
R	type_ (see page 19402)	This is type_, a member of class IWebBrowser.
	Visible (see page 19434)	This is Visible, a member of class IWebBrowserApp.
	Width (see page 19402)	This is Width, a member of class IWebBrowser.

132.2.29.2 IWebBrowserApp Methods

The methods of the IWebBrowserApp class are listed here.

Public Methods

	Name	Description
	ClientToWindow (see page 19427)	This is ClientToWindow, a member of class IWebBrowserApp.
	Get_FullName (see page 19427)	This is Get_FullName, a member of class IWebBrowserApp.
	Get_FullScreen (see page 19428)	This is Get_FullScreen, a member of class IWebBrowserApp.
	Get_HWnd (see page 19428)	This is Get_HWnd, a member of class IWebBrowserApp.
	Get_MenuBar (see page 19428)	This is Get_MenuBar, a member of class IWebBrowserApp.
	Get_Name (see page 19428)	This is Get_Name, a member of class IWebBrowserApp.
	Get_Path (see page 19429)	This is Get_Path, a member of class IWebBrowserApp.
	Get_StatusBar (see page 19429)	This is Get_StatusBar, a member of class IWebBrowserApp.
	Get_StatusText (see page 19429)	This is Get_StatusText, a member of class IWebBrowserApp.
	Get_ToolBar (see page 19429)	This is Get_ToolBar, a member of class IWebBrowserApp.
	Get_Visible (see page 19429)	This is Get_Visible, a member of class IWebBrowserApp.
	GetProperty (see page 19430)	This is GetProperty, a member of class IWebBrowserApp.
	PutProperty (see page 19430)	This is PutProperty, a member of class IWebBrowserApp.
	Quit (see page 19430)	This is Quit, a member of class IWebBrowserApp.
	Set_FullScreen (see page 19430)	This is Set_FullScreen, a member of class IWebBrowserApp.
	Set_MenuBar (see page 19431)	This is Set_MenuBar, a member of class IWebBrowserApp.
	Set_StatusBar (see page 19431)	This is Set_StatusBar, a member of class IWebBrowserApp.
	Set_StatusText (see page 19431)	This is Set_StatusText, a member of class IWebBrowserApp.
	Set_ToolBar (see page 19431)	This is Set_ToolBar, a member of class IWebBrowserApp.
	Set_Visible (see page 19431)	This is Set_Visible, a member of class IWebBrowserApp.

132.2.29.2.1 IWebBrowserApp.ClientToWindow Method

Pascal

```
procedure ClientToWindow(var pcx: SYSINT; var pcy: SYSINT); safecall;
```

C++

```
__fastcall ClientToWindow(SYSINT pcx, SYSINT pcy);
```

Description

This is ClientToWindow, a member of class IWebBrowserApp.

132.2.29.2.2 IWebBrowserApp.Get_FullName Method

Pascal

```
function Get_FullName: WideString; safecall;
```

C++

```
__fastcall BSTR Get_FullName();
```

Description

This is Get_FullName, a member of class IWebBrowserApp.

132.2.29.2.3 IWebBrowserApp.Get_FullScreen Method

Pascal

```
function Get_FullScreen: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_FullScreen();
```

Description

This is Get_FullScreen, a member of class IWebBrowserApp.

132.2.29.2.4 IWebBrowserApp.Get_HWnd Method

Pascal

```
function Get_HWnd: Integer; safecall;
```

C++

```
__fastcall int Get_HWnd();
```

Description

This is Get_HWnd, a member of class IWebBrowserApp.

132.2.29.2.5 IWebBrowserApp.Get_MenuBar Method

Pascal

```
function Get_MenuBar: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_MenuBar();
```

Description

This is Get_MenuBar, a member of class IWebBrowserApp.

132.2.29.2.6 IWebBrowserApp.Get_Name Method

Pascal

```
function Get_Name: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Name();
```

Description

This is Get_Name, a member of class IWebBrowserApp.

132.2.29.2.7 IWebBrowserApp.Get_Path Method

Pascal

```
function Get_Path: WideString; safecall;
```

C++

```
__fastcall BSTR Get_Path();
```

Description

This is Get_Path, a member of class IWebBrowserApp.

132.2.29.2.8 IWebBrowserApp.Get_StatusBar Method

Pascal

```
function Get_StatusBar: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_StatusBar();
```

Description

This is Get_StatusBar, a member of class IWebBrowserApp.

132.2.29.2.9 IWebBrowserApp.Get_StatusText Method

Pascal

```
function Get_StatusText: WideString; safecall;
```

C++

```
__fastcall BSTR Get_StatusText();
```

Description

This is Get_StatusText, a member of class IWebBrowserApp.

132.2.29.2.10 IWebBrowserApp.Get_ToolBar Method

Pascal

```
function Get_ToolBar: SYSINT; safecall;
```

C++

```
__fastcall SYSINT Get_ToolBar();
```

Description

This is Get_ToolBar, a member of class IWebBrowserApp.

132.2.29.2.11 IWebBrowserApp.Get_Visible Method

Pascal

```
function Get_Visible: WordBool; safecall;
```

C++

```
__fastcall WordBool Get_Visible();
```

Description

This is Get_Visible, a member of class IWebBrowserApp.

132.2.29.2.12 IWebBrowserApp.GetProperty Method

Pascal

```
function GetProperty(const Property_: WideString): OleVariant; safecall;
```

C++

```
__fastcall OleVariant GetProperty(const BSTR Property_);
```

Description

This is GetProperty, a member of class IWebBrowserApp.

132.2.29.2.13 IWebBrowserApp.PutProperty Method

Pascal

```
procedure PutProperty(const Property_: WideString; vtValue: OleVariant); safecall;
```

C++

```
__fastcall PutProperty(const BSTR Property_, OleVariant vtValue);
```

Description

This is PutProperty, a member of class IWebBrowserApp.

132.2.29.2.14 IWebBrowserApp.Quit Method

Pascal

```
procedure Quit; safecall;
```

C++

```
__fastcall Quit();
```

Description

This is Quit, a member of class IWebBrowserApp.

132.2.29.2.15 IWebBrowserApp.Set_FullScreen Method

Pascal

```
procedure Set_FullScreen(pbFullScreen: WordBool); safecall;
```

C++

```
__fastcall Set_FullScreen(WordBool pbFullScreen);
```

Description

This is Set_FullScreen, a member of class IWebBrowserApp.

132.2.29.2.16 IWebBrowserApp.Set_MenuBar Method

Pascal

```
procedure Set_MenuBar(Value: WordBool); safecall;
```

C++

```
__fastcall Set_MenuBar(WordBool Value);
```

Description

This is Set_MenuBar, a member of class IWebBrowserApp.

132.2.29.2.17 IWebBrowserApp.Set_StatusBar Method

Pascal

```
procedure Set_StatusBar(pBool: WordBool); safecall;
```

C++

```
__fastcall Set_StatusBar(WordBool pBool);
```

Description

This is Set_StatusBar, a member of class IWebBrowserApp.

132.2.29.2.18 IWebBrowserApp.Set_StatusText Method

Pascal

```
procedure Set_StatusText(const StatusText: WideString); safecall;
```

C++

```
__fastcall Set_StatusText(const BSTR StatusText);
```

Description

This is Set_StatusText, a member of class IWebBrowserApp.

132.2.29.2.19 IWebBrowserApp.Set_ToolBar Method

Pascal

```
procedure Set_ToolBar(Value: SYSINT); safecall;
```

C++

```
__fastcall Set_ToolBar(SYSINT Value);
```

Description

This is Set_ToolBar, a member of class IWebBrowserApp.

132.2.29.2.20 IWebBrowserApp.Set_Visible Method

Pascal

```
procedure Set_Visible(pBool: WordBool); safecall;
```

C++

```
__fastcall Set_Visible(WordBool pBool);
```

Description

This is Set_Visible, a member of class IWebBrowserApp.

132.2.29.3 IWebBrowserApp Properties

The properties of the IWebBrowserApp class are listed here.

Public Properties

	Name	Description
R	FullName (see page 19432)	This is FullName, a member of class IWebBrowserApp.
	FullScreen (see page 19432)	This is FullScreen, a member of class IWebBrowserApp.
R	HWnd (see page 19432)	This is HWnd, a member of class IWebBrowserApp.
	MenuBar (see page 19433)	This is MenuBar, a member of class IWebBrowserApp.
R	Name (see page 19433)	This is Name, a member of class IWebBrowserApp.
R	Path (see page 19433)	This is Path, a member of class IWebBrowserApp.
	StatusBar (see page 19433)	This is StatusBar, a member of class IWebBrowserApp.
	StatusText (see page 19434)	This is StatusText, a member of class IWebBrowserApp.
	ToolBar (see page 19434)	This is ToolBar, a member of class IWebBrowserApp.
	Visible (see page 19434)	This is Visible, a member of class IWebBrowserApp.

132.2.29.3.1 IWebBrowserApp.FullName Property

Pascal

```
property FullName: WideString;
```

C++

```
__property BSTR FullName;
```

Description

This is FullName, a member of class IWebBrowserApp.

132.2.29.3.2 IWebBrowserApp.FullScreen Property

Pascal

```
property FullScreen: WordBool;
```

C++

```
__property WordBool FullScreen;
```

Description

This is FullScreen, a member of class IWebBrowserApp.

132.2.29.3.3 IWebBrowserApp.HWnd Property

Pascal

```
property HWnd: Integer;
```

C++

```
__property int HWnd;
```

Description

This is HWnd, a member of class IWebBrowserApp.

132.2.29.3.4 IWebBrowserApp.MenuBar Property

Pascal

```
property MenuBar: WordBool;
```

C++

```
__property WordBool MenuBar;
```

Description

This is MenuBar, a member of class IWebBrowserApp.

132.2.29.3.5 IWebBrowserApp.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IWebBrowserApp.

132.2.29.3.6 IWebBrowserApp.Path Property

Pascal

```
property Path: WideString;
```

C++

```
__property BSTR Path;
```

Description

This is Path, a member of class IWebBrowserApp.

132.2.29.3.7 IWebBrowserApp.StatusBar Property

Pascal

```
property StatusBar: WordBool;
```

C++

```
__property WordBool StatusBar;
```

Description

This is StatusBar, a member of class IWebBrowserApp.

132.2.29.3.8 IWebBrowserApp.StatusText Property

Pascal

```
property StatusText: WideString;
```

C++

```
__property BSTR StatusText;
```

Description

This is StatusText, a member of class IWebBrowserApp.

132.2.29.3.9 IWebBrowserApp.ToolBar Property

Pascal

```
property ToolBar: SYSINT;
```

C++

```
__property SYSINT ToolBar;
```

Description

This is ToolBar, a member of class IWebBrowserApp.

132.2.29.3.10 IWebBrowserApp.Visible Property

Pascal

```
property Visible: WordBool;
```

C++

```
__property WordBool Visible;
```

Description

This is Visible, a member of class IWebBrowserApp.

132.2.30 IWebBrowserAppDisp Interface

Class Hierarchy

Pascal

```
IWebBrowserAppDisp = dispinterface;
```

C++

```
class IWebBrowserAppDisp;
```

File

SHDocVw

Description

This is class SHDocVw.IWebBrowserAppDisp.

132.2.30.1 IWebBrowserAppDisp Members

The following tables list the members exposed by IWebBrowserAppDisp.

Public Methods

	Name	Description
	ClientToWindow (see page 19436)	This is ClientToWindow, a member of class IWebBrowserAppDisp.
	GetProperty (see page 19436)	This is GetProperty, a member of class IWebBrowserAppDisp.
	GoBack (see page 19436)	This is GoBack, a member of class IWebBrowserAppDisp.
	GoForward (see page 19436)	This is GoForward, a member of class IWebBrowserAppDisp.
	GoHome (see page 19437)	This is GoHome, a member of class IWebBrowserAppDisp.
	GoSearch (see page 19437)	This is GoSearch, a member of class IWebBrowserAppDisp.
	Navigate (see page 19437)	This is Navigate, a member of class IWebBrowserAppDisp.
	PutProperty (see page 19437)	This is PutProperty, a member of class IWebBrowserAppDisp.
	Quit (see page 19438)	This is Quit, a member of class IWebBrowserAppDisp.
	Refresh (see page 19438)	This is Refresh, a member of class IWebBrowserAppDisp.
	Refresh2 (see page 19438)	This is Refresh2, a member of class IWebBrowserAppDisp.
	Stop (see page 19438)	This is Stop, a member of class IWebBrowserAppDisp.

Public Properties

	Name	Description
	Application (see page 19439)	This is Application, a member of class IWebBrowserAppDisp.
	Busy (see page 19439)	This is Busy, a member of class IWebBrowserAppDisp.
	Container (see page 19439)	This is Container, a member of class IWebBrowserAppDisp.
	Document (see page 19440)	This is Document, a member of class IWebBrowserAppDisp.
	FullName (see page 19440)	This is FullName, a member of class IWebBrowserAppDisp.
	FullScreen (see page 19440)	This is FullScreen, a member of class IWebBrowserAppDisp.
	Height (see page 19440)	This is Height, a member of class IWebBrowserAppDisp.
	HWnd (see page 19441)	This is HWnd, a member of class IWebBrowserAppDisp.
	Left (see page 19441)	This is Left, a member of class IWebBrowserAppDisp.
	LocationName (see page 19441)	This is LocationName, a member of class IWebBrowserAppDisp.
	LocationURL (see page 19441)	This is LocationURL, a member of class IWebBrowserAppDisp.
	MenuBar (see page 19441)	This is MenuBar, a member of class IWebBrowserAppDisp.
	Name (see page 19442)	This is Name, a member of class IWebBrowserAppDisp.
	Parent (see page 19442)	This is Parent, a member of class IWebBrowserAppDisp.
	Path (see page 19442)	This is Path, a member of class IWebBrowserAppDisp.
	StatusBar (see page 19442)	This is StatusBar, a member of class IWebBrowserAppDisp.
	StatusText (see page 19443)	This is StatusText, a member of class IWebBrowserAppDisp.
	ToolBar (see page 19443)	This is ToolBar, a member of class IWebBrowserAppDisp.
	Top (see page 19443)	This is Top, a member of class IWebBrowserAppDisp.
	TopLevelContainer (see page 19443)	This is TopLevelContainer, a member of class IWebBrowserAppDisp.
	type_ (see page 19443)	This is type_, a member of class IWebBrowserAppDisp.
	Visible (see page 19444)	This is Visible, a member of class IWebBrowserAppDisp.
	Width (see page 19444)	This is Width, a member of class IWebBrowserAppDisp.

132.2.30.2 IWebBrowserAppDisp Methods

The methods of the IWebBrowserAppDisp class are listed here.

Public Methods

	Name	Description
	ClientToWindow (see page 19436)	This is ClientToWindow, a member of class IWebBrowserAppDisp.

	GetProperty (see page 19436)	This is GetProperty, a member of class IWebBrowserAppDisp.
	GoBack (see page 19436)	This is GoBack, a member of class IWebBrowserAppDisp.
	GoForward (see page 19436)	This is GoForward, a member of class IWebBrowserAppDisp.
	GoHome (see page 19437)	This is GoHome, a member of class IWebBrowserAppDisp.
	GoSearch (see page 19437)	This is GoSearch, a member of class IWebBrowserAppDisp.
	Navigate (see page 19437)	This is Navigate, a member of class IWebBrowserAppDisp.
	PutProperty (see page 19437)	This is PutProperty, a member of class IWebBrowserAppDisp.
	Quit (see page 19438)	This is Quit, a member of class IWebBrowserAppDisp.
	Refresh (see page 19438)	This is Refresh, a member of class IWebBrowserAppDisp.
	Refresh2 (see page 19438)	This is Refresh2, a member of class IWebBrowserAppDisp.
	Stop (see page 19438)	This is Stop, a member of class IWebBrowserAppDisp.

132.2.30.2.1 IWebBrowserAppDisp.ClientToWindow Method

Pascal

```
procedure ClientToWindow(var pcx: SYSINT; var pcy: SYSINT);
```

C++

```
__fastcall ClientToWindow(SYSINT pcx, SYSINT pcy);
```

Description

This is ClientToWindow, a member of class IWebBrowserAppDisp.

132.2.30.2.2 IWebBrowserAppDisp.GetProperty Method

Pascal

```
function GetProperty(const Property_: WideString): OleVariant;
```

C++

```
__fastcall OleVariant GetProperty(const BSTR Property_);
```

Description

This is GetProperty, a member of class IWebBrowserAppDisp.

132.2.30.2.3 IWebBrowserAppDisp.GoBack Method

Pascal

```
procedure GoBack;
```

C++

```
__fastcall GoBack();
```

Description

This is GoBack, a member of class IWebBrowserAppDisp.

132.2.30.2.4 IWebBrowserAppDisp.GoForward Method

Pascal

```
procedure GoForward;
```

C++

```
__fastcall GoForward();
```

Description

This is GoForward, a member of class IWebBrowserAppDisp.

132.2.30.2.5 IWebBrowserAppDisp.GoHome Method

Pascal

```
procedure GoHome;
```

C++

```
__fastcall GoHome();
```

Description

This is GoHome, a member of class IWebBrowserAppDisp.

132.2.30.2.6 IWebBrowserAppDisp.GoSearch Method

Pascal

```
procedure GoSearch;
```

C++

```
__fastcall GoSearch();
```

Description

This is GoSearch, a member of class IWebBrowserAppDisp.

132.2.30.2.7 IWebBrowserAppDisp.Navigate Method

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant);
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate, a member of class IWebBrowserAppDisp.

132.2.30.2.8 IWebBrowserAppDisp.PutProperty Method

Pascal

```
procedure PutProperty(const Property_: WideString; vtValue: OleVariant);
```

C++

```
__fastcall PutProperty(const BSTR Property_, OleVariant vtValue);
```

Description

This is PutProperty, a member of class IWebBrowserAppDisp.

132.2.30.2.9 IWebBrowserAppDisp.Quit Method

Pascal

```
procedure Quit;
```

C++

```
__fastcall Quit();
```

Description

This is Quit, a member of class IWebBrowserAppDisp.

132.2.30.2.10 IWebBrowserAppDisp.Refresh Method

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

This is Refresh, a member of class IWebBrowserAppDisp.

132.2.30.2.11 IWebBrowserAppDisp.Refresh2 Method

Pascal

```
procedure Refresh2(var Level: OleVariant);
```

C++

```
__fastcall Refresh2(OleVariant Level);
```

Description

This is Refresh2, a member of class IWebBrowserAppDisp.

132.2.30.2.12 IWebBrowserAppDisp.Stop Method

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

This is Stop, a member of class IWebBrowserAppDisp.

132.2.30.3 IWebBrowserAppDisp Properties

The properties of the IWebBrowserAppDisp class are listed here.

Public Properties

	Name	Description
	Application (see page 19439)	This is Application, a member of class IWebBrowserAppDisp.
	Busy (see page 19439)	This is Busy, a member of class IWebBrowserAppDisp.
	Container (see page 19439)	This is Container, a member of class IWebBrowserAppDisp.
	Document (see page 19440)	This is Document, a member of class IWebBrowserAppDisp.
	FullName (see page 19440)	This is FullName, a member of class IWebBrowserAppDisp.
	FullScreen (see page 19440)	This is FullScreen, a member of class IWebBrowserAppDisp.
	Height (see page 19440)	This is Height, a member of class IWebBrowserAppDisp.
	HWnd (see page 19441)	This is HWnd, a member of class IWebBrowserAppDisp.
	Left (see page 19441)	This is Left, a member of class IWebBrowserAppDisp.
	LocationName (see page 19441)	This is LocationName, a member of class IWebBrowserAppDisp.
	LocationURL (see page 19441)	This is LocationURL, a member of class IWebBrowserAppDisp.
	MenuBar (see page 19441)	This is MenuBar, a member of class IWebBrowserAppDisp.
	Name (see page 19442)	This is Name, a member of class IWebBrowserAppDisp.
	Parent (see page 19442)	This is Parent, a member of class IWebBrowserAppDisp.
	Path (see page 19442)	This is Path, a member of class IWebBrowserAppDisp.
	StatusBar (see page 19442)	This is StatusBar, a member of class IWebBrowserAppDisp.
	StatusText (see page 19443)	This is StatusText, a member of class IWebBrowserAppDisp.
	ToolBar (see page 19443)	This is ToolBar, a member of class IWebBrowserAppDisp.
	Top (see page 19443)	This is Top, a member of class IWebBrowserAppDisp.
	TopLevelContainer (see page 19443)	This is TopLevelContainer, a member of class IWebBrowserAppDisp.
	type_ (see page 19443)	This is type_, a member of class IWebBrowserAppDisp.
	Visible (see page 19444)	This is Visible, a member of class IWebBrowserAppDisp.
	Width (see page 19444)	This is Width, a member of class IWebBrowserAppDisp.

132.2.30.3.1 IWebBrowserAppDisp.Application Property

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

This is Application, a member of class IWebBrowserAppDisp.

132.2.30.3.2 IWebBrowserAppDisp.Busy Property

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

This is Busy, a member of class IWebBrowserAppDisp.

132.2.30.3.3 IWebBrowserAppDisp.Container Property

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

This is Container, a member of class IWebBrowserAppDisp.

132.2.30.3.4 IWebBrowserAppDisp.Document Property

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

This is Document, a member of class IWebBrowserAppDisp.

132.2.30.3.5 IWebBrowserAppDisp.FullName Property

Pascal

```
property FullName: WideString;
```

C++

```
__property BSTR FullName;
```

Description

This is FullName, a member of class IWebBrowserAppDisp.

132.2.30.3.6 IWebBrowserAppDisp.FullScreen Property

Pascal

```
property FullScreen: WordBool;
```

C++

```
__property WordBool FullScreen;
```

Description

This is FullScreen, a member of class IWebBrowserAppDisp.

132.2.30.3.7 IWebBrowserAppDisp.Height Property

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

This is Height, a member of class IWebBrowserAppDisp.

132.2.30.3.8 IWebBrowserAppDisp.HWnd Property

Pascal

```
property HWnd: Integer;
```

C++

```
__property int HWnd;
```

Description

This is HWnd, a member of class IWebBrowserAppDisp.

132.2.30.3.9 IWebBrowserAppDisp.Left Property

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

This is Left, a member of class IWebBrowserAppDisp.

132.2.30.3.10 IWebBrowserAppDisp.LocationName Property

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

This is LocationName, a member of class IWebBrowserAppDisp.

132.2.30.3.11 IWebBrowserAppDisp.LocationURL Property

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

This is LocationURL, a member of class IWebBrowserAppDisp.

132.2.30.3.12 IWebBrowserAppDisp.MenuBar Property

Pascal

```
property MenuBar: WordBool;
```

C++

```
__property WordBool MenuBar;
```

Description

This is MenuBar, a member of class IWebBrowserAppDisp.

132.2.30.3.13 IWebBrowserAppDisp.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IWebBrowserAppDisp.

132.2.30.3.14 IWebBrowserAppDisp.Parent Property

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

This is Parent, a member of class IWebBrowserAppDisp.

132.2.30.3.15 IWebBrowserAppDisp.Path Property

Pascal

```
property Path: WideString;
```

C++

```
__property BSTR Path;
```

Description

This is Path, a member of class IWebBrowserAppDisp.

132.2.30.3.16 IWebBrowserAppDisp.StatusBar Property

Pascal

```
property StatusBar: WordBool;
```

C++

```
__property WordBool StatusBar;
```

Description

This is StatusBar, a member of class IWebBrowserAppDisp.

132.2.30.3.17 IWebBrowserAppDisp.StatusText Property

Pascal

```
property StatusText: WideString;
```

C++

```
__property BSTR StatusText;
```

Description

This is StatusText, a member of class IWebBrowserAppDisp.

132.2.30.3.18 IWebBrowserAppDisp.ToolBar Property

Pascal

```
property ToolBar: SYSINT;
```

C++

```
__property SYSINT ToolBar;
```

Description

This is ToolBar, a member of class IWebBrowserAppDisp.

132.2.30.3.19 IWebBrowserAppDisp.Top Property

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

This is Top, a member of class IWebBrowserAppDisp.

132.2.30.3.20 IWebBrowserAppDisp.TopLevelContainer Property

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

This is TopLevelContainer, a member of class IWebBrowserAppDisp.

132.2.30.3.21 IWebBrowserAppDisp.type_ Property

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

This is type_, a member of class IWebBrowserAppDisp.

132.2.30.3.22 IWebBrowserAppDisp.Visible Property

Pascal

```
property Visible: WordBool;
```

C++

```
__property WordBool Visible;
```

Description

This is Visible, a member of class IWebBrowserAppDisp.

132.2.30.3.23 IWebBrowserAppDisp.Width Property

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

This is Width, a member of class IWebBrowserAppDisp.

132.2.31 IWebBrowserDisp Interface

Class Hierarchy

SHDocVw.IWebBrowserDisp

Pascal

```
IWebBrowserDisp = dispinterface;
```

C++

```
class IWebBrowserDisp;
```

File

SHDocVw

Description

This is class SHDocVw.IWebBrowserDisp.

132.2.31.1 IWebBrowserDisp Members

The following tables list the members exposed by IWebBrowserDisp.

Public Methods

	Name	Description
	GoBack (see page 19445)	This is GoBack, a member of class IWebBrowserDisp.
	GoForward (see page 19446)	This is GoForward, a member of class IWebBrowserDisp.
	GoHome (see page 19446)	This is GoHome, a member of class IWebBrowserDisp.
	GoSearch (see page 19446)	This is GoSearch, a member of class IWebBrowserDisp.
	Navigate (see page 19446)	This is Navigate, a member of class IWebBrowserDisp.
	Refresh (see page 19446)	This is Refresh, a member of class IWebBrowserDisp.
	Refresh2 (see page 19447)	This is Refresh2, a member of class IWebBrowserDisp.
	Stop (see page 19447)	This is Stop, a member of class IWebBrowserDisp.

Public Properties

	Name	Description
	Application (see page 19448)	This is Application, a member of class IWebBrowserDisp.
	Busy (see page 19448)	This is Busy, a member of class IWebBrowserDisp.
	Container (see page 19448)	This is Container, a member of class IWebBrowserDisp.
	Document (see page 19448)	This is Document, a member of class IWebBrowserDisp.
	Height (see page 19448)	This is Height, a member of class IWebBrowserDisp.
	Left (see page 19449)	This is Left, a member of class IWebBrowserDisp.
	LocationName (see page 19449)	This is LocationName, a member of class IWebBrowserDisp.
	LocationURL (see page 19449)	This is LocationURL, a member of class IWebBrowserDisp.
	Parent (see page 19449)	This is Parent, a member of class IWebBrowserDisp.
	Top (see page 19450)	This is Top, a member of class IWebBrowserDisp.
	TopLevelContainer (see page 19450)	This is TopLevelContainer, a member of class IWebBrowserDisp.
	type_ (see page 19450)	This is type_, a member of class IWebBrowserDisp.
	Width (see page 19450)	This is Width, a member of class IWebBrowserDisp.

132.2.31.2 IWebBrowserDisp Methods

The methods of the IWebBrowserDisp class are listed here.

Public Methods

	Name	Description
	GoBack (see page 19445)	This is GoBack, a member of class IWebBrowserDisp.
	GoForward (see page 19446)	This is GoForward, a member of class IWebBrowserDisp.
	GoHome (see page 19446)	This is GoHome, a member of class IWebBrowserDisp.
	GoSearch (see page 19446)	This is GoSearch, a member of class IWebBrowserDisp.
	Navigate (see page 19446)	This is Navigate, a member of class IWebBrowserDisp.
	Refresh (see page 19446)	This is Refresh, a member of class IWebBrowserDisp.
	Refresh2 (see page 19447)	This is Refresh2, a member of class IWebBrowserDisp.
	Stop (see page 19447)	This is Stop, a member of class IWebBrowserDisp.

132.2.31.2.1 IWebBrowserDisp.GoBack Method

Pascal

```
procedure GoBack;
```

C++

```
__fastcall GoBack();
```

Description

This is GoBack, a member of class IWebBrowserDisp.

132.2.31.2.2 IWebBrowserDisp.GoForward Method

Pascal

```
procedure GoForward;
```

C++

```
__fastcall GoForward();
```

Description

This is GoForward, a member of class IWebBrowserDisp.

132.2.31.2.3 IWebBrowserDisp.GoHome Method

Pascal

```
procedure GoHome;
```

C++

```
__fastcall GoHome();
```

Description

This is GoHome, a member of class IWebBrowserDisp.

132.2.31.2.4 IWebBrowserDisp.GoSearch Method

Pascal

```
procedure GoSearch;
```

C++

```
__fastcall GoSearch();
```

Description

This is GoSearch, a member of class IWebBrowserDisp.

132.2.31.2.5 IWebBrowserDisp.Navigate Method

Pascal

```
procedure Navigate(const URL: WideString; const Flags: OleVariant; const TargetFrameName:
OleVariant; var PostData: OleVariant; const Headers: OleVariant);
```

C++

```
__fastcall Navigate(const BSTR URL, const OleVariant Flags, const OleVariant TargetFrameName,
OleVariant PostData, const OleVariant Headers);
```

Description

This is Navigate, a member of class IWebBrowserDisp.

132.2.31.2.6 IWebBrowserDisp.Refresh Method

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

This is Refresh, a member of class IWebBrowserDisp.

132.2.31.2.7 IWebBrowserDisp.Refresh2 Method

Pascal

```
procedure Refresh2(var Level: OleVariant);
```

C++

```
__fastcall Refresh2(OleVariant Level);
```

Description

This is Refresh2, a member of class IWebBrowserDisp.

132.2.31.2.8 IWebBrowserDisp.Stop Method

Pascal

```
procedure Stop;
```

C++

```
__fastcall Stop();
```

Description

This is Stop, a member of class IWebBrowserDisp.

132.2.31.3 IWebBrowserDisp Properties

The properties of the IWebBrowserDisp class are listed here.

Public Properties

	Name	Description
	Application (see page 19448)	This is Application, a member of class IWebBrowserDisp.
	Busy (see page 19448)	This is Busy, a member of class IWebBrowserDisp.
	Container (see page 19448)	This is Container, a member of class IWebBrowserDisp.
	Document (see page 19448)	This is Document, a member of class IWebBrowserDisp.
	Height (see page 19448)	This is Height, a member of class IWebBrowserDisp.
	Left (see page 19449)	This is Left, a member of class IWebBrowserDisp.
	LocationName (see page 19449)	This is LocationName, a member of class IWebBrowserDisp.
	LocationURL (see page 19449)	This is LocationURL, a member of class IWebBrowserDisp.
	Parent (see page 19449)	This is Parent, a member of class IWebBrowserDisp.
	Top (see page 19450)	This is Top, a member of class IWebBrowserDisp.
	TopLevelContainer (see page 19450)	This is TopLevelContainer, a member of class IWebBrowserDisp.
	type_ (see page 19450)	This is type_, a member of class IWebBrowserDisp.
	Width (see page 19450)	This is Width, a member of class IWebBrowserDisp.

132.2.31.3.1 IWebBrowserDisp.Application Property

Pascal

```
property Application: IDispatch;
```

C++

```
__property IDispatch Application;
```

Description

This is Application, a member of class IWebBrowserDisp.

132.2.31.3.2 IWebBrowserDisp.Busy Property

Pascal

```
property Busy: WordBool;
```

C++

```
__property WordBool Busy;
```

Description

This is Busy, a member of class IWebBrowserDisp.

132.2.31.3.3 IWebBrowserDisp.Container Property

Pascal

```
property Container: IDispatch;
```

C++

```
__property IDispatch Container;
```

Description

This is Container, a member of class IWebBrowserDisp.

132.2.31.3.4 IWebBrowserDisp.Document Property

Pascal

```
property Document: IDispatch;
```

C++

```
__property IDispatch Document;
```

Description

This is Document, a member of class IWebBrowserDisp.

132.2.31.3.5 IWebBrowserDisp.Height Property

Pascal

```
property Height: Integer;
```

C++

```
__property int Height;
```

Description

This is Height, a member of class IWebBrowserDisp.

132.2.31.3.6 IWebBrowserDisp.Left Property

Pascal

```
property Left: Integer;
```

C++

```
__property int Left;
```

Description

This is Left, a member of class IWebBrowserDisp.

132.2.31.3.7 IWebBrowserDisp.LocationName Property

Pascal

```
property LocationName: WideString;
```

C++

```
__property BSTR LocationName;
```

Description

This is LocationName, a member of class IWebBrowserDisp.

132.2.31.3.8 IWebBrowserDisp.LocationURL Property

Pascal

```
property LocationURL: WideString;
```

C++

```
__property BSTR LocationURL;
```

Description

This is LocationURL, a member of class IWebBrowserDisp.

132.2.31.3.9 IWebBrowserDisp.Parent Property

Pascal

```
property Parent: IDispatch;
```

C++

```
__property IDispatch Parent;
```

Description

This is Parent, a member of class IWebBrowserDisp.

132.2.31.3.10 IWebBrowserDisp.Top Property

Pascal

```
property Top: Integer;
```

C++

```
__property int Top;
```

Description

This is Top, a member of class IWebBrowserDisp.

132.2.31.3.11 IWebBrowserDisp.TopLevelContainer Property

Pascal

```
property TopLevelContainer: WordBool;
```

C++

```
__property WordBool TopLevelContainer;
```

Description

This is TopLevelContainer, a member of class IWebBrowserDisp.

132.2.31.3.12 IWebBrowserDisp.type_ Property

Pascal

```
property type_: WideString;
```

C++

```
__property BSTR type_;
```

Description

This is type_, a member of class IWebBrowserDisp.

132.2.31.3.13 IWebBrowserDisp.Width Property

Pascal

```
property Width: Integer;
```

C++

```
__property int Width;
```

Description

This is Width, a member of class IWebBrowserDisp.

132.3 Types

The following table lists types in this documentation.

Types

Name	Description
BrowserNavConstants (see page 19453)	This is type SHDocVw.BrowserNavConstants.
CommandStateChangeConstants (see page 19453)	This is type SHDocVw.CommandStateChangeConstants.
CScriptErrorList (see page 19453)	This is type SHDocVw.CScriptErrorList.
InternetExplorer (see page 19454)	This is type SHDocVw.InternetExplorer.
OLECMDEXECOPT (see page 19454)	OLECMDF (see page 19455) influences the way in which an OLECMDID (see page 19455) command is executed.
OLECMDF (see page 19455)	OLECMDF represents the type of support an Automation object provides for a specific command at a specific time.
OLECMDID (see page 19455)	OLECMDID represents a command that can be executed by an Automation object.
POleVariant1 (see page 19456)	This is type SHDocVw.POleVariant1.
RefreshConstants (see page 19456)	This is type SHDocVw.RefreshConstants.
SearchAssistantOC (see page 19456)	This is type SHDocVw.SearchAssistantOC.
SecureLockIconConstants (see page 19457)	This is type SHDocVw.SecureLockIconConstants.
ShellBrowserWindow (see page 19457)	This is type SHDocVw.ShellBrowserWindow.
ShellNameSpace (see page 19457)	This is type SHDocVw.ShellNameSpace.
ShellUIHelper (see page 19458)	This is type SHDocVw.ShellUIHelper.
ShellWindowFindWindowOptions (see page 19458)	This is type SHDocVw.ShellWindowFindWindowOptions.
ShellWindows (see page 19458)	This is type SHDocVw.ShellWindows.
ShellWindowTypeConstants (see page 19459)	This is type SHDocVw.ShellWindowTypeConstants.
tagREADYSTATE (see page 19459)	This is type SHDocVw.tagREADYSTATE.
TInternetExplorerBeforeNavigate2 (see page 19459)	This is type SHDocVw.TInternetExplorerBeforeNavigate2.
TInternetExplorerClientToHostWindow (see page 19460)	This is type SHDocVw.TInternetExplorerClientToHostWindow.
TInternetExplorerCommandStateChange (see page 19460)	This is type SHDocVw.TInternetExplorerCommandStateChange.
TInternetExplorerDocumentComplete (see page 19460)	This is type SHDocVw.TInternetExplorerDocumentComplete.
TInternetExplorerFileDownload (see page 19461)	This is type SHDocVw.TInternetExplorerFileDownload.
TInternetExplorerNavigateComplete2 (see page 19461)	This is type SHDocVw.TInternetExplorerNavigateComplete2.
TInternetExplorerNavigateError (see page 19461)	This is type SHDocVw.TInternetExplorerNavigateError.
TInternetExplorerNewWindow2 (see page 19462)	This is type SHDocVw.TInternetExplorerNewWindow2.
TInternetExplorerOnFullScreen (see page 19462)	This is type SHDocVw.TInternetExplorerOnFullScreen.
TInternetExplorerOnMenuBar (see page 19462)	This is type SHDocVw.TInternetExplorerOnMenuBar.
TInternetExplorerOnStatusBar (see page 19463)	This is type SHDocVw.TInternetExplorerOnStatusBar.
TInternetExplorerOnTheaterMode (see page 19463)	This is type SHDocVw.TInternetExplorerOnTheaterMode.
TInternetExplorerOnToolBar (see page 19463)	This is type SHDocVw.TInternetExplorerOnToolBar.
TInternetExplorerOnVisible (see page 19464)	This is type SHDocVw.TInternetExplorerOnVisible.
TInternetExplorerPrintTemplateInstantiation (see page 19464)	This is type SHDocVw.TInternetExplorerPrintTemplateInstantiation.
TInternetExplorerPrintTemplateTeardown (see page 19464)	This is type SHDocVw.TInternetExplorerPrintTemplateTeardown.
TInternetExplorerPrivacyImpactedStateChange (see page 19465)	This is type SHDocVw.TInternetExplorerPrivacyImpactedStateChange.
TInternetExplorerProgressChange (see page 19465)	This is type SHDocVw.TInternetExplorerProgressChange.
TInternetExplorerPropertyChange (see page 19465)	This is type SHDocVw.TInternetExplorerPropertyChange.
TInternetExplorerSetSecureLockIcon (see page 19466)	This is type SHDocVw.TInternetExplorerSetSecureLockIcon.
TInternetExplorerStatusTextChange (see page 19466)	This is type SHDocVw.TInternetExplorerStatusTextChange.
TInternetExplorerTitleChange (see page 19466)	This is type SHDocVw.TInternetExplorerTitleChange.
TInternetExplorerUpdatePageStatus (see page 19467)	This is type SHDocVw.TInternetExplorerUpdatePageStatus.
TInternetExplorerWindowClosing (see page 19467)	This is type SHDocVw.TInternetExplorerWindowClosing.

TInternetExplorerWindowSetHeight (see page 19467)	This is type SHDocVw.TInternetExplorerWindowSetHeight.
TInternetExplorerWindowSetLeft (see page 19468)	This is type SHDocVw.TInternetExplorerWindowSetLeft.
TInternetExplorerWindowSetResizable (see page 19468)	This is type SHDocVw.TInternetExplorerWindowSetResizable.
TInternetExplorerWindowSetTop (see page 19468)	This is type SHDocVw.TInternetExplorerWindowSetTop.
TInternetExplorerWindowSetWidth (see page 19469)	This is type SHDocVw.TInternetExplorerWindowSetWidth.
TShellNameSpaceFavoritesSelectionChange (see page 19469)	This is type SHDocVw.TShellNameSpaceFavoritesSelectionChange.
TShellWindowsWindowRegistered (see page 19470)	This is type SHDocVw.TShellWindowsWindowRegistered.
TShellWindowsWindowRevoked (see page 19470)	This is type SHDocVw.TShellWindowsWindowRevoked.
TWebBrowser_V1BeforeNavigate (see page 19470)	This is type SHDocVw.TWebBrowser_V1BeforeNavigate.
TWebBrowser_V1CommandStateChange (see page 19471)	This is type SHDocVw.TWebBrowser_V1CommandStateChange.
TWebBrowser_V1FrameBeforeNavigate (see page 19471)	This is type SHDocVw.TWebBrowser_V1FrameBeforeNavigate.
TWebBrowser_V1FrameNavigateComplete (see page 19471)	This is type SHDocVw.TWebBrowser_V1FrameNavigateComplete.
TWebBrowser_V1FrameNewWindow (see page 19472)	This is type SHDocVw.TWebBrowser_V1FrameNewWindow.
TWebBrowser_V1NavigateComplete (see page 19472)	This is type SHDocVw.TWebBrowser_V1NavigateComplete.
TWebBrowser_V1NewWindow (see page 19472)	This is type SHDocVw.TWebBrowser_V1NewWindow.
TWebBrowser_V1ProgressChange (see page 19473)	This is type SHDocVw.TWebBrowser_V1ProgressChange.
TWebBrowser_V1PropertyChange (see page 19473)	This is type SHDocVw.TWebBrowser_V1PropertyChange.
TWebBrowser_V1Quit (see page 19474)	This is type SHDocVw.TWebBrowser_V1Quit.
TWebBrowser_V1StatusTextChange (see page 19474)	This is type SHDocVw.TWebBrowser_V1StatusTextChange.
TWebBrowser_V1TitleChange (see page 19474)	This is type SHDocVw.TWebBrowser_V1TitleChange.
TWebBrowserBeforeNavigate2 (see page 19475)	This is type SHDocVw.TWebBrowserBeforeNavigate2.
TWebBrowserClientToHostWindow (see page 19475)	This is type SHDocVw.TWebBrowserClientToHostWindow.
TWebBrowserCommandStateChange (see page 19475)	This is type SHDocVw.TWebBrowserCommandStateChange.
TWebBrowserDocumentComplete (see page 19476)	This is type SHDocVw.TWebBrowserDocumentComplete.
TWebBrowserFileDownload (see page 19476)	This is type SHDocVw.TWebBrowserFileDownload.
TWebBrowserNavigateComplete2 (see page 19476)	This is type SHDocVw.TWebBrowserNavigateComplete2.
TWebBrowserNavigateError (see page 19477)	This is type SHDocVw.TWebBrowserNavigateError.
TWebBrowserNewWindow2 (see page 19477)	This is type SHDocVw.TWebBrowserNewWindow2.
TWebBrowserOnFullScreen (see page 19477)	This is type SHDocVw.TWebBrowserOnFullScreen.
TWebBrowserOnMenuBar (see page 19478)	This is type SHDocVw.TWebBrowserOnMenuBar.
TWebBrowserOnStatusBar (see page 19478)	This is type SHDocVw.TWebBrowserOnStatusBar.
TWebBrowserOnTheaterMode (see page 19478)	This is type SHDocVw.TWebBrowserOnTheaterMode.
TWebBrowserOnToolBar (see page 19479)	This is type SHDocVw.TWebBrowserOnToolBar.
TWebBrowserOnVisible (see page 19479)	This is type SHDocVw.TWebBrowserOnVisible.
TWebBrowserPrintTemplateInstantiation (see page 19479)	This is type SHDocVw.TWebBrowserPrintTemplateInstantiation.
TWebBrowserPrintTemplateTeardown (see page 19480)	This is type SHDocVw.TWebBrowserPrintTemplateTeardown.
TWebBrowserPrivacyImpactedStateChange (see page 19480)	This is type SHDocVw.TWebBrowserPrivacyImpactedStateChange.
TWebBrowserProgressChange (see page 19480)	This is type SHDocVw.TWebBrowserProgressChange.
TWebBrowserPropertyChange (see page 19481)	This is type SHDocVw.TWebBrowserPropertyChange.
TWebBrowserSetSecureLockIcon (see page 19481)	This is type SHDocVw.TWebBrowserSetSecureLockIcon.
TWebBrowserStatusTextChange (see page 19481)	This is type SHDocVw.TWebBrowserStatusTextChange.
TWebBrowserTitleChange (see page 19482)	This is type SHDocVw.TWebBrowserTitleChange.
TWebBrowserUpdatePageStatus (see page 19482)	This is type SHDocVw.TWebBrowserUpdatePageStatus.
TWebBrowserWindowClosing (see page 19482)	This is type SHDocVw.TWebBrowserWindowClosing.
TWebBrowserWindowSetHeight (see page 19483)	This is type SHDocVw.TWebBrowserWindowSetHeight.
TWebBrowserWindowSetLeft (see page 19483)	This is type SHDocVw.TWebBrowserWindowSetLeft.
TWebBrowserWindowSetResizable (see page 19483)	This is type SHDocVw.TWebBrowserWindowSetResizable.
TWebBrowserWindowSetTop (see page 19484)	This is type SHDocVw.TWebBrowserWindowSetTop.
TWebBrowserWindowSetWidth (see page 19484)	This is type SHDocVw.TWebBrowserWindowSetWidth.
WebBrowser (see page 19484)	This is type SHDocVw.WebBrowser.
WebBrowser_V1 (see page 19485)	This is type SHDocVw.WebBrowser_V1.

132.3.1 SHDocVw.BrowserNavConstants Type

Pascal

```
BrowserNavConstants = TOleEnum;
```

C++

```
TOleEnum BrowserNavConstants;
```

File

SHDocVw

Description

This is type SHDocVw.BrowserNavConstants.

132.3.2 SHDocVw.CommandStateChangeConstants Type

Pascal

```
CommandStateChangeConstants = TOleEnum;
```

C++

```
TOleEnum CommandStateChangeConstants;
```

File

SHDocVw

Description

This is type SHDocVw.CommandStateChangeConstants.

132.3.3 SHDocVw.CScriptErrorList Type

Pascal

```
CScriptErrorList = IScriptErrorList;
```

C++

```
IScriptErrorList CScriptErrorList;
```

File

SHDocVw

Description

This is type SHDocVw.CScriptErrorList.

132.3.4 SHDocVw.InternetExplorer Type

Pascal

```
InternetExplorer = IWebBrowser2;
```

C++

```
IWebBrowser2 InternetExplorer;
```

File

SHDocVw

Description

This is type SHDocVw.InternetExplorer.

132.3.5 SHDocVw.OLECMDEXECOPT Type

OLECMDF (see page 19455) influences the way in which an OLECMDID (see page 19455) command is executed.

Pascal

```
OLECMDEXECOPT = TOleEnum;
```

C++

```
TOleEnum OLECMDEXECOPT;
```

File

SHDocVw

Description

In C++ code imported from the shdocvw type library, OLECMDEXECOPT indicates what an Automation object should do in response to an OLECMDID (see page 19455) command. The following table lists the possible values:

Constant	Value	Meaning
OLECMDEXECOPT_DODEFAULT (see page 19503)	0	Use the default behavior, whether prompting the user for input or not.
OLECMDEXECOPT_PROMPTUSER (see page 19503)	1	Execute the command after obtaining user input.
OLECMDEXECOPT_DONTPROMPTUSER (see page 19503)	2	Execute the command without prompting the user.
OLECMDEXECOPT_SHOWHELP (see page 19504)	3	Show help for the command, but do not execute it.

See Also

OLECMDID (see page 19455)

132.3.6 SHDocVw.OLECMDF Type

OLECMDF represents the type of support an Automation object provides for a specific command at a specific time.

Pascal

```
OLECMDF = TOleEnum;
```

C++

```
TOleEnum OLECMDF;
```

File

SHDocVw

Description

In C++ code imported from the shdocvw type library, OLECMDF is a set of flags that together indicate how a command can be used. These values can be or'd together:

Value	Meaning	
OLECMDF_SUPPORTED (see page 19506)	The Automation object supports the command (but it may not be enabled).	
OLECMDF_ENABLED (see page 19504)	The command is currently enabled.	
OLECMDF_LATCHED (see page 19505)	The command is an on/off toggle that is currently on.	
OLECMDF_NINCHED (see page 19505)	Not currently used.	
OLECMDF_INVISIBLE (see page 19505)	Not currently used.	
OLECMDF_DEFHIDEONCTXTMENU (see page 19504)	Not currently used.	

See Also

OLECMDID (see page 19455)

132.3.7 SHDocVw.OLECMDID Type

OLECMDID represents a command that can be executed by an Automation object.

Pascal

```
OLECMDID = TOleEnum;
```

C++

```
TOleEnum OLECMDID;
```

File

SHDocVw

Description

In C++ code imported from the shdocvw type library, OLECMDID represents a set of standard commands that can be executed by many Automation objects. Typically, each command represents a command in the user interface of the Automation object, such as a menu command. For specific details on how the Automation object interprets a particular command, see the documentation for the Automation object.

See Also

OLECMDEXECOPT (see page 19454)

132.3.8 SHDocVw.POleVariant1 Type

Pascal

```
POleVariant1 = ^OleVariant;
```

C++

```
^OleVariant POleVariant1;
```

File

SHDocVw

Description

This is type SHDocVw.POleVariant1.

132.3.9 SHDocVw.RefreshConstants Type

Pascal

```
RefreshConstants = TOleEnum;
```

C++

```
TOleEnum RefreshConstants;
```

File

SHDocVw

Description

This is type SHDocVw.RefreshConstants.

132.3.10 SHDocVw.SearchAssistantOC Type

Pascal

```
SearchAssistantOC = ISearchAssistantOC3;
```

C++

```
ISearchAssistantOC3 SearchAssistantOC;
```

File

SHDocVw

Description

This is type SHDocVw.SearchAssistantOC.

132.3.11 SHDocVw.SecureLockIconConstants Type

Pascal

```
SecureLockIconConstants = TOleEnum;
```

C++

```
TOleEnum SecureLockIconConstants;
```

File

SHDocVw

Description

This is type SHDocVw.SecureLockIconConstants.

132.3.12 SHDocVw.ShellBrowserWindow Type

Pascal

```
ShellBrowserWindow = IWebBrowser2;
```

C++

```
IWebBrowser2 ShellBrowserWindow;
```

File

SHDocVw

Description

This is type SHDocVw.ShellBrowserWindow.

132.3.13 SHDocVw.ShellNameSpace Type

Pascal

```
ShellNameSpace = IShellNameSpace;
```

C++

```
IShellNameSpace ShellNameSpace;
```

File

SHDocVw

Description

This is type SHDocVw.ShellNameSpace.

132.3.14 SHDocVw.ShellUIHelper Type

Pascal

```
ShellUIHelper = IShellUIHelper;
```

C++

```
IShellUIHelper ShellUIHelper;
```

File

SHDocVw

Description

This is type SHDocVw.ShellUIHelper.

132.3.15 SHDocVw.ShellWindowFindWindowOptions Type

Pascal

```
ShellWindowFindWindowOptions = TOleEnum;
```

C++

```
TOleEnum ShellWindowFindWindowOptions;
```

File

SHDocVw

Description

This is type SHDocVw.ShellWindowFindWindowOptions.

132.3.16 SHDocVw.ShellWindows Type

Pascal

```
ShellWindows = IShellWindows;
```

C++

```
IShellWindows ShellWindows;
```

File

SHDocVw

Description

This is type SHDocVw.ShellWindows.

132.3.17 SHDocVw.ShellWindowTypeConstants Type

Pascal

```
ShellWindowTypeConstants = TOleEnum;
```

C++

```
TOleEnum ShellWindowTypeConstants;
```

File

SHDocVw

Description

This is type SHDocVw.ShellWindowTypeConstants.

132.3.18 SHDocVw.tagREADYSTATE Type

Pascal

```
tagREADYSTATE = TOleEnum;
```

C++

```
TOleEnum tagREADYSTATE;
```

File

SHDocVw

Description

This is type SHDocVw.tagREADYSTATE.

132.3.19 SHDocVw.TInternetExplorerBeforeNavigate2 Type

Pascal

```
TInternetExplorerBeforeNavigate2 = procedure (ASender: TObject; const pDisp: IDispatch; var
URL: OleVariant; var Flags: OleVariant; var TargetFrameName: OleVariant; var PostData:
OleVariant; var Headers: OleVariant; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant; var Flags: OleVariant; var
TargetFrameName: OleVariant; var PostData: OleVariant; var Headers: OleVariant; var Cancel:
WordBool) ( TInternetExplorerBeforeNavigate2)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerBeforeNavigate2.

132.3.20 SHDocVw.TInternetExplorerClientToHostWindow Type

Pascal

```
TInternetExplorerClientToHostWindow = procedure (ASender: TObject; var CX: Integer; var CY:
Integer) of object;
```

C++

```
(ASender: TObject; var CX: Integer; var CY: Integer) ( TInternetExplorerClientToHostWindow)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerClientToHostWindow.

132.3.21 SHDocVw.TInternetExplorerCommandStateChange Type

Pascal

```
TInternetExplorerCommandStateChange = procedure (ASender: TObject; Command: Integer; Enable:
WordBool) of object;
```

C++

```
(ASender: TObject; Command: Integer; Enable: WordBool) (
TInternetExplorerCommandStateChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerCommandStateChange.

132.3.22 SHDocVw.TInternetExplorerDocumentComplete Type

Pascal

```
TInternetExplorerDocumentComplete = procedure (ASender: TObject; const pDisp: IDispatch; var
URL: OleVariant) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant) (
TInternetExplorerDocumentComplete)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerDocumentComplete.

132.3.23 SHDocVw.TInternetExplorerFileDownload Type

Pascal

```
TInternetExplorerFileDownload = procedure (ASender: TObject; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; var Cancel: WordBool) ( TInternetExplorerFileDownload)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerFileDownload.

132.3.24 SHDocVw.TInternetExplorerNavigateComplete2 Type

Pascal

```
TInternetExplorerNavigateComplete2 = procedure (ASender: TObject; const pDisp: IDispatch; var
URL: OleVariant) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant) (
TInternetExplorerNavigateComplete2)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerNavigateComplete2.

132.3.25 SHDocVw.TInternetExplorerNavigateError Type

Pascal

```
TInternetExplorerNavigateError = procedure (ASender: TObject; const pDisp: IDispatch; var URL:
OleVariant; var Frame: OleVariant; var StatusCode: OleVariant; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant; var Frame: OleVariant; var
```

```
StatusCode: OleVariant; var Cancel: WordBool) ( TInternetExplorerNavigateError)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerNavigateError.

132.3.26 SHDocVw.TInternetExplorerNewWindow2 Type

Pascal

```
TInternetExplorerNewWindow2 = procedure (ASender: TObject; var ppDisp: IDispatch; var Cancel:
WordBool) of object;
```

C++

```
(ASender: TObject; var ppDisp: IDispatch; var Cancel: WordBool) (
TInternetExplorerNewWindow2)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerNewWindow2.

132.3.27 SHDocVw.TInternetExplorerOnFullScreen Type

Pascal

```
TInternetExplorerOnFullScreen = procedure (ASender: TObject; FullScreen: WordBool) of object;
```

C++

```
(ASender: TObject; FullScreen: WordBool) ( TInternetExplorerOnFullScreen)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerOnFullScreen.

132.3.28 SHDocVw.TInternetExplorerOnMenuBar Type

Pascal

```
TInternetExplorerOnMenuBar = procedure (ASender: TObject; MenuBar: WordBool) of object;
```

C++

```
(ASender: TObject; MenuBar: WordBool) ( TInternetExplorerOnMenuBar)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerOnMenuBar.

132.3.29 SHDocVw.TInternetExplorerOnStatusBar Type

Pascal

```
TInternetExplorerOnStatusBar = procedure (ASender: TObject; StatusBar: WordBool) of object;
```

C++

```
(ASender: TObject; StatusBar: WordBool) ( TInternetExplorerOnStatusBar)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerOnStatusBar.

132.3.30 SHDocVw.TInternetExplorerOnTheaterMode Type

Pascal

```
TInternetExplorerOnTheaterMode = procedure (ASender: TObject; TheaterMode: WordBool) of object;
```

C++

```
(ASender: TObject; TheaterMode: WordBool) ( TInternetExplorerOnTheaterMode)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerOnTheaterMode.

132.3.31 SHDocVw.TInternetExplorerOnToolBar Type

Pascal

```
TInternetExplorerOnToolBar = procedure (ASender: TObject; ToolBar: WordBool) of object;
```

C++

```
(ASender: TObject; ToolBar: WordBool) ( TInternetExplorerOnToolBar)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerOnToolBar.

132.3.32 SHDocVw.TInternetExplorerOnVisible Type

Pascal

```
TInternetExplorerOnVisible = procedure (ASender: TObject; Visible: WordBool) of object;
```

C++

```
(ASender: TObject; Visible: WordBool) ( TInternetExplorerOnVisible)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerOnVisible.

132.3.33 SHDocVw.TInternetExplorerPrintTemplateInstantiation Type

Pascal

```
TInternetExplorerPrintTemplateInstantiation = procedure (ASender: TObject; const pDisp:
IDispatch) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch) ( TInternetExplorerPrintTemplateInstantiation)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerPrintTemplateInstantiation.

132.3.34 SHDocVw.TInternetExplorerPrintTemplateTeardown Type

Pascal

```
TInternetExplorerPrintTemplateTeardown = procedure (ASender: TObject; const pDisp: IDispatch)
of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch) ( TInternetExplorerPrintTemplateTeardown)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerPrintTemplateTeardown.

132.3.35 SHDocVw.TInternetExplorerPrivacyImpactedStateChange Type

Pascal

```
TInternetExplorerPrivacyImpactedStateChange = procedure (ASender: TObject; bImpacted:
WordBool) of object;
```

C++

```
(ASender: TObject; bImpacted: WordBool) ( TInternetExplorerPrivacyImpactedStateChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerPrivacyImpactedStateChange.

132.3.36 SHDocVw.TInternetExplorerProgressChange Type

Pascal

```
TInternetExplorerProgressChange = procedure (ASender: TObject; Progress: Integer; ProgressMax:
Integer) of object;
```

C++

```
(ASender: TObject; Progress: Integer; ProgressMax: Integer) (
TInternetExplorerProgressChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerProgressChange.

132.3.37 SHDocVw.TInternetExplorerPropertyChange Type

Pascal

```
TInternetExplorerPropertyChange = procedure (ASender: TObject; const szProperty: WideString)
of object;
```

C++

```
(ASender: TObject; const szProperty: WideString) ( TInternetExplorerPropertyChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerPropertyChange.

132.3.38 SHDocVw.TInternetExplorerSetSecureLockIcon Type

Pascal

```
TInternetExplorerSetSecureLockIcon = procedure (ASender: TObject; SecureLockIcon: Integer) of
object;
```

C++

```
(ASender: TObject; SecureLockIcon: Integer) ( TInternetExplorerSetSecureLockIcon)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerSetSecureLockIcon.

132.3.39 SHDocVw.TInternetExplorerStatusTextChange Type

Pascal

```
TInternetExplorerStatusTextChange = procedure (ASender: TObject; const Text: WideString) of
object;
```

C++

```
(ASender: TObject; const Text: WideString) ( TInternetExplorerStatusTextChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerStatusTextChange.

132.3.40 SHDocVw.TInternetExplorerTitleChange Type

Pascal

```
TInternetExplorerTitleChange = procedure (ASender: TObject; const Text: WideString) of object;
```

C++

```
(ASender: TObject; const Text: WideString) ( TInternetExplorerTitleChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerTitleChange.

132.3.41 SHDocVw.TInternetExplorerUpdatePageStatus Type

Pascal

```
TInternetExplorerUpdatePageStatus = procedure (ASender: TObject; const pDisp: IDispatch; var
nPage: OleVariant; var fDone: OleVariant) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var nPage: OleVariant; var fDone: OleVariant) (
TInternetExplorerUpdatePageStatus)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerUpdatePageStatus.

132.3.42 SHDocVw.TInternetExplorerWindowClosing Type

Pascal

```
TInternetExplorerWindowClosing = procedure (ASender: TObject; IsChildWindow: WordBool; var
Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; IsChildWindow: WordBool; var Cancel: WordBool) (
TInternetExplorerWindowClosing)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerWindowClosing.

132.3.43 SHDocVw.TInternetExplorerWindowSetHeight Type

Pascal

```
TInternetExplorerWindowSetHeight = procedure (ASender: TObject; Height: Integer) of object;
```

C++

```
(ASender: TObject; Height: Integer) ( TInternetExplorerWindowSetHeight)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerWindowSetHeight.

132.3.44 SHDocVw.TInternetExplorerWindowSetLeft Type

Pascal

```
TInternetExplorerWindowSetLeft = procedure (ASender: TObject; Left: Integer) of object;
```

C++

```
(ASender: TObject; Left: Integer) ( TInternetExplorerWindowSetLeft)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerWindowSetLeft.

132.3.45 SHDocVw.TInternetExplorerWindowSetResizable Type

Pascal

```
TInternetExplorerWindowSetResizable = procedure (ASender: TObject; Resizable: WordBool) of
object;
```

C++

```
(ASender: TObject; Resizable: WordBool) ( TInternetExplorerWindowSetResizable)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerWindowSetResizable.

132.3.46 SHDocVw.TInternetExplorerWindowSetTop Type

Pascal

```
TInternetExplorerWindowSetTop = procedure (ASender: TObject; Top: Integer) of object;
```

C++

```
(ASender: TObject; Top: Integer) ( TInternetExplorerWindowSetTop)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerWindowSetTop.

132.3.47 SHDocVw.TInternetExplorerWindowSetWidth Type

Pascal

```
TInternetExplorerWindowSetWidth = procedure (ASender: TObject; Width: Integer) of object;
```

C++

```
(ASender: TObject; Width: Integer) ( TInternetExplorerWindowSetWidth)();
```

File

SHDocVw

Description

This is type SHDocVw.TInternetExplorerWindowSetWidth.

132.3.48 SHDocVw.TShellNameSpaceFavoritesSelectionChange Type

Pascal

```
TShellNameSpaceFavoritesSelectionChange = procedure (ASender: TObject; cItems: Integer; hItem:
Integer; const strName: WideString; const strUrl: WideString; cVisits: Integer; const strDate:
WideString; fAvailableOffline: Integer) of object;
```

C++

```
(ASender: TObject; cItems: Integer; hItem: Integer; const strName: WideString; const strUrl:
WideString; cVisits: Integer; const strDate: WideString; fAvailableOffline: Integer) (
TShellNameSpaceFavoritesSelectionChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TShellNameSpaceFavoritesSelectionChange.

132.3.49 SHDocVw.TShellWindowsWindowRegistered Type

Pascal

```
TShellWindowsWindowRegistered = procedure (ASender: TObject; lCookie: Integer) of object;
```

C++

```
(ASender: TObject; lCookie: Integer) ( TShellWindowsWindowRegistered)();
```

File

SHDocVw

Description

This is type SHDocVw.TShellWindowsWindowRegistered.

132.3.50 SHDocVw.TShellWindowsWindowRevoked Type

Pascal

```
TShellWindowsWindowRevoked = procedure (ASender: TObject; lCookie: Integer) of object;
```

C++

```
(ASender: TObject; lCookie: Integer) ( TShellWindowsWindowRevoked)();
```

File

SHDocVw

Description

This is type SHDocVw.TShellWindowsWindowRevoked.

132.3.51 SHDocVw.TWebBrowser_V1BeforeNavigate Type

Pascal

```
TWebBrowser_V1BeforeNavigate = procedure (ASender: TObject; const URL: WideString; Flags:
Integer; const TargetFrameName: WideString; var PostData: OleVariant; const Headers:
WideString; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; const URL: WideString; Flags: Integer; const TargetFrameName: WideString;
var PostData: OleVariant; const Headers: WideString; var Cancel: WordBool) (
TWebBrowser_V1BeforeNavigate)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1BeforeNavigate.

132.3.52 SHDocVw.TWebBrowser_V1CommandStateChange Type

Pascal

```
TWebBrowser_V1CommandStateChange = procedure (ASender: TObject; Command: Integer; Enable:
WordBool) of object;
```

C++

```
(ASender: TObject; Command: Integer; Enable: WordBool) ( TWebBrowser_V1CommandStateChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1CommandStateChange.

132.3.53 SHDocVw.TWebBrowser_V1FrameBeforeNavigate Type

Pascal

```
TWebBrowser_V1FrameBeforeNavigate = procedure (ASender: TObject; const URL: WideString; Flags:
Integer; const TargetFrameName: WideString; var PostData: OleVariant; const Headers:
WideString; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; const URL: WideString; Flags: Integer; const TargetFrameName: WideString;
var PostData: OleVariant; const Headers: WideString; var Cancel: WordBool) (
TWebBrowser_V1FrameBeforeNavigate)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1FrameBeforeNavigate.

132.3.54 SHDocVw.TWebBrowser_V1FrameNavigateComplete Type

Pascal

```
TWebBrowser_V1FrameNavigateComplete = procedure (ASender: TObject; const URL: WideString) of
object;
```

C++

```
(ASender: TObject; const URL: WideString) ( TWebBrowser_V1FrameNavigateComplete)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1FrameNavigateComplete.

132.3.55 SHDocVw.TWebBrowser_V1FrameNewWindow Type

Pascal

```
TWebBrowser_V1FrameNewWindow = procedure (ASender: TObject; const URL: WideString; Flags:
Integer; const TargetFrameName: WideString; var PostData: OleVariant; const Headers:
WideString; var Processed: WordBool) of object;
```

C++

```
(ASender: TObject; const URL: WideString; Flags: Integer; const TargetFrameName: WideString;
var PostData: OleVariant; const Headers: WideString; var Processed: WordBool) (
TWebBrowser_V1FrameNewWindow)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1FrameNewWindow.

132.3.56 SHDocVw.TWebBrowser_V1NavigateComplete Type

Pascal

```
TWebBrowser_V1NavigateComplete = procedure (ASender: TObject; const URL: WideString) of object;
```

C++

```
(ASender: TObject; const URL: WideString) ( TWebBrowser_V1NavigateComplete)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1NavigateComplete.

132.3.57 SHDocVw.TWebBrowser_V1NewWindow Type

Pascal

```
TWebBrowser_V1NewWindow = procedure (ASender: TObject; const URL: WideString; Flags: Integer;
```

```
const TargetFrameName: WideString; var PostData: OleVariant; const Headers: WideString; var
Processed: WordBool) of object;
```

C++

```
(ASender: TObject; const URL: WideString; Flags: Integer; const TargetFrameName: WideString;
var PostData: OleVariant; const Headers: WideString; var Processed: WordBool) (
TWebBrowser_V1NewWindow)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1NewWindow.

132.3.58 SHDocVw.TWebBrowser_V1ProgressChange Type

Pascal

```
TWebBrowser_V1ProgressChange = procedure (ASender: TObject; Progress: Integer; ProgressMax:
Integer) of object;
```

C++

```
(ASender: TObject; Progress: Integer; ProgressMax: Integer) ( TWebBrowser_V1ProgressChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1ProgressChange.

132.3.59 SHDocVw.TWebBrowser_V1PropertyChange Type

Pascal

```
TWebBrowser_V1PropertyChange = procedure (ASender: TObject; const Property_: WideString) of
object;
```

C++

```
(ASender: TObject; const Property_: WideString) ( TWebBrowser_V1PropertyChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1PropertyChange.

132.3.60 SHDocVw.TWebBrowser_V1Quit Type

Pascal

```
TWebBrowser_V1Quit = procedure (ASender: TObject; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; var Cancel: WordBool) ( TWebBrowser_V1Quit)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1Quit.

132.3.61 SHDocVw.TWebBrowser_V1StatusTextChange Type

Pascal

```
TWebBrowser_V1StatusTextChange = procedure (ASender: TObject; const Text: WideString) of
object;
```

C++

```
(ASender: TObject; const Text: WideString) ( TWebBrowser_V1StatusTextChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1StatusTextChange.

132.3.62 SHDocVw.TWebBrowser_V1TitleChange Type

Pascal

```
TWebBrowser_V1TitleChange = procedure (ASender: TObject; const Text: WideString) of object;
```

C++

```
(ASender: TObject; const Text: WideString) ( TWebBrowser_V1TitleChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowser_V1TitleChange.

132.3.63 SHDocVw.TWebBrowserBeforeNavigate2 Type

Pascal

```
TWebBrowserBeforeNavigate2 = procedure (ASender: TObject; const pDisp: IDispatch; var URL:
OleVariant; var Flags: OleVariant; var TargetFrameName: OleVariant; var PostData: OleVariant;
var Headers: OleVariant; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant; var Flags: OleVariant; var
TargetFrameName: OleVariant; var PostData: OleVariant; var Headers: OleVariant; var Cancel:
WordBool) ( TWebBrowserBeforeNavigate2)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserBeforeNavigate2.

132.3.64 SHDocVw.TWebBrowserClientToHostWindow Type

Pascal

```
TWebBrowserClientToHostWindow = procedure (ASender: TObject; var CX: Integer; var CY: Integer)
of object;
```

C++

```
(ASender: TObject; var CX: Integer; var CY: Integer) ( TWebBrowserClientToHostWindow)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserClientToHostWindow.

132.3.65 SHDocVw.TWebBrowserCommandStateChange Type

Pascal

```
TWebBrowserCommandStateChange = procedure (ASender: TObject; Command: Integer; Enable:
WordBool) of object;
```

C++

```
(ASender: TObject; Command: Integer; Enable: WordBool) ( TWebBrowserCommandStateChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserCommandStateChange.

132.3.66 SHDocVw.TWebBrowserDocumentComplete Type

Pascal

```
TWebBrowserDocumentComplete = procedure (ASender: TObject; const pDisp: IDispatch; var URL:
OleVariant) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant) (
TWebBrowserDocumentComplete)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserDocumentComplete.

132.3.67 SHDocVw.TWebBrowserFileDownload Type

Pascal

```
TWebBrowserFileDownload = procedure (ASender: TObject; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; var Cancel: WordBool) ( TWebBrowserFileDownload)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserFileDownload.

132.3.68 SHDocVw.TWebBrowserNavigateComplete2 Type

Pascal

```
TWebBrowserNavigateComplete2 = procedure (ASender: TObject; const pDisp: IDispatch; var URL:
OleVariant) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant) (
TWebBrowserNavigateComplete2)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserNavigateComplete2.

132.3.69 SHDocVw.TWebBrowserNavigateError Type

Pascal

```
TWebBrowserNavigateError = procedure (ASender: TObject; const pDisp: IDispatch; var URL:
OleVariant; var Frame: OleVariant; var StatusCode: OleVariant; var Cancel: WordBool) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var URL: OleVariant; var Frame: OleVariant; var
StatusCode: OleVariant; var Cancel: WordBool) ( TWebBrowserNavigateError)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserNavigateError.

132.3.70 SHDocVw.TWebBrowserNewWindow2 Type

Pascal

```
TWebBrowserNewWindow2 = procedure (ASender: TObject; var ppDisp: IDispatch; var Cancel:
WordBool) of object;
```

C++

```
(ASender: TObject; var ppDisp: IDispatch; var Cancel: WordBool) ( TWebBrowserNewWindow2)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserNewWindow2.

132.3.71 SHDocVw.TWebBrowserOnFullScreen Type

Pascal

```
TWebBrowserOnFullScreen = procedure (ASender: TObject; FullScreen: WordBool) of object;
```

C++

```
(ASender: TObject; FullScreen: WordBool) ( TWebBrowserOnFullScreen)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserOnFullScreen.

132.3.72 SHDocVw.TWebBrowserOnMenuBar Type

Pascal

```
TWebBrowserOnMenuBar = procedure (ASender: TObject; MenuBar: WordBool) of object;
```

C++

```
(ASender: TObject; MenuBar: WordBool) ( TWebBrowserOnMenuBar)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserOnMenuBar.

132.3.73 SHDocVw.TWebBrowserOnStatusBar Type

Pascal

```
TWebBrowserOnStatusBar = procedure (ASender: TObject; StatusBar: WordBool) of object;
```

C++

```
(ASender: TObject; StatusBar: WordBool) ( TWebBrowserOnStatusBar)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserOnStatusBar.

132.3.74 SHDocVw.TWebBrowserOnTheaterMode Type

Pascal

```
TWebBrowserOnTheaterMode = procedure (ASender: TObject; TheaterMode: WordBool) of object;
```

C++

```
(ASender: TObject; TheaterMode: WordBool) ( TWebBrowserOnTheaterMode)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserOnTheaterMode.

132.3.75 SHDocVw.TWebBrowserOnToolBar Type

Pascal

```
TWebBrowserOnToolBar = procedure (ASender: TObject; ToolBar: WordBool) of object;
```

C++

```
(ASender: TObject; ToolBar: WordBool) ( TWebBrowserOnToolBar)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserOnToolBar.

132.3.76 SHDocVw.TWebBrowserOnVisible Type

Pascal

```
TWebBrowserOnVisible = procedure (ASender: TObject; Visible: WordBool) of object;
```

C++

```
(ASender: TObject; Visible: WordBool) ( TWebBrowserOnVisible)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserOnVisible.

132.3.77 SHDocVw.TWebBrowserPrintTemplateInstantiation Type

Pascal

```
TWebBrowserPrintTemplateInstantiation = procedure (ASender: TObject; const pDisp: IDispatch)
of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch) ( TWebBrowserPrintTemplateInstantiation)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserPrintTemplateInstantiation.

132.3.78 SHDocVw.TWebBrowserPrintTemplateTeardown Type

Pascal

```
TWebBrowserPrintTemplateTeardown = procedure (ASender: TObject; const pDisp: IDispatch) of
object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch) ( TWebBrowserPrintTemplateTeardown)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserPrintTemplateTeardown.

132.3.79 SHDocVw.TWebBrowserPrivacyImpactedStateChange Type

Pascal

```
TWebBrowserPrivacyImpactedStateChange = procedure (ASender: TObject; bImpacted: WordBool) of
object;
```

C++

```
(ASender: TObject; bImpacted: WordBool) ( TWebBrowserPrivacyImpactedStateChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserPrivacyImpactedStateChange.

132.3.80 SHDocVw.TWebBrowserProgressChange Type

Pascal

```
TWebBrowserProgressChange = procedure (ASender: TObject; Progress: Integer; ProgressMax:
Integer) of object;
```

C++

```
(ASender: TObject; Progress: Integer; ProgressMax: Integer) ( TWebBrowserProgressChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserProgressChange.

132.3.81 SHDocVw.TWebBrowserPropertyChange Type

Pascal

```
TWebBrowserPropertyChange = procedure (ASender: TObject; const szProperty: WideString) of
object;
```

C++

```
(ASender: TObject; const szProperty: WideString) ( TWebBrowserPropertyChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserPropertyChange.

132.3.82 SHDocVw.TWebBrowserSetSecureLockIcon Type

Pascal

```
TWebBrowserSetSecureLockIcon = procedure (ASender: TObject; SecureLockIcon: Integer) of object;
```

C++

```
(ASender: TObject; SecureLockIcon: Integer) ( TWebBrowserSetSecureLockIcon)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserSetSecureLockIcon.

132.3.83 SHDocVw.TWebBrowserStatusTextChange Type

Pascal

```
TWebBrowserStatusTextChange = procedure (ASender: TObject; const Text: WideString) of object;
```

C++

```
(ASender: TObject; const Text: WideString) ( TWebBrowserStatusTextChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserStatusTextChange.

132.3.84 SHDocVw.TWebBrowserTitleChange Type

Pascal

```
TWebBrowserTitleChange = procedure (ASender: TObject; const Text: WideString) of object;
```

C++

```
(ASender: TObject; const Text: WideString) ( TWebBrowserTitleChange)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserTitleChange.

132.3.85 SHDocVw.TWebBrowserUpdatePageStatus Type

Pascal

```
TWebBrowserUpdatePageStatus = procedure (ASender: TObject; const pDisp: IDispatch; var nPage:
OleVariant; var fDone: OleVariant) of object;
```

C++

```
(ASender: TObject; const pDisp: IDispatch; var nPage: OleVariant; var fDone: OleVariant) (
TWebBrowserUpdatePageStatus)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserUpdatePageStatus.

132.3.86 SHDocVw.TWebBrowserWindowClosing Type

Pascal

```
TWebBrowserWindowClosing = procedure (ASender: TObject; IsChildWindow: WordBool; var Cancel:
WordBool) of object;
```

C++

```
(ASender: TObject; IsChildWindow: WordBool; var Cancel: WordBool) (
TWebBrowserWindowClosing)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserWindowClosing.

132.3.87 SHDocVw.TWebBrowserWindowSetHeight Type

Pascal

```
TWebBrowserWindowSetHeight = procedure (ASender: TObject; Height: Integer) of object;
```

C++

```
(ASender: TObject; Height: Integer) ( TWebBrowserWindowSetHeight)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserWindowSetHeight.

132.3.88 SHDocVw.TWebBrowserWindowSetLeft Type

Pascal

```
TWebBrowserWindowSetLeft = procedure (ASender: TObject; Left: Integer) of object;
```

C++

```
(ASender: TObject; Left: Integer) ( TWebBrowserWindowSetLeft)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserWindowSetLeft.

132.3.89 SHDocVw.TWebBrowserWindowSetResizable Type

Pascal

```
TWebBrowserWindowSetResizable = procedure (ASender: TObject; Resizable: WordBool) of object;
```

C++

```
(ASender: TObject; Resizable: WordBool) ( TWebBrowserWindowSetResizable)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserWindowSetResizable.

132.3.90 SHDocVw.TWebBrowserWindowSetTop Type

Pascal

```
TWebBrowserWindowSetTop = procedure (ASender: TObject; Top: Integer) of object;
```

C++

```
(ASender: TObject; Top: Integer) ( TWebBrowserWindowSetTop)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserWindowSetTop.

132.3.91 SHDocVw.TWebBrowserWindowSetWidth Type

Pascal

```
TWebBrowserWindowSetWidth = procedure (ASender: TObject; Width: Integer) of object;
```

C++

```
(ASender: TObject; Width: Integer) ( TWebBrowserWindowSetWidth)();
```

File

SHDocVw

Description

This is type SHDocVw.TWebBrowserWindowSetWidth.

132.3.92 SHDocVw.WebBrowser Type

Pascal

```
WebBrowser = IWebBrowser2;
```

C++

```
IWebBrowser2 WebBrowser;
```

File

SHDocVw

Description

This is type SHDocVw.WebBrowser.

132.3.93 SHDocVw.WebBrowser_V1 Type

Pascal

```
WebBrowser_V1 = IWebBrowser;
```

C++

```
IWebBrowser WebBrowser_V1;
```

File

SHDocVw

Description

This is type SHDocVw.WebBrowser_V1.

132.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CGID_IWebBrowser (see page 19488)	This is constant SHDocVw.CGID_IWebBrowser.
CLASS_CScriptErrorList (see page 19489)	This is constant SHDocVw.CLASS_CScriptErrorList.
CLASS_InternetExplorer (see page 19489)	This is constant SHDocVw.CLASS_InternetExplorer.
CLASS_SearchAssistantOC (see page 19489)	This is constant SHDocVw.CLASS_SearchAssistantOC.
CLASS_ShellBrowserWindow (see page 19490)	This is constant SHDocVw.CLASS_ShellBrowserWindow.
CLASS_ShellNameSpace (see page 19490)	This is constant SHDocVw.CLASS_ShellNameSpace.
CLASS_ShellUIHelper (see page 19490)	This is constant SHDocVw.CLASS_ShellUIHelper.
CLASS_ShellWindows (see page 19491)	This is constant SHDocVw.CLASS_ShellWindows.
CLASS_WebBrowser (see page 19491)	This is constant SHDocVw.CLASS_WebBrowser.
CLASS_WebBrowser_V1 (see page 19491)	This is constant SHDocVw.CLASS_WebBrowser_V1.
CSC_NAVIGATEBACK (see page 19492)	This is constant SHDocVw.CSC_NAVIGATEBACK.
CSC_NAVIGATEFORWARD (see page 19492)	This is constant SHDocVw.CSC_NAVIGATEFORWARD.
CSC_UPDATECOMMANDS (see page 19492)	This is constant SHDocVw.CSC_UPDATECOMMANDS.
DIID__SearchAssistantEvents (see page 19493)	This is constant SHDocVw.DIID__SearchAssistantEvents.
DIID_DShellNameSpaceEvents (see page 19493)	This is constant SHDocVw.DIID_DShellNameSpaceEvents.
DIID_DShellWindowsEvents (see page 19493)	This is constant SHDocVw.DIID_DShellWindowsEvents.
DIID_DWebBrowserEvents (see page 19494)	This is constant SHDocVw.DIID_DWebBrowserEvents.
DIID_DWebBrowserEvents2 (see page 19494)	This is constant SHDocVw.DIID_DWebBrowserEvents2.
dtlOcxPage (see page 19494)	This is constant SHDocVw.dtlOcxPage.
dtlServerPage (see page 19495)	This is constant SHDocVw.dtlServerPage.
HTMLID_FIND (see page 19495)	This is constant SHDocVw.HTMLID_FIND.
HTMLID_OPTIONS (see page 19495)	This is constant SHDocVw.HTMLID_OPTIONS.
HTMLID_VIEWSOURCE (see page 19496)	This is constant SHDocVw.HTMLID_VIEWSOURCE.
IID_IScriptErrorList (see page 19496)	This is constant SHDocVw.IID_IScriptErrorList.
IID_ISearch (see page 19496)	This is constant SHDocVw.IID_ISearch.
IID_ISearchAssistantOC (see page 19497)	This is constant SHDocVw.IID_ISearchAssistantOC.
IID_ISearchAssistantOC2 (see page 19497)	This is constant SHDocVw.IID_ISearchAssistantOC2.
IID_ISearchAssistantOC3 (see page 19497)	This is constant SHDocVw.IID_ISearchAssistantOC3.
IID_ISearches (see page 19498)	This is constant SHDocVw.IID_ISearches.
IID_IShellFavoritesNameSpace (see page 19498)	This is constant SHDocVw.IID_IShellFavoritesNameSpace.
IID_IShellNameSpace (see page 19498)	This is constant SHDocVw.IID_IShellNameSpace.
IID_IShellUIHelper (see page 19499)	This is constant SHDocVw.IID_IShellUIHelper.
IID_IShellWindows (see page 19499)	This is constant SHDocVw.IID_IShellWindows.
IID_IWebBrowser (see page 19499)	This is constant SHDocVw.IID_IWebBrowser.
IID_IWebBrowser2 (see page 19500)	This is constant SHDocVw.IID_IWebBrowser2.
IID_IWebBrowserApp (see page 19500)	This is constant SHDocVw.IID_IWebBrowserApp.
LIBID_SHDocVw (see page 19500)	This is constant SHDocVw.LIBID_SHDocVw.
navAllowAutosearch (see page 19501)	This is constant SHDocVw.navAllowAutosearch.
navBrowserBar (see page 19501)	This is constant SHDocVw.navBrowserBar.
navNoHistory (see page 19501)	This is constant SHDocVw.navNoHistory.
navNoReadFromCache (see page 19502)	This is constant SHDocVw.navNoReadFromCache.
navNoWriteToCache (see page 19502)	This is constant SHDocVw.navNoWriteToCache.
navOpenInNewWindow (see page 19502)	This is constant SHDocVw.navOpenInNewWindow.
OLECMDEXECOPT_DODEFAULT (see page 19503)	This is constant SHDocVw.OLECMDEXECOPT_DODEFAULT.

OLECMDEXECOPT_DONTPROMPTUSER (see page 19503)	This is constant SHDocVw.OLECMDEXECOPT_DONTPROMPTUSER.
OLECMDEXECOPT_PROMPTUSER (see page 19503)	This is constant SHDocVw.OLECMDEXECOPT_PROMPTUSER.
OLECMDEXECOPT_SHOWHELP (see page 19504)	This is constant SHDocVw.OLECMDEXECOPT_SHOWHELP.
OLECMDF_DEFHIDEONCTXTMENU (see page 19504)	This is constant SHDocVw.OLECMDF_DEFHIDEONCTXTMENU.
OLECMDF_ENABLED (see page 19504)	This is constant SHDocVw.OLECMDF_ENABLED.
OLECMDF_INVISIBLE (see page 19505)	This is constant SHDocVw.OLECMDF_INVISIBLE.
OLECMDF_LATCHED (see page 19505)	This is constant SHDocVw.OLECMDF_LATCHED.
OLECMDF_NINCHED (see page 19505)	This is constant SHDocVw.OLECMDF_NINCHED.
OLECMDF_SUPPORTED (see page 19506)	This is constant SHDocVw.OLECMDF_SUPPORTED.
OLECMDID_ALLOWUILESSSAVEAS (see page 19506)	This is constant SHDocVw.OLECMDID_ALLOWUILESSSAVEAS.
OLECMDID_CLEARSELECTION (see page 19506)	This is constant SHDocVw.OLECMDID_CLEARSELECTION.
OLECMDID_CLOSE (see page 19507)	This is constant SHDocVw.OLECMDID_CLOSE.
OLECMDID_COPY (see page 19507)	This is constant SHDocVw.OLECMDID_COPY.
OLECMDID_CUT (see page 19507)	This is constant SHDocVw.OLECMDID_CUT.
OLECMDID_DELETE (see page 19508)	This is constant SHDocVw.OLECMDID_DELETE.
OLECMDID_DONTDOWNLOADCSS (see page 19508)	This is constant SHDocVw.OLECMDID_DONTDOWNLOADCSS.
OLECMDID_ENABLE_INTERACTION (see page 19508)	This is constant SHDocVw.OLECMDID_ENABLE_INTERACTION.
OLECMDID_FIND (see page 19509)	This is constant SHDocVw.OLECMDID_FIND.
OLECMDID_GETPRINTTEMPLATE (see page 19509)	This is constant SHDocVw.OLECMDID_GETPRINTTEMPLATE.
OLECMDID_GETZOOMRANGE (see page 19509)	This is constant SHDocVw.OLECMDID_GETZOOMRANGE.
OLECMDID_HIDETOOLBARS (see page 19510)	This is constant SHDocVw.OLECMDID_HIDETOOLBARS.
OLECMDID_HTTPEQUIV (see page 19510)	This is constant SHDocVw.OLECMDID_HTTPEQUIV.
OLECMDID_HTTPEQUIV_DONE (see page 19510)	This is constant SHDocVw.OLECMDID_HTTPEQUIV_DONE.
OLECMDID_NEW (see page 19511)	This is constant SHDocVw.OLECMDID_NEW.
OLECMDID_ONTOOLBARACTIVATED (see page 19511)	This is constant SHDocVw.OLECMDID_ONTOOLBARACTIVATED.
OLECMDID_ONUNLOAD (see page 19511)	This is constant SHDocVw.OLECMDID_ONUNLOAD.
OLECMDID_OPEN (see page 19512)	This is constant SHDocVw.OLECMDID_OPEN.
OLECMDID_PAGESETUP (see page 19512)	This is constant SHDocVw.OLECMDID_PAGESETUP.
OLECMDID_PASTE (see page 19512)	This is constant SHDocVw.OLECMDID_PASTE.
OLECMDID_PASTESPECIAL (see page 19513)	This is constant SHDocVw.OLECMDID_PASTESPECIAL.
OLECMDID_PREREFRESH (see page 19513)	This is constant SHDocVw.OLECMDID_PREREFRESH.
OLECMDID_PRINT (see page 19513)	This is constant SHDocVw.OLECMDID_PRINT.
OLECMDID_PRINT2 (see page 19514)	This is constant SHDocVw.OLECMDID_PRINT2.
OLECMDID_PRINTPREVIEW (see page 19514)	This is constant SHDocVw.OLECMDID_PRINTPREVIEW.
OLECMDID_PRINTPREVIEW2 (see page 19514)	This is constant SHDocVw.OLECMDID_PRINTPREVIEW2.
OLECMDID_PROPERTIES (see page 19515)	This is constant SHDocVw.OLECMDID_PROPERTIES.
OLECMDID_PROPERTYBAG2 (see page 19515)	This is constant SHDocVw.OLECMDID_PROPERTYBAG2.
OLECMDID_REDO (see page 19515)	This is constant SHDocVw.OLECMDID_REDO.
OLECMDID_REFRESH (see page 19516)	This is constant SHDocVw.OLECMDID_REFRESH.
OLECMDID_SAVE (see page 19516)	This is constant SHDocVw.OLECMDID_SAVE.
OLECMDID_SAVEAS (see page 19516)	This is constant SHDocVw.OLECMDID_SAVEAS.
OLECMDID_SAVECOPYAS (see page 19517)	This is constant SHDocVw.OLECMDID_SAVECOPYAS.
OLECMDID_SELECTALL (see page 19517)	This is constant SHDocVw.OLECMDID_SELECTALL.
OLECMDID_SETDOWNLOADSTATE (see page 19517)	This is constant SHDocVw.OLECMDID_SETDOWNLOADSTATE.
OLECMDID_SETPRINTTEMPLATE (see page 19518)	This is constant SHDocVw.OLECMDID_SETPRINTTEMPLATE.
OLECMDID_SETPROGRESSMAX (see page 19518)	This is constant SHDocVw.OLECMDID_SETPROGRESSMAX.
OLECMDID_SETPROGRESSPOS (see page 19518)	This is constant SHDocVw.OLECMDID_SETPROGRESSPOS.
OLECMDID_SETPROGRESSTEXT (see page 19519)	This is constant SHDocVw.OLECMDID_SETPROGRESSTEXT.
OLECMDID_SETTITLE (see page 19519)	This is constant SHDocVw.OLECMDID_SETTITLE.
OLECMDID_SHOWFIND (see page 19519)	This is constant SHDocVw.OLECMDID_SHOWFIND.
OLECMDID_SHOWMESSAGE (see page 19520)	This is constant SHDocVw.OLECMDID_SHOWMESSAGE.
OLECMDID_SHOWPAGESETUP (see page 19520)	This is constant SHDocVw.OLECMDID_SHOWPAGESETUP.
OLECMDID_SHOWPRINT (see page 19520)	This is constant SHDocVw.OLECMDID_SHOWPRINT.
OLECMDID_SHOWSCRIPTERROR (see page 19521)	This is constant SHDocVw.OLECMDID_SHOWSCRIPTERROR.

OLECMDID_SPELL (see page 19521)	This is constant SHDocVw.OLECMDID_SPELL.
OLECMDID_STOP (see page 19521)	This is constant SHDocVw.OLECMDID_STOP.
OLECMDID_STOPDOWNLOAD (see page 19522)	This is constant SHDocVw.OLECMDID_STOPDOWNLOAD.
OLECMDID_UNDO (see page 19522)	This is constant SHDocVw.OLECMDID_UNDO.
OLECMDID_UPDATECOMMANDS (see page 19522)	This is constant SHDocVw.OLECMDID_UPDATECOMMANDS.
OLECMDID_UPDATEPAGESTATUS (see page 19523)	This is constant SHDocVw.OLECMDID_UPDATEPAGESTATUS.
OLECMDID_ZOOM (see page 19523)	This is constant SHDocVw.OLECMDID_ZOOM.
READYSTATE_COMPLETE (see page 19523)	This is constant SHDocVw.READYSTATE_COMPLETE.
READYSTATE_INTERACTIVE (see page 19524)	This is constant SHDocVw.READYSTATE_INTERACTIVE.
READYSTATE_LOADED (see page 19524)	This is constant SHDocVw.READYSTATE_LOADED.
READYSTATE_LOADING (see page 19524)	This is constant SHDocVw.READYSTATE_LOADING.
READYSTATE_UNINITIALIZED (see page 19525)	This is constant SHDocVw.READYSTATE_UNINITIALIZED.
REFRESH_COMPLETELY (see page 19525)	This is constant SHDocVw.REFRESH_COMPLETELY.
REFRESH_CONTINUE (see page 19525)	This is constant SHDocVw.REFRESH_CONTINUE.
REFRESH_IFEXPIRED (see page 19526)	This is constant SHDocVw.REFRESH_IFEXPIRED.
REFRESH_NORMAL (see page 19526)	This is constant SHDocVw.REFRESH_NORMAL.
secureLockIconMixed (see page 19526)	This is constant SHDocVw.secureLockIconMixed.
secureLockIconSecure128Bit (see page 19527)	This is constant SHDocVw.secureLockIconSecure128Bit.
secureLockIconSecure40Bit (see page 19527)	This is constant SHDocVw.secureLockIconSecure40Bit.
secureLockIconSecure56Bit (see page 19527)	This is constant SHDocVw.secureLockIconSecure56Bit.
secureLockIconSecureFortezza (see page 19528)	This is constant SHDocVw.secureLockIconSecureFortezza.
secureLockIconSecureUnknownBits (see page 19528)	This is constant SHDocVw.secureLockIconSecureUnknownBits.
secureLockIconUnsecure (see page 19528)	This is constant SHDocVw.secureLockIconUnsecure.
SHDocVwMajorVersion (see page 19529)	This is constant SHDocVw.SHDocVwMajorVersion.
SHDocVwMinorVersion (see page 19529)	This is constant SHDocVw.SHDocVwMinorVersion.
SWC_3RDPARTY (see page 19529)	This is constant SHDocVw.SWC_3RDPARTY.
SWC_BROWSER (see page 19530)	This is constant SHDocVw.SWC_BROWSER.
SWC_CALLBACK (see page 19530)	This is constant SHDocVw.SWC_CALLBACK.
SWC_EXPLORER (see page 19530)	This is constant SHDocVw.SWC_EXPLORER.
SWFO_COOKIEPASSED (see page 19531)	This is constant SHDocVw.SWFO_COOKIEPASSED.
SWFO_INCLUDEPENDING (see page 19531)	This is constant SHDocVw.SWFO_INCLUDEPENDING.
SWFO_NEEDDISPATCH (see page 19531)	This is constant SHDocVw.SWFO_NEEDDISPATCH.

132.4.1 SHDocVw.CGID_IWebBrowser Constant

Pascal

```
CGID_IWebBrowser: TGUID = '{ED016940-BD5B-11CF-BA4E-00C04FD70816}';
```

C++

```
TGUID CGID_IWebBrowser = '{ED016940-BD5B-11CF-BA4E-00C04FD70816}';
```

File

SHDocVw

Description

This is constant SHDocVw.CGID_IWebBrowser.

132.4.2 SHDocVw.CLASS_CScriptErrorList Constant

Pascal

```
CLASS_CScriptErrorList: TGUID = '{EFD01300-160F-11D2-BB2E-00805FF7EFCA}';
```

C++

```
TGUID CLASS_CScriptErrorList = '{EFD01300-160F-11D2-BB2E-00805FF7EFCA}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_CScriptErrorList.

132.4.3 SHDocVw.CLASS_InternetExplorer Constant

Pascal

```
CLASS_InternetExplorer: TGUID = '{0002DF01-0000-0000-C000-000000000046}';
```

C++

```
TGUID CLASS_InternetExplorer = '{0002DF01-0000-0000-C000-000000000046}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_InternetExplorer.

132.4.4 SHDocVw.CLASS_SearchAssistantOC Constant

Pascal

```
CLASS_SearchAssistantOC: TGUID = '{B45FF030-4447-11D2-85DE-00C04FA35C89}';
```

C++

```
TGUID CLASS_SearchAssistantOC = '{B45FF030-4447-11D2-85DE-00C04FA35C89}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_SearchAssistantOC.

132.4.5 SHDocVw.CLASS_ShellBrowserWindow Constant

Pascal

```
CLASS_ShellBrowserWindow: TGUID = '{C08AFD90-F2A1-11D1-8455-00A0C91F3880}';
```

C++

```
TGUID CLASS_ShellBrowserWindow = '{C08AFD90-F2A1-11D1-8455-00A0C91F3880}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_ShellBrowserWindow.

132.4.6 SHDocVw.CLASS_ShellNameSpace Constant

Pascal

```
CLASS_ShellNameSpace: TGUID = '{55136805-B2DE-11D1-B9F2-00A0C98BC547}';
```

C++

```
TGUID CLASS_ShellNameSpace = '{55136805-B2DE-11D1-B9F2-00A0C98BC547}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_ShellNameSpace.

132.4.7 SHDocVw.CLASS_ShellUIHelper Constant

Pascal

```
CLASS_ShellUIHelper: TGUID = '{64AB4BB7-111E-11D1-8F79-00C04FC2FBE1}';
```

C++

```
TGUID CLASS_ShellUIHelper = '{64AB4BB7-111E-11D1-8F79-00C04FC2FBE1}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_ShellUIHelper.

132.4.8 SHDocVw.CLASS_ShellWindows Constant

Pascal

```
CLASS_ShellWindows: TGUID = '{9BA05972-F6A8-11CF-A442-00A0C90A8F39}';
```

C++

```
TGUID CLASS_ShellWindows = '{9BA05972-F6A8-11CF-A442-00A0C90A8F39}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_ShellWindows.

132.4.9 SHDocVw.CLASS_WebBrowser Constant

Pascal

```
CLASS_WebBrowser: TGUID = '{8856F961-340A-11D0-A96B-00C04FD705A2}';
```

C++

```
TGUID CLASS_WebBrowser = '{8856F961-340A-11D0-A96B-00C04FD705A2}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_WebBrowser.

132.4.10 SHDocVw.CLASS_WebBrowser_V1 Constant

Pascal

```
CLASS_WebBrowser_V1: TGUID = '{EAB22AC3-30C1-11CF-A7EB-0000C05BAE0B}';
```

C++

```
TGUID CLASS_WebBrowser_V1 = '{EAB22AC3-30C1-11CF-A7EB-0000C05BAE0B}';
```

File

SHDocVw

Description

This is constant SHDocVw.CLASS_WebBrowser_V1.

132.4.11 SHDocVw.CSC_NAVIGATEBACK Constant

Pascal

```
CSC_NAVIGATEBACK = $00000002;
```

C++

```
CSC_NAVIGATEBACK = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.CSC_NAVIGATEBACK.

132.4.12 SHDocVw.CSC_NAVIGATEFORWARD Constant

Pascal

```
CSC_NAVIGATEFORWARD = $00000001;
```

C++

```
CSC_NAVIGATEFORWARD = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.CSC_NAVIGATEFORWARD.

132.4.13 SHDocVw.CSC_UPDATECOMMANDS Constant

Pascal

```
CSC_UPDATECOMMANDS = $FFFFFFFF;
```

C++

```
CSC_UPDATECOMMANDS = 0xFFFFFFFF;
```

File

SHDocVw

Description

This is constant SHDocVw.CSC_UPDATECOMMANDS.

132.4.14 SHDocVw.DIID__SearchAssistantEvents Constant

Pascal

```
DIID__SearchAssistantEvents: TGUID = '{1611FDDA-445B-11D2-85DE-00C04FA35C89}';
```

C++

```
TGUID DIID__SearchAssistantEvents = '{1611FDDA-445B-11D2-85DE-00C04FA35C89}';
```

File

SHDocVw

Description

This is constant SHDocVw.DIID__SearchAssistantEvents.

132.4.15 SHDocVw.DIID_DShellNameSpaceEvents Constant

Pascal

```
DIID_DShellNameSpaceEvents: TGUID = '{55136806-B2DE-11D1-B9F2-00A0C98BC547}';
```

C++

```
TGUID DIID_DShellNameSpaceEvents = '{55136806-B2DE-11D1-B9F2-00A0C98BC547}';
```

File

SHDocVw

Description

This is constant SHDocVw.DIID_DShellNameSpaceEvents.

132.4.16 SHDocVw.DIID_DShellWindowsEvents Constant

Pascal

```
DIID_DShellWindowsEvents: TGUID = '{FE4106E0-399A-11D0-A48C-00A0C90A8F39}';
```

C++

```
TGUID DIID_DShellWindowsEvents = '{FE4106E0-399A-11D0-A48C-00A0C90A8F39}';
```

File

SHDocVw

Description

This is constant SHDocVw.DIID_DShellWindowsEvents.

132.4.17 SHDocVw.DIID_DWebBrowserEvents Constant

Pascal

```
DIID_DWebBrowserEvents: TGUID = '{EAB22AC2-30C1-11CF-A7EB-0000C05BAE0B}';
```

C++

```
TGUID DIID_DWebBrowserEvents = '{EAB22AC2-30C1-11CF-A7EB-0000C05BAE0B}';
```

File

SHDocVw

Description

This is constant SHDocVw.DIID_DWebBrowserEvents.

132.4.18 SHDocVw.DIID_DWebBrowserEvents2 Constant

Pascal

```
DIID_DWebBrowserEvents2: TGUID = '{34A715A0-6587-11D0-924A-0020AFC7AC4D}';
```

C++

```
TGUID DIID_DWebBrowserEvents2 = '{34A715A0-6587-11D0-924A-0020AFC7AC4D}';
```

File

SHDocVw

Description

This is constant SHDocVw.DIID_DWebBrowserEvents2.

132.4.19 SHDocVw.dtlOcxPage Constant

Pascal

```
dtlOcxPage = 'ActiveX';
```

C++

```
dtlOcxPage = 'ActiveX';
```

File

SHDocVw

Description

This is constant SHDocVw.dtlOcxPage.

132.4.20 SHDocVw.dtlServerPage Constant

Pascal

```
dtlServerPage = 'Servers';
```

C++

```
dtlServerPage = 'Servers';
```

File

SHDocVw

Description

This is constant SHDocVw.dtlServerPage.

132.4.21 SHDocVw.HTMLID_FIND Constant

Pascal

```
HTMLID_FIND = 1;
```

C++

```
HTMLID_FIND = 1;
```

File

SHDocVw

Description

This is constant SHDocVw.HTMLID_FIND.

132.4.22 SHDocVw.HTMLID_OPTIONS Constant

Pascal

```
HTMLID_OPTIONS = 3;
```

C++

```
HTMLID_OPTIONS = 3;
```

File

SHDocVw

Description

This is constant SHDocVw.HTMLID_OPTIONS.

132.4.23 SHDocVw.HTMLID_VIEWSOURCE Constant

Pascal

```
HTMLID_VIEWSOURCE = 2;
```

C++

```
HTMLID_VIEWSOURCE = 2;
```

File

SHDocVw

Description

This is constant SHDocVw.HTMLID_VIEWSOURCE.

132.4.24 SHDocVw.IID_IScriptErrorList Constant

Pascal

```
IID_IScriptErrorList: TGUID = '{F3470F24-15FD-11D2-BB2E-00805FF7EFCA}';
```

C++

```
TGUID IID_IScriptErrorList = '{F3470F24-15FD-11D2-BB2E-00805FF7EFCA}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IScriptErrorList.

132.4.25 SHDocVw.IID_ISearch Constant

Pascal

```
IID_ISearch: TGUID = '{BA9239A4-3DD5-11D2-BF8B-00C04FB93661}';
```

C++

```
TGUID IID_ISearch = '{BA9239A4-3DD5-11D2-BF8B-00C04FB93661}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_ISearch.

132.4.26 SHDocVw.IID_ISearchAssistantOC Constant

Pascal

```
IID_ISearchAssistantOC: TGUID = '{72423E8F-8011-11D2-BE79-00A0C9A83DA1}';
```

C++

```
TGUID IID_ISearchAssistantOC = '{72423E8F-8011-11D2-BE79-00A0C9A83DA1}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_ISearchAssistantOC.

132.4.27 SHDocVw.IID_ISearchAssistantOC2 Constant

Pascal

```
IID_ISearchAssistantOC2: TGUID = '{72423E8F-8011-11D2-BE79-00A0C9A83DA2}';
```

C++

```
TGUID IID_ISearchAssistantOC2 = '{72423E8F-8011-11D2-BE79-00A0C9A83DA2}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_ISearchAssistantOC2.

132.4.28 SHDocVw.IID_ISearchAssistantOC3 Constant

Pascal

```
IID_ISearchAssistantOC3: TGUID = '{72423E8F-8011-11D2-BE79-00A0C9A83DA3}';
```

C++

```
TGUID IID_ISearchAssistantOC3 = '{72423E8F-8011-11D2-BE79-00A0C9A83DA3}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_ISearchAssistantOC3.

132.4.29 SHDocVw.IID_ISearches Constant

Pascal

```
IID_ISearches: TGUID = '{47C922A2-3DD5-11D2-BF8B-00C04FB93661}';
```

C++

```
TGUID IID_ISearches = '{47C922A2-3DD5-11D2-BF8B-00C04FB93661}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_ISearches.

132.4.30 SHDocVw.IID_IShellFavoritesNameSpace Constant

Pascal

```
IID_IShellFavoritesNameSpace: TGUID = '{55136804-B2DE-11D1-B9F2-00A0C98BC547}';
```

C++

```
TGUID IID_IShellFavoritesNameSpace = '{55136804-B2DE-11D1-B9F2-00A0C98BC547}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IShellFavoritesNameSpace.

132.4.31 SHDocVw.IID_IShellNameSpace Constant

Pascal

```
IID_IShellNameSpace: TGUID = '{E572D3C9-37BE-4AE2-825D-D521763E3108}';
```

C++

```
TGUID IID_IShellNameSpace = '{E572D3C9-37BE-4AE2-825D-D521763E3108}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IShellNameSpace.

132.4.32 SHDocVw.IID_IShellUIHelper Constant

Pascal

```
IID_IShellUIHelper: TGUID = '{729FE2F8-1EA8-11D1-8F85-00C04FC2FBE1}';
```

C++

```
TGUID IID_IShellUIHelper = '{729FE2F8-1EA8-11D1-8F85-00C04FC2FBE1}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IShellUIHelper.

132.4.33 SHDocVw.IID_IShellWindows Constant

Pascal

```
IID_IShellWindows: TGUID = '{85CB6900-4D95-11CF-960C-0080C7F4EE85}';
```

C++

```
TGUID IID_IShellWindows = '{85CB6900-4D95-11CF-960C-0080C7F4EE85}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IShellWindows.

132.4.34 SHDocVw.IID_IWebBrowser Constant

Pascal

```
IID_IWebBrowser: TGUID = '{EAB22AC1-30C1-11CF-A7EB-0000C05BAE0B}';
```

C++

```
TGUID IID_IWebBrowser = '{EAB22AC1-30C1-11CF-A7EB-0000C05BAE0B}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IWebBrowser.

132.4.35 SHDocVw.IID_IWebBrowser2 Constant

Pascal

```
IID_IWebBrowser2: TGUID = '{D30C1661-CDAF-11D0-8A3E-00C04FC9E26E}';
```

C++

```
TGUID IID_IWebBrowser2 = '{D30C1661-CDAF-11D0-8A3E-00C04FC9E26E}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IWebBrowser2.

132.4.36 SHDocVw.IID_IWebBrowserApp Constant

Pascal

```
IID_IWebBrowserApp: TGUID = '{0002DF05-0000-0000-C000-000000000046}';
```

C++

```
TGUID IID_IWebBrowserApp = '{0002DF05-0000-0000-C000-000000000046}';
```

File

SHDocVw

Description

This is constant SHDocVw.IID_IWebBrowserApp.

132.4.37 SHDocVw.LIBID_SHDocVw Constant

Pascal

```
LIBID_SHDocVw: TGUID = '{EAB22AC0-30C1-11CF-A7EB-0000C05BAE0B}';
```

C++

```
TGUID LIBID_SHDocVw = '{EAB22AC0-30C1-11CF-A7EB-0000C05BAE0B}';
```

File

SHDocVw

Description

This is constant SHDocVw.LIBID_SHDocVw.

132.4.38 SHDocVw.navAllowAutosearch Constant

Pascal

```
navAllowAutosearch = $00000010;
```

C++

```
navAllowAutosearch = 0x00000010;
```

File

SHDocVw

Description

This is constant SHDocVw.navAllowAutosearch.

132.4.39 SHDocVw.navBrowserBar Constant

Pascal

```
navBrowserBar = $00000020;
```

C++

```
navBrowserBar = 0x00000020;
```

File

SHDocVw

Description

This is constant SHDocVw.navBrowserBar.

132.4.40 SHDocVw.navNoHistory Constant

Pascal

```
navNoHistory = $00000002;
```

C++

```
navNoHistory = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.navNoHistory.

132.4.41 SHDocVw.navNoReadFromCache Constant

Pascal

```
navNoReadFromCache = $00000004;
```

C++

```
navNoReadFromCache = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.navNoReadFromCache.

132.4.42 SHDocVw.navNoWriteToCache Constant

Pascal

```
navNoWriteToCache = $00000008;
```

C++

```
navNoWriteToCache = 0x00000008;
```

File

SHDocVw

Description

This is constant SHDocVw.navNoWriteToCache.

132.4.43 SHDocVw.navOpenInNewWindow Constant

Pascal

```
navOpenInNewWindow = $00000001;
```

C++

```
navOpenInNewWindow = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.navOpenInNewWindow.

132.4.44 SHDocVw.OLECMDEXECOPT_DODEFAULT Constant

Pascal

```
OLECMDEXECOPT_DODEFAULT = $00000000;
```

C++

```
OLECMDEXECOPT_DODEFAULT = 0x00000000;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDEXECOPT_DODEFAULT.

132.4.45 SHDocVw.OLECMDEXECOPT_DONTPROMPTUSER Constant

Pascal

```
OLECMDEXECOPT_DONTPROMPTUSER = $00000002;
```

C++

```
OLECMDEXECOPT_DONTPROMPTUSER = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDEXECOPT_DONTPROMPTUSER.

132.4.46 SHDocVw.OLECMDEXECOPT_PROMPTUSER Constant

Pascal

```
OLECMDEXECOPT_PROMPTUSER = $00000001;
```

C++

```
OLECMDEXECOPT_PROMPTUSER = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDEXECOPT_PROMPTUSER.

132.4.47 SHDocVw.OLECMDEXECOPT_SHOWHELP Constant

Pascal

```
OLECMDEXECOPT_SHOWHELP = $00000003;
```

C++

```
OLECMDEXECOPT_SHOWHELP = 0x00000003;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDEXECOPT_SHOWHELP.

132.4.48 SHDocVw.OLECMDF_DEFHIDEONCTXTMENU Constant

Pascal

```
OLECMDF_DEFHIDEONCTXTMENU = $00000020;
```

C++

```
OLECMDF_DEFHIDEONCTXTMENU = 0x00000020;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDF_DEFHIDEONCTXTMENU.

132.4.49 SHDocVw.OLECMDF_ENABLED Constant

Pascal

```
OLECMDF_ENABLED = $00000002;
```

C++

```
OLECMDF_ENABLED = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDF_ENABLED.

132.4.50 SHDocVw.OLECMDF_INVISIBLE Constant

Pascal

```
OLECMDF_INVISIBLE = $00000010;
```

C++

```
OLECMDF_INVISIBLE = 0x00000010;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDF_INVISIBLE.

132.4.51 SHDocVw.OLECMDF_LATCHED Constant

Pascal

```
OLECMDF_LATCHED = $00000004;
```

C++

```
OLECMDF_LATCHED = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDF_LATCHED.

132.4.52 SHDocVw.OLECMDF_NINCHED Constant

Pascal

```
OLECMDF_NINCHED = $00000008;
```

C++

```
OLECMDF_NINCHED = 0x00000008;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDF_NINCHED.

132.4.53 SHDocVw.OLECMDF_SUPPORTED Constant

Pascal

```
OLECMDF_SUPPORTED = $00000001;
```

C++

```
OLECMDF_SUPPORTED = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDF_SUPPORTED.

132.4.54 SHDocVw.OLECMDID_ALLOWUILESSSAVEAS Constant

Pascal

```
OLECMDID_ALLOWUILESSSAVEAS = $0000002E;
```

C++

```
OLECMDID_ALLOWUILESSSAVEAS = 0x0000002E;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_ALLOWUILESSSAVEAS.

132.4.55 SHDocVw.OLECMDID_CLEARSELECTION Constant

Pascal

```
OLECMDID_CLEARSELECTION = $00000012;
```

C++

```
OLECMDID_CLEARSELECTION = 0x00000012;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_CLEARSELECTION.

132.4.56 SHDocVw.OLECMDID_CLOSE Constant

Pascal

```
OLECMDID_CLOSE = $0000002D;
```

C++

```
OLECMDID_CLOSE = 0x0000002D;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_CLOSE.

132.4.57 SHDocVw.OLECMDID_COPY Constant

Pascal

```
OLECMDID_COPY = $0000000C;
```

C++

```
OLECMDID_COPY = 0x0000000C;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_COPY.

132.4.58 SHDocVw.OLECMDID_CUT Constant

Pascal

```
OLECMDID_CUT = $0000000B;
```

C++

```
OLECMDID_CUT = 0x0000000B;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_CUT.

132.4.59 SHDocVw.OLECMDID_DELETE Constant

Pascal

```
OLECMDID_DELETE = $00000021;
```

C++

```
OLECMDID_DELETE = 0x00000021;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_DELETE.

132.4.60 SHDocVw.OLECMDID_DONTDOWNLOADCSS Constant

Pascal

```
OLECMDID_DONTDOWNLOADCSS = $0000002F;
```

C++

```
OLECMDID_DONTDOWNLOADCSS = 0x0000002F;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_DONTDOWNLOADCSS.

132.4.61 SHDocVw.OLECMDID_ENABLE_INTERACTION Constant

Pascal

```
OLECMDID_ENABLE_INTERACTION = $00000024;
```

C++

```
OLECMDID_ENABLE_INTERACTION = 0x00000024;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_ENABLE_INTERACTION.

132.4.62 SHDocVw.OLECMDID_FIND Constant

Pascal

```
OLECMDID_FIND = $00000020;
```

C++

```
OLECMDID_FIND = 0x00000020;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_FIND.

132.4.63 SHDocVw.OLECMDID_GETPRINTTEMPLATE Constant

Pascal

```
OLECMDID_GETPRINTTEMPLATE = $00000034;
```

C++

```
OLECMDID_GETPRINTTEMPLATE = 0x00000034;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_GETPRINTTEMPLATE.

132.4.64 SHDocVw.OLECMDID_GETZOOMRANGE Constant

Pascal

```
OLECMDID_GETZOOMRANGE = $00000014;
```

C++

```
OLECMDID_GETZOOMRANGE = 0x00000014;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_GETZOOMRANGE.

132.4.65 SHDocVw.OLECMDID_HIDETOOLBARS Constant

Pascal

```
OLECMDID_HIDETOOLBARS = $00000018;
```

C++

```
OLECMDID_HIDETOOLBARS = 0x00000018;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_HIDETOOLBARS.

132.4.66 SHDocVw.OLECMDID_HTTPEQUIV Constant

Pascal

```
OLECMDID_HTTPEQUIV = $00000022;
```

C++

```
OLECMDID_HTTPEQUIV = 0x00000022;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_HTTPEQUIV.

132.4.67 SHDocVw.OLECMDID_HTTPEQUIV_DONE Constant

Pascal

```
OLECMDID_HTTPEQUIV_DONE = $00000023;
```

C++

```
OLECMDID_HTTPEQUIV_DONE = 0x00000023;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_HTTPEQUIV_DONE.

132.4.68 SHDocVw.OLECMDID_NEW Constant

Pascal

```
OLECMDID_NEW = $00000002;
```

C++

```
OLECMDID_NEW = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_NEW.

132.4.69 SHDocVw.OLECMDID_ONTOOLBARACTIVATED Constant

Pascal

```
OLECMDID_ONTOOLBARACTIVATED = $0000001F;
```

C++

```
OLECMDID_ONTOOLBARACTIVATED = 0x0000001F;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_ONTOOLBARACTIVATED.

132.4.70 SHDocVw.OLECMDID_ONUNLOAD Constant

Pascal

```
OLECMDID_ONUNLOAD = $00000025;
```

C++

```
OLECMDID_ONUNLOAD = 0x00000025;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_ONUNLOAD.

132.4.71 SHDocVw.OLECMDID_OPEN Constant

Pascal

```
OLECMDID_OPEN = $00000001;
```

C++

```
OLECMDID_OPEN = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_OPEN.

132.4.72 SHDocVw.OLECMDID_PAGESETUP Constant

Pascal

```
OLECMDID_PAGESETUP = $00000008;
```

C++

```
OLECMDID_PAGESETUP = 0x00000008;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PAGESETUP.

132.4.73 SHDocVw.OLECMDID_PASTE Constant

Pascal

```
OLECMDID_PASTE = $0000000D;
```

C++

```
OLECMDID_PASTE = 0x0000000D;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PASTE.

132.4.74 SHDocVw.OLECMDID_PASTESPECIAL Constant

Pascal

```
OLECMDID_PASTESPECIAL = $0000000E;
```

C++

```
OLECMDID_PASTESPECIAL = 0x0000000E;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PASTESPECIAL.

132.4.75 SHDocVw.OLECMDID_PREREFRESH Constant

Pascal

```
OLECMDID_PREREFRESH = $00000027;
```

C++

```
OLECMDID_PREREFRESH = 0x00000027;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PREREFRESH.

132.4.76 SHDocVw.OLECMDID_PRINT Constant

Pascal

```
OLECMDID_PRINT = $00000006;
```

C++

```
OLECMDID_PRINT = 0x00000006;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PRINT.

132.4.77 SHDocVw.OLECMDID_PRINT2 Constant

Pascal

```
OLECMDID_PRINT2 = $00000031;
```

C++

```
OLECMDID_PRINT2 = 0x00000031;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PRINT2.

132.4.78 SHDocVw.OLECMDID_PRINTPREVIEW Constant

Pascal

```
OLECMDID_PRINTPREVIEW = $00000007;
```

C++

```
OLECMDID_PRINTPREVIEW = 0x00000007;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PRINTPREVIEW.

132.4.79 SHDocVw.OLECMDID_PRINTPREVIEW2 Constant

Pascal

```
OLECMDID_PRINTPREVIEW2 = $00000032;
```

C++

```
OLECMDID_PRINTPREVIEW2 = 0x00000032;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PRINTPREVIEW2.

132.4.80 SHDocVw.OLECMDID_PROPERTIES Constant

Pascal

```
OLECMDID_PROPERTIES = $0000000A;
```

C++

```
OLECMDID_PROPERTIES = 0x0000000A;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PROPERTIES.

132.4.81 SHDocVw.OLECMDID_PROPERTYBAG2 Constant

Pascal

```
OLECMDID_PROPERTYBAG2 = $00000026;
```

C++

```
OLECMDID_PROPERTYBAG2 = 0x00000026;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_PROPERTYBAG2.

132.4.82 SHDocVw.OLECMDID_REDO Constant

Pascal

```
OLECMDID_REDO = $00000010;
```

C++

```
OLECMDID_REDO = 0x00000010;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_REDO.

132.4.83 SHDocVw.OLECMDID_REFRESH Constant

Pascal

```
OLECMDID_REFRESH = $00000016;
```

C++

```
OLECMDID_REFRESH = 0x00000016;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_REFRESH.

132.4.84 SHDocVw.OLECMDID_SAVE Constant

Pascal

```
OLECMDID_SAVE = $00000003;
```

C++

```
OLECMDID_SAVE = 0x00000003;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SAVE.

132.4.85 SHDocVw.OLECMDID_SAVEAS Constant

Pascal

```
OLECMDID_SAVEAS = $00000004;
```

C++

```
OLECMDID_SAVEAS = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SAVEAS.

132.4.86 SHDocVw.OLECMDID_SAVECOPYAS Constant

Pascal

```
OLECMDID_SAVECOPYAS = $00000005;
```

C++

```
OLECMDID_SAVECOPYAS = 0x00000005;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SAVECOPYAS.

132.4.87 SHDocVw.OLECMDID_SELECTALL Constant

Pascal

```
OLECMDID_SELECTALL = $00000011;
```

C++

```
OLECMDID_SELECTALL = 0x00000011;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SELECTALL.

132.4.88 SHDocVw.OLECMDID_SETDOWNLOADSTATE Constant

Pascal

```
OLECMDID_SETDOWNLOADSTATE = $0000001D;
```

C++

```
OLECMDID_SETDOWNLOADSTATE = 0x0000001D;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SETDOWNLOADSTATE.

132.4.89 SHDocVw.OLECMDID_SETPRINTTEMPLATE Constant

Pascal

```
OLECMDID_SETPRINTTEMPLATE = $00000033;
```

C++

```
OLECMDID_SETPRINTTEMPLATE = 0x00000033;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SETPRINTTEMPLATE.

132.4.90 SHDocVw.OLECMDID_SETPROGRESSMAX Constant

Pascal

```
OLECMDID_SETPROGRESSMAX = $00000019;
```

C++

```
OLECMDID_SETPROGRESSMAX = 0x00000019;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SETPROGRESSMAX.

132.4.91 SHDocVw.OLECMDID_SETPROGRESSPOS Constant

Pascal

```
OLECMDID_SETPROGRESSPOS = $0000001A;
```

C++

```
OLECMDID_SETPROGRESSPOS = 0x0000001A;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SETPROGRESSPOS.

132.4.92 SHDocVw.OLECMDID_SETPROGRESSTEXT Constant

Pascal

```
OLECMDID_SETPROGRESSTEXT = $0000001B;
```

C++

```
OLECMDID_SETPROGRESSTEXT = 0x0000001B;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SETPROGRESSTEXT.

132.4.93 SHDocVw.OLECMDID_SETTITLE Constant

Pascal

```
OLECMDID_SETTITLE = $0000001C;
```

C++

```
OLECMDID_SETTITLE = 0x0000001C;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SETTITLE.

132.4.94 SHDocVw.OLECMDID_SHOWFIND Constant

Pascal

```
OLECMDID_SHOWFIND = $0000002A;
```

C++

```
OLECMDID_SHOWFIND = 0x0000002A;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SHOWFIND.

132.4.95 SHDocVw.OLECMDID_SHOWMESSAGE Constant

Pascal

```
OLECMDID_SHOWMESSAGE = $00000029;
```

C++

```
OLECMDID_SHOWMESSAGE = 0x00000029;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SHOWMESSAGE.

132.4.96 SHDocVw.OLECMDID_SHOWPAGESETUP Constant

Pascal

```
OLECMDID_SHOWPAGESETUP = $0000002B;
```

C++

```
OLECMDID_SHOWPAGESETUP = 0x0000002B;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SHOWPAGESETUP.

132.4.97 SHDocVw.OLECMDID_SHOWPRINT Constant

Pascal

```
OLECMDID_SHOWPRINT = $0000002C;
```

C++

```
OLECMDID_SHOWPRINT = 0x0000002C;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SHOWPRINT.

132.4.98 SHDocVw.OLECMDID_SHOWSCRIPTERROR Constant

Pascal

```
OLECMDID_SHOWSCRIPTERROR = $00000028;
```

C++

```
OLECMDID_SHOWSCRIPTERROR = 0x00000028;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SHOWSCRIPTERROR.

132.4.99 SHDocVw.OLECMDID_SPELL Constant

Pascal

```
OLECMDID_SPELL = $00000009;
```

C++

```
OLECMDID_SPELL = 0x00000009;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_SPELL.

132.4.100 SHDocVw.OLECMDID_STOP Constant

Pascal

```
OLECMDID_STOP = $00000017;
```

C++

```
OLECMDID_STOP = 0x00000017;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_STOP.

132.4.101 SHDocVw.OLECMDID_STOPDOWNLOAD Constant

Pascal

```
OLECMDID_STOPDOWNLOAD = $0000001E;
```

C++

```
OLECMDID_STOPDOWNLOAD = 0x0000001E;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_STOPDOWNLOAD.

132.4.102 SHDocVw.OLECMDID_UNDO Constant

Pascal

```
OLECMDID_UNDO = $0000000F;
```

C++

```
OLECMDID_UNDO = 0x0000000F;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_UNDO.

132.4.103 SHDocVw.OLECMDID_UPDATECOMMANDS Constant

Pascal

```
OLECMDID_UPDATECOMMANDS = $00000015;
```

C++

```
OLECMDID_UPDATECOMMANDS = 0x00000015;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_UPDATECOMMANDS.

132.4.104 SHDocVw.OLECMDID_UPDATEPAGESTATUS Constant

Pascal

```
OLECMDID_UPDATEPAGESTATUS = $00000030;
```

C++

```
OLECMDID_UPDATEPAGESTATUS = 0x00000030;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_UPDATEPAGESTATUS.

132.4.105 SHDocVw.OLECMDID_ZOOM Constant

Pascal

```
OLECMDID_ZOOM = $00000013;
```

C++

```
OLECMDID_ZOOM = 0x00000013;
```

File

SHDocVw

Description

This is constant SHDocVw.OLECMDID_ZOOM.

132.4.106 SHDocVw.READYSTATE_COMPLETE Constant

Pascal

```
READYSTATE_COMPLETE = $00000004;
```

C++

```
READYSTATE_COMPLETE = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.READYSTATE_COMPLETE.

132.4.107 SHDocVw.READYSTATE_INTERACTIVE Constant

Pascal

```
READYSTATE_INTERACTIVE = $00000003;
```

C++

```
READYSTATE_INTERACTIVE = 0x00000003;
```

File

SHDocVw

Description

This is constant SHDocVw.READYSTATE_INTERACTIVE.

132.4.108 SHDocVw.READYSTATE_LOADED Constant

Pascal

```
READYSTATE_LOADED = $00000002;
```

C++

```
READYSTATE_LOADED = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.READYSTATE_LOADED.

132.4.109 SHDocVw.READYSTATE_LOADING Constant

Pascal

```
READYSTATE_LOADING = $00000001;
```

C++

```
READYSTATE_LOADING = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.READYSTATE_LOADING.

132.4.110 SHDocVw.READYSTATE_UNINITIALIZED Constant

Pascal

```
READYSTATE_UNINITIALIZED = $00000000;
```

C++

```
READYSTATE_UNINITIALIZED = 0x00000000;
```

File

SHDocVw

Description

This is constant SHDocVw.READYSTATE_UNINITIALIZED.

132.4.111 SHDocVw.REFRESH_COMPLETELY Constant

Pascal

```
REFRESH_COMPLETELY = 3;
```

C++

```
REFRESH_COMPLETELY = 3;
```

File

SHDocVw

Description

This is constant SHDocVw.REFRESH_COMPLETELY.

132.4.112 SHDocVw.REFRESH_CONTINUE Constant

Pascal

```
REFRESH_CONTINUE = 2;
```

C++

```
REFRESH_CONTINUE = 2;
```

File

SHDocVw

Description

This is constant SHDocVw.REFRESH_CONTINUE.

132.4.113 SHDocVw.REFRESH_IFEXPIRED Constant

Pascal

```
REFRESH_IFEXPIRED = 1;
```

C++

```
REFRESH_IFEXPIRED = 1;
```

File

SHDocVw

Description

This is constant SHDocVw.REFRESH_IFEXPIRED.

132.4.114 SHDocVw.REFRESH_NORMAL Constant

Pascal

```
REFRESH_NORMAL = 0;
```

C++

```
REFRESH_NORMAL = 0;
```

File

SHDocVw

Description

This is constant SHDocVw.REFRESH_NORMAL.

132.4.115 SHDocVw.secureLockIconMixed Constant

Pascal

```
secureLockIconMixed = $00000001;
```

C++

```
secureLockIconMixed = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconMixed.

132.4.116 SHDocVw.secureLockIconSecure128Bit Constant

Pascal

```
secureLockIconSecure128Bit = $00000006;
```

C++

```
secureLockIconSecure128Bit = 0x00000006;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconSecure128Bit.

132.4.117 SHDocVw.secureLockIconSecure40Bit Constant

Pascal

```
secureLockIconSecure40Bit = $00000003;
```

C++

```
secureLockIconSecure40Bit = 0x00000003;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconSecure40Bit.

132.4.118 SHDocVw.secureLockIconSecure56Bit Constant

Pascal

```
secureLockIconSecure56Bit = $00000004;
```

C++

```
secureLockIconSecure56Bit = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconSecure56Bit.

132.4.119 SHDocVw.secureLockIconSecureFortezza Constant

Pascal

```
secureLockIconSecureFortezza = $00000005;
```

C++

```
secureLockIconSecureFortezza = 0x00000005;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconSecureFortezza.

132.4.120 SHDocVw.secureLockIconSecureUnknownBits Constant

Pascal

```
secureLockIconSecureUnknownBits = $00000002;
```

C++

```
secureLockIconSecureUnknownBits = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconSecureUnknownBits.

132.4.121 SHDocVw.secureLockIconUnsecure Constant

Pascal

```
secureLockIconUnsecure = $00000000;
```

C++

```
secureLockIconUnsecure = 0x00000000;
```

File

SHDocVw

Description

This is constant SHDocVw.secureLockIconUnsecure.

132.4.122 SHDocVw.SHDocVwMajorVersion Constant

Pascal

```
SHDocVwMajorVersion = 1;
```

C++

```
SHDocVwMajorVersion = 1;
```

File

SHDocVw

Description

This is constant SHDocVw.SHDocVwMajorVersion.

132.4.123 SHDocVw.SHDocVwMinorVersion Constant

Pascal

```
SHDocVwMinorVersion = 1;
```

C++

```
SHDocVwMinorVersion = 1;
```

File

SHDocVw

Description

This is constant SHDocVw.SHDocVwMinorVersion.

132.4.124 SHDocVw.SWC_3RDPARTY Constant

Pascal

```
SWC_3RDPARTY = $00000002;
```

C++

```
SWC_3RDPARTY = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.SWC_3RDPARTY.

132.4.125 SHDocVw.SWC_BROWSER Constant

Pascal

```
SWC_BROWSER = $00000001;
```

C++

```
SWC_BROWSER = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.SWC_BROWSER.

132.4.126 SHDocVw.SWC_CALLBACK Constant

Pascal

```
SWC_CALLBACK = $00000004;
```

C++

```
SWC_CALLBACK = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.SWC_CALLBACK.

132.4.127 SHDocVw.SWC_EXPLORER Constant

Pascal

```
SWC_EXPLORER = $00000000;
```

C++

```
SWC_EXPLORER = 0x00000000;
```

File

SHDocVw

Description

This is constant SHDocVw.SWC_EXPLORER.

132.4.128 SHDocVw.SWFO_COOKIEPASSED Constant

Pascal

```
SWFO_COOKIEPASSED = $00000004;
```

C++

```
SWFO_COOKIEPASSED = 0x00000004;
```

File

SHDocVw

Description

This is constant SHDocVw.SWFO_COOKIEPASSED.

132.4.129 SHDocVw.SWFO_INCLUDEPENDING Constant

Pascal

```
SWFO_INCLUDEPENDING = $00000002;
```

C++

```
SWFO_INCLUDEPENDING = 0x00000002;
```

File

SHDocVw

Description

This is constant SHDocVw.SWFO_INCLUDEPENDING.

132.4.130 SHDocVw.SWFO_NEEDDISPATCH Constant

Pascal

```
SWFO_NEEDDISPATCH = $00000001;
```

C++

```
SWFO_NEEDDISPATCH = 0x00000001;
```

File

SHDocVw

Description

This is constant SHDocVw.SWFO_NEEDDISPATCH.

133 ShellAnimations Namespace

This is namespace ShellAnimations.

Topics

Name	Description
Classes (see page 19534)	The following table lists classes in this documentation.

Classes

	Name	Description
	TShellResources (see page 19534)	TShellResources provides forwards compability for programs that use system animations in Windows Vista.

133.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TShellResources (see page 19534)	TShellResources provides forwards compability for programs that use system animations in Windows Vista.

133.1.1 TShellResources Class

TShellResources provides forwards compability for programs that use system animations in Windows Vista.

Class Hierarchy

Pascal

```
TShellResources = class(TComponent);
```

C++

```
class TShellResources : public TComponent;
```

File

ShellAnimations

Description

Windows Vista shell animations are no longer accessible outside of the system; programs must now store local copies of these animations instead of linking to them as was done in the past.

Placing TShellResources onto a form copies the following system animation resources into the program:

- CopyFile.res
- CopyFiles.res
- DeleteFile.res
- EmptyRecycle.res
- FindComputer.res
- FindFiles.res
- FindFolder.res
- RecycleFile.res

TShellResources should only be used in programs that are run on Vista and use animations from the common library, otherwise this function adds unneeded overhead.

See Also

TAnimate (see page 3422)

134 SimpleDS Namespace

This is namespace SimpleDS.

Topics

Name	Description
Classes (see page 19538)	The following table lists classes in this documentation.

Classes

	Name	Description
	TInternalSQLDataSet (see page 19538)	This is class SimpleDS.TInternalSQLDataSet.
	TSimpleDataSet (see page 19555)	TSimpleDataSet uses dbExpress to fetch data and cache it internally in memory.

134.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TInternalSQLDataSet (see page 19538)	This is class SimpleDS.TInternalSQLDataSet.
	TSimpleDataSet (see page 19555)	TSimpleDataSet uses dbExpress to fetch data and cache it internally in memory.

134.1.1 TInternalSQLDataSet Class

Class Hierarchy

Pascal

```
TInternalSQLDataSet = class(TCustomSQLDataSet);
```

C++

```
class TInternalSQLDataSet : public TCustomSQLDataSet;
```

File

SimpleDS

Description

This is class SimpleDS.TInternalSQLDataSet.

134.1.1.1 TInternalSQLDataSet Members

The following tables list the members exposed by TInternalSQLDataSet.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	AddFieldDesc (see page 20163)	This is AddFieldDesc, a member of class TCustomSQLDataSet.
	AddIndexDefs (see page 20163)	This is AddIndexDefs, a member of class TCustomSQLDataSet.

	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
	CheckPrepareError (see page 20164)	This is CheckPrepareError, a member of class TCustomSQLDataSet.
	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
	ClearIndexDefs (see page 20164)	This is ClearIndexDefs, a member of class TCustomSQLDataSet.
	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.
	CloseCursor (see page 20164)	This is CloseCursor, a member of class TCustomSQLDataSet.
	CloseStatement (see page 20164)	This is CloseStatement, a member of class TCustomSQLDataSet.
	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
	DataEvent (see page 6924)	This is DataEvent, a member of class TDataSet.
	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 20165)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	ExecSQL (see page 20165)	This is ExecSQL, a member of class TCustomSQLDataSet.
	ExecuteStatement (see page 20166)	This is ExecuteStatement, a member of class TCustomSQLDataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.

	FreeBuffers (see page 20166)	This is FreeBuffers, a member of class TCustomSQLDataSet.
	FreeCommand (see page 20166)	This is FreeCommand, a member of class TCustomSQLDataSet.
V	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeReader (see page 20166)	This is FreeReader, a member of class TCustomSQLDataSet.
V	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
V	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
V	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
V	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.
V	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.
V	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
V	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
V	GetCanModify (see page 6950)	This is GetCanModify, a member of class TDataSet.
V	GetCanModify (see page 20167)	This is GetCanModify, a member of class TCustomSQLDataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
V	GetDataSource (see page 6951)	This is GetDataSource, a member of class TDataSet.
V	GetDataSource (see page 20167)	This is GetDataSource, a member of class TCustomSQLDataSet.
V	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
V	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
V	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
V	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
V	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
	GetObjectTypeNames (see page 20169)	This is GetObjectTypeNames, a member of class TCustomSQLDataSet.
	GetOutputParams (see page 20169)	This is GetOutputParams, a member of class TCustomSQLDataSet.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
V	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
V	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
A	GetRecord (see page 6956)	This is GetRecord, a member of class TDataSet.
V	GetRecord (see page 20170)	This is GetRecord, a member of class TCustomSQLDataSet.
V	GetRecordCount (see page 6956)	This is GetRecordCount, a member of class TDataSet.
V	GetRecordCount (see page 20170)	This is GetRecordCount, a member of class TCustomSQLDataSet.
V	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
	GetSortFieldNames (see page 20170)	This is GetSortFieldNames, a member of class TCustomSQLDataSet.
V	GetStateFieldValue (see page 6956)	This is GetStateFieldValue, a member of class TDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
V	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
V	InitRecord (see page 20170)	This is InitRecord, a member of class TCustomSQLDataSet.
V	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
V	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
A	InternalClose (see page 6963)	This is InternalClose, a member of class TDataSet.
V	InternalClose (see page 20171)	This is InternalClose, a member of class TCustomSQLDataSet.
V	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
V	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.

	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
	InternalHandleException (see page 6964)	This is InternalHandleException, a member of class TDataSet.
	InternalHandleException (see page 20171)	This is InternalHandleException, a member of class TCustomSQLDataSet.
	InternalInitFieldDefs (see page 6965)	This is InternalInitFieldDefs, a member of class TDataSet.
	InternalInitFieldDefs (see page 20171)	This is InternalInitFieldDefs, a member of class TCustomSQLDataSet.
	InternalInitRecord (see page 6965)	This is InternalInitRecord, a member of class TDataSet.
	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
	InternalOpen (see page 6966)	This is InternalOpen, a member of class TDataSet.
	InternalOpen (see page 20171)	This is InternalOpen, a member of class TCustomSQLDataSet.
	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
	InternalRefresh (see page 6966)	This is InternalRefresh, a member of class TDataSet.
	InternalRefresh (see page 20171)	This is InternalRefresh, a member of class TCustomSQLDataSet.
	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsCursorOpen (see page 6966)	This is IsCursorOpen, a member of class TDataSet.
	IsCursorOpen (see page 20172)	This is IsCursorOpen, a member of class TCustomSQLDataSet.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 6969)	Initializes the component after the form file has been read into memory.
	Loaded (see page 20172)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 20173)	This is LocateRecord, a member of class TCustomSQLDataSet.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	OpenCursor (see page 6976)	This is OpenCursor, a member of class TDataSet.
	OpenCursor (see page 20174)	This is OpenCursor, a member of class TCustomSQLDataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
	OpenSchema (see page 20174)	This is OpenSchema, a member of class TCustomSQLDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 20175)	This is PropertyChanged, a member of class TCustomSQLDataSet.
	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.
	PSEndTransaction (see page 20175)	Ends a transaction that was started by a call to PSStartTransaction.
	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
	PSExecute (see page 20176)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 20176)	This is PSExecuteStatement, a member of class TCustomSQLDataSet.
	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 20176)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 6982)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 7537)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 20177)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 6982)	Gets the command type to be executed by PSExecute.
	PSGetCommandType (see page 20177)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 20178)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 6983)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 20178)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.

	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 6984)	This is PSGetKeyFieldsW, a member of class TDataSet.
	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
	PSGetKeyFieldsW (see page 20179)	This is PSGetKeyFieldsW, a member of class TCustomSQLDataSet.
	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
	PSGetParams (see page 20179)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 6985)	This is PSGetQuoteCharW, a member of class TDataSet.
	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
	PSGetQuoteCharW (see page 20179)	This is PSGetQuoteCharW, a member of class TCustomSQLDataSet.
	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 6986)	This is PSGetTableNameW, a member of class TDataSet.
	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
	PSGetTableNameW (see page 20179)	This is PSGetTableNameW, a member of class TCustomSQLDataSet.
	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
	PSGetUpdateException (see page 20180)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 20180)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 20180)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 20181)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 20181)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 20182)	Assigns a specified SQL command to be executed by PSExecute.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 20182)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSStartTransaction (see page 20182)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 20183)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetBufListSize (see page 20184)	This is SetBufListSize, a member of class TCustomSQLDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 20184)	This is SetCommandText, a member of class TCustomSQLDataSet.

V	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
V	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFCommandText (see page 20184)	This is SetFCommandText, a member of class TCustomSQLDataSet.
V	SetFieldData (see page 20184)	This is SetFieldData, a member of class TCustomSQLDataSet.
V	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
V	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
V	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.
V	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetMaxBlobSize (see page 20184)	This is SetMaxBlobSize, a member of class TCustomSQLDataSet.
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
V	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetParamsFromCursor (see page 20185)	This is SetParamsFromCursor, a member of class TCustomSQLDataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
	SetSortFieldNames (see page 20186)	This is SetSortFieldNames, a member of class TCustomSQLDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
V	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateIndexDefs (see page 7002)	This is UpdateIndexDefs, a member of class TDataSet.
V	UpdateIndexDefs (see page 20186)	This is UpdateIndexDefs, a member of class TCustomSQLDataSet.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
	BlobBuffer (see page 20189)	Reserves a buffer for storing BLOB values.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.

R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
	Constraints (see page 7013)	Specifies record-level constraints that must be met when editing the data.
	CurrentBlobSize (see page 20191)	Indicates the size of the most recently read BLOB field.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
R	DataLink (see page 20191)	Identifies the datalink that manages communication between the SQL dataset and another, master dataset.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	InternalConnection (see page 20194)	Indicates the component that connects the dataset to its database server, taking into account whether the connection was cloned.
	LastError (see page 20194)	Saves the error message for the last error returned by dbExpress.
	NativeCommand (see page 20195)	Represents the SQL command that is sent to the server.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
R	ParamCount (see page 20197)	Indicates the number of parameters listed by the Params (see page 20197) property.
	ProcParams (see page 20199)	ProcParams lists the parameter descriptors obtained from the server for any stored procedure parameters.
	Reserved (see page 7035)	For internal use only.
R	RowsAffected (see page 20200)	Indicates the number of rows operated on by the latest query execution.
	SchemaInfo (see page 20200)	Identifies the metadata with which to populate the dataset.

Public Events

	Name	Description
	AfterCancel (see page 7038)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 7040)	Occurs after an application closes a dataset.
	AfterDelete (see page 7041)	Occurs after an application deletes a record.
	AfterEdit (see page 7044)	Occurs after an application starts editing a record.
	AfterInsert (see page 7044)	Occurs after an application inserts a new record.
	AfterOpen (see page 7045)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 7046)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 7047)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 7047)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 7048)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 7048)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 7049)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 7049)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 7050)	Occurs before an application enters insert mode.
	BeforeOpen (see page 7051)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 7052)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 7052)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 7053)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 7053)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 7054)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 7054)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 7055)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 7056)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 7056)	Occurs when an application attempts to modify or insert a record and an exception is raised.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.
V	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
	Close (see page 6920)	Closes a dataset.
V	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 6904)	Creates an instance of a TDataSet (see page 6894) component.
V	Create (see page 20160)	Creates an instance of a TCustomSQLDataSet (see page 20150) component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	CreateBlobStream (see page 6922)	Provides the interface for a method that creates a blob stream for a Binary large object (BLOB) field in the dataset.
V	CreateBlobStream (see page 20164)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6904)	Destroys the TDataSet (see page 6894) instance.
V	Destroy (see page 20161)	Destroys the TCustomSQLDataSet (see page 20150) instance.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.

	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.
V	GetBlobFieldData (see page 20166)	Retrieves the current value of a BLOB field into a buffer.
V	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
V	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
V	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
V	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
V	GetDetailLinkFields (see page 20167)	Lists the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
V	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
V	GetFieldData (see page 20168)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
V	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyFieldNames (see page 20169)	Fills a list with the names of all fields in all indexes defined for the dataset.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetQuoteChar (see page 20169)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
V	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
V	IsSequenced (see page 20172)	Indicates whether the dataset can use record numbers to indicate the order of records.

	Last (see page 6968)	Moves to the last record in the dataset.
V	Locate (see page 6970)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
V	Locate (see page 20173)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
V	Lookup (see page 6970)	Implements a virtual method to retrieve field values from a record that matches specified search values.
V	Lookup (see page 20174)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	Open (see page 6976)	Opens the dataset.
	ParamByName (see page 20175)	This is ParamByName, a member of class TCustomSQLDataSet.
V	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
V	PrepareStatement (see page 20175)	Performs a prepare on the SQL statement.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 7579)	Gets the SQL command to be executed by PSExecute (see page 7578).
	PSGetCommandText (see page 7591)	Gets the SQL command to be executed by PSExecute (see page 7590).
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.

	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).
	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetSchemaInfo (see page 20185)	Indicates whether the dataset represents metadata from the server, and if so, what kind.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.

Public Properties

	Name	Description
	Active (see page 7004)	Specifies whether or not a dataset is open.
R	AggFields (see page 7006)	Contains any aggregate fields.
	AutoCalcFields (see page 7006)	Determines when the OnCalcFields (see page 7053) event is triggered and when lookup field values are calculated.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSetField (see page 7013)	Indicates the persistent TDataSetField (see page 7060) object that owns a nested dataset.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignerData (see page 20192)	Stores custom data.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
	FieldDefs (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset
	Filter (see page 7026)	Specifies the text of the current filter for a dataset.
	Filtered (see page 7027)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 7027)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
	IndexDefs (see page 20193)	Contains the definitions of all indexes defined on the server for the dataset.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
R	Modified (see page 7029)	Indicates whether the active record is modified.
	ObjectView (see page 7031)	Specifies whether fields are stored hierarchically or flattened out in the Fields (see page 7023) property.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Prepared (see page 20198)	Specifies whether the command is prepared before execution.
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
R	RecordCount (see page 20199)	Indicates the total number of records associated with the dataset.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
	SQLConnection (see page 20201)	Specifies the SQL connection component that connects the dataset to a database server.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	TransactionLevel (see page 20202)	Indicates the transaction to which this dataset belongs.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterClose (see page 20203)	Occurs after a data source connection is closed.
	AfterOpen (see page 20203)	Occurs after the connection to a data source is opened.
	AfterRefresh (see page 20203)	Occurs after a DataSet has been changed and is refreshed.
	AfterScroll (see page 20204)	Occurs after a result set is scrolled.
	BeforeClose (see page 20204)	Occurs just before a data connection is closed.
	BeforeOpen (see page 20204)	Occurs just before a data connection is opened, but after an open operation has been initiated.
	BeforeRefresh (see page 20204)	Occurs before a DataSet refresh occurs.
	BeforeScroll (see page 20204)	Occurs when a DataSet scroll operation has been initiated but before the scrolling actually takes place.
	OnCalcFields (see page 20204)	Occurs when calculated or derived fields are updated.
	ParseDeleteSql (see page 20205)	Occurs when an application attempts to parse the DELETE statement stored in the CommandText (see page 20189) property.

	ParseInsertSql (see page 20205)	Occurs when an application attempts to parse the INSERT statement stored in the CommandText (see page 20189) property.
	ParseSelectSql (see page 20205)	Occurs when an application attempts to parse the SELECT statement specified in the CommandText (see page 20189) property.
	ParseUpdateSql (see page 20205)	Occurs when an application attempts to parse a SQL UPDATE statement stored in the CommandText (see page 20189) property.

Published Properties

	Name	Description
	Active (see page 20187)	Specifies whether or not a dataset is open.
	CommandText (see page 19550)	Specifies the command the dataset executes.
	CommandType (see page 19551)	Indicates the meaning of the CommandText property.
	DataSource (see page 19552)	Links the SQL dataset to another (master) dataset.
	GetMetadata (see page 19552)	Specifies whether the SQL dataset fetches metadata information along with the data.
	MaxBlobSize (see page 19553)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NumericMapping (see page 20195)	Maps fldBCD to either ftFMTBCD or ftBCD field types.
	ObjectView (see page 20196)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	ParamCheck (see page 19553)	Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.
	Params (see page 19554)	Represents the parameters for a query or stored procedure.
	SchemaName (see page 20201)	Specifies the name of the database schema.
	SortFieldNames (see page 19555)	Indicates the sort order when CommandType is ctTable.
	Tag (see page 2808)	Stores an integer value as part of a component.

134.1.1.2 TInternalSQLDataSet Properties

The properties of the TInternalSQLDataSet class are listed here.

Published Properties

	Name	Description
	CommandText (see page 19550)	Specifies the command the dataset executes.
	CommandType (see page 19551)	Indicates the meaning of the CommandText property.
	DataSource (see page 19552)	Links the SQL dataset to another (master) dataset.
	GetMetadata (see page 19552)	Specifies whether the SQL dataset fetches metadata information along with the data.
	MaxBlobSize (see page 19553)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.
	ParamCheck (see page 19553)	Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.
	Params (see page 19554)	Represents the parameters for a query or stored procedure.
	SortFieldNames (see page 19555)	Indicates the sort order when CommandType is ctTable.

134.1.1.2.1 TInternalSQLDataSet.CommandText Property

Specifies the command the dataset executes.

Pascal

```
property CommandText: WideString;
```

C++

```
__property BSTR CommandText;
```

Description

The value of CommandText depends on the CommandType property:

When CommandType is ctQuery, CommandText is an SQL statement that the dataset executes. If the statement is a SELECT statement, the SQL dataset executes the statement when it is opened. If the statement does not return a result set, the SQL dataset executes the statement when the ExecSQL method is called.

When CommandType is ctStoredProc, CommandText is the name of a stored procedure. The SQL dataset executes the stored procedure when it is opened or when the ExecSQL method is called, depending on whether the stored procedure returns a set of records.

When CommandType is ctTable, CommandText is the name of a table on the database server. The SQL dataset automatically generates a SELECT statement to fetch all the records on all the fields in this table, sorting by the fields listed in the SortFieldNames property. The generated statement is executed when the dataset is opened.

If CommandText is an SQL statement that includes parameters or the name of a stored procedure that has parameters, use the Params property to supply parameter values.

134.1.1.2.2 TInternalSQLDataSet.CommandType Property

Indicates the meaning of the CommandText property.

Pascal

```
property CommandType: TSQLCommandType;
```

C++

```
__property TSQLCommandType CommandType;
```

Description

CommandType indicates the type of command that is contained in the CommandText property. TCustomSQLDataSet descendants set this value to the way in which they specify a query or stored procedure.

The following table lists the possible values:

CommandType	Corresponding CommandText
ctQuery	An SQL statement that the dataset executes.
ctStoredProc	The name of a stored procedure.
ctTable	The name of a table on the database server. The SQL dataset automatically generates a SELECT statement to fetch all the records on all the fields in this table.

134.1.1.2.3 TInternalSQLDataSet.DataSource Property

Links the SQL dataset to another (master) dataset.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;__property TDataSource DataSource;
```

Description

DataSource links this SQL dataset to another (master) dataset that supplies values for this dataset's parameters.

When the SQL dataset's CommandText (or SQL) property specifies a parameterized query but the application does not provide values for the corresponding parameters in the Params property, the SQL dataset fetches parameter values from the dataset identified with the specified data source. When the current record in the dataset associated with DataSource changes, the SQL dataset refreshes its data to reflect the new parameter values.

134.1.1.2.4 TInternalSQLDataSet.GetMetadata Property

Specifies whether the SQL dataset fetches metadata information along with the data.

Pascal

```
property GetMetadata: Boolean;
```

C++

```
__property Boolean GetMetadata;
```

Description

Use GetMetadata to turn on or off the fetching of metadata on a database object. Setting GetMetadata to False will improve performance because no additional SQL will execute in order to get index information. However, setting GetMetadata to False might slow any attempts to update data using a client dataset that is linked via a dataset provider because the resolver might not generate optimized SQL to perform the update.

GetMetadata must be True to perform any operations that require an index. These operations include setting up master/detail relationships, updating data from a client dataset when the provider's UpdateMode is not upWhereAll, and delayed fetching of BLOB data.

Set GetMetadata to False if you are fetching a dataset for read-only purposes.

134.1.1.2.5 TInternalSQLDataSet.MaxBlobSize Property

Indicates the maximum number of bytes fetched for any BLOB field in the dataset.

Pascal

```
property MaxBlobSize: Integer;
```

C++

```
__property int MaxBlobSize;
```

Description

MaxBlobSize limits the amount of data that can be fetched from Binary Large Object (BLOB) fields. BLOB fields can hold an indefinite amount of data. However, SQL datasets read that data into a memory buffer. By limiting the amount of data that can be fetched from a BLOB field, you limit the size of the buffer.

If MaxBlobSize is –1, the dataset imposes no maximum BLOB size. If MaxBlobSize is 0, the dataset uses the parameters of the associated SQL connection, if any, to determine the maximum BLOB size.

Note: MaxBlobSize should agree with any parameters on the associated SQL connection component that limit the size of BLOB data.

SQLConnection (see page 20201)

134.1.1.2.6 TInternalSQLDataSet.ParamCheck Property

Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

By default, the Params property is updated automatically to reflect any parameters that appear in the query specified by the CommandText property (or the SQL property for TSQLQuery) at runtime. That is, whenever the CommandText property changes, the Params property is regenerated to reflect the new set of parameters.

There are times when you want to override this default behavior. For example, when specifying a data definition language (DDL) statement that defines a stored procedure, the resulting SQL command may include parameters. These parameters, however, should not be used as parameters of the SQL dataset, because they are not parameters of the DDL command, but rather, they are parameters of the stored procedure that the command creates.

In order to override the default generation of the Params property in response to changes in CommandText, set ParamCheck to false.

134.1.1.2.7 TInternalSQLDataSet.Params Property

Represents the parameters for a query or stored procedure.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

Params is a collection of TParam objects that represent the parameters of a query or stored procedure specified by the SQL dataset. When you specify a query by setting the CommandText property (or the SQL property in TSQLQuery), the SQL dataset automatically parse the query and fills Params with a TParam object for every parameter in the query. Similarly, when you specify a stored procedure by setting the CommandText property (or the StoredProcName property in TSQLStoredProc), the SQL dataset automatically asks the server for a list of stored procedure parameters and fills Params with a TParam object for every parameter of the stored procedure.

At design-time, use the Params property editor to access the individual TParam objects. For queries, use this property editor to check the DataType property of each parameter and to assign values to the parameters. For stored procedures, you may need to do more, changing the type or number of parameters if the server does not supply complete information about stored procedure parameters.

You can also use Params to assign parameter properties in code at runtime.

Note: If you do not assign values to input parameters before opening the dataset, it fetches values from the dataset identified by the DataSource property. However, this only works if the individual TParam objects have the same names as fields in the master dataset.

134.1.1.2.8 TInternalSQLDataSet.SortFieldNames Property

Indicates the sort order when CommandType is ctTable.

Pascal

```
property SortFieldNames: WideString;
```

C++

```
__property BSTR SortFieldNames;
```

Description

Use SortFieldNames to specify the fields that should be used to order the records in the dataset. SortFieldNames is only used when CommandType is ctTable.

SortFieldNames is a semicolon-delimited list of field names. These names are used to generate the ORDER BY clause of the SQL statement the dataset creates to fetch data from a server table. Records are sorted by the first named field, and within that sort order, by the second named field, and so on.

134.1.2 TSimpleDataSet Class

TSimpleDataSet uses dbExpress to fetch data and cache it internally in memory.

Class Hierarchy

Pascal

```
TSimpleDataSet = class(TCustomClientDataSet);
```

C++

```
class TSimpleDataSet : public TCustomClientDataSet;
```

File

SimpleDS

Description

TSimpleDataSet is a client dataset that uses an internal TSQLDataSet and TDataSetProvider for fetching data and applying updates. It combines the fast access and easy deployment of a unidirectional dataset with a client dataset's ability to edit and navigate data.

TSimpleDataSet uses dbExpress for fast access to database information. As a client dataset, TSimpleDataSet caches that information in memory and saves any updates the application makes. With its internal dataset provider, TSimpleDataSet can apply those updates back to the database server. Thus, TSimpleDataSet works like TClientDataSet when it is connected to a local TSQLDataSet via a provider, except that the source dataset and provider are internal.

TSimpleDataSet surfaces some of the properties and events of TSQLDataSet so that you can specify the database server from which to fetch data, indicate what data to fetch from that server, influence what information is included in data packets, and provide input on the updating process.

In addition to using the source TSQLDataSet, TSimpleDataSet can read from and write to a dedicated file on disk. The internal provider and source dataset are not needed for working with file-based data, making TClientDataSet a more suitable choice if you are writing a purely file-based application. However, the ability to work with a file on disk makes TSimpleDataSet well-suited to briefcase model applications.

Types of Unidirectional Datasets

134.1.2.1 TSimpleDataSet Members

The following tables list the members exposed by TSimpleDataSet.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	ActivateFilters (see page 8391)	This is ActivateFilters, a member of class TCustomClientDataSet.
	AddDataPacket (see page 8391)	This is AddDataPacket, a member of class TCustomClientDataSet.
	AddFieldDesc (see page 8391)	This is AddFieldDesc, a member of class TCustomClientDataSet.
	AllocConnection (see page 19571)	This is AllocConnection, a member of class TSimpleDataSet.
	AllocDataSet (see page 19571)	This is AllocDataSet, a member of class TSimpleDataSet.
	AllocKeyBuffers (see page 8392)	This is AllocKeyBuffers, a member of class TCustomClientDataSet.
	AllocProvider (see page 19572)	This is AllocProvider, a member of class TSimpleDataSet.
	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
	AllocRecordBuffer (see page 8393)	This is AllocRecordBuffer, a member of class TCustomClientDataSet.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Check (see page 8397)	This is Check, a member of class TCustomClientDataSet.
	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
	CheckDetailRecords (see page 8397)	This is CheckDetailRecords, a member of class TCustomClientDataSet.
	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
	CheckProviderEOF (see page 8397)	This is CheckProviderEOF, a member of class TCustomClientDataSet.
	CheckSetKeyMode (see page 8397)	This is CheckSetKeyMode, a member of class TCustomClientDataSet.
	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
	ClearCalcFields (see page 8398)	This is ClearCalcFields, a member of class TCustomClientDataSet.
	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.
	CloseCursor (see page 8400)	This is CloseCursor, a member of class TCustomClientDataSet.
	ConstraintsStored (see page 8401)	This is ConstraintsStored, a member of class TCustomClientDataSet.
	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
	DataConvert (see page 8404)	This is DataConvert, a member of class TCustomClientDataSet.
	DataEvent (see page 6924)	This is DataEvent, a member of class TDataSet.
	DataEvent (see page 8404)	This is DataEvent, a member of class TCustomClientDataSet.
	DeactivateFilters (see page 8405)	This is DeactivateFilters, a member of class TCustomClientDataSet.
	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
	DefChanged (see page 8405)	This is DefChanged, a member of class TCustomClientDataSet.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 8405)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
	DestroyLookupCursor (see page 8406)	This is DestroyLookupCursor, a member of class TCustomClientDataSet.
	DoAfterApplyUpdates (see page 8407)	This is DoAfterApplyUpdates, a member of class TCustomClientDataSet.
	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.

	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
	DoAfterExecute (see page 8407)	This is DoAfterExecute, a member of class TCustomClientDataSet.
	DoAfterGetParams (see page 8407)	This is DoAfterGetParams, a member of class TCustomClientDataSet.
	DoAfterGetRecords (see page 8407)	This is DoAfterGetRecords, a member of class TCustomClientDataSet.
	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
	DoAfterRowRequest (see page 8408)	This is DoAfterRowRequest, a member of class TCustomClientDataSet.
	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoApplyUpdates (see page 8408)	This is DoApplyUpdates, a member of class TCustomClientDataSet.
	DoBeforeApplyUpdates (see page 8408)	This is DoBeforeApplyUpdates, a member of class TCustomClientDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeExecute (see page 8408)	This is DoBeforeExecute, a member of class TCustomClientDataSet.
	DoBeforeGetParams (see page 8408)	This is DoBeforeGetParams, a member of class TCustomClientDataSet.
	DoBeforeGetRecords (see page 8409)	This is DoBeforeGetRecords, a member of class TCustomClientDataSet.
	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
	DoBeforeInsert (see page 8409)	This is DoBeforeInsert, a member of class TCustomClientDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeRowRequest (see page 8409)	This is DoBeforeRowRequest, a member of class TCustomClientDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
	DoExecute (see page 8409)	This is DoExecute, a member of class TCustomClientDataSet.
	DoGetRecords (see page 8410)	This is DoGetRecords, a member of class TCustomClientDataSet.
	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	DoOnNewRecord (see page 8410)	This is DoOnNewRecord, a member of class TCustomClientDataSet.
	DoRowRequest (see page 8410)	This is DoRowRequest, a member of class TCustomClientDataSet.
	FetchMoreData (see page 8415)	This is FetchMoreData, a member of class TCustomClientDataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.
	FindRecord (see page 8417)	This is FindRecord, a member of class TCustomClientDataSet.
	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeKeyBuffers (see page 8417)	This is FreeKeyBuffers, a member of class TCustomClientDataSet.
	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
	FreeRecordBuffer (see page 8417)	This is FreeRecordBuffer, a member of class TCustomClientDataSet.
	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
	GetAggregateValue (see page 8418)	This is GetAggregateValue, a member of class TCustomClientDataSet.
	GetAppServer (see page 8418)	This is GetAppServer, a member of class TCustomClientDataSet.
	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.
	GetBookmarkData (see page 8418)	This is GetBookmarkData, a member of class TCustomClientDataSet.
	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.
	GetBookmarkFlag (see page 8418)	This is GetBookmarkFlag, a member of class TCustomClientDataSet.
	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
	GetCanModify (see page 6950)	This is GetCanModify, a member of class TDataSet.
	GetCanModify (see page 8418)	This is GetCanModify, a member of class TCustomClientDataSet.

	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
V	GetDataSource (see page 6951)	This is GetDataSource, a member of class TDataSet.
V	GetDataSource (see page 8419)	This is GetDataSource, a member of class TCustomClientDataSet.
V	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
V	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
	GetIndexField (see page 8421)	This is GetIndexField, a member of class TCustomClientDataSet.
	GetIndexFieldCount (see page 8421)	This is GetIndexFieldCount, a member of class TCustomClientDataSet.
V	GetIsClone (see page 8422)	This is GetIsClone, a member of class TCustomClientDataSet.
V	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
V	GetIsIndexField (see page 8422)	This is GetIsIndexField, a member of class TCustomClientDataSet.
	GetKeyBuffer (see page 8423)	This is GetKeyBuffer, a member of class TCustomClientDataSet.
	GetKeyExclusive (see page 8423)	This is GetKeyExclusive, a member of class TCustomClientDataSet.
	GetKeyFieldCount (see page 8423)	This is GetKeyFieldCount, a member of class TCustomClientDataSet.
V	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
V	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
V	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
V	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
V	GetRecNo (see page 8425)	This is GetRecNo, a member of class TCustomClientDataSet.
A	GetRecord (see page 6956)	This is GetRecord, a member of class TDataSet.
V	GetRecord (see page 8425)	This is GetRecord, a member of class TCustomClientDataSet.
V	GetRecordCount (see page 6956)	This is GetRecordCount, a member of class TDataSet.
V	GetRecordCount (see page 8426)	This is GetRecordCount, a member of class TCustomClientDataSet.
V	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
V	GetRecordSize (see page 8426)	This is GetRecordSize, a member of class TCustomClientDataSet.
V	GetRemoteServer (see page 8426)	This is GetRemoteServer, a member of class TCustomClientDataSet.
V	GetStateFieldValue (see page 6956)	This is GetStateFieldValue, a member of class TDataSet.
V	GetStateFieldValue (see page 8426)	This is GetStateFieldValue, a member of class TCustomClientDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
	InitKeyBuffer (see page 8428)	This is InitKeyBuffer, a member of class TCustomClientDataSet.
V	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
V	InitRecord (see page 8428)	This is InitRecord, a member of class TCustomClientDataSet.
V	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
V	InternalAddRecord (see page 8428)	This is InternalAddRecord, a member of class TCustomClientDataSet.
V	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
V	InternalCancel (see page 8429)	This is InternalCancel, a member of class TCustomClientDataSet.
A	InternalClose (see page 6963)	This is InternalClose, a member of class TDataSet.
V	InternalClose (see page 8429)	This is InternalClose, a member of class TCustomClientDataSet.
V	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
V	InternalDelete (see page 8429)	This is InternalDelete, a member of class TCustomClientDataSet.
V	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.
V	InternalEdit (see page 8429)	This is InternalEdit, a member of class TCustomClientDataSet.

	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
	InternalFirst (see page 8430)	This is InternalFirst, a member of class TCustomClientDataSet.
	InternalGetOptionalParam (see page 8430)	This is InternalGetOptionalParam, a member of class TCustomClientDataSet.
	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
	InternalGotoBookmark (see page 8430)	This is InternalGotoBookmark, a member of class TCustomClientDataSet.
	InternalHandleException (see page 6964)	This is InternalHandleException, a member of class TDataSet.
	InternalHandleException (see page 8430)	This is InternalHandleException, a member of class TCustomClientDataSet.
	InternalInitFieldDefs (see page 6965)	This is InternalInitFieldDefs, a member of class TDataSet.
	InternalInitFieldDefs (see page 8430)	This is InternalInitFieldDefs, a member of class TCustomClientDataSet.
	InternalInitRecord (see page 6965)	This is InternalInitRecord, a member of class TDataSet.
	InternalInitRecord (see page 8431)	This is InternalInitRecord, a member of class TCustomClientDataSet.
	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
	InternalInsert (see page 8431)	This is InternalInsert, a member of class TCustomClientDataSet.
	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
	InternalLast (see page 8431)	This is InternalLast, a member of class TCustomClientDataSet.
	InternalOpen (see page 6966)	This is InternalOpen, a member of class TDataSet.
	InternalOpen (see page 8431)	This is InternalOpen, a member of class TCustomClientDataSet.
	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
	InternalPost (see page 8432)	This is InternalPost, a member of class TCustomClientDataSet.
	InternalRefresh (see page 6966)	This is InternalRefresh, a member of class TDataSet.
	InternalRefresh (see page 8432)	This is InternalRefresh, a member of class TCustomClientDataSet.
	InternalSetOptionalParam (see page 8432)	This is InternalSetOptionalParam, a member of class TCustomClientDataSet.
	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
	InternalSetToRecord (see page 8432)	This is InternalSetToRecord, a member of class TCustomClientDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsCursorOpen (see page 6966)	This is IsCursorOpen, a member of class TDataSet.
	IsCursorOpen (see page 8432)	This is IsCursorOpen, a member of class TCustomClientDataSet.
	Loaded (see page 19572)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 8436)	This is LocateRecord, a member of class TCustomClientDataSet.
	Notification (see page 19572)	Forwards notification messages to all owned components.
	OpenCursor (see page 19573)	This is OpenCursor, a member of class TSimpleDataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PostKeyBuffer (see page 8439)	This is PostKeyBuffer, a member of class TCustomClientDataSet.
	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.
	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 19573)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 6982)	Gets the command type to be executed by PSExecute.
	PSGetCommandType (see page 8440)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 6983)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 8440)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 6984)	This is PSGetKeyFieldsW, a member of class TDataSet.
	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.

	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 6985)	This is PSGetQuoteCharW, a member of class TDataSet.
	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 6986)	This is PSGetTableNameW, a member of class TDataSet.
	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadDataPacket (see page 8441)	This is ReadDataPacket, a member of class TCustomClientDataSet.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	RefreshInternalCalcFields (see page 8441)	This is RefreshInternalCalcFields, a member of class TCustomClientDataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	ResetAggField (see page 8442)	This is ResetAggField, a member of class TCustomClientDataSet.
	ResetCursorRange (see page 8443)	This is ResetCursorRange, a member of class TCustomClientDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAggregates (see page 8445)	This is SetAggregates, a member of class TCustomClientDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppServer (see page 8446)	This is SetAppServer, a member of class TCustomClientDataSet.
	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
	SetBookmarkData (see page 8446)	This is SetBookmarkData, a member of class TCustomClientDataSet.
	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
	SetBookmarkFlag (see page 8446)	This is SetBookmarkFlag, a member of class TCustomClientDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 8447)	This is SetCommandText, a member of class TCustomClientDataSet.
	SetConnection (see page 19574)	This is SetConnection, a member of class TSimpleDataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetCursorRange (see page 8447)	This is SetCursorRange, a member of class TCustomClientDataSet.
	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDataSetField (see page 8447)	This is SetDataSetField, a member of class TCustomClientDataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldData (see page 8447)	This is SetFieldData, a member of class TCustomClientDataSet.
	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.

	SetFilterData (see page 8448)	This is SetFilterData, a member of class TCustomClientDataSet.
V	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
V	SetFiltered (see page 8448)	This is SetFiltered, a member of class TCustomClientDataSet.
V	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.
V	SetFilterOptions (see page 8448)	This is SetFilterOptions, a member of class TCustomClientDataSet.
V	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
V	SetFilterText (see page 8448)	This is SetFilterText, a member of class TCustomClientDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetIndexField (see page 8448)	This is SetIndexField, a member of class TCustomClientDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetKeyBuffer (see page 8449)	This is SetKeyBuffer, a member of class TCustomClientDataSet.
	SetKeyExclusive (see page 8449)	This is SetKeyExclusive, a member of class TCustomClientDataSet.
	SetKeyFieldCount (see page 8450)	This is SetKeyFieldCount, a member of class TCustomClientDataSet.
	SetKeyFields (see page 8450)	This is SetKeyFields, a member of class TCustomClientDataSet.
	SetLinkRanges (see page 8450)	This is SetLinkRanges, a member of class TCustomClientDataSet.
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
V	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
V	SetOnFilterRecord (see page 8450)	This is SetOnFilterRecord, a member of class TCustomClientDataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetProviderEOF (see page 8452)	This is SetProviderEOF, a member of class TCustomClientDataSet.
V	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
V	SetRecNo (see page 8454)	This is SetRecNo, a member of class TCustomClientDataSet.
V	SetRemoteServer (see page 8454)	This is SetRemoteServer, a member of class TCustomClientDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
V	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	SwitchToIndex (see page 8455)	This is SwitchToIndex, a member of class TCustomClientDataSet.
	SyncCursors (see page 8455)	This is SyncCursors, a member of class TCustomClientDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateIndexDefs (see page 7002)	This is UpdateIndexDefs, a member of class TDataSet.
V	UpdateIndexDefs (see page 8455)	This is UpdateIndexDefs, a member of class TCustomClientDataSet.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteDataPacket (see page 8456)	This is WriteDataPacket, a member of class TCustomClientDataSet.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.

R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
	CommandText (see page 8465)	Specifies an SQL command to be executed by the database server.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
	DSBase (see page 8471)	Specifies the interface the client dataset uses to communicate with classes in Midas.dll or Midaslib.dcu (on Windows) or midas.so (on Linux).
R	DSCursor (see page 8471)	Provides access to the interface for the client dataset's data cursor.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	IsClone (see page 8484)	This is IsClone, a member of class TCustomClientDataSet.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
	ProviderEOF (see page 8491)	Indicates whether the client dataset has all of its data.
R	Ranged (see page 8492)	This is Ranged, a member of class TCustomClientDataSet.
	Reserved (see page 7035)	For internal use only.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
	AddIndex (see page 8391)	Creates a new index for the client dataset.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendData (see page 8393)	Adds a newly fetched packet of records to those already stored in the client dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
	ApplyRange (see page 8393)	Applies a range to the dataset.
V	ApplyUpdates (see page 8394)	Sends all updated, inserted, and deleted records from the client dataset to the provider for writing to the database.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.
V	BookmarkValid (see page 8395)	Tests the validity of a specified bookmark.
V	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
V	Cancel (see page 8395)	Cancels unposted changes to the current record.
	CancelRange (see page 8396)	Removes any ranges currently in effect for the client dataset.
	CancelUpdates (see page 8396)	Clears all pending edits and clears the change log.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
V	CloneCursor (see page 8398)	Shares the data belonging to another client dataset.
	Close (see page 6920)	Closes a dataset.
V	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.

	CompareBookmarks (see page 8400)	Compares two bookmarks.
	ConstraintsDisabled (see page 8400)	Indicates whether constraints are enabled for a client dataset.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
	Create (see page 19570)	Creates and initializes an instance of TSimpleDataSet (see page 19555).
	CreateBlobStream (see page 6922)	Provides the interface for a method that creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CreateBlobStream (see page 8401)	Returns a TClientBlobStream (see page 8285) object for reading or writing the data in a specified blob field.
	CreateDataSet (see page 8401)	Creates a new, empty client dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
	DataRequest (see page 8404)	Generates an OnDataRequest event on the associated provider
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
	DeleteIndex (see page 8406)	Deletes an index for the client dataset.
	Destroy (see page 19571)	Destroys the instance of TSimpleDataSet (see page 19555).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableConstraints (see page 8406)	Disables the enforcement of constraints.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EditKey (see page 8410)	Enables modification of the search key buffer.
	EditRangeEnd (see page 8411)	Enables changing the ending value for an existing range.
	EditRangeStart (see page 8411)	Enables changing the starting value for an existing range.
	EmptyDataSet (see page 8412)	Removes all records from the dataset.
	EnableConstraints (see page 8412)	Reenables enforcement of constraints when records are posted.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
	Execute (see page 8413)	Executes an SQL command by the provider's dataset.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FetchBlobs (see page 8414)	Retrieves BLOB field values from the provider.
	FetchDetails (see page 8414)	Retrieves nested detail datasets from the provider.
	FetchParams (see page 8415)	Retrieves parameter values from the provider.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
	FindKey (see page 8416)	Searches for a record containing specified field values.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNearest (see page 8416)	Moves the cursor to the record that most closely matches a specified set of key values.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.
V	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
V	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
V	GetCurrentRecord (see page 8419)	Retrieves the current record into a buffer.
V	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
V	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
V	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
V	GetFieldData (see page 8419)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
V	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetGroupState (see page 8420)	Indicates where the current record sits within a specified group of records.
	GetIndexInfo (see page 8421)	Retrieves information about the current index.
	GetIndexNames (see page 8422)	Retrieves a list of available indexes for a client dataset.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetNextPacket (see page 8423)	Retrieves the next block of records from the provider.
	GetOptionalParam (see page 8425)	Retrieves a custom parameter from the data packet.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	GotoCurrent (see page 8427)	Sets the current record in this dataset the same as the current record in another, cloned dataset.
	GotoKey (see page 8427)	Moves the cursor to a record specified by the current key.
	GotoNearest (see page 8427)	Moves the cursor to the record that most closely matches the current key.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
V	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
	LoadFromFile (see page 8433)	Loads a client dataset's data from a file.
	LoadFromStream (see page 8435)	Loads a client dataset's data from a stream.
V	Locate (see page 6970)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
V	Locate (see page 8435)	Searches the dataset for a specified record and makes that record current.
V	Lookup (see page 6970)	Implements a virtual method to retrieve field values from a record that matches specified search values.
V	Lookup (see page 8436)	Retrieves field values from a record that matches specified search values.
	MergeChangeLog (see page 8437)	Merges any data changes in the change log into the client dataset, overwriting existing values.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	Open (see page 6976)	Opens the dataset.
V	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
V	Post (see page 8438)	Writes a modified record to the Data (see page 8467) property or the change log.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).

	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).
	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Reconcile (see page 8441)	Clears successfully updated records from the client dataset's cache of changes.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RefreshRecord (see page 8442)	Updates the base values of the current record to match the current values of the provider's dataset.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
	RevertRecord (see page 8443)	Undoes edits to the current record.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 8443)	Saves a client dataset's data to an external file.
	SaveToStream (see page 8445)	Saves a client dataset's data to a stream.
	SetAltRecBuffers (see page 8446)	Sets record buffers when accessing field values.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetKey (see page 8449)	Enables setting of keys and ranges for a dataset prior to a search.
V	SetOptionalParam (see page 8450)	Saves a custom parameter with the data packet.
	SetProvider (see page 8451)	Associates the client dataset with a provider in the same process space.
	SetRange (see page 8452)	Sets the starting and ending values of a range, and applies it.
	SetRangeEnd (see page 8453)	Indicates that subsequent assignments to field values specify the end of the range of rows to include in the dataset.
	SetRangeStart (see page 8454)	Indicates that subsequent assignments to field values specify the start of the range of rows to include in the dataset.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UndoLastChange (see page 8455)	Undoes the last edit, insert, or delete operation to a record in the client dataset.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.
V	UpdateStatus (see page 8456)	Reports the update status for the current record in the dataset.

Public Properties

	Name	Description
R	ActiveAggs (see page 8460)	Lists the maintained aggregates supported by the current index.
R	AggFields (see page 7006)	Contains any aggregate fields.
	AppServer (see page 8462)	Provides access to the interface the client dataset uses to communicate with a provider.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
R	ChangeCount (see page 8463)	Indicates the number of changes in the change log.

R	CloneSource (see page 8464)	Indicates the client dataset (if any) with which this client dataset shares data.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	ConnectionBroker (see page 8466)	Specifies a connection broker that handles the connection to an application server.
	Data (see page 8467)	Represents the data of the client dataset in a transportable format.
	DataSetField (see page 7013)	Indicates the persistent TDataSetField (see page 7060) object that owns a nested dataset.
	DataSetField (see page 8469)	Indicates the TDataSetField component that represents this client dataset.
R	DataSize (see page 8469)	Indicates the number of bytes required to represent the Data (see page 8467) property.
R	DataSource (see page 7014)	Represents the data source of another dataset that supplies values to the dataset.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Delta (see page 8470)	Represents a packet of change log data.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
R	GroupingLevel (see page 8479)	Indicates the depth of grouping support provided by the current index.
R	HasAppServer (see page 8480)	Indicates whether the client dataset is connected to a provider.
R	IndexFieldCount (see page 8481)	Indicates the number of fields that make up the current index.
	IndexFields (see page 8482)	Specifies the fields associated with the current index.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
	KeyExclusive (see page 8484)	Specifies the upper and lower boundaries for a range.
	KeyFieldCount (see page 8484)	Specifies the number of fields to use when conducting a partial key search on a multi-field key.
R	KeySize (see page 8485)	Indicates the size of the current key used for the dataset.
	LogChanges (see page 8485)	Indicates whether to maintain a change log separate from the data.
R	Modified (see page 7029)	Indicates whether the active record is modified.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ProviderName (see page 8492)	Specifies the name of a provider component that supplies data to and applies updates from the client dataset..
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
	RemoteServer (see page 8493)	Specifies the connection component that this client dataset uses to connect to an application server.
	SavePoint (see page 8494)	Represents the current state of edits when logging changes.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	StatusFilter (see page 8495)	Filters the client dataset so that it exposes only those records with a specific update status.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

	XMLData (see page 8496)	Represents the data of the client dataset in XML.

Published Events

	Name	Description
	AfterApplyUpdates (see page 19598)	Occurs after the client dataset applies updates to the provider but before it attempts to reconcile update errors.
	AfterCancel (see page 19599)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 19601)	Occurs after an application closes a dataset.
	AfterDelete (see page 19602)	Occurs after an application deletes a record.
	AfterEdit (see page 19605)	Occurs after an application starts editing a record.
	AfterExecute (see page 19606)	Occurs after the client dataset receives the results from an execute command.
	AfterGetParams (see page 19606)	Occurs after the client dataset receives parameter values from the provider.
	AfterGetRecords (see page 19607)	Occurs after the client dataset fetches a data packet from the provider.
	AfterInsert (see page 19608)	Occurs after an application inserts a new record.
	AfterOpen (see page 19609)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 19610)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 19610)	Occurs after an application refreshes the data in the dataset.
	AfterRowRequest (see page 19611)	Occurs after the client dataset fetches new information about the current record.
	AfterScroll (see page 19612)	Occurs after an application scrolls from one record to another.
	BeforeApplyUpdates (see page 19612)	Occurs before the client dataset applies updates to the remote server.
	BeforeCancel (see page 19613)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 19613)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 19614)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 19614)	Occurs before an application enters edit mode for the active record.
	BeforeExecute (see page 19615)	Occurs before the client dataset executes the provider's query or stored procedure.
	BeforeGetParams (see page 19616)	Occurs before the client dataset fetches parameter values from the provider.
	BeforeGetRecords (see page 19616)	Occurs before the client dataset fetches a data packet from the provider.
	BeforeInsert (see page 19618)	Occurs before an application enters insert mode.
	BeforeOpen (see page 19619)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 19620)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 19620)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeRowRequest (see page 19621)	Occurs before the client dataset fetches new information about the current record.
	BeforeScroll (see page 19622)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 19622)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 19623)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 19623)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 19624)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 19625)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 19625)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnReconcileError (see page 19625)	Occurs when a client dataset needs to reconcile an update to a record that could not be applied.

Published Properties

	Name	Description
	Active (see page 19575)	Specifies whether the client dataset contains data.
	Aggregates (see page 19577)	Lists all aggregates that apply to the client dataset.
	AggregatesActive (see page 19578)	Specifies whether the client dataset calculates and maintains aggregate values.

	AutoCalcFields (see page 19578)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
	Connection (see page 19579)	Identifies the TSQLConnection component that connects the dataset to a database server.
	Constraints (see page 19579)	Specifies record-level constraints that must be met when editing the data.
R	DataSet (see page 19580)	Provides access to the internal dataset that fetches data from the server.
	DisableStringTrim (see page 19580)	Specifies whether trailing spaces are trimmed from field values when records are posted.
	FetchOnDemand (see page 19581)	Indicates whether to fetch data packets from the provider on an as-needed basis.
	FieldDefs (see page 19582)	Points to the list of field definitions for the dataset.
	FileName (see page 19585)	Specifies a file that stores the data of the client dataset.
	Filter (see page 19585)	Specifies the text of the current filter.
	Filtered (see page 19587)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 19588)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
	IndexDefs (see page 19588)	Contains information about the indexes for a client dataset.
	IndexFieldNames (see page 19589)	Lists the fields to use as an index.
	IndexName (see page 19590)	Identifies an index for the client dataset.
	MasterFields (see page 19591)	Names one or more fields in a master table to link with corresponding fields in this dataset in order to establish a master-detail relationship.
	MasterSource (see page 19592)	Specifies a data source component for the master dataset when establishing a detail-master relationship between this dataset and another one.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ObjectView (see page 19592)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	PacketRecords (see page 19593)	Indicates the number or type of records in a single data packet.
	Params (see page 19594)	Contains parameter values that are sent to the provider.
	ReadOnly (see page 19596)	Specifies whether the client dataset is read-only for this application.
	StoreDefs (see page 19597)	Indicates whether field and index definitions are saved with the client dataset.
	Tag (see page 2808)	Stores an integer value as part of a component.

134.1.2.2 TSimpleDataSet.Create Constructor

Creates and initializes an instance of TSimpleDataSet (see page 19555).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSimpleDataSet(TComponent * AOwner);
```

Description

Call Create to create TSimpleDataSet (see page 19555) at runtime. Datasets added to forms or data modules at design time are created automatically.

AOwner is the component that is responsible for freeing the TSimpleDataSet (see page 19555) instance. If AOwner is nil (Delphi) or NULL (C++), the application must explicitly free the dataset.

Create creates the internal source dataset and provider that fetch data from the database server and apply updates back to the database server.

See Also

Owner (see page 2807)

134.1.2.3 TSimpleDataSet.Destroy Destructor

Destroys the instance of TSimpleDataSet (see page 19555).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSimpleDataSet();
```

Description

Do not call Destroy directly in an application. Usually destruction of datasets is handled automatically. If an application creates its own instances of a dataset without assigning an Owner, however, it should call Free, which verifies that the dataset component is not nil before calling Destroy.

See Also

Free (see page 22300)

134.1.2.4 TSimpleDataSet Methods

The methods of the TSimpleDataSet class are listed here.

Protected Methods

	Name	Description
	AllocConnection (see page 19571)	This is AllocConnection, a member of class TSimpleDataSet.
	AllocDataSet (see page 19571)	This is AllocDataSet, a member of class TSimpleDataSet.
	AllocProvider (see page 19572)	This is AllocProvider, a member of class TSimpleDataSet.
	Loaded (see page 19572)	Initializes the component after the form file has been read into memory.
	Notification (see page 19572)	Forwards notification messages to all owned components.
	OpenCursor (see page 19573)	This is OpenCursor, a member of class TSimpleDataSet.
	PSGetCommandText (see page 19573)	Gets the SQL command to be executed by PSExecute.
	SetConnection (see page 19574)	This is SetConnection, a member of class TSimpleDataSet.

134.1.2.4.1 TSimpleDataSet.AllocConnection Method

Pascal

```
procedure AllocConnection; virtual;
```

C++

```
virtual __fastcall AllocConnection();
```

Description

This is AllocConnection, a member of class TSimpleDataSet.

134.1.2.4.2 TSimpleDataSet.AllocDataSet Method

Pascal

```
procedure AllocDataSet; virtual;
```

C++

```
virtual __fastcall AllocDataSet();
```

Description

This is AllocDataSet, a member of class TSimpleDataSet.

134.1.2.4.3 TSimpleDataSet.AllocProvider Method

Pascal

```
procedure AllocProvider; virtual;
```

C++

```
virtual __fastcall AllocProvider();
```

Description

This is AllocProvider, a member of class TSimpleDataSet.

134.1.2.4.4 TSimpleDataSet.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

See Also

ComponentState (see page 2804)

Create (see page 2766)

TReader (see page 2933)

134.1.2.4.5 TSimpleDataSet.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

134.1.2.4.6 TSimpleDataSet.OpenCursor Method

Pascal

```
procedure OpenCursor(InfoQuery: Boolean); override;
```

C++

```
virtual __fastcall OpenCursor(Boolean InfoQuery);
```

Description

This is OpenCursor, a member of class TSimpleDataSet.

134.1.2.4.7 TSimpleDataSet.PSGetCommandText Method

Gets the SQL command to be executed by PSExecute.

Pascal

```
function PSGetCommandText: string; override;
```

C++

```
virtual __fastcall AnsiString PSGetCommandText();
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText, and subsequently executed by a call to PSExecute.

See Also

CommandText (see page 8465)

PSExecute (see page 7578)

PSSetCommandText (see page 7585)

GetRecords (see page 18468)

Execute (see page 18466)

Options (see page 18440)

134.1.2.4.8 TSimpleDataSet.SetConnection Method

Pascal

```
procedure SetConnection(Value: TSQLConnection); virtual;
```

C++

```
virtual __fastcall SetConnection(TSQLConnection Value);
```

Description

This is SetConnection, a member of class TSimpleDataSet.

134.1.2.5 TSimpleDataSet Properties

The properties of the TSimpleDataSet class are listed here.

Published Properties

	Name	Description
	Active (see page 19575)	Specifies whether the client dataset contains data.
	Aggregates (see page 19577)	Lists all aggregates that apply to the client dataset.
	AggregatesActive (see page 19578)	Specifies whether the client dataset calculates and maintains aggregate values.
	AutoCalcFields (see page 19578)	Determines when the OnCalcFields event is triggered and when lookup field values are calculated.
	Connection (see page 19579)	Identifies the TSQLConnection component that connects the dataset to a database server.
	Constraints (see page 19579)	Specifies record-level constraints that must be met when editing the data.
R	DataSet (see page 19580)	Provides access to the internal dataset that fetches data from the server.
	DisableStringTrim (see page 19580)	Specifies whether trailing spaces are trimmed from field values when records are posted.
	FetchOnDemand (see page 19581)	Indicates whether to fetch data packets from the provider on an as-needed basis.
	FieldDefs (see page 19582)	Points to the list of field definitions for the dataset.
	FileName (see page 19585)	Specifies a file that stores the data of the client dataset.
	Filter (see page 19585)	Specifies the text of the current filter.
	Filtered (see page 19587)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 19588)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
	IndexDefs (see page 19588)	Contains information about the indexes for a client dataset.
	IndexFieldNames (see page 19589)	Lists the fields to use as an index.
	IndexName (see page 19590)	Identifies an index for the client dataset.
	MasterFields (see page 19591)	Names one or more fields in a master table to link with corresponding fields in this dataset in order to establish a master-detail relationship.
	MasterSource (see page 19592)	Specifies a data source component for the master dataset when establishing a detail-master relationship between this dataset and another one.
	ObjectView (see page 19592)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	PacketRecords (see page 19593)	Indicates the number or type of records in a single data packet.
	Params (see page 19594)	Contains parameter values that are sent to the provider.

	ReadOnly (see page 19596)	Specifies whether the client dataset is read-only for this application.
	StoreDefs (see page 19597)	Indicates whether field and index definitions are saved with the client dataset.

134.1.2.5.1 TSimpleDataSet.Active Property

Specifies whether the client dataset contains data.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Use Active to determine whether the client dataset makes its data available. When Active is false, the client dataset is closed; It can't manipulate the data it represents. When Active is true, data can be read or edited using the client dataset.

Setting Active to true:

1Fills the client dataset with data. Depending on the other properties of the client dataset, this data comes from:

The file specified by the FileName property.

The provider specified by the ProviderName property or SetProvider method. (For some TCustomClientDataSet descendants, this is an internal provider component)

The data that was active when the client dataset was deactivated (only if the application has run continuously since the dataset was deactivated).

2Triggers a BeforeOpen event.

3Sets the State property to dsBrowse.

4Opens a cursor into the dataset.

5Triggers an After Open event.

If the client dataset has never been active previously, setting Active to true defines the structure (metadata) of the client dataset. This structure is retrieved with the data packet from the provider or stored on disk, or, if there is no data packet, it is built using the current value of the FieldDefs property or from the persistent field components listed by the Fields property.

If an error occurs during the dataset open, the dataset state is set to dsInactive, and the cursor is closed.

Setting Active to false:

1Triggers a BeforeClose event.

2Sets the State property to dsInactive.

3Closes the cursor, saving the current data to disk if the FileName property is set, and saving the current data packet to a cache so that it can be restored when the client dataset is reopened.

4Triggers an AfterClose event.

Note: Calling the Open method sets Active to true; calling the Close method sets Active to false.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
```

```
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
    end;
  end else
    LastValue := NULL;
  OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
  ClientDataSet1.GetNextPacket;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  ClientDataSet1.Open;
end;

procedure TForm1.Button3Click(Sender: TObject);
var
  I: Integer;
begin
  ClientDataSet1.Close;
```

```
    RemoteServer1.Connected := False;
    with RemoteServer1 do
    begin
      for I := 0 to DataSetCount - 1 do
        DataSets[I].DisableControls;
    end;
  end;

  procedure TForm1.CheckButtonActive(DataSet: TDataSet);
  begin
    Button1.Enabled := not ClientDataSet1.Active;
    Button2.Enabled := ClientDataSet1.Active;
    Button3.Enabled := ClientDataSet1.Active;
  end;
```

134.1.2.5.2 TSimpleDataSet.Aggregates Property

Lists all aggregates that apply to the client dataset.

Pascal

```
property Aggregates: TAggregates;
```

C++

```
__property TAggregates Aggregates;
```

Description

Use Aggregates to define aggregates that summarize the data in the client dataset. Aggregates is a collection of TAggregate objects, each of which defines a formula for calculating an aggregate value from a group of records in the client dataset. The individual aggregates can summarize all the records in the client dataset or subgroups of records that have the same value on a set of fields. Aggregates that summarize a subgroup of records are associated with indexes, and can only be used when the associated index is current.

Do not use Aggregates to obtain summarized values maintained by the client dataset. Aggregates can contain TAggregate objects that are not currently active. Instead, use the ActiveAggs property, which represents only those TAggregate objects that are currently active.

Note: You do not need to add a TAggregate object to the Aggregates collection when you add an aggregate field using the Fields editor. The Fields editor automatically adds TAggregate objects to Aggregates for every aggregate field you define.

TAggregateField (see page 6743)

Obtaining Aggregate Values

Specifying Aggregates

Defining an Aggregate Field

134.1.2.5.3 TSimpleDataSet.AggregatesActive Property

Specifies whether the client dataset calculates and maintains aggregate values.

Pascal

```
property AggregatesActive: Boolean;
```

C++

```
__property Boolean AggregatesActive;
```

Description

Use AggregatesActive to indicate whether the client dataset should maintain aggregate values. When AggregatesActive is false (the default), the client dataset does not support maintained aggregates. This allows the client dataset to avoid the overhead of calculating values that the application is not using. When AggregatesActive is true, the client dataset calculates and maintains all aggregate values specified by the Aggregates property that are compatible with the current index.

When aggregates are maintained, the Value method of every active aggregate object returns a value that reflects the current data in the client dataset. When users edit the data in the dataset, these values are recalculated to reflect the user's changes.

Note: To selectively enable and disable aggregates rather than turning them all on or off at once, use the Active property of individual TAggregate objects. These objects are available through the Aggregates property.

Value (see page 8273)

Active (see page 8274)

134.1.2.5.4 TSimpleDataSet.AutoCalcFields Property

Determines when the OnCalcFields event is triggered and when lookup field values are calculated.

Pascal

```
property AutoCalcFields: Boolean;
```

C++

```
__property Boolean AutoCalcFields;
```

Description

Set AutoCalcFields to control when the OnCalcFields event is triggered to update calculated fields and when lookup fields are calculated.

A calculated field is one that derives its value from the values of one or more fields in the active record, sometimes with additional processing. Lookup fields are fields whose values come from a secondary dataset or lookup cache.

Note: Unidirectional datasets support calculated fields but not unidirectional fields. For unidirectional datasets, OnCalcFields only controls when calculated fields are updated.

When AutoCalcFields is true (the default), Lookup fields are recalculated and OnCalcFields is triggered when:

The dataset is opened.

The dataset is put into dsEdit state.

Focus moves from one visual control to another, or from one column to another in a data-aware grid and modifications have been made to the record.

When AutoCalcFields is false, Lookup fields are recalculated and the OnCalcFields event occurs only when

The dataset is opened.

The dataset is put into dsEdit state.

A record is retrieved from a database.

If an application permits users to change data, OnCalcFields is frequently triggered. In these cases an application may set AutoCalcFields to false to reduce the frequency with which the OnCalcFields event occurs and with which lookup values are fetched.

OnCalcFields (see page 7053)

Calculating Fields

134.1.2.5.5 TSimpleDataSet.Connection Property

Identifies the TSQLConnection component that connects the dataset to a database server.

Pascal

```
property Connection: TSQLConnection;
```

C++

```
__property TSQLConnection Connection;
```

Description

Use Connection to specify the component that connects this dataset to a database server. TSimpleDataSet (see page 19555) can use either an external TSQLConnection component or, if you set the ConnectionName property instead, an internally-created component. By using an external TSQLConnection component, you can let multiple datasets share a single database connection.

Setting Up a Simple Dataset

Connecting to a Data Store Using TADOConnection

134.1.2.5.6 TSimpleDataSet.Constraints Property

Specifies record-level constraints that must be met when editing the data.

Pascal

```
property Constraints: TCheckConstraints;
```

C++

```
__property TCheckConstraints Constraints;
```

Description

Use Constraints to read or add record-level constraints to the dataset. Record-level constraints usually impose relationships between the fields in a single record. Constraints that limit the value of a single field should be added to the individual field components.

See Also

TCheckConstraint (see page 6841)

CustomConstraint (see page 7156)

ImportedConstraint (see page 7167)

Constraining Data Values

134.1.2.5.7 TSimpleDataSet.DataSet Property

Provides access to the internal dataset that fetches data from the server.

Pascal

```
property DataSet: TInternalSQLDataSet;
```

C++

```
__property TInternalSQLDataSet DataSet;
```

Description

Read DataSet to access the internal dataset that TSimpleDataSet (see page 19555) uses to fetch data from the server. TSimpleDataSet (see page 19555) populates its Data property by fetching data from this internal dataset using an internal provider component.

See Also

Data (see page 8467)

134.1.2.5.8 TSimpleDataSet.DisableStringTrim Property

Specifies whether trailing spaces are trimmed from field values when records are posted.

Pascal

```
property DisableStringTrim: Boolean;
```

C++

```
__property Boolean DisableStringTrim;
```

Description

When DisableStringTrim is false, trailing spaces are trimmed from field values when records are posted. When DisableStringTrim is true, field values are posted exactly as typed, including any trailing spaces.

134.1.2.5.9 TSimpleDataSet.FetchOnDemand Property

Indicates whether to fetch data packets from the provider on an as-needed basis.

Pascal

```
property FetchOnDemand: Boolean;
```

C++

```
__property Boolean FetchOnDemand;
```

Description

By default FetchOnDemand is true, meaning that the client dataset fetches additional packets of data as needed (for example, as a user scrolls through data, or conducts a search). If the provider does not automatically include BLOB fields or nested detail sets in data packets, setting FetchOnDemand to true causes the client dataset to fetch these values when needed as well.

Set FetchOnDemand to false only if your application contains code that explicitly fetches data packets as needed using the GetNextPacket method. Similarly, if FetchOnDemand is false and the provider does not include BLOB data by default (Options includes poFetchBlobsOnDemand), the application must fetch BLOB fields explicitly using the FetchBlobs method. If the provider does not include nested detail sets (Options includes poFetchDetailsOnDemand) and FetchOnDemand is false, the application must fetch nested details explicitly using the FetchDetails method.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
    end;
  end else
    LastValue := NULL;
  OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
end;
```

```
procedure TForm1.Button2Click(Sender: TObject);
begin
  ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
  ClientDataSet1.GetNextPacket;
end;
```

Requesting Data from the Source Dataset or Document

134.1.2.5.10 TSimpleDataSet.FieldDefs Property

Points to the list of field definitions for the dataset.

Pascal

```
property FieldDefs: TFieldDefs;
```

C++

```
__property TFieldDefs FieldDefs;
```

Description

FieldDefs lists the field definitions for a dataset. While an application can examine FieldDefs to explore the field definitions for a dataset, it should not change these definitions unless creating a new table with CreateTable or CreateDataSet.

To access fields and field values in a dataset, use the Fields, AggFields, and FieldValues properties, and the FieldsByName method.

Note: If the dataset includes object field descendants, FieldDefs represents a hierarchical view of the data, meaning that the definitions include object field definitions. To determine the definitions in a flattened view, use FieldDefList instead.

C++ Examples:

```
/*
The following code creates and activates a client dataset in
the form's OnCreate event handler.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TFieldDefs *pDefs = CDS2->FieldDefs;
  TFieldDef *pDef = pDefs->AddFieldDef();
  pDef->DataType = ftInteger;
  pDef->Name = "Field1";

  pDef = pDefs->AddFieldDef();
  pDef->DataType = ftString;
  pDef->Size = 10;
  pDef->Name = "Field2";

  TIndexDef *pIDef = CDS2->IndexDefs->AddIndexDef();
  pIDef->Fields = "Field1";
  pIDef->Name = "IntIndex";

  CDS2->CreateDataSet();
}
```

Delphi Examples:

```
{
The following code creates and activates a client dataset in
the form's OnCreate event handler.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  with CDS2 do
  begin
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftInteger;
      Name := 'Field1';
    end;
    with FieldDefs.AddFieldDef do
    begin
      DataType := ftString;
      Size := 10;
      Name := 'Field2';
    end;
    with IndexDefs.AddIndexDef do
    begin
      Fields := 'Field1';
      Name := 'IntIndex';
    end;
    CreateDataSet;
  end;
end;
{ The following example shows how to create a table. }
procedure TForm1.Button1Click(Sender: TObject);
begin
  Table1.Close;
  Table1.DeleteTable;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if Table1.Exists then
      MessageDlg('CustInfo table already exists.', mtWarning, [mbOK], 0)
    else
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
      { it a name }
      { Next, describe the fields in the table }
      with FieldDefs do
      begin
        Clear;
        with AddFieldDef do
        begin
          Name := 'Field1';
          DataType := ftInteger;
          Required := True;
        end;
        with AddFieldDef do
```

```
          begin
            Name := 'Field2';
            DataType := ftString;
            Size := 30;
          end;
        end;
        { Next, describe any indexes }
        with IndexDefs do
        begin
          Clear;
          { The 1st index has no name because it is
          { a Paradox primary key }
          with AddIndexDef do
          begin
            Name := '';
            Fields := 'Field1';
            Options := [ixPrimary];
          end;
          with AddIndexDef do
          begin
            Name := 'Fld2Indx';
            Fields := 'Field2';
            Options := [ixCaseInsensitive];
          end;
        end;
        { Call the CreateTable method to create the table }
        CreateTable;
        Table1.Active:= True;
        for i := 1 to 20 do
          Table1.AppendRecord([i*111, i*222]);
      end;
    end;
    DS2.DataSet:= Table1;
    DBGrid2.DataSource.DataSet:= Table1;
    Table1.Active:= True;
  end;
```

Creating and Deleting Tables

134.1.2.5.11 TSimpleDataSet.FileName Property

Specifies a file that stores the data of the client dataset.

Pascal

```
property FileName: string;
```

C++

```
__property AnsiString FileName;
```

Description

Set FileName if the client dataset always reads its data from and writes its data to a single file. When FileName represents a valid file name, the client dataset automatically writes its data to that file when it is closed. When FileName specifies the name of an existing file, the client dataset automatically reads its data from that file when it is opened.

Changes are not merged into the data when it is saved to the file. This allows an application that employs the "briefcase" model to set FileName without losing updates that are destined for a database server. Single-tiered applications should explicitly merge changes before closing the dataset and saving the data to disk.

Note: When client datasets write their data to a file, they overwrite the contents of the file. Any previous contents of the file are lost.

To read from or write to a different file, use the LoadFromFile and SaveToFile methods instead. These methods can also be used to load and save data at times other than when the Active property changes.

Loading Data from a File or Stream

Saving Data to a File or Stream

Using a Dedicated File on Disk

134.1.2.5.12 TSimpleDataSet.Filter Property

Specifies the text of the current filter.

Pascal

```
property Filter: string;
```

C++

```
__property AnsiString Filter;
```

Description

Use Filter to specify a dataset filter. When filtering is applied to a client dataset, only those records that meet a filter's conditions are available to an application. Filter contains the string that describes the filter condition. Client datasets support the following set of filter operations: See the Limiting what records appear link at the bottom of this topic for a complete list of available filter operations.

Operator or function ComparisonsExampleComment

Operator or function Comparisons	Example	Comment
=	State = 'CA'	
<>	State <> 'CA'	
>=	DateEntered >= '1/1/1998'	
<=	Total <= 100,000	
>	Percentile > 50	
<	Field1 < Field2	
BLANK	State <> 'CA' or State = BLANK	Blank records do not appear unless explicitly included in the filter.
IS NULL	Field1 IS NULL	
IS NOT NULL	Field1 IS NOT NULL	
Logical operators		
and	State = 'CA' and Country = 'US'	
or	State = 'CA' or State = 'MA'	
not	not (State = 'CA')	
Arithmetic operators		
+	Total + 5 > 100	Applies to numbers, strings, or date (time) + number
-	Field1 - 7 <> 10	Applies to numbers, dates, or date (time) - number
*	Discount * 100 > 20	Applies to numbers only
/	Discount > Total / 5	Applies to numbers only
String functions		
Upper	Upper(Field1) = 'ALWAYS'	
Lower	Lower(Field1 + Field2) = 'josp'	
Substring	Substring(DateString,8) = '1998' | Substring(DateString,1,3) = 'JAN'	Value goes from position of second argument to end or number of chars in third arg. First char has position 1.
Trim	Trim(Field1 + Field2) | Trim(Field1, '-')	removes third argument from front and back. If no third argument, trims spaces.
TrimLeft	TrimLeft(StringField) | TrimLeft(Field1, '$') <> ''	See Trim
TrimRight	TrimRight(StringField) | TrimRight(Field1, '.') <> ''	See Trim
DateTime functions		
Year	Year(DateField) = 2000	
Month	Month(DateField) <> 12	
Day	Day(DateField) = 1	
Hour	Hour(DateField) < 16	
Minute	Minute(DateField) = 0	

Second	Second(DateField) = 30	
GetDate	GetDate - DateField > 7	Represents current date and time
Date	DateField = Date(GetDate)	Returns the date portion of a datetime value
Time	TimeField > Time(GetDate)	Returns the time portion of a datetime value
Miscellaneous		
Like	Memo LIKE '%filters%'	Works like SQL-92 without the ESC clause. When applied to BLOB fields, FilterOptions determines whether case is considered.
In	Day(DateField) in (1,7)	Works like SQL-92. Second argument is a list of values all with the same type.
*	State = 'M*'	Wildcard for partial comparisons

134.1.2.5.13 TSimpleDataSet.Filtered Property

Specifies whether or not filtering is active for a dataset.

Pascal

```
property Filtered: Boolean;
```

C++

```
__property Boolean Filtered;
```

Description

Check Filtered to determine whether or not dataset filtering is in effect. If Filtered is true, then filtering is active. To apply filter conditions specified in the Filter property or the OnFilterRecord event handler, set Filtered to true. Because unidirectional datasets do not support filters, when you set Filtered to true on a unidirectional dataset, it raises an exception.

Note: When filtering is enabled, user edits to a record may mean that the record no longer meets a filter's test condition. The next time an attempt is made to the read the record from the dataset while the filter is in effect, the record is not visible. If that happens, the next record that passes the filter condition becomes the active record.

See Also

134.1.2.5.14 TSimpleDataSet.FilterOptions Property

Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.

Pascal

```
property FilterOptions: TFilterOptions;
```

C++

```
__property TFilterOptions FilterOptions;
```

Description

Set FilterOptions to specify whether or not filtering is case insensitive when filtering on string or character fields, and whether or not partial comparisons for matching filter conditions is allowed.

Note: Because unidirectional datasets do not support filters, when you set the FilterOptions property of a unidirectional dataset, it raises an exception.

By default, FilterOptions is set to an empty set. For filters based on string fields, set FilterOptions to foCaseInsensitive to catch all variations on a string regardless of capitalization.

When a string in a filter ends with an asterisk (*), it can be used to match partial strings. To disable matching of partial strings and to treat the asterisk as a literal character in string comparisons, set FilterOptions to include foNoPartialCompare.

134.1.2.5.15 TSimpleDataSet.IndexDefs Property

Contains information about the indexes for a client dataset.

Pascal

```
property IndexDefs: TIndexDefs;
```

C++

```
__property TIndexDefs IndexDefs;
```

Description

Examine IndexDefs for index information. IndexDefs maintains an array of TIndexDef items, each of which describes an available index for the dataset. Set the value of IndexDefs before calling CreateDataSet to create a set of indexes with the client dataset.

Note: The index items in IndexDefs may not always reflect the current indexes available for a dataset. Before examining IndexDefs, call the IndexDefs.Update (Delphi) or IndexDefs->Update (C++) method to refresh the item list.

C++ Examples:

```
/*
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
*/
void __fastcall TForm1::Button3Click(TObject *Sender)
{
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2->Active = False;
  // Get the current available indices
  CDS2->IndexDefs->Update();
  // Find a field named "Field2"
  for (int I = 0; I < CDS2->IndexDefs->Count; I++)
    if (CDS2->IndexDefs->Items[I]->Fields == "Field2")
    {
      // set that index as the current index for the dataset}
      CDS2->IndexName = CDS2->IndexDefs->Items[I]->Name;
    }
  CDS2->Active = True;
}
```

Delphi Examples:

```
{
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
}
procedure TForm1.Button3Click(Sender: TObject);
var
  I : Integer;
begin
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2.Active := False;
  { Get the current available indices }
  CDS2.IndexDefs.Update;
  { Find a field named 'Field2' }
  for I := 0 to CDS2.IndexDefs.Count - 1 do
    if CDS2.IndexDefs.Items[I].Fields = 'Field2' then
    begin
      { set that index as the current index for the dataset}
      CDS2.IndexName := CDS2.IndexDefs.Items[I].Name;
    end;
  CDS2.Active := True;
end;
```

Adding a New Index

134.1.2.5.16 TSimpleDataSet.IndexFieldNames Property

Lists the fields to use as an index.

Pascal

```
property IndexFieldNames: Widestring;
```

C++

```
__property BSTR IndexFieldNames;
```

Description

Use IndexFieldNames as an alternative method of specifying the index to use for a client dataset. Specify the name of each field on which to index the dataset, separating names with semicolons. Ordering of field names is significant.

Note: Indexes added using IndexFieldNames do not support grouping or maintained aggregates.

Tip: Use IndexFieldNames to create sort orders on the fly at runtime.

Note: The IndexFieldNames and IndexName properties are mutually exclusive. Setting one clears the other.

See Also

IndexDefs (see page 8480)

IndexName (see page 8483)

Creating an Index with IndexFieldNames

Adding a New Index

134.1.2.5.17 TSimpleDataSet.IndexName Property

Identifies an index for the client dataset.

Pascal

```
property IndexName: Widestring;
```

C++

```
__property BSTR IndexName;
```

Description

Use IndexName to specify an alternative index for a client dataset.If IndexName is empty, the dataset's sort order is based on the IndexFieldNames property or on its default ordering in the data packet. Default ordering is determined by the predefined index, DEFAULT_ORDER.

If IndexName contains a valid index name, then that index is used to determine sort order of records.

Note: IndexFieldNames and IndexName are mutually exclusive. Setting one clears the other.

C++ Examples:

```
/*
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
*/
void __fastcall TForm1::Button3Click(TObject *Sender)
{
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2->Active = False;
```

```
    // Get the current available indices
    CDS2->IndexDefs->Update();
    // Find a field named "Field2"
    for (int I = 0; I < CDS2->IndexDefs->Count; I++)
      if (CDS2->IndexDefs->Items[I]->Fields == "Field2")
      {
        // set that index as the current index for the dataset}
        CDS2->IndexName = CDS2->IndexDefs->Items[I]->Name;
      }
    CDS2->Active = True;
  }
```

Delphi Examples:

```
{
This example uses the IndexName property to sort the records
in a client dataset on the Field2 field.
}
procedure TForm1.Button3Click(Sender: TObject);
var
  I : Integer;
begin
  // If Active is True, Update will remove Fields added in FormCreate
  // and add the DEFAULT_ORDER and CHANGEINDEX Fields
  CDS2.Active := False;
  { Get the current available indices }
  CDS2.IndexDefs.Update;
  { Find a field named 'Field2' }
  for I := 0 to CDS2.IndexDefs.Count - 1 do
    if CDS2.IndexDefs.Items[I].Fields = 'Field2' then
    begin
      { set that index as the current index for the dataset}
      CDS2.IndexName := CDS2.IndexDefs.Items[I].Name;
    end;
  CDS2.Active := True;
end;
```

Deleting and Switching Indexes

134.1.2.5.18 TSimpleDataSet.MasterFields Property

Names one or more fields in a master table to link with corresponding fields in this dataset in order to establish a master-detail relationship.

Pascal

```
property MasterFields: Widestring;
```

C++

```
__property BSTR MasterFields;
```

Description

Use MasterFields after setting the MasterSource property to specify the names of one or more fields to use in establishing a detail-master relationship between this dataset and the one specified in MasterSource.

MasterFields is a string containing one or more field names in the master table. Separate field names with semicolons.

Each time the current record in the master table changes, the new values in those fields are used to select corresponding records in this dataset for display.

Note: At design time, use the Field Link designer to establish the master-detail relationship between two datasets.

See Also

MasterSource (see page 8486)

Making the Table a Detail of Another Dataset

134.1.2.5.19 TSimpleDataSet.MasterSource Property

Specifies a data source component for the master dataset when establishing a detail-master relationship between this dataset and another one.

Pascal

```
property MasterSource: TDataSource;
```

C++

```
__property TDataSource MasterSource;
```

Description

Use MasterSource to specify the name of the data source component whose DataSet property identifies a dataset to use as a master table in establishing a detail-master relationship between this dataset and another one.

At design time choose an available data source from the MasterSource property's drop-down list in the Object Inspector.

After setting the MasterSource property, specify which fields to use in the master table by setting the MasterFields property. At runtime each time the current record in the master table changes, the new values in those fields are used to select corresponding records in this dataset for display.

Note: At design time, use the Field Link designer to establish the master-detail relationship between two datasets.

Tip: MasterSource establishes a master/detail relationship using the traditional linked cursor approach. Alternately, client datasets can participate in master/detail relationships using nested datasets, where the detail dataset is stored with the master table's data. To assign a client dataset's data as the value of a nested detail, use the DataSetField property.

MasterFields (see page 8486)

Making the Table a Detail of Another Dataset

134.1.2.5.20 TSimpleDataSet.ObjectView Property

Specifies whether fields are stored hierarchically or flattened out in the Fields property.

Pascal

```
property ObjectView: Boolean;
```

C++

```
__property Boolean ObjectView;
```

Description

ObjectView affects the way the Fields property stores object fields and the way data-aware grids display ADT and array fields.

When ObjectView is true, the fields are stored hierarchically in the Fields property, meaning any child fields of an object field are referenced by the object field and don't appear sequentially after the object field in the TFields:: .Fields array. When ObjectView is false, the fields are stored sequentially in the Fields property, meaning any child fields of an object field are stored after the object field as siblings in the Fields array.

When ObjectView is false, object field types, such as TADTField, are not created. This switch is provided for increased compatibility with older data-aware controls, which may not handle object field types properly. The default is false for TBDEDataSet, and true for TClientDataSet.

Note: If the ObjectView property of the dataset provided to a TClientDataSet is false, then the TClientDataSet's ObjectView property always acts as false, since the data received is already flattened.

Working with Array Fields

134.1.2.5.21 TSimpleDataSet.PacketRecords Property

Indicates the number or type of records in a single data packet.

Pascal

```
property PacketRecords: Integer;
```

C++

```
__property int PacketRecords;
```

Description

Use PacketRecords to specify how many records should be contained in a single packet fetched from a provider, or to indicate that the packet returned should contain only metadata.

When a client dataset is instantiated, PacketRecords is automatically set to -1, meaning that a single packet should contain all records in the dataset.

If PacketRecords is greater than zero, then it specifies the number of records to return in a packet.

To retrieve the metadata for a dataset, set PacketRecords to 0. When PacketRecords is zero, the provider returns only information from its dataset that defines the database's structure, such as table, column, constraint, and domain definitions.

Warning: When PacketRecords is greater than 0, the client dataset must fetch its data incrementally. If the provider is on a stateless application server, the client dataset must inform the provider where to start fetching data. This communication can occur using a BeforeGetRecords event handler.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
```

```
  value of the first field for the last record to the server so
  that the server can return the correct records. The complete
  project using this code example is in
  Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
  }
  procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
  var
    LastValue: OleVariant;
    CDSClone: TClientDataSet;
  begin
    if ClientDataSet1.Active then
    begin
      CDSClone := TClientDataSet.Create(Form1);
      try
        CDSClone.CloneCursor(ClientDataSet1, True);
        { turn off FetchOnDemand so that the clone only fetches
          the last LOCAL record }
        CDSClone.FetchOnDemand := False;
        CDSClone.Last;
        LastValue := CDSClone.Fields[0].AsString;
        CDSClone.Close;
      finally
        CDSClone.Free;
      end;
    end else
      LastValue := NULL;
    OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
  end;

  procedure TForm1.Button2Click(Sender: TObject);
  begin
    ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
    ClientDataSet1.GetNextPacket;
  end;
```

Requesting Data from the Source Dataset or Document

Using the BDE to Cache Updates

Updating Data in dbExpress Applications

134.1.2.5.22 TSimpleDataSet.Params Property

Contains parameter values that are sent to the provider.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

Use Params to specify parameter values that the provider should pass to a source dataset. If the client dataset uses an internal provider, Params represents the values for any parameters used by the SQL statement specified by the CommandText property. If the client dataset uses an external provider that is associated with a dataset that represents a query or stored procedure, these

parameter values supply input parameter values for that query or stored procedure and return any output parameters of a stored procedure. If the provider is associated with a TTable or TSQLTable component, Params limits the records that are sent in data packets. After specifying the parameters (at design time or runtime), they are sent to the provider automatically when the client dataset fetches data or executes a query or stored procedure using its Execute method.

To send parameter values to a query or stored procedure, for every parameter on the query or stored procedure for which the client dataset should send a value, add a parameter object (TParam) to Params. Assign each parameter object the same Name, DataType, and ParamType as the corresponding parameter on the query or stored procedure. These values are automatically encoded and sent to the provider when the client dataset fetches data.

To send parameter values to a TTable or TSQLTable, add a parameter object for each field in the table that is used to limit the values sent in data packets. Assign each parameter object the same Name and DataType as the corresponding field component on the table. These parameter values are automatically sent when the client dataset fetches data, and the records returned in data packets from the provider only contain records that match the assigned value on the corresponding fields. You can achieve the same affect by applying a filter to the field, but using Params is more efficient because the data need not be included in data packets.

Note: To initialize Params so that it reflects the parameters of a provider's associated query or stored procedure, call the FetchParams method.

Warning: The parameters are only applied to the provider when a query or stored procedure is run the first time the client dataset fetches records. To change parameter values and force a query or stored procedure to be rerun with new values, use the Execute method.

Delphi Examples:

```
{
This example fills in the parameters of a client dataset
from the entries of a list box.
}
procedure TForm1.Button4Click(Sender: TObject);
var
  I: Integer;
  ListItem: string;
begin
  { Call FetchParams to ensure parameters reflect server metadata }
  ClientDataSet1.FetchParams;
  with ClientDataSet1.Params do
  begin
    for I := 0 to Count - 1 do
    begin
      ListItem := ListBox1.Items[I];
      case Items[I].DataType of
        ftString:
          Items[I].AsString := ListItem;
        ftSmallInt:
          Items[I].AsSmallInt := StrToIntDef(ListItem, 0);
        ftInteger:
          Items[I].AsInteger := StrToIntDef(ListItem, 0);
        ftWord:
          Items[I].AsWord := StrToIntDef(ListItem, 0);
        ftBoolean:
          begin
            if ListItem = 'True' then
              Items[I].AsBoolean := True
            else
              Items[I].AsBoolean := False;
          end;
```

```
          ftFloat:
            Items[I].AsFloat := StrToFloat(ListItem);
          ftCurrency:
            Items[I].AsCurrency := StrToFloat(ListItem);
          ftBCD:
            Items[I].AsBCD := StrToCurr(ListItem);
          ftDate:
            Items[I].AsDate := StrToDate(ListItem);
          ftTime:
            Items[I].AsTime := StrToTime(ListItem);
          ftDateTime:
            Items[I].AsDateTime := StrToDateTime(ListItem);
        end;
      end;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ListBox1.Items.Add('Here is a string');
    ListBox1.Items.Add('4');
    ListBox1.Items.Add('3456789');
    ListBox1.Items.Add('34');
    ListBox1.Items.Add('0');
    ListBox1.Items.Add('12.56');
    ListBox1.Items.Add('4.23');
    ListBox1.Items.Add('99.5');
    ListBox1.Items.Add('4/12/53');
    ListBox1.Items.Add('7:45:00');
    ListBox1.Items.Add('4/12/53 7:45:00');

  end;
```

Getting Parameters from the Application Server

Limiting Records with Parameters

Overview of Using Cached Updates

Passing Parameters to the Source Dataset

Sending Query or Stored Procedure Parameters

Setting Up a Simple Dataset

134.1.2.5.23 TSimpleDataSet.ReadOnly Property

Specifies whether the client dataset is read-only for this application.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Use the ReadOnly property to prevent users from updating, inserting, or deleting data in the dataset. By default, ReadOnly is false, meaning users can potentially alter the dataset's data.

To guarantee that users cannot modify or add data to a dataset, set ReadOnly to true.

When ReadOnly is true, the dataset's CanModify property is false.

Note: Even if ReadOnly is false, users may not be able to modify or add data to a client dataset if it gets its data from a provider. The provider's Options property can limit whether data can be edited, and if so, what types of edits are allowed.

See Also

Active (see page 7004)

CanModify

Options (see page 18440)

134.1.2.5.24 TSimpleDataSet.StoreDefs Property

Indicates whether field and index definitions are saved with the client dataset.

Pascal

```
property StoreDefs: Boolean;
```

C++

```
__property Boolean StoreDefs;
```

Description

If StoreDefs is true, the client dataset's index and field definitions are stored with the client dataset when the form or data module that contains it is saved. Setting StoreDefs to true makes the CreateDataSet method into a one-step procedure that creates fields and indexes at runtime.

134.1.2.6 TSimpleDataSet Events

The events of the TSimpleDataSet class are listed here.

Published Events

	Name	Description
	AfterApplyUpdates (see page 19598)	Occurs after the client dataset applies updates to the provider but before it attempts to reconcile update errors.
	AfterCancel (see page 19599)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 19601)	Occurs after an application closes a dataset.
	AfterDelete (see page 19602)	Occurs after an application deletes a record.

	AfterEdit (see page 19605)	Occurs after an application starts editing a record.
	AfterExecute (see page 19606)	Occurs after the client dataset receives the results from an execute command.
	AfterGetParams (see page 19606)	Occurs after the client dataset receives parameter values from the provider.
	AfterGetRecords (see page 19607)	Occurs after the client dataset fetches a data packet from the provider.
	AfterInsert (see page 19608)	Occurs after an application inserts a new record.
	AfterOpen (see page 19609)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 19610)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 19610)	Occurs after an application refreshes the data in the dataset.
	AfterRowRequest (see page 19611)	Occurs after the client dataset fetches new information about the current record.
	AfterScroll (see page 19612)	Occurs after an application scrolls from one record to another.
	BeforeApplyUpdates (see page 19612)	Occurs before the client dataset applies updates to the remote server.
	BeforeCancel (see page 19613)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 19613)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 19614)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 19614)	Occurs before an application enters edit mode for the active record.
	BeforeExecute (see page 19615)	Occurs before the client dataset executes the provider's query or stored procedure.
	BeforeGetParams (see page 19616)	Occurs before the client dataset fetches parameter values from the provider.
	BeforeGetRecords (see page 19616)	Occurs before the client dataset fetches a data packet from the provider.
	BeforeInsert (see page 19618)	Occurs before an application enters insert mode.
	BeforeOpen (see page 19619)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 19620)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 19620)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeRowRequest (see page 19621)	Occurs before the client dataset fetches new information about the current record.
	BeforeScroll (see page 19622)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 19622)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 19623)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 19623)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 19624)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 19625)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 19625)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnReconcileError (see page 19625)	Occurs when a client dataset needs to reconcile an update to a record that could not be applied.

134.1.2.6.1 TSimpleDataSet.AfterApplyUpdates Event

Occurs after the client dataset applies updates to the provider but before it attempts to reconcile update errors.

Pascal

```
property AfterApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterApplyUpdates;
```

Description

Write an AfterApplyUpdates event handler to respond to custom information returned to the client dataset from a provider's AfterApplyUpdates event handler. AfterApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's ApplyUpdates method, the following events occur:

1.The client dataset receives a BeforeApplyUpdates event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeApplyUpdates event, where it can respond to or change that information before it applies the updates.

3.The provider applies the updates, and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates event handler.

6.The client dataset generates an OnReconcileError for every record that could not be applied by the provider.

Applying Updates

Communicating with the Client Dataset

134.1.2.6.2 TSimpleDataSet.AfterCancel Event

Occurs after an application completes a request to cancel modifications to the active record.

Pascal

```
property AfterCancel: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterCancel;
```

Description

Write an AfterCancel event handler to take specific action after an application cancels changes to the active record. AfterCancel is called by the Cancel method after it updates the current position, releases the lock on the active record if necessary, and sets the dataset state to dsBrowse. If an application requires additional processing before returning control to a user after a Cancel event, code it in the AfterCancel event.

Delphi Examples:

```
{
This example updates the form’s status bar with a message
when an AfterCancel event occurs.  Set the StatusBar
SimplePanel property to True.
}
procedure TForm1.Table1AfterCancel(DataSet: TDataSet);
begin
  StatusBar1.SimpleText := 'Record changes cancelled for ' + DataSet.Name;
end;
```

```
procedure TForm1.Button2Click(Sender: TObject);
begin
  Table1.Cancel;
end;

procedure TForm1.Button3Click(Sender: TObject);
begin
  Table1.Post
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Name := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if Table1.Exists then
    begin
        Table1.Close;
        Table1.DeleteTable;
    end;
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
      { it a name }
      { Next, describe the fields in the table }
      with FieldDefs do
      begin
        Clear;
        with AddFieldDef do
        begin
          Name := 'Field1';
          DataType := ftInteger;
          Required := True;
        end;
        with AddFieldDef do
        begin
          Name := 'Field2';
          DataType := ftString;
          Size := 30;
        end;
      end;
      { Next, describe any indexes }
      with IndexDefs do
      begin
        Clear;
        { The 1st index has no name because it is
        { a Paradox primary key }
        with AddIndexDef do
        begin
          Name := '';
          Fields := 'Field1';
          Options := [ixPrimary];
        end;
        with AddIndexDef do
        begin
          Name := 'Fld2Indx';
          Fields := 'Field2';
```

```
          Options := [ixCaseInsensitive];
        end;
      end;
      { Call the CreateTable method to create the table }
      CreateTable;
      Table1.Active:= True;
      for i := 1 to 20 do
        Table1.AppendRecord([i*111, i*222]);
    end;
  end;
  DS2.DataSet:= Table1;
  DBGrid2.DataSource.DataSet:= Table1;
  Table1.AfterCancel:= Table1AfterCancel;
  Table1.Active:= True;
end;
```

134.1.2.6.3 TSimpleDataSet.AfterClose Event

Occurs after an application closes a dataset.

Pascal

```
property AfterClose: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterClose;
```

Description

Write an AfterClose event handler to take specific action immediately after an application closes a dataset. For example, as a security measure, an application might clear a PASSWORD entry from the Params property of a TSQLConnection component when the dataset is closed.

AfterClose is called after a dataset is closed and the dataset state is set to dsInactive.

Delphi Examples:

```
{
This example adds an entry to a memo with a message when an
AfterOpen event or an AfterClose event occurs.  Populate the
ClientDataSet events with CheckButtonActive.
}
procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  if (Button1.Enabled) then
    Memo2.Lines.Add('Now that the dataset is open, record information is available.')
  else
    Memo2.Lines.Add('Now that the dataset is closed, record information is not available.');
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
```

```
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  ClientDataSet1.Open;
end;

procedure TForm1.Button3Click(Sender: TObject);
var
  I: Integer;
begin
  ClientDataSet1.Close;
  RemoteServer1.Connected := False;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].DisableControls;
  end;
end;

procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
```

Opening and Closing Datasets

134.1.2.6.4 TSimpleDataSet.AfterDelete Event

Occurs after an application deletes a record.

Pascal

```
property AfterDelete: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterDelete;
```

Description

Write an AfterDelete event handler to take specific action immediately after an application deletes the active record in a dataset. AfterDelete is called by Delete after it deletes the record, sets the dataset state to dsBrowse, and repositions the current record.

C++ Examples:

```
/*
This example displays a message on the form's status bar
indicating the record count after a record is deleted.  Set
the StatusBar SimplePanel property to True.
*/
void __fastcall TForm1::Table1AfterDelete(TDataSet *DataSet)
{
  StatusBar1->SimpleText = Format(
    "There are now %d records in the table",
    ARRAYOFCONST(((int)DataSet->RecordCount)));
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Table1->Delete();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Table1 = new TTable(Form1);
  Table1->Active = false; // The Table component must not be active
  Table1->DatabaseName = "DBDEMOS";
  Table1->TableType = ttParadox;
  Table1->TableName = "CustInfo";
  Table1->Active = False;
  if (!Table1->Exists) // Don't overwrite an existing table
  {
    Table1->Close();
    Table1->DeleteTable();
  }
  // The Table component must not be active
  // First, describe the type of table and give
  // it a name
  // Next, describe the fields in the table
  Table1->FieldDefs->Clear();
  TFieldDef *pNewDef = Table1->FieldDefs->AddFieldDef();
  pNewDef->Name = "Field1";
  pNewDef->DataType = ftInteger;
  pNewDef->Required = true;
  pNewDef = Table1->FieldDefs->AddFieldDef();
  pNewDef->Name = "Field2";
  pNewDef->DataType = ftString;
  pNewDef->Size = 30;
  // Next, describe any indexes
  Table1->IndexDefs->Clear();
  /* the 1st index has no name because it is a Paradox primary key */
  Table1->IndexDefs->Add("","Field1", TIndexOptions() <<ixPrimary << ixUnique);
  Table1->IndexDefs->Add("Fld2Index","Field2", TIndexOptions() << ixCaseInsensitive);
  // Now that we have specified what we want, create the table
  Table1->CreateTable();
  Table1->Active = True;
  for (int i = 1; i <= 20; i++)
    Table1->AppendRecord(ARRAYOFCONST((i*111, i*222)));
  DS2->DataSet = Table1;
  DBGrid2->DataSource->DataSet = Table1;
  Table1->AfterDelete = Table1AfterDelete;
  Table1->Active = True;
}
```

Delphi Examples:

```
{
This example displays a message on the form's status bar
indicating the record count after a record is deleted.  Set
the StatusBar SimplePanel property to True.
}
procedure TForm1.Table1AfterDelete(DataSet: TDataSet);
```

```
begin
  StatusBar1.SimpleText := Format('There are now %d records in the table',
[DataSet.RecordCount]);
end;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Table1.Delete;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Table1:= TTable.Create(Form1);
  with Table1 do
  begin
    DatabaseName := 'DBDEMOS';
    TableType := ttParadox;
    TableName := 'CustInfo';
    Name := 'CustInfo';
    Table1.Active := False;
    { Don't overwrite an existing table }
    if Table1.Exists then
    begin
        Table1.Close;
        Table1.DeleteTable;
    end;
    begin
      { The Table component must not be active }
      { First, describe the type of table and give }
      { it a name }
      { Next, describe the fields in the table }
      with FieldDefs do
      begin
        Clear;
        with AddFieldDef do
        begin
          Name := 'Field1';
          DataType := ftInteger;
          Required := True;
        end;
        with AddFieldDef do
        begin
          Name := 'Field2';
          DataType := ftString;
          Size := 30;
        end;
      end;
      { Next, describe any indexes }
      with IndexDefs do
      begin
        Clear;
        { The 1st index has no name because it is
        { a Paradox primary key }
        with AddIndexDef do
        begin
          Name := '';
          Fields := 'Field1';
          Options := [ixPrimary];
        end;
        with AddIndexDef do
        begin
          Name := 'Fld2Indx';
          Fields := 'Field2';
          Options := [ixCaseInsensitive];
```

```
        end;
      end;
      { Call the CreateTable method to create the table }
      CreateTable;
      Table1.Active:= True;
      for i := 1 to 20 do
        Table1.AppendRecord([i*111, i*222]);
    end;
  end;
  DS2.DataSet:= Table1;
  DBGrid2.DataSource.DataSet:= Table1;
  Table1.AfterDelete:= Table1AfterDelete;
  Table1.Active:= True;
end;
```

134.1.2.6.5 TSimpleDataSet.AfterEdit Event

Occurs after an application starts editing a record.

Pascal

```
property AfterEdit: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterEdit;
```

Description

Write an AfterEdit event handler to take specific action immediately after dataset enters edit mode. AfterEdit is called by Edit after it enables editing of a record, recalculates calculated fields, and calls the data event handler to process a record change.

Delphi Examples:

```
{
This example adds an entry to a memo with a message
when an AfterEdit event occurs and when a BeforeEdit event
occurs.  Click on Run SQL to populate the DBGrid.  Then
select a cell to edit and click the Edit current cell
button, or just start editing the cell to invoke the
BeforeEdit and AfterEdit events.
}
procedure TForm1.ClientDataSet1AfterEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.ClientDataSet1BeforeEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  ClientDataSet1.Edit;
end;
```

BeforeEdit (see page 7049)

Edit (see page 6932)

134.1.2.6.6 TSimpleDataSet.AfterExecute Event

Occurs after the client dataset receives the results from an execute command.

Pascal

```
property AfterExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterExecute;
```

Description

Write an AfterExecute event handler to respond to custom information returned to the client dataset from a provider's AfterExecute event handler. AfterExecute is part of the mechanism by which a client dataset and a provider communicate information when executing an SQL command from the client. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's Execute method, the following events occur:

1.The client dataset receives a BeforeExecute event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeExecute event, where it can respond to or change that information before it executes the query or stored procedure.

3.The provider executes the appropriate command (either the command supplied by the CommandText property, or the command associated with a dataset such as a query or stored procedure).

4.The provider receives an AfterExecute event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeExecute event handler.

5.The client dataset unpacks any output parameters from the provider into the Params property and then receives an AfterExecute event, where it can respond to the custom information returned by the provider's AfterExecute event handler.

Communicating with the Client Dataset

134.1.2.6.7 TSimpleDataSet.AfterGetParams Event

Occurs after the client dataset receives parameter values from the provider.

Pascal

```
property AfterGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetParams;
```

Description

Write an AfterGetParams event handler to respond to custom information returned to the client dataset from a provider's AfterGetParams event handler. AfterGetParams is part of the mechanism by which a client dataset and a provider communicate information when the client application calls FetchParams. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's FetchParams method, the following events occur:

1.The client dataset receives a BeforeGetParams event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeGetParams event, where it can respond to or change that information before it retrieves parameter values.

3.The provider encodes all of its dataset's current parameter values into an OleVariant.

4.The provider receives an AfterGetParams event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetParams event handler.

5.The client dataset unpacks the parameters from the provider into the Params property and then receives an AfterGetParams event, where it can respond to the custom information returned by the provider's AfterGetParams event handler.

Communicating with the Client Dataset

134.1.2.6.8 TSimpleDataSet.AfterGetRecords Event

Occurs after the client dataset fetches a data packet from the provider.

Pascal

```
property AfterGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetRecords;
```

Description

Write an AfterGetRecords event handler to respond to custom information returned to the client dataset from a provider's AfterGetRecords event handler. AfterGetRecords is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches data from the application server, the following events occur:

1. The client dataset receives a BeforeGetRecords event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2. The provider receives a BeforeGetRecords event, where it can respond to or change that information before it creates a data packet.
3. The provider generates an OnGetData event where it can edit the data before creating a data packet, and then generates the data packet.
4. The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.
5. The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider's AfterGetRecords event handler.

Communicating with the Client Dataset

134.1.2.6.9 TSimpleDataSet.AfterInsert Event

Occurs after an application inserts a new record.

Pascal

```
property AfterInsert: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterInsert;
```

Description

Write an AfterInsert event handler to take specific action immediately after an application inserts a record. The Insert and Append methods generate an AfterInsert event after inserting or appending a new record.

Delphi Examples:

```
{
This example updates a memo with a message when an
AfterInsert event or a BeforeInsert event occurs.
}
procedure TForm1.ClientDataSet1AfterInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After inserting a record');
end;

procedure TForm1.ClientDataSet1BeforeInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before inserting a record');
end;
```

See Also

BeforeInsert (see page 7050)

Append (see page 6910)

Insert (see page 6959)

134.1.2.6.10 TSimpleDataSet.AfterOpen Event

Occurs after an application completes opening a dataset and before any data access occurs.

Pascal

```
property AfterOpen: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterOpen;
```

Description

Write an AfterOpen event handler to take specific action immediately after an application opens the dataset. AfterOpen is called after the dataset establishes access to its data and the dataset is put into dsBrowse state. For example, an AfterOpen event handler might check an ini file to determine the last record touched in the dataset the previous time the application ran, and position the dataset at that record.

Delphi Examples:

```
{
This example adds an entry to a memo with a message when an
AfterOpen event or an AfterClose event occurs.  Populate the
ClientDataSet events with CheckButtonActive.
}
procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  if (Button1.Enabled) then
    Memo2.Lines.Add('Now that the dataset is open, record information is available.')
  else
    Memo2.Lines.Add('Now that the dataset is closed, record information is not available.');
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
{
The following code fragment illustrates how DataSets and
DataSetCount can be used to ensure that an action is taken
for every open dataset.  Assign CheckButtonActive as the
AfterClose and AfterOpen event handlers for TClientDataSet1.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  if not RemoteServer1.Connected then
    RemoteServer1.Connected := True;
  ClientDataSet1.Close;
  with RemoteServer1 do
  begin
    for I := 0 to DataSetCount - 1 do
      DataSets[I].EnableControls;
  end;
  ClientDataSet1.Open;
end;

procedure TForm1.Button3Click(Sender: TObject);
var
  I: Integer;
begin
  ClientDataSet1.Close;
  RemoteServer1.Connected := False;
  with RemoteServer1 do
  begin
```

```
    for I := 0 to DataSetCount - 1 do
      DataSets[I].DisableControls;
  end;
end;

procedure TForm1.CheckButtonActive(DataSet: TDataSet);
begin
  Button1.Enabled := not ClientDataSet1.Active;
  Button2.Enabled := ClientDataSet1.Active;
  Button3.Enabled := ClientDataSet1.Active;
end;
```

Open (see page 6976)

Opening and Closing Datasets

134.1.2.6.11 TSimpleDataSet.AfterPost Event

Occurs after an application writes the active record to the database or change log and returns to browse state.

Pascal

```
property AfterPost: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterPost;
```

Description

Write an AfterPost event handler to take specific action immediately after an application posts a change to the active record. AfterPost is called after a modification or insertion is made to a record.

Delphi Examples:

```
{
This example updates the form's status bar with a message
when an AfterPost event occurs.
}
procedure TForm1.ClientDataSet1AfterPost(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before posting a record');
end;
```

See Also

BeforePost (see page 7052)

Post (see page 6977)

134.1.2.6.12 TSimpleDataSet.AfterRefresh Event

Occurs after an application refreshes the data in the dataset.

Pascal

```
property AfterRefresh: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterRefresh;
```

Description

Write an AfterRefresh event handler to take specific action immediately after an application has updated the records in the dataset. AfterRefresh is generated by calls to the Refresh method.

See Also

BeforeRefresh (see page 7052)

Refresh (see page 6991)

134.1.2.6.13 TSimpleDataSet.AfterRowRequest Event

Occurs after the client dataset fetches new information about the current record.

Pascal

```
property AfterRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterRowRequest;
```

Description

Write an AfterRowRequest event handler to respond to custom information returned to the client dataset from a provider's AfterRowRequest event handler. AfterRowRequest is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeRowRequest event, where it can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

5.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider's AfterRowRequest event handler.

RefreshRecord (see page 8442)

Communicating with the Client Dataset

134.1.2.6.14 TSimpleDataSet.AfterScroll Event

Occurs after an application scrolls from one record to another.

Pascal

```
property AfterScroll: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterScroll;
```

Description

Write an AfterScroll event handler to take specific action immediately after an application scrolls to another record as a result of a call to the First, Last, MoveBy, Next, Prior, FindKey, FindFirst, FindNext, FindLast, FindPrior, and Locate methods. AfterScroll is called after all other events triggered by these methods and any other methods that switch from record to record in the dataset.

See Also

BeforeScroll (see page 7053)

First (see page 6942)

Last (see page 6968)

MoveBy (see page 6971)

Navigating Datasets

134.1.2.6.15 TSimpleDataSet.BeforeApplyUpdates Event

Occurs before the client dataset applies updates to the remote server.

Pascal

```
property BeforeApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeApplyUpdates;
```

Description

Write a BeforeApplyUpdates event handler to send custom information to the client dataset's provider. BeforeApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's ApplyUpdates method, the following events occur:

1.The client dataset receives a BeforeApplyUpdates event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeApplyUpdates event, where it can respond to or change that information before it applies the updates.

3.The provider applies the updates and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider's AfterApplyUpdates event handler.

Applying Updates

Communicating with the Client Dataset

134.1.2.6.16 TSimpleDataSet.BeforeCancel Event

Occurs before an application executes a request to cancel changes to the active record.

Pascal

```
property BeforeCancel: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeCancel;
```

Description

Write a BeforeCancel event to take specific action before an application carries out a request to cancel changes. BeforeCancel is called by the Cancel method before it cancels a dataset operation such as Edit, Insert, or Delete.

An application might use the BeforeCancel event to record a user's changes in an undo buffer.

See Also

AfterCancel (see page 7038)

Delete (see page 6924)

Edit (see page 6932)

Insert (see page 6959)

134.1.2.6.17 TSimpleDataSet.BeforeClose Event

Occurs immediately before the dataset closes.

Pascal

```
property BeforeClose: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeClose;
```

Description

Write a BeforeClose event to take specific action before an application closes a dataset. Calling Close or setting the Active property to false results in a call to the BeforeClose event handler.

See Also

Active (see page 7004)

AfterClose (see page 7040)

Close (see page 6920)

Opening and Closing Datasets

Posting Data

134.1.2.6.18 TSimpleDataSet.BeforeDelete Event

Occurs before an application attempts to delete the active record.

Pascal

```
property BeforeDelete: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeDelete;
```

Description

Write a BeforeDelete event handler to take specific action before an application deletes the active record. BeforeDelete is called by Delete before it actually deletes a record.

In Delphi, making use of this event an application might, for example, display a dialog box asking for confirmation before deleting the record. On denial of confirmation, the application could abort the deletion by calling the Abort procedure.

See Also

AfterDelete (see page 7041)

Delete (see page 6924)

Abort (see page 22786)

134.1.2.6.19 TSimpleDataSet.BeforeEdit Event

Occurs before an application enters edit mode for the active record.

Pascal

```
property BeforeEdit: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeEdit;
```

Description

Write a BeforeEdit event handler to take specific action before an application enables editing of the active record. For example, an application that keeps a log of database edits could use the BeforeEdit event to record the edit request, time, and user before entering edit state.

Delphi Examples:

```
{
This example adds an entry to a memo with a message
when an AfterEdit event occurs and when a BeforeEdit event
occurs.  Click on Run SQL to populate the DBGrid.  Then
select a cell to edit and click the Edit current cell
button, or just start editing the cell to invoke the
```

```
BeforeEdit and AfterEdit events.
}
procedure TForm1.ClientDataSet1AfterEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.ClientDataSet1BeforeEdit(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before editing record' + IntToStr(DataSet.RecNo));
end;

procedure TForm1.Button4Click(Sender: TObject);
begin
  ClientDataSet1.Edit;
end;
```

134.1.2.6.20 TSimpleDataSet.BeforeExecute Event

Occurs before the client dataset executes the provider's query or stored procedure.

Pascal

```
property BeforeExecute: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to send custom information to the client dataset's provider. BeforeExecute is part of the mechanism by which a client dataset and a provider communicate information when explicitly executing an SQL command by the provider's dataset. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's Execute method, the following events occur:

1.The client dataset receives a BeforeExecute event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeExecute event, where it can respond to or change that information before it executes the query or stored procedure.

3.The provider executes the appropriate command (either the command supplied by the CommandText property, or the command associated with a dataset such as a query or stored procedure).

4.The provider receives an AfterExecute event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeExecute event handler.

5.The client dataset unpacks any output parameters from the provider into the Params property and then receives an AfterExecute event, where it can respond to the custom information returned by the provider's AfterExecute event handler.

See Also

Execute (see page 8413)

AS_Execute (see page 16453)

AfterExecute (see page 8504)

CommandText (see page 8465)

Communicating with the Client Dataset

134.1.2.6.21 TSimpleDataSet.BeforeGetParams Event

Occurs before the client dataset fetches parameter values from the provider.

Pascal

```
property BeforeGetParams: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetParams;
```

Description

Write a BeforeGetParams event handler to send custom information to the client dataset's provider. BeforeGetparams is part of the mechanism by which a client dataset and a provider communicate information when passing parameter values from the provider's dataset. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the application calls the client dataset's FetchParams method, the following events occur:

1.The client dataset receives a BeforeGetParams event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeGetParams event, where it can respond to or change that information before it retrieves parameter values.

3.The provider encodes all of its dataset's current parameter values into an OleVariant.

4.The provider receives an AfterGetParams event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetParams event handler.

5.The client dataset unpacks the parameters from the provider into the Params property and then receives an AfterGetParams event, where it can respond to the custom information returned by the provider's AfterGetParams event handler.

See Also

FetchParams (see page 8415)

AS_GetParams (see page 16454)

GetParams (see page 18467)

BeforeGetParams (see page 18480)

AfterGetParams (see page 8505)

Communicating with the Client Dataset

134.1.2.6.22 TSimpleDataSet.BeforeGetRecords Event

Occurs before the client dataset fetches a data packet from the provider.

Pascal

```
property BeforeGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetRecords;
```

Description

Write a BeforeGetRecords event handler to send custom information to the client dataset's provider. BeforeGetRecords is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches data from the application server, the following events occur:

1.The client dataset receives a BeforeGetRecords event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider receives a BeforeGetRecords event, where it can respond to or change that information before it creates a data packet.

3.The provider generates the data packet.

4.The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.

5.The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider's AfterGetRecords event handler.

Delphi Examples:

```
{
This example shows how to use the BeforeGetRecords event
handler (a TRemoteEventType value) to send the provider
information it needs for incremental data fetching. Before
fetching the next data packet, the client dataset packages
up the key value of the last record so that the provider
knows where to begin the next data packet. It also sends
some application-specific information, which is stored in
Memo1.  This method is used to pass the sql statement and the
value of the first field for the last record to the server so
that the server can return the correct records. The complete
project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TForm1.ClientDataSet1BeforeGetRecords(Sender: TObject; var OwnerData: OleVariant);
var
  LastValue: OleVariant;
  CDSClone: TClientDataSet;
begin
  if ClientDataSet1.Active then
  begin
    CDSClone := TClientDataSet.Create(Form1);
    try
      CDSClone.CloneCursor(ClientDataSet1, True);
      { turn off FetchOnDemand so that the clone only fetches
        the last LOCAL record }
      CDSClone.FetchOnDemand := False;
      CDSClone.Last;
      LastValue := CDSClone.Fields[0].AsString;
      CDSClone.Close;
    finally
      CDSClone.Free;
    end;
```

```
    end else
      LastValue := NULL;
    OwnerData := VarArrayOf([Memo1.Lines.Text, LastValue]);
  end;

  procedure TForm1.Button2Click(Sender: TObject);
  begin
    ClientDataSet1.PacketRecords := StrToInt(Edit1.Text);
    ClientDataSet1.GetNextPacket;
  end;
```

AfterGetRecords (see page 8506)

Communicating with the Client Dataset

134.1.2.6.23 TSimpleDataSet.BeforeInsert Event

Occurs before an application enters insert mode.

Pascal

```
property BeforeInsert: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeInsert;
```

Description

Write a BeforeInsert event handler to take specific action before an application inserts or appends a new record. The Insert or Append method generates a BeforeInsert method before it sets the dataset into dsInsert state.

Delphi Examples:

```
{
This example updates a memo with a message when an
AfterInsert event or a BeforeInsert event occurs.
}
procedure TForm1.ClientDataSet1AfterInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('After inserting a record');
end;

procedure TForm1.ClientDataSet1BeforeInsert(DataSet: TDataSet);
begin
   Memo2.Lines.Add('Before inserting a record');
end;
{
This example uses the BeforeInsert event to do data
validation. If the StrToInt function raises an exception,
the edit control's contents are set to a valid value so
that the assignment to the INTEGER field in the dataset
will succeed.  Continuing after the exception causes a
'0' to be placed in the PORTA field.
DataSet design:
This example requires a ClientDataSet, a DBGrid, a
DataSource and a DBNavigator.  Name the ClientDataSet CDS.
Set the DataSet property in the DataSource to CDS and name
that DataSource DS.  Set the DataSource in the DBNavigator
```

```
to DS the DataSource in the DBGrid to DS.  Right click on CDS
and select the Fields Editor, then right click on the Field
Editor form and create two fields by selecting "new field".
In the field configuration window, set the name to HOST, the
Component value will automatically be set to CDSHOST.  Set
the filed type to String.  In the field configuration window
for the second field, set the name to PORTA, the Component
value will automatically be set to CDSPORTA.  Set the field
type to Integer.  The file used to load CDS must have an
attribute name of HOST with an attribute type of string and
an attribute name of PORTA with an attribute type of integer.
Add DB, DBCtrls, Grids, DBGrids and DBClient to the uses clause.
}
{$IFNDEF UNICODE}
uses SwSystem;
{$ENDIF}

procedure TForm1.Button3Click(Sender: TObject);
begin
  CDS.Insert;
  CDS.FieldByName('PORTA').AsInteger := StrToInt(Edit1.Text);
  CDS.Post;
end;

procedure TForm1.CDSBeforeInsert(DataSet: TDataSet);
begin
  try
  { Make sure edit field can be converted to integer --
   this will raise an exception if it can't }
    StrToInt(Edit1.Text);
  except
    Edit1.Text := '0';
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
{$IFDEF UNICODE}
  CDS.LoadFromFile(GetCurrentDir + '\CDS.XML');
{$ELSE}
  CDS.LoadFromFile(gsAppPath + 'CDS.XML');
{$ENDIF}
end;
```

134.1.2.6.24 TSimpleDataSet.BeforeOpen Event

Occurs before an application executes a request to open a dataset.

Pascal

```
property BeforeOpen: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeOpen;
```

Description

Write a BeforeOpen event handler to take specific action before an application opens a dataset for viewing or editing. BeforeOpen is triggered when an application sets the Active property to true for a dataset or an application calls Open.

See Also

Active (see page 7004)

AfterOpen (see page 7045)

Open (see page 6976)

Opening and Closing Datasets

134.1.2.6.25 TSimpleDataSet.BeforePost Event

Occurs before an application posts changes for the active record to the database or change log.

Pascal

```
property BeforePost: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforePost;
```

Description

Write a BeforePost event handler to take specific action before an application posts dataset changes. BeforePost is triggered when an application calls the Post method. Post checks to make sure all required fields are present, then calls BeforePost before posting the record.

An application might use BeforePost to perform validity checks on data changes before committing them. If it encountered a validity problem, it could call Abort to cancel the Post operation (Delphi) or throw an exception (C++).

Delphi Examples:

```
{
This example checks for a valid entry in a TDBEdit control
and calls the Abort procedure if the control is empty; Abort
cancels the post before it happens.
}
procedure TForm1.ClientDataSet1BeforePost(DataSet: TDataSet);
begin
  if DBEdit1.Text = '' then
    Abort;
  DataSet.Fields[2].AsString := DBEdit1.Text;
end;
```

See Also

AfterPost (see page 7046)

Post (see page 6977)

Abort (see page 22786)

Working with Field Component Methods at Runtime

134.1.2.6.26 TSimpleDataSet.BeforeRefresh Event

Occurs immediately before an application refreshes the data in the dataset.

Pascal

```
property BeforeRefresh: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeRefresh;
```

Description

Write a BeforeRefresh event handler to take specific action immediately before an application updates the records in the dataset. BeforeRefresh is generated by calls to the Refresh method.

See Also

AfterRefresh (see page 7047)

Refresh (see page 6991)

134.1.2.6.27 TSimpleDataSet.BeforeRowRequest Event

Occurs before the client dataset fetches new information about the current record.

Pascal

```
property BeforeRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeRowRequest;
```

Description

Write a BeforeRowRequest event handler to send custom information to the client dataset's provider. BeforeRowRequest is part of the mechanism by which a client dataset and a provider communicate information about data fetching. When working with a provider on a stateless application server, this mechanism allows the client dataset and the provider to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest event, where it can encode custom information into an OleVariant that is passed to the provider as the OwnerData parameter.

2.The provider on the application server receives a BeforeRowRequest event, where it can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

5.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider's AfterRowRequest event handler.

Communicating with the Client Dataset

134.1.2.6.28 TSimpleDataSet.BeforeScroll Event

Occurs before an application scrolls from one record to another.

Pascal

```
property BeforeScroll: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeScroll;
```

Description

Write a BeforeScroll event handler to take specific action immediately before an application scrolls to another record as a result of a call to the First, Last, MoveBy, Next, Prior, FindKey, FindFirst, FindNext, FindLast, FindPrior, and Locate methods. BeforeScroll is called before all other events triggered by these methods and any other methods that switch from record to record in the dataset.

See Also

AfterScroll (see page 7047)

First (see page 6942)

Last (see page 6968)

MoveBy (see page 6971)

Next (see page 6973)

Prior (see page 6979)

Navigating Datasets

134.1.2.6.29 TSimpleDataSet.OnCalcFields Event

Occurs when an application recalculates calculated fields.

Pascal

```
property OnCalcFields: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent OnCalcFields;
```

Description

Write an OnCalcFields event handler to take specific action when an application recalculates calculated fields. A calculated field is one that derives its value from the values in one or more fields in the dataset, sometimes with additional processing.

OnCalcFields is triggered when:

A dataset is opened.

A dataset is put into dsEdit state.

A record is retrieved from a database.

When the AutoCalcFields property is true, OnCalcFields is also triggered when:

Focus moves from one visual control to another, or from one column to another is a data-aware grid control and modifications were made to the record.

Note: When the AutoCalcFields property is true, an OnCalcFields event handler should not modify the dataset (or a linked dataset if it is part of a master-detail relationship), because such modifications retrigger the OnCalcField event, leading to infinite recursion.

If an application permits users to change data, OnCalcFields is frequently triggered. To reduce the frequency with which OnCalcFields occurs, set AutoCalcFields to false.

Warning: When the dataset is the master table of a master-detail relationship, OnCalcFields occurs before detail sets have been synchronized with the master table.

Defining a Calculated Field

134.1.2.6.30 TSimpleDataSet.OnDeleteError Event

Occurs when an application attempts to delete a record and an exception is raised.

Pascal

```
property OnDeleteError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnDeleteError;
```

Description

Write an OnDeleteError event handler to handle exceptions that occur when an attempt to delete a record fails.

See Also

OnEditError (see page 7054)

OnPostError (see page 7056)

Delete (see page 6924)

134.1.2.6.31 TSimpleDataSet.OnEditError Event

Occurs when an application attempts to modify or insert a record and an exception is raised.

Pascal

```
property OnEditError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnEditError;
```

Description

Write an OnEditError event handler to handle exceptions that occur when an attempt to edit a record fails.

See Also

OnDeleteError (see page 7054)

OnPostError (see page 7056)

Edit (see page 6932)

Insert (see page 6959)

134.1.2.6.32 TSimpleDataSet.OnFilterRecord Event

Occurs each time a different record in the dataset becomes the active record and filtering is enabled.

Pascal

```
property OnFilterRecord: TFilterRecordEvent;
```

C++

```
__property TFilterRecordEvent OnFilterRecord;
```

Description

Write an OnFilterRecord event handler to specify for each record in a dataset whether it should be visible to the application. To indicate that a record passes the filter condition, the OnFilterRecord event handler must set the Accept parameter to true. To exclude a record, set the Accept parameter to false. Most TDataSet descendants (such as ADO datasets or BDE-based datasets) initialize Accept to true before calling the OnFilterRecord event handler.

Warning: Do not supply an OnFilterRecord event handler to a unidirectional dataset. Unidirectional datasets do not support filters, and assigning an OnFilterRecord event handler causes the dataset to raise an exception.

Filtering is enabled if the Filtered property is true. When an application is processing a filter, the State property for the dataset is dsFilter.

Use an OnFilterRecord event handler to filter records using a criterion that can't be implemented using the Filter property. For example, using the Filter property, field comparisons are not supported against local tables (Paradox, dBASE, Access, FoxPro), but an OnFilterRecord event handler can implement any criterion at all.

Tip: Be sure that any interactions between the Filter property and the OnFilterRecord event handler do not result in an empty filter set when they are used simultaneously in an application.

Navigating Records in a Filtered Dataset

Displaying and Editing a Subset of Data Using Filters

Writing an OnFilterRecord Event Handler

134.1.2.6.33 TSimpleDataSet.OnNewRecord Event

Occurs when an application inserts or appends a new dataset record.

Pascal

```
property OnNewRecord: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent OnNewRecord;
```

Description

Write an OnNewRecord event handler to take specific actions as an application inserts or appends a new record. OnNewRecord is called as part of the insert or append process. An application might use the OnNewRecord event to set initial values for a record or as a way of implementing cascading insertions in related datasets.

See Also

AfterInsert (see page 7044)

BeforeInsert (see page 7050)

134.1.2.6.34 TSimpleDataSet.OnPostError Event

Occurs when an application attempts to modify or insert a record and an exception is raised.

Pascal

```
property OnPostError: TDataSetErrorEvent;
```

C++

```
__property TDataSetErrorEvent OnPostError;
```

Description

Write an OnPostError event handler to handle exceptions that occur when an attempt to post a record fails.

See Also

OnDeleteError (see page 7054)

OnEditError (see page 7054)

Post (see page 6977)

134.1.2.6.35 TSimpleDataSet.OnReconcileError Event

Occurs when a client dataset needs to reconcile an update to a record that could not be applied.

Pascal

```
property OnReconcileError: TReconcileErrorEvent;
```

C++

```
__property TReconcileErrorEvent OnReconcileError;
```

Description

Write an OnReconcileError event handler to respond to error conditions that arise when the Reconcile method cycles through records that could not be applied to the database. This event handles only those update errors that were not handled in an OnUpdateError event handler.

The OnReconcileError event handler is called once for each record that could not be applied to the dataset or handled by the provider.

Warning: A provider can't detect when an update conflicts with another user's changes to a memo field. This situation does not generate an OnReconcileError event.

Structs, Records, Enums (see page 19789)	The following table lists structs, records, enums in this documentation.
Types (see page 19794)	The following table lists types in this documentation.
Variables (see page 19796)	The following table lists variables in this documentation.
Constants (see page 19799)	The following table lists constants in this documentation.

Classes

	Name	Description
	TAbstractDesigntimeWarnings (see page 19631)	TAbstractDesigntimeWarnings assembles design-time warning messages that appear in the HTML view of the form your application builds.
	TAbstractInetFileType (see page 19633)	This is class SiteComp.TAbstractInetFileType.
	TNotifyList (see page 19636)	TNotifyList is a collection of objects that should be notified of changes.
	TScriptComponent (see page 19641)	This is class SiteComp.TScriptComponent.
	TScriptObject (see page 19643)	This is class SiteComp.TScriptObject.

Constants

Name	Description
AdapterActionHTMLElementTypeNames (see page 19799)	This is constant SiteComp.AdapterActionHTMLElementTypeNames.
AdapterDisplayHTMLElementTypeNames (see page 19799)	This is constant SiteComp.AdapterDisplayHTMLElementTypeNames.
AdapterDisplayViewModeTypeNames (see page 19800)	This is constant SiteComp.AdapterDisplayViewModeTypeNames.
AdapterInputHTMLElementTypeNames (see page 19800)	This is constant SiteComp.AdapterInputHTMLElementTypeNames.

Functions

	Name	Description
	FullyQualifiedFieldName (see page 19788)	This is function SiteComp.FullyQualifiedFieldName.
	FullyQualifiedName (see page 19788)	This is function SiteComp.FullyQualifiedName.

Interfaces

	Name	Description
	IActionImageProducer (see page 19646)	IActionImageProducer is the interface for accessing the image or set of images that represent an adapter action.
	IAdapterAccess (see page 19649)	This is class SiteComp.IAdapterAccess.
	IAdapterActionAccess (see page 19650)	This is class SiteComp.IAdapterActionAccess.
	IAdapterActionAttributes (see page 19651)	This is class SiteComp.IAdapterActionAttributes.
	IAdapterDispatcher (see page 19653)	IAdapterDispatcher is the interface for interacting with the adapter dispatcher.
	IAdapterDispatchParams (see page 19655)	IAdapterDispatchParams describes adapter action parameters and adapter field values.
	IAdapterError (see page 19660)	This is class SiteComp.IAdapterError.
	IAdapterErrors (see page 19663)	IAdapterErrors is implemented by adapter errors objects.
	IAdapterFieldAccess (see page 19666)	This is class SiteComp.IAdapterFieldAccess.
	IAdapterFieldAttributes (see page 19667)	This is class SiteComp.IAdapterFieldAttributes.
	IAdapterHiddenField (see page 19669)	This is class SiteComp.IAdapterHiddenField.
	IAdapterHiddenFields (see page 19671)	This is class SiteComp.IAdapterHiddenFields.
	IAdapterItemRequestParams (see page 19673)	IAdapterItemRequestParams is the interface for reading the parameters for an adapter field or action request.
	IAdapterMode (see page 19677)	This is class SiteComp.IAdapterMode.
	IAdapterRequestHandler (see page 19680)	IAdapterRequestHandler handles requests to execute an adapter action or retrieve the value of an image field.
	IAsFormatted (see page 19681)	This is class SiteComp.IAsFormatted.
	IDefaultPageFileName (see page 19682)	This is class SiteComp.IDefaultPageFileName.
	IFieldValuesAdapter (see page 19683)	This is class SiteComp.IFieldValuesAdapter.
	IFindIncludeFile (see page 19684)	This is class SiteComp.IFindIncludeFile.
	IGetAdapterActions (see page 19685)	This is class SiteComp.IGetAdapterActions.
	IGetAdapterDisplayCharacteristics (see page 19686)	This is class SiteComp.IGetAdapterDisplayCharacteristics.
	IGetAdapterErrors (see page 19687)	This is class SiteComp.IGetAdapterErrors.
	IGetAdapterFields (see page 19688)	This is class SiteComp.IGetAdapterFields.
	IGetAdapterHiddenFields (see page 19689)	This is class SiteComp.IGetAdapterHiddenFields.
	IGetAdapterImage (see page 19690)	This is class SiteComp.IGetAdapterImage.
	IGetAdapterItemRequestParams (see page 19691)	This is class SiteComp.IGetAdapterItemRequestParams.
	IGetAdapterRequestDefaultResponse (see page 19692)	This is class SiteComp.IGetAdapterRequestDefaultResponse.
	IGetAdapterValuesList (see page 19694)	This is class SiteComp.IGetAdapterValuesList.
	IGetDefaultAction (see page 19695)	This is class SiteComp.IGetDefaultAction.
	IGetDesigntimeWarnings (see page 19697)	This is class SiteComp.IGetDesigntimeWarnings.
	IGetFieldValuesAdapter (see page 19698)	This is class SiteComp.IGetFieldValuesAdapter.
	IGetHTMLStyle (see page 19699)	IGetHTMLStyle is used to inquire about the preferred display representation of an adapter field or adapter action.
	IGetProducerComponent (see page 19702)	This is class SiteComp.IGetProducerComponent.
	IGetScriptObject (see page 19703)	This is class SiteComp.IGetScriptObject.
	IGetScriptObjectClassKey (see page 19704)	This is class SiteComp.IGetScriptObjectClassKey.
	IGetWebAppComponents (see page 19705)	This is class SiteComp.IGetWebAppComponents.
	IIDEFileManager (see page 19708)	This is class SiteComp.IIDEFileManager.
	IImageProducer (see page 19709)	IImageProducer is the interface for accessing the image that an adapter component supplies.
	IInternetEnvOptions (see page 19710)	This is class SiteComp.IInternetEnvOptions.
	IInternetExecuteScript (see page 19713)	This is class SiteComp.IInternetExecuteScript.
	IInternetFileTypes (see page 19714)	This is class SiteComp.IInternetFileTypes.
	IInternetScriptDebugger (see page 19715)	This is class SiteComp.IInternetScriptDebugger.
	IIsAdapterActionList (see page 19716)	This is class SiteComp.IIsAdapterActionList.
	IIterateIntfSupport (see page 19718)	This is class SiteComp.IIterateIntfSupport.
	IIterateObjectSupport (see page 19719)	This is class SiteComp.IIterateObjectSupport.
	IIteratorIndex (see page 19720)	IIteratorIndex is the interface that indicates where an object is positioned when it is iterating over its subitems.

	IIteratorSupport (see page 19722)	IIteratorSupport is the interface that allows server-side script to iterate over the items of an adapter or one of its child objects.
	INotifyAdapterChange (see page 19724)	INotifyAdapterChange is the interface that allows objects to respond when an adapter changes.
	INotifyList (see page 19725)	INotifyList is the interface that allows objects to register and unregister an interest in changes to a component.
	IPageDispatcher (see page 19727)	IPageDispatcher is the interface for interacting with the page dispatcher.
	IPageResult (see page 19732)	This is class SiteComp.IPageResult.
	ISessionsService (see page 19733)	ISessionsService is the interface for controlling a TSessionsService object.
	ISessionsServiceConnectID (see page 19736)	This is class SiteComp.ISessionsServiceConnectID.
	ISessionsServicePersist (see page 19737)	This is class SiteComp.ISessionsServicePersist.
	ISessionsServiceStoreID (see page 19739)	This is class SiteComp.ISessionsServiceStoreID.
	IValuesListAdapter (see page 19740)	IValuesListAdapter is the interface for supplying name/value pairs.
	IWebActionsList (see page 19743)	This is class SiteComp.IWebActionsList.
	IWebApplicationInfo (see page 19745)	IWebApplicationInfo is the interface for the application adapter.
	IWebContainerSubComponent (see page 19748)	This is class SiteComp.IWebContainerSubComponent.
	IWebDataFields (see page 19749)	This is class SiteComp.IWebDataFields.
	IWebEnabled (see page 19751)	This is class SiteComp.IWebEnabled.
	IWebFormComponentContainer (see page 19752)	This is class SiteComp.IWebFormComponentContainer.
	IWebGetActionName (see page 19754)	This is class SiteComp.IWebGetActionName.
	IWebGetDisplayLabel (see page 19755)	This is class SiteComp.IWebGetDisplayLabel.
	IWebGetDisplayWidth (see page 19756)	This is class SiteComp.IWebGetDisplayWidth.
	IWebGetFieldName (see page 19757)	This is class SiteComp.IWebGetFieldName.
	IWebGetFieldValue (see page 19758)	This is class SiteComp.IWebGetFieldValue.
	IWebGetFieldValues (see page 19760)	IWebGetFieldValues is used to iterate over multiple values associated with an adapter field.
	IWebGetMaxLength (see page 19763)	This is class SiteComp.IWebGetMaxLength.
	IWebGetSessionIDs (see page 19764)	This is class SiteComp.IWebGetSessionIDs.
	IWebImageHREF (see page 19765)	IWebImageHREF is the interface for obtaining an HREF that addresses an image.
	IWebInputName (see page 19766)	This is class SiteComp.IWebInputName.
	IWebIsDefaultAction (see page 19768)	This is class SiteComp.IWebIsDefaultAction.
	IWebIsDefaultField (see page 19769)	This is class SiteComp.IWebIsDefaultField.
	IWebSession (see page 19770)	IWebSession allows an application to terminate a Web session.
	IWebSessionAttributes (see page 19771)	This is class SiteComp.IWebSessionAttributes.
	IWebSessionID (see page 19776)	This is class SiteComp.IWebSessionID.
	IWebSessionIDs (see page 19777)	IWebSessionIDs lists the session IDs (see page 19779) for all sessions that TSessionsService stores in memory.
	IWebSessionValues (see page 19780)	This is class SiteComp.IWebSessionValues.
	IWebSetActionName (see page 19782)	This is class SiteComp.IWebSetActionName.
	IWebSetFieldName (see page 19783)	This is class SiteComp.IWebSetFieldName.
	IWebUserList (see page 19784)	IWebUserList is the interface for validating user logins and access rights.
	IWebValueIsEqual (see page 19786)	This is class SiteComp.IWebValueIsEqual.

Structs, Records, Enums

	Name	Description
	TAdapterActionHTMLElementType (see page 19789)	This is record SiteComp.TAdapterActionHTMLElementType.
	TAdapterDisplayCharacteristic (see page 19789)	This is record SiteComp.TAdapterDisplayCharacteristic.
	TAdapterDisplayHTMLElementType (see page 19790)	This is record SiteComp.TAdapterDisplayHTMLElementType.
	TAdapterDisplayViewModeType (see page 19790)	This is record SiteComp.TAdapterDisplayViewModeType.
	TAdapterInputHTMLElementType (see page 19791)	This is record SiteComp.TAdapterInputHTMLElementType.
	TAdapterItemRequestParamOption (see page 19792)	This is record SiteComp.TAdapterItemRequestParamOption.
	TDispatchPageFlag (see page 19792)	This is record SiteComp.TDispatchPageFlag.
	TQualifyOption (see page 19792)	This is record SiteComp.TQualifyOption.

Types

Name	Description
TAdapterDisplayCharacteristics (see page 19794)	This is type SiteComp.TAdapterDisplayCharacteristics.
TAdapterItemRequestParamOptions (see page 19794)	This is type SiteComp.TAdapterItemRequestParamOptions.
TDispatchPageFlags (see page 19795)	This is type SiteComp.TDispatchPageFlags.
TSessionID (see page 19795)	This is type SiteComp.TSessionID.

Variables

Name	Description
ExecuteScript (see page 19796)	This is variable SiteComp.ExecuteScript.
GetHTMLSampleImage (see page 19796)	This is variable SiteComp.GetHTMLSampleImage.
IDEFileManager (see page 19797)	This is variable SiteComp.IDEFileManager.
InetFileTypes (see page 19797)	This is variable SiteComp.InetFileTypes.
InternetEnvOptions (see page 19797)	This is variable SiteComp.InternetEnvOptions.
ScriptDebugger (see page 19798)	This is variable SiteComp.ScriptDebugger.

135.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TAbstractDesigntimeWarnings (see page 19631)	TAbstractDesigntimeWarnings assembles design-time warning messages that appear in the HTML view of the form your application builds.
	TAbstractInetFileType (see page 19633)	This is class SiteComp.TAbstractInetFileType.
	TNotifyList (see page 19636)	TNotifyList is a collection of objects that should be notified of changes.
	TScriptComponent (see page 19641)	This is class SiteComp.TScriptComponent.
	TScriptObject (see page 19643)	This is class SiteComp.TScriptObject.

135.1.1 TAbstractDesigntimeWarnings Class

TAbstractDesigntimeWarnings assembles design-time warning messages that appear in the HTML view of the form your application builds.

Class Hierarchy

SiteComp.TAbstractDesigntimeWarnings

Pascal

```
TAbstractDesigntimeWarnings = class;
```

C++

```
class TAbstractDesigntimeWarnings;
```

File

SiteComp

Description

TAbstractDesigntimeWarnings is the base class for objects that collect the warning messages for an adapter page producer. At design time, as you add Web items to an adapter page producer, the page producer and the Web items you add to it write warnings to a TAbstractDesigntimeWarnings object describing any problems you can rectify (such as properties that need to be set or components that need to be added.) These warning messages appear in the preview of the emerging HTML form on the HTML view page of the editor.

See Also

TAdapterPageProducer (see page 19802)

GetDesigntimeWarnings

135.1.1.1 TAbstractDesigntimeWarnings Members

The following tables list the members exposed by TAbstractDesigntimeWarnings.

Public Methods

	Name	Description
	AddObject (see page 19632)	Requests any design time warnings from a specified object.
	AddString (see page 19632)	Adds a warning string to the set of warnings that appear at design time.

135.1.1.2 TAbstractDesigntimeWarnings Methods

The methods of the TAbstractDesigntimeWarnings class are listed here.

Public Methods

	Name	Description
	AddObject (see page 19632)	Requests any design time warnings from a specified object.
	AddString (see page 19632)	Adds a warning string to the set of warnings that appear at design time.

135.1.1.2.1 TAbstractDesigntimeWarnings.AddObject Method

Requests any design time warnings from a specified object.

Pascal

```
procedure AddObject(AObject: TObject); virtual; abstract;
```

C++

```
virtual __fastcall AddObject(TObject * AObject) = 0;
```

Description

AddObject collects the design time warnings from the specified object by calling its GetDesigntimeWarnings method (if it has one). If the object has already been added by a previous call to AddObject, AddObject detects this and does nothing.

AObject is the Web item from which to request design-time warnings.

See Also

GetDesigntimeWarnings (see page 25130)

AddString (see page 19632)

135.1.1.2.2 TAbstractDesigntimeWarnings.AddString Method

Adds a warning string to the set of warnings that appear at design time.

Pascal

```
procedure AddString(AWarning: string); virtual; abstract;
```

C++

```
virtual __fastcall AddString(AnsiString AWarning) = 0;
```

Description

AddString adds a string to the design-time warnings object. The adapter page producer displays all such warning strings in the HTML form that appears in the HTML view of the editor.

AWarning is a warning string that describes a problem that the developer can rectify (such as an invalid property value or missing component).

See Also

TAdapterPageProducer (see page 19802)

AddObject (see page 19632)

135.1.2 TAbstractInetFileType Class

Class Hierarchy

Pascal

```
TAbstractInetFileType = class(TObject);
```

C++

```
class TAbstractInetFileType : public TObject;
```

File

SiteComp

Description

This is class SiteComp.TAbstractInetFileType.

135.1.2.1 TAbstractInetFileType Members

The following tables list the members exposed by TAbstractInetFileType.

Protected Methods

	Name	Description
	GetExtCount (see page 19634)	This is GetExtCount, a member of class TAbstractInetFileType.
	GetFileExt (see page 19634)	This is GetFileExt, a member of class TAbstractInetFileType.
	GetTypeID (see page 19635)	This is GetTypeID, a member of class TAbstractInetFileType.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	FileExt (see page 19635)	This is FileExt, a member of class TAbstractInetFileType.
R	FileExtCount (see page 19635)	This is FileExtCount, a member of class TAbstractInetFileType.
R	TypeID (see page 19635)	This is TypeID, a member of class TAbstractInetFileType.

135.1.2.2 TAbstractInetFileType Methods

The methods of the TAbstractInetFileType class are listed here.

Protected Methods

	Name	Description
A	GetExtCount (see page 19634)	This is GetExtCount, a member of class TAbstractInetFileType.
A	GetFileExt (see page 19634)	This is GetFileExt, a member of class TAbstractInetFileType.
A	GetTypeID (see page 19635)	This is GetTypeID, a member of class TAbstractInetFileType.

135.1.2.2.1 TAbstractInetFileType.GetExtCount Method

Pascal

```
function GetExtCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetExtCount() = 0;
```

Description

This is GetExtCount, a member of class TAbstractInetFileType.

135.1.2.2.2 TAbstractInetFileType.GetFileExt Method

Pascal

```
function GetFileExt(I: Integer): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetFileExt(int I) = 0;
```

Description

This is GetFileExt, a member of class TAbstractInetFileType.

135.1.2.2.3 TAbstractInetFileType.GetTypeID Method

Pascal

```
function GetTypeID: string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetTypeID() = 0;
```

Description

This is GetTypeID, a member of class TAbstractInetFileType.

135.1.2.3 TAbstractInetFileType Properties

The properties of the TAbstractInetFileType class are listed here.

Public Properties

	Name	Description
R	FileExt (see page 19635)	This is FileExt, a member of class TAbstractInetFileType.
R	FileExtCount (see page 19635)	This is FileExtCount, a member of class TAbstractInetFileType.
R	TypeID (see page 19635)	This is TypeID, a member of class TAbstractInetFileType.

135.1.2.3.1 TAbstractInetFileType.FileExt Property

Pascal

```
property FileExt [I: Integer]: string;
```

C++

```
__property AnsiString FileExt[int I];
```

Description

This is FileExt, a member of class TAbstractInetFileType.

135.1.2.3.2 TAbstractInetFileType.FileExtCount Property

Pascal

```
property FileExtCount: Integer;
```

C++

```
__property int FileExtCount;
```

Description

This is FileExtCount, a member of class TAbstractInetFileType.

135.1.2.3.3 TAbstractInetFileType.TypeID Property

Pascal

```
property TypeID: string;
```

C++

```
__property AnsiString TypeID;
```

Description

This is TypeID, a member of class TAbstractInetFileType.

135.1.3 TNotifyList Class

TNotifyList is a collection of objects that should be notified of changes.

Class Hierarchy

Pascal

```
TNotifyList = class(TObject);
```

C++

```
class TNotifyList : public TObject;
```

File

SiteComp

Description

TNotifyList maintains a list of objects that have registered interest in change notifications. This class is used for a helper object on components that support the INotifyList (see page 19725) interface. When objects use the INotifyList (see page 19725) interface to register interest in change notifications, the component adds them to its TNotifyList instance. When those objects use the INotifyList (see page 19725) interface to unregister their interest, they are removed from the TNotifyList instance.

When the object that uses TNotifyList changes, it sends a notification to every object in the list. For example, when an adapter changes, it obtains an INotifyAdapterChange (see page 19724) interface from every object in the list. It uses this interface to call the object's NotifyAdapterChange method.

See Also

TCustomAdapter

INotifyAdapterChange (see page 19724)

INotifyList (see page 19725)

135.1.3.1 TNotifyList Members

The following tables list the members exposed by TNotifyList.

Public Methods

	Name	Description
	AddNotify (see page 19638)	Adds a new object to the list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 19637)	Creates an initializes an instance of TNotifyList (see page 19636).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 19637)	Frees an instance of TNotifyList (see page 19636).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetCount (see page 19638)	Returns the value of the Count (see page 19640) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetItem (see page 19639)	Returns the value of the Items (see page 19640) property.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RemoveNotify (see page 19639)	Removes an object from the list.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Count (see page 19640)	Indicates the number of objects in the list.
R	Items (see page 19640)	Lists the objects in this collection.

135.1.3.2 TNotifyList.Create Constructor

Creates an initializes an instance of TNotifyList (see page 19636).

Pascal

```
constructor Create;
```

C++

```
__fastcall TNotifyList();
```

Description

WebSnap applications should not need to create instances of TNotifyList (see page 19636). These objects are created by the component that uses them to keep track of objects that have registered an interest in change notifications.

See Also

NotifyList (see page 24183)

INotifyList (see page 19725)

135.1.3.3 TNotifyList.Destroy Destructor

Frees an instance of TNotifyList (see page 19636).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TNotifyList();
```

Description

WebSnap applications should not need to free instances of TNotifyList (see page 19636), as this is handled by the components that use them. If you must free a TNotifyList (see page 19636) instance, use the Free method.

See Also

Free (see page 22300)

135.1.3.4 TNotifyList Methods

The methods of the TNotifyList class are listed here.

Public Methods

	Name	Description
	AddNotify (see page 19638)	Adds a new object to the list.
	GetCount (see page 19638)	Returns the value of the Count (see page 19640) property.
	GetItem (see page 19639)	Returns the value of the Items (see page 19640) property.
	RemoveNotify (see page 19639)	Removes an object from the list.

135.1.3.4.1 TNotifyList.AddNotify Method

Adds a new object to the list.

Pascal

```
procedure AddNotify(ANotify: TObject);
```

C++

```
__fastcall AddNotify(TObject * ANotify);
```

Description

Call AddNotify to add an object to the end of the Items (see page 19640) property array. This method is called to add objects that want to be informed of changes to the component that uses this list.

ANotify is the object to add. This object should implement an interface that allows the associated component to inform it of changes. For example, objects in the TNotifyList (see page 19636) collection maintained by an adapter support the INotifyAdapterChange (see page 19724) interface.

See Also

Items (see page 19640)

RemoveNotify (see page 19639)

INotifyAdapterChange (see page 19724)

135.1.3.4.2 TNotifyList.GetCount Method

Returns the value of the Count (see page 19640) property.

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

GetCount is the read implementation of the Count (see page 19640) property. It returns the number of objects in the list.

See Also

Count (see page 19640)

135.1.3.4.3 TNotifyList.GetItem Method

Returns the value of the Items (see page 19640) property.

Pascal

```
function GetItem(Index: Integer): TObject;
```

C++

```
__fastcall TObject * GetItem(int Index);
```

Description

GetItem is the read implementation of the Items (see page 19640) property.

Index is the zero-offset index of the item to return.

GetItem returns the specified item from the list.

See Also

Items (see page 19640)

135.1.3.4.4 TNotifyList.RemoveNotify Method

Removes an object from the list.

Pascal

```
procedure RemoveNotify(ANotify: TObject);
```

C++

```
__fastcall RemoveNotify(TObject * ANotify);
```

Description

Call RemoveNotify to remove an object from the list. This method is called to remove objects that are no longer interested in changes to the associated component.

ANotify is the object to remove. This object must have been previously added by a call to the AddNotify (see page 19638) method.

See Also

Items (see page 19640)

AddNotify (see page 19638)

135.1.3.5 TNotifyList Properties

The properties of the TNotifyList class are listed here.

Public Properties

	Name	Description
R	Count (see page 19640)	Indicates the number of objects in the list.
R	Items (see page 19640)	Lists the objects in this collection.

135.1.3.5.1 TNotifyList.Count Property

Indicates the number of objects in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Count indicates the number of objects in the Items (see page 19640) property array. Use this value as an upper bound for the index when iterating over all the objects in the list.

See Also

Items (see page 19640)

135.1.3.5.2 TNotifyList.Items Property

Lists the objects in this collection.

Pascal

```
property Items [Index: Integer]: TObject;
```

C++

```
__property TObject * Items[int Index];
```

Description

Use Items to reference an object in the list. Each item is an object that supports an interface that allows the associated component to inform it of changes. For example, objects in the TNotifyList (see page 19636) collection maintained by an adapter support the INotifyAdapterChange (see page 19724) interface.

Index is the index of the object, where 0 specifies the first item, 1 specifies the second item, and so on. The Count (see page 19640) property gives an upper bound for this index.

Note: In Delphi, Items is the default property of TNotifyList (see page 19636). That means the property name may be omitted in code.

See Also

Count (see page 19640)

AddNotify (see page 19638)

RemoveNotify (see page 19639)

INotifyAdapterChange (see page 19724)

operator_sb

135.1.4 TScriptComponent Class

Class Hierarchy

Pascal

```
TScriptComponent = class(TScriptObject, IInterfaceComponentReference);
```

C++

```
class TScriptComponent : public TScriptObject, public IInterfaceComponentReference;
```

File

SiteComp

Description

This is class SiteComp.TScriptComponent.

135.1.4.1 TScriptComponent Members

The following tables list the members exposed by TScriptComponent.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetComponent (see page 19643)	Returns a reference to the component associated by the implementing class.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 19642)	This is Create, a member of class TScriptComponent.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Obj (see page 19643)	This is Obj, a member of class TScriptComponent.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

135.1.4.2 TScriptComponent.Create Constructor

Pascal

```
constructor Create(AObject: TComponent); virtual;
```

C++

```
virtual __fastcall TScriptComponent(TComponent * AObject);
```

Description

This is Create, a member of class TScriptComponent.

135.1.4.3 TScriptComponent Methods

The methods of the TScriptComponent class are listed here.

Protected Methods

	Name	Description
	GetComponent (see page 19643)	Returns a reference to the component associated by the implementing class.

135.1.4.3.1 TScriptComponent.GetComponent Method

Returns a reference to the component associated by the implementing class.

Pascal

```
function GetComponent: TComponent;
```

C++

```
__fastcall TComponent * GetComponent();
```

Description

GetComponent returns a TComponent value that is associated with the implementing class. For example, the TComponent class itself implements the GetComponent to return a pointer to itself.

See Also

TComponent (see page 2762)

135.1.4.4 TScriptComponent Properties

The properties of the TScriptComponent class are listed here.

Public Properties

	Name	Description
R	Obj (see page 19643)	This is Obj, a member of class TScriptComponent.

135.1.4.4.1 TScriptComponent.Obj Property

Pascal

```
property Obj: TComponent;
```

C++

```
__property TComponent * Obj;
```

Description

This is Obj, a member of class TScriptComponent.

135.1.5 TScriptObject Class

Class Hierarchy

Pascal

```
TScriptObject = class(TInterfacedObject);
```

C++

```
class TScriptObject : public TInterfacedObject;
```

File

SiteComp

Description

This is class SiteComp.TScriptObject.

135.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IActionImageProducer (see page 19646)	IActionImageProducer is the interface for accessing the image or set of images that represent an adapter action.
	IAdapterAccess (see page 19649)	This is class SiteComp.IAdapterAccess.
	IAdapterActionAccess (see page 19650)	This is class SiteComp.IAdapterActionAccess.
	IAdapterActionAttributes (see page 19651)	This is class SiteComp.IAdapterActionAttributes.
	IAdapterDispatcher (see page 19653)	IAdapterDispatcher is the interface for interacting with the adapter dispatcher.
	IAdapterDispatchParams (see page 19655)	IAdapterDispatchParams describes adapter action parameters and adapter field values.
	IAdapterError (see page 19660)	This is class SiteComp.IAdapterError.
	IAdapterErrors (see page 19663)	IAdapterErrors is implemented by adapter errors objects.
	IAdapterFieldAccess (see page 19666)	This is class SiteComp.IAdapterFieldAccess.
	IAdapterFieldAttributes (see page 19667)	This is class SiteComp.IAdapterFieldAttributes.
	IAdapterHiddenField (see page 19669)	This is class SiteComp.IAdapterHiddenField.
	IAdapterHiddenFields (see page 19671)	This is class SiteComp.IAdapterHiddenFields.
	IAdapterItemRequestParams (see page 19673)	IAdapterItemRequestParams is the interface for reading the parameters for an adapter field or action request.
	IAdapterMode (see page 19677)	This is class SiteComp.IAdapterMode.
	IAdapterRequestHandler (see page 19680)	IAdapterRequestHandler handles requests to execute an adapter action or retrieve the value of an image field.
	IAsFormatted (see page 19681)	This is class SiteComp.IAsFormatted.
	IDefaultPageFileName (see page 19682)	This is class SiteComp.IDefaultPageFileName.
	IFieldValuesAdapter (see page 19683)	This is class SiteComp.IFieldValuesAdapter.
	IFindIncludeFile (see page 19684)	This is class SiteComp.IFindIncludeFile.
	IGetAdapterActions (see page 19685)	This is class SiteComp.IGetAdapterActions.
	IGetAdapterDisplayCharacteristics (see page 19686)	This is class SiteComp.IGetAdapterDisplayCharacteristics.
	IGetAdapterErrors (see page 19687)	This is class SiteComp.IGetAdapterErrors.
	IGetAdapterFields (see page 19688)	This is class SiteComp.IGetAdapterFields.
	IGetAdapterHiddenFields (see page 19689)	This is class SiteComp.IGetAdapterHiddenFields.
	IGetAdapterImage (see page 19690)	This is class SiteComp.IGetAdapterImage.
	IGetAdapterItemRequestParams (see page 19691)	This is class SiteComp.IGetAdapterItemRequestParams.
	IGetAdapterRequestDefaultResponse (see page 19692)	This is class SiteComp.IGetAdapterRequestDefaultResponse.
	IGetAdapterValuesList (see page 19694)	This is class SiteComp.IGetAdapterValuesList.
	IGetDefaultAction (see page 19695)	This is class SiteComp.IGetDefaultAction.
	IGetDesigntimeWarnings (see page 19697)	This is class SiteComp.IGetDesigntimeWarnings.
	IGetFieldValuesAdapter (see page 19698)	This is class SiteComp.IGetFieldValuesAdapter.
	IGetHTMLStyle (see page 19699)	IGetHTMLStyle is used to inquire about the preferred display representation of an adapter field or adapter action.
	IGetProducerComponent (see page 19702)	This is class SiteComp.IGetProducerComponent.
	IGetScriptObject (see page 19703)	This is class SiteComp.IGetScriptObject.
	IGetScriptObjectClassKey (see page 19704)	This is class SiteComp.IGetScriptObjectClassKey.
	IGetWebAppComponents (see page 19705)	This is class SiteComp.IGetWebAppComponents.
	IIDEFileManager (see page 19708)	This is class SiteComp.IIDEFileManager.
	IImageProducer (see page 19709)	IImageProducer is the interface for accessing the image that an adapter component supplies.
	IInternetEnvOptions (see page 19710)	This is class SiteComp.IInternetEnvOptions.
	IInternetExecuteScript (see page 19713)	This is class SiteComp.IInternetExecuteScript.

	IInternetFileTypes (see page 19714)	This is class SiteComp.IInternetFileTypes.
	IInternetScriptDebugger (see page 19715)	This is class SiteComp.IInternetScriptDebugger.
	IIsAdapterActionList (see page 19716)	This is class SiteComp.IIsAdapterActionList.
	IIterateIntfSupport (see page 19718)	This is class SiteComp.IIterateIntfSupport.
	IIterateObjectSupport (see page 19719)	This is class SiteComp.IIterateObjectSupport.
	IIteratorIndex (see page 19720)	IIteratorIndex is the interface that indicates where an object is positioned when it is iterating over its subitems.
	IIteratorSupport (see page 19722)	IIteratorSupport is the interface that allows server-side script to iterate over the items of an adapter or one of its child objects.
	INotifyAdapterChange (see page 19724)	INotifyAdapterChange is the interface that allows objects to respond when an adapter changes.
	INotifyList (see page 19725)	INotifyList is the interface that allows objects to register and unregister an interest in changes to a component.
	IPageDispatcher (see page 19727)	IPageDispatcher is the interface for interacting with the page dispatcher.
	IPageResult (see page 19732)	This is class SiteComp.IPageResult.
	ISessionsService (see page 19733)	ISessionsService is the interface for controlling a TSessionsService object.
	ISessionsServiceConnectID (see page 19736)	This is class SiteComp.ISessionsServiceConnectID.
	ISessionsServicePersist (see page 19737)	This is class SiteComp.ISessionsServicePersist.
	ISessionsServiceStoreID (see page 19739)	This is class SiteComp.ISessionsServiceStoreID.
	IValuesListAdapter (see page 19740)	IValuesListAdapter is the interface for supplying name/value pairs.
	IWebActionsList (see page 19743)	This is class SiteComp.IWebActionsList.
	IWebApplicationInfo (see page 19745)	IWebApplicationInfo is the interface for the application adapter.
	IWebContainerSubComponent (see page 19748)	This is class SiteComp.IWebContainerSubComponent.
	IWebDataFields (see page 19749)	This is class SiteComp.IWebDataFields.
	IWebEnabled (see page 19751)	This is class SiteComp.IWebEnabled.
	IWebFormComponentContainer (see page 19752)	This is class SiteComp.IWebFormComponentContainer.
	IWebGetActionName (see page 19754)	This is class SiteComp.IWebGetActionName.
	IWebGetDisplayLabel (see page 19755)	This is class SiteComp.IWebGetDisplayLabel.
	IWebGetDisplayWidth (see page 19756)	This is class SiteComp.IWebGetDisplayWidth.
	IWebGetFieldName (see page 19757)	This is class SiteComp.IWebGetFieldName.
	IWebGetFieldValue (see page 19758)	This is class SiteComp.IWebGetFieldValue.
	IWebGetFieldValues (see page 19760)	IWebGetFieldValues is used to iterate over multiple values associated with an adapter field.
	IWebGetMaxLength (see page 19763)	This is class SiteComp.IWebGetMaxLength.
	IWebGetSessionIDs (see page 19764)	This is class SiteComp.IWebGetSessionIDs.
	IWebImageHREF (see page 19765)	IWebImageHREF is the interface for obtaining an HREF that addresses an image.
	IWebInputName (see page 19766)	This is class SiteComp.IWebInputName.
	IWebIsDefaultAction (see page 19768)	This is class SiteComp.IWebIsDefaultAction.
	IWebIsDefaultField (see page 19769)	This is class SiteComp.IWebIsDefaultField.
	IWebSession (see page 19770)	IWebSession allows an application to terminate a Web session.
	IWebSessionAttributes (see page 19771)	This is class SiteComp.IWebSessionAttributes.
	IWebSessionID (see page 19776)	This is class SiteComp.IWebSessionID.
	IWebSessionIDs (see page 19777)	IWebSessionIDs lists the session IDs (see page 19779) for all sessions that TSessionsService stores in memory.
	IWebSessionValues (see page 19780)	This is class SiteComp.IWebSessionValues.
	IWebSetActionName (see page 19782)	This is class SiteComp.IWebSetActionName.
	IWebSetFieldName (see page 19783)	This is class SiteComp.IWebSetFieldName.
	IWebUserList (see page 19784)	IWebUserList is the interface for validating user logins and access rights.
	IWebValueIsEqual (see page 19786)	This is class SiteComp.IWebValueIsEqual.

135.2.1 IActionImageProducer Interface

IActionImageProducer is the interface for accessing the image or set of images that represent an adapter action.

Class Hierarchy

Pascal

```
IActionImageProducer = interface(IImageProducer);
```

C++

```
__interface IActionImageProducer : public IImageProducer;
```

File

SiteComp

Description

IActionImageProducer is the interface used to access the object that supplies images for an adapter action. This interface can supply a single image for the action, or a set of related images that can be used when an HTML control changes its appearance in response to user actions.

IActionImageProducer does not directly supply the HREF for the image or images it represents. Instead, it supplies the interface for another object. That object may generate the image, or it may simply generate an HREF that addresses the object that generates the image. This extra level of indirection allows the object that implements IActionImageProducer to work with multiple adapter fields that produce a variety of images.

Note: Method declarations that use IActionImageProducer use the _di_IActionImageProducer type instead. This type is a DelphiInterface wrapper around the IActionImageProducer interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IActionImageProducer >
_di_IActionImageProducer;
```

TCustomAdapterActionButton (see page 25189)

135.2.1.1 IActionImageProducer Members

The following tables list the members exposed by IActionImageProducer.

Public Methods

	Name	Description
	GetAdapterEventImage (see page 19648)	Returns the object that is responsible for providing a specified image from a set of related images.
	GetAdapterImage (see page 19710)	This is GetAdapterImage, a member of class IImageProducer.
	GetDisplayStyle (see page 19648)	Indicates what type of images this interface can be used to access.

135.2.1.2 IActionImageProducer Methods

The methods of the IActionImageProducer class are listed here.

Public Methods

	Name	Description
	GetAdapterEventImage (see page 19648)	Returns the object that is responsible for providing a specified image from a set of related images.

	GetDisplayStyle (see page 19648)	Indicates what type of images this interface can be used to access.

135.2.1.2.1 IActionImageProducer.GetAdapterEventImage Method

Returns the object that is responsible for providing a specified image from a set of related images.

Pascal

```
function GetAdapterEventImage(const AComponentName: WideString; const AEvent: WideString;
const ACaption: WideString): TObject;
```

C++

```
__fastcall TObject * GetAdapterEventImage(const BSTR AComponentName, const BSTR AEvent, const
BSTR ACaption);
```

Description

GetAdapterEventImage returns the object that supplies an HREF for the specified image. That object can supply the HREF in one of two ways:

It can implement the IWebImageHREF (see page 19765) interface.

It can be the object that produces the image in response to request messages. In this case, the adapter dispatcher's EncodeAdapterItemRequestAsHREF method generates the HREF to address this object.

AComponentName is the name of the component that is requesting the image. GetAdapterEventImage can use this parameter to determine which of several objects is appropriate for supplying the image.

AEvent identifies the user event that the image should reflect. This parameter is used when the GetDisplayStyle (see page 19648) method returns 'EventImages'. If AEvent is an empty string, GetAdapterEventImage returns the object that supplies the base image. If AEvent is not empty, GetAdapterEventImage returns the object that supplies the version of the image to use in response to the associated user action. Possible values are 'onmouseover', 'onmouseout', and 'onmousedown'.

ACaption is a text label that describes the desired image. GetAdapterEventImage can use this parameter to determine which of several objects is appropriate for supplying the image.

See Also

IWebImageHREF (see page 19765)

EncodeAdapterItemRequestAsHREF (see page 24872)

getadapterimage (see page 19710)

GetDisplayStyle (see page 19648)

135.2.1.2.2 IActionImageProducer.GetDisplayStyle Method

Indicates what type of images this interface can be used to access.

Pascal

```
function GetDisplayStyle(Sender: TComponent): string;
```

C++

```
__fastcall AnsiString GetDisplayStyle(TComponent * Sender);
```

Description

GetDisplayStyle returns either 'Image' or 'EventImages', depending on whether it can supply a single image for an adapter action and caption, or multiple images that reflect various user events.

If GetDisplayStyle returns 'Image', use the GetAdapterImage (see page 19710) method to obtain an interface for the image

object. If GetDisplayStyle returns 'EventImages', use the GetAdapterEventImage (see page 19648) method to obtain an interface for the image object.

When a TAdapterActionButton component uses this interface for its ImageProducer property, its DisplayType property should be compatible with the display style this method returns. That is, if this method returns 'Image', the adapter action button should have a DisplayType of ctImage or ctDefault. If this method returns 'EventImages', the adapter action button can have a DisplayType of ctImage, ctEventImages, or ctDefault.

Sender is the component that is requesting the image.

See Also

DisplayType (see page 25202)

GetAdapterEventImage (see page 19648)

getadapterimage (see page 19710)

135.2.2 IAdapterAccess Interface

Class Hierarchy

SiteComp.IAdapterAccess

Pascal

```
IAdapterAccess = interface;
```

C++

```
__interface IAdapterAccess;
```

File

SiteComp

Description

This is class SiteComp.IAdapterAccess.

135.2.2.1 IAdapterAccess Members

The following tables list the members exposed by IAdapterAccess.

Public Methods

	Name	Description
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.

135.2.2.2 IAdapterAccess Methods

The methods of the IAdapterAccess class are listed here.

Public Methods

	Name	Description
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.

135.2.2.2.1 IAdapterAccess.HasExecuteAccess Method

Pascal

```
function HasExecuteAccess: Boolean;
```

C++

```
__fastcall Boolean HasExecuteAccess();
```

Description

This is HasExecuteAccess, a member of class IAdapterAccess.

135.2.2.2.2 IAdapterAccess.HasModifyAccess Method

Pascal

```
function HasModifyAccess: Boolean;
```

C++

```
__fastcall Boolean HasModifyAccess();
```

Description

This is HasModifyAccess, a member of class IAdapterAccess.

135.2.2.2.3 IAdapterAccess.HasViewAccess Method

Pascal

```
function HasViewAccess: Boolean;
```

C++

```
__fastcall Boolean HasViewAccess();
```

Description

This is HasViewAccess, a member of class IAdapterAccess.

135.2.3 IAdapterActionAccess Interface

Class Hierarchy

SiteComp.IAdapterActionAccess

Pascal

```
IAdapterActionAccess = interface;
```

C++

```
__interface IAdapterActionAccess;
```

File

SiteComp

Description

This is class SiteComp.IAdapterActionAccess.

135.2.3.1 IAdapterActionAccess Members

The following tables list the members exposed by IAdapterActionAccess.

Public Methods

	Name	Description
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.

135.2.3.2 IAdapterActionAccess Methods

The methods of the IAdapterActionAccess class are listed here.

Public Methods

	Name	Description
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.

135.2.3.2.1 IAdapterActionAccess.HasExecuteAccess Method

Pascal

```
function HasExecuteAccess: Boolean;
```

C++

```
__fastcall Boolean HasExecuteAccess();
```

Description

This is HasExecuteAccess, a member of class IAdapterActionAccess.

135.2.4 IAdapterActionAttributes Interface

Class Hierarchy

SiteComp.IAdapterActionAttributes

Pascal

```
IAdapterActionAttributes = interface;
```

C++

```
__interface IAdapterActionAttributes;
```

File

SiteComp

Description

This is class SiteComp.IAdapterActionAttributes.

135.2.4.1 IAdapterActionAttributes Members

The following tables list the members exposed by IAdapterActionAttributes.

Public Methods

	Name	Description
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.

Public Properties

	Name	Description
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

135.2.4.2 IAdapterActionAttributes Methods

The methods of the IAdapterActionAttributes class are listed here.

Public Methods

	Name	Description
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.

135.2.4.2.1 IAdapterActionAttributes.GetVisible Method

Pascal

```
function GetVisible: Boolean;
```

C++

```
__fastcall Boolean GetVisible();
```

Description

This is GetVisible, a member of class IAdapterActionAttributes.

135.2.4.3 IAdapterActionAttributes Properties

The properties of the IAdapterActionAttributes class are listed here.

Public Properties

	Name	Description
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

135.2.4.3.1 IAdapterActionAttributes.Visible Property

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

This is Visible, a member of class IAdapterActionAttributes.

135.2.5 IAdapterDispatcher Interface

IAdapterDispatcher is the interface for interacting with the adapter dispatcher.

Class Hierarchy

Pascal

```
IAdapterDispatcher = interface(IWebRequestHandler);
```

C++

```
__interface IAdapterDispatcher : public IWebRequestHandler;
```

File

SiteComp

Description

The TAdapterDispatcher component implements IAdapterDispatcher. This interface, which the TWebAppComponents object publishes, allows the WebSnap application to dispatch request messages that represent HTML form submissions and requests for dynamic images that can be resolved using adapter actions and fields. It also encodes the hidden fields and HREF values that are used to make those calls to adapter fields and actions.

Note: In C++, method declarations that use IAdapterDispatcher use the _di_IAdapterDispatcher type instead. This type is a DelphiInterface wrapper around the IAdapterDispatcher interface:

Note: typedef System::DelphiInterface (see page 22167)< IAdapterDispatcher > _di_IAdapterDispatcher;

See Also

TAdapterDispatcher (see page 24840)

TCustomWebAppComponents (see page 24906)

TWebAPpComponents

135.2.5.1 IAdapterDispatcher Members

The following tables list the members exposed by IAdapterDispatcher.

Public Methods

	Name	Description
	EncodeAdapterItemRequestAsFieldValue (see page 19654)	Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.
	EncodeAdapterItemRequestAsHREF (see page 19654)	Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.
	GetAdapterItemRequestParams (see page 19655)	Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.
	HandleRequest (see page 15238)	Processes an HTTP request message.

135.2.5.2 IAdapterDispatcher Methods

The methods of the IAdapterDispatcher class are listed here.

Public Methods

	Name	Description
	EncodeAdapterItemRequestAsFieldValue (see page 19654)	Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.
	EncodeAdapterItemRequestAsHREF (see page 19654)	Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.
	GetAdapterItemRequestParams (see page 19655)	Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.

135.2.5.2.1 IAdapterDispatcher.EncodeAdapterItemRequestAsFieldValue Method

Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.

Pascal

```
function EncodeAdapterItemRequestAsFieldValue(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions): string;
```

C++

```
__fastcall AnsiString EncodeAdapterItemRequestAsFieldValue(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions);
```

Description

Call EncodeAdapterItemRequestAsFieldValue to encode the adapter action or image field parameters as they should appear as field values in form submissions. That is, the resulting parameter string has a form such as '?param1=value1&param2=value2'.

AHandler is the interface of the adapter whose action or image field requires the parameters.

AOptions is a set of flags that indicate what types of parameters to include.

EncodeAdapterItmRequestAsFieldValue returns the parameter string.

See Also

GetAdapterItemRequestParams (see page 19655)

EncodeAdapterItemRequestAsHREF (see page 19654)

135.2.5.2.2 IAdapterDispatcher.EncodeAdapterItemRequestAsHREF Method

Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.

Pascal

```
function EncodeAdapterItemRequestAsHREF(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions): string;
```

C++

```
__fastcall AnsiString EncodeAdapterItemRequestAsHREF(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions);
```

Description

Call EncodeAdapterItemRequestAsHREF to encode the adapter action or image field parameters as they should appear as parameters to an anchor tag in an HTML form.

AHandler is the interface of the adapter whose action or image field requires the parameters.

AOptions is a set of flags that indicate what types of parameters to include.

EncodeAdapterItemRequestAsHREF returns the parameter string.

See Also

GetAdapterItemRequestParams (see page 19655)

EncodeAdapterItemRequestAsFieldValue (see page 19654)

135.2.5.2.3 IAdapterDispatcher.GetAdapterItemRequestParams Method

Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.

Pascal

```
procedure GetAdapterItemRequestParams(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions; AParams: IAdapterItemRequestParams);
```

C++

```
__fastcall GetAdapterItemRequestParams(IUnknown AHandler, TAdapterItemRequestParamOptions
AOptions, IAdapterItemRequestParams AParams);
```

Description

Call GetAdapterItemRequestParams to retrieve the adapter action and image field parameters.

AHandler is the interface of the adapter whose action or field requires the parameters.

AOptions is a set of flags that indicate what types of parameters should be included.

AParams is an interface for reading and writing parameter values. GetAdapterItemRequestParams uses this interface to write the parameter values.

See Also

EncodeAdapterItemRequestAsHREF (see page 19654)

EncodeAdapterItemRequestAsFieldValue (see page 19654)

135.2.6 IAdapterDispatchParams Interface

IAdapterDispatchParams describes adapter action parameters and adapter field values.

Class Hierarchy

Pascal

```
IAdapterDispatchParams = interface;
```

C++

```
__interface IAdapterDispatchParams;
```

File

SiteComp

Description

Use IAdapterDispatchParams to obtain context information that is needed to execute an adapter action or to obtain the value of an image field from an adapter. When server-side script in a WebSnap application executes an adapter action or requests the value of an image field, an object that implements this interface is created to store information about the adapter that can perform the specified task and the parameters that must be passed to the adapter for it to do so. This interface is then passed to the adapter action's HandleRequest method so that it can look up the adapter and the parameters.

Note: In C++, method declarations that use IAdapterDispatchParams use the _di_IAdapterDispatchParams type instead. This type is a DelphiInterface wrapper around the IAdapterDispatchParams interface:

Note: typedef System::DelphiInterface (see page 22167)< IAdapterDispatchParams > _di_IAdapterDispatchParams;

See Also

IAdapterRequestHandler (see page 19680)

TAdapterDispatchParams (see page 24848)

TBaseAdapterAction (see page 24043)

135.2.6.1 IAdapterDispatchParams Members

The following tables list the members exposed by IAdapterDispatchParams.

Public Methods

	Name	Description
	GetHandler (see page 19657)	Returns the value of the Handler (see page 19658) property.
	GetObjectIdentifier (see page 19657)	Returns the value of the ObjectIdentifier (see page 19658) property.
	GetParams (see page 19657)	Returns the value of the Params (see page 19659) property.
	GetRequestIdentifier (see page 19657)	Returns the value of the RequestIdentifier (see page 19659) property.

Public Properties

	Name	Description
R	Handler (see page 19658)	Indicates the adapter object that can handle the current request.
R	ObjectIdentifier (see page 19658)	Specifies the name of the action to execute or the field to retrieve.
R	Params (see page 19659)	Indicates the parameter values to use when executing the action or looking up the image.
R	RequestIdentifier (see page 19659)	Identifies the type of the request identified by the ObjectIdentifier (see page 19658) property.

135.2.6.2 IAdapterDispatchParams Methods

The methods of the IAdapterDispatchParams class are listed here.

Public Methods

	Name	Description
	GetHandler (see page 19657)	Returns the value of the Handler (see page 19658) property.
	GetObjectIdentifier (see page 19657)	Returns the value of the ObjectIdentifier (see page 19658) property.
	GetParams (see page 19657)	Returns the value of the Params (see page 19659) property.

	GetRequestIdentifier (see page 19657)	Returns the value of the RequestIdentifier (see page 19659) property.

135.2.6.2.1 IAdapterDispatchParams.GetHandler Method

Returns the value of the Handler (see page 19658) property.

Pascal

```
function GetHandler: TObject;
```

C++

```
__fastcall TObject * GetHandler();
```

Description

GetHandler is the read implementation of the Handler (see page 19658) property.

See Also

Handler (see page 19658)

135.2.6.2.2 IAdapterDispatchParams.GetObjectIdentifier Method

Returns the value of the ObjectIdentifier (see page 19658) property.

Pascal

```
function GetObjectIdentifier: string;
```

C++

```
__fastcall AnsiString GetObjectIdentifier();
```

Description

GetObjectIdentifier is the read implementation of the ObjectIdentifier (see page 19658) property.

See Also

ObjectIdentifier (see page 19658)

135.2.6.2.3 IAdapterDispatchParams.GetParams Method

Returns the value of the Params (see page 19659) property.

Pascal

```
function GetParams: TStrings;
```

C++

```
__fastcall TStrings GetParams();
```

Description

GetParams is the read implementation of the Params (see page 19659) property.

See Also

Params (see page 19659)

135.2.6.2.4 IAdapterDispatchParams.GetRequestIdentifier Method

Returns the value of the RequestIdentifier (see page 19659) property.

Pascal

```
function GetRequestIdentifier: string;
```

C++

```
__fastcall AnsiString GetRequestIdentifier();
```

Description

GetRequestIdentifier is the read implementation of the RequestIdentifier (see page 19659) property.

See Also

RequestIdentifier (see page 19659)

135.2.6.3 IAdapterDispatchParams Properties

The properties of the IAdapterDispatchParams class are listed here.

Public Properties

	Name	Description
R	Handler (see page 19658)	Indicates the adapter object that can handle the current request.
R	ObjectIdentifier (see page 19658)	Specifies the name of the action to execute or the field to retrieve.
R	Params (see page 19659)	Indicates the parameter values to use when executing the action or looking up the image.
R	RequestIdentifier (see page 19659)	Identifies the type of the request identified by the ObjectIdentifier (see page 19658) property.

135.2.6.3.1 IAdapterDispatchParams.Handler Property

Indicates the adapter object that can handle the current request.

Pascal

```
property Handler: TObject;
```

C++

```
__property TObject * Handler;
```

Description

Read Handler to access the adapter that can execute the action or supply the image that is requested.

See Also

ObjectIdentifier (see page 19658)

RequestIdentifier (see page 24854)

135.2.6.3.2 IAdapterDispatchParams.ObjectIdentifier Property

Specifies the name of the action to execute or the field to retrieve.

Pascal

```
property ObjectIdentifier: string;
```

C++

```
__property AnsiString ObjectIdentifier;
```

Description

Read ObjectIdentifier to determine the name of the requested action or field. The interpretation of this value is the responsibility of the object specified by the Handler (see page 19658) parameter.

See Also

Handler (see page 19658)

RequestIdentifier (see page 24854)

135.2.6.3.3 IAdapterDispatchParams.Params Property

Indicates the parameter values to use when executing the action or looking up the image.

Pascal

```
property Params: TStrings;
```

C++

```
__property TStrings Params;
```

Description

Read Params to determine the parameters that the adapter action can use to perform its task. Each string in this string list has the form Name=Value, where Name is the name of a parameter and Value is its value.

The interpretation of the parameter values is up to the adapter specified by the Handler (see page 19658) object or to the adapter action object that handles the request.

See Also

Handler (see page 19658)

ObjectIdentifier (see page 24854)

135.2.6.3.4 IAdapterDispatchParams.RequestIdentifier Property

Identifies the type of the request identified by the ObjectIdentifier (see page 19658) property.

Pascal

```
property RequestIdentifier: string;
```

C++

```
__property AnsiString RequestIdentifier;
```

Description

Read RequestIdentifier to determine the type of processing the current request requires. For example, the RequestIdentifier may identify the request as a request for the value of an image field or a request to execute an action.

The interpretation of this value is the responsibility of the object specified by the Handler (see page 19658) parameter.

See Also

Handler (see page 19658)

ObjectIdentifier (see page 24854)

135.2.7 IAdapterError Interface

Class Hierarchy

SiteComp.IAdapterError

Pascal

```
IAdapterError = interface;
```

C++

```
__interface IAdapterError;
```

File

SiteComp

Description

This is class SiteComp.IAdapterError.

135.2.7.1 IAdapterError Members

The following tables list the members exposed by IAdapterError.

Public Methods

	Name	Description
	GetErrorText (see page 19660)	Returns the value of the ErrorText (see page 19662) property.
	GetField (see page 19661)	Returns the value of the Field (see page 19662) property.
	GetID (see page 19661)	Returns the value of the ID (see page 19662) property.

Public Properties

	Name	Description
R	ErrorText (see page 19662)	Returns text describing the error.
R	Field (see page 19662)	Returns text describing the error.
R	ID (see page 19662)	Returns error ID.

135.2.7.2 IAdapterError Methods

The methods of the IAdapterError class are listed here.

Public Methods

	Name	Description
	GetErrorText (see page 19660)	Returns the value of the ErrorText (see page 19662) property.
	GetField (see page 19661)	Returns the value of the Field (see page 19662) property.
	GetID (see page 19661)	Returns the value of the ID (see page 19662) property.

135.2.7.2.1 IAdapterError.GetErrorText Method

Returns the value of the ErrorText (see page 19662) property.

Pascal

```
function GetErrorText: string;
```

C++

```
__fastcall AnsiString GetErrorText();
```

Description

GetErrorText is the read implementation of the ErrorText (see page 19662) property.

See Also

ErrorText (see page 19662)

135.2.7.2.2 IAdapterError.GetField Method

Returns the value of the Field (see page 19662) property.

Pascal

```
function GetField: TComponent;
```

C++

```
__fastcall TComponent * GetField();
```

Description

GetField is the read implementation of the Field (see page 19662) property.

See Also

Field (see page 19662)

135.2.7.2.3 IAdapterError.GetID Method

Returns the value of the ID (see page 19662) property.

Pascal

```
function GetID: integer;
```

C++

```
__fastcall int GetID();
```

Description

GetID is the read implementation of the ID (see page 19662) property.

See Also

ID (see page 19662)

135.2.7.3 IAdapterError Properties

The properties of the IAdapterError class are listed here.

Public Properties

	Name	Description
R	ErrorText (see page 19662)	Returns text describing the error.
R	Field (see page 19662)	Returns text describing the error.

R	ID (see page 19662)	Returns error ID.

135.2.7.3.1 IAdapterError.ErrorText Property

Returns text describing the error.

Pascal

```
property ErrorText: string;
```

C++

```
__property AnsiString ErrorText;
```

Description

Examine ErrorText to obtain text describing the error.

See Also

GetErrorText (see page 19660)

135.2.7.3.2 IAdapterError.Field Property

Returns text describing the error.

Pascal

```
property Field: TComponent;
```

C++

```
__property TComponent * Field;
```

Description

Examine Field to obtain a reference to the field component involved in the error.

See Also

GetField (see page 19661)

135.2.7.3.3 IAdapterError.ID Property

Returns error ID.

Pascal

```
property ID: integer;
```

C++

```
__property int ID;
```

Description

Examine ID to obtain the error ID value.

See Also

GetID (see page 19661)

ID (see page 23698)

135.2.8 IAdapterErrors Interface

IAdapterErrors is implemented by adapter errors objects.

Class Hierarchy

SiteComp.IAdapterErrors

Pascal

```
IAdapterErrors = interface;
```

C++

```
__interface IAdapterErrors;
```

File

SiteComp

Description

Adapter errors objects keep a list of errors detected while executing an adapter action or generating a page using an adapter. Adapter errors objects may be accessed with server-side script using the adapter's Errors (see page 19666) property.

See Also

IAdapterError (see page 19660)

TCustomAdapter

135.2.8.1 IAdapterErrors Members

The following tables list the members exposed by IAdapterErrors.

Public Methods

	Name	Description
	ClearErrors (see page 19664)	Clears the errors list.
	DefineLabel (see page 19664)	Associates a label with all errors associated with a particular adapter field.
	GetError (see page 19664)	Returns a particular error.
	GetErrorCount (see page 19665)	Return the number of errors in the errors list.
	GetObjectErrors (see page 19665)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 19665)	Indicates whether the errors list contains objects associated with a particular adapter field.

Public Properties

	Name	Description
R	ErrorCount (see page 19666)	Returns the number of errors in the errors list.
R	Errors (see page 19666)	Returns an error from the list.

135.2.8.2 IAdapterErrors Methods

The methods of the IAdapterErrors class are listed here.

Public Methods

	Name	Description
	ClearErrors (see page 19664)	Clears the errors list.
	DefineLabel (see page 19664)	Associates a label with all errors associated with a particular adapter field.
	GetError (see page 19664)	Returns a particular error.
	GetErrorCount (see page 19665)	Return the number of errors in the errors list.
	GetObjectErrors (see page 19665)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 19665)	Indicates whether the errors list contains objects associated with a particular adapter field.

135.2.8.2.1 IAdapterErrors.ClearErrors Method

Clears the errors list.

Pascal

```
procedure ClearErrors;
```

C++

```
__fastcall ClearErrors();
```

Description

Clears the errors list.

135.2.8.2.2 IAdapterErrors.DefineLabel Method

Associates a label with all errors associated with a particular adapter field.

Pascal

```
procedure DefineLabel(const AName: string; const ALabel: string);
```

C++

```
__fastcall DefineLabel(const AnsiString AName, const AnsiString ALabel);
```

Description

DefineLabel is responsible for replacing an label text in error messages associated with a particular adapter field with the given label. DefineLabel is used when the label used on the Web page is not the same as the label generated as part of the error message.

135.2.8.2.3 IAdapterErrors.GetError Method

Returns a particular error.

Pascal

```
function GetError(I: Integer): IAdapterError;
```

C++

```
__fastcall IAdapterError GetError(int I);
```

Description

I is a zero-based index.

See Also

IAdapterError (see page 19660)

135.2.8.2.4 IAdapterErrors.GetErrorCount Method

Return the number of errors in the errors list.

Pascal

```
function GetErrorCount: Integer;
```

C++

```
__fastcall int GetErrorCount();
```

Description

Return the number of errors in the errors list.

135.2.8.2.5 IAdapterErrors.GetObjectErrors Method

Returns an object that is used to enumerate all errors associated with an adapter field.

Pascal

```
function GetObjectErrors(const AName: string): TObject;
```

C++

```
__fastcall TObject * GetObjectErrors(const AnsiString AName);
```

Description

AName identifies an adapter field. nil (Delphi) or NULL (C++) is returned if there are no errors associated with the adapter field.

See Also

HasObjectErrors (see page 19665)

135.2.8.2.6 IAdapterErrors.HasObjectErrors Method

Indicates whether the errors list contains objects associated with a particular adapter field.

Pascal

```
function HasObjectErrors(const AName: string): Boolean;
```

C++

```
__fastcall Boolean HasObjectErrors(const AnsiString AName);
```

Description

HasObjectErrors returns true if any errors are associated with the given adapter field. AName identifies an adapter field.

See Also

GetObjectErrors (see page 19665)

135.2.8.3 IAdapterErrors Properties

The properties of the IAdapterErrors class are listed here.

Public Properties

	Name	Description
R	ErrorCount (see page 19666)	Returns the number of errors in the errors list.

	Errors (see page 19666)	Returns an error from the list.

135.2.8.3.1 IAdapterErrors.ErrorCount Property

Returns the number of errors in the errors list.

Pascal

```
property ErrorCount: Integer;
```

C++

```
__property int ErrorCount;
```

Description

ErrorCount returns the result of GetErrorCount (see page 19665).

See Also

GetErrorCount (see page 19665)

135.2.8.3.2 IAdapterErrors.Errors Property

Returns an error from the list.

Pascal

```
property Errors [I: Integer]: IAdapterError;
```

C++

```
__property IAdapterError Errors[int I];
```

Description

I is a zero-based index. Errors returns the result of GetError (see page 19664).

See Also

IAdapterError (see page 19660)

GetError (see page 19664)

135.2.9 IAdapterFieldAccess Interface

Class Hierarchy

Pascal

```
IAdapterFieldAccess = interface;
```

C++

```
__interface IAdapterFieldAccess;
```

File

SiteComp

Description

This is class SiteComp.IAdapterFieldAccess.

135.2.9.1 IAdapterFieldAccess Members

The following tables list the members exposed by IAdapterFieldAccess.

Public Methods

	Name	Description
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.

135.2.9.2 IAdapterFieldAccess Methods

The methods of the IAdapterFieldAccess class are listed here.

Public Methods

	Name	Description
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.

135.2.9.2.1 IAdapterFieldAccess.HasModifyAccess Method

Pascal

```
function HasModifyAccess: Boolean;
```

C++

```
__fastcall Boolean HasModifyAccess();
```

Description

This is HasModifyAccess, a member of class IAdapterFieldAccess.

135.2.9.2.2 IAdapterFieldAccess.HasViewAccess Method

Pascal

```
function HasViewAccess: Boolean;
```

C++

```
__fastcall Boolean HasViewAccess();
```

Description

This is HasViewAccess, a member of class IAdapterFieldAccess.

135.2.10 IAdapterFieldAttributes Interface

Class Hierarchy

SiteComp.IAdapterFieldAttributes

Pascal

```
IAdapterFieldAttributes = interface;
```

C++

```
__interface IAdapterFieldAttributes;
```

File

SiteComp

Description

This is class SiteComp.IAdapterFieldAttributes.

135.2.10.1 IAdapterFieldAttributes Members

The following tables list the members exposed by IAdapterFieldAttributes.

Public Methods

	Name	Description
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.

Public Properties

	Name	Description
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

135.2.10.2 IAdapterFieldAttributes Methods

The methods of the IAdapterFieldAttributes class are listed here.

Public Methods

	Name	Description
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.

135.2.10.2.1 IAdapterFieldAttributes.GetRequired Method

Pascal

```
function GetRequired: Boolean;
```

C++

```
__fastcall Boolean GetRequired();
```

Description

This is GetRequired, a member of class IAdapterFieldAttributes.

135.2.10.2.2 IAdapterFieldAttributes.GetVisible Method

Pascal

```
function GetVisible: Boolean;
```

C++

```
__fastcall Boolean GetVisible();
```

Description

This is GetVisible, a member of class IAdapterFieldAttributes.

135.2.10.3 IAdapterFieldAttributes Properties

The properties of the IAdapterFieldAttributes class are listed here.

Public Properties

	Name	Description
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

135.2.10.3.1 IAdapterFieldAttributes.Required Property

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;
```

Description

This is Required, a member of class IAdapterFieldAttributes.

135.2.10.3.2 IAdapterFieldAttributes.Visible Property

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

This is Visible, a member of class IAdapterFieldAttributes.

135.2.11 IAdapterHiddenField Interface

Class Hierarchy

SiteComp.IAdapterHiddenField

Pascal

```
IAdapterHiddenField = interface;
```

C++

```
__interface IAdapterHiddenField;
```

File

SiteComp

Description

This is class SiteComp.IAdapterHiddenField.

135.2.11.1 IAdapterHiddenField Members

The following tables list the members exposed by IAdapterHiddenField.

Public Methods

	Name	Description
	GetName (see page 19670)	This is GetName, a member of class IAdapterHiddenField.
	GetValue (see page 19670)	This is GetValue, a member of class IAdapterHiddenField.

Public Properties

	Name	Description
R	Name (see page 19671)	This is Name, a member of class IAdapterHiddenField.
R	Value (see page 19671)	This is Value, a member of class IAdapterHiddenField.

135.2.11.2 IAdapterHiddenField Methods

The methods of the IAdapterHiddenField class are listed here.

Public Methods

	Name	Description
	GetName (see page 19670)	This is GetName, a member of class IAdapterHiddenField.
	GetValue (see page 19670)	This is GetValue, a member of class IAdapterHiddenField.

135.2.11.2.1 IAdapterHiddenField.GetName Method

Pascal

```
function GetName: string;
```

C++

```
__fastcall AnsiString GetName();
```

Description

This is GetName, a member of class IAdapterHiddenField.

135.2.11.2.2 IAdapterHiddenField.GetValue Method

Pascal

```
function GetValue: string;
```

C++

```
__fastcall AnsiString GetValue();
```

Description

This is GetValue, a member of class IAdapterHiddenField.

135.2.11.3 IAdapterHiddenField Properties

The properties of the IAdapterHiddenField class are listed here.

Public Properties

	Name	Description
R	Name (see page 19671)	This is Name, a member of class IAdapterHiddenField.
R	Value (see page 19671)	This is Value, a member of class IAdapterHiddenField.

135.2.11.3.1 IAdapterHiddenField.Name Property

Pascal

```
property Name: string;
```

C++

```
__property AnsiString Name;
```

Description

This is Name, a member of class IAdapterHiddenField.

135.2.11.3.2 IAdapterHiddenField.Value Property

Pascal

```
property Value: string;
```

C++

```
__property AnsiString Value;
```

Description

This is Value, a member of class IAdapterHiddenField.

135.2.12 IAdapterHiddenFields Interface

Class Hierarchy

SiteComp.IAdapterHiddenFields

Pascal

```
IAdapterHiddenFields = interface;
```

C++

```
__interface IAdapterHiddenFields;
```

File

SiteComp

Description

This is class SiteComp.IAdapterHiddenFields.

135.2.12.1 IAdapterHiddenFields Members

The following tables list the members exposed by IAdapterHiddenFields.

Public Methods

	Name	Description
	GetField (see page 19672)	This is GetField, a member of class IAdapterHiddenFields.
	GetFieldCount (see page 19672)	This is GetFieldCount, a member of class IAdapterHiddenFields.

Public Properties

	Name	Description
R	FieldCount (see page 19673)	This is FieldCount, a member of class IAdapterHiddenFields.
R	Fields (see page 19673)	This is Fields, a member of class IAdapterHiddenFields.

135.2.12.2 IAdapterHiddenFields Methods

The methods of the IAdapterHiddenFields class are listed here.

Public Methods

	Name	Description
	GetField (see page 19672)	This is GetField, a member of class IAdapterHiddenFields.
	GetFieldCount (see page 19672)	This is GetFieldCount, a member of class IAdapterHiddenFields.

135.2.12.2.1 IAdapterHiddenFields.GetField Method

Pascal

```
function GetField(I: Integer): IAdapterHiddenField;
```

C++

```
__fastcall IAdapterHiddenField GetField(int I);
```

Description

This is GetField, a member of class IAdapterHiddenFields.

135.2.12.2.2 IAdapterHiddenFields.GetFieldCount Method

Pascal

```
function GetFieldCount: Integer;
```

C++

```
__fastcall int GetFieldCount();
```

Description

This is GetFieldCount, a member of class IAdapterHiddenFields.

135.2.12.3 IAdapterHiddenFields Properties

The properties of the IAdapterHiddenFields class are listed here.

Public Properties

	Name	Description
R	FieldCount (see page 19673)	This is FieldCount, a member of class IAdapterHiddenFields.
R	Fields (see page 19673)	This is Fields, a member of class IAdapterHiddenFields.

135.2.12.3.1 IAdapterHiddenFields.FieldCount Property

Pascal

```
property FieldCount: Integer;
```

C++

```
__property int FieldCount;
```

Description

This is FieldCount, a member of class IAdapterHiddenFields.

135.2.12.3.2 IAdapterHiddenFields.Fields Property

Pascal

```
property Fields [I: Integer]: IAdapterHiddenField;
```

C++

```
__property IAdapterHiddenField Fields[int I];
```

Description

This is Fields, a member of class IAdapterHiddenFields.

135.2.13 IAdapterItemRequestParams Interface

IAdapterItemRequestParams is the interface for reading the parameters for an adapter field or action request.

Class Hierarchy

SiteComp.IAdapterItemRequestParams

Pascal

```
IAdapterItemRequestParams = interface;
```

C++

```
__interface IAdapterItemRequestParams;
```

File

SiteComp

Description

Use IAdapterItemRequestParams to read the parameters that accompany requests to an adapter field or action. The parameters, which can be accessed through the ParamValues (see page 19677) property, are a set of 'Name=Value' strings. In addition to providing access to the parameters, IAdapterItemRequestParams has two properties, SuccessPage (see page 19677) and FailurePage (see page 19676), which identify the Web pages that should be returned to the caller when the adapter request succeeds or fails.

Note: In C++, method declarations that use IAdapterItemRequestParams use the _di_IAdapterItemRequestParams type instead. This type is a DelphiInterface wrapper around the IAdapterItemRequestParams interface:

Note: typedef System::DelphiInterface (see page 22167)< IAdapterItemRequestParams > _di_IAdapterItemRequestParams;

See Also

TPageDispatcher (see page 24949)

TCustomWebAppComponents (see page 24906)

TWebAPpComponents

135.2.13.1 IAdapterItemRequestParams Members

The following tables list the members exposed by IAdapterItemRequestParams.

Public Methods

	Name	Description
	GetFailurePage (see page 19674)	Returns the value of the FailurePage (see page 19676) property.
	GetParamValues (see page 19675)	Returns the value of the ParamValues (see page 19677) property.
	GetSuccessPage (see page 19675)	Returns the value of the SuccessPage (see page 19677) property.
	SetFailurePage (see page 19675)	Sets the value of the FailurePage (see page 19676) property.
	SetSuccessPage (see page 19676)	Sets the value of the SuccessPage (see page 19677) property.

Public Properties

	Name	Description
	FailurePage (see page 19676)	Indicates the Web page module that the application should return if the adapter request fails.
R	ParamValues (see page 19677)	Lists the parameter values that are included in requests to the adapter action or field.
	SuccessPage (see page 19677)	Indicates the Web page module that the application should return if the adapter request succeeds.

135.2.13.2 IAdapterItemRequestParams Methods

The methods of the IAdapterItemRequestParams class are listed here.

Public Methods

	Name	Description
	GetFailurePage (see page 19674)	Returns the value of the FailurePage (see page 19676) property.
	GetParamValues (see page 19675)	Returns the value of the ParamValues (see page 19677) property.
	GetSuccessPage (see page 19675)	Returns the value of the SuccessPage (see page 19677) property.
	SetFailurePage (see page 19675)	Sets the value of the FailurePage (see page 19676) property.
	SetSuccessPage (see page 19676)	Sets the value of the SuccessPage (see page 19677) property.

135.2.13.2.1 IAdapterItemRequestParams.GetFailurePage Method

Returns the value of the FailurePage (see page 19676) property.

Pascal

```
function GetFailurePage: string;
```

C++

```
__fastcall AnsiString GetFailurePage();
```

Description

GetFailurePage is the read implementation of the FailurePage (see page 19676) property.

See Also

FailurePage (see page 19676)

135.2.13.2.2 IAdapterItemRequestParams.GetParamValues Method

Returns the value of the ParamValues (see page 19677) property.

Pascal

```
function GetParamValues: TStrings;
```

C++

```
__fastcall TStrings GetParamValues();
```

Description

GetParamValues is the read implementation of the ParamValues (see page 19677) property.

See Also

ParamValues (see page 19677)

135.2.13.2.3 IAdapterItemRequestParams.GetSuccessPage Method

Returns the value of the SuccessPage (see page 19677) property.

Pascal

```
function GetSuccessPage: string;
```

C++

```
__fastcall AnsiString GetSuccessPage();
```

Description

GetSuccessPage is the read implementation of the SuccessPage (see page 19677) property.

See Also

SuccessPage (see page 19677)

135.2.13.2.4 IAdapterItemRequestParams.SetFailurePage Method

Sets the value of the FailurePage (see page 19676) property.

Pascal

```
procedure SetFailurePage(const AValue: string);
```

C++

```
__fastcall SetFailurePage(const AnsiString AValue);
```

Description

SetFailurePage is the write implementation of the FailurePage (see page 19676) property.

AValue is the name of the Web page that should be returned if the adapter request fails.

See Also

FailurePage (see page 19676)

135.2.13.2.5 IAdapterItemRequestParams.SetSuccessPage Method

Sets the value of the SuccessPage (see page 19677) property.

Pascal

```
procedure SetSuccessPage(const AValue: string);
```

C++

```
__fastcall SetSuccessPage(const AnsiString AValue);
```

Description

SetSuccessPage is the write implementation of the SuccessPage (see page 19677) property.

AValue is the name of the Web page that should be returned when the adapter request succeeds.

See Also

SuccessPage (see page 19677)

135.2.13.3 IAdapterItemRequestParams Properties

The properties of the IAdapterItemRequestParams class are listed here.

Public Properties

	Name	Description
	FailurePage (see page 19676)	Indicates the Web page module that the application should return if the adapter request fails.
R	ParamValues (see page 19677)	Lists the parameter values that are included in requests to the adapter action or field.
	SuccessPage (see page 19677)	Indicates the Web page module that the application should return if the adapter request succeeds.

135.2.13.3.1 IAdapterItemRequestParams.FailurePage Property

Indicates the Web page module that the application should return if the adapter request fails.

Pascal

```
property FailurePage: string;
```

C++

```
__property AnsiString FailurePage;
```

Description

FailurePage is the name of the registered Web page module that should generate the content of the response message if the request to the adapter fails.

See Also

SuccessPage (see page 19677)

135.2.13.3.2 IAdapterItemRequestParams.ParamValues Property

Lists the parameter values that are included in requests to the adapter action or field.

Pascal

```
property ParamValues: TStrings;
```

C++

```
__property TStrings ParamValues;
```

Description

Use ParamValues to access the list of parameter values. Use the Names property of ParamValues to obtain the names of the parameters and the Values property to access the corresponding values.

See Also

Names (see page 3075)

Values (see page 3086)

135.2.13.3.3 IAdapterItemRequestParams.SuccessPage Property

Indicates the Web page module that the application should return if the adapter request succeeds.

Pascal

```
property SuccessPage: string;
```

C++

```
__property AnsiString SuccessPage;
```

Description

SuccessPage is the name of the registered Web page module that should generate the content of the response message when the request to the adapter succeeds.

See Also

SuccessPage

135.2.14 IAdapterMode Interface

Class Hierarchy

Pascal

```
IAdapterMode = interface;
```

C++

```
__interface IAdapterMode;
```

File

SiteComp

Description

This is class SiteComp.IAdapterMode.

135.2.14.1 IAdapterMode Members

The following tables list the members exposed by IAdapterMode.

Public Methods

	Name	Description
	GetAdapterMode (see page 19678)	This is GetAdapterMode, a member of class IAdapterMode.
	GetNeedAdapterMode (see page 19678)	This is GetNeedAdapterMode, a member of class IAdapterMode.
	RestoreDefaultAdapterMode (see page 19679)	This is RestoreDefaultAdapterMode, a member of class IAdapterMode.
	SetAdapterMode (see page 19679)	This is SetAdapterMode, a member of class IAdapterMode.

Public Properties

	Name	Description
	AdapterMode (see page 19679)	This is AdapterMode, a member of class IAdapterMode.
R	NeedAdapterMode (see page 19679)	This is NeedAdapterMode, a member of class IAdapterMode.

135.2.14.2 IAdapterMode Methods

The methods of the IAdapterMode class are listed here.

Public Methods

	Name	Description
	GetAdapterMode (see page 19678)	This is GetAdapterMode, a member of class IAdapterMode.
	GetNeedAdapterMode (see page 19678)	This is GetNeedAdapterMode, a member of class IAdapterMode.
	RestoreDefaultAdapterMode (see page 19679)	This is RestoreDefaultAdapterMode, a member of class IAdapterMode.
	SetAdapterMode (see page 19679)	This is SetAdapterMode, a member of class IAdapterMode.

135.2.14.2.1 IAdapterMode.GetAdapterMode Method

Pascal

```
function GetAdapterMode: string;
```

C++

```
__fastcall AnsiString GetAdapterMode();
```

Description

This is GetAdapterMode, a member of class IAdapterMode.

135.2.14.2.2 IAdapterMode.GetNeedAdapterMode Method

Pascal

```
function GetNeedAdapterMode: Boolean;
```

C++

```
__fastcall Boolean GetNeedAdapterMode();
```

Description

This is GetNeedAdapterMode, a member of class IAdapterMode.

135.2.14.2.3 IAdapterMode.RestoreDefaultAdapterMode Method

Pascal

```
procedure RestoreDefaultAdapterMode;
```

C++

```
__fastcall RestoreDefaultAdapterMode();
```

Description

This is RestoreDefaultAdapterMode, a member of class IAdapterMode.

135.2.14.2.4 IAdapterMode.SetAdapterMode Method

Pascal

```
procedure SetAdapterMode(const AValue: string);
```

C++

```
__fastcall SetAdapterMode(const AnsiString AValue);
```

Description

This is SetAdapterMode, a member of class IAdapterMode.

135.2.14.3 IAdapterMode Properties

The properties of the IAdapterMode class are listed here.

Public Properties

	Name	Description
	AdapterMode (see page 19679)	This is AdapterMode, a member of class IAdapterMode.
R	NeedAdapterMode (see page 19679)	This is NeedAdapterMode, a member of class IAdapterMode.

135.2.14.3.1 IAdapterMode.AdapterMode Property

Pascal

```
property AdapterMode: string;
```

C++

```
__property AnsiString AdapterMode;
```

Description

This is AdapterMode, a member of class IAdapterMode.

135.2.14.3.2 IAdapterMode.NeedAdapterMode Property

Pascal

```
property NeedAdapterMode: Boolean;
```

C++

```
__property Boolean NeedAdapterMode;
```

Description

This is NeedAdapterMode, a member of class IAdapterMode.

135.2.15 IAdapterRequestHandler Interface

IAdapterRequestHandler handles requests to execute an adapter action or retrieve the value of an image field.

Class Hierarchy

SiteComp.IAdapterRequestHandler

Pascal

```
IAdapterRequestHandler = interface;
```

C++

```
__interface IAdapterRequestHandler;
```

File

SiteComp

Description

IAdapterRequestHandler is implemented by classes that execute an adapter action or look up the value of an image field.

See Also

TBaseAdapterAction (see page 24043)

TCustomAdapterImageField (see page 24244)

135.2.15.1 IAdapterRequestHandler Members

The following tables list the members exposed by IAdapterRequestHandler.

Public Methods

	Name	Description
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.

135.2.15.2 IAdapterRequestHandler Methods

The methods of the IAdapterRequestHandler class are listed here.

Public Methods

	Name	Description
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.

135.2.15.2.1 IAdapterRequestHandler.CreateRequestContext Method

Creates an object that describes the adapter action parameters and adapter field values.

Pascal

```
procedure CreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall CreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

CreateRequestContext creates a new request context based on the specified parameters.

See Also

AdapterRequest (see page 24655)

TAdapterDispatcher (see page 24840)

CreateRequestContext (see page 24050)

CreateRequestContext (see page 24252)

135.2.15.2.2 IAdapterRequestHandler.HandleRequest Method

Executes the adapter action and generates a response.

Pascal

```
function HandleRequest(DispatchParams: IAdapterDispatchParams): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

The adapter dispatcher calls HandleRequest to execute the adapter action and generate a response.

See Also

HandleRequest (see page 24061)

HandleRequest (see page 24255)

135.2.16 IAsFormatted Interface

Class Hierarchy

SiteComp.IAsFormatted

Pascal

```
IAsFormatted = interface;
```

C++

```
__interface IAsFormatted;
```

File

SiteComp

Description

This is class SiteComp.IAsFormatted.

135.2.16.1 IAsFormatted Members

The following tables list the members exposed by IAsFormatted.

Public Methods

	Name	Description
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.

135.2.16.2 IAsFormatted Methods

The methods of the IAsFormatted class are listed here.

Public Methods

	Name	Description
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.

135.2.16.2.1 IAsFormatted.AsFormatted Method

Pascal

```
function AsFormatted: string;
```

C++

```
__fastcall AnsiString AsFormatted();
```

Description

This is AsFormatted, a member of class IAsFormatted.

135.2.17 IDefaultPageFileName Interface

Class Hierarchy

SiteComp.IDefaultPageFileName

Pascal

```
IDefaultPageFileName = interface;
```

C++

```
__interface IDefaultPageFileName;
```

File

SiteComp

Description

This is class SiteComp.IDefaultPageFileName.

135.2.17.1 IDefaultPageFileName Members

The following tables list the members exposed by IDefaultPageFileName.

Public Methods

	Name	Description
	SetDefaultPageFileName (see page 19683)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.

135.2.17.2 IDefaultPageFileName Methods

The methods of the IDefaultPageFileName class are listed here.

Public Methods

	Name	Description
	SetDefaultPageFileName (see page 19683)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.

135.2.17.2.1 IDefaultPageFileName.SetDefaultPageFileName Method

Pascal

```
procedure SetDefaultPageFileName(const APageFile: string);
```

C++

```
__fastcall SetDefaultPageFileName(const AnsiString APageFile);
```

Description

This is SetDefaultPageFileName, a member of class IDefaultPageFileName.

135.2.18 IFieldValuesAdapter Interface

Class Hierarchy

SiteComp.IFieldValuesAdapter

Pascal

```
IFieldValuesAdapter = interface;
```

C++

```
__interface IFieldValuesAdapter;
```

File

SiteComp

Description

This is class SiteComp.IFieldValuesAdapter.

135.2.18.1 IFieldValuesAdapter Members

The following tables list the members exposed by IFieldValuesAdapter.

Public Methods

	Name	Description
	GetField (see page 19684)	This is GetField, a member of class IFieldValuesAdapter.
	GetValueIndex (see page 19684)	This is GetValueIndex, a member of class IFieldValuesAdapter.

135.2.18.2 IFieldValuesAdapter Methods

The methods of the IFieldValuesAdapter class are listed here.

Public Methods

	Name	Description
	GetField (see page 19684)	This is GetField, a member of class IFieldValuesAdapter.
	GetValueIndex (see page 19684)	This is GetValueIndex, a member of class IFieldValuesAdapter.

135.2.18.2.1 IFieldValuesAdapter.GetField Method

Pascal

```
function GetField: TObject;
```

C++

```
__fastcall TObject * GetField();
```

Description

This is GetField, a member of class IFieldValuesAdapter.

135.2.18.2.2 IFieldValuesAdapter.GetValueIndex Method

Pascal

```
function GetValueIndex: Integer;
```

C++

```
__fastcall int GetValueIndex();
```

Description

This is GetValueIndex, a member of class IFieldValuesAdapter.

135.2.19 IFindIncludeFile Interface

Class Hierarchy

SiteComp.IFindIncludeFile

Pascal

```
IFindIncludeFile = interface;
```

C++

```
__interface IFindIncludeFile;
```

File

SiteComp

Description

This is class SiteComp.IFindIncludeFile.

135.2.19.1 IFindIncludeFile Members

The following tables list the members exposed by IFindIncludeFile.

Public Methods

	Name	Description
	FindIncludeFile (see page 19685)	This is FindIncludeFile, a member of class IFindIncludeFile.

135.2.19.2 IFindIncludeFile Methods

The methods of the IFindIncludeFile class are listed here.

Public Methods

	Name	Description
	FindIncludeFile (see page 19685)	This is FindIncludeFile, a member of class IFindIncludeFile.

135.2.19.2.1 IFindIncludeFile.FindIncludeFile Method

Pascal

```
function FindIncludeFile(AComponent: TComponent; const AFileName: string; var AResult:
string): Boolean;
```

C++

```
__fastcall Boolean FindIncludeFile(TComponent * AComponent, const AnsiString AFileName,
AnsiString AResult);
```

Description

This is FindIncludeFile, a member of class IFindIncludeFile.

135.2.20 IGetAdapterActions Interface

Class Hierarchy

SiteComp.IGetAdapterActions

Pascal

```
IGetAdapterActions = interface;
```

C++

```
__interface IGetAdapterActions;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterActions.

135.2.20.1 IGetAdapterActions Members

The following tables list the members exposed by IGetAdapterActions.

Public Methods

	Name	Description
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.

135.2.20.2 IGetAdapterActions Methods

The methods of the IGetAdapterActions class are listed here.

Public Methods

	Name	Description
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.

135.2.20.2.1 IGetAdapterActions.GetAdapterActions Method

Pascal

```
function GetAdapterActions: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterActions();
```

Description

This is GetAdapterActions, a member of class IGetAdapterActions.

135.2.21 IGetAdapterDisplayCharacteristics Interface

Class Hierarchy

SiteComp.IGetAdapterDisplayCharacteristics

Pascal

```
IGetAdapterDisplayCharacteristics = interface;
```

C++

```
__interface IGetAdapterDisplayCharacteristics;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterDisplayCharacteristics.

135.2.21.1 IGetAdapterDisplayCharacteristics Members

The following tables list the members exposed by IGetAdapterDisplayCharacteristics.

Public Methods

	Name	Description
	GetAdapterDisplayCharacteristics (see page 19687)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.

135.2.21.2 IGetAdapterDisplayCharacteristics Methods

The methods of the IGetAdapterDisplayCharacteristics class are listed here.

Public Methods

	Name	Description
	GetAdapterDisplayCharacteristics (see page 19687)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.

135.2.21.2.1 IGetAdapterDisplayCharacteristics.GetAdapterDisplayCharacteristics Method

Pascal

```
function GetAdapterDisplayCharacteristics: TAdapterDisplayCharacteristics;
```

C++

```
__fastcall TAdapterDisplayCharacteristics GetAdapterDisplayCharacteristics();
```

Description

This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.

135.2.22 IGetAdapterErrors Interface

Class Hierarchy

SiteComp.IGetAdapterErrors

Pascal

```
IGetAdapterErrors = interface;
```

C++

```
__interface IGetAdapterErrors;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterErrors.

135.2.22.1 IGetAdapterErrors Members

The following tables list the members exposed by IGetAdapterErrors.

Public Methods

	Name	Description
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.

135.2.22.2 IGetAdapterErrors Methods

The methods of the IGetAdapterErrors class are listed here.

Public Methods

	Name	Description
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.

135.2.22.2.1 IGetAdapterErrors.GetAdapterErrors Method

Pascal

```
function GetAdapterErrors: TObject;
```

C++

```
__fastcall TObject * GetAdapterErrors();
```

Description

This is GetAdapterErrors, a member of class IGetAdapterErrors.

135.2.23 IGetAdapterFields Interface

Class Hierarchy

SiteComp.IGetAdapterFields

Pascal

```
IGetAdapterFields = interface;
```

C++

```
__interface IGetAdapterFields;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterFields.

135.2.23.1 IGetAdapterFields Members

The following tables list the members exposed by IGetAdapterFields.

Public Methods

	Name	Description
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.

135.2.23.2 IGetAdapterFields Methods

The methods of the IGetAdapterFields class are listed here.

Public Methods

	Name	Description
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.

135.2.23.2.1 IGetAdapterFields.GetAdapterFields Method

Pascal

```
function GetAdapterFields: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterFields();
```

Description

This is GetAdapterFields, a member of class IGetAdapterFields.

135.2.24 IGetAdapterHiddenFields Interface

Class Hierarchy

SiteComp.IGetAdapterHiddenFields

Pascal

```
IGetAdapterHiddenFields = interface;
```

C++

```
__interface IGetAdapterHiddenFields;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterHiddenFields.

135.2.24.1 IGetAdapterHiddenFields Members

The following tables list the members exposed by IGetAdapterHiddenFields.

Public Methods

	Name	Description
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.

135.2.24.2 IGetAdapterHiddenFields Methods

The methods of the IGetAdapterHiddenFields class are listed here.

Public Methods

	Name	Description
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.

135.2.24.2.1 IGetAdapterHiddenFields.GetAdapterHiddenFields Method

Pascal

```
function GetAdapterHiddenFields: TObject;
```

C++

```
__fastcall TObject * GetAdapterHiddenFields();
```

Description

This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.

135.2.24.2.2 IGetAdapterHiddenFields.GetAdapterHiddenRecordFields Method

Pascal

```
function GetAdapterHiddenRecordFields: TObject;
```

C++

```
__fastcall TObject * GetAdapterHiddenRecordFields();
```

Description

This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.

135.2.25 IGetAdapterImage Interface

Class Hierarchy

SiteComp.IGetAdapterImage

Pascal

```
IGetAdapterImage = interface;
```

C++

```
__interface IGetAdapterImage;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterImage.

135.2.25.1 IGetAdapterImage Members

The following tables list the members exposed by IGetAdapterImage.

Public Methods

	Name	Description
	GetAdapterImage (see page 19691)	This is GetAdapterImage, a member of class IGetAdapterImage.

135.2.25.2 IGetAdapterImage Methods

The methods of the IGetAdapterImage class are listed here.

Public Methods

	Name	Description
	GetAdapterImage (see page 19691)	This is GetAdapterImage, a member of class IGetAdapterImage.

135.2.25.2.1 IGetAdapterImage.GetAdapterImage Method

Pascal

```
function GetAdapterImage: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterImage();
```

Description

This is GetAdapterImage, a member of class IGetAdapterImage.

135.2.26 IGetAdapterItemRequestParams Interface

Class Hierarchy

SiteComp.IGetAdapterItemRequestParams

Pascal

```
IGetAdapterItemRequestParams = interface;
```

C++

```
__interface IGetAdapterItemRequestParams;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterItemRequestParams.

135.2.26.1 IGetAdapterItemRequestParams Members

The following tables list the members exposed by IGetAdapterItemRequestParams.

Public Methods

	Name	Description
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.

135.2.26.2 IGetAdapterItemRequestParams Methods

The methods of the IGetAdapterItemRequestParams class are listed here.

Public Methods

	Name	Description
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.

135.2.26.2.1 IGetAdapterItemRequestParams.GetAdapterItemRequestParams Method

Pascal

```
procedure GetAdapterItemRequestParams(var AIdentifier: string; AParams:
IAdapterItemRequestParams);
```

C++

```
__fastcall GetAdapterItemRequestParams(AnsiString AIdentifier, IAdapterItemRequestParams
AParams);
```

Description

This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.

135.2.27 IGetAdapterRequestDefaultResponse Interface

Class Hierarchy

SiteComp.IGetAdapterRequestDefaultResponse

Pascal

```
IGetAdapterRequestDefaultResponse = interface;
```

C++

```
__interface IGetAdapterRequestDefaultResponse;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterRequestDefaultResponse.

135.2.27.1 IGetAdapterRequestDefaultResponse Members

The following tables list the members exposed by IGetAdapterRequestDefaultResponse.

Public Methods

	Name	Description
	GetFailurePage (see page 19693)	This is GetFailurePage, a member of class IGetAdapterRequestDefaultResponse.
	GetSuccessPage (see page 19693)	This is GetSuccessPage, a member of class IGetAdapterRequestDefaultResponse.

Public Properties

	Name	Description
R	FailurePage (see page 19694)	This is FailurePage, a member of class IGetAdapterRequestDefaultResponse.
R	SuccessPage (see page 19694)	This is SuccessPage, a member of class IGetAdapterRequestDefaultResponse.

135.2.27.2 IGetAdapterRequestDefaultResponse Methods

The methods of the IGetAdapterRequestDefaultResponse class are listed here.

Public Methods

	Name	Description
	GetFailurePage (see page 19693)	This is GetFailurePage, a member of class IGetAdapterRequestDefaultResponse.
	GetSuccessPage (see page 19693)	This is GetSuccessPage, a member of class IGetAdapterRequestDefaultResponse.

135.2.27.2.1 IGetAdapterRequestDefaultResponse.GetFailurePage Method

Pascal

```
function GetFailurePage: string;
```

C++

```
__fastcall AnsiString GetFailurePage();
```

Description

This is GetFailurePage, a member of class IGetAdapterRequestDefaultResponse.

135.2.27.2.2 IGetAdapterRequestDefaultResponse.GetSuccessPage Method

Pascal

```
function GetSuccessPage: string;
```

C++

```
__fastcall AnsiString GetSuccessPage();
```

Description

This is GetSuccessPage, a member of class IGetAdapterRequestDefaultResponse.

135.2.27.3 IGetAdapterRequestDefaultResponse Properties

The properties of the IGetAdapterRequestDefaultResponse class are listed here.

Public Properties

	Name	Description
R	FailurePage (see page 19694)	This is FailurePage, a member of class IGetAdapterRequestDefaultResponse.
R	SuccessPage (see page 19694)	This is SuccessPage, a member of class IGetAdapterRequestDefaultResponse.

135.2.27.3.1 IGetAdapterRequestDefaultResponse.FailurePage Property

Pascal

```
property FailurePage: string;
```

C++

```
__property AnsiString FailurePage;
```

Description

This is FailurePage, a member of class IGetAdapterRequestDefaultResponse.

135.2.27.3.2 IGetAdapterRequestDefaultResponse.SuccessPage Property

Pascal

```
property SuccessPage: string;
```

C++

```
__property AnsiString SuccessPage;
```

Description

This is SuccessPage, a member of class IGetAdapterRequestDefaultResponse.

135.2.28 IGetAdapterValuesList Interface

Class Hierarchy

SiteComp.IGetAdapterValuesList

Pascal

```
IGetAdapterValuesList = interface;
```

C++

```
__interface IGetAdapterValuesList;
```

File

SiteComp

Description

This is class SiteComp.IGetAdapterValuesList.

135.2.28.1 IGetAdapterValuesList Members

The following tables list the members exposed by IGetAdapterValuesList.

Public Methods

	Name	Description
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.

135.2.28.2 IGetAdapterValuesList Methods

The methods of the IGetAdapterValuesList class are listed here.

Public Methods

	Name	Description
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.

135.2.28.2.1 IGetAdapterValuesList.GetAdapterValuesList Method

Pascal

```
function GetAdapterValuesList: IValuesListAdapter;
```

C++

```
__fastcall IValuesListAdapter GetAdapterValuesList();
```

Description

This is GetAdapterValuesList, a member of class IGetAdapterValuesList.

135.2.29 IGetDefaultAction Interface

Class Hierarchy

SiteComp.IGetDefaultAction

Pascal

```
IGetDefaultAction = interface;
```

C++

```
__interface IGetDefaultAction;
```

File

SiteComp

Description

This is class SiteComp.IGetDefaultAction.

135.2.29.1 IGetDefaultAction Members

The following tables list the members exposed by IGetDefaultAction.

Public Methods

	Name	Description
	GetDefaultAction (see page 19696)	This is GetDefaultAction, a member of class IGetDefaultAction.

Public Properties

	Name	Description
R	DefaultAction (see page 19696)	This is DefaultAction, a member of class IGetDefaultAction.

135.2.29.2 IGetDefaultAction Methods

The methods of the IGetDefaultAction class are listed here.

Public Methods

	Name	Description
	GetDefaultAction (see page 19696)	This is GetDefaultAction, a member of class IGetDefaultAction.

135.2.29.2.1 IGetDefaultAction.GetDefaultAction Method

Pascal

```
function GetDefaultAction: TComponent;
```

C++

```
__fastcall TComponent * GetDefaultAction();
```

Description

This is GetDefaultAction, a member of class IGetDefaultAction.

135.2.29.3 IGetDefaultAction Properties

The properties of the IGetDefaultAction class are listed here.

Public Properties

	Name	Description
R	DefaultAction (see page 19696)	This is DefaultAction, a member of class IGetDefaultAction.

135.2.29.3.1 IGetDefaultAction.DefaultAction Property

Pascal

```
property DefaultAction: TComponent;
```

C++

```
__property TComponent * DefaultAction;
```

Description

This is DefaultAction, a member of class IGetDefaultAction.

135.2.30 IGetDesigntimeWarnings Interface

Class Hierarchy

SiteComp.IGetDesigntimeWarnings

Pascal

```
IGetDesigntimeWarnings = interface;
```

C++

```
__interface IGetDesigntimeWarnings;
```

File

SiteComp

Description

This is class SiteComp.IGetDesigntimeWarnings.

135.2.30.1 IGetDesigntimeWarnings Members

The following tables list the members exposed by IGetDesigntimeWarnings.

Public Methods

	Name	Description
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.

135.2.30.2 IGetDesigntimeWarnings Methods

The methods of the IGetDesigntimeWarnings class are listed here.

Public Methods

	Name	Description
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.

135.2.30.2.1 IGetDesigntimeWarnings.GetDesigntimeWarnings Method

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.

135.2.31 IGetFieldValuesAdapter Interface

Class Hierarchy

SiteComp.IGetFieldValuesAdapter

Pascal

```
IGetFieldValuesAdapter = interface;
```

C++

```
__interface IGetFieldValuesAdapter;
```

File

SiteComp

Description

This is class SiteComp.IGetFieldValuesAdapter.

135.2.31.1 IGetFieldValuesAdapter Members

The following tables list the members exposed by IGetFieldValuesAdapter.

Public Methods

	Name	Description
	GetFieldValuesAdapter (see page 19698)	This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.

135.2.31.2 IGetFieldValuesAdapter Methods

The methods of the IGetFieldValuesAdapter class are listed here.

Public Methods

	Name	Description
	GetFieldValuesAdapter (see page 19698)	This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.

135.2.31.2.1 IGetFieldValuesAdapter.GetFieldValuesAdapter Method

Pascal

```
function GetFieldValuesAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetFieldValuesAdapter();
```

Description

This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.

135.2.32 IGetHTMLStyle Interface

IGetHTMLStyle is used to inquire about the preferred display representation of an adapter field or adapter action.

Class Hierarchy

SiteComp.IGetHTMLStyle

Pascal

```
IGetHTMLStyle = interface;
```

C++

```
__interface IGetHTMLStyle;
```

File

SiteComp

Description

IGetHTMLStyle methods are typically called while generating HTML to display adapter fields and adapter actions. An adapter field implements this interface to indicate, for example, whether it's value should be displayed with an HTML input field or a select list. An adapter action implements this interface to indicate, for example, whether it's value should be displayed with an HTML button or hyperlink.

TAdapterPageProducer child components may call this interface when generating HTML. For example, TCustomAdapterDisplayField calls GetViewMode (see page 19701) when the TCustomAdapterDisplayField's ViewMode property is set to vmDefault. TCustomAdapterActionButton calls GetDisplayStyle (see page 19700) when its DisplayType property is ctDefault.

See Also

TAdapterNamedDisplayField (see page 23913)

TCustomAdapterDisplayColumn (see page 25230)

TCustomAdapterDisplayField (see page 25240)

135.2.32.1 IGetHTMLStyle Members

The following tables list the members exposed by IGetHTMLStyle.

Public Methods

	Name	Description
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.

135.2.32.2 IGetHTMLStyle Methods

The methods of the IGetHTMLStyle class are listed here.

Public Methods

	Name	Description
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.

135.2.32.2.1 IGetHTMLStyle.GetDisplayStyle Method

Returns the preferred display style for an adapter field or adapter action.

Pascal

```
function GetDisplayStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall AnsiString GetDisplayStyle(const AnsiString AAdapterMode);
```

Description

The AAdapterMode parameter can be used to request the style to be used when the adapter is a particular mode (e.g.; Edit).

Adapter fields typically return one of the following values:

Value	Meaning
Text	Display the field as read-only text
Image	Display the field as an image
List	Display the field as a list of read only values
Button	Display the adapter action as a button
Image	Display the adapter action as an image
Anchor	Display the adapter action as a hyperlink
EventImages	Display the adapter action as an image with events that change the image as the mouse is moved.

Adapter actions typically return one of the following values:

Value	Meaning
Button	Display the adapter action as a button
Image	Display the adapter action as an image
Anchor	Display the adapter action as a hyperlink
EventImages	Display the adapter action as an image with events that change the image as the mouse is moved.

User the server-side script DisplayStyle property to get these values from adapter fields and adapter actions.

See Also

DisplayType (see page 25249)

DisplayType (see page 25202)

135.2.32.2.2 IGetHTMLStyle.GetInputStyle Method

Returns the preferred editing style for an adapter field.

Pascal

```
function GetInputStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall AnsiString GetInputStyle(const AnsiString AAdapterMode);
```

Description

The AAdapterMode parameter can be used to request the style to be used when the adapter is a particular mode (e.g.; Browse).

Adapter fields typically return one of the following values:

Value	Meaning
TextInput	Edit the adapter field using a single line input field.
PasswordInput	Edit the adapter field as a password field.
Select	Edit the adapter field using a single selection list.
SelectMultiple	Edit the adapter field using a multiple selection list.
Radio	Edit the adapter field using radio buttons.
CheckBox	Edit the adapter field using check boxes.
TextArea	Edit the adapter field using a multi-line input field.
File	Edit the adapter field using a file upload input field.

Use the server-side script InputStyle property to get these values from adapter fields.

See Also

InputType (see page 25251)

135.2.32.2.3 IGetHTMLStyle.GetViewMode Method

Returns the preferred mode of an adapter field.

Pascal

```
function GetViewMode(const AAdapterMode: string): string;
```

C++

```
__fastcall AnsiString GetViewMode(const AnsiString AAdapterMode);
```

Description

The AAdapterMode parameter can be used to request the style to be used when the adapter is a particular mode (e.g.; Insert).

Adapter fields typically return one of the following values:

Value	Meaning
Input	Display the adapter field as an input field, by default use the style returned by the GetInputStyle (see page 19700) method.
Display	Display the adapter field as a read-only field, by default use the style returned by GetDisplayStyle (see page 19700).
ToggleOnAccess	Display as an input field in the end-user has modify rights, otherwise displays as a read-only field.

Use the server-side script ViewMode property to get these values from adapter fields.

See Also

ViewMode (see page 25252)

135.2.33 IGetProducerComponent Interface

Class Hierarchy

SiteComp.IGetProducerComponent

Pascal

```
IGetProducerComponent = interface;
```

C++

```
__interface IGetProducerComponent;
```

File

SiteComp

Description

This is class SiteComp.IGetProducerComponent.

135.2.33.1 IGetProducerComponent Members

The following tables list the members exposed by IGetProducerComponent.

Public Methods

	Name	Description
	GetProducerComponent (see page 19702)	This is GetProducerComponent, a member of class IGetProducerComponent.

135.2.33.2 IGetProducerComponent Methods

The methods of the IGetProducerComponent class are listed here.

Public Methods

	Name	Description
	GetProducerComponent (see page 19702)	This is GetProducerComponent, a member of class IGetProducerComponent.

135.2.33.2.1 IGetProducerComponent.GetProducerComponent Method

Pascal

```
function GetProducerComponent: TComponent;
```

C++

```
__fastcall TComponent * GetProducerComponent();
```

Description

This is GetProducerComponent, a member of class IGetProducerComponent.

135.2.34 IGetScriptObject Interface

Class Hierarchy

SiteComp.IGetScriptObject

Pascal

```
IGetScriptObject = interface;
```

C++

```
__interface IGetScriptObject;
```

File

SiteComp

Description

This is class SiteComp.IGetScriptObject.

135.2.34.1 IGetScriptObject Members

The following tables list the members exposed by IGetScriptObject.

Public Methods

	Name	Description
	GetScriptObject (see page 19703)	This is GetScriptObject, a member of class IGetScriptObject.

135.2.34.2 IGetScriptObject Methods

The methods of the IGetScriptObject class are listed here.

Public Methods

	Name	Description
	GetScriptObject (see page 19703)	This is GetScriptObject, a member of class IGetScriptObject.

135.2.34.2.1 IGetScriptObject.GetScriptObject Method

Pascal

```
function GetScriptObject: IInterface; deprecated;
```

C++

```
__fastcall IInterface GetScriptObject();
```

Description

This is GetScriptObject, a member of class IGetScriptObject.

135.2.35 IGetScriptObjectClassKey Interface

Class Hierarchy

SiteComp.IGetScriptObjectClassKey

Pascal

```
IGetScriptObjectClassKey = interface;
```

C++

```
__interface IGetScriptObjectClassKey;
```

File

SiteComp

Description

This is class SiteComp.IGetScriptObjectClassKey.

135.2.35.1 IGetScriptObjectClassKey Members

The following tables list the members exposed by IGetScriptObjectClassKey.

Public Methods

	Name	Description
	GetScriptObjectClassKey (see page 19704)	This is GetScriptObjectClassKey, a member of class IGetScriptObjectClassKey.

135.2.35.2 IGetScriptObjectClassKey Methods

The methods of the IGetScriptObjectClassKey class are listed here.

Public Methods

	Name	Description
	GetScriptObjectClassKey (see page 19704)	This is GetScriptObjectClassKey, a member of class IGetScriptObjectClassKey.

135.2.35.2.1 IGetScriptObjectClassKey.GetScriptObjectClassKey Method

Pascal

```
function GetScriptObjectClassKey: TClass; deprecated;
```

C++

```
__fastcall TClass GetScriptObjectClassKey();
```

Description

This is GetScriptObjectClassKey, a member of class IGetScriptObjectClassKey.

135.2.36 IGetWebAppComponents Interface

Class Hierarchy

SiteComp.IGetWebAppComponents

Pascal

```
IGetWebAppComponents = interface;
```

C++

```
__interface IGetWebAppComponents;
```

File

SiteComp

Description

This is class SiteComp.IGetWebAppComponents.

135.2.36.1 IGetWebAppComponents Members

The following tables list the members exposed by IGetWebAppComponents.

Public Methods

	Name	Description
	GetAdapterDispatcher (see page 19706)	This is GetAdapterDispatcher, a member of class IGetWebAppComponents.
	GetLocateFileService (see page 19706)	This is GetLocateFileService, a member of class IGetWebAppComponents.
	GetPageDispatcher (see page 19706)	This is GetPageDispatcher, a member of class IGetWebAppComponents.
	GetWebApplicationInfo (see page 19706)	This is GetWebApplicationInfo, a member of class IGetWebAppComponents.
	GetWebEndUser (see page 19706)	This is GetWebEndUser, a member of class IGetWebAppComponents.
	GetWebUserList (see page 19707)	This is GetWebUserList, a member of class IGetWebAppComponents.

Public Properties

	Name	Description
R	WebApplicationInfo (see page 19707)	This is WebApplicationInfo, a member of class IGetWebAppComponents.
R	WebEndUser (see page 19707)	This is WebEndUser, a member of class IGetWebAppComponents.

135.2.36.2 IGetWebAppComponents Methods

The methods of the IGetWebAppComponents class are listed here.

Public Methods

	Name	Description
	GetAdapterDispatcher (see page 19706)	This is GetAdapterDispatcher, a member of class IGetWebAppComponents.
	GetLocateFileService (see page 19706)	This is GetLocateFileService, a member of class IGetWebAppComponents.
	GetPageDispatcher (see page 19706)	This is GetPageDispatcher, a member of class IGetWebAppComponents.
	GetWebApplicationInfo (see page 19706)	This is GetWebApplicationInfo, a member of class IGetWebAppComponents.
	GetWebEndUser (see page 19706)	This is GetWebEndUser, a member of class IGetWebAppComponents.
	GetWebUserList (see page 19707)	This is GetWebUserList, a member of class IGetWebAppComponents.

135.2.36.2.1 IGetWebAppComponents.GetAdapterDispatcher Method

Pascal

```
function GetAdapterDispatcher: IAdapterDispatcher;
```

C++

```
__fastcall IAdapterDispatcher GetAdapterDispatcher();
```

Description

This is GetAdapterDispatcher, a member of class IGetWebAppComponents.

135.2.36.2.2 IGetWebAppComponents.GetLocateFileService Method

Pascal

```
function GetLocateFileService: ILocateFileService;
```

C++

```
__fastcall ILocateFileService GetLocateFileService();
```

Description

This is GetLocateFileService, a member of class IGetWebAppComponents.

135.2.36.2.3 IGetWebAppComponents.GetPageDispatcher Method

Pascal

```
function GetPageDispatcher: IPageDispatcher;
```

C++

```
__fastcall IPageDispatcher GetPageDispatcher();
```

Description

This is GetPageDispatcher, a member of class IGetWebAppComponents.

135.2.36.2.4 IGetWebAppComponents.GetWebApplicationInfo Method

Pascal

```
function GetWebApplicationInfo: IWebApplicationInfo;
```

C++

```
__fastcall IWebApplicationInfo GetWebApplicationInfo();
```

Description

This is GetWebApplicationInfo, a member of class IGetWebAppComponents.

135.2.36.2.5 IGetWebAppComponents.GetWebEndUser Method

Pascal

```
function GetWebEndUser: IWebEndUser;
```

C++

```
__fastcall IWebEndUser GetWebEndUser();
```

Description

This is GetWebEndUser, a member of class IGetWebAppComponents.

135.2.36.2.6 IGetWebAppComponents.GetWebUserList Method

Pascal

```
function GetWebUserList: IWebUserList;
```

C++

```
__fastcall IWebUserList GetWebUserList();
```

Description

This is GetWebUserList, a member of class IGetWebAppComponents.

135.2.36.3 IGetWebAppComponents Properties

The properties of the IGetWebAppComponents class are listed here.

Public Properties

	Name	Description
	WebApplicationInfo (see page 19707)	This is WebApplicationInfo, a member of class IGetWebAppComponents.
	WebEndUser (see page 19707)	This is WebEndUser, a member of class IGetWebAppComponents.

135.2.36.3.1 IGetWebAppComponents.WebApplicationInfo Property

Pascal

```
property WebApplicationInfo: IWebApplicationInfo;
```

C++

```
__property IWebApplicationInfo WebApplicationInfo;
```

Description

This is WebApplicationInfo, a member of class IGetWebAppComponents.

135.2.36.3.2 IGetWebAppComponents.WebEndUser Property

Pascal

```
property WebEndUser: IWebEndUser;
```

C++

```
__property IWebEndUser WebEndUser;
```

Description

This is WebEndUser, a member of class IGetWebAppComponents.

135.2.37 IIDEFileManager Interface

Class Hierarchy

SiteComp.IIDEFileManager

Pascal

```
IIDEFileManager = interface;
```

C++

```
__interface IIDEFileManager;
```

File

SiteComp

Description

This is class SiteComp.IIDEFileManager.

135.2.37.1 IIDEFileManager Members

The following tables list the members exposed by IIDEFileManager.

Public Methods

	Name	Description
	SearchFile (see page 19708)	This is SearchFile, a member of class IIDEFileManager.

135.2.37.2 IIDEFileManager Methods

The methods of the IIDEFileManager class are listed here.

Public Methods

	Name	Description
	SearchFile (see page 19708)	This is SearchFile, a member of class IIDEFileManager.

135.2.37.2.1 IIDEFileManager.SearchFile Method

Pascal

```
function SearchFile(const AFileName: string): string;
```

C++

```
__fastcall AnsiString SearchFile(const AnsiString AFileName);
```

Description

This is SearchFile, a member of class IIDEFileManager.

135.2.38 IImageProducer Interface

IImageProducer is the interface for accessing the image that an adapter component supplies.

Class Hierarchy

SiteComp.IImageProducer

Pascal

```
IImageProducer = interface;
```

C++

```
__interface IImageProducer;
```

File

SiteComp

Description

IImageProducer is the interface used to access the object that supplies an image to server-side script in a WebSnap application. It defines a single method, GetAdapterImage (see page 19710), which returns the interface of the object that is responsible for providing the image. That object may generate the image, or it may simply generate an HREF that addresses the object that generates the image.

Note that IImageProducer introduces an extra level of indirection when fetching images. IImageProducer is not necessarily the interface of the object that provides the image, it merely retrieves that interface. The reason for this indirection is because the object that implements IImageProducer may work with multiple adapter fields that produce a variety of images, depending on the supplied caption.

Note: In C++, method declarations that use IImageProducer use the _di_IImageProducer type instead. This type is a DelphiInterface wrapper around the IImageProducer interface:

Note: typedef System::DelphiInterface (see page 22167)< IImageProducer > _di_IImageProducer;

See Also

IActionImageProducer (see page 19646)

TDataSetAdapterImageField (see page 8138)

TAdapterImageField (see page 23869)

135.2.38.1 IImageProducer Members

The following tables list the members exposed by IImageProducer.

Public Methods

	Name	Description
	GetAdapterImage (see page 19710)	This is GetAdapterImage, a member of class IImageProducer.

135.2.38.2 IImageProducer Methods

The methods of the IImageProducer class are listed here.

Public Methods

	Name	Description
	GetAdapterImage (see page 19710)	This is GetAdapterImage, a member of class IImageProducer.

135.2.38.2.1 IImageProducer.GetAdapterImage Method

Pascal

```
function GetAdapterImage(const AComponentName: string; const ACaption: WideString): TObject;
```

C++

```
__fastcall TObject * GetAdapterImage(const AnsiString AComponentName, const BSTR ACaption);
```

Description

This is GetAdapterImage, a member of class IImageProducer.

135.2.39 IInternetEnvOptions Interface

Class Hierarchy

SiteComp.IInternetEnvOptions

Pascal

```
IInternetEnvOptions = interface;
```

C++

```
__interface IInternetEnvOptions;
```

File

SiteComp

Description

This is class SiteComp.IInternetEnvOptions.

135.2.39.1 IInternetEnvOptions Members

The following tables list the members exposed by IInternetEnvOptions.

Public Methods

	Name	Description
	GetDisableDebugging (see page 19711)	This is GetDisableDebugging, a member of class IInternetEnvOptions.
	GetHTMLExt (see page 19711)	This is GetHTMLExt, a member of class IInternetEnvOptions.
	GetSampleImageFile (see page 19711)	This is GetSampleImageFile, a member of class IInternetEnvOptions.
	GetScriptTimeoutSecs (see page 19712)	This is GetScriptTimeoutSecs, a member of class IInternetEnvOptions.

Public Properties

	Name	Description
R	DisableDebugger (see page 19712)	This is DisableDebugger, a member of class IInternetEnvOptions.
R	HTMLExt (see page 19712)	This is HTMLExt, a member of class IInternetEnvOptions.
R	SampleImageFile (see page 19712)	This is SampleImageFile, a member of class IInternetEnvOptions.
R	ScriptTimeoutSecs (see page 19713)	This is ScriptTimeoutSecs, a member of class IInternetEnvOptions.

135.2.39.2 IInternetEnvOptions Methods

The methods of the IInternetEnvOptions class are listed here.

Public Methods

	Name	Description
	GetDisableDebugging (see page 19711)	This is GetDisableDebugging, a member of class IInternetEnvOptions.
	GetHTMLExt (see page 19711)	This is GetHTMLExt, a member of class IInternetEnvOptions.
	GetSampleImageFile (see page 19711)	This is GetSampleImageFile, a member of class IInternetEnvOptions.
	GetScriptTimeoutSecs (see page 19712)	This is GetScriptTimeoutSecs, a member of class IInternetEnvOptions.

135.2.39.2.1 IInternetEnvOptions.GetDisableDebugging Method

Pascal

```
function GetDisableDebugging: Boolean;
```

C++

```
__fastcall Boolean GetDisableDebugging();
```

Description

This is GetDisableDebugging, a member of class IInternetEnvOptions.

135.2.39.2.2 IInternetEnvOptions.GetHTMLExt Method

Pascal

```
function GetHTMLExt: string;
```

C++

```
__fastcall AnsiString GetHTMLExt();
```

Description

This is GetHTMLExt, a member of class IInternetEnvOptions.

135.2.39.2.3 IInternetEnvOptions.GetSampleImageFile Method

Pascal

```
function GetSampleImageFile: string;
```

C++

```
__fastcall AnsiString GetSampleImageFile();
```

Description

This is GetSampleImageFile, a member of class IInternetEnvOptions.

135.2.39.2.4 IInternetEnvOptions.GetScriptTimeoutSecs Method

Pascal

```
function GetScriptTimeoutSecs: Integer;
```

C++

```
__fastcall int GetScriptTimeoutSecs();
```

Description

This is GetScriptTimeoutSecs, a member of class IInternetEnvOptions.

135.2.39.3 IInternetEnvOptions Properties

The properties of the IInternetEnvOptions class are listed here.

Public Properties

	Name	Description
R	DisableDebugger (see page 19712)	This is DisableDebugger, a member of class IInternetEnvOptions.
R	HTMLExt (see page 19712)	This is HTMLExt, a member of class IInternetEnvOptions.
R	SampleImageFile (see page 19712)	This is SampleImageFile, a member of class IInternetEnvOptions.
R	ScriptTimeoutSecs (see page 19713)	This is ScriptTimeoutSecs, a member of class IInternetEnvOptions.

135.2.39.3.1 IInternetEnvOptions.DisableDebugger Property

Pascal

```
property DisableDebugger: Boolean;
```

C++

```
__property Boolean DisableDebugger;
```

Description

This is DisableDebugger, a member of class IInternetEnvOptions.

135.2.39.3.2 IInternetEnvOptions.HTMLExt Property

Pascal

```
property HTMLExt: string;
```

C++

```
__property AnsiString HTMLExt;
```

Description

This is HTMLExt, a member of class IInternetEnvOptions.

135.2.39.3.3 IInternetEnvOptions.SampleImageFile Property

Pascal

```
property SampleImageFile: string;
```

C++

```
__property AnsiString SampleImageFile;
```

Description

This is SampleImageFile, a member of class IInternetEnvOptions.

135.2.39.3.4 IInternetEnvOptions.ScriptTimeoutSecs Property

Pascal

```
property ScriptTimeoutSecs: Integer;
```

C++

```
__property int ScriptTimeoutSecs;
```

Description

This is ScriptTimeoutSecs, a member of class IInternetEnvOptions.

135.2.40 IInternetExecuteScript Interface

Class Hierarchy

SiteComp.IInternetExecuteScript

Pascal

```
IInternetExecuteScript = interface;
```

C++

```
__interface IInternetExecuteScript;
```

File

SiteComp

Description

This is class SiteComp.IInternetExecuteScript.

135.2.40.1 IInternetExecuteScript Members

The following tables list the members exposed by IInternetExecuteScript.

Public Methods

	Name	Description
	CanExecuteScript (see page 19714)	This is CanExecuteScript, a member of class IInternetExecuteScript.
	ExecuteScript (see page 19714)	This is ExecuteScript, a member of class IInternetExecuteScript.

135.2.40.2 IInternetExecuteScript Methods

The methods of the IInternetExecuteScript class are listed here.

Public Methods

	Name	Description
	CanExecuteScript (see page 19714)	This is CanExecuteScript, a member of class IInternetExecuteScript.
	ExecuteScript (see page 19714)	This is ExecuteScript, a member of class IInternetExecuteScript.

135.2.40.2.1 IInternetExecuteScript.CanExecuteScript Method

Pascal

```
function CanExecuteScript(AContext: IUnknown): Boolean;
```

C++

```
__fastcall Boolean CanExecuteScript(IUnknown AContext);
```

Description

This is CanExecuteScript, a member of class IInternetExecuteScript.

135.2.40.2.2 IInternetExecuteScript.ExecuteScript Method

Pascal

```
procedure ExecuteScript(AContext: IUnknown);
```

C++

```
__fastcall ExecuteScript(IUnknown AContext);
```

Description

This is ExecuteScript, a member of class IInternetExecuteScript.

135.2.41 IInternetFileTypes Interface

Class Hierarchy

SiteComp.IInternetFileTypes

Pascal

```
IInternetFileTypes = interface;
```

C++

```
__interface IInternetFileTypes;
```

File

SiteComp

Description

This is class SiteComp.IInternetFileTypes.

135.2.41.1 IInternetFileTypes Members

The following tables list the members exposed by IInternetFileTypes.

Public Methods

	Name	Description
	FindFileExt (see page 19715)	This is FindFileExt, a member of class IInternetFileTypes.

135.2.41.2 IInternetFileTypes Methods

The methods of the IInternetFileTypes class are listed here.

Public Methods

	Name	Description
	FindFileExt (see page 19715)	This is FindFileExt, a member of class IInternetFileTypes.

135.2.41.2.1 IInternetFileTypes.FindFileExt Method

Pascal

```
function FindFileExt(const AFileExt: string): TAbstractInetFileType;
```

C++

```
__fastcall TAbstractInetFileType FindFileExt(const AnsiString AFileExt);
```

Description

This is FindFileExt, a member of class IInternetFileTypes.

135.2.42 IInternetScriptDebugger Interface

Class Hierarchy

SiteComp.IInternetScriptDebugger

Pascal

```
IInternetScriptDebugger = interface;
```

C++

```
__interface IInternetScriptDebugger;
```

File

SiteComp

Description

This is class SiteComp.IInternetScriptDebugger.

135.2.42.1 IInternetScriptDebugger Members

The following tables list the members exposed by IInternetScriptDebugger.

Public Methods

	Name	Description
	CanDebugScript (see page 19716)	This is CanDebugScript, a member of class IInternetScriptDebugger.
	DebugScript (see page 19716)	This is DebugScript, a member of class IInternetScriptDebugger.

135.2.42.2 IInternetScriptDebugger Methods

The methods of the IInternetScriptDebugger class are listed here.

Public Methods

	Name	Description
	CanDebugScript (see page 19716)	This is CanDebugScript, a member of class IInternetScriptDebugger.
	DebugScript (see page 19716)	This is DebugScript, a member of class IInternetScriptDebugger.

135.2.42.2.1 IInternetScriptDebugger.CanDebugScript Method

Pascal

```
function CanDebugScript(AContext: IUnknown): Boolean;
```

C++

```
__fastcall Boolean CanDebugScript(IUnknown AContext);
```

Description

This is CanDebugScript, a member of class IInternetScriptDebugger.

135.2.42.2.2 IInternetScriptDebugger.DebugScript Method

Pascal

```
procedure DebugScript(AContext: IUnknown);
```

C++

```
__fastcall DebugScript(IUnknown AContext);
```

Description

This is DebugScript, a member of class IInternetScriptDebugger.

135.2.43 IIsAdapterActionList Interface

Class Hierarchy

SiteComp.IIsAdapterActionList

Pascal

```
IIsAdapterActionList = interface;
```

C++

```
__interface IIsAdapterActionList;
```

File

SiteComp

Description

This is class SiteComp.IIsAdapterActionList.

135.2.43.1 IIsAdapterActionList Members

The following tables list the members exposed by IIsAdapterActionList.

Public Methods

	Name	Description
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.

Public Properties

	Name	Description
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.

135.2.43.2 IIsAdapterActionList Methods

The methods of the IIsAdapterActionList class are listed here.

Public Methods

	Name	Description
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.

135.2.43.2.1 IIsAdapterActionList.GetIsAdapterActionList Method

Pascal

```
function GetIsAdapterActionList: Boolean;
```

C++

```
__fastcall Boolean GetIsAdapterActionList();
```

Description

This is GetIsAdapterActionList, a member of class IIsAdapterActionList.

135.2.43.3 IIsAdapterActionList Properties

The properties of the IIsAdapterActionList class are listed here.

Public Properties

	Name	Description
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.

135.2.43.3.1 IIsAdapterActionList.IsAdapterActionList Property

Pascal

```
property IsAdapterActionList: Boolean;
```

C++

```
__property Boolean IsAdapterActionList;
```

Description

This is IsAdapterActionList, a member of class IIsAdapterActionList.

135.2.44 IIterateIntfSupport Interface

Class Hierarchy

Pascal

```
IIterateIntfSupport = interface(IIteratorSupport);
```

C++

```
__interface IIterateIntfSupport : public IIteratorSupport;
```

File

SiteComp

Description

This is class SiteComp.IIterateIntfSupport.

135.2.44.1 IIterateIntfSupport Members

The following tables list the members exposed by IIterateIntfSupport.

Public Methods

	Name	Description
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	GetCurrentIntf (see page 19718)	This is GetCurrentIntf, a member of class IIterateIntfSupport.
	NextIteration (see page 19723)	Advances to the objects next item.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.

135.2.44.2 IIterateIntfSupport Methods

The methods of the IIterateIntfSupport class are listed here.

Public Methods

	Name	Description
	GetCurrentIntf (see page 19718)	This is GetCurrentIntf, a member of class IIterateIntfSupport.

135.2.44.2.1 IIterateIntfSupport.GetCurrentIntf Method

Pascal

```
function GetCurrentIntf(OwnerData: Pointer): IUnknown;
```

C++

```
__fastcall IUnknown GetCurrentIntf(void * OwnerData);
```

Description

This is GetCurrentIntf, a member of class IIterateIntfSupport.

135.2.45 IIterateObjectSupport Interface

Class Hierarchy

Pascal

```
IIterateObjectSupport = interface(IIteratorSupport);
```

C++

```
__interface IIterateObjectSupport : public IIteratorSupport;
```

File

SiteComp

Description

This is class SiteComp.IIterateObjectSupport.

135.2.45.1 IIterateObjectSupport Members

The following tables list the members exposed by IIterateObjectSupport.

Public Methods

	Name	Description
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	NextIteration (see page 19723)	Advances to the objects next item.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.

135.2.45.2 IIterateObjectSupport Methods

The methods of the IIterateObjectSupport class are listed here.

Public Methods

	Name	Description
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.

135.2.45.2.1 IIterateObjectSupport.GetCurrentObject Method

Pascal

```
function GetCurrentObject(OwnerData: Pointer): TObject;
```

C++

```
__fastcall TObject * GetCurrentObject(void * OwnerData);
```

Description

This is GetCurrentObject, a member of class IIterateObjectSupport.

135.2.46 IIteratorIndex Interface

IIteratorIndex is the interface that indicates where an object is positioned when it is iterating over its subitems.

Class Hierarchy

SiteComp.IIteratorIndex

Pascal

```
IIteratorIndex = interface;
```

C++

```
__interface IIteratorIndex;
```

File

SiteComp

Description

Server-side script uses the IIteratorIndex interface to detect when an object is in the middle of an enumeration, and if it is, to determine the item on which the object is positioned. This interface is used in conjunction with the IIteratorSupport (see page 19722) interface to enable server-side script to iterate over the items of an adapter or one of its sub-components.

Note: In C++, method declarations that use IIteratorIndex use the _di_IIteratorIndex type instead. This type is a DelphiInterface wrapper around the IIteratorIndex interface:

Note: typedef System::DelphiInterface (see page 22167)< IIteratorIndex > _di_IIteratorIndex;

See Also

IIteratorSupport (see page 19722)

135.2.46.1 IIteratorIndex Members

The following tables list the members exposed by IIteratorIndex.

Public Methods

	Name	Description
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.

Public Properties

	Name	Description
R	IteratorIndex (see page 19721)	Indicates the index of the current item.

135.2.46.2 IIteratorIndex Methods

The methods of the IIteratorIndex class are listed here.

Public Methods

	Name	Description
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.

135.2.46.2.1 IIteratorIndex.GetIteratorIndex Method

Returns the value of the IteratorIndex (see page 19721) property.

Pascal

```
function GetIteratorIndex: Integer;
```

C++

```
__fastcall int GetIteratorIndex();
```

Description

GetIteratorIndex is the read implementation for the IteratorIndex (see page 19721) property.

See Also

IteratorIndex (see page 19721)

135.2.46.2.2 IIteratorIndex.InIterator Method

Indicates whether the object is iterating over its items.

Pascal

```
function InIterator: Boolean;
```

C++

```
__fastcall Boolean InIterator();
```

Description

InIterator returns true if the object is iterating over its items. It returns false if an iteration never started or if an iteration process finished. When InIterator returns false, the current position of the object is indeterminate. In this case, the IteratorIndex (see page 19721) property's value can't be used.

See Also

InIterator (see page 24172)

IIteratorSupport (see page 19722)

135.2.46.3 IIteratorIndex Properties

The properties of the IIteratorIndex class are listed here.

Public Properties

	Name	Description
R	IteratorIndex (see page 19721)	Indicates the index of the current item.

135.2.46.3.1 IIteratorIndex.IteratorIndex Property

Indicates the index of the current item.

Pascal

```
property IteratorIndex: Integer;
```

C++

```
__property int IteratorIndex;
```

Description

IteratorIndex indicates the index of the current item when the object is iterating over its items. When IteratorIndex is 0, the object is positioned on its first item; When IteratorIndex is 1, the object is positioned on its second item, and so on.

When the object is not iterating over its items (when the InIterator (see page 19721) method returns false), the value of IteratorIndex is undefined.

See Also

InIterator (see page 19721)

135.2.47 IIteratorSupport Interface

IIteratorSupport is the interface that allows server-side script to iterate over the items of an adapter or one of its child objects.

Class Hierarchy

Pascal

```
IIteratorSupport = interface;
```

C++

```
__interface IIteratorSupport;
```

File

SiteComp

Description

Server-side script uses the IIteratorSupport interface to enumerate the items of an adapter or one of its sub-components. When the server-side script includes an enumerator, the WebSnap application automatically generates calls to the IIteratorSupport methods of the object that contains the items to enumerate.

The WebSnap application first calls the StartIterator (see page 19724) method to position the object on its first item. To advance to the next item, the application calls the NextIteration (see page 19723) method. Finally, the application calls the EndIterator (see page 19723) method to signal the end of the iteration.

Each object that implements IIteratorSupport determines the items over which it iterates. For example, if the object is an adapter, these can be records or pages that the adapter uses to group information, or name/value pairs that the adapter represents. If the object is a list of fields or actions, these can be the fields or actions in the list. If the object is an adapter field, these can be the possible values of the field. If the object is an adapter action, these can be the commands the action can execute.

Note: In C++, method declarations that use IIteratorSupport use the _di_IIteratorSupport type instead. This type is a DelphiInterface wrapper around the IIteratorSupport interface:

Note: typedef System::DelphiInterface (see page 22167)< IIteratorSupport > _di_IIteratorSupport;

See Also

IIteratorIndex (see page 19720)

135.2.47.1 IIteratorSupport Members

The following tables list the members exposed by IIteratorSupport.

Public Methods

	Name	Description
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	NextIteration (see page 19723)	Advances to the objects next item.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.

135.2.47.2 IIteratorSupport Methods

The methods of the IIteratorSupport class are listed here.

Public Methods

	Name	Description
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	NextIteration (see page 19723)	Advances to the objects next item.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.

135.2.47.2.1 IIteratorSupport.EndIterator Method

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

This is EndIterator, a member of class IIteratorSupport.

135.2.47.2.2 IIteratorSupport.NextIteration Method

Advances to the objects next item.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

Server-side script calls NextIteration to move to the next item.

OwnerData is a pointer to information that the object can use to influence the iteration process. Each object stores and uses this information in its own way. This information is first supplied by the initial call to the StartIterator (see page 19724) method. NextIteration can modify the information, after which it is supplied to the next call to the NextIteration or EndIterator (see page 19723) method.

NextIteration returns true if it successfully moves to the next item, false if there were no more items.

See Also

startiterator (see page 19724)

enditerator (see page 19723)

135.2.47.2.3 IIteratorSupport.StartIterator Method

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

This is StartIterator, a member of class IIteratorSupport.

135.2.48 INotifyAdapterChange Interface

INotifyAdapterChange is the interface that allows objects to respond when an adapter changes.

Class Hierarchy

SiteComp.INotifyAdapterChange

Pascal

```
INotifyAdapterChange = interface;
```

C++

```
__interface INotifyAdapterChange;
```

File

SiteComp

Description

Objects that depend on the fields, actions, or properties of an adapter implement the INotifyAdapterChange interface so that the adapter can notify them of changes. They register an interest in such notifications using the adapter's INotifyList (see page 19725) interface. Then, when the adapter changes, it uses this interface to inform them of the change. They can remove themselves from the adapter's notification list using the INotifyList (see page 19725) interface.

See Also

TCustomAdapter

TCustomAdapter

INotifyList (see page 19725)

135.2.48.1 INotifyAdapterChange Members

The following tables list the members exposed by INotifyAdapterChange.

Public Methods

	Name	Description
	NotifyAdapterChange (see page 19725)	Responds when the adapter changes.

135.2.48.2 INotifyAdapterChange Methods

The methods of the INotifyAdapterChange class are listed here.

Public Methods

	Name	Description
	NotifyAdapterChange (see page 19725)	Responds when the adapter changes.

135.2.48.2.1 INotifyAdapterChange.NotifyAdapterChange Method

Responds when the adapter changes.

Pascal

```
procedure NotifyAdapterChange(Sender: TComponent);
```

C++

```
__fastcall NotifyAdapterChange(TComponent * Sender);
```

Description

NotifyAdapterChange is the method objects implement to respond when the associated adapter changes.

Sender is the adapter component that changed.

135.2.49 INotifyList Interface

INotifyList is the interface that allows objects to register and unregister an interest in changes to a component.

Class Hierarchy

SiteComp.INotifyList

Pascal

```
INotifyList = interface;
```

C++

```
__interface INotifyList;
```

File

SiteComp

Description

WebSnap components that let other objects register interest in their changes implement INotifyList. When another object wants to be informed of changes, it calls the AddNotify (see page 19726) method. Then, when the component that implements INotifyList changes, it informs all of the objects that have called AddNotify (see page 19726) of the change. When an object wants to unregister its interest, it calls the RemoveNotify (see page 19726) method.

See Also

TNotifyList (see page 19636)

135.2.49.1 INotifyList Members

The following tables list the members exposed by INotifyList.

Public Methods

	Name	Description
	AddNotify (see page 19726)	Registers an interest in change notifications.
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.

135.2.49.2 INotifyList Methods

The methods of the INotifyList class are listed here.

Public Methods

	Name	Description
	AddNotify (see page 19726)	Registers an interest in change notifications.
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.

135.2.49.2.1 INotifyList.AddNotify Method

Registers an interest in change notifications.

Pascal

```
procedure AddNotify(ANotify: TObject);
```

C++

```
__fastcall AddNotify(TObject * ANotify);
```

Description

Call AddNotify to register an interest in change notifications. After a call to AddNotify, the object is notified every time the component changes, until it unregisters its interest by a call to the RemoveNotify (see page 19726) method.

ANotify is the object to notify of changes. It should implement an interface that allows the notifying component to call it when changes occur. What interface this is depends on the component that implements INotifyList (see page 19725).

See Also

RemoveNotify (see page 19726)

135.2.49.2.2 INotifyList.RemoveNotify Method

Unregisters interest in change notifications.

Pascal

```
procedure RemoveNotify(ANotify: TObject);
```

C++

```
__fastcall RemoveNotify(TObject * ANotify);
```

Description

Call RemoveNotify to unregister interest in change notifications. After a call to RemoveNotify, the object is no longer notified when the component changes.

ANotify is the object to unregister. It must be an object that previously registered interest by calling the AddNotify (see page 19726) method.

See Also

AddNotify (see page 19726)

135.2.50 IPageDispatcher Interface

IPageDispatcher is the interface for interacting with the page dispatcher.

Class Hierarchy

Pascal

```
IPageDispatcher = interface(IWebRequestHandler);
```

C++

```
__interface IPageDispatcher : public IWebRequestHandler;
```

File

SiteComp

Description

The TPageDispatcher component implements IPageDispatcher. This interface, which the TWebAppComponents object publishes, allows the WebSnap application to dispatch request messages. The request messages identify a target Web page using the pathinfo portion of their target URL. If the request is not addressed to an URL with a pathinfo portion, the IPageDispatcher forwards the request to the Web page module identified by the DefaultPageName (see page 19731) property.

In addition to dispatching requests for Web pages, IPageDispatcher includes methods that check whether the current user needs to log in, check whether the current user has rights to view the requested page, and to redirect requests.

Note: In C++, method declarations that use IPageDispatcher use the _di_IPageDispatcher type instead. This type is a DelphiInterface wrapper around the IPageDispatcher interface:

Note: typedef System::DelphiInterface (see page 22167)< IPageDispatcher > _di_IPageDispatcher;

See Also

TPageDispatcher (see page 24949)

TCustomWebAppComponents (see page 24906)

TWebAPpComponents

135.2.50.1 IPageDispatcher Members

The following tables list the members exposed by IPageDispatcher.

Public Methods

	Name	Description
	DispatchPageName (see page 19728)	Checks whether a specified user has a given access rights string.
	GetCanView (see page 19729)	Indicates whether the current user is permitted to view a specified Web page.
	GetDefaultPageName (see page 19729)	Returns the value of the DefaultPageName (see page 19731) property.
	GetLoginRequired (see page 19729)	Indicates whether a user must log in before accessing a specified Web page.
	HandleRequest (see page 15238)	Processes an HTTP request message.
	PageNameOfRequest (see page 19730)	Returns the name of the Web page to which an HTTP request is addressed.
	RedirectToPageName (see page 19730)	Fills out a response message so that it redirects the caller to another page in the application.

Public Properties

	Name	Description
R	DefaultPageName (see page 19731)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

135.2.50.2 IPageDispatcher Methods

The methods of the IPageDispatcher class are listed here.

Public Methods

	Name	Description
	DispatchPageName (see page 19728)	Checks whether a specified user has a given access rights string.
	GetCanView (see page 19729)	Indicates whether the current user is permitted to view a specified Web page.
	GetDefaultPageName (see page 19729)	Returns the value of the DefaultPageName (see page 19731) property.
	GetLoginRequired (see page 19729)	Indicates whether a user must log in before accessing a specified Web page.
	PageNameOfRequest (see page 19730)	Returns the name of the Web page to which an HTTP request is addressed.
	RedirectToPageName (see page 19730)	Fills out a response message so that it redirects the caller to another page in the application.

135.2.50.2.1 IPageDispatcher.DispatchPageName Method

Checks whether a specified user has a given access rights string.

Pascal

```
function DispatchPageName(const APageName: string; AResponse: TWebResponse; AFlags:
TDispatchPageFlags): Boolean;
```

C++

```
__fastcall Boolean DispatchPageName(const AnsiString APageName, TWebResponse AResponse,
TDispatchPageFlags AFlags);
```

Description

Call DispatchPageName to fill out a response message with the Web page that a specified Web page module provides. DispatchPageName locates the Web page module that produces the requested Web page and uses it to fill out the content of a response object.

APageName is the name of the Web page to fetch. If APageName is an empty string, DispatchPageName uses the first Web page module that is registered with the current Web context.

AResponse is the response object whose Content property receives the requested Web page.

AFlags indicates the attributes that must be present on the Web page module. For example, if AFlags includes dpPublished, APageName must specify a published Web page module or the page dispatcher won't fetch the Web page.

DispatchPageName returns true if it successfully fetches the requested page, false if it fails to obtain the requested page.

See Also

RedirectToPageName (see page 19730)

HandleRequest (see page 15238)

Content (see page 15207)

WebContext (see page 24687)

135.2.50.2.2 IPageDispatcher.GetCanView Method

Indicates whether the current user is permitted to view a specified Web page.

Pascal

```
function GetCanView(const APageName: string): Boolean;
```

C++

```
__fastcall Boolean GetCanView(const AnsiString APageName);
```

Description

Call GetCanView to check whether the current user should be allowed to view a specified Web page. Typically, this method is called after the user logs in.

APageName is the name of the Web page the user wants to view.

See Also

GetLoginRequired (see page 19729)

HasViewRights (see page 24676)

OnCanViewPage (see page 24903)

135.2.50.2.3 IPageDispatcher.GetDefaultPageName Method

Returns the value of the DefaultPageName (see page 19731) property.

Pascal

```
function GetDefaultPageName: string;
```

C++

```
__fastcall AnsiString GetDefaultPageName();
```

Description

GetDefaultPageName is the read implementation of the DefaultPageName (see page 19731) property.

See Also

DefaultPageName (see page 19731)

135.2.50.2.4 IPageDispatcher.GetLoginRequired Method

Indicates whether a user must log in before accessing a specified Web page.

Pascal

```
function GetLoginRequired(const APageName: string): Boolean;
```

C++

```
__fastcall Boolean GetLoginRequired(const AnsiString APageName);
```

Description

Call GetLoginRequired to check whether users must log in before accessing a specified Web page. GetLoginRequired can check the Web page information object for the target Web page, but can also use other means (such as an event handler) to obtain this information.

APageName is the name of the Web page to check whether it requires users to first log in.

See Also

GetCanView (see page 19729)

IsLoginRequired

OnIsLoginRequired (see page 24904)

135.2.50.2.5 IPageDispatcher.PageNameOfRequest Method

Returns the name of the Web page to which an HTTP request is addressed.

Pascal

```
function PageNameOfRequest(ARequest: TWebRequest): string;
```

C++

```
__fastcall AnsiString PageNameOfRequest(TWebRequest ARequest);
```

Description

Call PageNameOfRequest to obtain the name of the Web page that a request message is trying to fetch.

ARequest is the request object that describes the HTTP request message.

PageNameOfRequest returns the last string in the path info portion of the request message's target URL.

See Also

DefaultPageName (see page 19731)

135.2.50.2.6 IPageDispatcher.RedirectToPageName Method

Fills out a response message so that it redirects the caller to another page in the application.

Pascal

```
function RedirectToPageName(const APageName: string; AParams: TStrings; AResponse:
TWebResponse; AFlags: TDispatchPageFlags): Boolean;
```

C++

```
__fastcall Boolean RedirectToPageName(const AnsiString APageName, TStrings AParams,
TWebResponse AResponse, TDispatchPageFlags AFlags);
```

Description

Call RedirectToPageName to generate a response that redirects the caller to another Web page in the WebSnap application.

APageName is the name of the Web page to which the request should be redirected. If APageName is an empty string, RedirectToPageName uses the first Web page module that is registered with the current Web context.

AParams is a string list containing application-defined name-value pairs. These name-value pairs supply the query fields of the redirected request message, and are added to the URL that is the target of the SendRedirect call.

AResponse is the response object that the WebSnap uses to make the SendRedirect call.

AFlags indicates the attributes that must be present on the Web page module to which the current request is redirected. For example, if AFlags includes dpPublished, APageName must specify a published Web page module.

RedirectToPageName returns true if it successfully redirects to the specified page.

See Also

DispatchPageName (see page 19728)

HandleRequest (see page 15238)

Content (see page 15207)

WebContext (see page 24687)

135.2.50.3 IPageDispatcher Properties

The properties of the IPageDispatcher class are listed here.

Public Properties

	Name	Description
R	DefaultPageName (see page 19731)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

135.2.50.3.1 IPageDispatcher.DefaultPageName Property

Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

Pascal

```
property DefaultPageName: string;
```

C++

```
__property AnsiString DefaultPageName;
```

Description

DefaultPageName is the name of the registered Web page module that should handle incoming request messages that do not have a pathinfo portion on their target URL. This is the name that is supplied to the Web page module wizard when you created the default Web page module. It forms the basis of that Web page module's class name. For example, if the default Web page module has the name MyDefaultPage, the Web page module class is of type TMyDefaultPage.

If DefaultPageName is an empty string, the page dispatcher uses the Web application module as a default Web page module, as long as it is a TWebAppPageModule object.

See Also

DispatchPageName (see page 19728)

TWebAppPageModule (see page 25394)

135.2.51 IPageResult Interface

Class Hierarchy

SiteComp.IPageResult

Pascal

```
IPageResult = interface;
```

C++

```
__interface IPageResult;
```

File

SiteComp

Description

This is class SiteComp.IPageResult.

135.2.51.1 IPageResult Members

The following tables list the members exposed by IPageResult.

Public Methods

	Name	Description
	DispatchPage (see page 19732)	This is DispatchPage, a member of class IPageResult.
	IncludePage (see page 19733)	This is IncludePage, a member of class IPageResult.
	RedirectToPage (see page 19733)	This is RedirectToPage, a member of class IPageResult.

135.2.51.2 IPageResult Methods

The methods of the IPageResult class are listed here.

Public Methods

	Name	Description
	DispatchPage (see page 19732)	This is DispatchPage, a member of class IPageResult.
	IncludePage (see page 19733)	This is IncludePage, a member of class IPageResult.
	RedirectToPage (see page 19733)	This is RedirectToPage, a member of class IPageResult.

135.2.51.2.1 IPageResult.DispatchPage Method

Pascal

```
function DispatchPage(const APageName: string; AWebResponse: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DispatchPage(const AnsiString APageName, TWebResponse AWebResponse);
```

Description

This is DispatchPage, a member of class IPageResult.

135.2.51.2.2 IPageResult.IncludePage Method

Pascal

```
function IncludePage(const APageName: string; var AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream IncludePage(const AnsiString APageName, Boolean AOwned);
```

Description

This is IncludePage, a member of class IPageResult.

135.2.51.2.3 IPageResult.RedirectToPage Method

Pascal

```
function RedirectToPage(const APageName: string; AParams: TStrings; AWebResponse:
TWebResponse): Boolean;
```

C++

```
__fastcall Boolean RedirectToPage(const AnsiString APageName, TStrings AParams, TWebResponse
AWebResponse);
```

Description

This is RedirectToPage, a member of class IPageResult.

135.2.52 ISessionsService Interface

ISessionsService is the interface for controlling a TSessionsService object.

Class Hierarchy

SiteComp.ISessionsService

Pascal

```
ISessionsService = interface;
```

C++

```
__interface ISessionsService;
```

File

SiteComp

Description

The TSessionsService component implements ISessionsService. Most applications do not need to use this interface directly. Instead, the TWebAppComponents component uses this interface to drive the orderly management of sessions. In addition, Web session objects (TWebSession) use this interface to update the sessions service when they are terminated.

Note: In C++, method declarations that use ISessionsService use the _di_ISessionsService type instead. This type is a DelphiInterface wrapper around the ISessionsService interface:

Note: typedef System::DelphiInterface (see page 22167)< ISessionsService > _di_ISessionsService;

See Also

TSessionsService (see page 25582)

TWebAppComponents (see page 24958)

TWebSession (see page 24968)

135.2.52.1 ISessionsService Members

The following tables list the members exposed by ISessionsService.

Public Methods

	Name	Description
	CheckStatusChange (see page 19734)	Checks whether any sessions have started or terminated.
	Clear (see page 19734)	Deletes all sessions from memory.
	NewSession (see page 19735)	Starts a new session.
	NotifyStatusChange (see page 19735)	Generates an OnEndSession or OnStartSession event, as approrpriate.

135.2.52.2 ISessionsService Methods

The methods of the ISessionsService class are listed here.

Public Methods

	Name	Description
	CheckStatusChange (see page 19734)	Checks whether any sessions have started or terminated.
	Clear (see page 19734)	Deletes all sessions from memory.
	NewSession (see page 19735)	Starts a new session.
	NotifyStatusChange (see page 19735)	Generates an OnEndSession or OnStartSession event, as approrpriate.

135.2.52.2.1 ISessionsService.CheckStatusChange Method

Checks whether any sessions have started or terminated.

Pascal

```
function CheckStatusChange: Boolean;
```

C++

```
__fastcall Boolean CheckStatusChange();
```

Description

CheckStatusChange examines the sessions currently in memory to see if any sessions have been started or terminated since the last call to NotifyStatusChange (see page 19735). If a session has started or terminated since the last call, CheckStatusChange returns true. Otherwise, it returns false.

See Also

NotifyStatusChange (see page 19735)

135.2.52.2.2 ISessionsService.Clear Method

Deletes all sessions from memory.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the sessions service of all the sessions it has stored in memory. Clear does not terminate active sessions in an orderly fashion (for example, it omits the call to NotifyStatusChange (see page 19735)), it merely frees all memory used to store sessions.

See Also

NotifyStatusChange (see page 19735)

135.2.52.2.3 ISessionsService.NewSession Method

Starts a new session.

Pascal

```
function NewSession: IWebSession;
```

C++

```
__fastcall IWebSession NewSession();
```

Description

Call NewSession to generate a new session. NewSession starts a new session and returns an interface that can be used to terminate that session.

See Also

NotifyStatusChange (see page 19735)

135.2.52.2.4 ISessionsService.NotifyStatusChange Method

Generates an OnEndSession or OnStartSession event, as approrpriate.

Pascal

```
procedure NotifyStatusChange;
```

C++

```
__fastcall NotifyStatusChange();
```

Description

Call NotifyStatusChange to generate the OnStartSession event for any new sessions that have been created since the last call and to generate the OnEndSession event for any sessions that terminated since the last call. For any terminated sessions, NotifyStatusChange frees the memory allocated to the session after the OnEndSession event handler exits.

See Also

OnEndSession (see page 25581)

OnStartSession (see page 25582)

CheckStatusChange (see page 19734)

135.2.53 ISessionsServiceConnectID Interface

Class Hierarchy

SiteComp.ISessionsServiceConnectID

Pascal

```
ISessionsServiceConnectID = interface;
```

C++

```
__interface ISessionsServiceConnectID;
```

File

SiteComp

Description

This is class SiteComp.ISessionsServiceConnectID.

135.2.53.1 ISessionsServiceConnectID Members

The following tables list the members exposed by ISessionsServiceConnectID.

Public Methods

	Name	Description
	Connect (see page 19736)	This is Connect, a member of class ISessionsServiceConnectID.
	ConnectActive (see page 19737)	This is ConnectActive, a member of class ISessionsServiceConnectID.

135.2.53.2 ISessionsServiceConnectID Methods

The methods of the ISessionsServiceConnectID class are listed here.

Public Methods

	Name	Description
	Connect (see page 19736)	This is Connect, a member of class ISessionsServiceConnectID.
	ConnectActive (see page 19737)	This is ConnectActive, a member of class ISessionsServiceConnectID.

135.2.53.2.1 ISessionsServiceConnectID.Connect Method

Pascal

```
function Connect(AID: TSessionID): IWebSession;
```

C++

```
__fastcall IWebSession Connect(TSessionID AID);
```

Description

This is Connect, a member of class ISessionsServiceConnectID.

135.2.53.2.2 ISessionsServiceConnectID.ConnectActive Method

Pascal

```
function ConnectActive(AID: TSessionID): IWebSession;
```

C++

```
__fastcall IWebSession ConnectActive(TSessionID AID);
```

Description

This is ConnectActive, a member of class ISessionsServiceConnectID.

135.2.54 ISessionsServicePersist Interface

Class Hierarchy

SiteComp.ISessionsServicePersist

Pascal

```
ISessionsServicePersist = interface;
```

C++

```
__interface ISessionsServicePersist;
```

File

SiteComp

Description

This is class SiteComp.ISessionsServicePersist.

135.2.54.1 ISessionsServicePersist Members

The following tables list the members exposed by ISessionsServicePersist.

Public Methods

	Name	Description
	LoadFromFile (see page 19738)	This is LoadFromFile, a member of class ISessionsServicePersist.
	LoadFromStream (see page 19738)	This is LoadFromStream, a member of class ISessionsServicePersist.
	SaveToFile (see page 19738)	This is SaveToFile, a member of class ISessionsServicePersist.
	SaveToStream (see page 19738)	This is SaveToStream, a member of class ISessionsServicePersist.

135.2.54.2 ISessionsServicePersist Methods

The methods of the ISessionsServicePersist class are listed here.

Public Methods

	Name	Description
	LoadFromFile (see page 19738)	This is LoadFromFile, a member of class ISessionsServicePersist.
	LoadFromStream (see page 19738)	This is LoadFromStream, a member of class ISessionsServicePersist.
	SaveToFile (see page 19738)	This is SaveToFile, a member of class ISessionsServicePersist.

	SaveToStream (see page 19738)	This is SaveToStream, a member of class ISessionsServicePersist.

135.2.54.2.1 ISessionsServicePersist.LoadFromFile Method

Pascal

```
procedure LoadFromFile(const Filename: string);
```

C++

```
__fastcall LoadFromFile(const AnsiString Filename);
```

Description

This is LoadFromFile, a member of class ISessionsServicePersist.

135.2.54.2.2 ISessionsServicePersist.LoadFromStream Method

Pascal

```
procedure LoadFromStream(S: TStream);
```

C++

```
__fastcall LoadFromStream(TStream S);
```

Description

This is LoadFromStream, a member of class ISessionsServicePersist.

135.2.54.2.3 ISessionsServicePersist.SaveToFile Method

Pascal

```
procedure SaveToFile(const Filename: string);
```

C++

```
__fastcall SaveToFile(const AnsiString Filename);
```

Description

This is SaveToFile, a member of class ISessionsServicePersist.

135.2.54.2.4 ISessionsServicePersist.SaveToStream Method

Pascal

```
procedure SaveToStream(S: TStream);
```

C++

```
__fastcall SaveToStream(TStream S);
```

Description

This is SaveToStream, a member of class ISessionsServicePersist.

135.2.55 ISessionsServiceStoreID Interface

Class Hierarchy

SiteComp.ISessionsServiceStoreID

Pascal

```
ISessionsServiceStoreID = interface;
```

C++

```
__interface ISessionsServiceStoreID;
```

File

SiteComp

Description

This is class SiteComp.ISessionsServiceStoreID.

135.2.55.1 ISessionsServiceStoreID Members

The following tables list the members exposed by ISessionsServiceStoreID.

Public Methods

	Name	Description
	ReadSessionID (see page 19739)	This is ReadSessionID, a member of class ISessionsServiceStoreID.
	WriteSessionID (see page 19740)	This is WriteSessionID, a member of class ISessionsServiceStoreID.

135.2.55.2 ISessionsServiceStoreID Methods

The methods of the ISessionsServiceStoreID class are listed here.

Public Methods

	Name	Description
	ReadSessionID (see page 19739)	This is ReadSessionID, a member of class ISessionsServiceStoreID.
	WriteSessionID (see page 19740)	This is WriteSessionID, a member of class ISessionsServiceStoreID.

135.2.55.2.1 ISessionsServiceStoreID.ReadSessionID Method

Pascal

```
function ReadSessionID(ARequest: TWebRequest; AResponse: TWebResponse; out AID: TSessionID):
Boolean;
```

C++

```
__fastcall Boolean ReadSessionID(TWebRequest ARequest, TWebResponse AResponse, TSessionID AID);
```

Description

This is ReadSessionID, a member of class ISessionsServiceStoreID.

135.2.55.2.2 ISessionsServiceStoreID.WriteSessionID Method

Pascal

```
procedure WriteSessionID(AResponse: TWebResponse; AID: TSessionID);
```

C++

```
__fastcall WriteSessionID(TWebResponse AResponse, TSessionID AID);
```

Description

This is WriteSessionID, a member of class ISessionsServiceStoreID.

135.2.56 IValuesListAdapter Interface

IValuesListAdapter is the interface for supplying name/value pairs.

Class Hierarchy

SiteComp.IValuesListAdapter

Pascal

```
IValuesListAdapter = interface;
```

C++

```
__interface IValuesListAdapter;
```

File

SiteComp

Description

Values list adapters such as TStringsValuesList and TDataSetValuesList implement the IValuesListAdapter interface. This allows adapter fields to use the values list adapter for supplying an associated list of name/value pairs. Typically, this list is used to enumerate the possible values for the adapter field so that they can be added to a selection control such as a list box in an HTML form.

The IValuesListAdapter interface introduces methods to read the current name or value, and to look up the name (or image) associated with a specified value. If the adapter that implements IValuesListAdapter does not also support iteration, server-side script can't change the current name/value pair. However, it can still look up the name or image for a specified value.

Note: In C++, method declarations that use IValuesListAdapter use the _di_IValuesListAdapter type instead. This type is a DelphiInterface wrapper around the IValuesListAdapter interface:

Note: typedef System::DelphiInterface (see page 22167)< IValuesListAdapter > _di_IValuesListAdapter;

See Also

TAdapterUpdateField (see page 24007)

TCustomDataSetAdapterField (see page 7823)

TStringsValuesList (see page 24540)

TDataSetValuesList (see page 8079)

IIteratorSupport (see page 19722)

135.2.56.1 IValuesListAdapter Members

The following tables list the members exposed by IValuesListAdapter.

Public Methods

	Name	Description
	GetListImage (see page 19741)	Returns the image object associated with the current name/value pair.
	GetListImageOfValue (see page 19742)	Returns the image object associated with a specified value.
	GetListName (see page 19742)	Returns the name part of the current name/value pair.
	GetListNameOfValue (see page 19742)	Returns the name associated with a specified value.
	GetListValue (see page 19743)	Returns the value of the current name/value pair.

135.2.56.2 IValuesListAdapter Methods

The methods of the IValuesListAdapter class are listed here.

Public Methods

	Name	Description
	GetListImage (see page 19741)	Returns the image object associated with the current name/value pair.
	GetListImageOfValue (see page 19742)	Returns the image object associated with a specified value.
	GetListName (see page 19742)	Returns the name part of the current name/value pair.
	GetListNameOfValue (see page 19742)	Returns the name associated with a specified value.
	GetListValue (see page 19743)	Returns the value of the current name/value pair.

135.2.56.2.1 IValuesListAdapter.GetListImage Method

Returns the image object associated with the current name/value pair.

Pascal

```
function GetListImage: TComponent;
```

C++

```
__fastcall TComponent * GetListImage();
```

Description

GetListImage returns the object that represents an image associated with the current name/value pair. The image object is the component that responds to request messages which originate from an anchor tag in an HTML form that refers to the image.

If the current name/value pair does not have an associated image, GetListImage returns nil (Delphi) or NULL (C++).

Note: GetListImage provides the support for the Image property of the values list adapter, which can be addressed by server-side script.

See Also

GetListImageOfValue (see page 19742)

GetListName (see page 19742)

GetListValue (see page 19743)

TWebRequestFile (see page 18696)

135.2.56.2.2 IValuesListAdapter.GetListImageOfValue Method

Returns the image object associated with a specified value.

Pascal

```
function GetListImageOfValue(Value: Variant): TComponent;
```

C++

```
__fastcall TComponent * GetListImageOfValue(Variant Value);
```

Description

GetListImageOfValue looks for a name/value pair with the specified value and returns the object that represents an image associated with that value. The image object is the component that responds to request messages which originate from an anchor tag in an HTML form that refers to the image.

Value is the value part of the name/value pair whose image you want.

If Value does not identify a name/value pair with an associated image, GetListImageOfValue returns nil (Delphi) or NULL (C++).

See Also

GetListImage (see page 19741)

GetListNameOfValue (see page 19742)

GetListValue (see page 19743)

TWebRequestFile (see page 18696)

135.2.56.2.3 IValuesListAdapter.GetListName Method

Returns the name part of the current name/value pair.

Pascal

```
function GetListName: string;
```

C++

```
__fastcall AnsiString GetListName();
```

Description

GetListName returns the name part of the current name/value pair. This method provides the support for the Name property of the values list adapter, which can be addressed by server-side script.

If the current name/value pair does not have a name, GetListName returns an empty string.

See Also

GetListNameOfValue (see page 19742)

GetListImage (see page 19741)

GetListValue (see page 19743)

135.2.56.2.4 IValuesListAdapter.GetListNameOfValue Method

Returns the name associated with a specified value.

Pascal

```
function GetListNameOfValue(Value: Variant): string;
```

C++

```
__fastcall AnsiString GetListNameOfValue(Variant Value);
```

Description

GetListNameOfValue looks for a name/value pair with the specified value and returns the name part.

Value is the value part of the name/value pair whose name you want.

If Value does not identify a name/value pair with a name, GetListNameOfValue returns an empty string.

See Also

GetListName (see page 19742)

GetListImageOfValue (see page 19742)

GetListValue (see page 19743)

135.2.56.2.5 IValuesListAdapter.GetListValue Method

Returns the value of the current name/value pair.

Pascal

```
function GetListValue: Variant;
```

C++

```
__fastcall Variant GetListValue();
```

Description

GetListValue returns the value part of the current name/value pair. This method provides the support for the Value property of the values list adapter, which can be addressed by server-side script.

If the current name/value pair does not have a value, GetListValue returns either the name part, or an unassigned Variant, depending on the type of values list adapter.

See Also

GetListName (see page 19742)

GetListImage (see page 19741)

135.2.57 IWebActionsList Interface

Class Hierarchy

Pascal

```
IWebActionsList = interface;
```

C++

```
__interface IWebActionsList;
```

File

SiteComp

Description

This is class SiteComp.IWebActionsList.

135.2.57.1 IWebActionsList Members

The following tables list the members exposed by IWebActionsList.

Public Methods

	Name	Description
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.

Public Properties

	Name	Description
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.

135.2.57.2 IWebActionsList Methods

The methods of the IWebActionsList class are listed here.

Public Methods

	Name	Description
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.

135.2.57.2.1 IWebActionsList.FindAction Method

Pascal

```
function FindAction(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindAction(const AnsiString AName);
```

Description

This is FindAction, a member of class IWebActionsList.

135.2.57.2.2 IWebActionsList.GetActionsList Method

Pascal

```
procedure GetActionsList(AList: TStrings);
```

C++

```
__fastcall GetActionsList(TStrings AList);
```

Description

This is GetActionsList, a member of class IWebActionsList.

135.2.57.2.3 IWebActionsList.GetVisibleActions Method

Pascal

```
function GetVisibleActions: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleActions();
```

Description

This is GetVisibleActions, a member of class IWebActionsList.

135.2.57.2.4 IWebActionsList.IsActionInUse Method

Pascal

```
function IsActionInUse(const AName: string): Boolean;
```

C++

```
__fastcall Boolean IsActionInUse(const AnsiString AName);
```

Description

This is IsActionInUse, a member of class IWebActionsList.

135.2.57.3 IWebActionsList Properties

The properties of the IWebActionsList class are listed here.

Public Properties

	Name	Description
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.

135.2.57.3.1 IWebActionsList.VisibleActions Property

Pascal

```
property VisibleActions: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleActions;
```

Description

This is VisibleActions, a member of class IWebActionsList.

135.2.58 IWebApplicationInfo Interface

IWebApplicationInfo is the interface for the application adapter.

Class Hierarchy

SiteComp.IWebApplicationInfo

Pascal

```
IWebApplicationInfo = interface;
```

C++

```
__interface IWebApplicationInfo;
```

File

SiteComp

Description

The TApplicationAdapter component implements IWebApplicationInfo. This interface, which the TWebAppComponents object publishes, allows the WebSnap application to obtain application. IWebApplicationInfo declares an ApplicationTitle (see page 19748) property, which allows server-side scripts to use the title of the application. It also provides access to the application adapter object, which may provide additional application-level information.

Note: In C++, method declarations that use IWebApplicationInfo use the _di_IWebApplicationInfo type instead. This type is a DelphiInterface wrapper around the IWebApplicationInfo interface:

Note: typedef System::DelphiInterface (see page 22167)< IWebApplicationInfo > _di_IWebApplicationInfo;

See Also

TApplicationAdapter (see page 24032)

TCustomWebAppComponents (see page 24906)

TWebAPpComponents

135.2.58.1 IWebApplicationInfo Members

The following tables list the members exposed by IWebApplicationInfo.

Public Methods

	Name	Description
	GetApplicationAdapter (see page 19747)	Returns the value of the ApplicationAdapter (see page 19747) property.
	GetApplicationTitle (see page 19747)	Returns the value of the ApplicationTitle (see page 19748) property.

Public Properties

	Name	Description
R	ApplicationAdapter (see page 19747)	Provides access to the adapter that implements the fields and actions of the Application variable in server-side scripts.
R	ApplicationTitle (see page 19748)	Indicates the title of the WebSnap application.

135.2.58.2 IWebApplicationInfo Methods

The methods of the IWebApplicationInfo class are listed here.

Public Methods

	Name	Description
	GetApplicationAdapter (see page 19747)	Returns the value of the ApplicationAdapter (see page 19747) property.
	GetApplicationTitle (see page 19747)	Returns the value of the ApplicationTitle (see page 19748) property.

135.2.58.2.1 IWebApplicationInfo.GetApplicationAdapter Method

Returns the value of the ApplicationAdapter (see page 19747) property.

Pascal

```
function GetApplicationAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetApplicationAdapter();
```

Description

GetApplicationAdapter is the read implementation of the ApplicationAdapter (see page 19747) property.

See Also

ApplicationAdapter (see page 19747)

135.2.58.2.2 IWebApplicationInfo.GetApplicationTitle Method

Returns the value of the ApplicationTitle (see page 19748) property.

Pascal

```
function GetApplicationTitle: string;
```

C++

```
__fastcall AnsiString GetApplicationTitle();
```

Description

GetApplicationTitle is the read implementation of the ApplicationTitle (see page 19748) property.

See Also

ApplicationTitle (see page 19748)

135.2.58.3 IWebApplicationInfo Properties

The properties of the IWebApplicationInfo class are listed here.

Public Properties

	Name	Description
R	ApplicationAdapter (see page 19747)	Provides access to the adapter that implements the fields and actions of the Application variable in server-side scripts.
R	ApplicationTitle (see page 19748)	Indicates the title of the WebSnap application.

135.2.58.3.1 IWebApplicationInfo.ApplicationAdapter Property

Provides access to the adapter that implements the fields and actions of the Application variable in server-side scripts.

Pascal

```
property ApplicationAdapter: TComponent;
```

C++

```
__property TComponent * ApplicationAdapter;
```

Description

Read ApplicationAdapter to access the application adapter component. This is the adapter that implements the fields and actions of the Application variable in server-side scripts. Typically, this is an instance of TApplicationAdapter.

See Also

TApplicationAdapter (see page 24032)

135.2.58.3.2 IWebApplicationInfo.ApplicationTitle Property

Indicates the title of the WebSnap application.

Pascal

```
property ApplicationTitle: string;
```

C++

```
__property AnsiString ApplicationTitle;
```

Description

Read ApplicationTitle to obtain the title of the WebSnap application. This property is the value of the Title field in the Application variable in server-side scripts.

See Also

Title (see page 24624)

135.2.59 IWebContainerSubComponent Interface

Class Hierarchy

SiteComp.IWebContainerSubComponent

Pascal

```
IWebContainerSubComponent = interface;
```

C++

```
__interface IWebContainerSubComponent;
```

File

SiteComp

Description

This is class SiteComp.IWebContainerSubComponent.

135.2.60 IWebDataFields Interface

Class Hierarchy

SiteComp.IWebDataFields

Pascal

```
IWebDataFields = interface;
```

C++

```
__interface IWebDataFields;
```

File

SiteComp

Description

This is class SiteComp.IWebDataFields.

135.2.60.1 IWebDataFields Members

The following tables list the members exposed by IWebDataFields.

Public Methods

	Name	Description
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.

Public Properties

	Name	Description
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

135.2.60.2 IWebDataFields Methods

The methods of the IWebDataFields class are listed here.

Public Methods

	Name	Description
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.

135.2.60.2.1 IWebDataFields.FindField Method

Pascal

```
function FindField(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindField(const AnsiString AName);
```

Description

This is FindField, a member of class IWebDataFields.

135.2.60.2.2 IWebDataFields.GetFieldsList Method

Pascal

```
procedure GetFieldsList(AList: TStrings);
```

C++

```
__fastcall GetFieldsList(TStrings AList);
```

Description

This is GetFieldsList, a member of class IWebDataFields.

135.2.60.2.3 IWebDataFields.GetVisibleFields Method

Pascal

```
function GetVisibleFields: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleFields();
```

Description

This is GetVisibleFields, a member of class IWebDataFields.

135.2.60.2.4 IWebDataFields.IsFieldInUse Method

Pascal

```
function IsFieldInUse(const AName: string): Boolean;
```

C++

```
__fastcall Boolean IsFieldInUse(const AnsiString AName);
```

Description

This is IsFieldInUse, a member of class IWebDataFields.

135.2.60.3 IWebDataFields Properties

The properties of the IWebDataFields class are listed here.

Public Properties

	Name	Description
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

135.2.60.3.1 IWebDataFields.VisibleFields Property

Pascal

```
property VisibleFields: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleFields;
```

Description

This is VisibleFields, a member of class IWebDataFields.

135.2.61 IWebEnabled Interface

Class Hierarchy

SiteComp.IWebEnabled

Pascal

```
IWebEnabled = interface;
```

C++

```
__interface IWebEnabled;
```

File

SiteComp

Description

This is class SiteComp.IWebEnabled.

135.2.61.1 IWebEnabled Members

The following tables list the members exposed by IWebEnabled.

Public Methods

	Name	Description
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

135.2.61.2 IWebEnabled Methods

The methods of the IWebEnabled class are listed here.

Public Methods

	Name	Description
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

135.2.61.2.1 IWebEnabled.WebEnabled Method

Pascal

```
function WebEnabled: Boolean;
```

C++

```
__fastcall Boolean WebEnabled();
```

Description

This is WebEnabled, a member of class IWebEnabled.

135.2.62 IWebFormComponentContainer Interface

Class Hierarchy

SiteComp.IWebFormComponentContainer

Pascal

```
IWebFormComponentContainer = interface;
```

C++

```
__interface IWebFormComponentContainer;
```

File

SiteComp

Description

This is class SiteComp.IWebFormComponentContainer.

135.2.62.1 IWebFormComponentContainer Members

The following tables list the members exposed by IWebFormComponentContainer.

Public Methods

	Name	Description
	GetCount (see page 19753)	This is GetCount, a member of class IWebFormComponentContainer.
	GetItem (see page 19753)	This is GetItem, a member of class IWebFormComponentContainer.

Public Properties

	Name	Description
R	Count (see page 19753)	This is Count, a member of class IWebFormComponentContainer.
R	Items (see page 19754)	This is Items, a member of class IWebFormComponentContainer.

135.2.62.2 IWebFormComponentContainer Methods

The methods of the IWebFormComponentContainer class are listed here.

Public Methods

	Name	Description
	GetCount (see page 19753)	This is GetCount, a member of class IWebFormComponentContainer.
	GetItem (see page 19753)	This is GetItem, a member of class IWebFormComponentContainer.

135.2.62.2.1 IWebFormComponentContainer.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class IWebFormComponentContainer.

135.2.62.2.2 IWebFormComponentContainer.GetItem Method

Pascal

```
function GetItem(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetItem(int I);
```

Description

This is GetItem, a member of class IWebFormComponentContainer.

135.2.62.3 IWebFormComponentContainer Properties

The properties of the IWebFormComponentContainer class are listed here.

Public Properties

	Name	Description
R	Count (see page 19753)	This is Count, a member of class IWebFormComponentContainer.
R	Items (see page 19754)	This is Items, a member of class IWebFormComponentContainer.

135.2.62.3.1 IWebFormComponentContainer.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class IWebFormComponentContainer.

135.2.62.3.2 IWebFormComponentContainer.Items Property

Pascal

```
property Items [I: Integer]: TComponent;
```

C++

```
__property TComponent * Items[int I];
```

Description

This is Items, a member of class IWebFormComponentContainer.

135.2.63 IWebGetActionName Interface

Class Hierarchy

SiteComp.IWebGetActionName

Pascal

```
IWebGetActionName = interface;
```

C++

```
__interface IWebGetActionName;
```

File

SiteComp

Description

This is class SiteComp.IWebGetActionName.

135.2.63.1 IWebGetActionName Members

The following tables list the members exposed by IWebGetActionName.

Public Methods

	Name	Description
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.

Public Properties

	Name	Description
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.

135.2.63.2 IWebGetActionName Methods

The methods of the IWebGetActionName class are listed here.

Public Methods

	Name	Description
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.

135.2.63.2.1 IWebGetActionName.GetActionName Method

Pascal

```
function GetActionName: string;
```

C++

```
__fastcall AnsiString GetActionName();
```

Description

This is GetActionName, a member of class IWebGetActionName.

135.2.63.3 IWebGetActionName Properties

The properties of the IWebGetActionName class are listed here.

Public Properties

	Name	Description
	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.

135.2.63.3.1 IWebGetActionName.ActionName Property

Pascal

```
property ActionName: string;
```

C++

```
__property AnsiString ActionName;
```

Description

This is ActionName, a member of class IWebGetActionName.

135.2.64 IWebGetDisplayLabel Interface

Class Hierarchy

SiteComp.IWebGetDisplayLabel

Pascal

```
IWebGetDisplayLabel = interface;
```

C++

```
__interface IWebGetDisplayLabel;
```

File

SiteComp

Description

This is class SiteComp.IWebGetDisplayLabel.

135.2.64.1 IWebGetDisplayLabel Members

The following tables list the members exposed by IWebGetDisplayLabel.

Public Methods

	Name	Description
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.

135.2.64.2 IWebGetDisplayLabel Methods

The methods of the IWebGetDisplayLabel class are listed here.

Public Methods

	Name	Description
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.

135.2.64.2.1 IWebGetDisplayLabel.GetDisplayLabel Method

Pascal

```
function GetDisplayLabel: string;
```

C++

```
__fastcall AnsiString GetDisplayLabel();
```

Description

This is GetDisplayLabel, a member of class IWebGetDisplayLabel.

135.2.65 IWebGetDisplayWidth Interface

Class Hierarchy

SiteComp.IWebGetDisplayWidth

Pascal

```
IWebGetDisplayWidth = interface;
```

C++

```
__interface IWebGetDisplayWidth;
```

File

SiteComp

Description

This is class SiteComp.IWebGetDisplayWidth.

135.2.65.1 IWebGetDisplayWidth Members

The following tables list the members exposed by IWebGetDisplayWidth.

Public Methods

	Name	Description
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.

135.2.65.2 IWebGetDisplayWidth Methods

The methods of the IWebGetDisplayWidth class are listed here.

Public Methods

	Name	Description
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.

135.2.65.2.1 IWebGetDisplayWidth.GetDisplayWidth Method

Pascal

```
function GetDisplayWidth: Integer;
```

C++

```
__fastcall int GetDisplayWidth();
```

Description

This is GetDisplayWidth, a member of class IWebGetDisplayWidth.

135.2.66 IWebGetFieldName Interface

Class Hierarchy

SiteComp.IWebGetFieldName

Pascal

```
IWebGetFieldName = interface;
```

C++

```
__interface IWebGetFieldName;
```

File

SiteComp

Description

This is class SiteComp.IWebGetFieldName.

135.2.66.1 IWebGetFieldName Members

The following tables list the members exposed by IWebGetFieldName.

Public Methods

	Name	Description
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.

Public Properties

	Name	Description
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.

135.2.66.2 IWebGetFieldName Methods

The methods of the IWebGetFieldName class are listed here.

Public Methods

	Name	Description
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.

135.2.66.2.1 IWebGetFieldName.GetFieldName Method

Pascal

```
function GetFieldName: string;
```

C++

```
__fastcall AnsiString GetFieldName();
```

Description

This is GetFieldName, a member of class IWebGetFieldName.

135.2.66.3 IWebGetFieldName Properties

The properties of the IWebGetFieldName class are listed here.

Public Properties

	Name	Description
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.

135.2.66.3.1 IWebGetFieldName.FieldName Property

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;
```

Description

This is FieldName, a member of class IWebGetFieldName.

135.2.67 IWebGetFieldValue Interface

Class Hierarchy

SiteComp.IWebGetFieldValue

Pascal

```
IWebGetFieldValue = interface;
```

C++

```
__interface IWebGetFieldValue;
```

File

SiteComp

Description

This is class SiteComp.IWebGetFieldValue.

135.2.67.1 IWebGetFieldValue Members

The following tables list the members exposed by IWebGetFieldValue.

Public Methods

	Name	Description
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.

Public Properties

	Name	Description
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.

135.2.67.2 IWebGetFieldValue Methods

The methods of the IWebGetFieldValue class are listed here.

Public Methods

	Name	Description
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.

135.2.67.2.1 IWebGetFieldValue.GetValue Method

Pascal

```
function GetValue: Variant;
```

C++

```
__fastcall Variant GetValue();
```

Description

This is GetValue, a member of class IWebGetFieldValue.

135.2.67.3 IWebGetFieldValue Properties

The properties of the IWebGetFieldValue class are listed here.

Public Properties

	Name	Description
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.

135.2.67.3.1 IWebGetFieldValue.Value Property

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

This is Value, a member of class IWebGetFieldValue.

135.2.68 IWebGetFieldValues Interface

IWebGetFieldValues is used to iterate over multiple values associated with an adapter field.

Class Hierarchy

SiteComp.IWebGetFieldValues

Pascal

```
IWebGetFieldValues = interface;
```

C++

```
__interface IWebGetFieldValues;
```

File

SiteComp

Description

IWebGetFieldValues is implemented by adapter fields that may have zero or more associated values. Server-side script accesses these values using the adapter field's Values property.

135.2.68.1 IWebGetFieldValues Members

The following tables list the members exposed by IWebGetFieldValues.

Public Methods

	Name	Description
	EndValueIterator (see page 19761)	Indicate the iteration is finished.
	GetCurrentValue (see page 19761)	Retrieves the current value as a variant.
	HasValue (see page 19761)	Indicates whether the adapter field has a matching value.
	NextValueIteration (see page 19762)	Position the iteration pointer on the next value.
	StartValueIterator (see page 19762)	Reset the iteration pointer to the first item.

135.2.68.2 IWebGetFieldValues Methods

The methods of the IWebGetFieldValues class are listed here.

Public Methods

	Name	Description
	EndValueIterator (see page 19761)	Indicate the iteration is finished.
	GetCurrentValue (see page 19761)	Retrieves the current value as a variant.
	HasValue (see page 19761)	Indicates whether the adapter field has a matching value.
	NextValueIteration (see page 19762)	Position the iteration pointer on the next value.
	StartValueIterator (see page 19762)	Reset the iteration pointer to the first item.

135.2.68.2.1 IWebGetFieldValues.EndValueIterator Method

Indicate the iteration is finished.

Pascal

```
procedure EndValueIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndValueIterator(void * OwnerData);
```

Description

EndValueIterator is used with StartValueIterator (see page 19762) and NextValueIteration (see page 19762) to loop through the values associated with an adapter field. EndValueIterator should be called when iteration is complete. The OwnerData parameter can be used to pass a value between the three iteration functions.

See Also

StartValueIterator (see page 19762)

NextValueIteration (see page 19762)

135.2.68.2.2 IWebGetFieldValues.GetCurrentValue Method

Retrieves the current value as a variant.

Pascal

```
function GetCurrentValue: Variant;
```

C++

```
__fastcall Variant GetCurrentValue();
```

Description

GetCurrentValue retrieves the value associated with internal iteration pointer. The FirstValueIterator and NextValueIteration (see page 19762) are called to position the internal iteration pointer. Server-side script accesses this value using the Values.Value property.

See Also

StartValueIterator (see page 19762)

NextValueIteration (see page 19762)

135.2.68.2.3 IWebGetFieldValues.HasValue Method

Indicates whether the adapter field has a matching value.

Pascal

```
function HasValue(const AValue: Variant): Boolean;
```

C++

```
__fastcall Boolean HasValue(const Variant AValue);
```

Description

Server-side script accesses this value using the Values.HasValue method. Server-side script to generate an HTML select list or check box group can use this method to determine whether an item should be selected or checked.

See Also

ViewMode (see page 25252)

135.2.68.2.4 IWebGetFieldValues.NextValueIteration Method

Position the iteration pointer on the next value.

Pascal

```
function NextValueIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextValueIteration(void * OwnerData);
```

Description

NextValueIteration is used with StartValueIterator (see page 19762) and EndValueIterator (see page 19761) to loop through the values associated with an adapter field. NextValueIteration returns False if there are no more values. The OwnerData parameter can be used to pass a value between the three iteration functions.

See Also

StartValueIterator (see page 19762)

EndValueIterator (see page 19761)

GetCurrentValue (see page 19761)

135.2.68.2.5 IWebGetFieldValues.StartValueIterator Method

Reset the iteration pointer to the first item.

Pascal

```
function StartValueIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartValueIterator(void * OwnerData);
```

Description

StartValueIterator is used with NextValueIteration (see page 19762) and EndValueIterator (see page 19761) to loop through the values associated with an adapter field. StartValueIterator returns false if there are no values. The OwnerData parameter can be used to pass a value between the three iteration functions.

See Also

NextValueIteration (see page 19762)

EndValueIterator (see page 19761)

GetCurrentValue (see page 19761)

135.2.69 IWebGetMaxLength Interface

Class Hierarchy

SiteComp.IWebGetMaxLength

Pascal

```
IWebGetMaxLength = interface;
```

C++

```
__interface IWebGetMaxLength;
```

File

SiteComp

Description

This is class SiteComp.IWebGetMaxLength.

135.2.69.1 IWebGetMaxLength Members

The following tables list the members exposed by IWebGetMaxLength.

Public Methods

	Name	Description
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.

135.2.69.2 IWebGetMaxLength Methods

The methods of the IWebGetMaxLength class are listed here.

Public Methods

	Name	Description
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.

135.2.69.2.1 IWebGetMaxLength.GetMaxLength Method

Pascal

```
function GetMaxLength: integer;
```

C++

```
__fastcall int GetMaxLength();
```

Description

This is GetMaxLength, a member of class IWebGetMaxLength.

135.2.70 IWebGetSessionIDs Interface

Class Hierarchy

SiteComp.IWebGetSessionIDs

Pascal

```
IWebGetSessionIDs = interface;
```

C++

```
__interface IWebGetSessionIDs;
```

File

SiteComp

Description

This is class SiteComp.IWebGetSessionIDs.

135.2.70.1 IWebGetSessionIDs Members

The following tables list the members exposed by IWebGetSessionIDs.

Public Methods

	Name	Description
	GetSessionIDs (see page 19764)	This is GetSessionIDs, a member of class IWebGetSessionIDs.

135.2.70.2 IWebGetSessionIDs Methods

The methods of the IWebGetSessionIDs class are listed here.

Public Methods

	Name	Description
	GetSessionIDs (see page 19764)	This is GetSessionIDs, a member of class IWebGetSessionIDs.

135.2.70.2.1 IWebGetSessionIDs.GetSessionIDs Method

Pascal

```
function GetSessionIDs: IWebSessionIDs;
```

C++

```
__fastcall IWebSessionIDs GetSessionIDs();
```

Description

This is GetSessionIDs, a member of class IWebGetSessionIDs.

135.2.71 IWebImageHREF Interface

IWebImageHREF is the interface for obtaining an HREF that addresses an image.

Class Hierarchy

SiteComp.IWebImageHREF

Pascal

```
IWebImageHREF = interface;
```

C++

```
__interface IWebImageHREF;
```

File

SiteComp

Description

IWebImageHREF defines a single method, WebImageHREF (see page 19766), which supplies a URL for an image that should appear in HTML forms. This interface is used when server-side script addresses the Image.AsHREF property of an adapter.

Adapter field objects that represent images (that is, adapter fields with an Image property) implement IWebImageHREF so that the image reference can be obtained from server-side script. Such adapter fields include TAdapterImageField and TDataSetAdapterImageField.

Note: Method declarations that use IWebImageHREF use the _di_IWebImageHREF type instead. This type is a DelphiInterface wrapper around the IWebImageHREF interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IWebImageHREF >  _di_IWebImageHREF;
```

See Also

TAdapterImageField (see page 23869)

TDataSetAdapterImageField (see page 8138)

135.2.71.1 IWebImageHREF Members

The following tables list the members exposed by IWebImageHREF.

Public Methods

	Name	Description
	WebImageHREF (see page 19766)	Retrieves a URL for an external image file.

135.2.71.2 IWebImageHREF Methods

The methods of the IWebImageHREF class are listed here.

Public Methods

	Name	Description
	WebImageHREF (see page 19766)	Retrieves a URL for an external image file.

135.2.71.2.1 IWebImageHREF.WebImageHREF Method

Retrieves a URL for an external image file.

Pascal

```
function WebImageHREF(var AHREF: string): Boolean;
```

C++

```
__fastcall Boolean WebImageHREF(AnsiString AHREF);
```

Description

WebImageHREF is called when server-side script uses the Image.AsHREF property. WebImageHREF returns a URL that identifies a specific image that is available as a simple file reference. If images must be generated dynamically in response to requests, then WebImageHREF returns false and the adapter dispatcher generates an HREF based on the request parameters supplied by the object that implements this interface.

AHREF returns the URL that identifies the image of this field.

WebImageHREF returns true if it supplies a URL as the value of the AHREF parameter, false if the HTML form must request images using a set of request parameters instead.

EncodeAdapterItemRequestAsHREF (see page 24872)

135.2.72 IWebInputName Interface

Class Hierarchy

SiteComp.IWebInputName

Pascal

```
IWebInputName = interface;
```

C++

```
__interface IWebInputName;
```

File

SiteComp

Description

This is class SiteComp.IWebInputName.

135.2.72.1 IWebInputName Members

The following tables list the members exposed by IWebInputName.

Public Methods

	Name	Description
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.

Public Properties

	Name	Description
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.

135.2.72.2 IWebInputName Methods

The methods of the IWebInputName class are listed here.

Public Methods

	Name	Description
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.

135.2.72.2.1 IWebInputName.GetInputName Method

Pascal

```
function GetInputName: string;
```

C++

```
__fastcall AnsiString GetInputName();
```

Description

This is GetInputName, a member of class IWebInputName.

135.2.72.3 IWebInputName Properties

The properties of the IWebInputName class are listed here.

Public Properties

	Name	Description
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.

135.2.72.3.1 IWebInputName.InputName Property

Pascal

```
property InputName: string;
```

C++

```
__property AnsiString InputName;
```

Description

This is InputName, a member of class IWebInputName.

135.2.73 IWebIsDefaultAction Interface

Class Hierarchy

SiteComp.IWebIsDefaultAction

Pascal

```
IWebIsDefaultAction = interface;
```

C++

```
__interface IWebIsDefaultAction;
```

File

SiteComp

Description

This is class SiteComp.IWebIsDefaultAction.

135.2.73.1 IWebIsDefaultAction Members

The following tables list the members exposed by IWebIsDefaultAction.

Public Methods

	Name	Description
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.

135.2.73.2 IWebIsDefaultAction Methods

The methods of the IWebIsDefaultAction class are listed here.

Public Methods

	Name	Description
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.

135.2.73.2.1 IWebIsDefaultAction.IsDefaultAction Method

Pascal

```
function IsDefaultAction(ADisplay: TObject): Boolean;
```

C++

```
__fastcall Boolean IsDefaultAction(TObject * ADisplay);
```

Description

This is IsDefaultAction, a member of class IWebIsDefaultAction.

135.2.74 IWebIsDefaultField Interface

Class Hierarchy

SiteComp.IWebIsDefaultField

Pascal

```
IWebIsDefaultField = interface;
```

C++

```
__interface IWebIsDefaultField;
```

File

SiteComp

Description

This is class SiteComp.IWebIsDefaultField.

135.2.74.1 IWebIsDefaultField Members

The following tables list the members exposed by IWebIsDefaultField.

Public Methods

	Name	Description
	IsDefaultField (see page 19769)	This is IsDefaultField, a member of class IWebIsDefaultField.

135.2.74.2 IWebIsDefaultField Methods

The methods of the IWebIsDefaultField class are listed here.

Public Methods

	Name	Description
	IsDefaultField (see page 19769)	This is IsDefaultField, a member of class IWebIsDefaultField.

135.2.74.2.1 IWebIsDefaultField.IsDefaultField Method

Pascal

```
function IsDefaultField(ADisplay: TObject): Boolean;
```

C++

```
__fastcall Boolean IsDefaultField(TObject * ADisplay);
```

Description

This is IsDefaultField, a member of class IWebIsDefaultField.

135.2.75 IWebSession Interface

IWebSession allows an application to terminate a Web session.

Class Hierarchy

SiteComp.IWebSession

Pascal

```
IWebSession = interface;
```

C++

```
__interface IWebSession;
```

File

SiteComp

Description

Use IWebSession to terminate an active Web session. When you add a new session to a TSessionsService component using the ISessionsService (see page 19733) interface, it returns an IWebSession interface for the new session. You can use this interface to terminate the session. Once a session terminates, the application can no longer access its named values.

Note: In C++, method declarations that use IWebSession use the _di_IWebSession type instead. This type is a DelphiInterface wrapper around the IWebSession interface:

Note: typedef System::DelphiInterface (see page 22167)< IWebSession > _di_IWebSession;

See Also

TWebSession (see page 24968)

TSessionsService (see page 25582)

ISessionsService (see page 19733)

135.2.75.1 IWebSession Members

The following tables list the members exposed by IWebSession.

Public Methods

	Name	Description
	Terminate (see page 19771)	Terminates the session.

135.2.75.2 IWebSession Methods

The methods of the IWebSession class are listed here.

Public Methods

	Name	Description
	Terminate (see page 19771)	Terminates the session.

135.2.75.2.1 IWebSession.Terminate Method

Terminates the session.

Pascal

```
procedure Terminate;
```

C++

```
__fastcall Terminate();
```

Description

Call Terminate to terminate a session. Once a session terminates, the application can no longer access its Values.

Sessions are terminated automatically when the application does not receive any requests for the session for TimeOutMinutes minutes.

Values

135.2.76 IWebSessionAttributes Interface

Class Hierarchy

SiteComp.IWebSessionAttributes

Pascal

```
IWebSessionAttributes = interface;
```

C++

```
__interface IWebSessionAttributes;
```

File

SiteComp

Description

This is class SiteComp.IWebSessionAttributes.

135.2.76.1 IWebSessionAttributes Members

The following tables list the members exposed by IWebSessionAttributes.

Public Methods

	Name	Description
	GetExpirationTime (see page 19772)	This is GetExpirationTime, a member of class IWebSessionAttributes.
	GetExpired (see page 19772)	This is GetExpired, a member of class IWebSessionAttributes.
	GetIsActive (see page 19773)	This is GetIsActive, a member of class IWebSessionAttributes.
	GetStartTime (see page 19773)	This is GetStartTime, a member of class IWebSessionAttributes.
	GetTerminated (see page 19773)	This is GetTerminated, a member of class IWebSessionAttributes.
	GetTimeoutMinutes (see page 19773)	This is GetTimeoutMinutes, a member of class IWebSessionAttributes.

	GetTouchTime (see page 19773)	This is GetTouchTime, a member of class IWebSessionAttributes.
	SetTimeoutMinutes (see page 19774)	This is SetTimeoutMinutes, a member of class IWebSessionAttributes.

Public Properties

	Name	Description
R	ExpirationTime (see page 19774)	This is ExpirationTime, a member of class IWebSessionAttributes.
R	Expired (see page 19774)	This is Expired, a member of class IWebSessionAttributes.
R	IsActive (see page 19775)	This is IsActive, a member of class IWebSessionAttributes.
R	StartTime (see page 19775)	This is StartTime, a member of class IWebSessionAttributes.
R	Terminated (see page 19775)	This is Terminated, a member of class IWebSessionAttributes.
	TimeoutMinutes (see page 19775)	This is TimeoutMinutes, a member of class IWebSessionAttributes.
R	TouchTime (see page 19775)	This is TouchTime, a member of class IWebSessionAttributes.

135.2.76.2 IWebSessionAttributes Methods

The methods of the IWebSessionAttributes class are listed here.

Public Methods

	Name	Description
	GetExpirationTime (see page 19772)	This is GetExpirationTime, a member of class IWebSessionAttributes.
	GetExpired (see page 19772)	This is GetExpired, a member of class IWebSessionAttributes.
	GetIsActive (see page 19773)	This is GetIsActive, a member of class IWebSessionAttributes.
	GetStartTime (see page 19773)	This is GetStartTime, a member of class IWebSessionAttributes.
	GetTerminated (see page 19773)	This is GetTerminated, a member of class IWebSessionAttributes.
	GetTimeoutMinutes (see page 19773)	This is GetTimeoutMinutes, a member of class IWebSessionAttributes.
	GetTouchTime (see page 19773)	This is GetTouchTime, a member of class IWebSessionAttributes.
	SetTimeoutMinutes (see page 19774)	This is SetTimeoutMinutes, a member of class IWebSessionAttributes.

135.2.76.2.1 IWebSessionAttributes.GetExpirationTime Method

Pascal

```
function GetExpirationTime: TDateTime;
```

C++

```
__fastcall TDateTime GetExpirationTime();
```

Description

This is GetExpirationTime, a member of class IWebSessionAttributes.

135.2.76.2.2 IWebSessionAttributes.GetExpired Method

Pascal

```
function GetExpired: Boolean;
```

C++

```
__fastcall Boolean GetExpired();
```

Description

This is GetExpired, a member of class IWebSessionAttributes.

135.2.76.2.3 IWebSessionAttributes.GetIsActive Method

Pascal

```
function GetIsActive: Boolean;
```

C++

```
__fastcall Boolean GetIsActive();
```

Description

This is GetIsActive, a member of class IWebSessionAttributes.

135.2.76.2.4 IWebSessionAttributes.GetStartTime Method

Pascal

```
function GetStartTime: TDateTime;
```

C++

```
__fastcall TDateTime GetStartTime();
```

Description

This is GetStartTime, a member of class IWebSessionAttributes.

135.2.76.2.5 IWebSessionAttributes.GetTerminated Method

Pascal

```
function GetTerminated: Boolean;
```

C++

```
__fastcall Boolean GetTerminated();
```

Description

This is GetTerminated, a member of class IWebSessionAttributes.

135.2.76.2.6 IWebSessionAttributes.GetTimeoutMinutes Method

Pascal

```
function GetTimeoutMinutes: Integer;
```

C++

```
__fastcall int GetTimeoutMinutes();
```

Description

This is GetTimeoutMinutes, a member of class IWebSessionAttributes.

135.2.76.2.7 IWebSessionAttributes.GetTouchTime Method

Pascal

```
function GetTouchTime: TDateTime;
```

C++

```
__fastcall TDateTime GetTouchTime();
```

Description

This is GetTouchTime, a member of class IWebSessionAttributes.

135.2.76.2.8 IWebSessionAttributes.SetTimeoutMinutes Method

Pascal

```
procedure SetTimeoutMinutes(AValue: Integer);
```

C++

```
__fastcall SetTimeoutMinutes(int AValue);
```

Description

This is SetTimeoutMinutes, a member of class IWebSessionAttributes.

135.2.76.3 IWebSessionAttributes Properties

The properties of the IWebSessionAttributes class are listed here.

Public Properties

	Name	Description
R	ExpirationTime (see page 19774)	This is ExpirationTime, a member of class IWebSessionAttributes.
R	Expired (see page 19774)	This is Expired, a member of class IWebSessionAttributes.
R	IsActive (see page 19775)	This is IsActive, a member of class IWebSessionAttributes.
R	StartTime (see page 19775)	This is StartTime, a member of class IWebSessionAttributes.
R	Terminated (see page 19775)	This is Terminated, a member of class IWebSessionAttributes.
	TimeoutMinutes (see page 19775)	This is TimeoutMinutes, a member of class IWebSessionAttributes.
R	TouchTime (see page 19775)	This is TouchTime, a member of class IWebSessionAttributes.

135.2.76.3.1 IWebSessionAttributes.ExpirationTime Property

Pascal

```
property ExpirationTime: TDateTime;
```

C++

```
__property TDateTime ExpirationTime;
```

Description

This is ExpirationTime, a member of class IWebSessionAttributes.

135.2.76.3.2 IWebSessionAttributes.Expired Property

Pascal

```
property Expired: Boolean;
```

C++

```
__property Boolean Expired;
```

Description

This is Expired, a member of class IWebSessionAttributes.

135.2.76.3.3 IWebSessionAttributes.IsActive Property

Pascal

```
property IsActive: Boolean;
```

C++

```
__property Boolean IsActive;
```

Description

This is IsActive, a member of class IWebSessionAttributes.

135.2.76.3.4 IWebSessionAttributes.StartTime Property

Pascal

```
property StartTime: TDateTime;
```

C++

```
__property TDateTime StartTime;
```

Description

This is StartTime, a member of class IWebSessionAttributes.

135.2.76.3.5 IWebSessionAttributes.Terminated Property

Pascal

```
property Terminated: Boolean;
```

C++

```
__property Boolean Terminated;
```

Description

This is Terminated, a member of class IWebSessionAttributes.

135.2.76.3.6 IWebSessionAttributes.TimeoutMinutes Property

Pascal

```
property TimeoutMinutes: Integer;
```

C++

```
__property int TimeoutMinutes;
```

Description

This is TimeoutMinutes, a member of class IWebSessionAttributes.

135.2.76.3.7 IWebSessionAttributes.TouchTime Property

Pascal

```
property TouchTime: TDateTime;
```

C++

```
__property TDateTime TouchTime;
```

Description

This is TouchTime, a member of class IWebSessionAttributes.

135.2.77 IWebSessionID Interface

Class Hierarchy

SiteComp.IWebSessionID

Pascal

```
IWebSessionID = interface;
```

C++

```
__interface IWebSessionID;
```

File

SiteComp

Description

This is class SiteComp.IWebSessionID.

135.2.77.1 IWebSessionID Members

The following tables list the members exposed by IWebSessionID.

Public Methods

	Name	Description
	GetID (see page 19776)	This is GetID, a member of class IWebSessionID.

Public Properties

	Name	Description
R	ID (see page 19777)	This is ID, a member of class IWebSessionID.

135.2.77.2 IWebSessionID Methods

The methods of the IWebSessionID class are listed here.

Public Methods

	Name	Description
	GetID (see page 19776)	This is GetID, a member of class IWebSessionID.

135.2.77.2.1 IWebSessionID.GetID Method

Pascal

```
function GetID: TSessionID;
```

C++

```
__fastcall TSessionID GetID();
```

Description

This is GetID, a member of class IWebSessionID.

135.2.77.3 IWebSessionID Properties

The properties of the IWebSessionID class are listed here.

Public Properties

	Name	Description
R	ID (see page 19777)	This is ID, a member of class IWebSessionID.

135.2.77.3.1 IWebSessionID.ID Property

Pascal

```
property ID: TSessionID;
```

C++

```
__property TSessionID ID;
```

Description

This is ID, a member of class IWebSessionID.

135.2.78 IWebSessionIDs Interface

IWebSessionIDs lists the session IDs (see page 19779) for all sessions that TSessionsService stores in memory.

Class Hierarchy

SiteComp.IWebSessionIDs

Pascal

```
IWebSessionIDs = interface;
```

C++

```
__interface IWebSessionIDs;
```

File

SiteComp

Description

Use IWebSessionIDs to obtain the session IDs (see page 19779) for all the sessions in a sessions service.

Note: In C++, method declarations that use IWebSessionIDs use the _di_IWebSessionIDs type instead. This type is a DelphiInterface wrapper around the IWebSessionIDs interface:

Note: typedef System::DelphiInterface (see page 22167)< IWebSessionIDs > _di_IWebSessionIDs;

See Also

TSessionsService (see page 25582)

135.2.78.1 IWebSessionIDs Members

The following tables list the members exposed by IWebSessionIDs.

Public Methods

	Name	Description
	GetID (see page 19778)	Returns the value of the IDs (see page 19779) property.
	GetIDCount (see page 19778)	Returns the value of the IDCount (see page 19779) property.

Public Properties

	Name	Description
R	IDCount (see page 19779)	Indicates the number of session IDs (see page 19779) available.
R	IDs (see page 19779)	Lists the session IDs for all the sessions stored by the sessions service.

135.2.78.2 IWebSessionIDs Methods

The methods of the IWebSessionIDs class are listed here.

Public Methods

	Name	Description
	GetID (see page 19778)	Returns the value of the IDs (see page 19779) property.
	GetIDCount (see page 19778)	Returns the value of the IDCount (see page 19779) property.

135.2.78.2.1 IWebSessionIDs.GetID Method

Returns the value of the IDs (see page 19779) property.

Pascal

```
function GetID(I: Integer): TSessionID;
```

C++

```
__fastcall TSessionID GetID(int I);
```

Description

GetID is the read implementation of the IDs (see page 19779) property.

I is the index of the session ID to return.

See Also

IDs (see page 19779)

135.2.78.2.2 IWebSessionIDs.GetIDCount Method

Returns the value of the IDCount (see page 19779) property.

Pascal

```
function GetIDCount: Integer;
```

C++

```
__fastcall int GetIDCount();
```

Description

GetIDCount is the read implementation of the IDCount (see page 19779) property.

See Also

IDCount (see page 19779)

135.2.78.3 IWebSessionIDs Properties

The properties of the IWebSessionIDs class are listed here.

Public Properties

	Name	Description
R	IDCount (see page 19779)	Indicates the number of session IDs (see page 19779) available.
R	IDs (see page 19779)	Lists the session IDs for all the sessions stored by the sessions service.

135.2.78.3.1 IWebSessionIDs.IDCount Property

Indicates the number of session IDs (see page 19779) available.

Pascal

```
property IDCount: Integer;
```

C++

```
__property int IDCount;
```

Description

Read IDCount to obtain an upper bound for the Index parameter of the IDs (see page 19779) property. IDCount is the number of session IDs (see page 19779) (hence, the number of sessions) that the sessions service has stored in memory.

See Also

IDs (see page 19779)

135.2.78.3.2 IWebSessionIDs.IDs Property

Lists the session IDs for all the sessions stored by the sessions service.

Pascal

```
property IDs [I: Integer]: TSessionID;
```

C++

```
__property TSessionID IDs[int I];
```

Description

Use IDs to iterate over the session IDs of all the sessions that the sessions service stores.

I is the index of the session ID. It can be any value from 0 to IDCount (see page 19779) – 1.

See Also

IDCount (see page 19779)

135.2.79 IWebSessionValues Interface

Class Hierarchy

SiteComp.IWebSessionValues

Pascal

```
IWebSessionValues = interface;
```

C++

```
__interface IWebSessionValues;
```

File

SiteComp

Description

This is class SiteComp.IWebSessionValues.

135.2.79.1 IWebSessionValues Members

The following tables list the members exposed by IWebSessionValues.

Public Methods

	Name	Description
	GetItemCount (see page 19780)	This is GetItemCount, a member of class IWebSessionValues.
	GetItems (see page 19781)	This is GetItems, a member of class IWebSessionValues.
	GetValue (see page 19781)	This is GetValue, a member of class IWebSessionValues.
	SetValue (see page 19781)	This is SetValue, a member of class IWebSessionValues.

Public Properties

	Name	Description
	Values (see page 19782)	This is Values, a member of class IWebSessionValues.

135.2.79.2 IWebSessionValues Methods

The methods of the IWebSessionValues class are listed here.

Public Methods

	Name	Description
	GetItemCount (see page 19780)	This is GetItemCount, a member of class IWebSessionValues.
	GetItems (see page 19781)	This is GetItems, a member of class IWebSessionValues.
	GetValue (see page 19781)	This is GetValue, a member of class IWebSessionValues.
	SetValue (see page 19781)	This is SetValue, a member of class IWebSessionValues.

135.2.79.2.1 IWebSessionValues.GetItemCount Method

Pascal

```
function GetItemCount: Integer;
```

C++

```
__fastcall int GetItemCount();
```

Description

This is GetItemCount, a member of class IWebSessionValues.

135.2.79.2.2 IWebSessionValues.GetItems Method

Pascal

```
procedure GetItems(var AItems: TAbstractNamedVariants);
```

C++

```
__fastcall GetItems(TAbstractNamedVariants AItems);
```

Description

This is GetItems, a member of class IWebSessionValues.

135.2.79.2.3 IWebSessionValues.GetValue Method

Pascal

```
function GetValue(const AName: string): Variant;
```

C++

```
__fastcall Variant GetValue(const AnsiString AName);
```

Description

This is GetValue, a member of class IWebSessionValues.

135.2.79.2.4 IWebSessionValues.SetValue Method

Pascal

```
procedure SetValue(const AName: string; const AValue: Variant);
```

C++

```
__fastcall SetValue(const AnsiString AName, const Variant AValue);
```

Description

This is SetValue, a member of class IWebSessionValues.

135.2.79.3 IWebSessionValues Properties

The properties of the IWebSessionValues class are listed here.

Public Properties

	Name	Description
	Values (see page 19782)	This is Values, a member of class IWebSessionValues.

135.2.79.3.1 IWebSessionValues.Values Property

Pascal

```
property Values [const AName: string]: Variant;
```

C++

```
__property Variant Values[AnsiString const AName];
```

Description

This is Values, a member of class IWebSessionValues.

135.2.80 IWebSetActionName Interface

Class Hierarchy

SiteComp.IWebSetActionName

Pascal

```
IWebSetActionName = interface;
```

C++

```
__interface IWebSetActionName;
```

File

SiteComp

Description

This is class SiteComp.IWebSetActionName.

135.2.80.1 IWebSetActionName Members

The following tables list the members exposed by IWebSetActionName.

Public Methods

	Name	Description
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.

135.2.80.2 IWebSetActionName Methods

The methods of the IWebSetActionName class are listed here.

Public Methods

	Name	Description
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.

135.2.80.2.1 IWebSetActionName.SetActionName Method

Pascal

```
procedure SetActionName(const AFieldName: string);
```

C++

```
__fastcall SetActionName(const AnsiString AFieldName);
```

Description

This is SetActionName, a member of class IWebSetActionName.

135.2.81 IWebSetFieldName Interface

Class Hierarchy

SiteComp.IWebSetFieldName

Pascal

```
IWebSetFieldName = interface;
```

C++

```
__interface IWebSetFieldName;
```

File

SiteComp

Description

This is class SiteComp.IWebSetFieldName.

135.2.81.1 IWebSetFieldName Members

The following tables list the members exposed by IWebSetFieldName.

Public Methods

	Name	Description
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.

135.2.81.2 IWebSetFieldName Methods

The methods of the IWebSetFieldName class are listed here.

Public Methods

	Name	Description
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.

135.2.81.2.1 IWebSetFieldName.SetFieldName Method

Pascal

```
procedure SetFieldName(const AFieldName: string);
```

C++

```
__fastcall SetFieldName(const AnsiString AFieldName);
```

Description

This is SetFieldName, a member of class IWebSetFieldName.

135.2.82 IWebUserList Interface

IWebUserList is the interface for validating user logins and access rights.

Class Hierarchy

SiteComp.IWebUserList

Pascal

```
IWebUserList = interface;
```

C++

```
__interface IWebUserList;
```

File

SiteComp

Description

The TWebUserList component implements IWebUserList. This interface, which the TWebAppComponents object publishes, allows the WebSnap application to check whether a user supplied the correct password when logging in and whether the user has rights to perform the operation requested in an HTTP request message.

Note: In C++, method declarations that use IWebUserList use the _di_IWebUserList type instead. This type is a DelphiInterface wrapper around the IWebUserList interface:

Note: typedef System::DelphiInterface (see page 22167)< IWebUserList > _di_IWebUserList;

See Also

TWebUserList (see page 25625)

TCustomWebAppComponents (see page 24906)

TWebAPpComponents

135.2.82.1 IWebUserList Members

The following tables list the members exposed by IWebUserList.

Public Methods

	Name	Description
	CheckAccessRights (see page 19785)	Checks whether a specified user has a given access rights string.
	ValidateUser (see page 19785)	Validates a user login.

135.2.82.2 IWebUserList Methods

The methods of the IWebUserList class are listed here.

Public Methods

	Name	Description
	CheckAccessRights (see page 19785)	Checks whether a specified user has a given access rights string.
	ValidateUser (see page 19785)	Validates a user login.

135.2.82.2.1 IWebUserList.CheckAccessRights Method

Checks whether a specified user has a given access rights string.

Pascal

```
function CheckAccessRights(UserID: Variant; Rights: string): Boolean;
```

C++

```
__fastcall Boolean CheckAccessRights(Variant UserID, AnsiString Rights);
```

Description

Call CheckAccessRights to determine whether the current end user is authorized to view Web pages or adapters whose access rights string is Rights. The end user must be logged in before CheckAccessRights can determine the user's access rights.

UserID is the user ID of the user to check.

Rights is the access rights string that CheckAccessRights must look for. Typically, this is the value of the ViewRights property on a Web page information object that describes the page the user wants to access or on an adapter that the user wants to call.

See Also

HasViewRights (see page 24112)

HasModifyRights (see page 24112)

HasExecuteRights (see page 24111)

ViewAccess (see page 15069)

ViewAccess (see page 24183)

135.2.82.2.2 IWebUserList.ValidateUser Method

Validates a user login.

Pascal

```
function ValidateUser(Strings: TStrings): Variant;
```

C++

```
__fastcall Variant ValidateUser(TStrings Strings);
```

Description

Call ValidateUser to check whether the information a user supplies on login matches a user in the user list.

Strings is a string list that lists the information that the user supplied when logging in. Each entry in the string list is of the form Name=Value. Typically, the names of strings in the list are 'UserName' and 'Password'.

If the login information is valid, ValidateUser returns the UserID of the identified user. Otherwise, ValidateUser returns an unassigned Variant.

See Also

CheckAccessRights (see page 19785)

135.2.83 IWebValueIsEqual Interface

Class Hierarchy

SiteComp.IWebValueIsEqual

Pascal

```
IWebValueIsEqual = interface;
```

C++

```
__interface IWebValueIsEqual;
```

File

SiteComp

Description

This is class SiteComp.IWebValueIsEqual.

135.2.83.1 IWebValueIsEqual Members

The following tables list the members exposed by IWebValueIsEqual.

Public Methods

	Name	Description
	IsEqual (see page 19787)	This is IsEqual, a member of class IWebValueIsEqual.

135.2.83.2 IWebValueIsEqual Methods

The methods of the IWebValueIsEqual class are listed here.

Public Methods

	Name	Description
	IsEqual (see page 19787)	This is IsEqual, a member of class IWebValueIsEqual.

135.2.83.2.1 IWebValueIsEqual.IsEqual Method

Pascal

```
function IsEqual(const Value: Variant): Boolean;
```

C++

```
__fastcall Boolean IsEqual(const Variant Value);
```

Description

This is IsEqual, a member of class IWebValueIsEqual.

135.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	FullyQualifiedFieldName (see page 19788)	This is function SiteComp.FullyQualifiedFieldName.
	FullyQualifiedName (see page 19788)	This is function SiteComp.FullyQualifiedName.

135.3.1 SiteComp.FullyQualifiedFieldName Function

Pascal

```
function FullyQualifiedFieldName(AComponent: TComponent): string;
```

C++

```
AnsiString FullyQualifiedFieldName(TComponent * AComponent);
```

File

SiteComp

Description

This is function SiteComp.FullyQualifiedFieldName.

135.3.2 SiteComp.FullyQualifiedName Function

Pascal

```
function FullyQualifiedName(AComponent: TComponent; AOption: TQualifyOption): string;
```

C++

```
AnsiString FullyQualifiedName(TComponent * AComponent, TQualifyOption AOption);
```

File

SiteComp

Description

This is function SiteComp.FullyQualifiedName.

135.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAdapterActionHTMLElementType (see page 19789)	This is record SiteComp.TAdapterActionHTMLElementType.
	TAdapterDisplayCharacteristic (see page 19789)	This is record SiteComp.TAdapterDisplayCharacteristic.
	TAdapterDisplayHTMLElementType (see page 19790)	This is record SiteComp.TAdapterDisplayHTMLElementType.
	TAdapterDisplayViewModeType (see page 19790)	This is record SiteComp.TAdapterDisplayViewModeType.
	TAdapterInputHTMLElementType (see page 19791)	This is record SiteComp.TAdapterInputHTMLElementType.
	TAdapterItemRequestParamOption (see page 19792)	This is record SiteComp.TAdapterItemRequestParamOption.
	TDispatchPageFlag (see page 19792)	This is record SiteComp.TDispatchPageFlag.
	TQualifyOption (see page 19792)	This is record SiteComp.TQualifyOption.

135.4.1 SiteComp.TAdapterActionHTMLElementType Enumeration

Pascal

```
TAdapterActionHTMLElementType = (
  htmlaButton,
  htmlaImage,
  htmlaAnchor,
  htmlaEventImages
);
```

C++

```
enum TAdapterActionHTMLElementType {
  htmlaButton,
  htmlaImage,
  htmlaAnchor,
  htmlaEventImages
};
```

File

SiteComp

Description

This is record SiteComp.TAdapterActionHTMLElementType.

135.4.2 SiteComp.TAdapterDisplayCharacteristic Enumeration

Pascal

```
TAdapterDisplayCharacteristic = (
```

```
    dcMultipleRecordView,
    dcCurrentRecordView,
    dcChangeCurrentRecordView
  );
```

C++

```
  enum TAdapterDisplayCharacteristic {
    dcMultipleRecordView,
    dcCurrentRecordView,
    dcChangeCurrentRecordView
  };
```

File

SiteComp

Description

This is record SiteComp.TAdapterDisplayCharacteristic.

135.4.3 SiteComp.TAdapterDisplayHTMLElementType Enumeration

Pascal

```
  TAdapterDisplayHTMLElementType = (
    htmldText,
    htmldImage,
    htmldList,
    htmldNone
  );
```

C++

```
  enum TAdapterDisplayHTMLElementType {
    htmldText,
    htmldImage,
    htmldList,
    htmldNone
  };
```

File

SiteComp

Description

This is record SiteComp.TAdapterDisplayHTMLElementType.

135.4.4 SiteComp.TAdapterDisplayViewModeType Enumeration

Pascal

```
  TAdapterDisplayViewModeType = (
    htmlvmInput,
    htmlvmDisplay,
    htmlvmToggleOnAccess,
```

```
    htmlvmNone
  );
```

C++

```
  enum TAdapterDisplayViewModeType {
    htmlvmInput,
    htmlvmDisplay,
    htmlvmToggleOnAccess,
    htmlvmNone
  };
```

File

SiteComp

Description

This is record SiteComp.TAdapterDisplayViewModeType.

135.4.5 SiteComp.TAdapterInputHTMLElementType Enumeration

Pascal

```
  TAdapterInputHTMLElementType = (
    htmliNone,
    htmliTextInput,
    htmliPasswordInput,
    htmliSelect,
    htmliSelectMultiple,
    htmliRadio,
    htmliCheckBox,
    htmliTextArea,
    htmliFile
  );
```

C++

```
  enum TAdapterInputHTMLElementType {
    htmliNone,
    htmliTextInput,
    htmliPasswordInput,
    htmliSelect,
    htmliSelectMultiple,
    htmliRadio,
    htmliCheckBox,
    htmliTextArea,
    htmliFile
  };
```

File

SiteComp

Description

This is record SiteComp.TAdapterInputHTMLElementType.

135.4.6 SiteComp.TAdapterItemRequestParamOption Enumeration

Pascal

```
TAdapterItemRequestParamOption = (
  roExcludeID
);
```

C++

```
enum TAdapterItemRequestParamOption {
  roExcludeID
};
```

File

SiteComp

Description

This is record SiteComp.TAdapterItemRequestParamOption.

135.4.7 SiteComp.TDispatchPageFlag Enumeration

Pascal

```
TDispatchPageFlag = (
  dpPublished
);
```

C++

```
enum TDispatchPageFlag {
  dpPublished
};
```

File

SiteComp

Description

This is record SiteComp.TDispatchPageFlag.

135.4.8 SiteComp.TQualifyOption Enumeration

Pascal

```
TQualifyOption = (
  qaUseModulesVar,
  qaNoModulesVar,
  qaNoModuleName
);
```

C++

```
enum TQualifyOption {
  qaUseModulesVar,
  qaNoModulesVar,
  qaNoModuleName
};
```

File

SiteComp

Description

This is record SiteComp.TQualifyOption.

135.5 Types

The following table lists types in this documentation.

Types

Name	Description
TAdapterDisplayCharacteristics (see page 19794)	This is type SiteComp.TAdapterDisplayCharacteristics.
TAdapterItemRequestParamOptions (see page 19794)	This is type SiteComp.TAdapterItemRequestParamOptions.
TDispatchPageFlags (see page 19795)	This is type SiteComp.TDispatchPageFlags.
TSessionID (see page 19795)	This is type SiteComp.TSessionID.

135.5.1 SiteComp.TAdapterDisplayCharacteristics Type

Pascal

```
TAdapterDisplayCharacteristics = set of TAdapterDisplayCharacteristic;
```

C++

```
TAdapterDisplayCharacteristic TAdapterDisplayCharacteristics;
```

File

SiteComp

Description

This is type SiteComp.TAdapterDisplayCharacteristics.

135.5.2 SiteComp.TAdapterItemRequestParamOptions Type

Pascal

```
TAdapterItemRequestParamOptions = set of TAdapterItemRequestParamOption;
```

C++

```
TAdapterItemRequestParamOption TAdapterItemRequestParamOptions;
```

File

SiteComp

Description

This is type SiteComp.TAdapterItemRequestParamOptions.

135.5.3 SiteComp.TDispatchPageFlags Type

Pascal

```
TDispatchPageFlags = set of TDispatchPageFlag;
```

C++

```
TDispatchPageFlag TDispatchPageFlags;
```

File

SiteComp

Description

This is type SiteComp.TDispatchPageFlags.

135.5.4 SiteComp.TSessionID Type

Pascal

```
TSessionID = type string;
```

C++

```
type string TSessionID;
```

File

SiteComp

Description

This is type SiteComp.TSessionID.

135.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
ExecuteScript (see page 19796)	This is variable SiteComp.ExecuteScript.
GetHTMLSampleImage (see page 19796)	This is variable SiteComp.GetHTMLSampleImage.
IDEFileManager (see page 19797)	This is variable SiteComp.IDEFileManager.
InetFileTypes (see page 19797)	This is variable SiteComp.InetFileTypes.
InternetEnvOptions (see page 19797)	This is variable SiteComp.InternetEnvOptions.
ScriptDebugger (see page 19798)	This is variable SiteComp.ScriptDebugger.

135.6.1 SiteComp.ExecuteScript Variable

Pascal

```
ExecuteScript: IInternetExecuteScript = nil;
```

C++

```
IInternetExecuteScript ExecuteScript = nil;
```

File

SiteComp

Description

This is variable SiteComp.ExecuteScript.

135.6.2 SiteComp.GetHTMLSampleImage Variable

Pascal

```
GetHTMLSampleImage: function: string = nil;
```

C++

```
function: string GetHTMLSampleImage = nil;
```

File

SiteComp

Description

This is variable SiteComp.GetHTMLSampleImage.

135.6.3 SiteComp.IDEFileManager Variable

Pascal

```
IDEFileManager: IIDEFileManager = nil;
```

C++

```
IIDEFileManager IDEFileManager = nil;
```

File

SiteComp

Description

This is variable SiteComp.IDEFileManager.

135.6.4 SiteComp.InetFileTypes Variable

Pascal

```
InetFileTypes: IInternetFileTypes = nil;
```

C++

```
IInternetFileTypes InetFileTypes = nil;
```

File

SiteComp

Description

This is variable SiteComp.InetFileTypes.

135.6.5 SiteComp.InternetEnvOptions Variable

Pascal

```
InternetEnvOptions: IInternetEnvOptions = nil;
```

C++

```
IInternetEnvOptions InternetEnvOptions = nil;
```

File

SiteComp

Description

This is variable SiteComp.InternetEnvOptions.

135.6.6 SiteComp.ScriptDebugger Variable

Pascal

```
ScriptDebugger: IInternetScriptDebugger = nil;
```

C++

```
IInternetScriptDebugger ScriptDebugger = nil;
```

File

SiteComp

Description

This is variable SiteComp.ScriptDebugger.

135.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
AdapterActionHTMLElementTypeNames (see page 19799)	This is constant SiteComp.AdapterActionHTMLElementTypeNames.
AdapterDisplayHTMLElementTypeNames (see page 19799)	This is constant SiteComp.AdapterDisplayHTMLElementTypeNames.
AdapterDisplayViewModeTypeNames (see page 19800)	This is constant SiteComp.AdapterDisplayViewModeTypeNames.
AdapterInputHTMLElementTypeNames (see page 19800)	This is constant SiteComp.AdapterInputHTMLElementTypeNames.

135.7.1 SiteComp.AdapterActionHTMLElementTypeNames Constant

Pascal

```
AdapterActionHTMLElementTypeNames: array[TAdapterActionHTMLElementType] of string = ('Button',
'Image', 'Anchor', 'EventImages');
```

C++

```
array[TAdapterActionHTMLElementType] of string AdapterActionHTMLElementTypeNames = ('Button',
'Image', 'Anchor', 'EventImages');
```

File

SiteComp

Description

This is constant SiteComp.AdapterActionHTMLElementTypeNames.

135.7.2 SiteComp.AdapterDisplayHTMLElementTypeNames Constant

Pascal

```
AdapterDisplayHTMLElementTypeNames: array[TAdapterDisplayHTMLElementType] of string = ('Text',
'Image', 'List', '');
```

C++

```
array[TAdapterDisplayHTMLElementType] of string AdapterDisplayHTMLElementTypeNames = ('Text',
'Image', 'List', '');
```

File

SiteComp

Description

This is constant SiteComp.AdapterDisplayHTMLElementTypeNames.

135.7.3 SiteComp.AdapterDisplayViewModeTypeNames Constant

Pascal

```
AdapterDisplayViewModeTypeNames: array[TAdapterDisplayViewModeType] of string = ('Input',
'Display', 'ToggleOnAccess', '');
```

C++

```
array[TAdapterDisplayViewModeType] of string AdapterDisplayViewModeTypeNames = ('Input',
'Display', 'ToggleOnAccess', '');
```

File

SiteComp

Description

This is constant SiteComp.AdapterDisplayViewModeTypeNames.

135.7.4 SiteComp.AdapterInputHTMLElementTypeNames Constant

Pascal

```
AdapterInputHTMLElementTypeNames: array[TAdapterInputHTMLElementType] of string = ('',
'TextInput', 'PasswordInput', 'Select', 'SelectMultiple', 'Radio', 'CheckBox', 'TextArea',
'File');
```

C++

```
array[TAdapterInputHTMLElementType] of string AdapterInputHTMLElementTypeNames = ('',
'TextInput', 'PasswordInput', 'Select', 'SelectMultiple', 'Radio', 'CheckBox', 'TextArea',
'File');
```

File

SiteComp

Description

This is constant SiteComp.AdapterInputHTMLElementTypeNames.

136 SiteProd Namespace

This is namespace SiteProd.

Topics

Name	Description
Classes (see page 19802)	The following table lists classes in this documentation.

Classes

	Name	Description
	TAdapterPageProducer (see page 19802)	TAdapterPageProducer generates the proper HTML and server-side script needed to display adapter fields and execute adapter actions.
	TBaseAdapterPageProducer (see page 19813)	TBaseAdapterPageProducer generates the proper HTML and JavaScript needed to display adapter fields and execute adapter actions.
	TCustomAdapterPageProducer (see page 19832)	tcustomadapterpageproducer generates the proper HTML and JavaScript needed to display adapter fields and execute adapter actions.
	TSitePageElements (see page 19844)	TSitePageElements stores part of the content that page producers generate.

136.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TAdapterPageProducer (see page 19802)	TAdapterPageProducer generates the proper HTML and server-side script needed to display adapter fields and execute adapter actions.
	TBaseAdapterPageProducer (see page 19813)	TBaseAdapterPageProducer generates the proper HTML and JavaScript needed to display adapter fields and execute adapter actions.
	TCustomAdapterPageProducer (see page 19832)	tcustomadapterpageproducer generates the proper HTML and JavaScript needed to display adapter fields and execute adapter actions.
	TSitePageElements (see page 19844)	TSitePageElements stores part of the content that page producers generate.

136.1.1 TAdapterPageProducer Class

TAdapterPageProducer generates the proper HTML and server-side script needed to display adapter fields and execute adapter actions.

Class Hierarchy

Pascal

```
TAdapterPageProducer = class(TCustomAdapterPageProducer);
```

C++

```
class TAdapterPageProducer : public TCustomAdapterPageProducer;
```

File

SiteProd

Description

TAdapterPageProducer creates an HTML page using content it obtains from a hierarchy of components called Web items. Add components to this hierarchy to define HTML forms and tables. For example, to create an HTML form with a grid, add a TAdapterForm and TAdapterGrid components. The Web items that appear in the TAdapterPageProducer's hierarchy use Adapter components to fetch the information that they display.

Use the Web Page Module wizard to create a web page that uses the TAdapterPageProducer. You can select TAdapterPageProducer from the drop-down list at the top of the Web Page Module wizard, or add a TAdapterPageProducer component to an existing web page modue.

Web page modules that use the TAdapterPageProducer provide an editor view called HTML Script. Use this view to see the HTML Script that TAdapterPageProducer generates. The script generated by TAdapterPageProducer is not editable. However, you can copy the generated script from the HTML Script view to a new Web Page Module. You can then edit the copy of the script in the code editor or with an external HTML editor that supports embedded script tags (for example <% %>).

TAdapterPageProducer uses a template that contains the following special tags:

<#STYLES> - This tag is replaced by the stylesheet defined by the Styles (see page 19810) or StylesFile (see page 19811) property.

<#WARNINGS> - This tag is replaced with design time warnings that indicate possible problems with the hierarchy of web items.

<#SERVERSCRIPT> - This tag is replaced with the generated HTML/JavaScript. The TAdapterPageProducer will not generate any content if this tag is missing.

See Also

TAdapter (see page 23713)

TAdapterForm (see page 25159)

TAdapterGrid (see page 25175)

Page Producers

Server-side Scripting in WebSnap

136.1.1.1 TAdapterPageProducer Members

The following tables list the members exposed by TAdapterPageProducer.

Protected Events

	Name	Description
	OnHTMLTag (see page 15280)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 19820)	Specifies whether a Web item of a specified type can be added to the WebPageItems property list.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreatePageElements (see page 19821)	Creates the object that implements the PageElements (see page 19830) property.
V	DeclareStyles (see page 19821)	Returns an HTML Styles (see page 19830) tag that declares the styles specified by the Styles (see page 19830) or StylesFile (see page 19831) property.
V	DeclareWarnings (see page 19821)	Returns the formatted warnings that appear at design time to indicate the status of content generation.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAfterGetContent (see page 19822)	Generates an OnAfterGetContent (see page 19832) event.
	DoBeforeGetContent (see page 19822)	Generates an OnBeforeGetContent (see page 19832) event.
V	DoTagEvent (see page 5618)	This is DoTagEvent, a member of class TComponentsPageProducer.
	DoTagEvent (see page 15276)	This is DoTagEvent, a member of class TBasePageProducer.
V	DoTagEvent (see page 19822)	Translates HTML-transparent tags in the template.
V	FindComponent (see page 5619)	This is FindComponent, a member of class TComponentsPageProducer.
	FindComponentName (see page 5619)	This is FindComponentName, a member of class TComponentsPageProducer.
V	GeneratePageElements (see page 19823)	Fills the PageElements (see page 19830) property with information based on the other properties of the adapter Page Producer.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 18381)	This is GetChildren, a member of class TBasePageItemsProducer.
V	GetComponentContent (see page 5619)	This is GetComponentContent, a member of class TComponentsPageProducer.
	GetComponentList (see page 18382)	This is GetComponentList, a member of class TBasePageItemsProducer.
V	GetContentOptions (see page 5619)	This is GetContentOptions, a member of class TComponentsPageProducer.
V	GetContentOptions (see page 19823)	Returns an object that influences how the page producer generates its content.
	GetDefaultComponentList (see page 18382)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
V	GetDefaultTemplate (see page 19824)	Returns the default template that the page producer can use to generate content.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
V	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 15277)	This is GetTemplateFileName, a member of class TBasePageProducer.
V	GetTemplateFileName (see page 19839)	Returns the value of the HTMLFile (see page 19843) property.
	GetTemplateFileType (see page 19825)	Returns the type of file that can store the templates this object uses to generate its content.
V	GetTemplateStream (see page 15277)	This is GetTemplateStream, a member of class TBasePageProducer.
V	GetTemplateStream (see page 19840)	Returns a stream from which to read the HTML template that this producer uses.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXMLData (see page 19825)	Returns a stream for reading any XML data associated with the page producer.
	GetXSLData (see page 19826)	Returns a stream for reading an XSL template associated with the page producer.
V	HandleScriptTag (see page 15277)	This is HandleScriptTag, a member of class TBasePageProducer.
V	HandleScriptTag (see page 19826)	Translates HTML-transparent tags for an associated server-side script.
V	HandleTag (see page 5620)	This is HandleTag, a member of class TComponentsPageProducer.
V	HandleTag (see page 15278)	This is HandleTag, a member of class TBasePageProducer.

	HasHTMLBrowserView (see page 19827)	Indicates whether the IDE should display an HTML browser view for the producer's content.
	HasScriptView (see page 19827)	Indicates whether the IDE should display an associated server-side script.
	HasXMLBrowserView (see page 19827)	Indicates whether the IDE should display an XML tree view for any XML data associated with the page producer.
	HasXSLBrowserView (see page 19828)	Indicates whether the IDE should display an XSL tree view for an XSL template associated with the page producer.
V	ImplCanAddClass (see page 19828)	Provides the underlying implementation for the CanAddClass (see page 19820) method.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 18382)	This is SetChildOrder, a member of class TBasePageItemsProducer.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHTMLDoc (see page 19840)	Sets the HTMLDoc (see page 19842) property.
	SetHTMLFile (see page 19840)	Sets the HTMLFile (see page 19843) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetWebContentOptions (see page 19829)	Sets the options that limit how the page producer creates its generated HTML.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
V	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebContent (see page 19841)	Returns the HTML document assembled by the Adapter page producer.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	PageElements (see page 19830)	Stores information that the Adapter page producer uses when generating its content.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Content (see page 15106)	Returns the content produced by the content producer.
V	Content (see page 15274)	Returns the content produced by the content producer.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
V	ContentFromStream (see page 15275)	Returns the content produced in response to input read from a stream.
V	ContentFromStream (see page 19820)	Returns the content produced using a template read from a stream.
V	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
V	ContentFromString (see page 15275)	Returns the content produced in response to an input string.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 15274)	Creates an instance of TBasePageProducer (see page 15269).
V	Create (see page 18380)	Creates an instance of a TBasePageItemsProducer (see page 18376).
V	Create (see page 19818)	Creates and initializes an instance of TBaseAdapterPageProducer (see page 19813).
V	Create (see page 19838)	Creates and initializes an instance of TCustomAdapterPageProducer (see page 19832).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 18381)	Destroys the instance of the TBasePageItemsProducer (see page 18376).
V	Destroy (see page 19818)	Frees an instance of TBaseAdapterPageProducer (see page 19813).
V	Destroy (see page 19839)	Frees an instance of TCustomAdapterPageProducer (see page 19832).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.

	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	GetRequiredTags (see page 19824)	Returns the HTML-transparent tags that the adapter page producer requires to have present in its template.
	GetScriptEngines (see page 19825)	Returns a list of script engines that can work with server-side scripts that produce content for the page producer.
	GetTemplateFileType (see page 24780)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetXMLData (see page 24780)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 24780)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 24780)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasScriptView (see page 24780)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 24781)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 24781)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetStyles (see page 19829)	Assigns a value to the Styles (see page 19830) property.
	SetStylesFile (see page 19829)	Assigns a value to the StylesFile (see page 19831) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetWebContentOptions (see page 24782)	This is SetWebContentOptions, a member of class ISetWebContentOptions.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.

R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ScriptEngine (see page 15279)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 15279)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.

Published Events

	Name	Description
	OnAfterGetContent (see page 19812)	Occurs after the page producer generates its content.
	OnBeforeGetContent (see page 19812)	Occurs before the page producer generates its content.
	OnHTMLTag (see page 5620)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Published Properties

	Name	Description
	HTMLDoc (see page 19808)	Specifies the HTML template used to generate the value that the Content method returns.
	HTMLFile (see page 19809)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Styles (see page 19810)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 19811)	Specifies a file containing the individual styles for the page producer's style sheet.
	Tag (see page 2808)	Stores an integer value as part of a component.
	WebPageItems (see page 19811)	Maintains a list of components that generate HTML content for the producer.

136.1.1.2 TAdapterPageProducer Properties

The properties of the TAdapterPageProducer class are listed here.

Published Properties

	Name	Description
	HTMLDoc (see page 19808)	Specifies the HTML template used to generate the value that the Content method returns.
	HTMLFile (see page 19809)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
	Styles (see page 19810)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 19811)	Specifies a file containing the individual styles for the page producer's style sheet.
	WebPageItems (see page 19811)	Maintains a list of components that generate HTML content for the producer.

136.1.1.2.1 TAdapterPageProducer.HTMLDoc Property

Specifies the HTML template used to generate the value that the Content method returns.

Pascal

```
property HTMLDoc: TStrings;
```

C++

```
__property TStrings HTMLDoc;
```

Description

Set HTMLDoc to a set of strings that make up the HTML template. By default, HTMLDoc is initialized to the following template:

```
<HTML>
<HEAD>
</HEAD>
<BODY>
<#STYLES> <#WARNINGS> <#SERVERSCRIPT>
</BODY>
</HTML>
```

Each string is a sequence of one or more HTML commands or HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. TCustomAdapterPageProducer automatically handles the conversion of the HTML-transparent tags in the default template as follows:

<#STYLES> - This tag is replaced by the stylesheet defined by the Styles or StylesFile property.

<#WARNINGS> - This tag is replaced with design time warnings that indicate possible problems with the hierarchy of web items.

<#SERVERSCRIPT> - This tag is replaced with generated HTML/JavaScript based on the hierarchy of Web items. TCustomAdapterPageProducer will not generate any content if this tag is missing.

If you set HTMLDoc to include other HTML-transparent tags, you must translate these in an OnHTMLTag event handler.

Note: Setting HTMLDoc clears the HTMLFile property.

See Also

Content (see page 15274)

HTMLFile (see page 19843)

OnHTMLTag (see page 15280)

136.1.1.2.2 TAdapterPageProducer.HTMLFile Property

Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLFile: TFileName;
```

C++

```
__property TFileName HTMLFile;
```

Description

Set HTMLFile to the name of the file that contains an HTML template. The HTML template is a sequence of HTML commands and HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLFile clears the HTMLDoc property.

Note: When distributing applications that contain page producers which use the HTMLFile property, be sure to distribute the file along with the application. Also, be sure that the value of HTMLFile does not include a hard-coded path name that will not be available on the user's disk.

See Also

Content (see page 15274)

HTMLDoc (see page 19842)

OnHTMLTag (see page 15280)

136.1.1.2.3 TAdapterPageProducer.Styles Property

Defines the styles that can be used by the page producer and its Web items.

Pascal

```
property Styles: TStrings;
```

C++

```
__property TStrings Styles;
```

Description

Use Styles to define a style sheet for the HTML document produced by TBaseAdapterPageProducer. Each string in the TStrings object specifies a specific style by giving a style selector followed by a set of attributes in curly braces. These definitions can define styles for standard HTML elements such as

```
H2 B  {color: red}
```

or they can define styles that you name, such as

```
.MyStyle  {font-family: arial; font-weight: bold; font-size: 18px }
```

Note that user-defined style names must begin with a dot.

Styles for standard elements are applied automatically to HTML that uses the tag or tags that form the style selector. User-defined styles can be applied by setting the StyleRule property of a Web item to the user-defined style name that forms the

selector.

Note: If you are sharing a set of styles between multiple page producers or multiple applications, you can define the styles in a file. To define the styles in a file, use the StylesFile property instead. If StylesFile is defined, it takes precedence over the Styles property.

See Also

StylesFile (see page 19831)

Content (see page 15274)

136.1.1.2.4 TAdapterPageProducer.StylesFile Property

Specifies a file containing the individual styles for the page producer's style sheet.

Pascal

```
property StylesFile: TFileName;
```

C++

```
__property TFileName StylesFile;
```

Description

Set StylesFile to the name of a file containing the style definitions used by the page producer. The page producer uses these style definitions to declare a style sheet in the HTML document it generates.

Styles for standard elements are applied automatically to HTML in the document. User-defined styles can be applied by setting the StyleRule property of a Web item to the user-defined style name that forms the selector of a style definition.

Note: If the StylesFile property is not set, you can specify the style definitions using the Styles property instead.

See Also

Styles (see page 19830)

Content (see page 15274)

136.1.1.2.5 TAdapterPageProducer.WebPageItems Property

Maintains a list of components that generate HTML content for the producer.

Pascal

```
property WebPageItems: TWebComponentList;
```

C++

```
__property TWebComponentList WebPageItems;
```

Description

WebPageItems lists the components that generate content for the page items producer. Each of these components supports the IWebContent interface, and can contain its own list of Web items that help it generate its content.

The type of items that can be added to the WebPageItems list are restricted by a protected method that is abstract or, in C++ terminology, pure virtual in TBasePageItemsProducer. Descendant classes implement this protected method to indicate what types of items can be added to the list.

At design time, use the Web page editor to add components to the WebPageItems property.

Note: Typically, WebPageItems lists all the components that generate content for the page items producer, in the order that the generated content appears in the final HTML document. However, the page items producer can transform COMPONENT tags in

its template using components that are not in this list, as long as they have the same owner as the page items producer..

136.1.1.3 TAdapterPageProducer Events

The events of the TAdapterPageProducer class are listed here.

Published Events

	Name	Description
	OnAfterGetContent (see page 19812)	Occurs after the page producer generates its content.
	OnBeforeGetContent (see page 19812)	Occurs before the page producer generates its content.

136.1.1.3.1 TAdapterPageProducer.OnAfterGetContent Event

Occurs after the page producer generates its content.

Pascal

```
property OnAfterGetContent: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAfterGetContent;
```

Description

Write an OnAfterGetContent event handler to take specific action immediately after the producer generates its content.

See Also

ContentFromStream (see page 19820)

OnBeforeGetContent (see page 19832)

136.1.1.3.2 TAdapterPageProducer.OnBeforeGetContent Event

Occurs before the page producer generates its content.

Pascal

```
property OnBeforeGetContent: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnBeforeGetContent;
```

Description

Write an OnBeforeGetContent event handler to take specific action immediately before the producer generates its content.

See Also

ContentFromStream (see page 19820)

OnAfterGetContent (see page 19832)

136.1.2 TBaseAdapterPageProducer Class

TBaseAdapterPageProducer generates the proper HTML and JavaScript needed to display adapter fields and execute adapter actions.

Class Hierarchy

Pascal

```
TBaseAdapterPageProducer = class(TBasePageItemsProducer, IWebComponentEditor,
ISetWebContentOptions, IProducerEditorViewSupport);
```

C++

```
class TBaseAdapterPageProducer : public TBasePageItemsProducer, public IWebComponentEditor,
public ISetWebContentOptions, public IProducerEditorViewSupport;
```

File

SiteProd

Description

TBaseAdapterPageProducer creates an HTML page using content it obtains from a hierarchy of components called Web items. The Web items that appear in the TBaseAdapterPageProducer's hierarchy use Adapter components to fetch the information that they display.

Use TBaseAdapterPageProducer as a base class for page producer components that assemble their content from Web items that use Adapter components. TBaseAdapterPageProducer implements the logic for converting an HTML template into content it assembles from its hierarchy of Web items.

TBaseAdapterPageProducer implements the logic to translate the following special HTML-transparent tags:

<#STYLES> - This tag is replaced by the stylesheet defined by the Styles (see page 19830) or StylesFile (see page 19831) property.

<#WARNINGS> - This tag is replaced with design time warnings that indicate possible problems with the hierarchy of web items.

<#SERVERSCRIPT> - This tag is replaced with generated HTML/JavaScript based on the hierarchy of Web items.

136.1.2.1 TBaseAdapterPageProducer Members

The following tables list the members exposed by TBaseAdapterPageProducer.

Protected Events

	Name	Description
	OnHTMLTag (see page 15280)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 19820)	Specifies whether a Web item of a specified type can be added to the WebPageItems property list.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreatePageElements (see page 19821)	Creates the object that implements the PageElements (see page 19830) property.
V	DeclareStyles (see page 19821)	Returns an HTML Styles (see page 19830) tag that declares the styles specified by the Styles (see page 19830) or StylesFile (see page 19831) property.
V	DeclareWarnings (see page 19821)	Returns the formatted warnings that appear at design time to indicate the status of content generation.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAfterGetContent (see page 19822)	Generates an OnAfterGetContent (see page 19832) event.
	DoBeforeGetContent (see page 19822)	Generates an OnBeforeGetContent (see page 19832) event.
V	DoTagEvent (see page 19822)	Translates HTML-transparent tags in the template.
V	FindComponent (see page 5619)	This is FindComponent, a member of class TComponentsPageProducer.
	FindComponentName (see page 5619)	This is FindComponentName, a member of class TComponentsPageProducer.
V	GeneratePageElements (see page 19823)	Fills the PageElements (see page 19830) property with information based on the other properties of the adapter Page Producer.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 18381)	This is GetChildren, a member of class TBasePageItemsProducer.
V	GetComponentContent (see page 5619)	This is GetComponentContent, a member of class TComponentsPageProducer.
	GetComponentList (see page 18382)	This is GetComponentList, a member of class TBasePageItemsProducer.
V	GetContentOptions (see page 19823)	Returns an object that influences how the page producer generates its content.
	GetDefaultComponentList (see page 18382)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
V	GetDefaultTemplate (see page 19824)	Returns the default template that the page producer can use to generate content.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.

	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.
	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
	GetTemplateFileName (see page 15277)	This is GetTemplateFileName, a member of class TBasePageProducer.
	GetTemplateFileType (see page 19825)	Returns the type of file that can store the templates this object uses to generate its content.
	GetTemplateStream (see page 15277)	This is GetTemplateStream, a member of class TBasePageProducer.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXMLData (see page 19825)	Returns a stream for reading any XML data associated with the page producer.
	GetXSLData (see page 19826)	Returns a stream for reading an XSL template associated with the page producer.
	HandleScriptTag (see page 19826)	Translates HTML-transparent tags for an associated server-side script.
	HandleTag (see page 5620)	This is HandleTag, a member of class TComponentsPageProducer.
	HandleTag (see page 15278)	This is HandleTag, a member of class TBasePageProducer.
	HasHTMLBrowserView (see page 19827)	Indicates whether the IDE should display an HTML browser view for the producer's content.
	HasScriptView (see page 19827)	Indicates whether the IDE should display an associated server-side script.
	HasXMLBrowserView (see page 19827)	Indicates whether the IDE should display an XML tree view for any XML data associated with the page producer.
	HasXSLBrowserView (see page 19828)	Indicates whether the IDE should display an XSL tree view for an XSL template associated with the page producer.
	ImplCanAddClass (see page 19828)	Provides the underlying implementation for the CanAddClass (see page 19820) method.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 18382)	This is SetChildOrder, a member of class TBasePageItemsProducer.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetWebContentOptions (see page 19829)	Sets the options that limit how the page producer creates its generated HTML.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.

	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	PageElements (see page 19830)	Stores information that the Adapter page producer uses when generating its content.

Public Events

	Name	Description
	OnAfterGetContent (see page 19832)	Occurs after the page producer generates its content.
	OnBeforeGetContent (see page 19832)	Occurs before the page producer generates its content.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Content (see page 15106)	Returns the content produced by the content producer.
V	Content (see page 15274)	Returns the content produced by the content producer.
V	ContentFromStream (see page 19820)	Returns the content produced using a template read from a stream.
V	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
V	ContentFromString (see page 15275)	Returns the content produced in response to an input string.
V	Create (see page 19818)	Creates and initializes an instance of TBaseAdapterPageProducer (see page 19813).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 19818)	Frees an instance of TBaseAdapterPageProducer (see page 19813).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.

	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	GetRequiredTags (see page 19824)	Returns the HTML-transparent tags that the adapter page producer requires to have present in its template.
	GetScriptEngines (see page 19825)	Returns a list of script engines that can work with server-side scripts that produce content for the page producer.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetStyles (see page 19829)	Assigns a value to the Styles (see page 19830) property.
	SetStylesFile (see page 19829)	Assigns a value to the StylesFile (see page 19831) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.

R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ScriptEngine (see page 15279)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 15279)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	Styles (see page 19830)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 19831)	Specifies a file containing the individual styles for the page producer's style sheet.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.
R	WebPageItems (see page 18382)	Maintains a list of components that generate HTML content for the producer.

Published Events

	Name	Description
	OnHTMLTag (see page 5620)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

136.1.2.2 TBaseAdapterPageProducer.Create Constructor

Creates and initializes an instance of TBaseAdapterPageProducer (see page 19813).

Pascal

```
constructor Create(AComponent: TComponent); override;
```

C++

```
virtual __fastcall TBaseAdapterPageProducer(TComponent * AComponent);
```

Description

Call Create to instantiate an adapter page producer at runtime. Adapter page producers placed in a Web page module at design time (or by the Web page module wizard) are instantiated automatically.

AOwner is a component, typically a Web page module, that becomes the value of the Owner property. The Owner is responsible for freeing the TBaseAdapterPageProducer (see page 19813) instance.

See Also

Owner (see page 2807)

136.1.2.3 TBaseAdapterPageProducer.Destroy Destructor

Frees an instance of TBaseAdapterPageProducer (see page 19813).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBaseAdapterPageProducer();
```

Description

Do not call Destroy directly. Instead, call the Free method, which checks whether the reference to the producer is not nil before calling Destroy.

See Also

Free (see page 22300)

136.1.2.4 TBaseAdapterPageProducer Methods

The methods of the TBaseAdapterPageProducer class are listed here.

Protected Methods

	Name	Description
	CanAddClass (see page 19820)	Specifies whether a Web item of a specified type can be added to the WebPageItems property list.
V	CreatePageElements (see page 19821)	Creates the object that implements the PageElements (see page 19830) property.
V	DeclareStyles (see page 19821)	Returns an HTML Styles (see page 19830) tag that declares the styles specified by the Styles (see page 19830) or StylesFile (see page 19831) property.
V	DeclareWarnings (see page 19821)	Returns the formatted warnings that appear at design time to indicate the status of content generation.
	DoAfterGetContent (see page 19822)	Generates an OnAfterGetContent (see page 19832) event.
	DoBeforeGetContent (see page 19822)	Generates an OnBeforeGetContent (see page 19832) event.
V	DoTagEvent (see page 19822)	Translates HTML-transparent tags in the template.
V	GeneratePageElements (see page 19823)	Fills the PageElements (see page 19830) property with information based on the other properties of the adapter Page Producer.
V	GetContentOptions (see page 19823)	Returns an object that influences how the page producer generates its content.
V	GetDefaultTemplate (see page 19824)	Returns the default template that the page producer can use to generate content.
	GetTemplateFileType (see page 19825)	Returns the type of file that can store the templates this object uses to generate its content.
	GetXMLData (see page 19825)	Returns a stream for reading any XML data associated with the page producer.
	GetXSLData (see page 19826)	Returns a stream for reading an XSL template associated with the page producer.
V	HandleScriptTag (see page 19826)	Translates HTML-transparent tags for an associated server-side script.
	HasHTMLBrowserView (see page 19827)	Indicates whether the IDE should display an HTML browser view for the producer's content.
	HasScriptView (see page 19827)	Indicates whether the IDE should display an associated server-side script.
	HasXMLBrowserView (see page 19827)	Indicates whether the IDE should display an XML tree view for any XML data associated with the page producer.
	HasXSLBrowserView (see page 19828)	Indicates whether the IDE should display an XSL tree view for an XSL template associated with the page producer.
V	ImplCanAddClass (see page 19828)	Provides the underlying implementation for the CanAddClass (see page 19820) method.
	SetWebContentOptions (see page 19829)	Sets the options that limit how the page producer creates its generated HTML.

Public Methods

	Name	Description
V	ContentFromStream (see page 19820)	Returns the content produced using a template read from a stream.
	GetRequiredTags (see page 19824)	Returns the HTML-transparent tags that the adapter page producer requires to have present in its template.
	GetScriptEngines (see page 19825)	Returns a list of script engines that can work with server-side scripts that produce content for the page producer.
	SetStyles (see page 19829)	Assigns a value to the Styles (see page 19830) property.
	SetStylesFile (see page 19829)	Assigns a value to the StylesFile (see page 19831) property.

136.1.2.4.1 TBaseAdapterPageProducer.CanAddClass Method

Specifies whether a Web item of a specified type can be added to the WebPageItems property list.

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

The IDE calls CanAddClass to determine what Web items can be added to supply content for the TBaseAdapterPageProducer (see page 19813) descendant. CanAddClass calls the virtual ImplCanAddClass (see page 19828) method to determine whether a class of Web item is valid.

AParent is the TBaseAdapterPageProducer (see page 19813) descendant to whose WebPageItems property the Web item will be added.

AClass is the class of the proposed child Web item.

CanAddClass returns true if the TBaseAdapterPageProducer (see page 19813) descendant can use content generated by a component of type AClass, false otherwise.

See Also

ImplCanAddClass (see page 19828)

WebPageItems (see page 18382)

136.1.2.4.2 TBaseAdapterPageProducer.ContentFromStream Method

Returns the content produced using a template read from a stream.

Pascal

```
function ContentFromStream(InStream: TStream): string; override;
```

C++

```
virtual __fastcall AnsiString ContentFromStream(TStream InStream);
```

Description

Call ContentFromStream to retrieve the content produced by the adapter page producer based on the template provided by the Stream parameter. ContentFromStream:

1. Generates an OnBeforeGetContent (see page 19832) event.
2. Translates the HTML template that is the value of Stream, using information produced by the items listed in the WebPageItems property.
3. Generates an OnAfterGetContent (see page 19832) event.
4. Returns the HTML produced in step 2.

See Also

Content (see page 15274)

OnBeforeGetContent (see page 19832)

WebPageItems (see page 18382)

OnAfterGetContent (see page 19832)

136.1.2.4.3 TBaseAdapterPageProducer.CreatePageElements Method

Creates the object that implements the PageElements (see page 19830) property.

Pascal

```
function CreatePageElements: TSitePageElements; virtual;
```

C++

```
virtual __fastcall TSitePageElements CreatePageElements();
```

Description

CreatePageElements creates the object that is used as the value of the PageElements (see page 19830) property. This object holds temporary information that the page producer uses to assemble its content.

See Also

PageElements (see page 19830)

GeneratePageElements (see page 19823)

136.1.2.4.4 TBaseAdapterPageProducer.DeclareStyles Method

Returns an HTML Styles (see page 19830) tag that declares the styles specified by the Styles (see page 19830) or StylesFile (see page 19831) property.

Pascal

```
function DeclareStyles: string; virtual;
```

C++

```
virtual __fastcall AnsiString DeclareStyles();
```

Description

The GeneratePageElements (see page 19823) method calls DeclareStyles to generate the HTML that declares a stylesheet in the generated HTML page. DeclareStyles uses the StylesFile (see page 19831) property to determine the styles it declares. If StylesFile (see page 19831) is an empty string, DeclareStyles uses the Styles (see page 19830) property instead. If both StylesFile (see page 19831) and Styles (see page 19830) are set to empty strings, DeclareStyles returns an empty string.

See Also

Styles (see page 19830)

StylesFile (see page 19831)

GeneratePageElements (see page 19823)

136.1.2.4.5 TBaseAdapterPageProducer.DeclareWarnings Method

Returns the formatted warnings that appear at design time to indicate the status of content generation.

Pascal

```
function DeclareWarnings(Warnings: TStrings): string; virtual;
```

C++

```
virtual __fastcall AnsiString DeclareWarnings(TStrings Warnings);
```

Description

The GeneratePageElements (see page 19823) method calls DeclareWarnings to generate the text that describes any design-time warnings. These warnings indicate possible problems with the hierarchy of web items.

See Also

GeneratePageElements (see page 19823)

WebPageItems (see page 18382)

136.1.2.4.6 TBaseAdapterPageProducer.DoAfterGetContent Method

Generates an OnAfterGetContent (see page 19832) event.

Pascal

```
procedure DoAfterGetContent;
```

C++

```
__fastcall DoAfterGetContent();
```

Description

TBaseAdapterPageProducer (see page 19813) calls DoAfterGetContent internally to generate the OnAfterGetContent (see page 19832) event.

See Also

OnAfterGetContent (see page 19832)

136.1.2.4.7 TBaseAdapterPageProducer.DoBeforeGetContent Method

Generates an OnBeforeGetContent (see page 19832) event.

Pascal

```
procedure DoBeforeGetContent;
```

C++

```
__fastcall DoBeforeGetContent();
```

Description

TBaseAdapterPageProducer (see page 19813) calls DoBeforeGetContent internally to generate the OnBeforeGetContent (see page 19832) event.

See Also

OnBeforeGetContent (see page 19832)

136.1.2.4.8 TBaseAdapterPageProducer.DoTagEvent Method

Translates HTML-transparent tags in the template.

Pascal

```
procedure DoTagEvent(Tag: TTag; const TagString: string; TagParams: TStrings; var ReplaceText:
string); override;
```

C++

```
virtual __fastcall DoTagEvent(TTag Tag, const AnsiString TagString, TStrings TagParams,
```

```
AnsiString ReplaceText);
```

Description

When the page producer encounters an HTML-transparent tag in its template, it calls DoTagEvent to translate that tag into the appropriate value. TBaseAdapterPageProducer (see page 19813) overrides the inherited method to handle the <#STYLES>, <#WARNINGS>, and <#SERVERSCRIPT> tags. For any other tags, DoTagEvent generates an OnHTMLTag event.

Tag is the type of HTML-transparent tag that was encountered in the HTML template.

TagString is tag name of the HTML-transparent tag. This is the first string that follows the pound sign (#).

TagParams gives the parameter portion of the HTML-transparent tag. Each string in the TStrings object has the form ParamName=Value.

ReplaceText returns the translated string that should replace the HTML-transparent tag.

See Also

OnHTMLTag (see page 15280)

136.1.2.4.9 TBaseAdapterPageProducer.GeneratePageElements Method

Fills the PageElements (see page 19830) property with information based on the other properties of the adapter Page Producer.

Pascal

```
procedure GeneratePageElements; virtual;
```

C++

```
virtual __fastcall GeneratePageElements();
```

Description

GeneratePageElements assembles information about the styles, warnings, server script, server functions, and server variables that the adapter page producer uses to generate its content. It writes this information into the members of the object that is the value of the PageElements (see page 19830) property.

See Also

PageElements (see page 19830)

136.1.2.4.10 TBaseAdapterPageProducer.GetContentOptions Method

Returns an object that influences how the page producer generates its content.

Pascal

```
function GetContentOptions(var Owned: Boolean): TWebContentOptions; override;
```

C++

```
virtual __fastcall TWebContentOptions GetContentOptions(Boolean Owned);
```

Description

TBaseAdapterPageProducer (see page 19813) calls GetContentOptions internally to look up the options that limit what can be included in the generated HTML.

Owned returns a value that indicates whether the return value should be freed by the caller. If Owned is true, the caller should free the TWebContentOptions object after it has used it.

See Also

SetWebContentOptions (see page 19829)

136.1.2.4.11 TBaseAdapterPageProducer.GetDefaultTemplate Method

Returns the default template that the page producer can use to generate content.

Pascal

```
function GetDefaultTemplate: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetDefaultTemplate();
```

Description

GetDefaultTemplate returns the default template that the page producer can use to generate its content. This template has the form:

```
<HTML>
<HEAD>
</HEAD>
<BODY>
<#STYLES> <#WARNINGS> <#SERVERSCRIPT>
</BODY>
</HTML>
```

TBaseAdapterPageProducer (see page 19813) automatically handles the conversion of the HTML-transparent tags in the default template as follows:

<#STYLES> - This tag is replaced by the stylesheet defined by the Styles (see page 19830) or StylesFile (see page 19831) property.

<#WARNINGS> - This tag is replaced with design time warnings that indicate possible problems with the hierarchy of web items.

<#SERVERSCRIPT> - This tag is replaced with generated HTML/JavaScript based on the hierarchy of Web items.

See Also

Styles (see page 19830)

StylesFile (see page 19831)

136.1.2.4.12 TBaseAdapterPageProducer.GetRequiredTags Method

Returns the HTML-transparent tags that the adapter page producer requires to have present in its template.

Pascal

```
class function GetRequiredTags: string;
```

C++

```
__fastcall AnsiString GetRequiredTags();
```

Description

GetRequiredTags returns a string containing the special tags that the page producer expects to find for generating its content. This method returns the string '<#STYLES> <#WARNINGS> <#SERVERSCRIPT>'.

See Also

ContentFromStream (see page 19820)

136.1.2.4.13 TBaseAdapterPageProducer.GetScriptEngines Method

Returns a list of script engines that can work with server-side scripts that produce content for the page producer.

Pascal

```
class procedure GetScriptEngines(S: TStrings);
```

C++

```
__fastcall GetScriptEngines(TStrings S);
```

Description

GetScriptEngines fills an existing string list with the set of all values that can be assigned to the ScriptEngine property. These determine the script engine that works with associated server-side scripts.

This method adds a single string, 'JSCRIPT', to the string list passed as the S parameter.

See Also

ScriptEngine (see page 15279)

136.1.2.4.14 TBaseAdapterPageProducer.GetTemplateFileType Method

Returns the type of file that can store the templates this object uses to generate its content.

Pascal

```
function GetTemplateFileType: string;
```

C++

```
__fastcall AnsiString GetTemplateFileType();
```

Description

GetTemplateFileType returns the string 'HTML', because Adapter page producers generate their contents based on an HTML template that includes HTML-transparent tags.

See Also

GetDefaultTemplate (see page 19824)

136.1.2.4.15 TBaseAdapterPageProducer.GetXMLData Method

Returns a stream for reading any XML data associated with the page producer.

Pascal

```
function GetXMLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXMLData(Boolean Owned);
```

Description

The IDE calls GetXMLData for producers that indicate that they support an XML browser view (that is, if the HasXMLBrowserView (see page 19827) method returns true). In TBaseAdapterPageProducer (see page 19813), GetXMLData always returns nil (Delphi) or NULL (C++), because adapter page producers do not use associated XML data.

Owned returns an indication of whether the caller needs to free the returned stream. In this case, this parameter is irrelevant, because GetXMLData always returns nil (Delphi) or NULL (C++).

See Also

HasXMLBrowserView (see page 19827)

136.1.2.4.16 TBaseAdapterPageProducer.GetXSLData Method

Returns a stream for reading an XSL template associated with the page producer.

Pascal

```
function GetXSLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXSLData(Boolean Owned);
```

Description

The IDE calls GetXSLData for producers that indicate that they support an XSL browser view (that is, if the HasXSLBrowserView (see page 19828) method returns true). In TBaseAdapterPageProducer (see page 19813), GetXSLData always returns nil (Delphi) or NULL (C++), because adapter page producers do not use an associated XSL template.

Owned returns an indication of whether the caller needs to free the returned stream. In this case, this parameter is irrelevant, because GetXSLData always returns nil (Delphi) or NULL (C++).

See Also

HasXSLBrowserView (see page 19828)

136.1.2.4.17 TBaseAdapterPageProducer.HandleScriptTag Method

Translates HTML-transparent tags for an associated server-side script.

Pascal

```
function HandleScriptTag(const TagString: string; TagParams: TStrings; var ReplaceString:
string): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandleScriptTag(const AnsiString TagString, TStrings TagParams,
AnsiString ReplaceString);
```

Description

When a server-side script encounters an HTML-transparent tag, it calls HandleScriptTag to allow the page producer to translate that tag for it. HandleScriptTag translates the <#SERVERSCRIPT> tag, supplying the content produced by the hierarchy of Web items that is the value of the WebPageItems property.

TagString is tag name of the HTML-transparent tag. This is the first string that follows the pound sign (#).

TagParams gives the parameter portion of the HTML-transparent tag. Each string in the TStrings object has the form ParamName=Value.

ReplaceText returns the translated string that should replace the HTML-transparent tag.

HandleScriptTag returns true if it can translate the tag (that is, if TagString is 'SERVERSCRIPT'). It returns false if TagString identifies any other type of tag.

See Also

WebPageItems (see page 18382)

136.1.2.4.18 TBaseAdapterPageProducer.HasHTMLBrowserView Method

Indicates whether the IDE should display an HTML browser view for the producer's content.

Pascal

```
function HasHTMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasHTMLBrowserView();
```

Description

The IDE calls HasHTMLBrowserView to determine whether it should create an HTML tab page in the code editor for displaying the content of the page producer.

HasHTMLBrowserView returns true. As a result, at design time, the value that the Content method returns appears on the HTML tab page of the code editor when the adapter page producer is selected.

See Also

HasScriptView (see page 19827)

HasXMLBrowserView (see page 19827)

HasXSLBrowserView (see page 19828)

Content (see page 15274)

136.1.2.4.19 TBaseAdapterPageProducer.HasScriptView Method

Indicates whether the IDE should display an associated server-side script.

Pascal

```
function HasScriptView: Boolean;
```

C++

```
__fastcall Boolean HasScriptView();
```

Description

The IDE calls HasScriptView to determine whether it should create a script tab page in the code editor for displaying the server-side script associated with the page producer.

HasScriptView returns true. As a result, at design time, the associated server-side script appears on a tab page of the code editor when the adapter page producer is selected.

See Also

HasHTMLBrowserView (see page 19827)

HasXMLBrowserView (see page 19827)

HasXSLBrowserView (see page 19828)

136.1.2.4.20 TBaseAdapterPageProducer.HasXMLBrowserView Method

Indicates whether the IDE should display an XML tree view for any XML data associated with the page producer.

Pascal

```
function HasXMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXMLBrowserView();
```

Description

The IDE calls HasXMLBrowserView to determine whether it should create an XML tab page in the code editor for displaying the XML data that the page producer uses.

HasXMLBrowserView returns false because adapter page producers do not use associated XML data.

See Also

HasScriptView (see page 19827)

HasHTMLBrowserView (see page 19827)

HasXSLBrowserView (see page 19828)

GetXMLData (see page 19825)

136.1.2.4.21 TBaseAdapterPageProducer.HasXSLBrowserView Method

Indicates whether the IDE should display an XSL tree view for an XSL template associated with the page producer.

Pascal

```
function HasXSLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXSLBrowserView();
```

Description

The IDE calls HasXSLBrowserView to determine whether it should create an XSL tab page in the code editor for displaying the XSL template that the page producer uses.

HasXSLBrowserView returns false because adapter page producers do not use associated XSL templates.

See Also

HasScriptView (see page 19827)

HasHTMLBrowserView (see page 19827)

HasXMLBrowserView (see page 19827)

GetXSLData (see page 19826)

136.1.2.4.22 TBaseAdapterPageProducer.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass (see page 19820) method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass (see page 19820) method calls ImpleCanAddClass to determine whether the TBaseAdapterPageProducer (see page 19813) descendant can add a component of type AClass to its WebPageItems property list. AParent is the TBaseAdapterPageProducer (see page 19813) instance to which the component will be added.

In TBaseAdapterPageProducer (see page 19813), ImplCanAddClass returns true if AClass descends from TCustomAdapterForm or TCustomLayoutGroup.

See Also

CanAddClass (see page 19820)

WebPageItems (see page 18382)

TCustomAdapterForm (see page 25276)

TCustomLayoutGroup (see page 16528)

136.1.2.4.23 TBaseAdapterPageProducer.SetStyles Method

Assigns a value to the Styles (see page 19830) property.

Pascal

```
procedure SetStyles(Value: TStrings);
```

C++

```
__fastcall SetStyles(TStrings Value);
```

Description

SetStyles is the write implementation of the Styles (see page 19830) property.

See Also

Styles (see page 19830)

136.1.2.4.24 TBaseAdapterPageProducer.SetStylesFile Method

Assigns a value to the StylesFile (see page 19831) property.

Pascal

```
procedure SetStylesFile(const Value: TFileName);
```

C++

```
__fastcall SetStylesFile(const TFileName Value);
```

Description

SetStylesFile is the write implementation of the StylesFile (see page 19831) property.

See Also

StylesFile (see page 19831)

136.1.2.4.25 TBaseAdapterPageProducer.SetWebContentOptions Method

Sets the options that limit how the page producer creates its generated HTML.

Pascal

```
procedure SetWebContentOptions(AOptions: TWebContentOptions);
```

C++

```
__fastcall SetWebContentOptions(TWebContentOptions AOptions);
```

Description

SetWebContentOptions assigns a set of flags to the adapter page producer that limit what it can include in generated HTML.

AOptions is the TWebContentOptions object that represents the set of options for this page producer. TBaseAdapterPageProducer (see page 19813) takes ownership of the object, so the caller should not free it.

See Also

GetContentOptions (see page 19823)

136.1.2.5 TBaseAdapterPageProducer Properties

The properties of the TBaseAdapterPageProducer class are listed here.

Protected Properties

	Name	Description
R	PageElements (see page 19830)	Stores information that the Adapter page producer uses when generating its content.

Public Properties

	Name	Description
	Styles (see page 19830)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 19831)	Specifies a file containing the individual styles for the page producer's style sheet.

136.1.2.5.1 TBaseAdapterPageProducer.PageElements Property

Stores information that the Adapter page producer uses when generating its content.

Pascal

```
property PageElements: TSitePageElements;
```

C++

```
__property TSitePageElements PageElements;
```

Description

TBaseAdapterPageProducer (see page 19813) uses PageElements internally to store styles, warnings, server script, server functions, and server variables. It uses the properties of PageElements to assemble its content.

See Also

Content (see page 15274)

OnHTMLTag (see page 15280)

136.1.2.5.2 TBaseAdapterPageProducer.Styles Property

Defines the styles that can be used by the page producer and its Web items.

Pascal

```
property Styles: TStrings;
```

C++

```
__property TStrings Styles;
```

Description

Use Styles to define a style sheet for the HTML document produced by TBaseAdapterPageProducer (see page 19813). Each string in the TStrings object specifies a specific style by giving a style selector followed by a set of attributes in curly braces. These definitions can define styles for standard HTML elements such as

```
H2 B  {color: red}
```

or they can define styles that you name, such as

```
.MyStyle  {font-family: arial; font-weight: bold; font-size: 18px }
```

Note that user-defined style names must begin with a dot.

Styles for standard elements are applied automatically to HTML that uses the tag or tags that form the style selector. User-defined styles can be applied by setting the StyleRule property of a Web item to the user-defined style name that forms the selector.

Note: If you are sharing a set of styles between multiple page producers or multiple applications, you can define the styles in a file. To define the styles in a file, use the StylesFile (see page 19831) property instead. If StylesFile (see page 19831) is defined, it takes precedence over the Styles property.

See Also

StylesFile (see page 19831)

Content (see page 15274)

136.1.2.5.3 TBaseAdapterPageProducer.StylesFile Property

Specifies a file containing the individual styles for the page producer's style sheet.

Pascal

```
property StylesFile: TFileName;
```

C++

```
__property TFileName StylesFile;
```

Description

Set StylesFile to the name of a file containing the style definitions used by the page producer. The page producer uses these style definitions to declare a style sheet in the HTML document it generates.

Styles (see page 19830) for standard elements are applied automatically to HTML in the document. User-defined styles can be applied by setting the StyleRule property of a Web item to the user-defined style name that forms the selector of a style definition.

Note: If the StylesFile property is not set, you can specify the style definitions using the Styles (see page 19830) property instead.

See Also

Styles (see page 19830)

Content (see page 15274)

136.1.2.6 TBaseAdapterPageProducer Events

The events of the TBaseAdapterPageProducer class are listed here.

Public Events

	Name	Description
	OnAfterGetContent (see page 19832)	Occurs after the page producer generates its content.
	OnBeforeGetContent (see page 19832)	Occurs before the page producer generates its content.

136.1.2.6.1 TBaseAdapterPageProducer.OnAfterGetContent Event

Occurs after the page producer generates its content.

Pascal

```
property OnAfterGetContent: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAfterGetContent;
```

Description

Write an OnAfterGetContent event handler to take specific action immediately after the producer generates its content.

See Also

ContentFromStream (see page 19820)

OnBeforeGetContent (see page 19832)

136.1.2.6.2 TBaseAdapterPageProducer.OnBeforeGetContent Event

Occurs before the page producer generates its content.

Pascal

```
property OnBeforeGetContent: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnBeforeGetContent;
```

Description

Write an OnBeforeGetContent event handler to take specific action immediately before the producer generates its content.

See Also

ContentFromStream (see page 19820)

OnAfterGetContent (see page 19832)

136.1.3 TCustomAdapterPageProducer Class

tcustomadapterpageproducer generates the proper HTML and JavaScript needed to display adapter fields and execute adapter actions.

Class Hierarchy

Pascal

```
TCustomAdapterPageProducer = class(TBaseAdapterPageProducer, IWebContent);
```

C++

```
class TCustomAdapterPageProducer : public TBaseAdapterPageProducer, public IWebContent;
```

File

SiteProd

Description

tcustomadapterpageproducer creates an HTML page using content it obtains from a hierarchy of components called Web items. The Web items that appear in the tcustomadapterpageproducer's hierarchy use Adapter components to fetch the information that they display.

Use tcustomadapterpageproducer as a base class for page producer components that assemble their content from Web items that use Adapter components.

tcustomadapterpageproducer introduces two properties, HTMLDoc (see page 19842) and HTMLFile (see page 19843), each of which can specify a template that the page producer uses to generate its content. By default, this template is set to include the following special tags:

<#STYLES> - This tag is replaced by the stylesheet defined by the Styles (see page 19830) or StylesFile (see page 19831) property.

<#WARNINGS> - This tag is replaced with design time warnings that indicate possible problems with the hierarchy of web items.

<#SERVERSCRIPT> - This tag is replaced with generated HTML/JavaScript based on the hierarchy of Web items. tcustomadapterpageproducer will not generate any content if this tag is missing.

Applications can alter the template to further embellish the content that the page producer generates.

136.1.3.1 TCustomAdapterPageProducer Members

The following tables list the members exposed by TCustomAdapterPageProducer.

Protected Events

	Name	Description
	OnHTMLTag (see page 15280)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 19820)	Specifies whether a Web item of a specified type can be added to the WebPageItems property list.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreatePageElements (see page 19821)	Creates the object that implements the PageElements (see page 19830) property.
V	DeclareStyles (see page 19821)	Returns an HTML Styles (see page 19830) tag that declares the styles specified by the Styles (see page 19830) or StylesFile (see page 19831) property.
V	DeclareWarnings (see page 19821)	Returns the formatted warnings that appear at design time to indicate the status of content generation.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAfterGetContent (see page 19822)	Generates an OnAfterGetContent (see page 19832) event.
	DoBeforeGetContent (see page 19822)	Generates an OnBeforeGetContent (see page 19832) event.
V	DoTagEvent (see page 5618)	This is DoTagEvent, a member of class TComponentsPageProducer.
	DoTagEvent (see page 15276)	This is DoTagEvent, a member of class TBasePageProducer.
V	DoTagEvent (see page 19822)	Translates HTML-transparent tags in the template.
V	FindComponent (see page 5619)	This is FindComponent, a member of class TComponentsPageProducer.
	FindComponentName (see page 5619)	This is FindComponentName, a member of class TComponentsPageProducer.
V	GeneratePageElements (see page 19823)	Fills the PageElements (see page 19830) property with information based on the other properties of the adapter Page Producer.
	GetAppDispatcher (see page 15108)	This is GetAppDispatcher, a member of class TCustomContentProducer.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 18381)	This is GetChildren, a member of class TBasePageItemsProducer.
V	GetComponentContent (see page 5619)	This is GetComponentContent, a member of class TComponentsPageProducer.
	GetComponentList (see page 18382)	This is GetComponentList, a member of class TBasePageItemsProducer.
V	GetContentOptions (see page 5619)	This is GetContentOptions, a member of class TComponentsPageProducer.
V	GetContentOptions (see page 19823)	Returns an object that influences how the page producer generates its content.
	GetDefaultComponentList (see page 18382)	This is GetDefaultComponentList, a member of class TBasePageItemsProducer.
V	GetDefaultTemplate (see page 19824)	Returns the default template that the page producer can use to generate content.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerTemplateFileName (see page 15276)	This is GetProducerTemplateFileName, a member of class TBasePageProducer.
	GetProducerTemplateStream (see page 15276)	This is GetProducerTemplateStream, a member of class TBasePageProducer.
V	GetScriptEngine (see page 15277)	This is GetScriptEngine, a member of class TBasePageProducer.

	GetTagID (see page 15277)	This is GetTagID, a member of class TBasePageProducer.
	GetTemplateFileName (see page 19839)	Returns the value of the HTMLFile (see page 19843) property.
	GetTemplateFileType (see page 19825)	Returns the type of file that can store the templates this object uses to generate its content.
	GetTemplateStream (see page 19840)	Returns a stream from which to read the HTML template that this producer uses.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXMLData (see page 19825)	Returns a stream for reading any XML data associated with the page producer.
	GetXSLData (see page 19826)	Returns a stream for reading an XSL template associated with the page producer.
	HandleScriptTag (see page 15277)	This is HandleScriptTag, a member of class TBasePageProducer.
	HandleScriptTag (see page 19826)	Translates HTML-transparent tags for an associated server-side script.
	HandleTag (see page 5620)	This is HandleTag, a member of class TComponentsPageProducer.
	HandleTag (see page 15278)	This is HandleTag, a member of class TBasePageProducer.
	HasHTMLBrowserView (see page 19827)	Indicates whether the IDE should display an HTML browser view for the producer's content.
	HasScriptView (see page 19827)	Indicates whether the IDE should display an associated server-side script.
	HasXMLBrowserView (see page 19827)	Indicates whether the IDE should display an XML tree view for any XML data associated with the page producer.
	HasXSLBrowserView (see page 19828)	Indicates whether the IDE should display an XSL tree view for an XSL template associated with the page producer.
	ImplCanAddClass (see page 19828)	Provides the underlying implementation for the CanAddClass (see page 19820) method.
	ImplHandleTag (see page 15278)	This is ImplHandleTag, a member of class TBasePageProducer.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 15108)	Overrides the inherited method to respond to messages that the dispatcher is going away.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 15108)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15109)	This is ProduceContentFromStream, a member of class TCustomContentProducer.
	ProduceContentFromString (see page 15109)	This is ProduceContentFromString, a member of class TCustomContentProducer.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ServerScriptFromStream (see page 15278)	This is ServerScriptFromStream, a member of class TBasePageProducer.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 15109)	This is SetAppDispatcher, a member of class TCustomContentProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 18382)	This is SetChildOrder, a member of class TBasePageItemsProducer.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHTMLDoc (see page 19840)	Sets the HTMLDoc (see page 19842) property.
	SetHTMLFile (see page 19840)	Sets the HTMLFile (see page 19843) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetWebContentOptions (see page 19829)	Sets the options that limit how the page producer creates its generated HTML.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UseScriptEngine (see page 15278)	This is UseScriptEngine, a member of class TBasePageProducer.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebContent (see page 19841)	Returns the HTML document assembled by the Adapter page producer.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	PageElements (see page 19830)	Stores information that the Adapter page producer uses when generating its content.

Public Events

	Name	Description
	OnAfterGetContent (see page 19832)	Occurs after the page producer generates its content.
	OnBeforeGetContent (see page 19832)	Occurs before the page producer generates its content.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Content (see page 15106)	Returns the content produced by the content producer.
V	Content (see page 15274)	Returns the content produced by the content producer.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	ContentFromStream (see page 15107)	Returns the content produced in response to input read from a stream.
V	ContentFromStream (see page 15275)	Returns the content produced in response to input read from a stream.
V	ContentFromStream (see page 19820)	Returns the content produced using a template read from a stream.
V	ContentFromString (see page 15107)	Returns the content produced in response to an input string.
V	ContentFromString (see page 15275)	Returns the content produced in response to an input string.
V	Create (see page 19838)	Creates and initializes an instance of TCustomAdapterPageProducer (see page 19832).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 19839)	Frees an instance of TCustomAdapterPageProducer (see page 19832).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	GetRequiredTags (see page 19824)	Returns the HTML-transparent tags that the adapter page producer requires to have present in its template.
	GetScriptEngines (see page 19825)	Returns a list of script engines that can work with server-side scripts that produce content for the page producer.
	GetTemplateFileType (see page 24780)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetXMLData (see page 24780)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 24780)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 24780)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasScriptView (see page 24780)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 24781)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 24781)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetStyles (see page 19829)	Assigns a value to the Styles (see page 19830) property.
	SetStylesFile (see page 19829)	Assigns a value to the StylesFile (see page 19831) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetWebContentOptions (see page 24782)	This is SetWebContentOptions, a member of class ISetWebContentOptions.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 15109)	Provides access to the dispatcher for the Web server application that includes the TCustomContentProducer (see page 15102) object.
R	DispatcherComponent (see page 15110)	Provides access to the dispatcher component.
	HTMLDoc (see page 19842)	Specifies the HTML template used to generate the value that the Content method returns.
	HTMLFile (see page 19843)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ScriptEngine (see page 15279)	Names the script engine that generates or interprets script embedded in the documents that this producer creates.
	StripParamQuotes (see page 15279)	Specifies whether to strip quotation marks when extracting the parameters from an HTML-transparent tag.
	Styles (see page 19830)	Defines the styles that can be used by the page producer and its Web items.
	StylesFile (see page 19831)	Specifies a file containing the individual styles for the page producer's style sheet.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebModuleContext (see page 15279)	Provides access to the Web module context object.
R	WebPageItems (see page 18382)	Maintains a list of components that generate HTML content for the producer.

Published Events

	Name	Description
	OnHTMLTag (see page 5620)	Occurs when the page producer needs to interpret the value of an HTML-transparent tag in the HTML template.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

136.1.3.2 TCustomAdapterPageProducer.Create Constructor

Creates and initializes an instance of TCustomAdapterPageProducer (see page 19832).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterPageProducer(TComponent * AOwner);
```

Description

Call Create to instantiate an adapter page producer at runtime. Adapter page producers placed in a Web page module at design time (or by the Web page module wizard) are instantiated automatically.

AOwner is a component, typically a Web page module, that becomes the value of the Owner property. The Owner is responsible

for freeing the TCustomAdapterPageProducer (see page 19832) instance.

See Also

Owner (see page 2807)

136.1.3.3 TCustomAdapterPageProducer.Destroy Destructor

Frees an instance of TCustomAdapterPageProducer (see page 19832).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterPageProducer();
```

Description

Do not call Destroy directly. Instead, call the Free method, which checks whether the reference to the producer is not nil before calling Destroy.

See Also

Free (see page 22300)

136.1.3.4 TCustomAdapterPageProducer Methods

The methods of the TCustomAdapterPageProducer class are listed here.

Protected Methods

	Name	Description
V	GetTemplateFileName (see page 19839)	Returns the value of the HTMLFile (see page 19843) property.
V	GetTemplateStream (see page 19840)	Returns a stream from which to read the HTML template that this producer uses.
	SetHTMLDoc (see page 19840)	Sets the HTMLDoc (see page 19842) property.
	SetHTMLFile (see page 19840)	Sets the HTMLFile (see page 19843) property.
	WebContent (see page 19841)	Returns the HTML document assembled by the Adapter page producer.

136.1.3.4.1 TCustomAdapterPageProducer.GetTemplateFileName Method

Returns the value of the HTMLFile (see page 19843) property.

Pascal

```
function GetTemplateFileName: string; override;
```

C++

```
virtual __fastcall AnsiString GetTemplateFileName();
```

Description

TBasePageProducer introduces the protected GetTemplateFileName method to obtain the name of a file that contains a template from which to produce content. Each page producer component overrides GetTemplateFileName to supply this template in a class-specific way. TCustomAdapterPageProducer (see page 19832) returns the value of the HTMLFile (see page 19843) property.

See Also

GetTemplateStream (see page 19840)

HTMLFile (see page 19843)

136.1.3.4.2 TCustomAdapterPageProducer.GetTemplateStream Method

Returns a stream from which to read the HTML template that this producer uses.

Pascal

```
function GetTemplateStream(out AOwned: Boolean): TStream; override;
```

C++

```
virtual __fastcall TStream GetTemplateStream(Boolean AOwned);
```

Description

TBasePageProducer introduces the protected GetTemplateStream method to obtain a stream from which to read the producer component's HTML template. Each page producer component overrides GetTemplateStream to supply this stream in a class-specific way.

AOwned returns a value that indicates whether the caller should free the returned stream after reading the template. When AOwned is true, the caller should free the stream object.

TCustomAdapterPageProducer (see page 19832) returns a stream from which the template specified by the HTMLFile (see page 19843) or HTMLDoc (see page 19842) property can be read.

See Also

GetTemplateFileName (see page 19839)

HTMLFile (see page 19843)

HTMLDoc (see page 19842)

136.1.3.4.3 TCustomAdapterPageProducer.SetHTMLDoc Method

Sets the HTMLDoc (see page 19842) property.

Pascal

```
procedure SetHTMLDoc(const Value: TStrings);
```

C++

```
__fastcall SetHTMLDoc(const TStrings Value);
```

Description

SetHTMLDoc is the protected write implementation of the HTMLDoc (see page 19842) property.

Value is a TStrings descendant that contains the new HTML template. SetHTMLDoc assigns the strings in this object to the TStrings object that implements the HTMLDoc (see page 19842) property. Note that this method does not take ownership of the specified object.

See Also

HTMLDoc (see page 19842)

Assign (see page 3043)

136.1.3.4.4 TCustomAdapterPageProducer.SetHTMLFile Method

Sets the HTMLFile (see page 19843) property.

Pascal

```
procedure SetHTMLFile(const Value: TFileName);
```

C++

```
__fastcall SetHTMLFile(const TFileName Value);
```

Description

SetHTMLFile is the protected write implementation of the HTMLFile (see page 19843) property.

Value is the name of the template that the page producer should use to generate its content.

See Also

HTMLFile (see page 19843)

136.1.3.4.5 TCustomAdapterPageProducer.WebContent Method

Returns the HTML document assembled by the Adapter page producer.

Pascal

```
function WebContent(Options: TWebContentOptions; Layout: TLayout): string;
```

C++

```
__fastcall AnsiString WebContent(TWebContentOptions Options, TLayout Layout);
```

Description

Call WebContent to get the HTML document produced by TCustomAdapterPageProducer (see page 19832). TCustomAdapterPageProducer (see page 19832) uses WebContent to implement the Content method of its IWebContent interface.

Options contains a set of flags that limit what can be included in the generated HTML.

Layout is ignored by the WebContent method. It is included as a parameter for compatibility with other content producers that use a helper object to coordinate the layout of content produced by multiple Web items.

The Adapter page producer creates its content by replacing HTML-transparent tags in the template specified by HTMLDoc (see page 19842) or HTMLFile (see page 19843).

By default, this template has the form

```
<HTML>
<HEAD>
</HEAD>
<BODY>
<#STYLES> <#WARNINGS> <#SERVERSCRIPT>
</BODY>
</HTML>
```

Although the template can be changed to include any combination of these tags with custom HTML or tags that the application translates in an OnHTMLTag event handler.

The WebContent method translates the tags listed above as follows:

<#STYLES> - This tag is replaced by the stylesheet defined by the Styles (see page 19830) or StylesFile (see page 19831) property.

<#WARNINGS> - This tag is replaced with design time warnings that indicate possible problems with the hierarchy of web items specified by the WebPageItems property.

<#SERVERSCRIPT> - This tag is replaced with generated HTML/JavaScript based on the hierarchy of Web items.

TCustomAdapterPageProducer (see page 19832) will not generate any content if this tag is missing.

The string returned by WebContent can be used as the Content property of the response to an HTTP request message.

See Also

IWebContent (see page 24792)

Styles (see page 19830)

StylesFile (see page 19831)

OnHTMLTag (see page 15280)

HTMLDoc (see page 19842)

HTMLFile (see page 19843)

WebPageItems (see page 18382)

136.1.3.5 TCustomAdapterPageProducer Properties

The properties of the TCustomAdapterPageProducer class are listed here.

Public Properties

	Name	Description
	HTMLDoc (see page 19842)	Specifies the HTML template used to generate the value that the Content method returns.
	HTMLFile (see page 19843)	Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.

136.1.3.5.1 TCustomAdapterPageProducer.HTMLDoc Property

Specifies the HTML template used to generate the value that the Content method returns.

Pascal

```
property HTMLDoc: TStrings;
```

C++

```
__property TStrings HTMLDoc;
```

Description

Set HTMLDoc to a set of strings that make up the HTML template. By default, HTMLDoc is initialized to the following template:

```
<HTML>
<HEAD>
</HEAD>
<BODY>
<#STYLES> <#WARNINGS> <#SERVERSCRIPT>
</BODY>
</HTML>
```

Each string is a sequence of one or more HTML commands or HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white

space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. TCustomAdapterPageProducer (see page 19832) automatically handles the conversion of the HTML-transparent tags in the default template as follows:

<#STYLES> - This tag is replaced by the stylesheet defined by the Styles (see page 19830) or StylesFile (see page 19831) property.

<#WARNINGS> - This tag is replaced with design time warnings that indicate possible problems with the hierarchy of web items.

<#SERVERSCRIPT> - This tag is replaced with generated HTML/JavaScript based on the hierarchy of Web items. TCustomAdapterPageProducer (see page 19832) will not generate any content if this tag is missing.

If you set HTMLDoc to include other HTML-transparent tags, you must translate these in an OnHTMLTag event handler.

Note: Setting HTMLDoc clears the HTMLFile (see page 19843) property.

See Also

Content (see page 15274)

HTMLFile (see page 19843)

OnHTMLTag (see page 15280)

136.1.3.5.2 TCustomAdapterPageProducer.HTMLFile Property

Specifies the name of a file that contains the HTML template used to generate the value returned by the Content method.

Pascal

```
property HTMLFile: TFileName;
```

C++

```
__property TFileName HTMLFile;
```

Description

Set HTMLFile to the name of the file that contains an HTML template. The HTML template is a sequence of HTML commands and HTML-transparent tags. An HTML-transparent tag has the form

```
<#TagName Param1=Value1 Param2=Value2 ...>
```

A pound sign (#) immediately follows the opening angle bracket (<) with no spaces separating it from the angle bracket. The pound sign identifies the string to the page producer as an HTML-transparent tag. The tag name immediately follows the pound sign with no spaces separating it from the pound sign. The page producer converts the entire HTML-transparent tag into true HTML commands based on the value of the tag name. Following the tag name, the HTML-transparent tag can optionally include parameters that specify details of the conversion to be performed. Each parameter is of the form ParamName=Value, where there is no space between the parameter name, the equals symbol (=) and the value. Each parameter is delimited by white space.

The angle brackets (< >) make the tag transparent to HTML browsers that do not recognize the #TagName construct.

Note: Setting HTMLFile clears the HTMLDoc (see page 19842) property.

Note: When distributing applications that contain page producers which use the HTMLFile property, be sure to distribute the file along with the application. Also, be sure that the value of HTMLFile does not include a hard-coded path name that will not be available on the user's disk.

HTMLDoc (see page 19842)

OnHTMLTag (see page 15280)

136.1.4 TSitePageElements Class

TSitePageElements stores part of the content that page producers generate.

Class Hierarchy

Pascal

```
TSitePageElements = class(TObject);
```

C++

```
class TSitePageElements : public TObject;
```

File

SiteProd

Description

TSitePageElements stores styles, warnings, server script, server functions, and server variables. These values are stored as class members of type string (not properties). The adapter page producer combines them to make up its generated content.

136.1.4.1 TSitePageElements Members

The following tables list the members exposed by TSitePageElements.

Public Fields

	Name	Description
	ServerFunctionsContent (see page 19845)	This is ServerFunctionsContent, a member of class TSitePageElements.
	ServerScriptContent (see page 19845)	This is ServerScriptContent, a member of class TSitePageElements.
	ServerVariablesContent (see page 19846)	This is ServerVariablesContent, a member of class TSitePageElements.
	StylesContent (see page 19846)	This is StylesContent, a member of class TSitePageElements.
	WarningsContent (see page 19846)	This is WarningsContent, a member of class TSitePageElements.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

136.1.4.2 TSitePageElements Fields

The fields of the TSitePageElements class are listed here.

Public Fields

	Name	Description
	ServerFunctionsContent (see page 19845)	This is ServerFunctionsContent, a member of class TSitePageElements.
	ServerScriptContent (see page 19845)	This is ServerScriptContent, a member of class TSitePageElements.
	ServerVariablesContent (see page 19846)	This is ServerVariablesContent, a member of class TSitePageElements.
	StylesContent (see page 19846)	This is StylesContent, a member of class TSitePageElements.
	WarningsContent (see page 19846)	This is WarningsContent, a member of class TSitePageElements.

136.1.4.2.1 TSitePageElements.ServerFunctionsContent Field

Pascal

```
ServerFunctionsContent: string;
```

C++

```
AnsiString ServerFunctionsContent;
```

Description

This is ServerFunctionsContent, a member of class TSitePageElements.

136.1.4.2.2 TSitePageElements.ServerScriptContent Field

Pascal

```
ServerScriptContent: string;
```

C++

```
AnsiString ServerScriptContent;
```

Description

This is ServerScriptContent, a member of class TSitePageElements.

136.1.4.2.3 TSitePageElements.ServerVariablesContent Field

Pascal

```
ServerVariablesContent: string;
```

C++

```
AnsiString ServerVariablesContent;
```

Description

This is ServerVariablesContent, a member of class TSitePageElements.

136.1.4.2.4 TSitePageElements.StylesContent Field

Pascal

```
StylesContent: string;
```

C++

```
AnsiString StylesContent;
```

Description

This is StylesContent, a member of class TSitePageElements.

136.1.4.2.5 TSitePageElements.WarningsContent Field

Pascal

```
WarningsContent: string;
```

C++

```
AnsiString WarningsContent;
```

Description

This is WarningsContent, a member of class TSitePageElements.

137 SOAPAttachIntf Namespace

This is namespace SOAPAttachIntf.

Topics

Name	Description
Classes (see page 19848)	The following table lists classes in this documentation.
Interfaces (see page 19853)	The following table lists interfaces in this documentation.
Types (see page 19862)	The following table lists types in this documentation.

Classes

	Name	Description
	TSoapDataList (see page 19848)	TSoapDataList maintains a list of SOAP attachments.

Interfaces

	Name	Description
	IMimeAttachmentHandler (see page 19853)	IMimeAttachmentHandler is the interface for interpreting or manipulating the multipart form that represents a Web Service call that includes an attachment.

Types

Name	Description
TOnGetAttachmentEvent (see page 19862)	This is type SOAPAttachIntf.TOnGetAttachmentEvent.
TOnSendAttachmentEvent (see page 19862)	This is type SOAPAttachIntf.TOnSendAttachmentEvent.

137.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TSoapDataList (see page 19848)	TSoapDataList maintains a list of SOAP attachments.

137.1.1 TSoapDataList Class

TSoapDataList maintains a list of SOAP attachments.

Class Hierarchy

System::TObject → Classes.TList → SOAPAttachIntf.TSoapDataList

Pascal

```
TSoapDataList = class(TList);
```

C++

```
class TSoapDataList : public TList;
```

File

SOAPAttachIntf

Description

Use TSoapDataList to store and maintain a list of SOAP attachments (TSOAPAttachment objects).

See Also

TList (see page 2868)

TSoapAttachment

137.1.1.1 TSoapDataList Members

The following tables list the members exposed by TSoapDataList.

Protected Methods

	Name	Description
	Get (see page 2878)	This is Get, a member of class TList.
V	Grow (see page 2879)	This is Grow, a member of class TList.
V	Notify (see page 2884)	Responds when items are added, removed, or extracted from the list.
	Put (see page 2887)	This is Put, a member of class TList.
	SetCapacity (see page 2891)	This is SetCapacity, a member of class TList.
	SetCount (see page 2892)	This is SetCount, a member of class TList.

Public Methods

	Name	Description
	Add (see page 19850)	Adds a new attachment to the end of the list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 19850)	Raises an exception.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 19851)	Empties the list and frees the TSOAPAttachment objects.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2874)	Removes the item at the position given by the Index parameter.
V	Destroy (see page 2870)	Destroys an instance of TList (see page 2868).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Error (see page 2875)	This is the overview for the Error method overload.
	Exchange (see page 2876)	Swaps the position of two items in the Items (see page 2898) array.
	Expand (see page 2877)	Increases the Capacity (see page 2895) of the list.
	Extract (see page 2877)	Removes a specified item from the list.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	First (see page 2878)	Returns Items (see page 2898)[0].
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2878)	Returns a TList (see page 2868) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	IndexOf (see page 2879)	Returns the index of the first entry in the Items (see page 2898) array with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 19851)	Raises an exception.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Last (see page 2882)	Returns Items (see page 2898)[Count (see page 2896) - 1].
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	Move (see page 2884)	Changes the position of an item in the Items (see page 2898) array.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Pack (see page 2885)	Deletes all nil (Delphi) or NULL (C++) items from the Items (see page 2898) array.
	Remove (see page 19852)	Raises an exception.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Sort (see page 2892)	Performs a QuickSort on the list based on the comparison function Compare.

Public Properties

	Name	Description
	Capacity (see page 2895)	Specifies the allocated size of the array of pointers maintained by the TList (see page 2868) object.
	Count (see page 2896)	Indicates the number of entries in the list that are in use.
	Items (see page 2898)	Lists the object references.
R	List (see page 2900)	Specifies the array of pointers that make up the Items (see page 2898) array.

137.1.1.2 TSoapDataList Methods

The methods of the TSoapDataList class are listed here.

Public Methods

	Name	Description
	Add (see page 19850)	Adds a new attachment to the end of the list.
	Assign (see page 19850)	Raises an exception.
V	Clear (see page 19851)	Empties the list and frees the TSOAPAttachment objects.
	Insert (see page 19851)	Raises an exception.
	Remove (see page 19852)	Raises an exception.

137.1.1.2.1 TSoapDataList.Add Method

Adds a new attachment to the end of the list.

Pascal

```
function Add(Item: Pointer): Integer; reintroduce;
```

C++

```
__fastcall int Add(void * Item);
```

Description

Do not call the Add method. This method is used internally to add attachments to the data list when the application first reads an incoming message that includes attachments or when marshaling a message to be sent that includes attachments. Applications should not change the list of attachments, or they will interfere with the marshaling and unmarshaling of attachment data.

Item is a pointer to the TSoapAttachment instance that is added to the list.

Add returns the index of the new attachment.

See Also

Capacity (see page 2895)

Count (see page 2896)

Insert (see page 19851)

Items (see page 2898)

Clear (see page 19851)

137.1.1.2.2 TSoapDataList.Assign Method

Raises an exception.

Pascal

```
procedure Assign(ListA: TList; AOperator: TListAssignOp = laCopy; ListB: TList = Nil);
reintroduce;
```

C++

```
__fastcall Assign(TList ListA, TListAssignOp AOperator = laCopy, TList ListB = Nil);
```

Description

Do not call the Assign method. TSoapDataList (see page 19848) replaces the inherited method to raise an exception if you call this method because applications should not change the items in a TSoapDataList (see page 19848) object.

See Also

Add (see page 19850)

137.1.1.2.3 TSoapDataList.Clear Method

Empties the list and frees the TSOAPAttachment objects.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Clear removes all of the objects from the list and frees each one. Do not call this method. It is used internally when marshaling and unmarshaling messages that contain attachments. Applications should not change the items in a TSoapDataList (see page 19848) object.

See Also

Delete (see page 2874)

Items (see page 2898)

Remove (see page 2887)

137.1.1.2.4 TSoapDataList.Insert Method

Raises an exception.

Pascal

```
procedure Insert(Index: Integer; aClass: TClass); reintroduce;
```

C++

```
__fastcall Insert(int Index, TClass aClass);
```

Description

Do not call the Insert method. TSoapDataList (see page 19848) replaces the inherited method to raise an exception if you call this method because applications should not change the items in a TSoapDataList (see page 19848) object.

See Also

Add (see page 19850)

137.1.1.2.5 TSoapDataList.Remove Method

Raises an exception.

Pascal

```
function Remove(aClass: TClass): Integer; reintroduce;
```

C++

```
__fastcall int Remove(TClass aClass);
```

Description

Do not call the Remove method. TSoapDataList (see page 19848) replaces the inherited method to raise an exception if you call this method because applications should not change the items in a TSoapDataList (see page 19848) object.

See Also

Clear (see page 19851)

137.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IMimeAttachmentHandler (see page 19853)	IMimeAttachmentHandler is the interface for interpreting or manipulating the multipart form that represents a Web Service call that includes an attachment.

137.2.1 IMimeAttachmentHandler Interface

IMimeAttachmentHandler is the interface for interpreting or manipulating the multipart form that represents a Web Service call that includes an attachment.

Class Hierarchy

SOAPAttachIntf.IMimeAttachmentHandler

Pascal

```
IMimeAttachmentHandler = interface;
```

C++

```
__interface IMimeAttachmentHandler;
```

File

SOAPAttachIntf

Description

IMimeAttachmentHandler defines methods for working with multipart forms that represent SOAP requests which include attachements. It is used internally to process the headers of the SOAP envelope part of multipart forms, to generate events when the application sends or receives a multipart form that represents a Web Service call which includes attachments, and to parse or assemble such a multipart form.

Note: C++ method declarations that use IMimeAttachmentHandler use the _di_IMimeAttachmentHandler type instead. This type is a DelphiInterface wrapper around the IMimeAttachmentHandler interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IMimeAttachmentHandler >
_di_IMimeAttachmentHandler;
```

See Also

TSoapAttachment

137.2.1.1 IMimeAttachmentHandler Members

The following tables list the members exposed by IMimeAttachmentHandler.

Public Events

	Name	Description
	OnGetAttachment (see page 19860)	Occurs for each attachment as it is read.
	OnSendAttachment (see page 19860)	Occurs for each attachment that is added to a multipart form to be sent.

Public Methods

	Name	Description
	AddSoapHeader (see page 19854)	Adds a specified header to the SOAP envelope portion of the emerging .
	CreateMimeStream (see page 19855)	Creates and initializes a stream that will eventually contain an assembled multipart form.
	FinalizeStream (see page 19856)	Performs any necessary final steps in creating the emerging multipart form.
	GetMIMEBoundary (see page 19856)	Returns the value of the MIMEBoundary (see page 19859) property.
	GetMIMEStream (see page 19856)	Returns a stream from which to read the assembled multipart form.
	GetOnGetAttachmentEvent (see page 19857)	Returns the OnGetAttachment (see page 19860) event handler.
	GetOnSendAttachmentEvent (see page 19857)	Returns the OnSendAttachment (see page 19860) event handler.
	ProcessMultiPartForm (see page 19857)	Parses a multipart form into the SOAP envelope and a list of attachments.
	SetMIMEBoundary (see page 19858)	Sets the value of the MIMEBoundary (see page 19859) property.
	SetOnGetAttachmentEvent (see page 19858)	Assigns the OnGetAttachment (see page 19860) event handler.
	SetOnSendAttachmentEvent (see page 19859)	Assigns the OnSendAttachment (see page 19860) event handler.

Public Properties

	Name	Description
	MIMEBoundary (see page 19859)	Indicates the MIME boundary string that signals the boundaries between the parts of the multipart form.

137.2.1.2 IMimeAttachmentHandler Methods

The methods of the IMimeAttachmentHandler class are listed here.

Public Methods

	Name	Description
	AddSoapHeader (see page 19854)	Adds a specified header to the SOAP envelope portion of the emerging .
	CreateMimeStream (see page 19855)	Creates and initializes a stream that will eventually contain an assembled multipart form.
	FinalizeStream (see page 19856)	Performs any necessary final steps in creating the emerging multipart form.
	GetMIMEBoundary (see page 19856)	Returns the value of the MIMEBoundary (see page 19859) property.
	GetMIMEStream (see page 19856)	Returns a stream from which to read the assembled multipart form.
	GetOnGetAttachmentEvent (see page 19857)	Returns the OnGetAttachment (see page 19860) event handler.
	GetOnSendAttachmentEvent (see page 19857)	Returns the OnSendAttachment (see page 19860) event handler.
	ProcessMultiPartForm (see page 19857)	Parses a multipart form into the SOAP envelope and a list of attachments.
	SetMIMEBoundary (see page 19858)	Sets the value of the MIMEBoundary (see page 19859) property.
	SetOnGetAttachmentEvent (see page 19858)	Assigns the OnGetAttachment (see page 19860) event handler.
	SetOnSendAttachmentEvent (see page 19859)	Assigns the OnSendAttachment (see page 19860) event handler.

137.2.1.2.1 IMimeAttachmentHandler.AddSoapHeader Method

Adds a specified header to the SOAP envelope portion of the emerging .

Pascal

```
procedure AddSoapHeader(Value: string);
```

C++

```
__fastcall AddSoapHeader(AnsiString Value);
```

Description

Call AddSoapHeader to add an arbitrary header to the SOAP envelope portion of an emerging multipart form. This method should not be called until after a call to the CreateMimeStream (see page 19855) method initializes the emerging multipart form.

Value is the text of the header to add to the SOAP envelope.

Typically, this method is called to add the ContentType header to the SOAP envelope when its value is not known at the point when the application calls CreateMimeStream (see page 19855).

Note: After all calls to AddSoapHeader have been made to add headers to the SOAP envelope, the application must call the FinalizeStream (see page 19856) method to allow the MIME attachment handler to finish generating the multipart form. Only after the call to FinalizeStream (see page 19856) can the application read the content of the multipart form by calling the GetMIMEStream (see page 19856) method.

See Also

CreateMimeStream (see page 19855)

FinalizeStream (see page 19856)

GetMIMEStream (see page 19856)

137.2.1.2.2 IMimeAttachmentHandler.CreateMimeStream Method

Creates and initializes a stream that will eventually contain an assembled multipart form.

Pascal

```
procedure CreateMimeStream(Envelope: TStream; Attachments: TSoapDataList);
```

C++

```
__fastcall CreateMimeStream(TStream Envelope, TSoapDataList Attachments);
```

Description

Call CreateMimeStream as the first step when generating a multipart form to represent a SOAP packet and its associated attachments.

Envelope is a stream from which CreateMimeStream can read the SOAP envelope portion of the multipart form. This must be a complete encoding with the exception of headers, which can be added by subsequent calls to the AddSoapHeader (see page 19854) method.

Attachments is a list of TSoapAttachment objects that represent the attachments that should be included in the multipart form.

CreateMimeStream creates a new stream object and initializes it with the data from Envelope and Attachments. This new stream can then be completed by calling the AddSoapHeader (see page 19854) method to add any headers to the SOAP envelope portion and then calling the FinalizeStream (see page 19856) method. After calling FinalizeStream (see page 19856), the application can access the generated stream by calling the GetMIMEStream (see page 19856) method.

See Also

FinalizeStream (see page 19856)

AddSoapHeader (see page 19854)

GetMIMEStream (see page 19856)

137.2.1.2.3 IMimeAttachmentHandler.FinalizeStream Method

Performs any necessary final steps in creating the emerging multipart form.

Pascal

```
procedure FinalizeStream;
```

C++

```
__fastcall FinalizeStream();
```

Description

Call FinalizeStream as a final step when assembling a multipart form to represent a SOAP packet and its associated attachments. When an application assembles a multipart form to represent a SOAP packet and its associated attachments, it takes the following steps:

1. Call CreateMimeStream (see page 19855) to create the stream object that includes data from the SOAP envelope and the content of any attachments.
2. Call AddSoapHeader (see page 19854) to add any headers to the SOAP envelope portion of the stream.
3. Call FinalizeStream to indicate that all changes are complete and allow the MIME attachment handler to make any final changes.

Only after a call to FinalizeStream can the application read the assembled multipart form by calling GetMIMEStream (see page 19856).

See Also

CreateMimeStream (see page 19855)

AddSoapHeader (see page 19854)

GetMIMEStream (see page 19856)

137.2.1.2.4 IMimeAttachmentHandler.GetMIMEBoundary Method

Returns the value of the MIMEBoundary (see page 19859) property.

Pascal

```
function GetMIMEBoundary: String;
```

C++

```
__fastcall AnsiString GetMIMEBoundary();
```

Description

GetMIMEBoundary is the read implementation for the MIMEBoundary (see page 19859) property.

See Also

MIMEBoundary (see page 19859)

137.2.1.2.5 IMimeAttachmentHandler.GetMIMEStream Method

Returns a stream from which to read the assembled multipart form.

Pascal

```
function GetMIMEStream(Release: Boolean = False): TStream;
```

C++

```
__fastcall TStream GetMIMEStream(Boolean Release = False);
```

Description

Call GetMIMEStream after a call to the FinalizeStream (see page 19856) method to access the stream from which to read a newly-assembled multipart form. This stream should not be used until after the multipart form is fully assembled.

Release indicates whether the caller is responsible for freeing the stream object. When Release is true, the caller takes ownership of the stream and is responsible for freeing it. When Release is false, the caller should not free the stream that is returned, because the object that implements IMimeAttachmentHandler (see page 19853) will free it.

See Also

CreateMimeStream (see page 19855)

AddSoapHeader (see page 19854)

FinalizeStream (see page 19856)

137.2.1.2.6 IMimeAttachmentHandler.GetOnGetAttachmentEvent Method

Returns the OnGetAttachment (see page 19860) event handler.

Pascal

```
function GetOnGetAttachmentEvent: TOnGetAttachmentEvent;
```

C++

```
__fastcall TOnGetAttachmentEvent GetOnGetAttachmentEvent();
```

Description

GetOnGetAttachmentEvent is the read implementation for the OnGetAttachment (see page 19860) event.

See Also

OnGetAttachment (see page 19860)

137.2.1.2.7 IMimeAttachmentHandler.GetOnSendAttachmentEvent Method

Returns the OnSendAttachment (see page 19860) event handler.

Pascal

```
function GetOnSendAttachmentEvent: TOnSendAttachmentEvent;
```

C++

```
__fastcall TOnSendAttachmentEvent GetOnSendAttachmentEvent();
```

Description

GetOnSendAttachmentEvent is the read implementation for the OnSendAttachment (see page 19860) event handler.

See Also

OnSendAttachment (see page 19860)

137.2.1.2.8 IMimeAttachmentHandler.ProcessMultiPartForm Method

Parses a multipart form into the SOAP envelope and a list of attachments.

Pascal

```
procedure ProcessMultiPartForm(const ASourceStream: TStream; const ADestStream: TStream;
AMimeBoundary: string; SoapHeaders: TStrings; Attachments: TSoapDataList; TempDir: string);
```

C++

```
__fastcall ProcessMultiPartForm(const TStream ASourceStream, const TStream ADestStream,
AnsiString AMimeBoundary, TStrings SoapHeaders, TSoapDataList Attachments, AnsiString TempDir);
```

Description

Call ProcessMultiPartForm to interpret a multipart form that is received by the client or server in a Web Service application. This method separates the SOAP envelope portion of the multipart form from the portions that represent attachments, and parses the headers of the SOAP envelope into a convenient string list.

ASourceStream is a stream from which ProcessMultiPartForm can read the incoming multipart form. This is the content of the incoming message.

ADestStream is a stream to which ProcessMultiPartForm writes the SOAP envelope portion of ASourceStream.

AMimeBoundary is the mime boundary string that identifies the boundaries between the parts of the multipart form. Typically, it is obtained from the headers of the incoming HTTP message whose content is the content of ASourceStream.

SoapHeaders is an existing TStrings descendant to which ProcessMultiPartForm writes the headers of the SOAP envelope portion of the multipart form. Each header is added as a string of the form HeaderName=Value.

Attachments is an empty TSoapDataList (see page 19848) object to which ProcessMultiPartForm adds the TSoapAttachment objects that represent the attachments in the multipart form.

TempDir is the name of the directory where ProcessMultiPartForm writes the temporary files it generates for each of the attachments.

137.2.1.2.9 IMimeAttachmentHandler.SetMIMEBoundary Method

Sets the value of the MIMEBoundary (see page 19859) property.

Pascal

```
procedure SetMIMEBoundary(const MimeBndry: String);
```

C++

```
__fastcall SetMIMEBoundary(const AnsiString MimeBndry);
```

Description

SetMIMEBoundary is the write implementation for the MIMEBoundary (see page 19859) property.

MimeBndry is the string that should identify the boundary between parts of the multipart form.

See Also

MIMEBoundary (see page 19859)

137.2.1.2.10 IMimeAttachmentHandler.SetOnGetAttachmentEvent Method

Assigns the OnGetAttachment (see page 19860) event handler.

Pascal

```
procedure SetOnGetAttachmentEvent(OnGetAttachment: TOnGetAttachmentEvent);
```

C++

```
__fastcall SetOnGetAttachmentEvent(TOnGetAttachmentEvent OnGetAttachment);
```

Description

SetOnGetAttachmentEvent is the write implementation for the OnGetAttachment (see page 19860) event.

OnGetAttachment (see page 19860) is the event handler that should to respond to the event.

See Also

OnGetAttachment (see page 19860)

137.2.1.2.11 IMimeAttachmentHandler.SetOnSendAttachmentEvent Method

Assigns the OnSendAttachment (see page 19860) event handler.

Pascal

```
procedure SetOnSendAttachmentEvent(OnSendAttachment: TOnSendAttachmentEvent);
```

C++

```
__fastcall SetOnSendAttachmentEvent(TOnSendAttachmentEvent OnSendAttachment);
```

Description

SetOnSendAttachmentEvent is the write implementation for the OnSendAttachment (see page 19860) event.

OnSendAttachment (see page 19860) is the event handler that should to respond to the event.

See Also

OnSendAttachment (see page 19860)

137.2.1.3 IMimeAttachmentHandler Properties

The properties of the IMimeAttachmentHandler class are listed here.

Public Properties

	Name	Description
	MIMEBoundary (see page 19859)	Indicates the MIME boundary string that signals the boundaries between the parts of the multipart form.

137.2.1.3.1 IMimeAttachmentHandler.MIMEBoundary Property

Indicates the MIME boundary string that signals the boundaries between the parts of the multipart form.

Pascal

```
property MIMEBoundary: string;
```

C++

```
__property AnsiString MIMEBoundary;
```

Description

MIMEBoundary is the string that identifies the boundary between the parts of the multipart form. It is an attribute of the ContentType header for the entire form.

When the MIME attachment handler is processing a received form, this property is not available until after the application has called the ProcessMultiPartForm (see page 19857) method. When the MIME attachment handler is assembling a multipart

form in order to send a message that includes attachments, the handler generates this string for the new form, and the CreateMimeStream (see page 19855) method uses it when assembling the form.

See Also

ProcessMultiPartForm (see page 19857)

CreateMimeStream (see page 19855)

137.2.1.4 IMimeAttachmentHandler Events

The events of the IMimeAttachmentHandler class are listed here.

Public Events

	Name	Description
	OnGetAttachment (see page 19860)	Occurs for each attachment as it is read.
	OnSendAttachment (see page 19860)	Occurs for each attachment that is added to a multipart form to be sent.

137.2.1.4.1 IMimeAttachmentHandler.OnGetAttachment Event

Occurs for each attachment as it is read.

Pascal

```
property OnGetAttachment: TOnGetAttachmentEvent;
```

C++

```
__property TOnGetAttachmentEvent OnGetAttachment;
```

Description

The MIME attachment handler generates this event as it reads each incoming attachment. Classes (see page 2685) that use the MIME attachment handler, such as TRio or TSoapPascalInvoker, assign their own event handlers as the value of this event.

See Also

OnSendAttachment (see page 19860)

OnGetAttachment (see page 18731)

OnGetAttachment (see page 20030)

137.2.1.4.2 IMimeAttachmentHandler.OnSendAttachment Event

Occurs for each attachment that is added to a multipart form to be sent.

Pascal

```
property OnSendAttachment: TOnSendAttachmentEvent;
```

C++

```
__property TOnSendAttachmentEvent OnSendAttachment;
```

Description

The MIME attachment handler generates this event as it adds each outgoing attachment to the multipart form. Classes (see page 2685) that use the MIME attachment handler, such as TRio or TSoapPascalInvoker, assign their own event handlers as the value of this event.

See Also

OnGetAttachment (see page 19860)

OnSendAttachment (see page 18731)

OnSendAttachment (see page 20030)

137.3 Types

The following table lists types in this documentation.

Types

Name	Description
TOnGetAttachmentEvent (see page 19862)	This is type SOAPAttachIntf.TOnGetAttachmentEvent.
TOnSendAttachmentEvent (see page 19862)	This is type SOAPAttachIntf.TOnSendAttachmentEvent.

137.3.1 SOAPAttachIntf.TOnGetAttachmentEvent Type

Pascal

```
TOnGetAttachmentEvent = procedure (AttachmentStream: TStream; Attachment: TSOAPAttachment) of
object;
```

C++

```
(AttachmentStream: TStream; Attachment: TSOAPAttachment) ( TOnGetAttachmentEvent)();
```

File

SOAPAttachIntf

Description

This is type SOAPAttachIntf.TOnGetAttachmentEvent.

137.3.2 SOAPAttachIntf.TOnSendAttachmentEvent Type

Pascal

```
TOnSendAttachmentEvent = procedure (AttachmentStream: TStream; Attachment: TSOAPAttachment) of
object;
```

C++

```
(AttachmentStream: TStream; Attachment: TSOAPAttachment) ( TOnSendAttachmentEvent)();
```

File

SOAPAttachIntf

Description

This is type SOAPAttachIntf.TOnSendAttachmentEvent.

138 SOAPConn Namespace

This is namespace SOAPConn.

Name	Description
Classes (see page 19864)	The following table lists classes in this documentation.

Classes

	Name	Description
	TSoapConnection (see page 19864)	TSoapConnection connects to an application server that is implemented as a Web Service.

138.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TSoapConnection (see page 19864)	TSoapConnection connects to an application server that is implemented as a Web Service.

138.1.1 TSoapConnection Class

TSoapConnection connects to an application server that is implemented as a Web Service.

Class Hierarchy

Pascal

```
TSoapConnection = class(TCustomRemoteServer);
```

C++

```
class TSoapConnection : public TCustomRemoteServer;
```

File

SOAPConn

Description

TSoapConnection is used in the client portion of a multi-tiered database application to establish and maintain the connection between the client and a remote application server that is implemented as a Web Service. The SOAP connection object can

Establish an initial connection to a remote application server.

Obtain an interface for the application server.

Obtain a list of providers on the application server.

Drop the connection to the remote application server.

TSoapConnection establishes the initial connection between the client application and a remote application server using SOAP.

Note: To use TSoapConnection on Windows, you must have wininet.dll installed on the client system. wininet.dll is found in the Windows system directory if you have IE3 or higher installed.

TSoapConnection uses an internal THTTPRio object to obtain an interface from the Web Service application. This interface is either IAppServer or IAppServerSOAP (or one of their descendants), depending on the value of the UseSOAPAdapter (see page 19879) property. The recommended approach is to use the IAppServerSOAP interface, which is better adapted to SOAP as a transport protocol. However, some application servers (those created using Delphi 6 or Kylix 2) only support an IAppServer interface. If you are using an application server that does not support IAppServerSOAP, set UseSOAPAdapter (see page 19879) to false.

Regardless of which interface TSoapConnection uses to communicate with the application server, it makes the information available to client datasets in the client application by providing an IAppServer interface. Client datasets use the IAppServer interface from the SOAP connection component to communicate with providers on the application server, or to otherwise call the application server's data module interface.

Note: Unlike when using other DataSnap connection components, you can't use the AppServer property of TSoapConnection to call methods of the application server's interface that are not IAppServer methods. Instead, to communicate with a SOAP data module on the application interface, use a separate THTTPRIO object or specify the interface using the SOAPServerIID (see page 19877) property and then call the GetSOAPServer (see page 19872) method

. To connect to remote application servers using DCOM, use the TDCOMConnection component instead. To connect to remote application servers using TCP/IP, use the TSocketConnection component instead. To connect to remote application servers using HTTP (but not SOAP), use TWebConnection.

Specifying a Connection Using SOAP

138.1.1.1 TSoapConnection Members

The following tables list the members exposed by TSoapConnection.

Protected Events

	Name	Description
	OnGetUsername (see page 8533)	This is OnGetUsername, a member of class TCustomRemoteServer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoConnect (see page 19870)	Provides the interface for a method that opens a connection.
	DoDisconnect (see page 19870)	Provides the interface for a method that terminates the connection.
	GetAppServer (see page 8530)	Returns the value of the AppServer (see page 8532) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetConnected (see page 19871)	Returns the value of the Connected property.
	GetDataSet (see page 6865)	Returns a dataset, given its index in the DataSets (see page 6870) property array.
	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSOAPServerIID (see page 19873)	This is GetSOAPServerIID, a member of class TSoapConnection.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 6866)	Initializes the connection component after all objects in the form or data module have been loaded.
	Notification (see page 19873)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RegisterClient (see page 6866)	Registers an object that uses the connection component.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppServer (see page 8531)	Sets the AppServer (see page 8532) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnected (see page 6867)	Changes the value of the Connected (see page 6868) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetSOAPServerIID (see page 19874)	This is SetSOAPServerIID, a member of class TSoapConnection.
	SetUseSoapAdapter (see page 19874)	This is SetUseSoapAdapter, a member of class TSoapConnection.
	UnRegisterClient (see page 6868)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 6863)	Closes the connection.
V	Create (see page 19869)	Creates and initializes an instance of TSoapConnection (see page 19864).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 19869)	Destroys an instance of TSoapConnection (see page 19864).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetProviderNames (see page 19871)	Executes a callback for all provider objects on the application server.
V	GetServer (see page 19871)	Returns an IAppServer interface for communicating with the application server.
V	GetServerList (see page 19872)	Returns a list of application servers (remote data modules) to which the component can connect.
	GetSOAPServer (see page 19872)	Returns the IAppServerSOAP interface of the application server.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AppServer (see page 8532)	Contains the interface for communicating with the application server.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 6870)	Lists the datasets currently using this connection component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	LoginPrompt (see page 6872)	Specifies whether a login dialog appears immediately before opening a new connection.
	OnLogin (see page 6873)	Occurs when a communication channel opens to the server.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	RIO (see page 19876)	Provides access to the internal remote interfaced object that communicates with the application server.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterConnect (see page 19880)	Occurs after a connection is established.
	AfterDisconnect (see page 19880)	Occurs after the connection closes.
	BeforeConnect (see page 19880)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 19881)	Occurs immediately before the connection closes.
	OnAfterExecute (see page 19881)	Occurs when TSoapConnection (see page 19864) receives the results from executing a method on the application server.
	OnBeforeExecute (see page 19882)	Occurs before TSoapConnection (see page 19864) sends a method call to the application server for execution.

Published Properties

	Name	Description
	Agent (see page 19874)	Provides the value of the User-Agent header for HTTP messages to the server.

	Connected (see page 19875)	Indicates whether the SOAP connection component is connected to the application server.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Password (see page 19875)	Specifies the password that allows the client application to log on to a local host or proxy server.
	Proxy (see page 19876)	Lists any proxy servers that are required to make the connection.
	ProxyByPass (see page 19876)	Lists the host names of locally registered servers that do not require a proxy.
	SOAPServerIID (see page 19877)	Identifies the invokable interface that TSoapConnection (see page 19864) uses to communicate with the application server.
	Tag (see page 2808)	Stores an integer value as part of a component.
	URL (see page 19878)	Specifies the Uniform Resource Locator for the THTTPSoapDispatcher on the application server.
	UserName (see page 19878)	Specifies the user name that allows the client application to log on to a local host or proxy server.
	UseSOAPAdapter (see page 19879)	Specifies how the SOAP connection component communicates with the application server.

138.1.1.2 TSoapConnection.Create Constructor

Creates and initializes an instance of TSoapConnection (see page 19864).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSoapConnection(TComponent * AOwner);
```

Description

Call Create to instantiate a TSoapConnection (see page 19864) object at runtime. SOAP connection components added to forms or data modules at design time are created automatically.

The AOwner parameter specifies the component (usually a form or data module) that is responsible for freeing the SOAP connection component.

See Also

Owner (see page 2807)

138.1.1.3 TSoapConnection.Destroy Destructor

Destroys an instance of TSoapConnection (see page 19864).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSoapConnection();
```

Description

Do not call Destroy directly in an application. Instead, use the Free method, which checks that the SOAP connection is not nil before calling Destroy.

138.1.1.4 TSoapConnection Methods

The methods of the TSoapConnection class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 19870)	Provides the interface for a method that opens a connection.
	DoDisconnect (see page 19870)	Provides the interface for a method that terminates the connection.
	GetConnected (see page 19871)	Returns the value of the Connected property.
	GetSOAPServerIID (see page 19873)	This is GetSOAPServerIID, a member of class TSoapConnection.
	Notification (see page 19873)	Forwards notification messages to all owned components.
	SetSOAPServerIID (see page 19874)	This is SetSOAPServerIID, a member of class TSoapConnection.
	SetUseSoapAdapter (see page 19874)	This is SetUseSoapAdapter, a member of class TSoapConnection.

Public Methods

	Name	Description
	GetProviderNames (see page 19871)	Executes a callback for all provider objects on the application server.
	GetServer (see page 19871)	Returns an IAppServer interface for communicating with the application server.
	GetServerList (see page 19872)	Returns a list of application servers (remote data modules) to which the component can connect.
	GetSOAPServer (see page 19872)	Returns the IAppServerSOAP interface of the application server.

138.1.1.4.1 TSoapConnection.DoConnect Method

Provides the interface for a method that opens a connection.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

The Connected property uses DoConnect to establish a connection. Descendant classes override the DoConnect method to establish their connection as appropriate. As implemented in TCustomConnection, DoConnect does nothing.

See Also

Connected (see page 6868)

DoDisconnect (see page 6864)

138.1.1.4.2 TSoapConnection.DoDisconnect Method

Provides the interface for a method that terminates the connection.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

The Connected property uses DoDisconnect to close a connection. Descendant classes override the DoDisconnect method to

drop a connection. As implemented in TCustomConnection, DoDisconnect does nothing.

See Also

Connected (see page 6868)

DoConnect (see page 6864)

138.1.1.4.3 TSoapConnection.GetConnected Method

Returns the value of the Connected property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected read implementation of the Connected property. Descendant classes override this method to return true if a connection is open and false otherwise. As defined in TCustomConnection, GetConnected always returns false.

See Also

Connected (see page 6868)

SetConnected (see page 6867)

138.1.1.4.4 TSoapConnection.GetProviderNames Method

Executes a callback for all provider objects on the application server.

Pascal

```
procedure GetProviderNames(Proc: TGetStrProc); override;
```

C++

```
virtual __fastcall GetProviderNames(TGetStrProc Proc);
```

Description

Call GetProviderNames to execute the procedure specified by the Proc parameter for every provider exposed by the application server. For every provider listed by the remote data module's AS_GetProviderNames method, Proc is called with the name of the provider.

See Also

AS_GetProviderNames (see page 16454)

AppServer (see page 8532)

ProviderName (see page 8492)

138.1.1.4.5 TSoapConnection.GetServer Method

Returns an IAppServer interface for communicating with the application server.

Pascal

```
function GetServer: IAppServer; override;
```

C++

```
virtual __fastcall IAppServer GetServer();
```

Description

Client datasets call GetServer to set the value of their AppServer property. This allows them to access providers on the remote application server.

GetServer ensures that there is a connection and then returns an IAppServer interface that can be used to communicate with providers on the application server. To use other methods of the application server's interface, use a separate THTTPRIO object or call the GetSOAPServer (see page 19872) method after setting the SOAPServerIID (see page 19877) property.

See Also

Connected (see page 19875)

AppServer (see page 8462)

THTTPRIO (see page 19928)

UseSOAPAdapter (see page 19879)

SOAPServerIID (see page 19877)

138.1.1.4.6 TSoapConnection.GetServerList Method

Returns a list of application servers (remote data modules) to which the component can connect.

Pascal

```
function GetServerList: OleVariant; override;
```

C++

```
virtual __fastcall OleVariant GetServerList();
```

Description

Connection components use GetServerList internally to fill the drop down list in the Object Inspector for the ServerName property.

As implemented in TCustomRemoteServer, GetServerList always returns NULL. Descendant classes override this method to return a list of application servers that are on the local machine and registered in the system registry (TDispatchConnection), or fetched from the server machine (TStreamedConnection).

See Also

ServerName (see page 16030)

138.1.1.4.7 TSoapConnection.GetSOAPServer Method

Returns the IAppServerSOAP interface of the application server.

Pascal

```
function GetSOAPServer: IAppServerSOAP;
```

C++

```
__fastcall IAppServerSOAP GetSOAPServer();
```

Description

Call GetSOAPServer to access the IAppServerSOAP interface that the SOAP connection component uses when

UseSOAPAdapter (see page 19879) is true. The internal adapter uses this interface to implement the IAppServer interface that the GetServer (see page 19871) method returns.

Tip: If you have set the SOAPServerIID (see page 19877) property, you can use the as operator (Delphi) or the Supports method (C++) to convert this interface into the application server's interface.

See Also

Connected (see page 19875)

GetServer (see page 19871)

UseSOAPAdapter (see page 19879)

THTTPRio

SOAPServerIID (see page 19877)

138.1.1.4.8 TSoapConnection.GetSOAPServerIID Method

Pascal

```
function GetSOAPServerIID: TGUID;
```

C++

```
__fastcall TGUID GetSOAPServerIID();
```

Description

This is GetSOAPServerIID, a member of class TSoapConnection.

138.1.1.4.9 TSoapConnection.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

138.1.1.4.10 TSoapConnection.SetSOAPServerIID Method

Pascal

```
procedure SetSOAPServerIID(const IID: String);
```

C++

```
__fastcall SetSOAPServerIID(const AnsiString IID);
```

Description

This is SetSOAPServerIID, a member of class TSoapConnection.

138.1.1.4.11 TSoapConnection.SetUseSoapAdapter Method

Pascal

```
procedure SetUseSoapAdapter(Value: Boolean);
```

C++

```
__fastcall SetUseSoapAdapter(Boolean Value);
```

Description

This is SetUseSoapAdapter, a member of class TSoapConnection.

138.1.1.5 TSoapConnection Properties

The properties of the TSoapConnection class are listed here.

Public Properties

	Name	Description
R	RIO (see page 19876)	Provides access to the internal remote interfaced object that communicates with the application server.

Published Properties

	Name	Description
	Agent (see page 19874)	Provides the value of the User-Agent header for HTTP messages to the server.
	Connected (see page 19875)	Indicates whether the SOAP connection component is connected to the application server.
	Password (see page 19875)	Specifies the password that allows the client application to log on to a local host or proxy server.
	Proxy (see page 19876)	Lists any proxy servers that are required to make the connection.
	ProxyByPass (see page 19876)	Lists the host names of locally registered servers that do not require a proxy.
	SOAPServerIID (see page 19877)	Identifies the invokable interface that TSoapConnection (see page 19864) uses to communicate with the application server.
	URL (see page 19878)	Specifies the Uniform Resource Locator for the THTTPSoapDispatcher on the application server.
	UserName (see page 19878)	Specifies the user name that allows the client application to log on to a local host or proxy server.
	UseSOAPAdapter (see page 19879)	Specifies how the SOAP connection component communicates with the application server.

138.1.1.5.1 TSoapConnection.Agent Property

Provides the value of the User-Agent header for HTTP messages to the server.

Pascal

```
property Agent: string;
```

C++

```
__property AnsiString Agent;
```

Description

Use Agent to supply HTTP messages generated by the SOAP connection component with the name of your application. This name is included as a User-Agent header. The User-Agent header is an optional string that describes the application generating the HTTP message.

See Also

Title (see page 13723)

138.1.1.5.2 TSoapConnection.Connected Property

Indicates whether the SOAP connection component is connected to the application server.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Set Connected to true to establish a connection to the application server. Set Connected to false to terminate the connection.

When changing the value of Connected, TSoapConnection (see page 19864) generates a BeforeConnect (see page 19880) and an AfterConnect (see page 19880) event, or a BeforeDisconnect (see page 19881) and an AfterDisconnect (see page 19880) event.

See Also

BeforeConnect (see page 6875)

AfterConnect (see page 6874)

BeforeDisconnect (see page 6875)

AfterDisconnect (see page 6875)

138.1.1.5.3 TSoapConnection.Password Property

Specifies the password that allows the client application to log on to a local host or proxy server.

Pascal

```
property Password: string;
```

C++

```
__property AnsiString Password;
```

Description

When the SOAP connection component connects to the application server, it supplies the values of the UserName (see page 19878) and Password properties so that it can log on to the local host or proxy. The value of Password can be an empty string if neither the local host nor proxy requires authentication.

Note: On Linux, if the proxy does not require authentication, you can use the UserName (see page 19878) and Password properties to log on to the Web Server.

See Also

UserName (see page 19878)

Specifying a Connection Using SOAP

138.1.1.5.4 TSoapConnection.Proxy Property

Lists any proxy servers that are required to make the connection.

Pascal

```
property Proxy: string;
```

C++

```
__property AnsiString Proxy;
```

Description

Use Proxy if the SOAP connection component can't resolve the host portion of URL (see page 19878) locally. If the server is registered locally, Proxy can be a null string. Otherwise, Proxy lists the host names of any proxy servers that can forward request messages on to the intended server machine.

See Also

ProxyByPass (see page 19876)

Specifying a Connection Using SOAP

138.1.1.5.5 TSoapConnection.ProxyByPass Property

Lists the host names of locally registered servers that do not require a proxy.

Pascal

```
property ProxyByPass: string;
```

C++

```
__property AnsiString ProxyByPass;
```

Description

Use ProxyByPass to indicate any server systems to which the SOAP connection component can make a direct connection. When the URL (see page 19878) property identifies a server in this list, the Web connection component makes a direct connection even if the Proxy (see page 19876) property is specified.

When ProxyByPass is an empty string, the Web connection component checks the registry for any locally known servers and bypasses the proxy server if the host portion of URL (see page 19878) refers to a registered local server.

See Also

Proxy (see page 19876)

URL (see page 19878)

138.1.1.5.6 TSoapConnection.RIO Property

Provides access to the internal remote interfaced object that communicates with the application server.

Pascal

```
property RIO: THTTPRIO;
```

C++

```
__property THTTPRIO RIO;
```

Description

TSoapConnection (see page 19864) uses an internal remote interfaced object (THTTPRIO) to communicate with the application server. This internal object obtains a reference to an invokable interface that is specified by the SOAPServerIID (see page 19877) property.

Use RIO to access the internal THTTPRIO instance.

See Also

SOAPServerIID (see page 19877)

138.1.1.5.7 TSoapConnection.SOAPServerIID Property

Identifies the invokable interface that TSoapConnection (see page 19864) uses to communicate with the application server.

Pascal

```
property SOAPServerIID: String;
```

C++

```
__property AnsiString SOAPServerIID;
```

Description

Set SOAPServerIID to identify the interface of the application server. SOAPServerIID is the GUID of the application server's interface. This interface is a descendant of IAppServerSOAP. Once you have formed a connection, you can access this interface by first calling the GetSOAPServer (see page 19872) method and then using the global Supports function or as operator (Delphi) or the Supports method of the interface (C++).

Warning: Use the GUID for the interface that is generated by the WSDL importer when you import the application server's definitions. This may differ from the GUID that the server uses in its implementation.

Note: In Delphi, at runtime, you can use the interface name in code and the compiler automatically converts that to the GUID. At design time (in the Object Inspector) or in C++ code, you must specify the GUID itself, not the interface name.

Note: SOAPServerIID is only used if the UseSOAPAdapter (see page 19879) property is true. In addition, if you set SOAPServerIID to anything other than IAppServerSOAP, you must import the definition of the application server's interface so that it is registered with the invocation registry.

URL (see page 19878)

IAppServerSOAP (see page 20012)

UseSOAPAdapter (see page 19879)

GetSOAPServer (see page 19872)

Specifying a Connection Using SOAP

138.1.1.5.8 TSoapConnection.URL Property

Specifies the Uniform Resource Locator for the THTTPSoapDispatcher on the application server.

Pascal

```
property URL: string;
```

C++

```
__property AnsiString URL;
```

Description

Use URL to specify the Uniform Resource Locator that the SOAP connection component uses to locate the application server.

URL includes the protocol (http or https), host name, and scriptname for the application server, as well as a path portion that identifies the THTTPSoapDispatcher on the application server. Typically, it has the form

```
http://DataHost.org/scripts/AppServer.dll/SOAP/
http://DataHost.org/scripts/AppServer.so/SOAP/
```

Note: By default, URL does not include the interface name. The name of the interface is assumed to be IAppServerSOAP (or IAppServer). If the server is written in the Delphi language and the target remote data module supports an IAppServerSOAP descendant, Delphi clients can optionally include the target interface name at the end of the URL. This allows clients to identify a SOAP data module when the server contains multiple SOAP data modules, or allows you to access the server's interface by calling the GetSOAPServer (see page 19872) method. If the client or server is not written using Delphi, you can accomplish this same effect using the SOAPServerIID (see page 19877) property.

Note: URL is a standard Uniform Resource Locator. As such, you can also use it to override the port associated with http (80) or https (443) if the Web server is configured differently. The port number follows the host name, preceded by a colon.

THTTPSoapDispatcher (see page 24628)

SOAPServerIID (see page 19877)

GetSOAPServer (see page 19872)

Specifying a Connection Using SOAP

138.1.1.5.9 TSoapConnection.UserName Property

Specifies the user name that allows the client application to log on to a local host or proxy server.

Pascal

```
property UserName: string;
```

C++

```
__property AnsiString UserName;
```

Description

When the SOAP connection component connects to the application server on a local host or to a proxy server, it supplies the values of the UserName and Password (see page 19875) properties so that it can log in. If neither the host nor the proxy server requires authentication, UserName can be an empty string.

Note: On Linux, if the proxy does not require authentication, you can use the UserName and Password (see page 19875) properties to log on to the Web Server.

See Also

Password (see page 19875)

Proxy (see page 19876)

Specifying a Connection Using SOAP

138.1.1.5.10 TSoapConnection.UseSOAPAdapter Property

Specifies how the SOAP connection component communicates with the application server.

Pascal

```
property UseSOAPAdapter: Boolean;
```

C++

```
__property Boolean UseSOAPAdapter;
```

Description

When UseSOAPAdapter is true, TSOAPConnection communicates with the application server using an IAppServerSOAP interface. It then uses an internal adapter which implements the IAppServer interface for client datasets. In this case, the GetServer (see page 19871) method returns the IAppServer interface that the internal adapter implements.

When UseSOAPAdpater is false, TSOAPConnection uses an IAppServer interface to communicate with the application server and exposes that interface with the GetServer (see page 19871) method. In this case, the GetSOAPServer (see page 19872) method returns nil (Delphi) or NULL (C++).

The recommended setting for UseSOAPAdapter is true. Unlike IAppServer, the IAppServerSOAP interface does not use the safecall calling convention. This makes it easier to marshal interface calls when the client or server is written in C++. IAppServerSOAP is not supported, however, when the application server is built using Delphi 6 (before update patch 2) or Kylix 2. If you are connecting to a server that does not support IAppServerSOAP, set UseSOAPAdapter to false.

138.1.1.6 TSoapConnection Events

The events of the TSoapConnection class are listed here.

Published Events

	Name	Description
	AfterConnect (see page 19880)	Occurs after a connection is established.
	AfterDisconnect (see page 19880)	Occurs after the connection closes.
	BeforeConnect (see page 19880)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 19881)	Occurs immediately before the connection closes.
	OnAfterExecute (see page 19881)	Occurs when TSoapConnection (see page 19864) receives the results from executing a method on the application server.

	OnBeforeExecute (see page 19882)	Occurs before TSoapConnection (see page 19864) sends a method call to the application server for execution.

138.1.1.6.1 TSoapConnection.AfterConnect Event

Occurs after a connection is established.

Pascal

```
property AfterConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterConnect;
```

Description

Write an AfterConnect event handler to take application-specific actions immediately after the connection component opens a connection to the remote source of database information.

See Also

BeforeConnect (see page 6875)

Connected (see page 6868)

Connecting to a Database Server

138.1.1.6.2 TSoapConnection.AfterDisconnect Event

Occurs after the connection closes.

Pascal

```
property AfterDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDisconnect;
```

Description

Write an AfterDisconnect event handler to take application-specific actions after the connection component drops a connection.

See Also

BeforeDisconnect (see page 6875)

Connected (see page 6868)

Disconnecting from a Database Server

138.1.1.6.3 TSoapConnection.BeforeConnect Event

Occurs immediately before establishing a connection.

Pascal

```
property BeforeConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeConnect;
```

Description

Write a BeforeConnect event handler to take application-specific actions before the connection component opens a connection

to the remote source of database information.

See Also

AfterConnect (see page 6874)

Connected (see page 6868)

Connecting to a Database Server

138.1.1.6.4 TSoapConnection.BeforeDisconnect Event

Occurs immediately before the connection closes.

Pascal

```
property BeforeDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDisconnect;
```

Description

Write a BeforeDisconnect event handler to take application-specific actions before dropping a connection.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

See Also

AfterDisconnect (see page 6875)

Connected (see page 6868)

Disconnecting from a Database Server

138.1.1.6.5 TSoapConnection.OnAfterExecute Event

Occurs when TSoapConnection (see page 19864) receives the results from executing a method on the application server.

Pascal

```
property OnAfterExecute: TAfterExecuteEvent;
```

C++

```
__property TAfterExecuteEvent OnAfterExecute;
```

Description

Write an OnAfterExecute event handler to examine or alter the encoded results from executing a method on the application server. OnAfterExecute is assigned as the OnAfterExecute event handler of an internal remote interfaced object that the SOAP connection uses to communicate with the application server.

See Also

OnBeforeExecute (see page 19882)

OnAfterExecute (see page 18730)

GetServer (see page 19871)

138.1.1.6.6 TSoapConnection.OnBeforeExecute Event

Occurs before TSoapConnection (see page 19864) sends a method call to the application server for execution.

Pascal

```
property OnBeforeExecute: TBeforeExecuteEvent;
```

C++

```
__property TBeforeExecuteEvent OnBeforeExecute;
```

Description

Write an OnBeforeExecute event handler to examine or alter an encoded method call before it is sent to the server. OnBeforeExecute occurs after the call has been marshaled into a SOAP request packet, but before that SOAP request packet has been sent to the application server.

OnBeforeExecute is assigned as the OnBeforeExecute event handler of an internal remote interfaced object that the SOAP connection uses to communicate with the application server.

See Also

OnAfterExecute (see page 19881)

OnBeforeExecute (see page 18730)

GetServer (see page 19871)

139 SOAPDm Namespace

This is namespace SOAPDm.

Topics

Name	Description
Classes (see page 19884)	The following table lists classes in this documentation.

Classes

	Name	Description
	TSoapDataModule (see page 19884)	TSoapDataModule encapsulates the objects and interfaces of an application server in a SOAP-based multi-tiered database application.

139.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TSoapDataModule (see page 19884)	TSoapDataModule encapsulates the objects and interfaces of an application server in a SOAP-based multi-tiered database application.

139.1.1 TSoapDataModule Class

TSoapDataModule encapsulates the objects and interfaces of an application server in a SOAP-based multi-tiered database application.

Class Hierarchy

Pascal

```
TSoapDataModule = class(TDataModule, IAppServer, IAppServerSOAP, IProviderContainer);
```

C++

```
class TSoapDataModule : public TDataModule, public IAppServer, public IAppServerSOAP, public
IProviderContainer;
```

File

SOAPDm

Description

Use a TSoapDataModule object as the central repository for all objects in a SOAP-based application server. SOAP data modules can contain any nonvisual components. Typically these are data access components, such as datasets and the provider components that handle communication between these datasets and client applications. They can also contain other nonvisual components, such as TTimer, or TImageList.

At design time a TSoapDataModule object provides a visual container into which a developer can place nonvisual components, set their properties, and write event handlers for them. In the unit file for the SOAP data module a developer can also code any business rules that are to be centralized in the middle tier of a multi-tiered application.

TSoapDataModule implements the IAppServer and IAppServerSOAP interfaces. These are both invokable interfaces, so if you add TSoapDataModule to a Web Service application, the invoker automatically forwards all IAppServer or IAppServerSOAP calls to the SOAP data module. The client application uses a TSoapConnection component to generate these calls.

To create a SOAP data module at design time,

1. Choose File|New|Other, and select Web Services application from the WebServices page of the new items dialog. This generates a Web module that contains a dispatcher and an invoker component. These components work together to interpret and execute incoming SOAP requests.
2. Choose File|New|Other, and select SOAP DataModule from the Web Services page of the new items dialog. This adds a TSoapDataModule descendant to your application. The TSoapDataModule descendant supports an invokable interface that descends from IAppServerSOAP as well as an IAppServer interface.

   Note: Web Service applications should not include more than one TSoapDataModule descendant. When the invoker component that appears in the primary Web module receives a request for the IAppServer or IAppServerSOAP interface, it can't distinguish between multiple implementation classes.

TSoapConnection (see page 19864)

IAppServerSOAP (see page 20012)

139.1.1.1 TSoapDataModule Members

The following tables list the members exposed by TSoapDataModule.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	ApplyUpdates (see page 19891)	Applies updates received from a client using a specified provider.
	AS_ApplyUpdates (see page 19892)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 19893)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 19893)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 19894)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 19895)	Returns a list of all the available providers on the SOAP data module.
	AS_GetRecords (see page 19895)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 19897)	Returns information from a specified record of the provider's dataset.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DataRequest (see page 19898)	Generates an OnDataRequest event on the specified provider component.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2830)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoCreate (see page 2831)	This is DoCreate, a member of class TDataModule.
V	DoDestroy (see page 2831)	This is DoDestroy, a member of class TDataModule.
	Execute (see page 19898)	Executes the query or stored procedure bound to a specified provider.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 2831)	This is GetChildren, a member of class TDataModule.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetParams (see page 19899)	Fetches current parameter values from the dataset bound to a specified provider.
V	GetProvider (see page 19899)	Returns a registered provider component given its name.
	GetProviderNames (see page 19900)	Returns a list of all the available providers on the SOAP data module.
	GetRecords (see page 19900)	Returns a data packet that contains the specified data.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleCreateException (see page 2831)	This is HandleCreateException, a member of class TDataModule.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 2832)	This is ReadState, a member of class TDataModule.
	RowRequest (see page 19902)	Returns information from a specified record of the provider's dataset.
V	SAS_ApplyUpdates (see page 19903)	This is SAS_ApplyUpdates, a member of class TSoapDataModule.
V	SAS_DataRequest (see page 19903)	Generates an OnSAS_DataRequest event on the specified provider component.
V	SAS_Execute (see page 19904)	SAS_Executes the query or stored procedure bound to a specified provider.
V	SAS_GetParams (see page 19905)	Fetches current parameter values from the dataset bound to a specified provider.
V	SAS_GetProviderNames (see page 19906)	Returns a list of all the available providers on the SOAP data module.
V	SAS_GetRecords (see page 19906)	This is SAS_GetRecords, a member of class TSoapDataModule.
V	SAS_RowRequest (see page 19907)	This is SAS_RowRequest, a member of class TSoapDataModule.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 19890)	Increments the reference count for this data module's interface.
	_Release (see page 19890)	Decrements the reference count for this data module's interface.
V	AfterConstruction (see page 19891)	Generates an OnCreate event.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 19897)	Generates an OnDestroy event.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 19888)	Creates a SOAP data module instance.
V	CreateNew (see page 2828)	Creates an instance of a data module and registers with the global screen object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 19889)	Frees a SOAP data module instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIDsOfNames (see page 22395)	This is GetIDsOfNames, a member of class IDispatch.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetTypeInfo (see page 22395)	This is GetTypeInfo, a member of class IDispatch.
	GetTypeInfoCount (see page 22395)	This is GetTypeInfoCount, a member of class IDispatch.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invoke (see page 22395)	This is Invoke, a member of class IDispatch.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	Lock (see page 19901)	Locks the SOAP data module so that it can't be locked by other threads.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 19901)	Allocates memory for each instance of TSoapDataModule (see page 19884).
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterProvider (see page 19902)	This is RegisterProvider, a member of class TSoapDataModule.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 19903)	Handles exceptions in methods declared using the safecall calling convention.

	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	Unlock (see page 19907)	Unlocks the SOAP data module after it was locked by a call to the Lock (see page 19901) method.
	UnRegisterProvider (see page 19907)	Removes a provider from the list returned by AS_GetProviderNames (see page 19895).
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignOffset (see page 2832)	Specifies the design offset for the data module at design time.
	DesignSize (see page 2832)	Specifies the design size for the data module at design time.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	ProviderCount (see page 19908)	Indicates the number of providers registered with the SOAP data module.
R	Providers (see page 19908)	Lists the registered provider components that are contained in the SOAP data module.
R	RefCount (see page 19909)	Reference counts the data module's interface.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnCreate (see page 2833)	Occurs when an application instantiates a data module.
	OnDestroy (see page 2834)	Occurs when the data module is about to be destroyed.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 2833)	Specifies when OnCreate (see page 2833) and OnDestroy (see page 2834) events occur.
	Tag (see page 2808)	Stores an integer value as part of a component.

139.1.1.2 TSoapDataModule.Create Constructor

Creates a SOAP data module instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSoapDataModule(TComponent * AOwner);
```

Description

Most applications do not need to call the constructor for TSoapDataModule (see page 19884). Instead, add a SOAP data module to a Web service application using the SOAP data module wizard on the SOAP page of the new items dialog.

AOwner specifies the component that is responsible for freeing the SOAP data module (typically the application). If you supply an owner, the SOAP data module acts as a component, and is freed by that owner. If you pass nil for the AOwner parameter, the

SOAP data module acts like an interfaced object, and maintains a reference count for every use of its interface. When that reference count goes to zero, the SOAP data module automatically frees itself. Note that is you set AOwner to nil but never obtain a reference to this object's interface, you must explicitly free the data module.

See Also

Create (see page 2827)

139.1.1.3 TSoapDataModule.Destroy Destructor

Frees a SOAP data module instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSoapDataModule();
```

Description

Most applications do not need to call the destructor for TSoapDataModule (see page 19884). The SOAP data module is freed by its owner when the application shuts down.

If you must destroy a SOAP data module at runtime, call the Free method instead.

See Also

Free (see page 22300)

139.1.1.4 TSoapDataModule Methods

The methods of the TSoapDataModule class are listed here.

Protected Methods

	Name	Description
	ApplyUpdates (see page 19891)	Applies updates received from a client using a specified provider.
	AS_ApplyUpdates (see page 19892)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 19893)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 19893)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 19894)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 19895)	Returns a list of all the available providers on the SOAP data module.
	AS_GetRecords (see page 19895)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 19897)	Returns information from a specified record of the provider's dataset.
	DataRequest (see page 19898)	Generates an OnDataRequest event on the specified provider component.
	Execute (see page 19898)	Executes the query or stored procedure bound to a specified provider.
	GetParams (see page 19899)	Fetches current parameter values from the dataset bound to a specified provider.
V	GetProvider (see page 19899)	Returns a registered provider component given its name.
	GetProviderNames (see page 19900)	Returns a list of all the available providers on the SOAP data module.
	GetRecords (see page 19900)	Returns a data packet that contains the specified data.
	RowRequest (see page 19902)	Returns information from a specified record of the provider's dataset.
V	SAS_ApplyUpdates (see page 19903)	This is SAS_ApplyUpdates, a member of class TSoapDataModule.
V	SAS_DataRequest (see page 19903)	Generates an OnSAS_DataRequest event on the specified provider component.
V	SAS_Execute (see page 19904)	SAS_Executes the query or stored procedure bound to a specified provider.
V	SAS_GetParams (see page 19905)	Fetches current parameter values from the dataset bound to a specified provider.
V	SAS_GetProviderNames (see page 19906)	Returns a list of all the available providers on the SOAP data module.

	SAS_GetRecords (see page 19906)	This is SAS_GetRecords, a member of class TSoapDataModule.
	SAS_RowRequest (see page 19907)	This is SAS_RowRequest, a member of class TSoapDataModule.

Public Methods

	Name	Description
	_AddRef (see page 19890)	Increments the reference count for this data module's interface.
	_Release (see page 19890)	Decrements the reference count for this data module's interface.
	AfterConstruction (see page 19891)	Generates an OnCreate event.
	BeforeDestruction (see page 19897)	Generates an OnDestroy event.
	Lock (see page 19901)	Locks the SOAP data module so that it can't be locked by other threads.
	NewInstance (see page 19901)	Allocates memory for each instance of TSoapDataModule (see page 19884).
	RegisterProvider (see page 19902)	This is RegisterProvider, a member of class TSoapDataModule.
	SafeCallException (see page 19903)	Handles exceptions in methods declared using the safecall calling convention.
	Unlock (see page 19907)	Unlocks the SOAP data module after it was locked by a call to the Lock (see page 19901) method.
	UnRegisterProvider (see page 19907)	Removes a provider from the list returned by AS_GetProviderNames (see page 19895).

139.1.1.4.1 TSoapDataModule._AddRef Method

Increments the reference count for this data module's interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

Do not call the __AddRef method directly. This method is called when an application obtains a reference to the SOAP data module's interface pointer. __AddRef increments the RefCount (see page 19909) property.

When the caller is through with the interface, it calls _Release (see page 19890). This allows the data module to free itself when it is no longer used (when the reference count goes to zero).

See Also

_Release (see page 19890)

RefCount (see page 19909)

IAppServer (see page 16450)

139.1.1.4.2 TSoapDataModule._Release Method

Decrements the reference count for this data module's interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

Do not call the __Release method directly. This method is called when an application releases a reference to the SOAP data module's interface pointer. __Release decrements the RefCount (see page 19909) property.

If the SOAP data module does not have an Owner, that is, if the value of the Owner property is nil (Delphi) or NULL (C++), then if the call to __Release changes the value of RefCount (see page 19909) to zero, the SOAP data module automatically frees itself.

See Also

_AddRef (see page 19890)

RefCount (see page 19909)

IAppServer (see page 16450)

Owner (see page 2807)

139.1.1.4.3 TSoapDataModule.AfterConstruction Method

Generates an OnCreate event.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction is called after the data module's constructor has finished. Do not call it explicitly in applications.

TDataModule overrides AfterConstruction to generate an OnCreate event when OldCreateOrder is false.

See Also

BeforeDestruction (see page 2830)

OnCreate (see page 2833)

OldCreateOrder (see page 2833)

139.1.1.4.4 TSoapDataModule.ApplyUpdates Method

Applies updates received from a client using a specified provider.

Pascal

```
function ApplyUpdates(const ProviderName: WideString; Delta: OleVariant; MaxErrors: Integer;
out ErrorCount: Integer; var OwnerData: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant ApplyUpdates(const BSTR ProviderName, OleVariant Delta, int MaxErrors,
int ErrorCount, OleVariant OwnerData);
```

Description

ApplyUpdates provides the underlying implementation for the AS_ApplyUpates method (on the IAppServer interface) and the SAS_ApplyUpdates (see page 19903) method (on the IAppServerSoap interface). It writes client updates to a dataset or database server.

ProviderName specifies the name of the provider component that manages the update operation.

Delta is a Variant containing the updated, inserted, and deleted records to write to the database.

MaxErrors indicates the maximum number of errors to permit before rolling back the update operation

ErrorCount returns the actual number of errors encountered during the update operation.

OwnerData is information supplied by the client application in a BeforeApplyUpdates event handler and returned to the client application in an AfterApplyUpdates event handler. It is passed to the provider's BeforeApplyUpdates event handler and returned from the provider's AfterApplyUpdates event handler.

ApplyUpdates returns a Variant that is a data packet containing all records that could not be applied.

See Also

as_applyupdates (see page 19892)

sas_applyupdates (see page 19903)

139.1.1.4.5 TSoapDataModule.AS_ApplyUpdates Method

Applies updates received from a client dataset using a specified provider.

Pascal

```
function AS_ApplyUpdates(const ProviderName: WideString; Delta: OleVariant; MaxErrors:
Integer; out ErrorCount: Integer; var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_ApplyUpdates(const BSTR ProviderName, OleVariant Delta, int
MaxErrors, int ErrorCount, OleVariant OwnerData);
```

Description

AS_AS_ApplyUpdates writes client updates to a dataset or database server.

ProviderName specifies the name of the provider component that manages the update operation.

Delta is a Variant containing the updated, inserted, and deleted records to write to the database.

MaxErrors indicates the maximum number of errors to permit before stopping the update operation.

ErrorCount returns the actual number of errors encountered during the update operation.

OwnerData is information supplied by the client application in a BeforeAS_ApplyUpdates event handler and returned to the client application in an AfterAS_ApplyUpdates event handler.

AS_AS_ApplyUpdates (Delphi) or AS_ApplyUpdates_result parameter (C++) returns a Variant that is a data packet containing all records that could not be applied to the database.

See Also

ApplyUpdates (see page 8394)

applyupdates (see page 18459)

BeforeApplyUpdates (see page 18479)

AfterApplyUpdates (see page 18475)

BeforeApplyUpdates (see page 8511)

AfterApplyUpdates (see page 8497)

AS_ApplyUpdates (see page 6590)

as_applyupdates

Communicating with the Client Dataset

139.1.1.4.6 TSoapDataModule.AS_DataRequest Method

Generates an OnAS_DataRequest event on the specified provider component.

Pascal

```
function AS_DataRequest(const ProviderName: WideString; Data: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_DataRequest(const BSTR ProviderName, OleVariant Data);
```

Description

Use AS_AS_DataRequest to invoke an OnAS_DataRequest event handler of the provider named by ProviderName. This method is provided to allow application developers to customize the communication between a client application and a provider component. There is no predefined meaning for the Data parameter or the return value (Delphi) or AS_DataRequest_result parameter (C++).

Note: Applications can only call the protected AS_AS_DataRequest method using the IAppServer interface.

See Also

OnDataRequest (see page 18482)

Providers (see page 19908)

DataRequest (see page 8404)

IAppServer (see page 16450)

139.1.1.4.7 TSoapDataModule.AS_Execute Method

AS_Executes the query or stored procedure bound to a specified provider.

Pascal

```
procedure AS_Execute(const ProviderName: WideString; const CommandText: WideString; var
Params: OleVariant; var OwnerData: OleVariant); safecall;
```

C++

```
__fastcall AS_Execute(const BSTR ProviderName, const BSTR CommandText, OleVariant Params,
OleVariant OwnerData);
```

Description

Use AS_AS_Execute to pass an execute command to a remote provider, using a specified set of parameters. AS_AS_Execute calls the AS_Execute method of the specified provider after assigning any parameters. Output parameters that result from executing a query or stored procedure are returned in the Params parameter.

Note: AS_AS_Execute should only be called for a provider whose dataset represents a query or stored procedure that does not return a cursor.

The ProviderName parameter specifies the name of the provider component associated with the query or stored procedure.

CommandText specifies an optional SQL statement that replaces the SQL of the provider's query, or the name of a stored procedure that replaces the provider's underlying stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

The Params parameter encodes any parameters expected by the query or stored procedure and returns any output parameters. To create a properly encoded value for Params from a TParams object, use the PackageParams method.

The OwnerData parameter contains custom information that appears as an argument to the provider's BeforeAS_Execute and AfterAS_Execute event handlers. This information originates in a client dataset's BeforeAS_Execute event handler. The value returned in OwnerData is passed to the client dataset's AfterAS_Execute event handler.

Note: Applications can only call the protected AS_AS_Execute method using the IAppServer interface. To execute a dataset in code from the application server, use the dataset component directly.

PackageParams (see page 8534)

Options (see page 18440)

139.1.1.4.8 TSoapDataModule.AS_GetParams Method

Fetches current parameter values from the dataset bound to a specified provider.

Pascal

```
function AS_GetParams(const ProviderName: WideString; var OwnerData: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_GetParams(const BSTR ProviderName, OleVariant OwnerData);
```

Description

Use AS_AS_GetParams to retrieve the current parameter values from the dataset associated with a provider. The ProviderName parameter specifies the name of the provider component whose dataset has the parameters. The OwnerData represents custom information that originates in a client dataset's BeforeAS_GetParams event handler and returns information that is passed to the client dataset's AfterAS_GetParams event handler.

Note: In Delphi, AS_AS_GetParams returns the parameters, encoded as a Variant array, or, if the provider does not support parameter fetching, a Null Variant.

Note: In C++, the AS_GetParams_result parameter the Variant array containing the parameters (or the Null Variant).

Use the UnpackParams procedure to convert parameter values returned by AS_AS_GetParams to a TParams object.

Warning: It is not a good idea to call AS_AS_GetParams on a SOAP data module. SOAP data modules are stateless, and any parameter values you fetch may be changed by other applications. The recommended way to obtain output parameter values is to call the AS_Execute (see page 19893) method instead.

Note: Applications can only call the protected AS_AS_GetParams method using the IAppServer interface.

139.1.1.4.9 TSoapDataModule.AS_GetProviderNames Method

Returns a list of all the available providers on the SOAP data module.

Pascal

```
function AS_GetProviderNames: OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetProviderNames();
```

Description

Call AS_AS_GetProviderNames for a list of all registered providers available from a SOAP data module. These values indicate the possible values for the ProviderName property of a client dataset that connects to the SOAP data module. When calling any of the SOAP data modules through the IAppServer interface, pass one of these names to indicate the provider that is the target of the method call.

AS_AS_GetProviderNames returns the names of the providers in a Variant array. Client datasets are associated with a provider by setting their ProviderName property to one of these names.

Note: Applications can only call the protected AS_AS_GetProviderNames method using the IAppServer interface.

See Also

ProviderName (see page 8492)

Providers (see page 19908)

IAppServer (see page 16450)

Exported (see page 18474)

139.1.1.4.10 TSoapDataModule.AS_GetRecords Method

Returns a data packet that contains the specified data.

Pascal

```
function AS_GetRecords(const ProviderName: WideString; Count: Integer; out RecsOut: Integer;
Options: Integer; const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetRecords(const BSTR ProviderName, int Count, int RecsOut, int
Options, const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

Call AS_AS_GetRecords to retrieve a specified number of records. AS_AS_GetRecords returns the requested records, starting with the current record of the provider's dataset. Because SOAP data modules are stateless, you may need to reposition the cursor or re-execute a query or stored procedure in the provider's BeforeAS_GetRecords event handler.

ProviderName gives the name of the provider component that provides the records.

Count indicates the number or type of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only Count records are retrieved.

RecsOut returns the actual number of records retrieved.

Options indicates what information should be added to the data packet in addition to data. It is a combination of the GetRecordOption constants. For example, the following value requests metadata along with a data packet encoded in XML:

```
MetaDataOption + XMLOption
MetaDataOption || XMLOption
```

CommandText specifies an optional SQL statement that replaces the SQL of the provider's query, or the name of a table or stored procedure that replaces the provider's underlying database table or stored procedure. This parameter is ignored if the provider's Options property does not include poAllowCommandText.

Params is a Variant containing any parameters that should be passed to the provider's dataset before it executes to generate the requested data. It returns any output parameters.

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_GetRecords event handler. This information is passed to the provider's BeforeAS_GetRecords event handler. OwnerData returns information supplied by the provider's AfterAS_GetRecords event handler.

Records are returned as a data packet in a Variant (as the return value in Delphi or the AS_GetRecords_result parameter in C++).

Note: Applications can only call the protected AS_AS_GetRecords method using the IAppServer interface. To fetch records directly in code from the application server, use the provider component's AS_GetRecords method.

139.1.1.4.11 TSoapDataModule.AS_RowRequest Method

Returns information from a specified record of the provider's dataset.

Pascal

```
function AS_RowRequest(const ProviderName: WideString; Row: OleVariant; RequestType: Integer;
var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_RowRequest(const BSTR ProviderName, OleVariant Row, int RequestType,
OleVariant OwnerData);
```

Description

Client datasets call AS_AS_RowRequest automatically to implement their FetchBlobs, FetchDetails , or RefreshRecord method.

The ProviderName parameter indicates the provider associated with the dataset from which information should be fetched.

The Row parameter is an OleVariant that describes the current record on the client dataset.

The RequestType parameter indicates the type of information required. It is an integer version of the TFetchOptions type. (An integer because the value may be marshaled to a remote application server). To create a value for RequestType, take the corresponding TFetchOptions value, cast it to a Byte, and cast the result to an Integer:

```
Integer(Byte([foBlobs, foDetails]));
(int) (Byte) (TFetchOptions() << foBlobs << foDetails);
```

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_RowRequest event handler. This information is passed to the provider's BeforeAS_RowRequest event handler. OwnerData returns custom information supplied by the provider's AfterAS_RowRequest event handler.

The requested data is returned as a delta packet.

Note: Applications can only call the protected AS_AS_RowRequest method using the IAppServer interface.

139.1.1.4.12 TSoapDataModule.BeforeDestruction Method

Generates an OnDestroy event.

Pascal

```
procedure BeforeDestruction; override;
```

C++

```
virtual __fastcall BeforeDestruction();
```

Description

BeforeDestruction is called immediately before the data module's destructor. Do not call it explicitly in applications.

TDataModule overrides BeforeDestruction to generate an OnDestroy event when OldCreateOrder is false.

See Also

AfterConstruction (see page 2829)

OnDestroy (see page 2834)

OldCreateOrder (see page 2833)

139.1.1.4.13 TSoapDataModule.DataRequest Method

Generates an OnDataRequest event on the specified provider component.

Pascal

```
function DataRequest(const ProviderName: WideString; Data: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant DataRequest(const BSTR ProviderName, OleVariant Data);
```

Description

DataRequest provides the underlying implementation for the AS_DataRequest (see page 19893) method (on the IAppServer interface) and the SAS_DataRequest (see page 19903) method (on the IAppServerSOAP interface). This method calls any OnDataRequest event handler of the specified provider.

There is no predefined meaning for the Data parameter. It represents custom information supplied by the client and passed to the OnDataRequest event handler.

DataRequest returns the value that is assigned to the OwnerData parameter of the event handler on exit.

See Also

AS_DataRequest (see page 19893)

SAS_DataRequest (see page 19903)

OnDataRequest (see page 18482)

139.1.1.4.14 TSoapDataModule.Execute Method

Executes the query or stored procedure bound to a specified provider.

Pascal

```
procedure Execute(const ProviderName: WideString; const CommandText: WideString; var Params:
OleVariant; var OwnerData: OleVariant);
```

C++

```
__fastcall Execute(const BSTR ProviderName, const BSTR CommandText, OleVariant Params,
OleVariant OwnerData);
```

Description

Execute provides the underlying implementation for the AS_Execute (see page 19893) method (on the IAppServer interface) and the SAS_Execute (see page 19904) method (on the IAppServerSOAP interface). It calls the Execute method of the specified provider after assigning any parameters. Output parameters that result from executing a query or stored procedure are returned in Params.

ProviderName specifies the name of the provider component associated with the query or stored procedure.

CommandText specifies an optional SQL statement that replaces the SQL of the provider's query, or the name of a stored procedure that replaces the provider's underlying stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

Params encodes any parameters expected by the query or stored procedure and returns any output parameters. To create a properly encoded value for Params from a TParams object, use the PackageParams method.

OwnerData contains custom information that appears as an argument to the provider's BeforeExecute and AfterExecute event handlers. This information originates in a client dataset's BeforeExecute event handler. The value returned in OwnerData is passed to the client dataset's AfterExecute event handler.

AS_Execute (see page 19893)

SAS_Execute (see page 19904)

139.1.1.4.15 TSoapDataModule.GetParams Method

Fetches current parameter values from the dataset bound to a specified provider.

Pascal

```
function GetParams(const ProviderName: WideString; var OwnerData: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant GetParams(const BSTR ProviderName, OleVariant OwnerData);
```

Description

GetParams provides the underlying implementation of the AS_GetParams (see page 19894) method (on the IAppServer interface) and the SAS_GetParams (see page 19905) method (on the IAppServerSOAP interface).

ProviderName specifies the name of the provider component whose dataset has the parameters to fetch.

OwnerData represents custom information that originates in a client dataset's BeforeGetParams event handler and returns information that is passed to the client dataset's AfterGetParams event handler.

GetParams returns the parameters, encoded as a Variant array, or, if the provider does not support parameter fetching, GetParams returns a Null Variant. Use the UnpackParams procedure to convert parameter values returned by GetParams to a TParams object.

See Also

SAS_GetParams (see page 19905)

AS_GetParams (see page 19894)

139.1.1.4.16 TSoapDataModule.GetProvider Method

Returns a registered provider component given its name.

Pascal

```
function GetProvider(const ProviderName: string): TCustomProvider; virtual;
```

C++

```
virtual __fastcall TCustomProvider GetProvider(const AnsiString ProviderName);
```

Description

GetProvider is the protected read implementation of the Providers (see page 19908) property.

ProviderName specifies the name of a provider that is returned. If ProviderName is not one of the names returned by AS_GetProviderNames (see page 19895) (for example, if the provider's Exported property is false), GetProvider raises an exception.

See Also

Providers (see page 19908)

Exported (see page 18474)

AS_GetProviderNames (see page 19895)

139.1.1.4.17 TSoapDataModule.GetProviderNames Method

Returns a list of all the available providers on the SOAP data module.

Pascal

```
function GetProviderNames: OleVariant;
```

C++

```
__fastcall OleVariant GetProviderNames();
```

Description

GetProviderNames provides the underlying implementation for the AS_GetProviderNames (see page 19895) method (on the IAppServer interface) and the SAS_GetProviderNames (see page 19906) method (on the IAppServerSOAP interface). It returns a list of all registered providers available from a SOAP data module.

GetProviderNames returns the names of the providers in a Variant array.

See Also

AS_GetProviderNames (see page 19895)

SAS_GetProviderNames (see page 19906)

139.1.1.4.18 TSoapDataModule.GetRecords Method

Returns a data packet that contains the specified data.

Pascal

```
function GetRecords(const ProviderName: WideString; Count: Integer; out RecsOut: Integer;
Options: Integer; const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant GetRecords(const BSTR ProviderName, int Count, int RecsOut, int Options,
const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

GetRecords provides the underlying implementation for the AS_GetRecords (see page 19895) method (on the IAppServer interface) and the SAS_GetRecords (see page 19906) method (on the IAppServerSOAP interface). GetRecords returns the requested records, starting with the current record of the provider's dataset.

- ProviderName gives the name of the provider component that supplies the records.

- Count indicates the number or type of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only Count records are retrieved.
- RecsOut returns the actual number of records retrieved.
- Options indicates what information should be added to the data packet in addition to data. It is a combination of the GetRecordOption constants.:
- CommandText specifies an optional SQL statement that replaces the SQL of the provider's query, or the name of a table or stored procedure that replaces the provider's underlying database table or stored procedure. This parameter is ignored if the provider's Options property does not include poAllowCommandText.
- Params is a Variant containing any parameters that should be passed to the provider's dataset before it executes to generate the requested data. It returns any output parameters.
- OwnerData contains custom information that is supplied by a client dataset's BeforeGetRecords event handler. This information is passed to the provider's BeforeGetRecords event handler. OwnerData returns information supplied by the provider's AfterGetRecords event handler.
- Records are returned as a data packet in a Variant.

See Also

AS_GetRecords (see page 19895)

sas_getrecords (see page 19906)

139.1.1.4.19 TSoapDataModule.Lock Method

Locks the SOAP data module so that it can't be locked by other threads.

Pascal

```
procedure Lock; virtual;
```

C++

```
virtual __fastcall Lock();
```

Description

SOAP data modules use Lock internally to ensure that all IAppServer calls are thread-safe. When implementing a SOAP data module descendant, call Lock before accessing any instance data, including the providers contained in the data module. When finished with the block of code that must be protected from thread conflicts, call the Unlock (see page 19907) method to release the lock.

Lock uses a critical section to guard against thread conflicts. This means that any code that accesses the SOAP data module's properties or contained objects must call Lock or it will introduce thread conflicts.

See Also

Providers (see page 19908)

Unlock (see page 19907)

IAppServer (see page 16450)

TCriticalSection (see page 22058)

139.1.1.4.20 TSoapDataModule.NewInstance Method

Allocates memory for each instance of TSoapDataModule (see page 19884).

Pascal

```
class function NewInstance: TObject; override;
```

C++

```
virtual __fastcall TObject * NewInstance();
```

Description

All constructors call NewInstance automatically. NewInstance calls InstanceSize to determine how much memory to allocate from the heap to contain a particular instance. Do not call NewInstance directly.

TSoapDataModule (see page 19884) overrides NewInstance to increment the reference count when a new instance is created. This prevents any constructor from accidentally deleting the instance due to a reference count of zero. The AfterConstruction (see page 19891) method decrements the reference count after all constructors have executed.

See Also

NewInstance (see page 22306)

InstanceSize (see page 22306)

afterconstruction (see page 19891)

139.1.1.4.21 TSoapDataModule.RegisterProvider Method

Pascal

```
procedure RegisterProvider(Value: TCustomProvider);
```

C++

```
__fastcall RegisterProvider(TCustomProvider Value);
```

Description

This is RegisterProvider, a member of class TSoapDataModule.

139.1.1.4.22 TSoapDataModule.RowRequest Method

Returns information from a specified record of the provider's dataset.

Pascal

```
function RowRequest(const ProviderName: WideString; Row: OleVariant; RequestType: Integer; var
OwnerData: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant RowRequest(const BSTR ProviderName, OleVariant Row, int RequestType,
OleVariant OwnerData);
```

Description

RowRequest provides the underlying implementation for the AS_RowRequest (see page 19897) method (on the IAppServer interface) and the SAS_RowRequest (see page 19907) method (on the IAppServerSOAP interface).

ProviderName indicates the provider associated with the dataset from which information should be fetched.

Row is an OleVariant that describes the current record on the client dataset.

RequestType indicates the type of information required. It is an integer version of the TFetchOptions type.

OwnerData contains custom information that is supplied by a client dataset's BeforeRowRequest event handler. This information is passed to the provider's BeforeRowRequest event handler. OwnerData returns custom information supplied by the provider's AfterRowRequest event handler.

The requested data is returned as a delta packet.

See Also

AS_RowRequest (see page 19897)

sas_rowrequest (see page 19907)

139.1.1.4.23 TSoapDataModule.SafeCallException Method

Handles exceptions in methods declared using the safecall calling convention.

Pascal

```
function SafeCallException(ExceptObject: TObject; ExceptAddr: Pointer): HResult; override;
```

C++

```
virtual __fastcall HRESULT SafeCallException(TObject * ExceptObject, void * ExceptAddr);
```

Description

SafeCallException is used for handling exceptions that are raised by methods such as the AS... methods, which use the safecall calling convention. This method ensures that the SOAP fault packet includes all the necessary error information so that clients can respond appropriately to exceptions in safecall methods.

ExceptObject is the exception that was raised.

ExceptAddr is the address where the exception occurred.

SafeCallException returns an error code that indicates what error occurred.

See Also

SafeCallException (see page 2787)

139.1.1.4.24 TSoapDataModule.SAS_ApplyUpdates Method

Pascal

```
function SAS_ApplyUpdates(const ProviderName: WideString; Delta: OleVariant; MaxErrors:
Integer; out ErrorCount: Integer; var OwnerData: OleVariant): OleVariant; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall OleVariant SAS_ApplyUpdates(const BSTR ProviderName, OleVariant
Delta, int MaxErrors, int ErrorCount, OleVariant OwnerData);
```

Description

This is SAS_ApplyUpdates, a member of class TSoapDataModule.

139.1.1.4.25 TSoapDataModule.SAS_DataRequest Method

Generates an OnSAS_DataRequest event on the specified provider component.

Pascal

```
function SAS_DataRequest(const ProviderName: WideString; Data: OleVariant): OleVariant;
virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall OleVariant SAS_DataRequest(const BSTR ProviderName, OleVariant
Data);
```

Description

Use SAS_SAS_DataRequest to invoke an OnSAS_DataRequest event handler of the provider named by ProviderName. This method is provided to allow application developers to customize the communication between a client application and a provider component.

ProviderName is the provider on which the data module generates an OnSAS_DataRequest event.

There is no predefined meaning for the Data parameter or the return value.

Note: Applications can only call the protected SAS_SAS_DataRequest method using the IAppServerSOAP interface.

See Also

OnDataRequest (see page 18482)

Providers (see page 19908)

DataRequest (see page 8404)

IAppServerSOAP (see page 20012)

139.1.1.4.26 TSoapDataModule.SAS_Execute Method

SAS_Executes the query or stored procedure bound to a specified provider.

Pascal

```
procedure SAS_Execute(const ProviderName: WideString; const CommandText: WideString; var
Params: OleVariant; var OwnerData: OleVariant); virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall SAS_Execute(const BSTR ProviderName, const BSTR CommandText,
OleVariant Params, OleVariant OwnerData);
```

Description

Use SAS_SAS_Execute to pass an execute command to a remote provider, using a specified set of parameters. SAS_SAS_Execute calls SAS_Execute, which calls the SAS_Execute method of the specified provider after assigning any parameters. Output parameters that result from executing a query or stored procedure are returned in the Params parameter.

Note: SAS_SAS_Execute should only be called for a provider whose dataset represents a query or stored procedure that does not return a cursor.

ProviderName specifies the name of the provider component associated with the query or stored procedure.

CommandText specifies an optional SQL statement that replaces the SQL of the provider's query, or the name of a stored procedure that replaces the provider's underlying stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

Params encodes any parameters expected by the query or stored procedure and returns any output parameters. To create a properly encoded value for Params from a TParams object, use the PackageParams method.

OwnerData contains custom information that appears as an argument to the provider's BeforeSAS_Execute and AfterSAS_Execute event handlers. This information originates in a client dataset's BeforeSAS_Execute event handler. The value returned in OwnerData is passed to the client dataset's AfterSAS_Execute event handler.

Note: Applications can only call the protected SAS_SAS_Execute method using the IAppServerSOAP interface. To execute a dataset in code from the application server, use the dataset component directly.

See Also

DataSet (see page 18529)

beforeexecute (see page 18479)

AfterExecute (see page 18476)

Params (see page 8489)

Execute (see page 18466)

Providers (see page 19908)

IAppServerSOAP (see page 20012)

BeforeExecute (see page 8514)

AfterExecute (see page 8504)

PackageParams (see page 8534)

Options (see page 18440)

139.1.1.4.27 TSoapDataModule.SAS_GetParams Method

Fetches current parameter values from the dataset bound to a specified provider.

Pascal

```
function SAS_GetParams(const ProviderName: WideString; var OwnerData: OleVariant): OleVariant;
virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall OleVariant SAS_GetParams(const BSTR ProviderName, OleVariant
OwnerData);
```

Description

Use SAS_SAS_GetParams to retrieve the current parameter values from the dataset associated with a provider.

ProviderName specifies the name of the provider component whose dataset has the parameters.

OwnerData represents custom information that originates in a client dataset's BeforeSAS_GetParams event handler and returns information that is passed to the client dataset's AfterSAS_GetParams event handler.

SAS_SAS_GetParams returns the parameters, encoded as a Variant array, or, if the provider does not support parameter fetching, SAS_SAS_GetParams returns a Null Variant. Use the UnpackParams procedure to convert parameter values returned by SAS_SAS_GetParams to a TParams object.

Warning: It is not a good idea to call SAS_SAS_GetParams on a SOAP data module. SOAP data modules are stateless, and any parameter values you fetch may be changed by other applications. The recommended way to obtain output parameter values is to call the SAS_Execute (see page 19904) method instead.

Note: Applications can only call the protected SAS_SAS_GetParams method using the IAppServerSOAP interface.

SAS_Execute (see page 19904)

UnpackParams (see page 8534)

139.1.1.4.28 TSoapDataModule.SAS_GetProviderNames Method

Returns a list of all the available providers on the SOAP data module.

Pascal

```
function SAS_GetProviderNames: TWideStringDynArray; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall TWideStringDynArray SAS_GetProviderNames();
```

Description

Call SAS_SAS_GetProviderNames for a list of all registered providers available from a SOAP data module. These values indicate the possible values for the ProviderName property of a client dataset that connects to the SOAP data module. When calling any of the SOAP data modules through the IAppServerSOAP interface, pass one of these names to indicate the provider that is the target of the method call.

SAS_SAS_GetProviderNames returns the names of the providers in a dynamic array. Client datasets are associated with a provider by setting their ProviderName property to one of these names.

Note: Applications can only call the protected SAS_SAS_GetProviderNames method using the IAppServerSOAP interface.

See Also

ProviderName (see page 8492)

Providers (see page 19908)

IAppServerSOAP (see page 20012)

Exported (see page 18474)

139.1.1.4.29 TSoapDataModule.SAS_GetRecords Method

Pascal

```
function SAS_GetRecords(const ProviderName: WideString; Count: Integer; out RecsOut: Integer;
Options: Integer; const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant): OleVariant; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall OleVariant SAS_GetRecords(const BSTR ProviderName, int Count, int
RecsOut, int Options, const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

This is SAS_GetRecords, a member of class TSoapDataModule.

139.1.1.4.30 TSoapDataModule.SAS_RowRequest Method

Pascal

```
function SAS_RowRequest(const ProviderName: WideString; Row: OleVariant; RequestType: Integer;
var OwnerData: OleVariant): OleVariant; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall OleVariant SAS_RowRequest(const BSTR ProviderName, OleVariant
Row, int RequestType, OleVariant OwnerData);
```

Description

This is SAS_RowRequest, a member of class TSoapDataModule.

139.1.1.4.31 TSoapDataModule.Unlock Method

Unlocks the SOAP data module after it was locked by a call to the Lock (see page 19901) method.

Pascal

```
procedure Unlock; virtual;
```

C++

```
virtual __fastcall Unlock();
```

Description

Use Unlock to release the critical section that was entered by a call to the Lock (see page 19901) method. Every call to the Lock (see page 19901) method must be paired with a corresponding call to Unlock.

See Also

Lock (see page 19901)

139.1.1.4.32 TSoapDataModule.UnRegisterProvider Method

Removes a provider from the list returned by AS_GetProviderNames (see page 19895).

Pascal

```
procedure UnRegisterProvider(Value: TCustomProvider);
```

C++

```
__fastcall UnRegisterProvider(TCustomProvider Value);
```

Description

Call UnRegisterProvider to remove a provider from the SOAP data module's list of available providers. Pass a reference to the provider that should be removed as the Value parameter. When a provider is not registered, it is not returned by the AS_GetProviderNames (see page 19895) method, which can be accessed through the IAppServer interface.

To temporarily disable a provider, use the provider's Exported property. Unexported providers can't be accessed through any IAppServer method calls.

Before a registered provider is destroyed, it must be unregistered using the UnRegisterProvider method. Providers (see page 19908) that have the SOAP data module as an Owner are unregistered automatically from their destructors.

See Also

registerprovider (see page 19902)

AS_GetProviderNames (see page 19895)

IAppServer (see page 16450)

Destroy (see page 18454)

Exported (see page 18474)

139.1.1.5 TSoapDataModule Properties

The properties of the TSoapDataModule class are listed here.

Public Properties

	Name	Description
R	ProviderCount (see page 19908)	Indicates the number of providers registered with the SOAP data module.
R	Providers (see page 19908)	Lists the registered provider components that are contained in the SOAP data module.
R	RefCount (see page 19909)	Reference counts the data module's interface.

139.1.1.5.1 TSoapDataModule.ProviderCount Property

Indicates the number of providers registered with the SOAP data module.

Pascal

```
property ProviderCount: integer;
```

C++

```
__property int ProviderCount;
```

Description

ProviderCount is the number of providers that can be accessed using the Providers (see page 19908) property.

See Also

Providers (see page 19908)

registerprovider (see page 19902)

139.1.1.5.2 TSoapDataModule.Providers Property

Lists the registered provider components that are contained in the SOAP data module.

Pascal

```
property Providers [const ProviderName: string]: TCustomProvider;
```

C++

```
__property TCustomProvider Providers[AnsiString const ProviderName];
```

Description

Use Providers to access a provider component from the SOAP data module given its name. The SOAP data module uses Providers to locate the target of method calls made using the IAppServer interface.

If the value passed as is not one of the names returned by AS_GetProviderNames (see page 19895) (for example, if the provider's Exported property is false) reading Providers raises an exception.

See Also

AS_GetProviderNames (see page 19895)

Exported (see page 18474)

registerprovider (see page 19902)

ProviderCount (see page 19908)

139.1.1.5.3 TSoapDataModule.RefCount Property

Reference counts the data module's interface.

Pascal

```
property RefCount: Integer;
```

C++

```
__property int RefCount;
```

Description

RefCount keeps track of the number of times the application takes a reference to the SOAP data module's interface. When application code obtains this data module's interface, a call is generated to the _AddRef (see page 19890) method, which increments RefCount. When application code releases the interface, a call is generated to the _Release (see page 19890) method, which decrements RefCount. When RefCount drops to zero, the SOAP data module frees itself if its Owner property is not nil (Delphi) or NULL (C++).

See Also

_AddRef (see page 19890)

_Release (see page 19890)

Owner (see page 2807)

140 SOAPDomConv Namespace

This is namespace SOAPDomConv.

Topics

Name	Description

140.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TSOAPDOMProcessor (see page 19912)	TSOAPDOMProcessor is the base class for components that process the SOAP headers from SOAP requests.

140.1.1 TSOAPDOMProcessor Class

TSOAPDOMProcessor is the base class for components that process the SOAP headers from SOAP requests.

Class Hierarchy

Pascal

```
TSOAPDOMProcessor = class(TComponent, IInterface);
```

C++

```
class TSOAPDOMProcessor : public TComponent, public IInterface;
```

File

SOAPDomConv

Description

TSOAPDOMProcessor is the base class for DOM-based components that interpret and create SOAP method calls. It manages a list of interfaces that it uses to create or interpret specialized headers in the SOAP message. Such headers can include application-specific information such as authentication, compression/decompression, encryption/decryption, and so on.

Do not create instances of TSOAPDOMProcessor. It is intended only as a base class for components that use the information in SOAP headers when interpreting or creating SOAP method calls.

See Also

TOPToSoapDomConvert (see page 18137)

140.1.1.1 TSOAPDOMProcessor Members

The following tables list the members exposed by TSOAPDOMProcessor.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FHeaderProcessors (see page 19915)	This is FHeaderProcessors, a member of class TSOAPDOMProcessor.

Protected Methods

	Name	Description
	_AddRef (see page 19916)	Called when an application uses a component interface.
	_Release (see page 19917)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FindHeaderProcessor (see page 19919)	Locates a processor to interpret or generate a specified SOAP header.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	MakeHeaderNodes (see page 19919)	Generates all the SOAP headers that this object knows how to create.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
V	AddHeaderProcessor (see page 19917)	Adds a processor to the internal list of interfaces to use for interpreting and creating SOAP headers.
V	AfterConstruction (see page 19918)	Responds after the last constructor executes.
V	Assign (see page 2930)	Copies the contents of another, similar object.

	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DefaultProcessHeader (see page 19918)	Handles the interpretation of a SOAP header when no processor can be found.
	Destroy (see page 19915)	Frees the memory associated with the TSOAPDOMProcessor (see page 19912) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 19919)	Allocates memory for each instance of TSOAPDOMProcessor (see page 19912).
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.

V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

140.1.1.2 TSOAPDOMProcessor.Destroy Destructor

Frees the memory associated with the TSOAPDOMProcessor (see page 19912) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSOAPDOMProcessor();
```

Description

Do not call Destroy to free an instance of TSOAPDOMProcessor (see page 19912). Instead, use the Free method, which first checks for a nil reference before calling Destroy.

See Also

Free (see page 22300)

140.1.1.3 TSOAPDOMProcessor Fields

The fields of the TSOAPDOMProcessor class are listed here.

Protected Fields

	Name	Description
	FHeaderProcessors (see page 19915)	This is FHeaderProcessors, a member of class TSOAPDOMProcessor.

140.1.1.3.1 TSOAPDOMProcessor.FHeaderProcessors Field

Pascal

```
FHeaderProcessors: TDOMHeaderProcessorArray;
```

C++

```
TDOMHeaderProcessorArray FHeaderProcessors;
```

Description

This is FHeaderProcessors, a member of class TSOAPDOMProcessor.

140.1.1.4 TSOAPDOMProcessor Methods

The methods of the TSOAPDOMProcessor class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 19916)	Called when an application uses a component interface.
	_Release (see page 19917)	Called when an application releases a component interface.
V	FindHeaderProcessor (see page 19919)	Locates a processor to interpret or generate a specified SOAP header.
	MakeHeaderNodes (see page 19919)	Generates all the SOAP headers that this object knows how to create.

Public Methods

	Name	Description
V	AddHeaderProcessor (see page 19917)	Adds a processor to the internal list of interfaces to use for interpreting and creating SOAP headers.
V	AfterConstruction (see page 19918)	Responds after the last constructor executes.
V	DefaultProcessHeader (see page 19918)	Handles the interpretation of a SOAP header when no processor can be found.
V	NewInstance (see page 19919)	Allocates memory for each instance of TSOAPDOMProcessor (see page 19912).

140.1.1.4.1 TSOAPDOMProcessor._AddRef Method

Called when an application uses a component interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

__AddRef is a basic implementation of the IInterface method, _AddRef.

Note: If the component is a wrapper for a COM object, __AddRef calls the _AddRef method of that COM object, and returns the resulting reference count.

In all other cases, __AddRef simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __AddRef to implement reference counting.

See Also

Invoke (see page 2781)

QueryInterface (see page 2784)

_Release (see page 2769)

ComObject (see page 2793)

_AddRef (see page 22397)

140.1.1.4.2 TSOAPDOMProcessor._Release Method

Called when an application releases a component interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

__Release is a basic implementation of the IInterface method, _Release.

__Release returns the resulting value of the reference count for the component's interface.

Note:

In all other cases, __Release simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __Release to implement reference counting.

See Also

Invoke (see page 2781)

QueryInterface (see page 2784)

_AddRef (see page 2769)

ComObject (see page 2793)

140.1.1.4.3 TSOAPDOMProcessor.AddHeaderProcessor Method

Adds a processor to the internal list of interfaces to use for interpreting and creating SOAP headers.

Pascal

```
procedure AddHeaderProcessor(Namespace: WideString; HeaderName: WideString; TypeName:
WideString; Processor: IDOMHeaderProcessor); virtual;
```

C++

```
virtual __fastcall AddHeaderProcessor(BSTR Namespace, BSTR HeaderName, BSTR TypeName,
IDOMHeaderProcessor Processor);
```

Description

AddHeaderProcessor stores a specified processor interface and the information necessary to identify the SOAP headers that it handles.

Namespace is the namespace URI in which the SOAP header identified by HeaderName is defined.

HeaderName is the name of the SOAP header that the processor handles.

TypeName is the name of the type that is used for the value of the header.

Processor is the interface for a helper object that creates or interprets SOAP headers that match Namespace, HeaderName, and TypeName.

Note: AddHeaderProcessor is supplied for backward compatibility. Headers are handled differently, using lists of TSOAPHeader descendants that are supplied as parameters to methods in descendant classes.

See Also

FindHeaderProcessor (see page 19919)

140.1.1.4.4 TSOAPDOMProcessor.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of TSOAPDOMProcessor (see page 19912) is allocated, its reference count is incremented to prevent its destruction while processing the constructor. AfterConstruction decrements that reference count to re-establish the correct count after all constructors have executed.

See Also

BeforeDestruction (see page 22289)

NewInstance (see page 19919)

140.1.1.4.5 TSOAPDOMProcessor.DefaultProcessHeader Method

Handles the interpretation of a SOAP header when no processor can be found.

Pascal

```
procedure DefaultProcessHeader(HeaderNode: IXMLNode; var Handled: Boolean; var AbortRequest:
Boolean); virtual;
```

C++

```
virtual __fastcall DefaultProcessHeader(IXMLNode HeaderNode, Boolean Handled, Boolean
AbortRequest);
```

Description

DefaultProcessHeader is called to provide a default interpretation of a SOAP header when it is not processed by one of the processors that FindHeaderProcessor (see page 19919) returns.

HeaderNode is the interface of the DOM representation of the SOAP header to be processed.

Handled returns true if DefaultProcessHeader handles the header node.

AbortRequest returns true if DefaultProcessHeader determines that the SOAP header can't be handled and that this results in an inability to interpret the entire SOAP request.

Note: DefaultProcessHeader is supplied for backward compatibility. Headers are handled differently, using lists of TSOAPHeader descendants that are supplied as parameters to methods in descendant classes.

See Also

FindHeaderProcessor (see page 19919)

140.1.1.4.6 TSOAPDOMProcessor.FindHeaderProcessor Method

Locates a processor to interpret or generate a specified SOAP header.

Pascal

```
function FindHeaderProcessor(Namespace: WideString; HeaderName: WideString; TypeName:
WideString): IDOMHeaderProcessor; virtual;
```

C++

```
virtual __fastcall IDOMHeaderProcessor FindHeaderProcessor(BSTR Namespace, BSTR HeaderName,
BSTR TypeName);
```

Description

FindHeaderProcessor returns the interface of the helper object that can generate or interpret a specified SOAP header. This processor must be previously added to the TSOAPDOMProcessor (see page 19912) object's internal list of processors by a call to the AddHeaderProcessor (see page 19917) method.

Namespace is the namespace URI in which the SOAP header identified by HeaderName is defined.

HeaderName is the name of the SOAP header that the processor handles.

TypeName is the name of the type that is used for the value of the header.

Note: FindHeaderProcessor is supplied for backward compatibility. Headers are handled differently, using lists of TSOAPHeader descendants that are supplied as parameters to methods in descendant classes.

See Also

AddHeaderProcessor (see page 19917)

140.1.1.4.7 TSOAPDOMProcessor.MakeHeaderNodes Method

Generates all the SOAP headers that this object knows how to create.

Pascal

```
function MakeHeaderNodes(HeaderNode: IXMLNode): IXMLNode;
```

C++

```
__fastcall IXMLNode MakeHeaderNodes(IXMLNode HeaderNode);
```

Description

MakeHeaderNodes uses the processors that have been added by the AddHeaderProcessor (see page 19917) method to generate a set of SOAP header nodes. These generated nodes are added as child nodes to the node specified by HeaderNode.

Note: MakeHeaderNodes is supplied for backward compatibility. Headers are handled differently, using lists of TSOAPHeader descendants that are supplied as parameters to methods in descendant classes.

See Also

AddHeaderProcessor (see page 19917)

140.1.1.4.8 TSOAPDOMProcessor.NewInstance Method

Allocates memory for each instance of TSOAPDOMProcessor (see page 19912).

Pascal

```
class function NewInstance: TObject; override;
```

C++

```
virtual __fastcall TObject * NewInstance();
```

Description

All constructors call NewInstance automatically. NewInstance calls InstanceSize to determine how much memory to allocate from the heap to contain a particular instance. Do not call NewInstance directly.

TSOAPDOMProcessor (see page 19912) overrides NewInstance to increment the reference count when a new instance is created. This prevents any constructor from accidentally deleting the instance due to a reference count of zero. The AfterConstruction (see page 19918) method decrements the reference count after all constructors have executed.

See Also

NewInstance (see page 22306)

InstanceSize (see page 22306)

AfterConstruction (see page 19918)

140.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IDOMHeaderProcessor (see page 19921)	IDOMHeaderProcessor is the interface for objects that interpret and create SOAP headers.

140.2.1 IDOMHeaderProcessor Interface

IDOMHeaderProcessor is the interface for objects that interpret and create SOAP headers.

Class Hierarchy

SOAPDomConv.IDOMHeaderProcessor

Pascal

```
IDOMHeaderProcessor = interface;
```

C++

```
__interface IDOMHeaderProcessor;
```

File

SOAPDomConv

Description

IDOMHeaderProcessor provides an interface for working with specialized SOAP headers. Each object that implements IDOMHeaderProcessor handles a specific type of soap header. The TSOAPDOMProcessor (see page 19912) class calls on this interface when it needs to create or interpret the headers of a SOAP packet.

IDOMHeaderProcessor declares two methods, CreateHeader (see page 19922) and ProcessHeader (see page 19922), which create or respond to a given SOAP header, respectively.

Note: C++ method declarations that use IDOMHeaderProcessor use the _di_IDOMHeaderProcessor type instead. This type is a DelphiInterface wrapper around the IDOMHeaderProcessor interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IDOMHeaderProcessor >
_di_IDOMHeaderProcessor;
```

Note: IDOMHeaderProcessor is supplied for backward compatibility. Headers are handled differently, using the ISOAPHeaders interface.

See Also

TSoapDomProcessor

ISOAPHeaders (see page 15613)

140.2.1.1 IDOMHeaderProcessor Members

The following tables list the members exposed by IDOMHeaderProcessor.

Public Methods

	Name	Description
	CreateHeader (see page 19922)	Creates a new SOAP header node.
	ProcessHeader (see page 19922)	Interprets and responds to a SOAP header.

140.2.1.2 IDOMHeaderProcessor Methods

The methods of the IDOMHeaderProcessor class are listed here.

Public Methods

	Name	Description
	CreateHeader (see page 19922)	Creates a new SOAP header node.
	ProcessHeader (see page 19922)	Interprets and responds to a SOAP header.

140.2.1.2.1 IDOMHeaderProcessor.CreateHeader Method

Creates a new SOAP header node.

Pascal

```
function CreateHeader(HeaderNode: IXMLNode): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateHeader(IXMLNode HeaderNode);
```

Description

CreateHeader creates a new header node.

HeaderNode is the node in the emerging SOAP packet that acts as a parent to the new header.

CreateHeader returns the new header node.

See Also

MakeHeaderNodes (see page 19919)

140.2.1.2.2 IDOMHeaderProcessor.ProcessHeader Method

Interprets and responds to a SOAP header.

Pascal

```
procedure ProcessHeader(HeaderNode: IXMLNode; var Handled: Boolean; var AbortRequest: Boolean);
```

C++

```
__fastcall ProcessHeader(IXMLNode HeaderNode, Boolean Handled, Boolean AbortRequest);
```

Description

ProcessHeader provides a response to a given SOAP header node.

HeaderNode is the interface of the DOM representation of the SOAP header to be processed.

Handled returns true if ProcessHeader handles the header node.

AbortRequest returns true if ProcessHeader determines that the SOAP header can't be handled and that this results in an inability to interpret the entire SOAP request. For example, if the header node represents authentication information, ProcessHeader could set AbortRequest to true if the header supplied an invalid password.

140.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TDOMHeaderProcessorEntry (see page 19924)	This is record SOAPDomConv.TDOMHeaderProcessorEntry.

140.3.1 SOAPDomConv.TDOMHeaderProcessorEntry Record

Pascal

```
TDOMHeaderProcessorEntry = record
  Processor: IDOMHeaderProcessor;
  NameSpace: WideString;
  HeaderName: WideString;
  TypeName: WideString;
end;
```

C++

```
struct TDOMHeaderProcessorEntry {
  IDOMHeaderProcessor Processor;
  BSTR NameSpace;
  BSTR HeaderName;
  BSTR TypeName;
};
```

File

SOAPDomConv

Description

This is record SOAPDomConv.TDOMHeaderProcessorEntry.

140.4 Types

The following table lists types in this documentation.

Types

Name	Description
TDOMHeaderProcessorArray (see page 19925)	This is type SOAPDomConv.TDOMHeaderProcessorArray.

140.4.1 SOAPDomConv.TDOMHeaderProcessorArray Type

Pascal

```
TDOMHeaderProcessorArray = array of TDOMHeaderProcessorEntry;
```

C++

```
array of TDOMHeaderProcessorEntry TDOMHeaderProcessorArray;
```

File

SOAPDomConv

Description

This is type SOAPDomConv.TDOMHeaderProcessorArray.

141 SOAPHTTPClient Namespace

This is namespace SOAPHTTPClient.

Topics

Name	Description
Classes (see page 19928)	The following table lists classes in this documentation.

Classes

	Name	Description
	THTTPRIO (see page 19928)	THTTPRIO uses HTTP messages to call remote interfaced objects using SOAP.

141.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	THTTPRIO (see page 19928)	THTTPRIO uses HTTP messages to call remote interfaced objects using SOAP.

141.1.1 THTTPRIO Class

THTTPRIO uses HTTP messages to call remote interfaced objects using SOAP.

Class Hierarchy

Pascal

```
THTTPRIO = class(TRIO);
```

C++

```
class THTTPRIO : public TRIO;
```

File

SOAPHTTPClient

Description

Use THTTPRIO to generate statically-linked calls to invokable interfaces on a remote Web Service (see page 19936) application. When an application casts THTTPRIO to a registered invokable interface, it dynamically generates an in-memory method table, providing an implementation to that invokable interface. THTTPRIO executes the methods in this method table by encoding the method call as a SOAP request and sending an HTTP request message to the Web Service (see page 19936) application. It unpacks the resulting HTTP response message to obtain the return value and any output parameters, or to raise an exception if the request generated an exception on the server.

Use the published properties of THTTPRIO to indicate how connect to the Web Service (see page 19936) application. There are two ways to identify where the server application is located:

You can use the URL (see page 19937) property to specify the URL (see page 19937) where the server application is located,.

If you want to look up connection information dynamically at runtime from a WSDL document, you can set the WSDLLocation (see page 19938) property. After setting WSDLLocation (see page 19938), select values for the Service (see page 19936) and Port (see page 19936) properties from drop-down lists in the object inspector to fully specify the binding you want to use.

If you need to use a proxy server, or if the server requires authentication, use the properties of the THTTPReqResp object that is the value of the HTTPWebNode (see page 19935) property to provide the necessary information.

Before THTTPRIO can generate a method table for an invokable interface, the interface must be registered with the invocation registry. To register an invokable interface, use the global InvRegistry function to access the registry, and use its RegisterInterface method.

See Also

InvRegistry

TInvokableClassRegistry (see page 15526)

Calling Invokable Interfaces

Understanding Invokable Interfaces

141.1.1.1 THTTPRIO Members

The following tables list the members exposed by THTTPRIO.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FConverter (see page 18723)	This is FConverter, a member of class TRIO.
	FIID (see page 18723)	This is FIID, a member of class TRIO.
	FWebNode (see page 18723)	This is FWebNode, a member of class TRIO.
	IntfMD (see page 18723)	This is IntfMD, a member of class TRIO.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecute (see page 18725)	Generates an OnAfterExecute (see page 18730) event.
V	DoBeforeExecute (see page 18725)	Generates an OnBeforeExecute (see page 18730) event.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetResponseStream (see page 18726)	Returns a newly created stream that receives the results of executing a method call.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 19933)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.

	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 18724)	Updates the reference count after the last constructor has executed.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 18725)	Prevents the destruction of a TRIO (see page 18718) instance if the reference count is greater than zero.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 19932)	Creates an instance of THTTPRIO (see page 19928).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 19932)	Destroys the instance of a THTTPRIO (see page 19928) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.

	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetRIO (see page 18734)	Returns the value of the RIO (see page 18734) property.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 18726)	Allocates memory for each instance of a remote interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	QueryInterface (see page 19934)	Implements the IInterface QueryInterface method.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	RefCount (see page 18728)	Maintains a reference count on the use of the TRIO (see page 18718) object's interface.
R	RIO (see page 18734)	Provides access to the remote interfaced object that implements this interface.
R	SOAPHeaders (see page 18728)	Provides access to the headers of SOAP messages that the remote interface object sends or receives.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	WebNode (see page 18729)	Handles the execution of method calls on the invokable interface.
R	WSDLItems (see page 19937)	Provides access to the definitions in the WSDL file specified by WSDLLocation (see page 19938).

Published Events

	Name	Description
	OnAfterExecute (see page 18730)	Occurs when TRIO (see page 18718) receives the results from executing a method of the invokable interface.
	OnBeforeExecute (see page 18730)	Occurs before TRIO (see page 18718) sends an encoded method call for execution.
	OnGetAttachment (see page 18731)	Occurs when TRIO (see page 18718) reads each attachment included in the results from executing a method of the invokable interface.
	OnSendAttachment (see page 18731)	Occurs when TRIO (see page 18718) sends each attachment that is the value of an argument of the method call on the invokable interface.

Published Properties

	Name	Description
	Converter (see page 19935)	Handles the marshaling and unmarshaling of calls to an invokable interface.
	HTTPWebNode (see page 19935)	Handles the execution of method calls on the invokable interface.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Port (see page 19936)	Specifies the port to use when sending the SOAP message to execute a method call.
	Service (see page 19936)	Specifies the Service to use when sending the SOAP message to execute a method call.
	Tag (see page 2808)	Stores an integer value as part of a component.
	URL (see page 19937)	Specifies the URL that identifies the target Web Service (see page 19936) application.
	WSDLLocation (see page 19938)	Specifies the location of the WSDL document that describes the target Web Service (see page 19936).

141.1.1.2 THTTPRIO.Create Constructor

Creates an instance of THTTPRIO (see page 19928).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall THTTPRIO(TComponent * AOwner);
```

Description

Call Create to instantiate a THTTPRIO (see page 19928) object at runtime. THTTPRIO (see page 19928) components added to forms or data modules at design time are created automatically.

The AOwner parameter specifies another component (usually a form or data module) that is responsible for freeing the THTTPRIO (see page 19928) instance. It becomes the value of the Owner property. If the THTTPRIO (see page 19928) instance is created with AOwner set to nil (Delphi) or NULL (C++), then it is automatically freed when its reference count drops to zero.

See Also

RefCount (see page 18728)

Owner (see page 2807)

141.1.1.3 THTTPRIO.Destroy Destructor

Destroys the instance of a THTTPRIO (see page 19928) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THTTPRIO();
```

Description

There is no need to explicitly free a THTTPRIO (see page 19928) instance.

If the THTTPRIO (see page 19928) object is created with an Owner, then that Owner handles the freeing of the THTTPRIO (see page 19928) instance. If the THTTPRIO (see page 19928) object is created without an Owner, then it is automatically freed when the reference count on its interface drops to zero.

See Also

Create (see page 19932)

Owner (see page 2807)

RefCount (see page 18728)

141.1.1.4 THTTPRIO Methods

The methods of the THTTPRIO class are listed here.

Protected Methods

	Name	Description
	Notification (see page 19933)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
	QueryInterface (see page 19934)	Implements the IInterface QueryInterface method.

141.1.1.4.1 THTTPRIO.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

141.1.1.4.2 THTTPRIO.QueryInterface Method

Implements the IInterface QueryInterface method.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface is called through the IInterface interface to obtain an interface pointer for the interface identified by the IID parameter. In Delphi, this call is generated when an application casts THTTPRIO (see page 19928) to an invokable interface using the as operator.

THTTPRIO (see page 19928) can only return a single type of interface pointer. The first time an application calls QueryInterface, THTTPRIO (see page 19928) generates an in-memory method table to support calls to the methods on the requested interface.

IID specifies the invokable interface that the application wants to call using this THTTPRIO (see page 19928) instance. If the THTTPRIO (see page 19928) object has already been typecast to an interface, then IID must identify that interface. If the THTTPRIO (see page 19928) instance has not yet been typecast to an interface, then IID must be a registered invokable interface.

Obj returns an interface pointer for the specified interface, unless THTTPRIO (see page 19928) was already implementing a different interface or IID identified an interface that was not registered.

QueryInterface returns 0 (S_OK) if Obj successfully returns an interface pointer. It returns E_NOINTERFACE otherwise.

Note: In C++, a second, templatized syntax takes a variable that is a DelphiInterface wrapper for the desired interface type.

If QueryInterface successfully returns an interface pointer, it automatically increments the reference count.

InvRegistry (see page 15620)

RegisterInterface (see page 15552)

RefCount (see page 18728)

141.1.1.5 THTTPRIO Properties

The properties of the THTTPRIO class are listed here.

Public Properties

	Name	Description
R	WSDLItems (see page 19937)	Provides access to the definitions in the WSDL file specified by WSDLLocation (see page 19938).

Published Properties

	Name	Description
	Converter (see page 19935)	Handles the marshaling and unmarshaling of calls to an invokable interface.
	HTTPWebNode (see page 19935)	Handles the execution of method calls on the invokable interface.
	Port (see page 19936)	Specifies the port to use when sending the SOAP message to execute a method call.
	Service (see page 19936)	Specifies the Service to use when sending the SOAP message to execute a method call.
	URL (see page 19937)	Specifies the URL that identifies the target Web Service (see page 19936) application.
	WSDLLocation (see page 19938)	Specifies the location of the WSDL document that describes the target Web Service (see page 19936).

141.1.1.5.1 THTTPRIO.Converter Property

Handles the marshaling and unmarshaling of calls to an invokable interface.

Pascal

```
property Converter: TOPToSoapDomConvert;
```

C++

```
__property TOPToSoapDomConvert Converter;
```

Description

THTTPRIO (see page 19928) uses Converter internally to marshal and unmarshal calls to an invokable interface. That is, when the THTTPRIO (see page 19928) object has been typecast to an invokable interface, it implements each method call by using Converter to marshal the call from an internal format into an encoding protocol, and to unmarshal any return values after that call is executed.

See Also

HTTPWebNode (see page 19935)

141.1.1.5.2 THTTPRIO.HTTPWebNode Property

Handles the execution of method calls on the invokable interface.

Pascal

```
property HTTPWebNode: THTTPReqResp;
```

C++

```
__property THTTPReqResp HTTPWebNode;
```

Description

THTTPRIO (see page 19928) uses HTTPWebNode internally to execute method calls. It is the implementation of the WebNode (see page 25429) property.

THTTPRio executes a method call by sending a SOAP request as an HTTP message to the Web Service (see page 19936) identified by either the URL (see page 19937) property or the WSDLLocation (see page 19938), Service (see page 19936), and Port (see page 19936) properties. If you need to use a proxy server to access the Web Service (see page 19936) application, or if the server requires authentication, use the properties of the THTTPReqResp object to provide the necessary information.

See Also

WebNode (see page 18729)

URL (see page 19937)

WSDLLocation (see page 19938)

Service (see page 19936)

Port (see page 19936)

141.1.1.5.3 THTTPRIO.Port Property

Specifies the port to use when sending the SOAP message to execute a method call.

Pascal

```
property Port: string;
```

C++

```
__property AnsiString Port;
```

Description

Set Port to indicate the desired port within the service specified by the Service (see page 19936) property. Port is the name of a port defined in the WSDL document specified by the WSDLLocation (see page 19938) property. Once you have set the WSDLLocation (see page 19938) property, you can select a value for Port from a drop-down list in the Object Inspector.

A port defines a binding (which indicates the interface to call and the encoding and transport protocols to use) and the address of the server machine.

See Also

WSDLLocation (see page 19938)

Service (see page 19936)

HTTPWebNode (see page 19935)

141.1.1.5.4 THTTPRIO.Service Property

Specifies the Service to use when sending the SOAP message to execute a method call.

Pascal

```
property Service: string;
```

C++

```
__property AnsiString Service;
```

Description

Set Service to indicate the Service that you want to use by making a remote method call. Service is the name of a Service defined in the WSDL document specified by the WSDLLocation (see page 19938) property. Once you have set the WSDLLocation (see page 19938) property, you can select a value for Service from a drop-down list in the Object Inspector.

A Service is a set of related interfaces provided by a Web Service application. The interface that THTTPRIO (see page 19928) represents must be on one of the interfaces that make up the specified service.

Note: When defining the target Web Service application by referring to a WSDL document, you must set the Port (see page 19936) property as well as the Service and WSDLLocation (see page 19938) properties.

See Also

WSDLLocation (see page 19938)

Port (see page 19936)

HTTPWebNode (see page 19935)

141.1.1.5.5 THTTPRIO.URL Property

Specifies the URL that identifies the target Web Service (see page 19936) application.

Pascal

```
property URL: string;
```

C++

```
__property AnsiString URL;
```

Description

Use URL to identify the target application that implements the invokable interface when there is no need to look up connection information from a WSDL document dynamically at runtime. If the server was written using the VCL, the path portion of this URL must match the target path name of the THTTPSoapDispatcher component on the Web Service (see page 19936) application. The protocol portion must specify http or https. Thus, for servers written in the VCL, URL has the form

`http://MyHost.com/scripts/MyWebService.dllso/SOAP/IMyInterface`

When you use URL to identify the server, THTTPRIO (see page 19928) obtains a namespace for the target interface from the invocation registry. It is necessary, therefore, that the target interface be registered with the same namespace in both client and server applications

Note: In Delphi, this happens automatically if you

Use the same unit to declare and register the target interface in both client and server applications.

Use the same value for the AppNamespacePrefix global variable.

Use the automatically-generated namespace.

If you are using C++, or if one of the above criteria is not met, you can ensure that the target interface is registered with the same namespace by explicitly specifying a namespace in the code that registers the interface.

Note: If you want your application to look up connection information from a WSDL document dynamically at runtime, you must use the WSDLLocation (see page 19938), Service (see page 19936), and Port (see page 19936) properties instead. Using the URL property is mutually exclusive with the use of WSDLLocation (see page 19938), Service (see page 19936) and Port (see page 19936).

See Also

WSDLLocation (see page 19938)

WebDispatch (see page 24634)

HTTPWebNode (see page 19935)

AppNamespacePrefix

141.1.1.5.6 THTTPRIO.WSDLItems Property

Provides access to the definitions in the WSDL file specified by WSDLLocation (see page 19938).

Pascal

```
property WSDLItems: TWSDLItems;
```

C++

```
__property TWSDLItems WSDLItems;
```

Description

WSDLItems is a helper object whose methods return the definitions included in the WSDL file specified by WSDLLocation (see page 19938). Applications should not need to use this object. Rather, THTTPRio uses this property to obtain information about how to connect to the Web Service (see page 19936) application and how to encode request messages.

See Also

WSDLLocation (see page 19938)

141.1.1.5.7 THTTPRIO.WSDLLocation Property

Specifies the location of the WSDL document that describes the target Web Service (see page 19936).

Pascal

```
property WSDLLocation: string;
```

C++

```
__property AnsiString WSDLLocation;
```

Description

Use WSDLLocation to specify a WSDL document that defines the target interface (port type). WSDLLocation can be either a fully qualified path name, or a URL (see page 19937) that indicates where the WSDL document can be found.

When using a WSDL document to indicate the target Web Service (see page 19936), you must also specify values for the Service (see page 19936) and Port (see page 19936) properties. Once WSDLLocation is set, you can use a drop-down list in the Object Inspector to select values for Port (see page 19936) and Service (see page 19936).

Note: If you do not need to look up connection information from the WSDL document at runtime, you can use the URL (see page 19937) property instead. Using the WSDLLocation property is mutually exclusive with the use of the URL (see page 19937) property.

See Also

WSDLLocation

Port (see page 19936)

Service (see page 19936)

URL (see page 19937)

142 SOAPHTTPDisp Namespace

This is namespace SOAPHTTPDisp.

Topics

Name	Description
Classes (see page 19940)	The following table lists classes in this documentation.
Interfaces (see page 19946)	The following table lists interfaces in this documentation.

Classes

	Name	Description
	THTTPSoapDispatchNode (see page 19940)	THTTPSoapDispatchNode forwards SOAP messages to an invoker for interpretation.

Interfaces

	Name	Description
	IHTTPSoapDispatch (see page 19946)	IHTTPSoapDispatch is the interface for objects that interpret SOAP request messages and execute the corresponding invokable interface.

142.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	THTTPSoapDispatchNode (see page 19940)	THTTPSoapDispatchNode forwards SOAP messages to an invoker for interpretation.

142.1.1 THTTPSoapDispatchNode Class

THTTPSoapDispatchNode forwards SOAP messages to an invoker for interpretation.

Class Hierarchy

Pascal

```
THTTPSoapDispatchNode = class(TComponent);
```

C++

```
class THTTPSoapDispatchNode : public TComponent;
```

File

SOAPHTTPDisp

Description

Use THTTPSoapDispatchNode as a base class for objects that use an invoker component to interpret and execute SOAP message calls. THTTPSoapDispatchNode maintains a reference to the interface of a component that can interpret and execute SOAP method calls. These calls are requests to execute a method on an invokable interface that is registered in the application. You can register an invokable interface by calling the RegisterInterface method of the TInvokableClassRegistry object that the global InvRegistry function returns.

THTTPSOAPPascalInvoker

THTTPSOAPCppInvoker

IHTTPSoapDispatch (see page 19946)

InvRegistry

TInvokableClassRegistry (see page 15526)

142.1.1.1 THTTPSoapDispatchNode Members

The following tables list the members exposed by THTTPSoapDispatchNode.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FSoapDispatcher (see page 19943)	This is FSoapDispatcher, a member of class THTTPSoapDispatchNode.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 19944)	Responds when objects are added or removed from the Web module.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.

	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	DispatchSOAP (see page 19944)	Forwards the SOAP message on to the invoker for interpretation and execution.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.

	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Dispatcher (see page 19945)	Specifies the interface of the component that interprets SOAP messages.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

142.1.1.2 THTTPSoapDispatchNode Fields

The fields of the THTTPSoapDispatchNode class are listed here.

Protected Fields

	Name	Description
	FSoapDispatcher (see page 19943)	This is FSoapDispatcher, a member of class THTTPSoapDispatchNode.

142.1.1.2.1 THTTPSoapDispatchNode.FSoapDispatcher Field

Pascal

```
FSoapDispatcher: IHTTPSoapDispatch;
```

C++

```
IHTTPSoapDispatch FSoapDispatcher;
```

Description

This is FSoapDispatcher, a member of class THTTPSoapDispatchNode.

142.1.1.3 THTTPSoapDispatchNode Methods

The methods of the THTTPSoapDispatchNode class are listed here.

Protected Methods

	Name	Description
	Notification (see page 19944)	Responds when objects are added or removed from the Web module.

Public Methods

	Name	Description
	DispatchSOAP (see page 19944)	Forwards the SOAP message on to the invoker for interpretation and execution.

142.1.1.3.1 THTTPSoapDispatchNode.DispatchSOAP Method

Forwards the SOAP message on to the invoker for interpretation and execution.

Pascal

```
procedure DispatchSOAP(const Path: WideString; const SoapAction: WideString; const Request:
TStream; Response: TStream); virtual;
```

C++

```
virtual __fastcall DispatchSOAP(const BSTR Path, const BSTR SoapAction, const TStream Request,
TStream Response);
```

Description

DispatchSOAP calls the DispatchSOAP method of the interface specified by the Dispatcher (see page 19945) property. The invoker that implements that interface interprets the message, executes it, and returns the results as a SOAP string.

Path is the path portion of the URL to which the incoming request message was addressed.

SoapAction is the content of the SOAP Action header of the incoming HTTP request message.

Request is a stream from which DispatchSOAP can read the content of the incoming request message. It contains the SOAP encoding of an interface call.

Response is a stream to which DispatchSOAP writes the content for the outgoing response message. DispatchSoap fills it out with the SOAP encoding of any return values.

See Also

DispatchSOAP (see page 19947)

Dispatcher (see page 19945)

142.1.1.3.2 THTTPSoapDispatchNode.Notification Method

Responds when objects are added or removed from the Web module.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. When Operation is opRemove, Notification checks whether AComponent is the implementer of the Dispatcher (see page 19945) property. If so, it sets Dispatcher (see page 19945) to nil (Delphi) or NULL (C++).

See Also

Dispatcher (see page 19945)

142.1.1.4 THTTPSoapDispatchNode Properties

The properties of the THTTPSoapDispatchNode class are listed here.

Published Properties

	Name	Description
	Dispatcher (see page 19945)	Specifies the interface of the component that interprets SOAP messages.

142.1.1.4.1 THTTPSoapDispatchNode.Dispatcher Property

Specifies the interface of the component that interprets SOAP messages.

Pascal

```
property Dispatcher: IHTTPSoapDispatch;
```

C++

```
__property IHTTPSoapDispatch Dispatcher;
```

Description

Set Dispatcher to the interface of a component that interprets SOAP messages and passes them on to the target invokable interface. Dispatcher is the interface of an invoker component, such as THTTPSoapPascalInvoker (Delphi) or THTTPSoapCppInvoker (C++). Invoker components interpret incoming SOAP calls, identify the invokable interface to which they are directed, execute the call, and assemble a response message.

142.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IHTTPSoapDispatch (see page 19946)	IHTTPSoapDispatch is the interface for objects that interpret SOAP request messages and execute the corresponding invokable interface.

142.2.1 IHTTPSoapDispatch Interface

IHTTPSoapDispatch is the interface for objects that interpret SOAP request messages and execute the corresponding invokable interface.

Class Hierarchy

SOAPHTTPDisp.IHTTPSoapDispatch

Pascal

```
IHTTPSoapDispatch = interface;
```

C++

```
__interface IHTTPSoapDispatch;
```

File

SOAPHTTPDisp

Description

The THTTPSoapDispatcher component uses this interface to call the object that interprets and responds to the incoming SOAP messages that it receives. By using an interface, THTTPSoapDispatcher can work with any component that interprets and executes SOAP messages.

This interface is implemented by THTTPSoapPascalInvoker and THTTPSoapCppInvoker.

Note: C++ method declarations that use IHTTPSoapDispatch use the _di_IHTTPSoapDispatch type instead. This type is a DelphiInterface wrapper around the IHTTPSoapDispatch interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IHTTPSoapDispatch >
_di_IHTTPSoapDispatch;
```

See Also

THTTPSoapPascalInvoker (see page 19951)

THTTPSoapDispatchNode (see page 19940)

142.2.1.1 IHTTPSoapDispatch Members

The following tables list the members exposed by IHTTPSoapDispatch.

Public Methods

	Name	Description
	DispatchSOAP (see page 19947)	Interprets an incoming SOAP message, calls the target interface, and encodes any return values.

142.2.1.2 IHTTPSoapDispatch Methods

The methods of the IHTTPSoapDispatch class are listed here.

Public Methods

	Name	Description
	DispatchSOAP (see page 19947)	Interprets an incoming SOAP message, calls the target interface, and encodes any return values.

142.2.1.2.1 IHTTPSoapDispatch.DispatchSOAP Method

Interprets an incoming SOAP message, calls the target interface, and encodes any return values.

Pascal

```
procedure DispatchSOAP(const Path: WideString; const SoapAction: WideString; const Request:
TStream; Response: TStream; var BindingType: TWebServiceBindingType);
```

C++

```
__fastcall DispatchSOAP(const BSTR Path, const BSTR SoapAction, const TStream Request, TStream
Response, TWebServiceBindingType BindingType);
```

Description

DispatchSOAP interprets a SOAP message, executes the interface call it represents, and encodes any return values as a SOAP string.

Path is the path portion of the URL to which the incoming request message was addressed.

SoapAction is the content of the SOAP Action header of the incoming HTTP request message.

Request is a stream from which DispatchSOAP can read the content of the incoming request message. It contains the SOAP encoding of an interface call.

Response is a stream to which DispatchSOAP writes the content for the outgoing response message. DispatchSoap fills it out with the SOAP encoding of any return values.

BindingType indicates the format of the Request and Response. It is either btSOAP (to indicate a SOAP packet) or btMime (for a multipart form when the request or response includes attachments). On entry, BindingType indicates the format of the encoded request message. DispatchSOAP changes BindingType to the format of the response message.

143 SOAPHTTPPasInv Namespace

This is namespace SOAPHTTPPasInv.

Topics

Name	Description
Classes (see page 19950)	The following table lists classes in this documentation.

Classes

	Name	Description
	THTTPSoapCppInvoker (see page 19950)	THTTPSoapCppInvoker interprets a SOAP request message and executes the corresponding invokable interface.
	THTTPSoapPascalInvoker (see page 19951)	THTTPSoapPascalInvoker interprets a SOAP request message and executes the corresponding invokable interface.

143.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	THTTPSoapCppInvoker (see page 19950)	THTTPSoapCppInvoker interprets a SOAP request message and executes the corresponding invokable interface.
	THTTPSoapPascalInvoker (see page 19951)	THTTPSoapPascalInvoker interprets a SOAP request message and executes the corresponding invokable interface.

143.1.1 THTTPSoapCppInvoker Class

THTTPSoapCppInvoker interprets a SOAP request message and executes the corresponding invokable interface.

Class Hierarchy

Pascal

```
THTTPSoapCppInvoker = class(THTTPSoapPascalInvoker);
```

C++

```
class THTTPSoapCppInvoker : public THTTPSoapPascalInvoker;
```

File

SOAPHTTPPasInv

Description

Use THTTPSoapCppInvoker in a C++ application that publishes a Web Service using SOAP. THTTPSoapCppInvoker receives an incoming SOAP request from a THTTPSoapDispatcher component, parses it and generates the appropriate call to a registered invokable interface, and encodes the results of that interface call.

THTTPSoapCppInvoker implements the IHTTPSoapDispatch interface, which the dispatcher uses to pass it incoming SOAP requests and to receive the content of the response message. To enable the dispatcher to use this interface, assign it as the value of the THTTPSoapDispatcher component's Dispatcher property.

THTTPSoapCppInvoker uses the invocation registry (InvRegistry) to determine whether the interface call encoded in the incoming SOAP request matches a method on a registered invokable interface. Thus, before the invoker can handle a call, the target interface must be registered using the RegisterInterface method of the invocation registry. In addition, the implementation class for that interface must be registered with the invocation registry.

143.1.2 THTTPSoapPascalInvoker Class

THTTPSoapPascalInvoker interprets a SOAP request message and executes the corresponding invokable interface.

Class Hierarchy

Pascal

```
THTTPSoapPascalInvoker = class(TSoapPascalInvoker, IHTTPSoapDispatch);
```

C++

```
class THTTPSoapPascalInvoker : public TSoapPascalInvoker, public IHTTPSoapDispatch;
```

File

SOAPHTTPPasInv

Description

Use THTTPSoapPascalInvoker in an application that publishes a Web Service using SOAP. THTTPSoapPascalInvoker receives an incoming SOAP request from a THTTPSoapDispatcher component, parses it and generates the appropriate call to a registered invokable interface, and encodes the results of that interface call.

In Delphi, you use THTTPSoapPascalInvoker directly as the invoker in your Web Service application. In C++, you use THTTPSoapCppInvoker (see page 19950), a descendant class, instead.

THTTPSoapPascalInvoker implements the IHTTPSoapDispatch interface, which the dispatcher uses to pass it incoming SOAP requests and to receive the content of the response message. To enable the dispatcher to use this interface, assign it as the value of the THTTPSoapDispatcher component's Dispatcher property.

THTTPSoapPascalInvoker uses the invocation registry (InvRegistry) to determine whether the interface call encoded in the incoming SOAP request matches a method on a registered invokable interface. Thus, before the invoker can handle a call, the target interface must be registered using the RegisterInterface method of the invocation registry. In addition, the implementation class for that interface must be registered with the invocation registry.

143.1.2.1 THTTPSoapPascalInvoker Members

The following tables list the members exposed by THTTPSoapPascalInvoker.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FConverter (see page 20025)	This is FConverter, a member of class TSoapPascalInvoker.
	FDomConverter (see page 20025)	This is FDomConverter, a member of class TSoapPascalInvoker.
	FHeadersIn (see page 20025)	This is FHeadersIn, a member of class TSoapPascalInvoker.
	FHeadersOut (see page 20025)	This is FHeadersOut, a member of class TSoapPascalInvoker.
	FSOAPHeaders (see page 20025)	This is FSOAPHeaders, a member of class TSoapPascalInvoker.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDomConverter (see page 20026)	This is GetDomConverter, a member of class TSoapPascalInvoker.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInvoker (see page 20026)	This is GetInvoker, a member of class TSoapPascalInvoker.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20027)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.

	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20024)	Creates a new TSoapPascalInvoker (see page 20020) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20024)	Frees the memory associated with the TSoapPascalInvoker (see page 20020) object.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DispatchSOAP (see page 19955)	Interprets an incoming SOAP message, calls the target interface, and encodes any return values.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDomConverter (see page 20033)	This is GetDomConverter, a member of class IAdapterConverter.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetInvoker (see page 20034)	This is GetInvoker, a member of class IInvokerConverter.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invoke (see page 20026)	Interprets a SOAP request message, calls the target interface, and encodes any return values.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterDispatchEvent (see page 20028)	Occurs after the invoker successfully calls an invokable interface to execute a SOAP request.
	BeforeDispatchEvent (see page 20029)	Occurs before the invoker calls an invokable interface to execute a SOAP request.
	BeforeDispatchEvent2 (see page 20029)	Occurs before the invoker calls an invokable interface to execute a SOAP request.
	OnExceptionEvent (see page 20030)	Occurs when the invoker encounters an exception while executing a SOAP request.
	OnGetAttachment (see page 20030)	Occurs when TSoapPascalInvoker (see page 20020) reads each attachment included in an incoming request.
	OnSendAttachment (see page 20030)	Occurs when TSoapPascalInvoker (see page 20020) sends each attachment included in the response to the current request.

Published Properties

	Name	Description
	Converter (see page 20028)	Specifies the interface of the component that handles the marshaling of SOAP messages.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

143.1.2.2 THTTPSoapPascalInvoker Methods

The methods of the THTTPSoapPascalInvoker class are listed here.

Public Methods

	Name	Description
	DispatchSOAP (see page 19955)	Interprets an incoming SOAP message, calls the target interface, and encodes any return values.

143.1.2.2.1 THTTPSoapPascalInvoker.DispatchSOAP Method

Interprets an incoming SOAP message, calls the target interface, and encodes any return values.

Pascal

```
procedure DispatchSOAP(const Path: WideString; const SoapAction: WideString; const Request:
TStream; Response: TStream; var BindingType: TWebServiceBindingType); virtual;
```

C++

```
virtual __fastcall DispatchSOAP(const BSTR Path, const BSTR SoapAction, const TStream Request,
TStream Response, TWebServiceBindingType BindingType);
```

Description

The SOAP dispatcher component (THTTPSoapDispatcher) calls DispatchSOAP when it receives an incoming SOAP message. DispatchSOAP interprets the message, looks up the target interface in the invocation registry, and calls the Invoke method to execute the call and encode any return values as a SOAP string.

Path is the path portion of the URL to which the incoming request message was addressed.

SoapAction is the content of the SOAP Action header of the incoming HTTP request message.

Request is a stream from which DispatchSOAP can read the content of the incoming request message. It contains the SOAP encoding of an interface call.

Response is a stream to which DispatchSOAP writes the SOAP encoding of any return values. THTTPSoapPascalInvoker (see page 19951) uses this as the content for the outgoing response message.

BindingType indicates the format of the Request and Response. It is either btSOAP (to indicate a SOAP packet) or btMime (for a multipart form when the request or response includes attachments). On entry, BindingType indicates the format of the encoded request message. DispatchSOAP changes BindingType to the format of the response message.

144 SOAPHTTPTrans Namespace

This is namespace SOAPHTTPTrans.

Topics

Name	Description
Classes (see page 19958)	The following table lists classes in this documentation.
Interfaces (see page 19983)	The following table lists interfaces in this documentation.
Structs, Records, Enums (see page 19985)	The following table lists structs, records, enums in this documentation.
Types (see page 19986)	The following table lists types in this documentation.

Classes

	Name	Description
	ESOAPHTTPException (see page 19958)	ESOAPHTTPException is the class for exceptions that occur when sending or receiving an HTTP message that contains a SOAP packet.
	THTTPReqResp (see page 19961)	THTTPReqResp executes a method call on an invokable interface by sending a SOAP message to the server.

Interfaces

	Name	Description
	IHTTPReqResp (see page 19983)	This is class SOAPHTTPTrans.IHTTPReqResp.

Structs, Records, Enums

	Name	Description
	SOAPInvokeOptions (see page 19985)	This is record SOAPHTTPTrans.SOAPInvokeOptions.

Types

Name	Description
TBeforePostEvent (see page 19986)	This is type SOAPHTTPTrans.TBeforePostEvent.
TPostingDataEvent (see page 19986)	This is type SOAPHTTPTrans.TPostingDataEvent.
TReceivingDataEvent (see page 19987)	This is type SOAPHTTPTrans.TReceivingDataEvent.
TSOAPInvokeOptions (see page 19987)	This is type SOAPHTTPTrans.TSOAPInvokeOptions.

144.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ESOAPHTTPException (see page 19958)	ESOAPHTTPException is the class for exceptions that occur when sending or receiving an HTTP message that contains a SOAP packet.
	THTTPReqResp (see page 19961)	THTTPReqResp executes a method call on an invokable interface by sending a SOAP message to the server.

144.1.1 ESOAPHTTPException Class

ESOAPHTTPException is the class for exceptions that occur when sending or receiving an HTTP message that contains a SOAP packet.

Class Hierarchy

Pascal

```
ESOAPHTTPException = class(Exception);
```

C++

```
class ESOAPHTTPException : public Exception;
```

File

SOAPHTTPTrans

Description

ESOAPHTTPException is raised when there is a problem with the HTTP messages that communicate a SOAP request or response in a Web Services application. Such problems include

The application can't send or receive the HTTP message.

The URL that describes the server is missing or badly formed.

The Content-type header of an HTTP message is not consistent with SOAP.

THTTPReqResp (see page 19961)

144.1.1.1 ESOAPHTTPException Members

The following tables list the members exposed by ESOAPHTTPException.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 19959)	Instantiates an instance of an ESOAPHTTPException (see page 19958) with a simple message string.
	CreateFmt (see page 19960)	Instantiates an instance of an ESOAPHTTPException (see page 19958) with a formatted message string.
	CreateFmtHelp (see page 22755)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 22755)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateRes (see page 22756)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 22756)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 22757)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 22759)	This is the overview for the CreateResHelp constructor overload.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	HelpContext (see page 22760)	Indicates the context ID number for context-sensitive online help associated with the exception.
	Message (see page 22760)	Message contains the text string to display in the exception dialog box when the exception is raised.
	StatusCode (see page 19961)	Indicates the HTTP status code of the message that gave rise to this exception.

144.1.1.2 ESOAPHTTPException.Create Constructor

Instantiates an instance of an ESOAPHTTPException (see page 19958) with a simple message string.

Pascal

```
constructor Create(const Msg: string; SCode: Integer = 0; Dummy: Integer = 0);
```

C++

```
__fastcall ESOAPHTTPException(const AnsiString Msg, int SCode = 0, int Dummy = 0);
```

Description

Call Create to construct an ESOAPHTTPException (see page 19958) object with a simple message string.

Msg is the string containing the runtime error message to display in the exception dialog box. Msg can be a hard-coded string, or can be a function call that returns a string.

SCode is the HTTP status code, if any, that triggered this exception. It becomes the value of the StatusCode (see page 19961) property.

See Also

CreateFmt (see page 19960)

StatusCode (see page 19961)

Message (see page 22760)

144.1.1.3 ESOAPHTTPException.CreateFmt Constructor

Instantiates an instance of an ESOAPHTTPException (see page 19958) with a formatted message string.

Pascal

```
constructor CreateFmt(const Msg: string; const Args: array of const; SCode: Integer = 0;
Dummy: Integer = 0);
```

C++

```
__fastcall ESOAPHTTPException(const AnsiString Msg, const array of const Args, int SCode = 0,
int Dummy = 0);
```

Description

Call CreateFmt to construct an ESOAPHTTPException (see page 19958) with a formatted message string.

Msg is a string constant containing format specifiers to be replaced with values from Args.

Args is an array of constants containing values to format according to format specifiers in Msg. CreateFmt calls the Format function to transform Msg with the values in Args.

SCode is the HTTP status code, if any, that triggered this exception. It becomes the value of the StatusCode (see page 19961) property.

See Also

Create (see page 19959)

StatusCode (see page 19961)

Message (see page 22760)

144.1.1.4 ESOAPHTTPException Properties

The properties of the ESOAPHTTPException class are listed here.

Public Properties

	Name	Description
	StatusCode (see page 19961)	Indicates the HTTP status code of the message that gave rise to this exception.

144.1.1.4.1 ESOAPHTTPException.StatusCode Property

Indicates the HTTP status code of the message that gave rise to this exception.

Pascal

```
property StatusCode: Integer;
```

C++

```
__property int StatusCode;
```

Description

StatusCode indicates the HTTP status code of the message that caused the application to raise an ESOAPHTTPException (see page 19958) exception. If the exception does not represent an HTTP response with a status code that indicates an error, StatusCode is 0.

The value of StatusCode is set by the ESOAPHTTPException (see page 19958) constructor.

Note: In Delphi code, this is set by the CreateFmt (see page 19960) or Create (see page 19959) constructor.

Note: In C++ code, this is set using one of the two constructor syntaxes that take a status code parameter.

See Also

Create (see page 19959)

CreateFmt (see page 19960)

144.1.2 THTTPReqResp Class

THTTPReqResp executes a method call on an invokable interface by sending a SOAP message to the server.

Class Hierarchy

Pascal

```
THTTPReqResp = class(TComponent, IInterface, IWebNode, IHTTPReqResp);
```

C++

```
class THTTPReqResp : public TComponent, public IInterface, public IWebNode, public
IHTTPReqResp;
```

File

SOAPHTTPTrans

Description

THTTPReqResp handles HTTP-based communication with a Web Service provider on behalf of a THTTPRio instance. THTTPRio uses this component to establish a connection to the Web Service provider and perform two tasks:

It can issue a "Get (see page 19971)" request to obtain information from a WSDL document.

It can issue a "Post" request to pass a method call to the server for execution and retrieve the results.

The Web Service that is the target of these HTTP messages can be specified directly, using the SoapAction (see page 19978) and URL (see page 19980) properties, or it can be taken from the SoapAction (see page 19978) in a WSDL document, as specified by the WSDLView (see page 19981) property. Additional properties provide details that are included in the HTTP request message header.

Note: On Windows, THTTPReqResp uses WinInet to establish a connection to the server. Wininet.dll must be installed on the client system. wininet.dll is found in the Windows system directory if you have IE3 or higher installed. WinInet has the advantage that it provides support for secure connections (https). To use WinInet, compile your project without the USE_INDY symbol defined.

Note: On Linux, THTTPReqResp uses an internal instance of the Indy HTTP component (TIdHTTP) to communicate with the server. The Indy component has the advantage that it can be used from an application that acts as both client and server, whereas WinInet only works for pure client code. To use an internal TIdHTTP, compile your project with the USE_INDY symbol defined.

IWebNode (see page 25430)

THTTPRio

TRIO (see page 18718)

144.1.2.1 THTTPReqResp Members

The following tables list the members exposed by THTTPReqResp.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 19967)	Called when an application uses a component interface.
	_Release (see page 19967)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetMimeBoundary (see page 19972)	Returns the value of the MimeBoundary property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetMimeBoundary (see page 19974)	Sets the value of the MimeBoundary property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
V	AfterConstruction (see page 19968)	Responds after the last constructor executes.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeforeExecute (see page 19968)	Performs transport-specific setup before executing an encoded method call.
	Check (see page 19969)	Raises an exception when an error is detected.
	CheckContentType (see page 19969)	Raises an exception if the response to a SOAP method call has a common invalid content-type header.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Connect (see page 19970)	Establishes or terminates a connection to the Web Service application.
V	Create (see page 19966)	Creates a new THTTPReqResp (see page 19961) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 19966)	Frees the memory associated with the THTTPReqResp (see page 19961) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Execute (see page 19970)	This is the overview for the Execute method overload.
	Execute (see page 25432)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	Get (see page 19971)	Sends a "Get" request to the server and retrieves the results.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHTTPReqResp (see page 19972)	Returns a reference to this component.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 19972)	Allocates memory for each instance of THTTPReqResp (see page 19961).
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	Receive (see page 19973)	Receives the contents of an HTTP response to the message sent by the Send (see page 19973) message.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Send (see page 19973)	Sends the encoded method call as an HTTP-based SOAP message.
V	SendGet (see page 19974)	SendGets sends a "GET" request to the server.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	ConnectTimeout (see page 19976)	Indicates the number of milliseconds that can elapse before aborting an attempt to connect to the server.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	MaxSinglePostSize (see page 19976)	This is MaxSinglePostSize, a member of class THTTPReqResp.
	MimeBoundary (see page 25433)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReceiveTimeout (see page 19978)	Indicates the number of milliseconds that can elapse before canceling a request when no response is received from the server.
	SendTimeout (see page 19978)	Indicates the number of milliseconds that can elapse before timing out the sending of a request.
	SoapAction (see page 19978)	Specifies the SoapAction header to include in the HTTP message that executes the method call.
	URL (see page 19980)	Specifies the URL that identifies the target interface on the target Web Service application.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnBeforePost (see page 19981)	Occurs before THTTPReqResp (see page 19961) sends its message.
	OnPostingData (see page 19982)	Occurs before THTTPReqResp (see page 19961) sends each chunk of data when the content is large.
	OnReceivingData (see page 19982)	Occurs after THTTPReqResp (see page 19961) receives each chunk of data when the content is large.

Published Properties

	Name	Description
	Agent (see page 19975)	Provides the value of the User-Agent header for HTTP messages to the Web Service provider.
	InvokeOptions (see page 19976)	Customizes the way THTTPReqResp (see page 19961) generates or handles headers in the messages it sends to the server.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Password (see page 19976)	Specifies the password that allows the client application to log on when the Web Service provider requires authentication.
	Proxy (see page 19977)	Lists any proxy servers that are required to make the connection.
	ProxyByPass (see page 19977)	Lists the host names of locally registered servers that do not require a proxy.
	Tag (see page 2808)	Stores an integer value as part of a component.
	UDDIBindingKey (see page 19979)	Indicates the binding key of a UDDI entry to use for fail-over support.
	UDDIOperator (see page 19979)	Indicates the URL (see page 19980) of the UDDI registry to use for fail-over support.
	UserName (see page 19980)	Specifies the user name that allows the client application to log on to the server.
	UseUTF8InHeader (see page 19980)	Specifies whether the Content-Type header should specify UTF-8 as a character set.
	WSDLView (see page 19981)	Indicates the target interface method using a WSDL document.

144.1.2.2 THTTPReqResp.Create Constructor

Creates a new THTTPReqResp (see page 19961) object.

Pascal

```
constructor Create(Owner: TComponent); override;
```

C++

```
virtual __fastcall THTTPReqResp(TComponent * Owner);
```

Description

Most applications do not create instances of THTTPReqResp (see page 19961). It is created and used by the THTTPRio class.

The Owner parameter specifies the component that is responsible for freeing the THTTPReqResp (see page 19961) instance.

See Also

Owner (see page 2807)

THTTPRio

144.1.2.3 THTTPReqResp.Destroy Destructor

Frees the memory associated with the THTTPReqResp (see page 19961) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THTTPReqResp();
```

Description

Do not call the Destroy method directly. Instead, use the Free method, which checks for a nil reference before calling Destroy.

The THTTPReqResp (see page 19961) destructor ensures that the connection to the server is closed before the component is freed.

See Also

Free (see page 22300)

144.1.2.4 THTTPReqResp Methods

The methods of the THTTPReqResp class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 19967)	Called when an application uses a component interface.
	_Release (see page 19967)	Called when an application releases a component interface.
	GetMimeBoundary (see page 19972)	Returns the value of the MimeBoundary property.
	SetMimeBoundary (see page 19974)	Sets the value of the MimeBoundary property.

Public Methods

	Name	Description
	AfterConstruction (see page 19968)	Responds after the last constructor executes.
	BeforeExecute (see page 19968)	Performs transport-specific setup before executing an encoded method call.
	Check (see page 19969)	Raises an exception when an error is detected.
	CheckContentType (see page 19969)	Raises an exception if the response to a SOAP method call has a common invalid content-type header.
	Connect (see page 19970)	Establishes or terminates a connection to the Web Service application.
	Execute (see page 19970)	This is the overview for the Execute method overload.
	Get (see page 19971)	Sends a "Get" request to the server and retrieves the results.
	GetHTTPReqResp (see page 19972)	Returns a reference to this component.
	NewInstance (see page 19972)	Allocates memory for each instance of THTTPReqResp (see page 19961).
	Receive (see page 19973)	Receives the contents of an HTTP response to the message sent by the Send (see page 19973) message.
	Send (see page 19973)	Sends the encoded method call as an HTTP-based SOAP message.
	SendGet (see page 19974)	SendGets sends a "GET" request to the server.

144.1.2.4.1 THTTPReqResp._AddRef Method

Called when an application uses a component interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

__AddRef is a basic implementation of the IInterface method, _AddRef.

Note: If the component is a wrapper for a COM object, __AddRef calls the _AddRef method of that COM object, and returns the resulting reference count.

In all other cases, __AddRef simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __AddRef to implement reference counting.

See Also

Invoke (see page 2781)

QueryInterface (see page 2784)

_Release (see page 2769)

ComObject (see page 2793)

_AddRef (see page 22397)

144.1.2.4.2 THTTPReqResp._Release Method

Called when an application releases a component interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

__Release is a basic implementation of the IInterface method, _Release.

__Release returns the resulting value of the reference count for the component's interface.

Note:

In all other cases, __Release simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __Release to implement reference counting.

See Also

Invoke (see page 2781)

QueryInterface (see page 2784)

_AddRef (see page 2769)

ComObject (see page 2793)

144.1.2.4.3 THTTPReqResp.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of THTTPReqResp (see page 19961) is allocated, its reference count is incremented to prevent its destruction while processing the constructor. AfterConstruction decrements that reference count to re-establish the correct count after all constructors have executed.

See Also

BeforeDestruction (see page 22289)

NewInstance (see page 19972)

144.1.2.4.4 THTTPReqResp.BeforeExecute Method

Performs transport-specific setup before executing an encoded method call.

Pascal

```
procedure BeforeExecute(const IntfMD: TIntfMetaData; const MethMD: TIntfMethEntry;
MethodIndex: Integer; AttachHandler: IMimeAttachmentHandler);
```

C++

```
__fastcall BeforeExecute(const TIntfMetaData IntfMD, const TIntfMethEntry MethMD, int
MethodIndex, IMimeAttachmentHandler AttachHandler);
```

Description

BeforeExecute implements the IWebNode method of the same name. The remote interface object (TRio) calls this method after its OnBeforeExecute event, but before calling the Execute (see page 19971) method to send a request to the server.

BeforeExecute looks up the information needed to call the server from the invocation registry, based on either the URL (see page 19980) that was supplied to the remote interfaced object or on the WSDLLocation, Service, and Port that were supplied to the remote interfaced object. If the method call requires an attachment, BeforeExecute looks up the MIME boundary for the attachment and adds headers to indicate the MIME boundary and content type of the attachment.

IntfMD is the runtime type information (RTTI) of the invokable interface that includes the method to execute.

MethMD is describes the method that is about to be executed.

MethodIndex indicates which overload to use when methMD describes an overloaded method. 0 indicates the first overload, 1 indicates the second overload, and so on.

AttachHandler is an interface to use for handling any attachments that are used as parameters of the method. If AttachHandler is nil (Delphi) or NULL (C++), the method call does not require passing any attachments.

See Also

Execute (see page 19971)

OnBeforeExecute (see page 18730)

BeforeExecute (see page 25431)

URL (see page 19937)

WSDLLocation (see page 19938)

Service (see page 19936)

Port (see page 19936)

144.1.2.4.5 THTTPReqResp.Check Method

Raises an exception when an error is detected.

Pascal

```
procedure Check(Error: Boolean; ShowSOAPAction: Boolean = False);
```

C++

```
__fastcall Check(Boolean Error, Boolean ShowSOAPAction = False);
```

Description

Note: On Windows (when using WinInet), THTTPReqResp (see page 19961) calls Check internally to raise an exception when it encounters an error.

Note: Check is not available on Linux.

Error indicates whether an error condition was detected.

ShowSOAPAction indicates whether the error message should include information about the SOAP Action header.

See Also

Exception (see page 22750)

144.1.2.4.6 THTTPReqResp.CheckContentType Method

Raises an exception if the response to a SOAP method call has a common invalid content-type header.

Pascal

```
procedure CheckContentType;
```

C++

```
__fastcall CheckContentType();
```

Description

CheckContentType checks the Content-type header of the response that THTTPReqResp (see page 19961) receives after sending a request to the Web Service application. If it recognizes the content-type as invalid, CheckContentType raises an ESOAPHTTPException (see page 19958).

CheckContentType does not rule out all invalid content types, only the most common.

See Also

ESOAPHTTPException (see page 19958)

144.1.2.4.7 THTTPReqResp.Connect Method

Establishes or terminates a connection to the Web Service application.

Pascal

```
procedure Connect(Value: Boolean);
```

C++

```
__fastcall Connect(Boolean Value);
```

Description

Note: On Windows, call Connect to open or close a connection to the Web Service application identified by the URL (see page 19980) property. Connect opens a connection using WinInet.

Note: Connect is not available on Linux.

Value indicates whether to open or close the connection. When Value is true, Connect establishes a connection. When Value is false, Connect terminates the connection.

See Also

URL (see page 19980)

144.1.2.4.8 Execute Method

This is the overview for the Execute method overload.

Overload List

	Name	Description
	THTTPReqResp.Execute (String, TStream) (see page 19971)	Executes a SOAP method call and returns the encoded results.
	THTTPReqResp.Execute (TStream) (see page 19971)	Executes a SOAP method call and returns the encoded results.
	THTTPReqResp.Execute (TStream, TStream) (see page 19971)	Executes a SOAP method call and returns the encoded results.

144.1.2.4.8.1 THTTPReqResp.Execute Method (String, TStream)

Executes a SOAP method call and returns the encoded results.

Pascal

```
procedure Execute(const DataMsg: String; Resp: TStream); virtual; overload;
procedure Execute(const Request: TStream; Response: TStream); virtual; overload;
function Execute(const Request: TStream): TStream; virtual; overload;
```

C++

```
virtual __fastcall Execute(const AnsiString DataMsg, TStream Resp);
virtual __fastcall Execute(const TStream Request, TStream Response);
virtual __fastcall TStream Execute(const TStream Request);
```

Description

Execute implements the IWebNode method of the same name. THTTPRio uses this method to execute a method on an invokable interface that has been encoded as a SOAP method call.

Execute

1. Connects to the Web Service application identified by the URL (see page 19980) property.
2. Creates an HTTP message with DataMsg or Request as its content and SoapAction (see page 19978) as its SoapAction (see page 19978) header.
3. Sends it to the Web Service application and retrieves the results.
4. Writes the results to the stream specified by Resp or returns a stream from which you can read the results. If using the third syntax, which returns a stream, the caller is responsible for freeing the stream object.

See Also

Execute (see page 25432)

THTTPRio

URL (see page 19980)

Send (see page 19973)

Receive (see page 19973)

SoapAction (see page 19978)

144.1.2.4.9 THTTPReqResp.Get Method

Sends a "Get" request to the server and retrieves the results.

Pascal

```
procedure Get(Resp: TStream); virtual;
```

C++

```
virtual __fastcall Get(TStream Resp);
```

Description

Get sends an HTTP request message to the server with a method type of GET. THTTPRio uses this method to fetch the WSDL document that underlies the WSDLView (see page 19981) property.

Resp is a stream that receives the contents of the response to the "Get" request message.

See Also

THTTPRio

URL (see page 19980)

Send (see page 19973)

Receive (see page 19973)

Execute (see page 19971)

WSDLView (see page 19981)

144.1.2.4.10 THTTPReqResp.GetHTTPReqResp Method

Returns a reference to this component.

Pascal

```
function GetHTTPReqResp: THTTPReqResp;
```

C++

```
__fastcall THTTPReqResp GetHTTPReqResp();
```

Description

GetHTTPReqResp returns this THTTPReqResp (see page 19961) instance (Delphi) or a pointer to this instance (C++).

144.1.2.4.11 THTTPReqResp.GetMimeBoundary Method

Returns the value of the MimeBoundary property.

Pascal

```
function GetMimeBoundary: string;
```

C++

```
__fastcall AnsiString GetMimeBoundary();
```

Description

GetMimeBoundary is the read access method for the MimeBoundary property.

See Also

MimeBoundary (see page 25433)

144.1.2.4.12 THTTPReqResp.NewInstance Method

Allocates memory for each instance of THTTPReqResp (see page 19961).

Pascal

```
class function NewInstance: TObject; override;
```

C++

```
virtual __fastcall TObject * NewInstance();
```

Description

All constructors call NewInstance automatically. NewInstance calls InstanceSize to determine how much memory to allocate from the heap to contain a particular instance. Do not call NewInstance directly.

THTTPReqResp (see page 19961) overrides NewInstance to increment the reference count when a new instance is created. This prevents any constructor from accidentally deleting the instance due to a reference count of zero. The AfterConstruction (see page 19968) method decrements the reference count after all constructors have executed.

See Also

NewInstance (see page 22306)

InstanceSize (see page 22306)

AfterConstruction (see page 19968)

144.1.2.4.13 THTTPReqResp.Receive Method

Receives the contents of an HTTP response to the message sent by the Send (see page 19973) message.

Pascal

```
procedure Receive(Context: Integer; Resp: TStream; IsGet: Boolean = False); virtual;
```

C++

```
virtual __fastcall Receive(int Context, TStream Resp, Boolean IsGet = False);
```

Description

Note: On Windows (when using WinInet), Receive fetches the HTTP response to the message sent by the SendMessage method, and writes its contents to the specified stream.

Note: Receive is not available on Linux.

Context is the context ID that identifies the original request message that the Send (see page 19973) message sent. It is the return value from a previous call to the Send (see page 19973) method.

Resp is a stream to which Receive can write the contents of the response message.

IsGet indicates whether the response stream contains the results from a "Get (see page 19971)" request message.

See Also

Send (see page 19973)

Execute (see page 19971)

144.1.2.4.14 THTTPReqResp.Send Method

Sends the encoded method call as an HTTP-based SOAP message.

Pascal

```
function Send(const ASrc: TStream): Integer; virtual;
```

C++

```
virtual __fastcall int Send(const TStream ASrc);
```

Description

Note: On Windows (when using WinInet), Send sends an HTTP request message with the SoapAction (see page 19978) header specified by SoapAction (see page 19978) to the URL (see page 19980) specified by URL (see page 19980).

Note: Send is not available on Linux.

ASrc is a stream from which to read the contents of a SOAP message for the method call.

Send returns a context ID that identifies this request message. This context ID is passed to the Receive (see page 19973) method to retrieve the corresponding response message from the server.

See Also

Receive (see page 19973)

Execute (see page 19971)

SoapAction (see page 19978)

URL (see page 19980)

144.1.2.4.15 THTTPReqResp.SendGet Method

SendGets sends a "GET" request to the server.

Pascal

```
function SendGet: Integer; virtual;
```

C++

```
virtual __fastcall int SendGet();
```

Description

Note: On Windows (when using WinInet), the Get (see page 19971) method calls SendGet to send the GET request to the URL (see page 19980) specified by URL (see page 19980).

Note: SendGet is not available on Linux.

SendGet returns a context ID that identifies the GET request message. The Get (see page 19971) method uses this context ID to retrieve the corresponding response message from the server.

See Also

Get (see page 19971)

URL (see page 19980)

144.1.2.4.16 THTTPReqResp.SetMimeBoundary Method

Sets the value of the MimeBoundary property.

Pascal

```
procedure SetMimeBoundary(Value: string);
```

C++

```
__fastcall SetMimeBoundary(AnsiString Value);
```

Description

SetMimeBoundary is the write implementation for the MimeBoundary property.

Value is the new value for MimeBoundary.

See Also

MimeBoundary (see page 25433)

144.1.2.5 THTTPReqResp Properties

The properties of the THTTPReqResp class are listed here.

Public Properties

	Name	Description
	ConnectTimeout (see page 19976)	Indicates the number of milliseconds that can elapse before aborting an attempt to connect to the server.
	MaxSinglePostSize (see page 19976)	This is MaxSinglePostSize, a member of class THTTPReqResp.
	ReceiveTimeout (see page 19978)	Indicates the number of milliseconds that can elapse before canceling a request when no response is received from the server.
	SendTimeout (see page 19978)	Indicates the number of milliseconds that can elapse before timing out the sending of a request.
	SoapAction (see page 19978)	Specifies the SoapAction header to include in the HTTP message that executes the method call.
	URL (see page 19980)	Specifies the URL that identifies the target interface on the target Web Service application.

Published Properties

	Name	Description
	Agent (see page 19975)	Provides the value of the User-Agent header for HTTP messages to the Web Service provider.
	InvokeOptions (see page 19976)	Customizes the way THTTPReqResp (see page 19961) generates or handles headers in the messages it sends to the server.
	Password (see page 19976)	Specifies the password that allows the client application to log on when the Web Service provider requires authentication.
	Proxy (see page 19977)	Lists any proxy servers that are required to make the connection.
	ProxyByPass (see page 19977)	Lists the host names of locally registered servers that do not require a proxy.
	UDDIBindingKey (see page 19979)	Indicates the binding key of a UDDI entry to use for fail-over support.
	UDDIOperator (see page 19979)	Indicates the URL (see page 19980) of the UDDI registry to use for fail-over support.
	UserName (see page 19980)	Specifies the user name that allows the client application to log on to the server.
	UseUTF8InHeader (see page 19980)	Specifies whether the Content-Type header should specify UTF-8 as a character set.
	WSDLView (see page 19981)	Indicates the target interface method using a WSDL document.

144.1.2.5.1 THTTPReqResp.Agent Property

Provides the value of the User-Agent header for HTTP messages to the Web Service provider.

Pascal

```
property Agent: string;
```

C++

```
__property AnsiString Agent;
```

Description

Use Agent to supply the SOAP request message with the name of your application. This name is included as a User-Agent header. The User-Agent header is an optional string that describes the application generating the request.

See Also

Title (see page 13723)

144.1.2.5.2 THTTPReqResp.ConnectTimeout Property

Indicates the number of milliseconds that can elapse before aborting an attempt to connect to the server.

Pascal

```
property ConnectTimeout: Integer;
```

C++

```
__property int ConnectTimeout;
```

Description

Use ConnectTimeout to indicate the number of milliseconds that can elapse before THTTPReqResp (see page 19961) abandons the attempt to form a connection.

See Also

SendTimeout (see page 19978)

ReceiveTimeout (see page 19978)

144.1.2.5.3 THTTPReqResp.InvokeOptions Property

Customizes the way THTTPReqResp (see page 19961) generates or handles headers in the messages it sends to the server.

Pascal

```
property InvokeOptions: TSOAPInvokeOptions;
```

C++

```
__property TSOAPInvokeOptions InvokeOptions;
```

Description

Use InvokeOptions to customize the way THTTPReqResp (see page 19961) generates SOAP messages to the invokable interface on the server. InvokeOptions is a set, allowing you to specify that THTTPReqResp (see page 19961) include none of the options.

See Also

SoapAction (see page 19978)

144.1.2.5.4 THTTPReqResp.MaxSinglePostSize Property

Pascal

```
property MaxSinglePostSize: Integer;
```

C++

```
__property int MaxSinglePostSize;
```

Description

This is MaxSinglePostSize, a member of class THTTPReqResp.

144.1.2.5.5 THTTPReqResp.Password Property

Specifies the password that allows the client application to log on when the Web Service provider requires authentication.

Pascal

```
property Password: string;
```

C++

```
__property AnsiString Password;
```

Description

When THTTPReqResp (see page 19961) establishes a connection, it supplies the values of the UserName (see page 19980) and Password properties so that it can log on to the host or proxy. The value of Password can be an empty string if neither the host nor proxy requires authentication.

See Also

UserName (see page 19980)

Connect (see page 19970)

144.1.2.5.6 THTTPReqResp.Proxy Property

Lists any proxy servers that are required to make the connection.

Pascal

```
property Proxy: string;
```

C++

```
__property AnsiString Proxy;
```

Description

Use Proxy if the client application can't resolve the value of host portion of URL (see page 19980) locally. If the server is registered locally, Proxy can be a null string. Otherwise, Proxy lists the host names of any proxy servers that can forward request messages on to the intended server machine.

See Also

ProxyByPass (see page 19977)

URL (see page 19980)

144.1.2.5.7 THTTPReqResp.ProxyByPass Property

Lists the host names of locally registered servers that do not require a proxy.

Pascal

```
property ProxyByPass: string;
```

C++

```
__property AnsiString ProxyByPass;
```

Description

Use ProxyByPass to indicate any server systems to which the client application can make a direct connection. When the URL (see page 19980) property addresses a server in this list, THTTPReqResp (see page 19961) makes a direct connection even if the Proxy (see page 19977) property is specified.

Note: ProxyByPass is only used on Windows, when the connection is formed using WinInet. On Linux, where the connection is formed using Indy, this property has no effect.

Note: When using WinInet, if ProxyByPass is an empty string, THTTPReqResp (see page 19961) checks the registry for any locally known servers and bypasses the proxy server if URL (see page 19980) refers to a registered local server.

See Also

Proxy (see page 19977)

URL (see page 19980)

144.1.2.5.8 THTTPReqResp.ReceiveTimeout Property

Indicates the number of milliseconds that can elapse before canceling a request when no response is received from the server.

Pascal

```
property ReceiveTimeout: Integer;
```

C++

```
__property int ReceiveTimeout;
```

Description

Use ReceiveTimeout to indicate the number of milliseconds that can elapse after sending a request before THTTPReqResp (see page 19961) cancels a request on the assumption that there will be no response forthcoming.

See Also

SendTimeout (see page 19978)

ConnectTimeout (see page 19976)

144.1.2.5.9 THTTPReqResp.SendTimeout Property

Indicates the number of milliseconds that can elapse before timing out the sending of a request.

Pascal

```
property SendTimeout: Integer;
```

C++

```
__property int SendTimeout;
```

Description

Use SendTimeout to indicate the number of milliseconds that can elapse when sending a request before THTTPReqResp (see page 19961) cancels the request.

See Also

ReceiveTimeout (see page 19978)

ConnectTimeout (see page 19976)

144.1.2.5.10 THTTPReqResp.SoapAction Property

Specifies the SoapAction header to include in the HTTP message that executes the method call.

Pascal

```
property SoapAction: string;
```

C++

```
__property AnsiString SoapAction;
```

Description

SoapAction specifies the SoapAction header that appears in the HTTP message that is sent by the Send (see page 19973) method.The value of this header is deduced from information in a WSDL document, as indicated by the WSDLView (see page 19981) property.

See Also

URL (see page 19980)

WSDLView (see page 19981)

Send (see page 19973)

RegisterInterface (see page 15552)

144.1.2.5.11 THTTPReqResp.UDDIBindingKey Property

Indicates the binding key of a UDDI entry to use for fail-over support.

Pascal

```
property UDDIBindingKey: WideString;
```

C++

```
__property BSTR UDDIBindingKey;
```

Description

UDDIBindingKey identifies the binding key for the Web Service TModel the defines the target interface. This key is used to look up the Web Service definition in the UDDI registry that the UDDIOperator (see page 19979) property identifies. UDDIBindingKey and UDDIOperator (see page 19979) are used to implement fail-over support for Web Services that are imported using the UDDI browser.

See Also

UDDIOperator (see page 19979)

144.1.2.5.12 THTTPReqResp.UDDIOperator Property

Indicates the URL (see page 19980) of the UDDI registry to use for fail-over support.

Pascal

```
property UDDIOperator: String;
```

C++

```
__property AnsiString UDDIOperator;
```

Description

UDDIOperator identifies the UDDI registry that was used to import the Web Service definition for the target interface. THTTPReqResp (see page 19961) uses this registry to look up the Web Service definition that the UDDIBindingKey (see page 19979) property identifies. UDDIOperator and UDDIBindingKey (see page 19979) are used to implement fail-over support for Web Services that are imported using the UDDI browser.

See Also

UDDIBindingKey (see page 19979)

144.1.2.5.13 THTTPReqResp.URL Property

Specifies the URL that identifies the target interface on the target Web Service application.

Pascal

```
property URL: string;
```

C++

```
__property AnsiString URL;
```

Description

URL specifies the URL to which to send the message containing the SOAP request.

When communicating with a Web Service based on an imported WSDL document, the value of URL is deduced from information in a WSDL document, as indicated by the WSDLView (see page 19981) property.

Note: In Delphi, you can construct this URL as follows: The path portion must match the target path name of the THTTPSoapDispatcher component on the Web Service application and the protocol portion must specify http or https.

See Also

WSDLView (see page 19981)

WebDispatch (see page 24634)

SoapAction (see page 19978)

Send (see page 19973)

144.1.2.5.14 THTTPReqResp.UserName Property

Specifies the user name that allows the client application to log on to the server.

Pascal

```
property UserName: string;
```

C++

```
__property AnsiString UserName;
```

Description

When THTTPReqResp (see page 19961) establishes a connection, it supplies the values of the UserName and Password (see page 19976) properties so that it can log on to the host or proxy. The value of Password (see page 19976) can be an empty string if neither the host nor proxy requires authentication.

See Also

Password (see page 19976)

Connect (see page 19970)

144.1.2.5.15 THTTPReqResp.UseUTF8InHeader Property

Specifies whether the Content-Type header should specify UTF-8 as a character set.

Pascal

```
property UseUTF8InHeader: Boolean;
```

C++

```
__property Boolean UseUTF8InHeader;
```

Description

Set UseUTF8InHeader to indicate how THTTPReqResp (see page 19961) should generate the Content-Type header of the HTTP request message it sends to the server. When UseUTF8InHeader is true, the Content-Type header indicates that the content of the request is encoded in XML using the UTF-8 character set. Otherwise, the Content-Type header simply indicates that the content is encoded in XML.

See Also

SoapAction (see page 19978)

144.1.2.5.16 THTTPReqResp.WSDLView Property

Indicates the target interface method using a WSDL document.

Pascal

```
property WSDLView: TWSDLView;
```

C++

```
__property TWSDLView WSDLView;
```

Description

WSDLView is a helper object that represents the WSDL file used to define the interfaces and protocols in the target Web Service application, as well as properties that indicate which is the target method call. It is used to generate the URL (see page 19980) and SoapAction (see page 19978) properties when importing definitions from a WSDL document.

See Also

URL (see page 19980)

SoapAction (see page 19978)

144.1.2.6 THTTPReqResp Events

The events of the THTTPReqResp class are listed here.

Published Events

	Name	Description
	OnBeforePost (see page 19981)	Occurs before THTTPReqResp (see page 19961) sends its message.
	OnPostingData (see page 19982)	Occurs before THTTPReqResp (see page 19961) sends each chunk of data when the content is large.
	OnReceivingData (see page 19982)	Occurs after THTTPReqResp (see page 19961) receives each chunk of data when the content is large.

144.1.2.6.1 THTTPReqResp.OnBeforePost Event

Occurs before THTTPReqResp (see page 19961) sends its message.

Pascal

```
property OnBeforePost: TBeforePostEvent;
```

C++

```
__property TBeforePostEvent OnBeforePost;
```

Description

Write an OnBeforePost event handler to make final changes to the HTTP request before it is sent. The Send (see page 19973) method generates OnBeforePost after setting up the content and headers of a request message but before sending it.

See Also

OnPostingData (see page 19982)

Send (see page 19973)

144.1.2.6.2 THTTPReqResp.OnPostingData Event

Occurs before THTTPReqResp (see page 19961) sends each chunk of data when the content is large.

Pascal

```
property OnPostingData: TPostingDataEvent;
```

C++

```
__property TPostingDataEvent OnPostingData;
```

Description

Write an OnPostingData event handler to provide the end-user with feedback of the progress when sending a request that contains a large amount of data. When the content of a request is very large (for example, when it contains large attachments), the Send (see page 19973) method breaks the message into blocks, which it sends separately. After sending each of these blocks, it generates an OnPostingData event. You can use the event handler to update a progress bar or similar control to indicate how much of the message has been sent.

See Also

OnBeforePost (see page 19981)

Send (see page 19973)

OnReceivingData (see page 19982)

144.1.2.6.3 THTTPReqResp.OnReceivingData Event

Occurs after THTTPReqResp (see page 19961) receives each chunk of data when the content is large.

Pascal

```
property OnReceivingData: TReceivingDataEvent;
```

C++

```
__property TReceivingDataEvent OnReceivingData;
```

Description

Write an OnReceivingData event handler to provide the end-user with feedback of the progress when receiving a request that contains a large amount of data. When the content of a response is very large (for example, when it contains large attachments), it is broken into blocks, which are sent separately. After receiving each of these blocks, the Receive (see page 19973) method generates an OnReceivingData event. You can use the event handler to update a progress bar or similar control to indicate how much of the response has been received.

See Also

OnPostingData (see page 19982)

Receive (see page 19973)

144.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IHTTPReqResp (see page 19983)	This is class SOAPHTTPTrans.IHTTPReqResp.

144.2.1 IHTTPReqResp Interface

Class Hierarchy

SOAPHTTPTrans.IHTTPReqResp

Pascal

```
IHTTPReqResp = interface;
```

C++

```
__interface IHTTPReqResp;
```

File

SOAPHTTPTrans

Description

This is class SOAPHTTPTrans.IHTTPReqResp.

144.2.1.1 IHTTPReqResp Members

The following tables list the members exposed by IHTTPReqResp.

Public Methods

	Name	Description
	GetHTTPReqResp (see page 19984)	This is GetHTTPReqResp, a member of class IHTTPReqResp.

144.2.1.2 IHTTPReqResp Methods

The methods of the IHTTPReqResp class are listed here.

Public Methods

	Name	Description
	GetHTTPReqResp (see page 19984)	This is GetHTTPReqResp, a member of class IHTTPReqResp.

144.2.1.2.1 IHTTPReqResp.GetHTTPReqResp Method

Pascal

```
function GetHTTPReqResp: THTTPReqResp;
```

C++

```
__fastcall THTTPReqResp GetHTTPReqResp();
```

Description

This is GetHTTPReqResp, a member of class IHTTPReqResp.

144.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	SOAPInvokeOptions (see page 19985)	This is record SOAPHTTPTrans.SOAPInvokeOptions.

144.3.1 SOAPHTTPTrans.SOAPInvokeOptions Enumeration

Pascal

```
SOAPInvokeOptions = (
  soNoValueForEmptySOAPAction,
  soIgnoreInvalidCerts,
  soNoSOAPActionHeader,
  soAutoCheckAccessPointViaUDDI
);
```

C++

```
enum SOAPInvokeOptions {
  soNoValueForEmptySOAPAction,
  soIgnoreInvalidCerts,
  soNoSOAPActionHeader,
  soAutoCheckAccessPointViaUDDI
};
```

File

SOAPHTTPTrans

Description

This is record SOAPHTTPTrans.SOAPInvokeOptions.

144.4 Types

The following table lists types in this documentation.

Types

Name	Description
TBeforePostEvent (see page 19986)	This is type SOAPHTTPTrans.TBeforePostEvent.
TPostingDataEvent (see page 19986)	This is type SOAPHTTPTrans.TPostingDataEvent.
TReceivingDataEvent (see page 19987)	This is type SOAPHTTPTrans.TReceivingDataEvent.
TSOAPInvokeOptions (see page 19987)	This is type SOAPHTTPTrans.TSOAPInvokeOptions.

144.4.1 SOAPHTTPTrans.TBeforePostEvent Type

Pascal

```
TBeforePostEvent = procedure (const HTTPReqResp: THTTPReqResp; Data: Pointer) of object;
```

C++

```
(const HTTPReqResp: THTTPReqResp; Data: Pointer) ( TBeforePostEvent)();
```

File

SOAPHTTPTrans

Description

This is type SOAPHTTPTrans.TBeforePostEvent.

144.4.2 SOAPHTTPTrans.TPostingDataEvent Type

Pascal

```
TPostingDataEvent = procedure (Sent: Integer; Total: Integer) of object;
```

C++

```
(Sent: Integer; Total: Integer) ( TPostingDataEvent)();
```

File

SOAPHTTPTrans

Description

This is type SOAPHTTPTrans.TPostingDataEvent.

144.4.3 SOAPHTTPTrans.TReceivingDataEvent Type

Pascal

```
TReceivingDataEvent = procedure (Read: Integer; Total: Integer) of object;
```

C++

```
(Read: Integer; Total: Integer) ( TReceivingDataEvent)();
```

File

SOAPHTTPTrans

Description

This is type SOAPHTTPTrans.TReceivingDataEvent.

144.4.4 SOAPHTTPTrans.TSOAPInvokeOptions Type

Pascal

```
TSOAPInvokeOptions = set of SOAPInvokeOptions;
```

C++

```
SOAPInvokeOptions TSOAPInvokeOptions;
```

File

SOAPHTTPTrans

Description

This is type SOAPHTTPTrans.TSOAPInvokeOptions.

145 SOAPLinked Namespace

This is namespace SOAPLinked.

Topics

Name	Description
Classes (see page 19990)	The following table lists classes in this documentation.

Classes

	Name	Description
	TLinkedRIO (see page 19990)	TLinkedRIO makes calls to a registered invokable interface that is implemented in the same application.
	TLinkedWebNode (see page 19997)	TLinkedWebNode executes a method call on an invokable interface that is implemented in the same application.
	TLogLinkedWebNode (see page 20005)	This is class SOAPLinked.TLogLinkedWebNode.

145.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TLinkedRIO (see page 19990)	TLinkedRIO makes calls to a registered invokable interface that is implemented in the same application.
	TLinkedWebNode (see page 19997)	TLinkedWebNode executes a method call on an invokable interface that is implemented in the same application.
	TLogLinkedWebNode (see page 20005)	This is class SOAPLinked.TLogLinkedWebNode.

145.1.1 TLinkedRIO Class

TLinkedRIO makes calls to a registered invokable interface that is implemented in the same application.

Class Hierarchy

Pascal

```
TLinkedRIO = class(TRIO);
```

C++

```
class TLinkedRIO : public TRIO;
```

File

SOAPLinked

Description

Use TLinkedRIO to generate calls to registered invokable interfaces within a Web Service application. Unlike other remote interfaced objects (TRIO descendants), TLinkedRIO provides no mechanism for connecting to a remote server. Rather, it passes calls directly to a TLinkedWebNode (see page 19997) object, which uses an internal invoker component to look up the target interface and forward calls to the implementation object.

TLinkedRIO is intended primarily for debugging Web Service applications during development. Instead of directly calling the implementation objects in the application, TLinkedRIO marshals the call into its SOAP representation and uses the invocation registry to locate the implementation object and forward the encoded request. If you use the CreateFile (see page 19994) constructor (Delphi) or supply a pair of file names to the constructor (C++), TLinkedRIO saves the encoded value of every method call and the encoded results so that you can track the "messages" that your application receives and sends.

Before TLinkedRIO can call a method table on an invokable interface, the interface must be registered with the invocation registry. To register an invokable interface, use the global InvRegistry function to access the registry, and use its RegisterInterface method.

See Also

InvRegistry

TInvokableClassRegistry (see page 15526)

TSoapPascalInvoker (see page 20020)

TLinkedWebNode (see page 19997)

145.1.1.1 TLinkedRIO Members

The following tables list the members exposed by TLinkedRIO.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FConverter (see page 18723)	This is FConverter, a member of class TRIO.
	FIID (see page 18723)	This is FIID, a member of class TRIO.
	FWebNode (see page 18723)	This is FWebNode, a member of class TRIO.
	IntfMD (see page 18723)	This is IntfMD, a member of class TRIO.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecute (see page 18725)	Generates an OnAfterExecute (see page 18730) event.
V	DoBeforeExecute (see page 18725)	Generates an OnBeforeExecute (see page 18730) event.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetResponseStream (see page 19996)	Returns a newly created stream that receives the results of executing a method call.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 18724)	Updates the reference count after the last constructor has executed.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 18725)	Prevents the destruction of a TRIO (see page 18718) instance if the reference count is greater than zero.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 19994)	Creates an instance of TLinkedRIO (see page 19990).
	CreateFile (see page 19994)	Creates an instance of TLinkedRIO (see page 19990).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 19995)	Destroys the instance of a TLinkedRIO (see page 19990) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetRIO (see page 18734)	Returns the value of the RIO (see page 18734) property.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 18726)	Allocates memory for each instance of a remote interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	QueryInterface (see page 19996)	Implements the IInterface QueryInterface method.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Converter (see page 18728)	Handles the marshaling and unmarshaling of calls to an invokable interface.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	RefCount (see page 18728)	Maintains a reference count on the use of the TRIO (see page 18718) object's interface.
R	RIO (see page 18734)	Provides access to the remote interfaced object that implements this interface.
R	SOAPHeaders (see page 18728)	Provides access to the headers of SOAP messages that the remote interface object sends or receives.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebNode (see page 19997)	Handles the execution of method calls on the invokable interface.

Published Events

	Name	Description
	OnAfterExecute (see page 18730)	Occurs when TRIO (see page 18718) receives the results from executing a method of the invokable interface.

	OnBeforeExecute (see page 18730)	Occurs before TRIO (see page 18718) sends an encoded method call for execution.
	OnGetAttachment (see page 18731)	Occurs when TRIO (see page 18718) reads each attachment included in the results from executing a method of the invokable interface.
	OnSendAttachment (see page 18731)	Occurs when TRIO (see page 18718) sends each attachment that is the value of an argument of the method call on the invokable interface.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

145.1.1.2 TLinkedRIO.Create Constructor

Creates an instance of TLinkedRIO (see page 19990).

Pascal

```
constructor Create(AOwner: TComponent); override; overload;
```

C++

```
virtual __fastcall TLinkedRIO(TComponent * AOwner);
```

Description

Call Create to instantiate a TLinkedRIO (see page 19990) object at runtime.

The AOwner parameter specifies another component (usually a form or data module) that is responsible for freeing the TLinkedRIO (see page 19990) instance. It becomes the value of the Owner property. If the TLinkedRIO (see page 19990) instance is created with AOwner set to nil, then it is automatically freed when its reference count drops to zero.

Tip: To save the encoded method calls that TLinkedRIO (see page 19990) generates and the encoded results that it receives, use the CreateFile (see page 19994) constructor instead.

See Also

RefCount (see page 18728)

Owner (see page 2807)

CreateFile (see page 19994)

145.1.1.3 TLinkedRIO.CreateFile Constructor

Creates an instance of TLinkedRIO (see page 19990).

Pascal

```
constructor CreateFile(AOwner: TComponent; ReqFile: string; RespFile: string); overload;
```

C++

```
__fastcall TLinkedRIO(TComponent * AOwner, AnsiString ReqFile, AnsiString RespFile);
```

Description

Call Create (see page 19994) to instantiate a TLinkedRIO (see page 19990) object when you want to save all of the encoded requests that it generates and the encoded results it receives to a file.

The AOwner parameter specifies another component (usually a form or data module) that is responsible for freeing the TLinkedRIO (see page 19990) instance. It becomes the value of the Owner property. If the TLinkedRIO (see page 19990)

instance is created with AOwner set to nil, then it is automatically freed when its reference count drops to zero.

ReqFile is a file to which TLinkedRIO (see page 19990) writes every encoded request before passing it on to WebNode (see page 19997) for execution. If ReqFile is an empty string, TLinkedRIO (see page 19990) automatically generates a file with the same name as the invoked method. This lets you generate separate log files for each method of the interface.

RespFile is a file to which TLinkedRIO (see page 19990) writes every encoded response it receives from WebNode (see page 19997) after executing a method call. If RespFile is an empty string, TLinkedRIO (see page 19990) automatically generates a file with the name of the method and the string _resp appended. This lets you generate separate log files for responses to each method of the interface.

See Also

RefCount (see page 18728)

Owner (see page 2807)

Create (see page 19994)

WebNode (see page 19997)

145.1.1.4 TLinkedRIO.Destroy Destructor

Destroys the instance of a TLinkedRIO (see page 19990) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TLinkedRIO();
```

Description

There is no need to explicitly free a TLinkedRIO (see page 19990) instance.

If the TLinkedRIO (see page 19990) object is created with an Owner, then that Owner handles the freeing of the TLinkedRIO (see page 19990) instance. If the TLinkedRIO (see page 19990) object is created without an Owner, then it is automatically freed when the reference count on its interface drops to zero.

See Also

Create (see page 19994)

Owner (see page 2807)

RefCount (see page 18728)

145.1.1.5 TLinkedRIO Methods

The methods of the TLinkedRIO class are listed here.

Protected Methods

	Name	Description
	GetResponseStream (see page 19996)	Returns a newly created stream that receives the results of executing a method call.

Public Methods

	Name	Description
	QueryInterface (see page 19996)	Implements the IInterface QueryInterface method.

145.1.1.5.1 TLinkedRIO.GetResponseStream Method

Returns a newly created stream that receives the results of executing a method call.

Pascal

```
function GetResponseStream(BindingType: TWebServiceBindingType): TStream; override;
```

C++

```
virtual __fastcall TStream GetResponseStream(TWebServiceBindingType BindingType);
```

Description

TRIO calls GetResponseStream internally when it executes a method call. It passes the returned stream as the Response parameter of the Execute method on the interface that the WebNode property specifies. After this stream receives the encoded response of a method call, the RIO component decodes the response and frees the stream.

BindingType indicates the expected coding of the response that the stream will hold. GetResponseStream can use this information to determine what type of stream to create.

Execute (see page 25432)

WebNode (see page 18729)

145.1.1.5.2 TLinkedRIO.QueryInterface Method

Implements the IInterface QueryInterface method.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface is called through the IInterface interface to obtain an interface pointer for the interface identified by the IID parameter. In Delphi, this call is generated when an application casts TLinkedRIO (see page 19990) to an invokable interface using the as operator.

TLinkedRIO (see page 19990) can only return a single type of interface pointer. The first time an application calls QueryInterface, TLinkedRIO (see page 19990) generates an in-memory method table to support calls to the methods on the requested interface.

IID specifies the invokable interface that the application wants to call using this TLinkedRIO (see page 19990) instance. If the TLinkedRIO (see page 19990) object has already been typecast to an interface, then IID must identify that interface. If the TLinkedRIO (see page 19990) instance has not yet been typecast to an interface, then IID must be a registered invokable interface.

Obj returns an interface pointer for the specified interface, unless TLinkedRIO (see page 19990) was already implementing a different interface or IID identified an interface that was not registered.

QueryInterface returns 0 (S_OK) if Obj successfully returns an interface pointer. It returns E_NOINTERFACE otherwise.

Note: In C++, a second, templatized syntax takes a variable that is a DelphiInterface wrapper for the desired interface type.

If QueryInterface successfully returns an interface pointer, it automatically increments the reference count.

145.1.1.6 TLinkedRIO Properties

The properties of the TLinkedRIO class are listed here.

Public Properties

	Name	Description
R	WebNode (see page 19997)	Handles the execution of method calls on the invokable interface.

145.1.1.6.1 TLinkedRIO.WebNode Property

Handles the execution of method calls on the invokable interface.

Pascal

```
property WebNode: TLinkedWebNode;
```

C++

```
__property TLinkedWebNode WebNode;
```

Description

TLinkedRIO (see page 19990) uses WebNode internally to execute method calls. It is the implementation of the IWebNode interface that all TRIO descendants use to send method calls to the Web Service application. In the case of TLinkedRIO (see page 19990), this object can only execute calls on invokable interfaces that are implemented in the same application.

IWebNode (see page 25430)

145.1.2 TLinkedWebNode Class

TLinkedWebNode executes a method call on an invokable interface that is implemented in the same application.

Class Hierarchy

Pascal

```
TLinkedWebNode = class(TComponent, IWebNode);
```

C++

```
class TLinkedWebNode : public TComponent, public IWebNode;
```

File

SOAPLinked

Description

TLinkedWebNode handles the communication between a TLinkedRIO (see page 19990) component and the implementation classes of registered invokable interfaces in the same application. To this end, it implements the IWebNode interface that all TRIO descendants use for executing encoded method calls.

TLinkedRIO (see page 19990) uses an internal invoker (TSoapPascalInvoker) to look up the invokable interface in the invocation registry and forward encoded requests for execution.

TLinkedRIO (see page 19990)

TSoapPascalInvoker (see page 20020)

145.1.2.1 TLinkedWebNode Members

The following tables list the members exposed by TLinkedWebNode.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetMimeBoundary (see page 20003)	Returns the value of the MimeBoundary (see page 20005) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetResponseStream (see page 20004)	Returns a stream to which the application can write the response to the method call.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetMimeBoundary (see page 20004)	Sets the value of the MimeBoundary (see page 20005) property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeforeExecute (see page 20002)	Caches the RTTI for the method that is about to be executed.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 20001)	Creates a new TLinkedWebNode (see page 19997) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 20001)	Frees the memory associated with the TLinkedWebNode (see page 19997) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 20002)	This is the overview for the Execute method overload.
	Execute (see page 25432)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Invoker (see page 20004)	Executes encoded method calls received from the associated TLinkedRIO (see page 19990) object.
	MimeBoundary (see page 20005)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

145.1.2.2 TLinkedWebNode.Create Constructor

Creates a new TLinkedWebNode (see page 19997) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TLinkedWebNode(TComponent * AOwner);
```

Description

Most applications do not create instances of TLinkedWebNode (see page 19997). It is created and used by the TLinkedRio class.

The Owner parameter specifies the component that is responsible for freeing the TLinkedWebNode (see page 19997) instance.

See Also

Owner (see page 2807)

TLinkedRio

145.1.2.3 TLinkedWebNode.Destroy Destructor

Frees the memory associated with the TLinkedWebNode (see page 19997) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TLinkedWebNode();
```

Description

Do not call the Destroy method directly. Instead, use the Free method, which checks for a nil reference before calling Destroy.

See Also

Free (see page 22300)

145.1.2.4 TLinkedWebNode Methods

The methods of the TLinkedWebNode class are listed here.

Protected Methods

	Name	Description
	GetMimeBoundary (see page 20003)	Returns the value of the MimeBoundary (see page 20005) property.
	GetResponseStream (see page 20004)	Returns a stream to which the application can write the response to the method call.

	SetMimeBoundary (see page 20004)	Sets the value of the MimeBoundary (see page 20005) property.

Public Methods

	Name	Description
	BeforeExecute (see page 20002)	Caches the RTTI for the method that is about to be executed.
	Execute (see page 20002)	This is the overview for the Execute method overload.

145.1.2.4.1 TLinkedWebNode.BeforeExecute Method

Caches the RTTI for the method that is about to be executed.

Pascal

```
procedure BeforeExecute(const IntfMetaData: TIntfMetaData; const MethodMetaData:
TIntfMethEntry; MethodIndex: Integer; AttachHandler: IMimeAttachmentHandler); virtual;
```

C++

```
virtual __fastcall BeforeExecute(const TIntfMetaData IntfMetaData, const TIntfMethEntry
MethodMetaData, int MethodIndex, IMimeAttachmentHandler AttachHandler);
```

Description

BeforeExecute implements the IWebNode method of the same name. The remote interface object (TRio) calls this method after its OnBeforeExecute event, but before calling the Execute (see page 20003) method to send a request to the Web Service application. BeforeExecute allows an IWebNode implementation class to perform any transport-specific tasks prior to establishing a connection. Because TLinkedWebNode (see page 19997) only works with interfaces implemented in the same executable, there is no transport protocol at all, and no transport-specific tasks to perform. BeforeExecute merely caches the RTTI for the method that is about to be executed.

IntfMD is the runtime type information (RTTI) of the invokable interface that includes the method to execute.

MethMD is describes the method that is about to be executed.

MethodIndex indicates which overload to use when methMD describes an overloaded method. 0 indicates the first overload, 1 indicates the second overload, and so on.

AttachHandler is an interface to use for handling any attachments that are used as parameters of the method. If AttachHandler is nil (Delphi) or NULL (C++), the method call does not require passing any attachments.

See Also

Execute (see page 20003)

OnBeforeExecute (see page 18730)

BeforeExecute (see page 25431)

145.1.2.4.2 Execute Method

This is the overview for the Execute method overload.

Overload List

	Name	Description
	TLinkedWebNode.Execute (String, TStream) (see page 20003)	Executes a SOAP method call and returns the encoded results.
	TLinkedWebNode.Execute (TStream) (see page 20003)	Executes a SOAP method call and returns the encoded results.

	TLinkedWebNode.Execute (TStream, TStream) (see page 20003)	Executes a SOAP method call and returns the encoded results.

145.1.2.4.2.1 TLinkedWebNode.Execute Method (String, TStream)

Executes a SOAP method call and returns the encoded results.

Pascal

```
procedure Execute(const DataMsg: String; Resp: TStream); virtual; overload;
procedure Execute(const Request: TStream; Response: TStream); virtual; overload;
function Execute(const Request: TStream): TStream; overload;
```

C++

```
virtual __fastcall Execute(const AnsiString DataMsg, TStream Resp);
virtual __fastcall Execute(const TStream Request, TStream Response);
__fastcall TStream Execute(const TStream Request);
```

Description

Execute implements the IWebNode method of the same name. TLinkedRio uses this method to execute a method on an invokable interface that has been encoded as a SOAP method call.

Execute

1. Uses the invocation registry to look up the implementation class for the invokable interface.
2. Uses its internal invoker (the Invoker (see page 20004) property) to unmarshal the request specified by Request or DataMsg and pass it to the implementation class for execution.
3. Returns the encoded results from the invoker in the stream specified by Response or, using the third syntax, in a stream that is the return value of the method. When using the third syntax, the caller is responsible for freeing the returned stream.

See Also

Execute (see page 25432)

TLinkedRio

Invoker (see page 20004)

145.1.2.4.3 TLinkedWebNode.GetMimeBoundary Method

Returns the value of the MimeBoundary (see page 20005) property.

Pascal

```
function GetMimeBoundary: string;
```

C++

```
__fastcall AnsiString GetMimeBoundary();
```

Description

GetMimeBoundary is the read implementation of the MimeBoundary (see page 20005) property.

See Also

MimeBoundary (see page 20005)

145.1.2.4.4 TLinkedWebNode.GetResponseStream Method

Returns a stream to which the application can write the response to the method call.

Pascal

```
function GetResponseStream: TStream; virtual;
```

C++

```
virtual __fastcall TStream GetResponseStream();
```

Description

GetResponseStream creates and returns a memory stream. The linked RIO object uses this stream as its response stream, which receives the response that results from the method call.

See Also

GetResponseStream (see page 18726)

145.1.2.4.5 TLinkedWebNode.SetMimeBoundary Method

Sets the value of the MimeBoundary (see page 20005) property.

Pascal

```
procedure SetMimeBoundary(Value: string);
```

C++

```
__fastcall SetMimeBoundary(AnsiString Value);
```

Description

SetMimeBoundary is the write implementation for the MimeBoundary (see page 20005) property.

Value is the new MIME boundary string.

See Also

MimeBoundary (see page 20005)

145.1.2.5 TLinkedWebNode Properties

The properties of the TLinkedWebNode class are listed here.

Public Properties

	Name	Description
R	Invoker (see page 20004)	Executes encoded method calls received from the associated TLinkedRIO (see page 19990) object.
	MimeBoundary (see page 20005)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.

145.1.2.5.1 TLinkedWebNode.Invoker Property

Executes encoded method calls received from the associated TLinkedRIO (see page 19990) object.

Pascal

```
property Invoker: TSoapPascalInvoker;
```

C++

```
__property TSoapPascalInvoker Invoker;
```

Description

Invoker is the internal invoker component that looks up method calls in the invocation registry, forwards encoded requests to the registered implementation class, and returns the encoded results for the associated TLinkedRIO (see page 19990) object.

See Also

TLinkedRIO (see page 19990)

145.1.2.5.2 TLinkedWebNode.MimeBoundary Property

Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.

Pascal

```
property MimeBoundary: string;
```

C++

```
__property AnsiString MimeBoundary;
```

Description

When the encoded method call is included in a multipart form, MimeBoundary is the value of the MIME boundary header that uniquely identifies the part of the form that contains the method call. If the method call is not included in a multipart form, MimeBoundary is an empty string.

See Also

MimeBoundary (see page 25433)

145.1.3 TLogLinkedWebNode Class

Class Hierarchy

Pascal

```
TLogLinkedWebNode = class(TLinkedWebNode);
```

C++

```
class TLogLinkedWebNode : public TLinkedWebNode;
```

File

SOAPLinked

Description

This is class SOAPLinked.TLogLinkedWebNode.

145.1.3.1 TLogLinkedWebNode Members

The following tables list the members exposed by TLogLinkedWebNode.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetMimeBoundary (see page 20003)	Returns the value of the MimeBoundary (see page 20005) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetResponseStream (see page 20010)	Returns a stream to which the application can write the response to the method call.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetMimeBoundary (see page 20004)	Sets the value of the MimeBoundary (see page 20005) property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.

	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeforeExecute (see page 20002)	Caches the RTTI for the method that is about to be executed.
	BeforeExecute (see page 25431)	Performs any transport-specific setup before executing an encoded method call.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 20008)	Creates a new TLinkedWebNode object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 20009)	Frees the memory associated with the TLinkedWebNode object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 20009)	This is Execute, a member of class TLogLinkedWebNode.
	Execute (see page 20002)	This is the overview for the Execute method overload.
	Execute (see page 25432)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMimeBoundary (see page 25433)	Returns the value of the MimeBoundary (see page 25433) property.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetMimeBoundary (see page 25433)	Sets the value of the MimeBoundary (see page 25433) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Invoker (see page 20004)	Executes encoded method calls received from the associated TLinkedRIO (see page 19990) object.
	MimeBoundary (see page 20005)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.
	MimeBoundary (see page 25433)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ReqFile (see page 20010)	This is ReqFile, a member of class TLogLinkedWebNode.
	RespFile (see page 20010)	This is RespFile, a member of class TLogLinkedWebNode.
	Tag (see page 2808)	Stores an integer value as part of a component.

145.1.3.2 TLogLinkedWebNode.Create Constructor

Creates a new TLinkedWebNode object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TLogLinkedWebNode(TComponent * AOwner);
```

Description

Most applications do not create instances of TLinkedWebNode. It is created and used by the TLinkedRio class.

The Owner parameter specifies the component that is responsible for freeing the TLinkedWebNode instance.

See Also

Owner (see page 2807)

TLinkedRio

145.1.3.3 TLogLinkedWebNode.Destroy Destructor

Frees the memory associated with the TLinkedWebNode object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TLogLinkedWebNode();
```

Description

Do not call the Destroy method directly. Instead, use the Free method, which checks for a nil reference before calling Destroy.

See Also

Free (see page 22300)

145.1.3.4 TLogLinkedWebNode Methods

The methods of the TLogLinkedWebNode class are listed here.

Protected Methods

	Name	Description
	GetResponseStream (see page 20010)	Returns a stream to which the application can write the response to the method call.

Public Methods

	Name	Description
	Execute (see page 20009)	This is Execute, a member of class TLogLinkedWebNode.

145.1.3.4.1 TLogLinkedWebNode.Execute Method

Pascal

```
procedure Execute(const Request: TStream; Response: TStream); override;
```

C++

```
virtual __fastcall Execute(const TStream Request, TStream Response);
```

Description

This is Execute, a member of class TLogLinkedWebNode.

145.1.3.4.2 TLogLinkedWebNode.GetResponseStream Method

Returns a stream to which the application can write the response to the method call.

Pascal

```
function GetResponseStream: TStream; override;
```

C++

```
virtual __fastcall TStream GetResponseStream();
```

Description

GetResponseStream creates and returns a memory stream. The linked RIO object uses this stream as its response stream, which receives the response that results from the method call.

See Also

GetResponseStream (see page 18726)

145.1.3.5 TLogLinkedWebNode Properties

The properties of the TLogLinkedWebNode class are listed here.

Published Properties

	Name	Description
	ReqFile (see page 20010)	This is ReqFile, a member of class TLogLinkedWebNode.
	RespFile (see page 20010)	This is RespFile, a member of class TLogLinkedWebNode.

145.1.3.5.1 TLogLinkedWebNode.ReqFile Property

Pascal

```
property ReqFile: string;
```

C++

```
__property AnsiString ReqFile;
```

Description

This is ReqFile, a member of class TLogLinkedWebNode.

145.1.3.5.2 TLogLinkedWebNode.RespFile Property

Pascal

```
property RespFile: string;
```

C++

```
__property AnsiString RespFile;
```

Description

This is RespFile, a member of class TLogLinkedWebNode.

146 SOAPMidas Namespace

This is namespace SOAPMidas.

Topics

Name	Description
Interfaces (see page 20012)	The following table lists interfaces in this documentation.
Functions (see page 20017)	The following table lists functions in this documentation.

Functions

	Name	Description
	RegDefIAppServerInvClass (see page 20017)	Registers a SOAP data module for use by clients built using Kylix 2 or Delphi 5 prior to update patch 2.

Interfaces

	Name	Description
	IAppServerSOAP (see page 20012)	IAppServerSOAP is the interface for communication with a SOAP data module.

146.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAppServerSOAP (see page 20012)	IAppServerSOAP is the interface for communication with a SOAP data module.

146.1.1 IAppServerSOAP Interface

IAppServerSOAP is the interface for communication with a SOAP data module.

Class Hierarchy

Pascal

```
IAppServerSOAP = interface(IInvokable);
```

C++

```
__interface IAppServerSOAP : public IInvokable;
```

File

SOAPMidas

Description

TSoapConnection and TSoapDataModule use the IAppServerSOAP interface to communicate information in a SOAP-based multi-tiered database application. This is different from other DataSnap components, which use the IAppServer interface. IAppServerSOAP differs from IAppServer primarily in that it uses the stdcall calling convention rather than safecall. This makes it easier for marshalling interface calls when the client or server is written in C++.

Note: C++ method declarations that use IAppServerSOAP use the _di_IAppServerSOAP type instead. This type is a DelphiInterface wrapper around the IAppServerSOAP interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IAppServerSOAP >  _di_IAppServerSOAP;
```

See Also

TSOAPConnection

TSoapDataModule (see page 19884)

IAppServer (see page 16450)

146.1.1.1 IAppServerSOAP Members

The following tables list the members exposed by IAppServerSOAP.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	SAS_ApplyUpdates (see page 20013)	This is SAS_ApplyUpdates, a member of class IAppServerSOAP.
	SAS_DataRequest (see page 20013)	Generates an OnSAS_DataRequest event on the specified provider component.
	SAS_Execute (see page 20014)	SAS_Executes the query or stored procedure bound to a specified provider.
	SAS_GetParams (see page 20015)	This is SAS_GetParams, a member of class IAppServerSOAP.
	SAS_GetProviderNames (see page 20015)	Returns a list of all the available providers on a remote data module.
	SAS_GetRecords (see page 20015)	This is SAS_GetRecords, a member of class IAppServerSOAP.
	SAS_RowRequest (see page 20016)	This is SAS_RowRequest, a member of class IAppServerSOAP.

146.1.1.2 IAppServerSOAP Methods

The methods of the IAppServerSOAP class are listed here.

Public Methods

	Name	Description
	SAS_ApplyUpdates (see page 20013)	This is SAS_ApplyUpdates, a member of class IAppServerSOAP.
	SAS_DataRequest (see page 20013)	Generates an OnSAS_DataRequest event on the specified provider component.
	SAS_Execute (see page 20014)	SAS_Executes the query or stored procedure bound to a specified provider.
	SAS_GetParams (see page 20015)	This is SAS_GetParams, a member of class IAppServerSOAP.
	SAS_GetProviderNames (see page 20015)	Returns a list of all the available providers on a remote data module.
	SAS_GetRecords (see page 20015)	This is SAS_GetRecords, a member of class IAppServerSOAP.
	SAS_RowRequest (see page 20016)	This is SAS_RowRequest, a member of class IAppServerSOAP.

146.1.1.2.1 IAppServerSOAP.SAS_ApplyUpdates Method

Pascal

```
function SAS_ApplyUpdates(const ProviderName: WideString; Delta: OleVariant; MaxErrors:
Integer; out ErrorCount: Integer; var OwnerData: OleVariant): OleVariant; stdcall;
```

C++

```
__fastcall __stdcall OleVariant SAS_ApplyUpdates(const BSTR ProviderName, OleVariant Delta,
int MaxErrors, int ErrorCount, OleVariant OwnerData);
```

Description

This is SAS_ApplyUpdates, a member of class IAppServerSOAP.

146.1.1.2.2 IAppServerSOAP.SAS_DataRequest Method

Generates an OnSAS_DataRequest event on the specified provider component.

Pascal

```
function SAS_DataRequest(const ProviderName: WideString; Data: OleVariant): OleVariant;
stdcall;
```

C++

```
__fastcall __stdcall OleVariant SAS_DataRequest(const BSTR ProviderName, OleVariant Data);
```

Description

Use SAS_SAS_DataRequest to invoke an OnSAS_DataRequest event handler of the provider named by ProviderName. This

method is provided to allow application developers to customize the communication between a client application and a provider component.

ProviderName is the provider on which the data module generates an OnSAS_DataRequest event.

There is no predefined meaning for the Data parameter or the return value.

See Also

OnDataRequest (see page 18482)

DataRequest (see page 8404)

146.1.1.2.3 IAppServerSOAP.SAS_Execute Method

SAS_Executes the query or stored procedure bound to a specified provider.

Pascal

```
procedure SAS_Execute(const ProviderName: WideString; const CommandText: WideString; var
Params: OleVariant; var OwnerData: OleVariant); stdcall;
```

C++

```
__fastcall __stdcall SAS_Execute(const BSTR ProviderName, const BSTR CommandText, OleVariant
Params, OleVariant OwnerData);
```

Description

Use SAS_SAS_Execute to pass an execute command to a remote provider, using a specified set of parameters. SAS_SAS_Execute calls the SAS_Execute method of the specified provider after assigning any parameters. Output parameters that result from executing a query or stored procedure are returned in the Params parameter.

The provider's SAS_Execute method generates a BeforeSAS_Execute event, passes the command on to its associated dataset, and generates an AfterSAS_Execute event. The dataset must represent a query or stored procedure that does not return a cursor.

ProviderName specifies the name of the provider component associated with the query or stored procedure.

CommandText specifies an optional SQL statement that replaces the SQL of the query, or the name of a stored procedure that replaces the dataset's stored procedure. This parameter is ignored if the provider's Options property does not include poAllowCommandText.

Params encodes any parameters expected by the query or stored procedure and returns any output parameters. To create a properly encoded value for Params from a TParams object, use the PackageParams method. To decode Params into a TParams object, use the Unpackparams routine.

OwnerData contains custom information that appears as an argument to the provider's BeforeSAS_Execute and AfterSAS_Execute event handlers. This information originates in a client dataset's BeforeSAS_Execute event handler. The value returned in OwnerData is passed to the client dataset's AfterSAS_Execute event handler.

Execute (see page 18466)

BeforeExecute (see page 8514)

AfterExecute (see page 8504)

Options (see page 18440)

PackageParams (see page 8534)

UnpackParams (see page 8534)

146.1.1.2.4 IAppServerSOAP.SAS_GetParams Method

Pascal

```
function SAS_GetParams(const ProviderName: WideString; var OwnerData: OleVariant): OleVariant;
stdcall;
```

C++

```
__fastcall __stdcall OleVariant SAS_GetParams(const BSTR ProviderName, OleVariant OwnerData);
```

Description

This is SAS_GetParams, a member of class IAppServerSOAP.

146.1.1.2.5 IAppServerSOAP.SAS_GetProviderNames Method

Returns a list of all the available providers on a remote data module.

Pascal

```
function SAS_GetProviderNames: TWideStringDynArray; stdcall;
```

C++

```
__fastcall __stdcall TWideStringDynArray SAS_GetProviderNames();
```

Description

Call SAS_SAS_GetProviderNames for a list of all registered providers available from a SOAP data module. These values indicate the possible values for the ProviderName property of a client dataset that connects to the SOAP data module. When calling any of the SOAP data modules through the IAppServerSOAP (see page 20012) interface, pass one of these names to indicate the provider that is the target of the method call.

SAS_SAS_GetProviderNames returns the names of the providers in a dynamic array. Client datasets are associated with a provider by setting their ProviderName property to one of these names.

See Also

ProviderName (see page 8492)

Providers (see page 19908)

146.1.1.2.6 IAppServerSOAP.SAS_GetRecords Method

Pascal

```
function SAS_GetRecords(const ProviderName: WideString; Count: Integer; out RecsOut: Integer;
Options: Integer; const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant): OleVariant; stdcall;
```

C++

```
__fastcall __stdcall OleVariant SAS_GetRecords(const BSTR ProviderName, int Count, int
RecsOut, int Options, const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

This is SAS_GetRecords, a member of class IAppServerSOAP.

146.1.1.2.7 IAppServerSOAP.SAS_RowRequest Method

Pascal

```
function SAS_RowRequest(const ProviderName: WideString; Row: OleVariant; RequestType: Integer;
var OwnerData: OleVariant): OleVariant; stdcall;
```

C++

```
__fastcall __stdcall OleVariant SAS_RowRequest(const BSTR ProviderName, OleVariant Row, int
RequestType, OleVariant OwnerData);
```

Description

This is SAS_RowRequest, a member of class IAppServerSOAP.

146.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	RegDefIAppServerInvClass (see page 20017)	Registers a SOAP data module for use by clients built using Kylix 2 or Delphi 5 prior to update patch 2.

146.2.1 SOAPMidas.RegDefIAppServerInvClass Function

Registers a SOAP data module for use by clients built using Kylix 2 or Delphi 5 prior to update patch 2.

Pascal

```
procedure RegDefIAppServerInvClass;
```

C++

```
RegDefIAppServerInvClass();
```

File

SOAPMidas

Description

RegDefIAppServerInvClass registers TSoapDataModule as an invokable class that implements IAppServer as a Web Service. C++ applications must add a call to this procedure after the registration of IAppServerSOAP (see page 20012) in the program startup code if they are to be used by clients written using Kylix 2 or Delphi 5 prior to update patch 2. This call is not necessary for other clients of a Web Service-based application server, because they look for the IAppServerSOAP (see page 20012) interface.

Note: Delphi applications do not need to call this procedure.

The following example shows where to place the call to RegDefIAppServerInvClass:

```
void static RegTypes()
{
  InvRegistry()->RegisterInterface(__interfaceTypeinfo(IMyAppServerService));
  InvRegistry()->RegisterInvokableClass(__classid(TMyAppServerService),
MyAppServerServiceFactory);
  RegDefIAppServerInvClass();
}
#pragma statrtup RegTypes 32
```

This is namespace SOAPPasInv.

Topics

Name	Description
Classes (see page 20020)	The following table lists classes in this documentation.
Interfaces (see page 20032)	The following table lists interfaces in this documentation.
Functions (see page 20035)	The following table lists functions in this documentation.
Types (see page 20036)	The following table lists types in this documentation.

Classes

	Name	Description
	TSoapPascalInvoker (see page 20020)	TSoapPascalInvoker is the base class for components that interpret SOAP requests and execute the corresponding invokable interface.

Functions

	Name	Description
	GetSOAPHeaders (see page 20035)	Returns the interface for accessing the SOAP headers that were received with a SOAP request and supplying the headers for the outgoing response.

Interfaces

	Name	Description
	IAdapterConverter (see page 20032)	This is class SOAPPasInv.IAdapterConverter.
	IInvokerConverter (see page 20033)	This is class SOAPPasInv.IInvokerConverter.

Types

Name	Description
TAfterDispatchEvent (see page 20036)	This is type SOAPPasInv.TAfterDispatchEvent.
TBeforeDispatchEvent (see page 20036)	This is type SOAPPasInv.TBeforeDispatchEvent.
TBeforeDispatchEvent2 (see page 20037)	This is type SOAPPasInv.TBeforeDispatchEvent2.
TOnExceptionEvent (see page 20037)	This is type SOAPPasInv.TOnExceptionEvent.

147.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TSoapPascalInvoker (see page 20020)	TSoapPascalInvoker is the base class for components that interpret SOAP requests and execute the corresponding invokable interface.

147.1.1 TSoapPascalInvoker Class

TSoapPascalInvoker is the base class for components that interpret SOAP requests and execute the corresponding invokable interface.

Class Hierarchy

Pascal

```
TSoapPascalInvoker = class(TComponent, IAdapterConverter, IInvokerConverter);
```

C++

```
class TSoapPascalInvoker : public TComponent, public IAdapterConverter, public
IInvokerConverter;
```

File

SOAPPasInv

Description

Use TSoapPascalInvoker as a base class for components that interpret SOAP requests. TSoapPascalInvoker implements the logic that parses a SOAP request, given its target invokable interface, executes the interface call, and encodes the results of that code.

Each TSoapPascalInvoker descendant receives SOAP requests that arrive via a specific transport protocol. The TSoapPascalInvoker descendant must implement the logic to take the incoming SOAP request, identify the target invokable interface, and look up its implementation class and runtime type information (RTTI).

See Also

IInvokable (see page 22398)

THTTPSoapPascalInvoker (see page 19951)

147.1.1.1 TSoapPascalInvoker Members

The following tables list the members exposed by TSoapPascalInvoker.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FConverter (see page 20025)	This is FConverter, a member of class TSoapPascalInvoker.
	FDomConverter (see page 20025)	This is FDomConverter, a member of class TSoapPascalInvoker.
	FHeadersIn (see page 20025)	This is FHeadersIn, a member of class TSoapPascalInvoker.
	FHeadersOut (see page 20025)	This is FHeadersOut, a member of class TSoapPascalInvoker.
	FSOAPHeaders (see page 20025)	This is FSOAPHeaders, a member of class TSoapPascalInvoker.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDomConverter (see page 20026)	This is GetDomConverter, a member of class TSoapPascalInvoker.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInvoker (see page 20026)	This is GetInvoker, a member of class TSoapPascalInvoker.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 20027)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 20024)	Creates a new TSoapPascalInvoker (see page 20020) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 20024)	Frees the memory associated with the TSoapPascalInvoker (see page 20020) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

V	Invoke (see page 20026)	Interprets a SOAP request message, calls the target interface, and encodes any return values.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterDispatchEvent (see page 20028)	Occurs after the invoker successfully calls an invokable interface to execute a SOAP request.
	BeforeDispatchEvent (see page 20029)	Occurs before the invoker calls an invokable interface to execute a SOAP request.
	BeforeDispatchEvent2 (see page 20029)	Occurs before the invoker calls an invokable interface to execute a SOAP request.
	OnExceptionEvent (see page 20030)	Occurs when the invoker encounters an exception while executing a SOAP request.
	OnGetAttachment (see page 20030)	Occurs when TSoapPascalInvoker (see page 20020) reads each attachment included in an incoming request.
	OnSendAttachment (see page 20030)	Occurs when TSoapPascalInvoker (see page 20020) sends each attachment included in the response to the current request.

Published Properties

	Name	Description
	Converter (see page 20028)	Specifies the interface of the component that handles the marshaling of SOAP messages.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

147.1.1.2 TSoapPascalInvoker.Create Constructor

Creates a new TSoapPascalInvoker (see page 20020) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSoapPascalInvoker(TComponent * AOwner);
```

Description

Call Create to instantiate an invoker at runtime. Invoker components added to Web modules at design time (including the one that the Soap Server wizard adds automatically) are created automatically.

The AOwner parameter specifies the component that is responsible for freeing the TSoapPascalInvoker (see page 20020) instance.

See Also

Owner (see page 2807)

147.1.1.3 TSoapPascalInvoker.Destroy Destructor

Frees the memory associated with the TSoapPascalInvoker (see page 20020) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSoapPascalInvoker();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which checks that the invoker component is not nil before calling Destroy.

See Also

Free (see page 22300)

147.1.1.4 TSoapPascalInvoker Fields

The fields of the TSoapPascalInvoker class are listed here.

Protected Fields

	Name	Description
	FConverter (see page 20025)	This is FConverter, a member of class TSoapPascalInvoker.
	FDomConverter (see page 20025)	This is FDomConverter, a member of class TSoapPascalInvoker.
	FHeadersIn (see page 20025)	This is FHeadersIn, a member of class TSoapPascalInvoker.
	FHeadersOut (see page 20025)	This is FHeadersOut, a member of class TSoapPascalInvoker.
	FSOAPHeaders (see page 20025)	This is FSOAPHeaders, a member of class TSoapPascalInvoker.

147.1.1.4.1 TSoapPascalInvoker.FConverter Field

Pascal

```
FConverter: IOPConvert;
```

C++

```
IOPConvert FConverter;
```

Description

This is FConverter, a member of class TSoapPascalInvoker.

147.1.1.4.2 TSoapPascalInvoker.FDomConverter Field

Pascal

```
FDomConverter: TOPToSoapDomConvert;
```

C++

```
TOPToSoapDomConvert FDomConverter;
```

Description

This is FDomConverter, a member of class TSoapPascalInvoker.

147.1.1.4.3 TSoapPascalInvoker.FHeadersIn Field

Pascal

```
FHeadersIn: THeaderList;
```

C++

```
THeaderList FHeadersIn;
```

Description

This is FHeadersIn, a member of class TSoapPascalInvoker.

147.1.1.4.4 TSoapPascalInvoker.FHeadersOut Field

Pascal

```
FHeadersOut: THeaderList;
```

C++

```
THeaderList FHeadersOut;
```

Description

This is FHeadersOut, a member of class TSoapPascalInvoker.

147.1.1.4.5 TSoapPascalInvoker.FSOAPHeaders Field

Pascal

```
FSOAPHeaders: TSOAPHeaders;
```

C++

```
TSOAPHeaders FSOAPHeaders;
```

Description

This is FSOAPHeaders, a member of class TSoapPascalInvoker.

147.1.1.5 TSoapPascalInvoker Methods

The methods of the TSoapPascalInvoker class are listed here.

Protected Methods

	Name	Description
	GetDomConverter (see page 20026)	This is GetDomConverter, a member of class TSoapPascalInvoker.
	GetInvoker (see page 20026)	This is GetInvoker, a member of class TSoapPascalInvoker.
V	Notification (see page 20027)	Forwards notification messages to all owned components.

Public Methods

	Name	Description
V	Invoke (see page 20026)	Interprets a SOAP request message, calls the target interface, and encodes any return values.

147.1.1.5.1 TSoapPascalInvoker.GetDomConverter Method

Pascal

```
function GetDomConverter: TOPToSoapDomConvert;
```

C++

```
__fastcall TOPToSoapDomConvert GetDomConverter();
```

Description

This is GetDomConverter, a member of class TSoapPascalInvoker.

147.1.1.5.2 TSoapPascalInvoker.GetInvoker Method

Pascal

```
function GetInvoker: TSoapPascalInvoker;
```

C++

```
__fastcall TSoapPascalInvoker GetInvoker();
```

Description

This is GetInvoker, a member of class TSoapPascalInvoker.

147.1.1.5.3 TSoapPascalInvoker.Invoke Method

Interprets a SOAP request message, calls the target interface, and encodes any return values.

Pascal

```
procedure Invoke(AClass: TClass; IntfInfo: PTypeInfo; MethName: string; const Request:
TStream; Response: TStream; var BindingType: TWebServiceBindingType); virtual;
```

C++

```
virtual __fastcall Invoke(TClass AClass, PTypeInfo IntfInfo, AnsiString MethName, const
TStream Request, TStream Response, TWebServiceBindingType BindingType);
```

Description

Call Invoke to convert a SOAP request to an interface call on an invokable interface.

AClass is the class that implements the invokable interface. The invoker passes this to the invocation registry so that it can obtain an instance of the implementation class, which it uses to execute the SOAP request.

IntfInfo (see page 15477) is the runtime type information (RTTI) from the invokable interface that is the target of the SOAP request. The invoker uses this to interpret the SOAP request.

MethName is the name of the method to call on the invokable interface.

Request is a stream from which Invoke can read the SOAP request. It contains the SOAP encoding of an interface call.

Response is a stream to which Invoke writes the SOAP encoding of any return values.

BindingType indicates the format of the Request and Response. It is either btSOAP (to indicate a SOAP packet) or btMime (for a multipart form when the request or response includes attachments). On entry, BindingType indicates the format of the encoded request message. Invoke changes BindingType to the format of the response message.

See Also

IInvokable (see page 22398)

InvRegistry (see page 15620)

GetInvokableObjectFromClass (see page 15539)

147.1.1.5.4 TSoapPascalInvoker.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

147.1.1.6 TSoapPascalInvoker Properties

The properties of the TSoapPascalInvoker class are listed here.

Published Properties

	Name	Description
	Converter (see page 20028)	Specifies the interface of the component that handles the marshaling of SOAP messages.

147.1.1.6.1 TSoapPascalInvoker.Converter Property

Specifies the interface of the component that handles the marshaling of SOAP messages.

Pascal

```
property Converter: TOPToSoapDomConvert;
```

C++

```
__property TOPToSoapDomConvert Converter;
```

Description

Converter is the component that marshals and unmarshals method calls for the invoker. The invoker uses this object to interpret incoming method calls and to generate the results it returns.

See Also

TOPToSoapDomConvert (see page 18137)

147.1.1.7 TSoapPascalInvoker Events

The events of the TSoapPascalInvoker class are listed here.

Published Events

	Name	Description
	AfterDispatchEvent (see page 20028)	Occurs after the invoker successfully calls an invokable interface to execute a SOAP request.
	BeforeDispatchEvent (see page 20029)	Occurs before the invoker calls an invokable interface to execute a SOAP request.
	BeforeDispatchEvent2 (see page 20029)	Occurs before the invoker calls an invokable interface to execute a SOAP request.
	OnExceptionEvent (see page 20030)	Occurs when the invoker encounters an exception while executing a SOAP request.
	OnGetAttachment (see page 20030)	Occurs when TSoapPascalInvoker (see page 20020) reads each attachment included in an incoming request.
	OnSendAttachment (see page 20030)	Occurs when TSoapPascalInvoker (see page 20020) sends each attachment included in the response to the current request.

147.1.1.7.1 TSoapPascalInvoker.AfterDispatchEvent Event

Occurs after the invoker successfully calls an invokable interface to execute a SOAP request.

Pascal

```
property AfterDispatchEvent: TAfterDispatchEvent;
```

C++

```
__property TAfterDispatchEvent AfterDispatchEvent;
```

Description

Write a AfterDispatchEvent event handler to examine a SOAP response after the invoker executes a request by calling the target invokable interface. The Invoke (see page 20026) method generates this event after it has executed a requested method and generated a response packet.

Note: AfterDispatchEvent only occurs if the method call is successful. If the invoker encounters an exception when trying to execute the specified method, it generates an OnExceptionEvent (see page 20030) instead.

See Also

BeforeDispatchEvent (see page 20029)

Invoke (see page 20026)

OnExceptionEvent (see page 20030)

147.1.1.7.2 TSoapPascalInvoker.BeforeDispatchEvent Event

Occurs before the invoker calls an invokable interface to execute a SOAP request.

Pascal

```
property BeforeDispatchEvent: TBeforeDispatchEvent;
```

C++

```
__property TBeforeDispatchEvent BeforeDispatchEvent;
```

Description

Write a BeforeDispatchEvent event handler to examine a SOAP request before the invoker calls on the target invokable interface to execute it. The Invoke (see page 20026) method generates this event after it has obtained an interface pointer for the target invokable interface, but before it calls the specified method on that interface.

See Also

AfterDispatchEvent (see page 20028)

Invoke (see page 20026)

BeforeDispatchEvent2 (see page 20029)

147.1.1.7.3 TSoapPascalInvoker.BeforeDispatchEvent2 Event

Occurs before the invoker calls an invokable interface to execute a SOAP request.

Pascal

```
property BeforeDispatchEvent2: TBeforeDispatchEvent2;
```

C++

```
__property TBeforeDispatchEvent2 BeforeDispatchEvent2;
```

Description

Write a BeforeDispatchEvent2 event handler to override the default handling of an incoming request. The Invoke (see page 20026) method generates this event after it has obtained an interface pointer for the target invokable interface, but before it calls the specified method on that interface.

See Also

AfterDispatchEvent (see page 20028)

Invoke (see page 20026)

BeforeDispatchEvent (see page 20029)

147.1.1.7.4 TSoapPascalInvoker.OnExceptionEvent Event

Occurs when the invoker encounters an exception while executing a SOAP request.

Pascal

```
property OnExceptionEvent: TOnExceptionEvent;
```

C++

```
__property TOnExceptionEvent OnExceptionEvent;
```

Description

Write a OnExceptionEvent event handler to examine a SOAP fault packet after the invoker encounters an exception when executing a SOAP request. The Invoke (see page 20026) method generates this event if it encounters an exception, after it generates the SOAP fault packet that describes the problem.

See Also

AfterDispatchEvent (see page 20028)

147.1.1.7.5 TSoapPascalInvoker.OnGetAttachment Event

Occurs when TSoapPascalInvoker (see page 20020) reads each attachment included in an incoming request.

Pascal

```
property OnGetAttachment: TOnGetAttachmentEvent;
```

C++

```
__property TOnGetAttachmentEvent OnGetAttachment;
```

Description

Write an OnGetAttachment event handler to examine the encoded attachments included with an incoming request or to redirect them so that they are saved to a specific file. OnGetAttachment occurs once for each attachment received.

Tip: Use the FileName property of the attachment object to redirect the attachment to a different file.

See Also

OnSendAttachment (see page 20030)

BeforeDispatchEvent (see page 20029)

147.1.1.7.6 TSoapPascalInvoker.OnSendAttachment Event

Occurs when TSoapPascalInvoker (see page 20020) sends each attachment included in the response to the current request.

Pascal

```
property OnSendAttachment: TOnSendAttachmentEvent;
```

C++

```
__property TOnSendAttachmentEvent OnSendAttachment;
```

Description

Write an OnSendAttachment event handler to examine or alter the attachments that are to be included in a message that represents the results of a method call. OnSendAttachment occurs once for each attachment sent with the response message.

See Also

AfterDispatchEvent (see page 20028)

OnGetAttachment (see page 20030)

147.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAdapterConverter (see page 20032)	This is class SOAPPasInv.IAdapterConverter.
	IInvokerConverter (see page 20033)	This is class SOAPPasInv.IInvokerConverter.

147.2.1 IAdapterConverter Interface

Class Hierarchy

SOAPPasInv.IAdapterConverter

Pascal

```
IAdapterConverter = interface;
```

C++

```
__interface IAdapterConverter;
```

File

SOAPPasInv

Description

This is class SOAPPasInv.IAdapterConverter.

147.2.1.1 IAdapterConverter Members

The following tables list the members exposed by IAdapterConverter.

Public Methods

	Name	Description
	GetDomConverter (see page 20033)	This is GetDomConverter, a member of class IAdapterConverter.

147.2.1.2 IAdapterConverter Methods

The methods of the IAdapterConverter class are listed here.

Public Methods

	Name	Description
	GetDomConverter (see page 20033)	This is GetDomConverter, a member of class IAdapterConverter.

147.2.1.2.1 IAdapterConverter.GetDomConverter Method

Pascal

```
function GetDomConverter: TOPToSoapDomConvert;
```

C++

```
__fastcall TOPToSoapDomConvert GetDomConverter();
```

Description

This is GetDomConverter, a member of class IAdapterConverter.

147.2.2 IInvokerConverter Interface

Class Hierarchy

SOAPPasInv.IInvokerConverter

Pascal

```
IInvokerConverter = interface;
```

C++

```
__interface IInvokerConverter;
```

File

SOAPPasInv

Description

This is class SOAPPasInv.IInvokerConverter.

147.2.2.1 IInvokerConverter Members

The following tables list the members exposed by IInvokerConverter.

Public Methods

	Name	Description
	GetInvoker (see page 20034)	This is GetInvoker, a member of class IInvokerConverter.

147.2.2.2 IInvokerConverter Methods

The methods of the IInvokerConverter class are listed here.

Public Methods

	Name	Description
	GetInvoker (see page 20034)	This is GetInvoker, a member of class IInvokerConverter.

147.2.2.2.1 IInvokerConverter.GetInvoker Method

Pascal

```
function GetInvoker: TSoapPascalInvoker;
```

C++

```
__fastcall TSoapPascalInvoker GetInvoker();
```

Description

This is GetInvoker, a member of class IInvokerConverter.

147.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetSOAPHeaders (see page 20035)	Returns the interface for accessing the SOAP headers that were received with a SOAP request and supplying the headers for the outgoing response.

147.3.1 SOAPPasInv.GetSOAPHeaders Function

Returns the interface for accessing the SOAP headers that were received with a SOAP request and supplying the headers for the outgoing response.

Pascal

```
function GetSOAPHeaders: ISOAPHeaders;
```

C++

```
ISOAPHeaders GetSOAPHeaders();
```

File

SOAPPasInv

Description

Call GetSOAPHeaders from an application that implements a Web Service when you do not use TInvokableClass as a base class for the implementation of an invokable interface. GetSOAPHeaders returns an ISOAPHeaders interface, which lets your application examine the SOAP headers in an incoming request message and to add SOAP headers to be sent with the outgoing response.
