Defining and Using SOAP Headers

147.4 Types

The following table lists types in this documentation.

Types

Name	Description
TAfterDispatchEvent (see page 20036)	This is type SOAPPasInv.TAfterDispatchEvent.
TBeforeDispatchEvent (see page 20036)	This is type SOAPPasInv.TBeforeDispatchEvent.
TBeforeDispatchEvent2 (see page 20037)	This is type SOAPPasInv.TBeforeDispatchEvent2.
TOnExceptionEvent (see page 20037)	This is type SOAPPasInv.TOnExceptionEvent.

147.4.1 SOAPPasInv.TAfterDispatchEvent Type

Pascal

```
TAfterDispatchEvent = procedure (const MethodName: string; SOAPResponse: TStream) of object;
```

C++

```
(const MethodName: string; SOAPResponse: TStream) ( TAfterDispatchEvent)();
```

File

SOAPPasInv

Description

This is type SOAPPasInv.TAfterDispatchEvent.

147.4.2 SOAPPasInv.TBeforeDispatchEvent Type

Pascal

```
TBeforeDispatchEvent = procedure (const MethodName: string; const Request: TStream) of object;
```

C++

```
(const MethodName: string; const Request: TStream) ( TBeforeDispatchEvent)();
```

File

SOAPPasInv

Description

This is type SOAPPasInv.TBeforeDispatchEvent.

147.4.3 SOAPPasInv.TBeforeDispatchEvent2 Type

Pascal

```
TBeforeDispatchEvent2 = procedure (const MethodName: string; const Request: TStream; Response:
TStream; var BindingType: TWebServiceBindingType; var Handled: Boolean) of object;
```

C++

```
(const MethodName: string; const Request: TStream; Response: TStream; var BindingType:
TWebServiceBindingType; var Handled: Boolean) ( TBeforeDispatchEvent2)();
```

File

SOAPPasInv

Description

This is type SOAPPasInv.TBeforeDispatchEvent2.

147.4.4 SOAPPasInv.TOnExceptionEvent Type

Pascal

```
TOnExceptionEvent = procedure (const MethodName: string; const Request: TStream; const
Response: TStream) of object;
```

C++

```
(const MethodName: string; const Request: TStream; const Response: TStream) (
TOnExceptionEvent)();
```

File

SOAPPasInv

Description

This is type SOAPPasInv.TOnExceptionEvent.

148 Sockets Namespace

This is namespace Sockets.

Topics

Name	Description
Classes (see page 20041)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 20135)	The following table lists structs, records, enums in this documentation.
Types (see page 20140)	The following table lists types in this documentation.
Constants (see page 20144)	The following table lists constants in this documentation.

Classes

	Name	Description
	ESocketError (see page 20041)	Exception class for failures that occur when trying to create, use, or shut down Windows socket objects.
	TBaseSocket (see page 20042)	TBaseSocket encapsulates local operations on file descriptors.
	TClientSocketThread (see page 20059)	Enables creation of separate threads of execution for the client socket in an application.
	TCustomIpClient (see page 20063)	Encapsulates the client network functions.
	TCustomTcpServer (see page 20072)	Ancestor object of all the server socket descendants.
	TIpSocket (see page 20082)	Encapsulates the network support functions.
	TRawSocket (see page 20094)	Encapsulates a raw socket.
	TServerSocketThread (see page 20099)	Enables creation of separate threads of execution for the server socket in an application.
	TTcpClient (see page 20105)	TCP client component.
	TTcpServer (see page 20115)	TTcpServer is the TCP server component.
	TUdpSocket (see page 20123)	UDP component.

Constants

Name	Description
CRLF (see page 20144)	This is constant Sockets.CRLF.

Structs, Records, Enums

	Name	Description
	TIPHeader (see page 20135)	This is record Sockets.TIPHeader.
	TServerSocketBlockMode (see page 20136)	Defines the set of possible socket flags for block mode.
	TSocketDomain (see page 20136)	Set of possible protocol family types used by a socket.
	TSocketType (see page 20138)	The TSocketType type defines the set of possible socket types.

Types

Name	Description
TGetThreadEvent (see page 20140)	This is type Sockets.TGetThreadEvent.
TSocketAcceptEvent (see page 20140)	This is type Sockets.TSocketAcceptEvent.
TSocketBlockMode (see page 20141)	Defines the set of possible flags for blocking mode of the socket.
TSocketDataEvent (see page 20141)	This is type Sockets.TSocketDataEvent.
TSocketErrorEvent (see page 20141)	This is type Sockets.TSocketErrorEvent.
TSocketHost (see page 20142)	This is type Sockets.TSocketHost.
TSocketNotifyEvent (see page 20142)	This is type Sockets.TSocketNotifyEvent.
TSocketPort (see page 20142)	This is type Sockets.TSocketPort.
TSocketProtocol (see page 20143)	This is type Sockets.TSocketProtocol.

148.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ESocketError (see page 20041)	Exception class for failures that occur when trying to create, use, or shut down Windows socket objects.
	TBaseSocket (see page 20042)	TBaseSocket encapsulates local operations on file descriptors.
	TClientSocketThread (see page 20059)	Enables creation of separate threads of execution for the client socket in an application.
	TCustomIpClient (see page 20063)	Encapsulates the client network functions.
	TCustomTcpServer (see page 20072)	Ancestor object of all the server socket descendants.
	TIpSocket (see page 20082)	Encapsulates the network support functions.
	TRawSocket (see page 20094)	Encapsulates a raw socket.
	TServerSocketThread (see page 20099)	Enables creation of separate threads of execution for the server socket in an application.
	TTcpClient (see page 20105)	TCP client component.
	TTcpServer (see page 20115)	TTcpServer is the TCP server component.
	TUdpSocket (see page 20123)	UDP component.

148.1.1 ESocketError Class

Exception class for failures that occur when trying to create, use, or shut down Windows socket objects.

Class Hierarchy

Pascal

```
ESocketError = class(Exception);
```

C++

```
class ESocketError : public Exception;
```

File

Sockets

Description

ESocketError is the exception class for failures that occur when trying to create, use, or shut down Windows socket objects.

ESocketError is thrown if:

A socket cannot be created.

A socket cannot be initialized.

A socket cannot be opened.

An application tries to change the properties of an already open socket.

A failure occurs when reading from or writing to a socket.

A socket cannot be properly closed.

There are two ESocketError classes defined, one in the ScktComp (see page 18737) unit and one in the Sockets (see page 20039) unit. The two exception classes are identically defined and serve the same function for different categories of socket objects. The two definitions occur simply to ensure that ESocketError is defined for all socket objects.

See Also

TCustomWinSocket (see page 18799)

148.1.2 TBaseSocket Class

TBaseSocket encapsulates local operations on file descriptors.

Class Hierarchy

Pascal

```
TBaseSocket = class(TComponent);
```

C++

```
class TBaseSocket : public TComponent;
```

File

Sockets

Description

The TBaseSocket component encapsulates local operations on files descriptors, which are objects that a program uses to read from or write to an open file, or open a network socket or a variety of other devices.

Do not create instances of TBaseSocket. Use TBaseSocket as a base class when declaring non-visual components that can appear on the component palette and be used in the form designer. Properties and methods of TBaseSocket provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

See Also

TIpSocket (see page 20082)

148.1.2.1 TBaseSocket Members

The following tables list the members exposed by TBaseSocket.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoCreateHandle (see page 20047)	This is DoCreateHandle, a member of class TBaseSocket.
	DoDestroyHandle (see page 20047)	This is DoDestroyHandle, a member of class TBaseSocket.
	DoHandleError (see page 20048)	This is DoHandleError, a member of class TBaseSocket.
	DoReceive (see page 20048)	This is DoReceive, a member of class TBaseSocket.
	DoSend (see page 20048)	This is DoSend, a member of class TBaseSocket.
	ErrorCheck (see page 20048)	This is ErrorCheck, a member of class TBaseSocket.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 20049)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBytesReceived (see page 20053)	This is SetBytesReceived, a member of class TBaseSocket.
	SetBytesSent (see page 20053)	This is SetBytesSent, a member of class TBaseSocket.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnCreateHandle (see page 20057)	Occurs when the handle to a socket becomes active.
	OnDestroyHandle (see page 20057)	Occurs when a socket is deactivated.

	OnError (see page 20058)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnReceive (see page 20058)	Occurs after a socket receives data, but before it passes the data to the application.
	OnSend (see page 20058)	Occurs just before a client socket writes information to the socket connection.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Close (see page 20047)	Shuts down the socket connection.
V	Create (see page 20046)	Creates an instance of TBaseSocket (see page 20042).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 20046)	Frees the memory associated with the TBaseSocket (see page 20042) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MapDomain (see page 20049)	Maps the domain.
	MapSockType (see page 20050)	Maps the socket type.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Open (see page 20050)	Creates the socket connection.
	PeekBuf (see page 20050)	Reads the buffer.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReceiveBuf (see page 20051)	Reads data buffers of to the socket.
	ReceiveIn (see page 20051)	Reads delimited lines of data from the socket.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Select (see page 20051)	Tests for socket activity.
	SendBuf (see page 20052)	Writes data buffers of size bufsize from the socket.
	SendIn (see page 20052)	Writes delimited lines of data to the socket.
	SendStream (see page 20053)	Writes a stream of data to the socket.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WaitForData (see page 20053)	Waits for the socket connection to be ready to transfer data.

Public Properties

	Name	Description
	Active (see page 20054)	Indicates whether the socket connection is open and available for communication with other machines.
	BlockMode (see page 20054)	Sets or returns the blocking mode of the socket.
R	BytesReceived (see page 20055)	Returns the number of bytes received by the socket.
R	BytesSent (see page 20055)	Returns the number of bytes sent from the socket.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Domain (see page 20055)	Sets or returns the protocol family used by the socket.
R	Handle (see page 20056)	Provides access to the unique-4 byte identifier that represents the instance of the socket object.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Protocol (see page 20056)	Sets or returns the protocol used by the socket.
	SockType (see page 20056)	Sets or returns the socket type.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

148.1.2.2 TBaseSocket.Create Constructor

Creates an instance of TBaseSocket (see page 20042).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBaseSocket(TComponent * AOwner);
```

Description

For C++, call Create indirectly, using the **new** keyword, to instantiate a TBaseSocket (see page 20042) object.

See Also

TBaseSocket (see page 20042)

148.1.2.3 TBaseSocket.Destroy Destructor

Frees the memory associated with the TBaseSocket (see page 20042) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBaseSocket();
```

Description

For C++, do not call ~TBaseSocket (see page 20042) directly. Instead, use the **delete** keyword on the object, which causes ~TBaseSocket (see page 20042) to be invoked automatically.

See Also

delete

TBaseSocket (see page 20042)

148.1.2.4 TBaseSocket Methods

The methods of the TBaseSocket class are listed here.

Protected Methods

	Name	Description
	DoCreateHandle (see page 20047)	This is DoCreateHandle, a member of class TBaseSocket.
	DoDestroyHandle (see page 20047)	This is DoDestroyHandle, a member of class TBaseSocket.
	DoHandleError (see page 20048)	This is DoHandleError, a member of class TBaseSocket.
V	DoReceive (see page 20048)	This is DoReceive, a member of class TBaseSocket.
V	DoSend (see page 20048)	This is DoSend, a member of class TBaseSocket.
V	ErrorCheck (see page 20048)	This is ErrorCheck, a member of class TBaseSocket.
V	Loaded (see page 20049)	Initializes the component after the form file has been read into memory.
	SetBytesReceived (see page 20053)	This is SetBytesReceived, a member of class TBaseSocket.
	SetBytesSent (see page 20053)	This is SetBytesSent, a member of class TBaseSocket.

Public Methods

	Name	Description
	Close (see page 20047)	Shuts down the socket connection.
	MapDomain (see page 20049)	Maps the domain.
	MapSockType (see page 20050)	Maps the socket type.
	Open (see page 20050)	Creates the socket connection.
	PeekBuf (see page 20050)	Reads the buffer.
	ReceiveBuf (see page 20051)	Reads data buffers of to the socket.
	ReceiveIn (see page 20051)	Reads delimited lines of data from the socket.
	Select (see page 20051)	Tests for socket activity.
	SendBuf (see page 20052)	Writes data buffers of size bufsize from the socket.
	SendIn (see page 20052)	Writes delimited lines of data to the socket.
	SendStream (see page 20053)	Writes a stream of data to the socket.
	WaitForData (see page 20053)	Waits for the socket connection to be ready to transfer data.

148.1.2.4.1 TBaseSocket.Close Method

Shuts down the socket connection.

Pascal

```
procedure Close; virtual;
```

C++

```
virtual __fastcall Close();
```

Description

Call Close to shut down the socket connection. Close sets the Active (see page 20054) property to **false**.

For client sockets, Close terminates the connection to the server. For server sockets, Close shuts down the connection so that the server socket is no longer listening for client requests.

See Also

Active (see page 20054)

Open (see page 20050)

148.1.2.4.2 TBaseSocket.DoCreateHandle Method

Pascal

```
procedure DoCreateHandle; dynamic;
```

C++

```
__fastcall DoCreateHandle();
```

Description

This is DoCreateHandle, a member of class TBaseSocket.

148.1.2.4.3 TBaseSocket.DoDestroyHandle Method

Pascal

```
procedure DoDestroyHandle; dynamic;
```

C++

```
__fastcall DoDestroyHandle();
```

Description

This is DoDestroyHandle, a member of class TBaseSocket.

148.1.2.4.4 TBaseSocket.DoHandleError Method

Pascal

```
procedure DoHandleError; dynamic;
```

C++

```
__fastcall DoHandleError();
```

Description

This is DoHandleError, a member of class TBaseSocket.

148.1.2.4.5 TBaseSocket.DoReceive Method

Pascal

```
procedure DoReceive(Buf: pchar; var DataLen: Integer); virtual;
```

C++

```
virtual __fastcall DoReceive(const char * Buf, int DataLen);
```

Description

This is DoReceive, a member of class TBaseSocket.

148.1.2.4.6 TBaseSocket.DoSend Method

Pascal

```
procedure DoSend(Buf: pchar; var DataLen: Integer); virtual;
```

C++

```
virtual __fastcall DoSend(const char * Buf, int DataLen);
```

Description

This is DoSend, a member of class TBaseSocket.

148.1.2.4.7 TBaseSocket.ErrorCheck Method

Pascal

```
function ErrorCheck(rc: Integer): Integer; virtual;
```

C++

```
virtual __fastcall int ErrorCheck(int rc);
```

Description

This is ErrorCheck, a member of class TBaseSocket.

148.1.2.4.8 TBaseSocket.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

See Also

ComponentState (see page 2804)

Create (see page 2766)

TReader (see page 2933)

148.1.2.4.9 TBaseSocket.MapDomain Method

Maps the domain.

Pascal

```
function MapDomain(sd: TSocketDomain): Integer;
```

C++

```
__fastcall int MapDomain(TSocketDomain sd);
```

Description

MapDomain maps the socket domain to an integer based on the value supplied by the Domain (see page 20055) property.

See Also

Domain (see page 20055)

MapSockType (see page 20050)

148.1.2.4.10 TBaseSocket.MapSockType Method

Maps the socket type.

Pascal

```
function MapSockType(st: TSocketType): Integer;
```

C++

```
__fastcall int MapSockType(TSocketType st);
```

Description

MapSockType maps the socket type to an integer based on the value supplied by the SockType (see page 20056) property.

See Also

SockType (see page 20056)

148.1.2.4.11 TBaseSocket.Open Method

Creates the socket connection.

Pascal

```
procedure Open; virtual;
```

C++

```
virtual __fastcall Open();
```

Description

Call Open to create the socket connection. Descendants of TBaseSocket (see page 20042) use Open to initiate the socket connection.

For client sockets, Open locates and connects to a server. For server sockets, Open opens the socket connection in a listening mode, but does not complete the connection to a client socket.

See Also

TBaseSocket (see page 20042)

Active (see page 20054)

Close (see page 20047)

148.1.2.4.12 TBaseSocket.PeekBuf Method

Reads the buffer.

Pascal

```
function PeekBuf(var Buf; BufSize: Integer): Integer;
```

C++

```
__fastcall int PeekBuf( Buf, int BufSize);
```

Description

Use PeekBuf to make a copy of data waiting in the socket buffer. Use the **Buf** parameter to assign a variable to the buffer, and use **Bufsize** to set the size of the buffer to be copied. PeekBuf only copies, but does not otherwise affect the contents of the buffer.

See Also

ReceiveBuf (see page 20051)

SendBuf (see page 20052)

148.1.2.4.13 TBaseSocket.ReceiveBuf Method

Reads data buffers of to the socket.

Pascal

```
function ReceiveBuf(var Buf; BufSize: Integer; Flags: Integer = 0): Integer;
```

C++

```
__fastcall int ReceiveBuf( Buf, int BufSize, int Flags = 0);
```

Description

ReceiveBuf reads data buffers of size **bufsize** to the socket. Use **buf** to assign a variable to the buffer, and use **bufsize** to set the size of the buffer to be read. The **flags** argument can be any of the flags used by the Linux **recv** function. Refer to recv(2) in the Linux manual pages for more information.

See Also

PeekBuf (see page 20050)

SendBuf (see page 20052)

148.1.2.4.14 TBaseSocket.ReceiveIn Method

Reads delimited lines of data from the socket.

Pascal

```
function ReceiveIn(const eol: string = CRLF): string;
```

C++

```
__fastcall AnsiString ReceiveIn(const AnsiString eol = CRLF);
```

Description

ReceiveIn reads a delimited chunk of data from the socket. The **delimeter** cannot be part of the character set. ReceiveIn fills the buffer until it reaches the **delimeter**.

See Also

SendIn (see page 20052)

OnReceive (see page 20058)

148.1.2.4.15 TBaseSocket.Select Method

Tests for socket activity.

Pascal

```
function Select(ReadReady: PBoolean; WriteReady: PBoolean; ExceptFlag: PBoolean; TimeOut:
Integer = 0): Boolean;
```

C++

```
__fastcall Boolean Select(PBoolean ReadReady, PBoolean WriteReady, PBoolean ExceptFlag, int
```

```
TimeOut = 0);
```

Description

Use Select to test for socket activity. Select indicates whether there is any data on the socket waiting to be sent or whether an error condition exists.

The parameter **TimeOut** is the time-out value. The socket waits for activity up to **TimeOut** milliseconds before returning. If **TimeOut** is not explicitly specified, the default value is zero. If **TimeOut** is any negative number, the socket is blocked. It waits for activity indefinitely, which can be useful for servers.

See Also

WaitForData (see page 20053)

148.1.2.4.16 TBaseSocket.SendBuf Method

Writes data buffers of size bufsize from the socket.

Pascal

```
function SendBuf(var Buf; BufSize: Integer; Flags: Integer = 0): Integer;
```

C++

```
__fastcall int SendBuf( Buf, int BufSize, int Flags = 0);
```

Description

SendBuf sends data buffers of size **bufsize** to the socket. Use **buf** to assign a variable to the buffer, and use **bufsize** to set the size of the buffer to be sent. The flags argument can be any of the flags used by the Linux **send** function. Refer to the send Linux manual page for more information.

See Also

PeekBuf (see page 20050)

ReceiveBuf (see page 20051)

148.1.2.4.17 TBaseSocket.SendIn Method

Writes delimited lines of data to the socket.

Pascal

```
function Sendln(s: string; const eol: string = CRLF): Integer;
```

C++

```
__fastcall int Sendln(AnsiString s, const AnsiString eol = CRLF);
```

Description

SendIn sends a delimited chunk of data to the socket. The **delimeter** cannot be part of the character set. SendIn fills the buffer until it reaches the **delimeter**.

See Also

ReceiveIn (see page 20051)

OnReceive (see page 20058)

148.1.2.4.18 TBaseSocket.SendStream Method

Writes a stream of data to the socket.

Pascal

```
function SendStream(AStream: TStream): Integer;
```

C++

```
__fastcall int SendStream(TStream AStream);
```

Description

SendStream sends a stream of data to the socket.

See Also

OnReceive (see page 20058)

148.1.2.4.19 TBaseSocket.SetBytesReceived Method

Pascal

```
procedure SetBytesReceived(Value: Cardinal);
```

C++

```
__fastcall SetBytesReceived(unsigned Value);
```

Description

This is SetBytesReceived, a member of class TBaseSocket.

148.1.2.4.20 TBaseSocket.SetBytesSent Method

Pascal

```
procedure SetBytesSent(Value: Cardinal);
```

C++

```
__fastcall SetBytesSent(unsigned Value);
```

Description

This is SetBytesSent, a member of class TBaseSocket.

148.1.2.4.21 TBaseSocket.WaitForData Method

Waits for the socket connection to be ready to transfer data.

Pascal

```
function WaitForData(TimeOut: Integer = 0): Boolean;
```

C++

```
__fastcall Boolean WaitForData(int TimeOut = 0);
```

Description

Call WaitForData to ensure that the socket connection is ready to read or write information. WaitForData returns **true** if the socket connection is ready. WaitForData returns **false** if the socket connection is not ready after **TimeOut** milliseconds elapse.

Call WaitForData before reading or writing information over the socket connection. Otherwise, ReceiveBuf (see page 20051),

ReceiveIn (see page 20051), SendBuf (see page 20052), and SendIn (see page 20052) method calls may time out before any data is transferred.

See Also

ReceiveBuf (see page 20051)

ReceiveIn (see page 20051)

SendBuf (see page 20052)

SendIn (see page 20052)

148.1.2.5 TBaseSocket Properties

The properties of the TBaseSocket class are listed here.

Public Properties

	Name	Description
	Active (see page 20054)	Indicates whether the socket connection is open and available for communication with other machines.
	BlockMode (see page 20054)	Sets or returns the blocking mode of the socket.
R	BytesReceived (see page 20055)	Returns the number of bytes received by the socket.
R	BytesSent (see page 20055)	Returns the number of bytes sent from the socket.
	Domain (see page 20055)	Sets or returns the protocol family used by the socket.
R	Handle (see page 20056)	Provides access to the unique-4 byte identifier that represents the instance of the socket object.
	Protocol (see page 20056)	Sets or returns the protocol used by the socket.
	SockType (see page 20056)	Sets or returns the socket type.

148.1.2.5.1 TBaseSocket.Active Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before attempting to use or change the socket connection, read Active to determine whether the connection is open and ready. For client sockets, setting Active opens or shuts down a socket connection to another machine. For server sockets, setting Active opens or shuts down a listening connection that makes the socket available for client requests.

At design time, set Active to **true** to make the socket open a connection when the application starts running (the default value is false). At runtime, use the Open (see page 20050) or Close (see page 20047) method to open or close the connection.

See Also

Close (see page 20047)

Open (see page 20050)

148.1.2.5.2 TBaseSocket.BlockMode Property

Sets or returns the blocking mode of the socket.

Pascal

```
property BlockMode: TSocketBlockMode;
```

C++

```
__property TSocketBlockMode BlockMode;
```

Description

Use BlockMode to set or return the blocking mode for the socket. By default, the socket is set to bmBlocking.

The TSocketBlockMode (see page 20141) type defines the set of possible socket flags for the BlockMode property.

See Also

TSocketBlockMode (see page 20141)

OnReceive (see page 20058)

OnSend (see page 20058)

148.1.2.5.3 TBaseSocket.BytesReceived Property

Returns the number of bytes received by the socket.

Pascal

```
property BytesReceived: Cardinal;
```

C++

```
__property unsigned BytesReceived;
```

Description

BytesReceived returns the number of bytes received by the socket.

See Also

BytesSent (see page 20055)

148.1.2.5.4 TBaseSocket.BytesSent Property

Returns the number of bytes sent from the socket.

Pascal

```
property BytesSent: Cardinal;
```

C++

```
__property unsigned BytesSent;
```

Description

BytesSent returns the number of bytes sent from the socket.

See Also

BytesReceived (see page 20055)

148.1.2.5.5 TBaseSocket.Domain Property

Sets or returns the protocol family used by the socket.

Pascal

```
property Domain: TSocketDomain;
```

C++

```
__property TSocketDomain Domain;
```

Description

Use Domain to set or return the protocol family used by the socket. The TSocketDomain (see page 20136) type defines the set of possible protocol family types for the Domain property. The default value of this property is pfUnspec.

See Also

MapDomain (see page 20049)

TSocketDomain (see page 20136)

148.1.2.5.6 TBaseSocket.Handle Property

Provides access to the unique-4 byte identifier that represents the instance of the socket object.

Pascal

```
property Handle: TSocket;
```

C++

```
__property TSocket Handle;
```

Description

Use Handle to return a typed pointer to the instance of the socket class. This Handle can be used when making low level function calls into the QT shared libraries, where the function call requires an instance pointer to the object.

148.1.2.5.7 TBaseSocket.Protocol Property

Sets or returns the protocol used by the socket.

Pascal

```
property Protocol: TSocketProtocol;
```

C++

```
__property TSocketProtocol Protocol;
```

Description

Protocol sets or returns the protocol used by the socket. The socket protocol can be IP, TCP, UDP, or other network protocols.

See Also

TTcpServer (see page 20115)

148.1.2.5.8 TBaseSocket.SockType Property

Sets or returns the socket type.

Pascal

```
property SockType: TSocketType;
```

C++

```
__property TSocketType SockType;
```

Description

SockType sets or returns the type of socket connection.

The TSocketType (see page 20138) type defines the set of possible socket types for the SockType property.

See Also

TSocketType (see page 20138)

148.1.2.6 TBaseSocket Events

The events of the TBaseSocket class are listed here.

Public Events

	Name	Description
	OnCreateHandle (see page 20057)	Occurs when the handle to a socket becomes active.
	OnDestroyHandle (see page 20057)	Occurs when a socket is deactivated.
	OnError (see page 20058)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnReceive (see page 20058)	Occurs after a socket receives data, but before it passes the data to the application.
	OnSend (see page 20058)	Occurs just before a client socket writes information to the socket connection.

148.1.2.6.1 TBaseSocket.OnCreateHandle Event

Occurs when the handle to a socket becomes active.

Pascal

```
property OnCreateHandle: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnCreateHandle;
```

Description

Write an OnCreateHandle event handler to take specific action when the handle to a socket becomes active.

See Also

Active (see page 20054)

Handle (see page 20056)

148.1.2.6.2 TBaseSocket.OnDestroyHandle Event

Occurs when a socket is deactivated.

Pascal

```
property OnDestroyHandle: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnDestroyHandle;
```

Description

Write an OnDestroyHandle event handler to take specific action when the socket is deactivated.

148.1.2.6.3 TBaseSocket.OnError Event

Occurs when the socket fails in making, using, or shutting down a connection.

Pascal

```
property OnError: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnError;
```

Description

Write an OnError event handler to respond to errors that arise with the socket connection. Set the **ErrorCode** parameter to 0 if the OnError event handler successfully deals with the error condition, to prevent an ESocketError (see page 20041) exception from being raised.

See Also

ESocketError (see page 20041)

148.1.2.6.4 TBaseSocket.OnReceive Event

Occurs after a socket receives data, but before it passes the data to the application.

Pascal

```
property OnReceive: TSocketDataEvent;
```

C++

```
__property TSocketDataEvent OnReceive;
```

Description

Write an OnReceive event handler to read from the socket connection. Use the OnReceive event to filter data before passing it back to the client application. If the socket is a blocking socket, use a TWinSocketStream object to read from the connection. Otherwise, use the methods of the **Socket** parameter to perform the actual reading.

See Also

TWinSocketStream (see page 18876)

BytesReceived (see page 20055)

ReceiveBuf (see page 20051)

ReceiveIn (see page 20051)

148.1.2.6.5 TBaseSocket.OnSend Event

Occurs just before a client socket writes information to the socket connection.

Pascal

```
property OnSend: TSocketDataEvent;
```

C++

```
__property TSocketDataEvent OnSend;
```

Description

Write an OnSend event handler to perform actions just prior to sending data. Use OnSend to monitor the data stream and

change it (for example, by removing linefeeds). If the socket is a blocking socket, use a TWinSocketStream object to write to the connection. Otherwise, use the methods of the **Socket** parameter to perform the actual writing.

See Also

TWinSocketStream (see page 18876)

SendBuf (see page 20052)

SendIn (see page 20052)

148.1.3 TClientSocketThread Class

Enables creation of separate threads of execution for the client socket in an application.

Class Hierarchy

Pascal

```
TClientSocketThread = class(TThread);
```

C++

```
class TClientSocketThread : public TThread;
```

File

Sockets

Description

Create (see page 20060) a TClientSocketThread (or a descendant of the class) to represent an execution thread for the client socket in a multi-threaded application. Each new instance of TClientSocketThread, a TThread descendant, is a new thread of execution. Using a separate TClientSocketThread allows the client socket to block without blocking the whole application.

See Also

Writing Multi-threaded Applications

TServerSocketThread (see page 20099)

TThread (see page 3108)

148.1.3.1 TClientSocketThread Members

The following tables list the members exposed by TClientSocketThread.

Protected Methods

	Name	Description
	CheckThreadError (see page 3114)	This is the overview for the CheckThreadError method overload.
V	DoTerminate (see page 3115)	Generates an OnTerminate (see page 3148) event.
V	SyncProc (see page 20062)	Method where data synchronization is actually performed.

Protected Properties

	Name	Description
	ReturnValue (see page 3141)	Specifies the value returned to other waiting threads when the thread finishes executing.

R	Terminated (see page 3142)	Indicates whether the thread has been asked to terminate.

Public Events

	Name	Description
	OnTerminate (see page 3148)	Occurs after the thread's Execute (see page 3115) method has returned and before the thread is destroyed.

Public Methods

	Name	Description
V	AfterConstruction (see page 3114)	Executes the thread when the thread is created with CreateSuspended set to false.
	Create (see page 20060)	Creates an instance of a TClientSocketThread (see page 20059) object.
V	Destroy (see page 20061)	Destroys the thread object and releases the memory allocated to it.
V	Execute (see page 20061)	Executes when the thread is run.
	ExecuteSyncProc (see page 20062)	Synchronizes data between threads.
	Queue (see page 3119)	This is the overview for the Queue method overload.
	RemoveQueuedEvents (see page 3120)	Remove queued method calls.
	Resume (see page 3120)	Restarts the execution of a suspended thread.
	StaticQueue (see page 3124)	Asynchronously executes a method call within the main thread.
	StaticSynchronize (see page 3125)	Executes a method call within the main thread.
	Suspend (see page 3125)	Pauses a running thread.
	Synchronize (see page 3126)	This is the overview for the Synchronize method overload.
	Terminate (see page 3126)	Signals the thread to terminate by setting the Terminated (see page 3142) property to true.
	WaitFor (see page 3132)	Waits for the thread to terminate and then returns the value of the ReturnValue (see page 3141) property.

Public Properties

	Name	Description
R	ClientSocket (see page 20063)	Refers to the client socket handling the connection in that thread.
R	FatalException (see page 3133)	Determines whether the thread object is automatically destroyed when the thread terminates.
	FreeOnTerminate (see page 3134)	Determines whether the thread object is automatically destroyed when the thread terminates.
R	Handle (see page 3137)	Indicates the thread's handle (Windows only).
	Priority (see page 3138)	Determines the thread's scheduling priority relative to other threads in the process.
R	ServerSocketThread (see page 20063)	Specifies the server socket's thread.
	Suspended (see page 3142)	Indicates whether a thread is suspended.
R	ThreadID (see page 3148)	Identifies the thread throughout the system.

148.1.3.2 TClientSocketThread.Create Constructor

Creates an instance of a TClientSocketThread (see page 20059) object.

Pascal

```
constructor Create(ServerSocketThread: TServerSocketThread);
```

C++

```
__fastcall TClientSocketThread(TServerSocketThread ServerSocketThread);
```

Description

For C++, call Create indirectly, using the **new** keyword, to create a thread in an application. If the **CreateSuspended** parameter is false, Execute (see page 20061) is called immediately. If **CreateSuspended** is true, Execute (see page 20061) is not called until after Resume is called.

See Also

TClientSocketThread (see page 20059)

Destroy (see page 20061)

Execute (see page 20061)

Resume (see page 3120)

148.1.3.3 TClientSocketThread.Destroy Destructor

Destroys the thread object and releases the memory allocated to it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TClientSocketThread();
```

Description

For C++, do not call Destroy in an application. Instead, use the **delete** keyword to destroy a thread when FreeOnTerminate is false.

See Also

delete

Create (see page 3110)

FreeOnTerminate (see page 3134)

148.1.3.4 TClientSocketThread Methods

The methods of the TClientSocketThread class are listed here.

Protected Methods

	Name	Description
	SyncProc (see page 20062)	Method where data synchronization is actually performed.

Public Methods

	Name	Description
	Execute (see page 20061)	Executes when the thread is run.
	ExecuteSyncProc (see page 20062)	Synchronizes data between threads.

148.1.3.4.1 TClientSocketThread.Execute Method

Executes when the thread is run.

Pascal

```
procedure Execute; override;
```

C++

```
virtual __fastcall Execute();
```

Description

Use Execute to execute the code that should be executed when the thread runs. Execute is responsible for checking the value of the Terminated property to determine if the thread needs to exit.

Note: Do not use the properties and methods of other objects directly in the Execute method of a thread. Instead, separate the use of other objects into a separate procedure call, and call that procedure by passing it as a parameter to the Synchronize method.

See Also

Terminated (see page 3142)

Synchronize (see page 3126)

148.1.3.4.2 TClientSocketThread.ExecuteSyncProc Method

Synchronizes data between threads.

Pascal

```
procedure ExecuteSyncProc;
```

C++

```
__fastcall ExecuteSyncProc();
```

Description

Objects in the client socket thread should not directly manipulate data in the main thread. Attempting to do so will cause synchronization problems and, most likely, the application will crash. To avoid synchronization errors, override the SyncProc (see page 20062) method to include instructions that must be executed by the main thread.

See Also

Synchronize (see page 3126)

SyncProc (see page 20062)

148.1.3.4.3 TClientSocketThread.SyncProc Method

Method where data synchronization is actually performed.

Pascal

```
procedure SyncProc; virtual;
```

C++

```
virtual __fastcall SyncProc();
```

Description

In subclasses of TClientSocketThread (see page 20059), override SyncProc to perform synchronization between threads. Put code in it to be executed by the main thread.

Warning: Do not call this protected method directly; instead, call ExecuteSyncProc (see page 20062).

See Also

TClientSocketThread (see page 20059)

ExecuteSyncProc (see page 20062)

Synchronize (see page 3126)

148.1.3.5 TClientSocketThread Properties

The properties of the TClientSocketThread class are listed here.

Public Properties

	Name	Description
R	ClientSocket (see page 20063)	Refers to the client socket handling the connection in that thread.
R	ServerSocketThread (see page 20063)	Specifies the server socket's thread.

148.1.3.5.1 TClientSocketThread.ClientSocket Property

Refers to the client socket handling the connection in that thread.

Pascal

```
property ClientSocket: TCustomIpClient;
```

C++

```
__property TCustomIpClient ClientSocket;
```

Description

Use ClientSocket to obtain access to the client socket object handling the connection in the current thread of execution.

See Also

TCustomIpClient (see page 20063)

148.1.3.5.2 TClientSocketThread.ServerSocketThread Property

Specifies the server socket's thread.

Pascal

```
property ServerSocketThread: TServerSocketThread;
```

C++

```
__property TServerSocketThread ServerSocketThread;
```

Description

Use ServerSocketThread get access to the thread object of the server socket.

See Also

TServerSocketThread (see page 20099)

148.1.4 TCustomIpClient Class

Encapsulates the client network functions.

Class Hierarchy

Pascal

```
TCustomIpClient = class(TIpSocket);
```

C++

```
class TCustomIpClient : public TIpSocket;
```

File

Sockets

Description

TCustomIpClient encapsulates the client network functions, linking sockets to network protocols such as TCP/IP and UDP, as well as raw sockets and custom protocols. Do not create instances of TCustomIpClient. Use TCustomIpClient as a base class when declaring non-visual components that can appear on the component palette and be used in the form designer. Properties and methods of TCustomIpClient provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

See Also

TBaseSocket (see page 20042)

148.1.4.1 TCustomIpClient Members

The following tables list the members exposed by TCustomIpClient.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Bind (see page 20087)	This is Bind, a member of class TIpSocket.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 20069)	This is DoConnect, a member of class TCustomIpClient.
	DoCreateHandle (see page 20047)	This is DoCreateHandle, a member of class TBaseSocket.
	DoDestroyHandle (see page 20047)	This is DoDestroyHandle, a member of class TBaseSocket.
V	DoDisconnect (see page 20070)	This is DoDisconnect, a member of class TCustomIpClient.
	DoHandleError (see page 20048)	This is DoHandleError, a member of class TBaseSocket.
V	DoReceive (see page 20048)	This is DoReceive, a member of class TBaseSocket.
V	DoSend (see page 20048)	This is DoSend, a member of class TBaseSocket.
V	ErrorCheck (see page 20048)	This is ErrorCheck, a member of class TBaseSocket.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.

	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 20049)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBytesReceived (see page 20053)	This is SetBytesReceived, a member of class TBaseSocket.
	SetBytesSent (see page 20053)	This is SetBytesSent, a member of class TBaseSocket.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnConnect (see page 20071)	Occurs on client sockets just after the connection to the server is opened.
	OnCreateHandle (see page 20057)	Occurs when the handle to a socket becomes active.
	OnDestroyHandle (see page 20057)	Occurs when a socket is deactivated.
	OnDisconnect (see page 20072)	Occurs on client sockets just after the connection to the server is closed.
	OnError (see page 20058)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnReceive (see page 20058)	Occurs after a socket receives data, but before it passes the data to the application.
	OnSend (see page 20058)	Occurs just before a client socket writes information to the socket connection.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Close (see page 20068)	Shuts down the socket connection.
	Connect (see page 20069)	Connects the local socket to the remote socket.
V	Create (see page 20068)	Creates an instance of TCustomIpClient (see page 20063).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20046)	Frees the memory associated with the TBaseSocket (see page 20042) object.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Disconnect (see page 20069)	Disconnects the local socket from the remote socket.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetSocketAddr (see page 20087)	Builds a valid network socket address.
	GetThreadObject (see page 20070)	Returns a reference to the TThread object for the currently executing thread.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LocalDomainName (see page 20088)	Returns the domain name for the local host.
	LocalHostAddr (see page 20088)	Returns the local IP address for the host machine.
	LocalHostName (see page 20088)	Returns the local host name.
	LookupHostAddr (see page 20089)	Looks up the host address based on the host name.
	LookupHostName (see page 20089)	Looks up the host name based on the IP address.
	LookupPort (see page 20089)	Returns the port number.
	LookupProtocol (see page 20090)	Returns the protocol number.
	MapDomain (see page 20049)	Maps the domain.
	MapSockType (see page 20050)	Maps the socket type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Open (see page 20070)	Creates the socket connection.
	PeekBuf (see page 20050)	Reads the buffer.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReceiveBuf (see page 20051)	Reads data buffers of to the socket.
	ReceiveFrom (see page 20090)	Receives a packet of information.
	ReceiveIn (see page 20051)	Reads delimited lines of data from the socket.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Select (see page 20051)	Tests for socket activity.
	SendBuf (see page 20052)	Writes data buffers of size bufsize from the socket.
	SendIn (see page 20052)	Writes delimited lines of data to the socket.
	SendStream (see page 20053)	Writes a stream of data to the socket.
	SendTo (see page 20091)	Sends a packet of information.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WaitForData (see page 20053)	Waits for the socket connection to be ready to transfer data.

Public Properties

	Name	Description
	Active (see page 20054)	Indicates whether the socket connection is open and available for communication with other machines.
	BlockMode (see page 20054)	Sets or returns the blocking mode of the socket.
R	BytesReceived (see page 20055)	Returns the number of bytes received by the socket.
R	BytesSent (see page 20055)	Returns the number of bytes sent from the socket.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Connected (see page 20071)	Indicates whether the socket connection is open and available for communication with other machines.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Domain (see page 20055)	Sets or returns the protocol family used by the socket.
	Domain (see page 20091)	Sets or returns the protocol family used by the socket.
R	Handle (see page 20056)	Provides access to the unique-4 byte identifier that represents the instance of the socket object.
	LocalHost (see page 20092)	Specifies the name of the local system.
	LocalPort (see page 20092)	Specifies the ID number of the port used by the socket connection.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Protocol (see page 20056)	Sets or returns the protocol used by the socket.
	RemoteHost (see page 20093)	Specifies the name of the remote system.
	RemotePort (see page 20093)	Specifies the ID number of the port used by the RemoteHost (see page 20093) to form the socket connection.
	SockType (see page 20056)	Sets or returns the socket type.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

148.1.4.2 TCustomIpClient.Create Constructor

Creates an instance of TCustomIpClient (see page 20063).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomIpClient(TComponent * AOwner);
```

Description

For C++, call Create indirectly, using the **new** keyword, to instantiate a TCustomIpClient (see page 20063) object.

See Also

Destroy

148.1.4.3 TCustomIpClient Methods

The methods of the TCustomIpClient class are listed here.

Protected Methods

	Name	Description
	DoConnect (see page 20069)	This is DoConnect, a member of class TCustomIpClient.
	DoDisconnect (see page 20070)	This is DoDisconnect, a member of class TCustomIpClient.

Public Methods

	Name	Description
	Close (see page 20068)	Shuts down the socket connection.
	Connect (see page 20069)	Connects the local socket to the remote socket.
	Disconnect (see page 20069)	Disconnects the local socket from the remote socket.
	GetThreadObject (see page 20070)	Returns a reference to the TThread object for the currently executing thread.
	Open (see page 20070)	Creates the socket connection.

148.1.4.3.1 TCustomIpClient.Close Method

Shuts down the socket connection.

Pascal

```
procedure Close; override;
```

C++

```
virtual __fastcall Close();
```

Description

Call Close to shut down the socket connection. This method performs the same functions as Disconnect (see page 20069).

See Also

Disconnect (see page 20069)

Open (see page 20070)

Active (see page 20054)

148.1.4.3.2 TCustomIpClient.Connect Method

Connects the local socket to the remote socket.

Pascal

```
function Connect: Boolean;
```

C++

```
__fastcall Boolean Connect();
```

Description

Call Connect to connect the local socket to the remote socket.

See Also

Connected (see page 20071)

Close (see page 20068)

Disconnect (see page 20069)

148.1.4.3.3 TCustomIpClient.Disconnect Method

Disconnects the local socket from the remote socket.

Pascal

```
procedure Disconnect;
```

C++

```
__fastcall Disconnect();
```

Description

Call Disconnect to break the connection between the local and remote sockets. This method performs the same function as Close (see page 20068).

See Also

Connected (see page 20071)

Close (see page 20068)

Connect (see page 20069)

148.1.4.3.4 TCustomIpClient.DoConnect Method

Pascal

```
procedure DoConnect; virtual;
```

C++

```
virtual __fastcall DoConnect();
```

Description

This is DoConnect, a member of class TCustomIpClient.

148.1.4.3.5 TCustomIpClient.DoDisconnect Method

Pascal

```
procedure DoDisconnect; virtual;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

This is DoDisconnect, a member of class TCustomIpClient.

148.1.4.3.6 TCustomIpClient.GetThreadObject Method

Returns a reference to the TThread object for the currently executing thread.

Pascal

```
function GetThreadObject: TClientSocketThread;
```

C++

```
__fastcall TClientSocketThread GetThreadObject();
```

Description

Call GetThreadObject to obtain a reference to the currently executing thread. GetThreadObject is only useful when BlockMode (see page 20054) is set to **bmBlockingMode**, which means that the client is executing in its own thread. If this method is called from the main application thread, the value NULL is returned.

See Also

TThread (see page 3108)

BlockMode (see page 20054)

148.1.4.3.7 TCustomIpClient.Open Method

Creates the socket connection.

Pascal

```
procedure Open; override;
```

C++

```
virtual __fastcall Open();
```

Description

Call Open to create and initiate the socket connection.

For client sockets, Open locates and connects to a server. For server sockets, Open opens the socket connection in a listening mode, but does not complete the connection to a client socket.

See Also

Active (see page 20054)

Close (see page 20068)

148.1.4.4 TCustomIpClient Properties

The properties of the TCustomIpClient class are listed here.

Public Properties

	Name	Description
R	Connected (see page 20071)	Indicates whether the socket connection is open and available for communication with other machines.

148.1.4.4.1 TCustomIpClient.Connected Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Read Connected before trying to use or change the socket connection. Connected indicates whether the socket connection has been established. When Connected is **true**, the socket is open and available for use. When Connected is **false**, the socket is closed and can be changed.

To open a socket, use the Open (see page 20070) method. To close a socket, use the Closemethod.

See Also

Close (see page 20068)

Open (see page 20070)

OnConnect (see page 20071)

148.1.4.5 TCustomIpClient Events

The events of the TCustomIpClient class are listed here.

Public Events

	Name	Description
	OnConnect (see page 20071)	Occurs on client sockets just after the connection to the server is opened.
	OnDisconnect (see page 20072)	Occurs on client sockets just after the connection to the server is closed.

148.1.4.5.1 TCustomIpClient.OnConnect Event

Occurs on client sockets just after the connection to the server is opened.

Pascal

```
property OnConnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnConnect;
```

Description

Write an OnConnect event handler for a client socket to take specific action after the connection to a server socket has been established. Depending on the service, this may be the point when the socket should start reading or writing over the connection.

See Also

Connected (see page 20071)

OnDisconnect (see page 20072)

148.1.4.5.2 TCustomIpClient.OnDisconnect Event

Occurs on client sockets just after the connection to the server is closed.

Pascal

```
property OnDisconnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnDisconnect;
```

Description

Write an OnDisconnect event handler for a client socket to take specific action just after the connection to a server socket is terminated.

See Also

Connected (see page 20071)

OnConnect (see page 20071)

148.1.5 TCustomTcpServer Class

Ancestor object of all the server socket descendants.

Class Hierarchy

Pascal

```
TCustomTcpServer = class(TIpSocket);
```

C++

```
class TCustomTcpServer : public TIpSocket;
```

File

Sockets

Description

Do not create instances of TCustomTcpServer. Use TCustomTcpServer as a base class when declaring non-visual components that can appear on the component palette and be used in the form designer. Properties and methods of TCustomTcpServer provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

148.1.5.1 TCustomTcpServer Members

The following tables list the members exposed by TCustomTcpServer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Bind (see page 20087)	This is Bind, a member of class TIpSocket.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20078)	This is DoAccept, a member of class TCustomTcpServer.
	DoCreateHandle (see page 20047)	This is DoCreateHandle, a member of class TBaseSocket.
	DoDestroyHandle (see page 20047)	This is DoDestroyHandle, a member of class TBaseSocket.
	DoHandleError (see page 20048)	This is DoHandleError, a member of class TBaseSocket.
V	DoReceive (see page 20048)	This is DoReceive, a member of class TBaseSocket.
V	DoSend (see page 20048)	This is DoSend, a member of class TBaseSocket.
V	ErrorCheck (see page 20048)	This is ErrorCheck, a member of class TBaseSocket.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Listen (see page 20079)	This is Listen, a member of class TCustomTcpServer.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 20049)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBytesReceived (see page 20053)	This is SetBytesReceived, a member of class TBaseSocket.
	SetBytesSent (see page 20053)	This is SetBytesSent, a member of class TBaseSocket.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property

	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnAccept (see page 20081)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnCreateHandle (see page 20057)	Occurs when the handle to a socket becomes active.
	OnDestroyHandle (see page 20057)	Occurs when a socket is deactivated.
	OnError (see page 20058)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnGetThread (see page 20081)	A wrapper for the TServerSocketThread (see page 20099) event of the same name.
	OnListening (see page 20082)	Occurs when a server socket begins listening for connections.
	OnReceive (see page 20058)	Occurs after a socket receives data, but before it passes the data to the application.
	OnSend (see page 20058)	Occurs just before a client socket writes information to the socket connection.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Accept (see page 20077)	This is the overview for the Accept method overload.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 20078)	Shuts down the socket connection.
	Create (see page 20076)	Creates an instance of TCustomTcpServer (see page 20072).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 20077)	Frees the memory associated with the TCustomTcpServer (see page 20072) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetSocketAddr (see page 20087)	Builds a valid network socket address.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LocalDomainName (see page 20088)	Returns the domain name for the local host.
	LocalHostAddr (see page 20088)	Returns the local IP address for the host machine.
	LocalHostName (see page 20088)	Returns the local host name.
	LookupHostAddr (see page 20089)	Looks up the host address based on the host name.
	LookupHostName (see page 20089)	Looks up the host name based on the IP address.
	LookupPort (see page 20089)	Returns the port number.
	LookupProtocol (see page 20090)	Returns the protocol number.
	MapDomain (see page 20049)	Maps the domain.
	MapSockType (see page 20050)	Maps the socket type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Open (see page 20079)	Opens the socket connection.
	PeekBuf (see page 20050)	Reads the buffer.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReceiveBuf (see page 20051)	Reads data buffers of to the socket.
	ReceiveFrom (see page 20090)	Receives a packet of information.
	ReceiveIn (see page 20051)	Reads delimited lines of data from the socket.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Select (see page 20051)	Tests for socket activity.
	SendBuf (see page 20052)	Writes data buffers of size bufsize from the socket.
	SendIn (see page 20052)	Writes delimited lines of data to the socket.
	SendStream (see page 20053)	Writes a stream of data to the socket.
	SendTo (see page 20091)	Sends a packet of information.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

	WaitForConnection (see page 20079)	Listens for TCP connections.
	WaitForData (see page 20053)	Waits for the socket connection to be ready to transfer data.

Public Properties

	Name	Description
	Active (see page 20054)	Indicates whether the socket connection is open and available for communication with other machines.
	BlockMode (see page 20080)	Sets or returns the blocking mode of the socket.
R	BytesReceived (see page 20055)	Returns the number of bytes received by the socket.
R	BytesSent (see page 20055)	Returns the number of bytes sent from the socket.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Domain (see page 20055)	Sets or returns the protocol family used by the socket.
	Domain (see page 20091)	Sets or returns the protocol family used by the socket.
R	Handle (see page 20056)	Provides access to the unique-4 byte identifier that represents the instance of the socket object.
R	Listening (see page 20080)	Sets the server application to listen for client requests.
	LocalHost (see page 20092)	Specifies the name of the local system.
	LocalPort (see page 20092)	Specifies the ID number of the port used by the socket connection.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Protocol (see page 20056)	Sets or returns the protocol used by the socket.
	RemoteHost (see page 20093)	Specifies the name of the remote system.
	RemotePort (see page 20093)	Specifies the ID number of the port used by the RemoteHost (see page 20093) to form the socket connection.
	ServerSocketThread (see page 20080)	Specifies the TServerSocketThread (see page 20099) in use.
	SockType (see page 20056)	Sets or returns the socket type.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

148.1.5.2 TCustomTcpServer.Create Constructor

Creates an instance of TCustomTcpServer (see page 20072).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomTcpServer(TComponent * AOwner);
```

Description

For C++, call Create indirectly, using the **new** keyword, to instantiate a TCustomTcpServer (see page 20072) object.

See Also

TCustomTcpServer (see page 20072)

Destroy (see page 20077)

148.1.5.3 TCustomTcpServer.Destroy Destructor

Frees the memory associated with the TCustomTcpServer (see page 20072) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomTcpServer();
```

Description

For C++, do not call Destroy directly. Instead, use the **delete** keyword on the object, which causes Destroy to be invoked automatically.

See Also

delete

148.1.5.4 TCustomTcpServer Methods

The methods of the TCustomTcpServer class are listed here.

Protected Methods

	Name	Description
	DoAccept (see page 20078)	This is DoAccept, a member of class TCustomTcpServer.
	Listen (see page 20079)	This is Listen, a member of class TCustomTcpServer.

Public Methods

	Name	Description
	Accept (see page 20077)	This is the overview for the Accept method overload.
	Close (see page 20078)	Shuts down the socket connection.
	Open (see page 20079)	Opens the socket connection.
	WaitForConnection (see page 20079)	Listens for TCP connections.

148.1.5.4.1 Accept Method

This is the overview for the Accept method overload.

Overload List

	Name	Description
	TCustomTcpServer.Accept () (see page 20077)	Accepts a connection to a client socket.
	TCustomTcpServer.Accept (TCustomIpClient) (see page 20077)	Accepts a connection to a client socket.

148.1.5.4.1.1 TCustomTcpServer.Accept Method ()

Accepts a connection to a client socket.

Pascal

```
function Accept: Boolean; overload;
function Accept(var ClientSocket: TCustomIpClient): Boolean; overload;
```

C++

```
__fastcall Boolean Accept();
__fastcall Boolean Accept(TCustomIpClient ClientSocket);
```

Description

Accept is called automatically in response to notifications that a client socket is requesting a connection.

The Accept method for TCustomTcpServerdoes nothing with the notification. Descendants of TCustomTcpServer (see page 20072) that represent listening server sockets override this method to accept the connection to the client socket. In the second declaration of the method, a TCustomIpClient (see page 20063) object is created (as the **ClientSocket** parameter) to handle the connection.

See Also

TCustomIpClient (see page 20063)

TCustomTcpServer (see page 20072)

OnAccept (see page 20081)

148.1.5.4.2 TCustomTcpServer.Close Method

Shuts down the socket connection.

Pascal

```
procedure Close; override;
```

C++

```
virtual __fastcall Close();
```

Description

Call Close to shut down the socket connection. Close sets the Active (see page 20054) property to false.

For client sockets, Close terminates the connection to the server. For server sockets, Close shuts down the connection so that the server socket is no longer listening for client requests.

See Also

Active (see page 20054)

Open (see page 20079)

148.1.5.4.3 TCustomTcpServer.DoAccept Method

Pascal

```
procedure DoAccept(ClientSocket: TCustomIpClient); virtual;
```

C++

```
virtual __fastcall DoAccept(TCustomIpClient ClientSocket);
```

Description

This is DoAccept, a member of class TCustomTcpServer.

148.1.5.4.4 TCustomTcpServer.Listen Method

Pascal

```
function Listen(backlog: Integer = SOMAXCONN): Boolean;
```

C++

```
__fastcall Boolean Listen(int backlog = SOMAXCONN);
```

Description

This is Listen, a member of class TCustomTcpServer.

148.1.5.4.5 TCustomTcpServer.Open Method

Opens the socket connection.

Pascal

```
procedure Open; override;
```

C++

```
virtual __fastcall Open();
```

Description

Call Open to initiate the socket connection. Open sets the Active (see page 20054) property to true.

For client sockets, Open locates and connects to a server. For server sockets, Open opens the socket connection in a listening mode, but does not complete the connection to a client socket.

See Also

Active (see page 20054)

Close (see page 20078)

148.1.5.4.6 TCustomTcpServer.WaitForConnection Method

Listens for TCP connections.

Pascal

```
function WaitForConnection: Boolean;
```

C++

```
__fastcall Boolean WaitForConnection();
```

Description

Call WaitForConnection to listen for TCP connections on the port specified by the LocalPort (see page 20092) property. The thread will block until a connection request is received.

See Also

LocalPort (see page 20092)

Accept (see page 20077)

148.1.5.5 TCustomTcpServer Properties

The properties of the TCustomTcpServer class are listed here.

Public Properties

	Name	Description
	BlockMode (see page 20080)	Sets or returns the blocking mode of the socket.
R	Listening (see page 20080)	Sets the server application to listen for client requests.
	ServerSocketThread (see page 20080)	Specifies the TServerSocketThread (see page 20099) in use.

148.1.5.5.1 TCustomTcpServer.BlockMode Property

Sets or returns the blocking mode of the socket.

Pascal

```
property BlockMode: TServerSocketBlockMode;
```

C++

```
__property TServerSocketBlockMode BlockMode;
```

Description

Use BlockMode to set or return the blocking mode for the socket. By default, the socket is set to bmThreadBlocking.

The TServerSocketBlockMode (see page 20136) type defines the set of possible socket flags for the BlockMode property.

See Also

OnReceive (see page 20058)

OnSend (see page 20058)

TServerSocketBlockMode (see page 20136)

148.1.5.5.2 TCustomTcpServer.Listening Property

Sets the server application to listen for client requests.

Pascal

```
property Listening: Boolean;
```

C++

```
__property Boolean Listening;
```

Description

Listening sets the server application to listen for client requests.

148.1.5.5.3 TCustomTcpServer.ServerSocketThread Property

Specifies the TServerSocketThread (see page 20099) in use.

Pascal

```
property ServerSocketThread: TServerSocketThread;
```

C++

```
__property TServerSocketThread ServerSocketThread;
```

Description

ServerSocketThread is a reference to the server socket thread object.

See Also

TServerSocketThread (see page 20099)

Listening (see page 20080)

148.1.5.6 TCustomTcpServer Events

The events of the TCustomTcpServer class are listed here.

Public Events

	Name	Description
	OnAccept (see page 20081)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnGetThread (see page 20081)	A wrapper for the TServerSocketThread (see page 20099) event of the same name.
	OnListening (see page 20082)	Occurs when a server socket begins listening for connections.

148.1.5.6.1 TCustomTcpServer.OnAccept Event

Occurs on server sockets just after the connection to a client socket is accepted.

Pascal

```
property OnAccept: TSocketAcceptEvent;
```

C++

```
__property TSocketAcceptEvent OnAccept;
```

Description

Write an OnAccept event handler for a server socket to take specific action after the connection to a client socket has been accepted. This is the first point when information is available about the local port and IP address that is used in the server endpoint of the connection. The port number, and possibly the IP address, differs from those of the listening socket.

Server sockets open a socket connection for listening to establish a queue to hold client requests. After a request from the queue is accepted by the server socket, an OnAccept event occurs. After the server socket accepts the connection, the client socket completes the connection, and an OnConnect event occurs for the client socket.

See Also

Active

OnConnect (see page 20071)

OnListening

148.1.5.6.2 TCustomTcpServer.OnGetThread Event

A wrapper for the TServerSocketThread (see page 20099) event of the same name.

Pascal

```
property OnGetThread: TGetThreadEvent;
```

C++

```
__property TGetThreadEvent OnGetThread;
```

Description

This event is exactly the same as the OnGetThread event of the TServerSocketThread (see page 20099) object referenced in ServerSocketThread (see page 20080).

See Also

TServerSocketThread (see page 20099)

ServerSocketThread (see page 20063)

OnGetThread (see page 20105)

148.1.5.6.3 TCustomTcpServer.OnListening Event

Occurs when a server socket begins listening for connections.

Pascal

```
property OnListening: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnListening;
```

Description

Write an OnListening event to take specific action when a server begins listening for a connection.

See Also

Listening (see page 20080)

TNotifyEvent (see page 3298)

148.1.6 TIpSocket Class

Encapsulates the network support functions.

Class Hierarchy

Pascal

```
TIpSocket = class(TBaseSocket);
```

C++

```
class TIpSocket : public TBaseSocket;
```

File

Sockets

Description

TIpSocket encapsulates the network support functions, linking sockets to network protocols such as TCP/IP and UDP, as well as raw sockets and custom protocols.

Do not create instances of TIpSocket. Use TIpSocket as a base class when declaring non-visual components that can appear on

the component palette and be used in the form designer. Properties and methods of TIpSocket provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

See Also

TBaseSocket (see page 20042)

148.1.6.1 TIpSocket Members

The following tables list the members exposed by TIpSocket.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Bind (see page 20087)	This is Bind, a member of class TIpSocket.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoCreateHandle (see page 20047)	This is DoCreateHandle, a member of class TBaseSocket.
	DoDestroyHandle (see page 20047)	This is DoDestroyHandle, a member of class TBaseSocket.
	DoHandleError (see page 20048)	This is DoHandleError, a member of class TBaseSocket.
V	DoReceive (see page 20048)	This is DoReceive, a member of class TBaseSocket.
V	DoSend (see page 20048)	This is DoSend, a member of class TBaseSocket.
V	ErrorCheck (see page 20048)	This is ErrorCheck, a member of class TBaseSocket.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 20049)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBytesReceived (see page 20053)	This is SetBytesReceived, a member of class TBaseSocket.
	SetBytesSent (see page 20053)	This is SetBytesSent, a member of class TBaseSocket.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnCreateHandle (see page 20057)	Occurs when the handle to a socket becomes active.
	OnDestroyHandle (see page 20057)	Occurs when a socket is deactivated.
	OnError (see page 20058)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnReceive (see page 20058)	Occurs after a socket receives data, but before it passes the data to the application.
	OnSend (see page 20058)	Occurs just before a client socket writes information to the socket connection.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 20047)	Shuts down the socket connection.
	Create (see page 20086)	Creates an instance of TIpSocket (see page 20082).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20046)	Frees the memory associated with the TBaseSocket (see page 20042) object.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetSocketAddr (see page 20087)	Builds a valid network socket address.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LocalDomainName (see page 20088)	Returns the domain name for the local host.
	LocalHostAddr (see page 20088)	Returns the local IP address for the host machine.
	LocalHostName (see page 20088)	Returns the local host name.
	LookupHostAddr (see page 20089)	Looks up the host address based on the host name.
	LookupHostName (see page 20089)	Looks up the host name based on the IP address.
	LookupPort (see page 20089)	Returns the port number.
	LookupProtocol (see page 20090)	Returns the protocol number.
	MapDomain (see page 20049)	Maps the domain.
	MapSockType (see page 20050)	Maps the socket type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Open (see page 20050)	Creates the socket connection.
	PeekBuf (see page 20050)	Reads the buffer.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReceiveBuf (see page 20051)	Reads data buffers of to the socket.
	ReceiveFrom (see page 20090)	Receives a packet of information.
	ReceiveIn (see page 20051)	Reads delimited lines of data from the socket.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Select (see page 20051)	Tests for socket activity.
	SendBuf (see page 20052)	Writes data buffers of size bufsize from the socket.
	SendIn (see page 20052)	Writes delimited lines of data to the socket.
	SendStream (see page 20053)	Writes a stream of data to the socket.
	SendTo (see page 20091)	Sends a packet of information.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WaitForData (see page 20053)	Waits for the socket connection to be ready to transfer data.

Public Properties

	Name	Description
	Active (see page 20054)	Indicates whether the socket connection is open and available for communication with other machines.
	BlockMode (see page 20054)	Sets or returns the blocking mode of the socket.
R	BytesReceived (see page 20055)	Returns the number of bytes received by the socket.
R	BytesSent (see page 20055)	Returns the number of bytes sent from the socket.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Domain (see page 20091)	Sets or returns the protocol family used by the socket.
R	Handle (see page 20056)	Provides access to the unique-4 byte identifier that represents the instance of the socket object.
	LocalHost (see page 20092)	Specifies the name of the local system.
	LocalPort (see page 20092)	Specifies the ID number of the port used by the socket connection.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Protocol (see page 20056)	Sets or returns the protocol used by the socket.
	RemoteHost (see page 20093)	Specifies the name of the remote system.
	RemotePort (see page 20093)	Specifies the ID number of the port used by the RemoteHost (see page 20093) to form the socket connection.
	SockType (see page 20056)	Sets or returns the socket type.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

148.1.6.2 TIpSocket.Create Constructor

Creates an instance of TIpSocket (see page 20082).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TIpSocket(TComponent * AOwner);
```

Description

For C++, call Create indirectly, using the **new** keyword, to instantiate a TIpSocket (see page 20082) object.

See Also

Destroy

148.1.6.3 TIpSocket Methods

The methods of the TIpSocket class are listed here.

Protected Methods

	Name	Description
	Bind (see page 20087)	This is Bind, a member of class TIpSocket.

Public Methods

	Name	Description
	GetSocketAddr (see page 20087)	Builds a valid network socket address.
	LocalDomainName (see page 20088)	Returns the domain name for the local host.
	LocalHostAddr (see page 20088)	Returns the local IP address for the host machine.
	LocalHostName (see page 20088)	Returns the local host name.
	LookupHostAddr (see page 20089)	Looks up the host address based on the host name.
	LookupHostName (see page 20089)	Looks up the host name based on the IP address.
	LookupPort (see page 20089)	Returns the port number.
	LookupProtocol (see page 20090)	Returns the protocol number.
	ReceiveFrom (see page 20090)	Receives a packet of information.
	SendTo (see page 20091)	Sends a packet of information.

148.1.6.3.1 TIpSocket.Bind Method

Pascal

```
function Bind: Boolean;
```

C++

```
__fastcall Boolean Bind();
```

Description

This is Bind, a member of class TIpSocket.

148.1.6.3.2 TIpSocket.GetSocketAddr Method

Builds a valid network socket address.

Pascal

```
function GetSocketAddr(h: TSocketHost; p: TSocketPort): TSockAddr;
```

C++

```
__fastcall TSockAddr GetSocketAddr(TSocketHost h, TSocketPort p);
```

Description

Use GetSocketAddr to build a valid socket address based on the host name and port number. The **TSocketHost (see page 20142)** and **TSocketPort (see page 20142)** arguments are used to return a TSockAddr structure, which can then be passed to Connect or Bind (see page 20087).

See Also

Bind (see page 20087)

Connect (see page 20069)

LocalHostAddr (see page 20088)

LookupHostAddr (see page 20089)

RemoteHost (see page 20093)

RemotePort (see page 20093)

148.1.6.3.3 TIpSocket.LocalDomainName Method

Returns the domain name for the local host.

Pascal

```
function LocalDomainName: string;
```

C++

```
__fastcall AnsiString LocalDomainName();
```

Description

Use LocalDomainName name to return the domain name for the local host.

See Also

LocalHostAddr (see page 20088)

LocalHostName (see page 20088)

148.1.6.3.4 TIpSocket.LocalHostAddr Method

Returns the local IP address for the host machine.

Pascal

```
function LocalHostAddr: TSocketHost;
```

C++

```
__fastcall TSocketHost LocalHostAddr();
```

Description

Use LocalHostAddr to return the local IP address in string format.

See Also

LocalHost (see page 20092)

LocalDomainName (see page 20088)

LocalHostName (see page 20088)

148.1.6.3.5 TIpSocket.LocalHostName Method

Returns the local host name.

Pascal

```
function LocalHostName: TSocketHost;
```

C++

```
__fastcall TSocketHost LocalHostName();
```

Description

Use LocalHostName to return the host name for the local host. For example:

```
ShowMessage(TcpClient1.LocalHostName);
```

See Also

LocalHost (see page 20092)

LocalDomainName (see page 20088)

LocalHostAddr (see page 20088)

148.1.6.3.6 TIpSocket.LookupHostAddr Method

Looks up the host address based on the host name.

Pascal

```
function LookupHostAddr(const hn: string): TSocketHost;
```

C++

```
__fastcall TSocketHost LookupHostAddr(const AnsiString hn);
```

Description

Use LookupHostAddr to look up the host address based on the machine's host name. For example:

```
StrToInt(TcpClient1.LookupHostAddr("borland.com"));
```

See Also

RemoteHost (see page 20093)

LookupHostName (see page 20089)

LookupPort (see page 20089)

148.1.6.3.7 TIpSocket.LookupHostName Method

Looks up the host name based on the IP address.

Pascal

```
function LookupHostName(const ipaddr: string): TSocketHost;
```

C++

```
__fastcall TSocketHost LookupHostName(const AnsiString ipaddr);
```

Description

Use LookupHostName to look up the host name based on the machine's IP address. For example:

```
TcpClient1.LookupHostName("123.60.192.10");
```

See Also

RemoteHost (see page 20093)

LookupHostAddr (see page 20089)

LookupPort (see page 20089)

148.1.6.3.8 TIpSocket.LookupPort Method

Returns the port number.

Pascal

```
function LookupPort(const sn: string; pn: pchar = nil): word;
```

C++

```
__fastcall word LookupPort(const AnsiString sn, const char * pn = nil);
```

Description

Use LookupPort to return the port number of the IP socket. The port number is related to the service name and protocol number.

For more information, refer to the home page of the Internet Assigned Numbers Authority (www.iana.org), which maintains lists of port numbers and their associated protocols. Also, refer to the documentation for the application's target operating system for information on how port numbers are stored and changed in that OS.

See Also

RemotePort (see page 20093)

LookupProtocol (see page 20090)

148.1.6.3.9 TIpSocket.LookupProtocol Method

Returns the protocol number.

Pascal

```
function LookupProtocol(const pn: string): TSocketProtocol;
```

C++

```
__fastcall TSocketProtocol LookupProtocol(const AnsiString pn);
```

Description

Use LookupProtocol to return the protocol number being used by the IP socket. The protocol number is based on the protocol name.

For more information, refer to the home page of the Internet Assigned Numbers Authority (www.iana.org), which maintains lists of protocol numbers and their associated protocols.

See Also

RemotePort (see page 20093)

LookupPort (see page 20089)

148.1.6.3.10 TIpSocket.ReceiveFrom Method

Receives a packet of information.

Pascal

```
function ReceiveFrom(var buf; bufsize: Integer; ToAddr: TSockAddr; var len: Integer; flags:
Integer = 0): Integer;
```

C++

```
__fastcall int ReceiveFrom( buf, int bufsize, TSockAddr ToAddr, int len, int flags = 0);
```

Description

Use ReceiveFrom to receive a single packet of information. Note that information in the packet is not checked for length, completeness, and such, which occurs at a higher level.

See Also

SendTo (see page 20091)

OnReceive (see page 20058)

148.1.6.3.11 TIpSocket.SendTo Method

Sends a packet of information.

Pascal

```
function SendTo(var buf; bufsize: Integer; ToAddr: TSockAddr; flags: Integer = 0): Integer;
```

C++

```
__fastcall int SendTo( buf, int bufsize, TSockAddr ToAddr, int flags = 0);
```

Description

Use SendTo to send a single packet of information over the network. Note that information in the packet is not checked for length, completeness, and such, which occurs at a higher level.

See Also

ReceiveFrom (see page 20090)

OnSend (see page 20058)

148.1.6.4 TIpSocket Properties

The properties of the TIpSocket class are listed here.

Public Properties

	Name	Description
	Domain (see page 20091)	Sets or returns the protocol family used by the socket.
	LocalHost (see page 20092)	Specifies the name of the local system.
	LocalPort (see page 20092)	Specifies the ID number of the port used by the socket connection.
	RemoteHost (see page 20093)	Specifies the name of the remote system.
	RemotePort (see page 20093)	Specifies the ID number of the port used by the RemoteHost (see page 20093) to form the socket connection.

148.1.6.4.1 TIpSocket.Domain Property

Sets or returns the protocol family used by the socket.

Pascal

```
property Domain: TSocketDomain;
```

C++

```
__property TSocketDomain Domain;
```

Description

Use Domain to set or return the protocol family used by the socket. The TSocketDomain type defines the set of possible protocol family types for the Domain property. The default value of this property is pfUnspec.

See Also

MapDomain (see page 20049)

TSocketDomain (see page 20136)

148.1.6.4.2 TIpSocket.LocalHost Property

Specifies the name of the local system.

Pascal

```
property LocalHost: TSocketHost;
```

C++

```
__property TSocketHost LocalHost;
```

Description

Use LocalHost to get the name of the system that is running the application that uses the socket. LocalHost is a string containing the domain name and service of the local socket endpoint, such as http://www.wSite.Com.

Port numbers allow a single system, identified by the LocalHostAddr (see page 20088) function, to host multiple connections simultaneously. Each combination of LocalPort (see page 20092) and LocalHostAddr (see page 20088) can only be bound to a single socket connection.

LocalHost provides an alias for the local IP address given in the LocalHostAddr (see page 20088) function. Most Intranets provide host names for the IP addresses of systems on the net. For more information on defining a host name for a given system, contact your network administrator.

See Also

LocalPort (see page 20092)

RemoteHost (see page 20093)

LocalHostAddr (see page 20088)

LookupHostName (see page 20089)

LookupPort (see page 20089)

148.1.6.4.3 TIpSocket.LocalPort Property

Specifies the ID number of the port used by the socket connection.

Pascal

```
property LocalPort: TSocketPort;
```

C++

```
__property TSocketPort LocalPort;
```

Description

Use LocalPort to determine the port number that is bound to the socket connection. For server endpoints of listening connections, LocalPort is the ID associated with the service the server socket provides. For client or server endpoints of connections to another socket, LocalPort is usually an arbitrary value picked when the connection was made.

Many values of LocalPort are associated by convention with a particular service such as FTP or HTTP.

See Also

LocalHost (see page 20092)

RemotePort (see page 20093)

LookupPort (see page 20089)

148.1.6.4.4 TIpSocket.RemoteHost Property

Specifies the name of the remote system.

Pascal

```
property RemoteHost: TSocketHost;
```

C++

```
__property TSocketHost RemoteHost;
```

Description

Use RemoteHost to get the name of the system on the other end of the socket connection. RemoteHost is a string containing the domain name and service of the remote endpoint of the socket connection, such as http://www.wSite.Com.

See Also

RemotePort (see page 20093)

LocalHostAddr (see page 20088)

LocalHostName (see page 20088)

LookupHostAddr (see page 20089)

LookupHostName (see page 20089)

148.1.6.4.5 TIpSocket.RemotePort Property

Specifies the ID number of the port used by the RemoteHost (see page 20093) to form the socket connection.

Pascal

```
property RemotePort: TSocketPort;
```

C++

```
__property TSocketPort RemotePort;
```

Description

Use RemotePort to determine the port number used by the socket on the other end of the socket connection.

Port numbers allow a single system, identified by the RemoteHost (see page 20093) property, to host multiple connections simultaneously. Each combination of RemotePort and RemoteHost (see page 20093) can only be bound to a single socket connection.

Many port numbers are associated by convention with a particular service such as ftp or http. To determine whether the value of RemotePort is associated with a specific service, use the LookupProtocol (see page 20090) method.

Note: If a client socket requests a specific port to indicate a desired service, the value of RemotePort for the actual connection may differ from the requested port number. Most server sockets listen on the port associated with a service, but switch to an arbitrary available port number for forming connections.

See Also

RemoteHost (see page 20093)

LookupPort (see page 20089)

LookupProtocol (see page 20090)

148.1.7 TRawSocket Class

Encapsulates a raw socket.

Class Hierarchy

Pascal

```
TRawSocket = class(TIpSocket);
```

C++

```
class TRawSocket : public TIpSocket;
```

File

Sockets

Description

TRawSocket encapsulates a raw socket.

See Also

TBaseSocket (see page 20042)

148.1.7.1 TRawSocket Members

The following tables list the members exposed by TRawSocket.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Bind (see page 20087)	This is Bind, a member of class TIpSocket.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoCreateHandle (see page 20047)	This is DoCreateHandle, a member of class TBaseSocket.
	DoDestroyHandle (see page 20047)	This is DoDestroyHandle, a member of class TBaseSocket.
	DoHandleError (see page 20048)	This is DoHandleError, a member of class TBaseSocket.
V	DoReceive (see page 20048)	This is DoReceive, a member of class TBaseSocket.
V	DoSend (see page 20048)	This is DoSend, a member of class TBaseSocket.
V	ErrorCheck (see page 20048)	This is ErrorCheck, a member of class TBaseSocket.

	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 20049)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBytesReceived (see page 20053)	This is SetBytesReceived, a member of class TBaseSocket.
	SetBytesSent (see page 20053)	This is SetBytesSent, a member of class TBaseSocket.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnCreateHandle (see page 20057)	Occurs when the handle to a socket becomes active.
	OnDestroyHandle (see page 20057)	Occurs when a socket is deactivated.
	OnError (see page 20058)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnReceive (see page 20058)	Occurs after a socket receives data, but before it passes the data to the application.
	OnSend (see page 20058)	Occurs just before a client socket writes information to the socket connection.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.

	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 20047)	Shuts down the socket connection.
	Create (see page 20098)	Creates an instance of a TRawSocket (see page 20094) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20046)	Frees the memory associated with the TBaseSocket (see page 20042) object.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetSocketAddr (see page 20087)	Builds a valid network socket address.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LocalDomainName (see page 20088)	Returns the domain name for the local host.
	LocalHostAddr (see page 20088)	Returns the local IP address for the host machine.
	LocalHostName (see page 20088)	Returns the local host name.
	LookupHostAddr (see page 20089)	Looks up the host address based on the host name.
	LookupHostName (see page 20089)	Looks up the host name based on the IP address.
	LookupPort (see page 20089)	Returns the port number.
	LookupProtocol (see page 20090)	Returns the protocol number.
	MapDomain (see page 20049)	Maps the domain.
	MapSockType (see page 20050)	Maps the socket type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Open (see page 20050)	Creates the socket connection.
	PeekBuf (see page 20050)	Reads the buffer.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReceiveBuf (see page 20051)	Reads data buffers of to the socket.
	ReceiveFrom (see page 20090)	Receives a packet of information.
	ReceiveIn (see page 20051)	Reads delimited lines of data from the socket.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Select (see page 20051)	Tests for socket activity.
	SendBuf (see page 20052)	Writes data buffers of size bufsize from the socket.
	SendIn (see page 20052)	Writes delimited lines of data to the socket.
	SendStream (see page 20053)	Writes a stream of data to the socket.
	SendTo (see page 20091)	Sends a packet of information.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WaitForData (see page 20053)	Waits for the socket connection to be ready to transfer data.

Public Properties

	Name	Description
	Active (see page 20054)	Indicates whether the socket connection is open and available for communication with other machines.
	BlockMode (see page 20054)	Sets or returns the blocking mode of the socket.
R	BytesReceived (see page 20055)	Returns the number of bytes received by the socket.
R	BytesSent (see page 20055)	Returns the number of bytes sent from the socket.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Domain (see page 20055)	Sets or returns the protocol family used by the socket.
	Domain (see page 20091)	Sets or returns the protocol family used by the socket.
R	Handle (see page 20056)	Provides access to the unique-4 byte identifier that represents the instance of the socket object.
	LocalHost (see page 20092)	Specifies the name of the local system.
	LocalPort (see page 20092)	Specifies the ID number of the port used by the socket connection.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Protocol (see page 20056)	Sets or returns the protocol used by the socket.
	RemoteHost (see page 20093)	Specifies the name of the remote system.
	RemotePort (see page 20093)	Specifies the ID number of the port used by the RemoteHost (see page 20093) to form the socket connection.
	SockType (see page 20098)	Sets or returns the socket type.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

148.1.7.2 TRawSocket.Create Constructor

Creates an instance of a TRawSocket (see page 20094) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRawSocket(TComponent * AOwner);
```

Description

Call Create indirectly, using the **new** keyword, to instantiate a TRawSocket (see page 20094) object.

See Also

TRawSocket (see page 20094)

Destroy

148.1.7.3 TRawSocket Properties

The properties of the TRawSocket class are listed here.

Public Properties

	Name	Description
	SockType (see page 20098)	Sets or returns the socket type.

148.1.7.3.1 TRawSocket.SockType Property

Sets or returns the socket type.

Pascal

```
property SockType: TSocketType;
```

C++

```
__property TSocketType SockType;
```

Description

SockType sets or returns the type of socket connection.

The TSocketType (see page 20138) type defines the set of possible socket types for the SockType property.

See Also

TSocketType (see page 20138)

148.1.8 TServerSocketThread Class

Enables creation of separate threads of execution for the server socket in an application.

Class Hierarchy

Pascal

```
TServerSocketThread = class(TThread);
```

C++

```
class TServerSocketThread : public TThread;
```

File

Sockets

Description

Create (see page 20100) TServerSocketThread (or a descendant of the class) to represent an execution thread for the server socket in a multi-threaded application. Each new instance of a TServerSocketThread, a TThread descendant, is a new thread of execution. Using a separate TServerSocketThread allows the server socket to block without blocking the whole application.

See Also

Writing Multi-threaded Applications

TClientSocketThread (see page 20059)

TThread (see page 3108)

148.1.8.1 TServerSocketThread Members

The following tables list the members exposed by TServerSocketThread.

Protected Methods

	Name	Description
	AddClientSocketThread (see page 20101)	This is AddClientSocketThread, a member of class TServerSocketThread.
	CheckThreadError (see page 3114)	This is the overview for the CheckThreadError method overload.
V	CreateThread (see page 20102)	This is CreateThread, a member of class TServerSocketThread.
V	DoTerminate (see page 3115)	Generates an OnTerminate (see page 3148) event.
	FetchClientSocketThread (see page 20103)	This is FetchClientSocketThread, a member of class TServerSocketThread.
	RemoveClientSocketThread (see page 20103)	This is RemoveClientSocketThread, a member of class TServerSocketThread.

Protected Properties

	Name	Description
	ReturnValue (see page 3141)	Specifies the value returned to other waiting threads when the thread finishes executing.
R	Terminated (see page 3142)	Indicates whether the thread has been asked to terminate.

Public Events

	Name	Description
	OnGetThread (see page 20105)	Creates and initializes a client socket thread when a connection is requested.

	OnTerminate (see page 3148)	Occurs after the thread's Execute (see page 3115) method has returned and before the thread is destroyed.

Public Methods

	Name	Description
V	AfterConstruction (see page 3114)	Executes the thread when the thread is created with CreateSuspended set to false.
	ClearThreadPool (see page 20102)	Terminates all of the threads in the thread pool.
	Create (see page 20100)	Creates an instance of a TServerSocketThread (see page 20099) object.
V	Destroy (see page 20101)	Destroys the thread object and releases the memory allocated to it.
V	Execute (see page 20102)	Provides the code which executes when the thread is run.
	Queue (see page 3119)	This is the overview for the Queue method overload.
	RemoveQueuedEvents (see page 3120)	Remove queued method calls.
	Resume (see page 3120)	Restarts the execution of a suspended thread.
	StaticQueue (see page 3124)	Asynchronously executes a method call within the main thread.
	StaticSynchronize (see page 3125)	Executes a method call within the main thread.
	Suspend (see page 3125)	Pauses a running thread.
	Synchronize (see page 3126)	This is the overview for the Synchronize method overload.
	Terminate (see page 3126)	Signals the thread to terminate by setting the Terminated (see page 3142) property to true.
	WaitFor (see page 3132)	Waits for the thread to terminate and then returns the value of the ReturnValue (see page 3141) property.

Public Properties

	Name	Description
R	FatalException (see page 3133)	Determines whether the thread object is automatically destroyed when the thread terminates.
	FreeOnTerminate (see page 3134)	Determines whether the thread object is automatically destroyed when the thread terminates.
R	Handle (see page 3137)	Indicates the thread's handle (Windows only).
	Priority (see page 3138)	Determines the thread's scheduling priority relative to other threads in the process.
R	ServerSocket (see page 20103)	Specifies the TCustomTcpServer (see page 20072) object that manages all the TClientSocketThread (see page 20059) objects for its client connections.
	Suspended (see page 3142)	Indicates whether a thread is suspended.
	ThreadCacheSize (see page 20104)	Indicates the number of TServerSocketThread (see page 20099) objects cached for reuse by new connections to client sockets.
R	ThreadID (see page 3148)	Identifies the thread throughout the system.
R	ThreadPool (see page 20104)	A list of all the client socket threads created by the TServerSocketThread (see page 20099) object.

148.1.8.2 TServerSocketThread.Create Constructor

Creates an instance of a TServerSocketThread (see page 20099) object.

Pascal

```
constructor Create(AServerSocket: TCustomTcpServer);
```

C++

```
__fastcall TServerSocketThread(TCustomTcpServer AServerSocket);
```

Description

For C++, call Create indirectly, using the **new** keyword, to create a thread in an application.

See Also

Destroy (see page 20101)

Execute (see page 20102)

148.1.8.3 TServerSocketThread.Destroy Destructor

Destroys the thread object and releases the memory allocated to it.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TServerSocketThread();
```

Description

For C++, do not call Destroy in an application. Instead, use the **delete** keyword to destroy a thread when FreeOnTerminate is false.

Destroy signals the thread to terminate and then waits for the thread to return before calling the parent class's destructor.

See Also

delete

FreeOnTerminate (see page 3134)

Create (see page 20100)

148.1.8.4 TServerSocketThread Methods

The methods of the TServerSocketThread class are listed here.

Protected Methods

	Name	Description
	AddClientSocketThread (see page 20101)	This is AddClientSocketThread, a member of class TServerSocketThread.
V	CreateThread (see page 20102)	This is CreateThread, a member of class TServerSocketThread.
	FetchClientSocketThread (see page 20103)	This is FetchClientSocketThread, a member of class TServerSocketThread.
	RemoveClientSocketThread (see page 20103)	This is RemoveClientSocketThread, a member of class TServerSocketThread.

Public Methods

	Name	Description
	ClearThreadPool (see page 20102)	Terminates all of the threads in the thread pool.
V	Execute (see page 20102)	Provides the code which executes when the thread is run.

148.1.8.4.1 TServerSocketThread.AddClientSocketThread Method

Pascal

```
function AddClientSocketThread: TClientSocketThread;
```

C++

```
__fastcall TClientSocketThread AddClientSocketThread();
```

Description

This is AddClientSocketThread, a member of class TServerSocketThread.

148.1.8.4.2 TServerSocketThread.ClearThreadPool Method

Terminates all of the threads in the thread pool.

Pascal

```
procedure ClearThreadPool;
```

C++

```
__fastcall ClearThreadPool();
```

Description

The thread pool is a list of client socket threads that are available to handle connection requests. This list is kept to allow reuse of old threads and improve performance. It is sometimes useful to destroy all of the thread object instances in this list.

Use ClearThreadPool to terminate all of the threads in the thread pool list. Any suspended thread in the pool is resumed so that termination can proceed.

See Also

ThreadPool (see page 20104)

Terminate (see page 3126)

148.1.8.4.3 TServerSocketThread.CreateThread Method

Pascal

```
function CreateThread: TClientSocketThread; virtual;
```

C++

```
virtual __fastcall TClientSocketThread CreateThread();
```

Description

This is CreateThread, a member of class TServerSocketThread.

148.1.8.4.4 TServerSocketThread.Execute Method

Provides the code which executes when the thread is run.

Pascal

```
procedure Execute; override;
```

C++

```
virtual __fastcall Execute();
```

Description

Use Execute to execute the code that should be executed when the thread runs. Execute is responsible for checking the value of the Terminated property to determine if the thread needs to exit.

Note: Do not use the properties and methods of other objects directly in the Execute method of a thread. Instead, separate the use of other objects into a separate procedure call, and call that procedure by passing it as a parameter to the Synchronize method.

See Also

Terminated (see page 3142)

Synchronize (see page 3126)

Create (see page 20100)

148.1.8.4.5 TServerSocketThread.FetchClientSocketThread Method

Pascal

```
function FetchClientSocketThread: TClientSocketThread;
```

C++

```
__fastcall TClientSocketThread FetchClientSocketThread();
```

Description

This is FetchClientSocketThread, a member of class TServerSocketThread.

148.1.8.4.6 TServerSocketThread.RemoveClientSocketThread Method

Pascal

```
procedure RemoveClientSocketThread(ClientSocketThread: TClientSocketThread);
```

C++

```
__fastcall RemoveClientSocketThread(TClientSocketThread ClientSocketThread);
```

Description

This is RemoveClientSocketThread, a member of class TServerSocketThread.

148.1.8.5 TServerSocketThread Properties

The properties of the TServerSocketThread class are listed here.

Public Properties

	Name	Description
R	ServerSocket (see page 20103)	Specifies the TCustomTcpServer (see page 20072) object that manages all the TClientSocketThread (see page 20059) objects for its client connections.
	ThreadCacheSize (see page 20104)	Indicates the number of TServerSocketThread (see page 20099) objects cached for reuse by new connections to client sockets.
R	ThreadPool (see page 20104)	A list of all the client socket threads created by the TServerSocketThread (see page 20099) object.

148.1.8.5.1 TServerSocketThread.ServerSocket Property

Specifies the TCustomTcpServer (see page 20072) object that manages all the TClientSocketThread (see page 20059) objects for its client connections.

Pascal

```
property ServerSocket: TCustomTcpServer;
```

C++

```
__property TCustomTcpServer ServerSocket;
```

Description

Use ServerSocket to get direct access to the listening socket object that spawned the thread for a client connection it accepted. TServerSocketThread (see page 20099) passes events and errors to the appropriate event handlers assigned to

ServerSocket. TServerSocketThread (see page 20099) adds itself to the cache of threads maintained by ServerSocket from its constructor, and removes itself when the thread terminates.

See Also

TClientSocketThread (see page 20059)

TServerSocketThread (see page 20099)

148.1.8.5.2 TServerSocketThread.ThreadCacheSize Property

Indicates the number of TServerSocketThread (see page 20099) objects cached for reuse by new connections to client sockets.

Pascal

```
property ThreadCacheSize: Integer;
```

C++

```
__property int ThreadCacheSize;
```

Description

Set ThreadCacheSize to specify the number of threads that are cached for reuse. The ideal value for ThreadCacheSize depends on the number and frequency of client socket requests received by the server socket. If ThreadCacheSize is too low, the server socket will spend more time freeing and creating threads when client connections are accepted. If ThreadCacheSize is too high, the server socket may unnecessarily lock up the memory for threads that are never reused.

148.1.8.5.3 TServerSocketThread.ThreadPool Property

A list of all the client socket threads created by the TServerSocketThread (see page 20099) object.

Pascal

```
property ThreadPool: TList;
```

C++

```
__property TList ThreadPool;
```

Description

TServerSocketThread (see page 20099) objects listen for requests on the network and delegate them to client socket threads. Each client socket thread is added to the list ThreadPool after it is created. Creating and destroying client socket threads can be quite time consuming, so whenever one completes its work on a given connection it becomes dormant. When a new connection request is received, the ThreadPool is checked for dormant client socket threads. If one is available, it is assigned the connection. If not, a new client socket thread created. By reusing previously-created threads, the application's performance is improved.

See Also

TClientSocketThread (see page 20059)

ClearThreadPool (see page 20102)

148.1.8.6 TServerSocketThread Events

The events of the TServerSocketThread class are listed here.

Public Events

	Name	Description
	OnGetThread (see page 20105)	Creates and initializes a client socket thread when a connection is requested.

148.1.8.6.1 TServerSocketThread.OnGetThread Event

Creates and initializes a client socket thread when a connection is requested.

Pascal

```
property OnGetThread: TGetThreadEvent;
```

C++

```
__property TGetThreadEvent OnGetThread;
```

Description

An OnGetThread event occurs when a connection is requested. The event handler creates an instance of TClientSocketThread (see page 20059) and initializes it. Write an event handler on TCustomTcpServer (see page 20072) to create and initialize instances of your own client socket thread class.

See Also

TClientSocketThread (see page 20059)

TCustomTcpServer (see page 20072)

148.1.9 TTcpClient Class

TCP client component.

Class Hierarchy

Pascal

```
TTcpClient = class(TCustomIpClient);
```

C++

```
class TTcpClient : public TCustomIpClient;
```

File

Sockets

Description

Use TTcpClient to create TCP client applications.

TTcpClient publishes properties and events from its ancestor socket components.

See Also

TCustomIpClient (see page 20063)

TTcpServer (see page 20115)

148.1.9.1 TTcpClient Members

The following tables list the members exposed by TTcpClient.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Bind (see page 20087)	This is Bind, a member of class TIpSocket.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 20069)	This is DoConnect, a member of class TCustomIpClient.
	DoCreateHandle (see page 20047)	This is DoCreateHandle, a member of class TBaseSocket.
	DoDestroyHandle (see page 20047)	This is DoDestroyHandle, a member of class TBaseSocket.
V	DoDisconnect (see page 20070)	This is DoDisconnect, a member of class TCustomIpClient.
	DoHandleError (see page 20048)	This is DoHandleError, a member of class TBaseSocket.
V	DoReceive (see page 20048)	This is DoReceive, a member of class TBaseSocket.
V	DoSend (see page 20048)	This is DoSend, a member of class TBaseSocket.
V	ErrorCheck (see page 20048)	This is ErrorCheck, a member of class TBaseSocket.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 20049)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBytesReceived (see page 20053)	This is SetBytesReceived, a member of class TBaseSocket.
	SetBytesSent (see page 20053)	This is SetBytesSent, a member of class TBaseSocket.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property

	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Close (see page 20047)	Shuts down the socket connection.
	Close (see page 20068)	Shuts down the socket connection.
	Connect (see page 20069)	Connects the local socket to the remote socket.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20046)	Creates an instance of TBaseSocket (see page 20042).
	Create (see page 20068)	Creates an instance of TCustomIpClient (see page 20063).
	Create (see page 20086)	Creates an instance of TIpSocket (see page 20082).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20046)	Frees the memory associated with the TBaseSocket (see page 20042) object.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Disconnect (see page 20069)	Disconnects the local socket from the remote socket.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetSocketAddr (see page 20087)	Builds a valid network socket address.
	GetThreadObject (see page 20070)	Returns a reference to the TThread object for the currently executing thread.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LocalDomainName (see page 20088)	Returns the domain name for the local host.
	LocalHostAddr (see page 20088)	Returns the local IP address for the host machine.
	LocalHostName (see page 20088)	Returns the local host name.
	LookupHostAddr (see page 20089)	Looks up the host address based on the host name.
	LookupHostName (see page 20089)	Looks up the host name based on the IP address.
	LookupPort (see page 20089)	Returns the port number.
	LookupProtocol (see page 20090)	Returns the protocol number.
	MapDomain (see page 20049)	Maps the domain.
	MapSockType (see page 20050)	Maps the socket type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Open (see page 20050)	Creates the socket connection.
V	Open (see page 20070)	Creates the socket connection.
	PeekBuf (see page 20050)	Reads the buffer.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReceiveBuf (see page 20051)	Reads data buffers of to the socket.
	ReceiveFrom (see page 20090)	Receives a packet of information.
	ReceiveIn (see page 20051)	Reads delimited lines of data from the socket.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Select (see page 20051)	Tests for socket activity.
	SendBuf (see page 20052)	Writes data buffers of size bufsize from the socket.
	SendIn (see page 20052)	Writes delimited lines of data to the socket.
	SendStream (see page 20053)	Writes a stream of data to the socket.
	SendTo (see page 20091)	Sends a packet of information.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WaitForData (see page 20053)	Waits for the socket connection to be ready to transfer data.

Public Properties

	Name	Description
R	BytesReceived (see page 20055)	Returns the number of bytes received by the socket.
R	BytesSent (see page 20055)	Returns the number of bytes sent from the socket.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Domain (see page 20055)	Sets or returns the protocol family used by the socket.
	Domain (see page 20091)	Sets or returns the protocol family used by the socket.
R	Handle (see page 20056)	Provides access to the unique-4 byte identifier that represents the instance of the socket object.
	LocalHost (see page 20092)	Specifies the name of the local system.
	LocalPort (see page 20092)	Specifies the ID number of the port used by the socket connection.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Protocol (see page 20056)	Sets or returns the protocol used by the socket.
	SockType (see page 20056)	Sets or returns the socket type.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnConnect (see page 20112)	Occurs on client sockets just after the connection to the server is opened.
	OnCreateHandle (see page 20113)	Occurs when the handle to a socket becomes active.
	OnDestroyHandle (see page 20113)	Occurs when a socket is deactivated.
	OnDisconnect (see page 20113)	Occurs on client sockets just after the connection to the server is closed.
	OnError (see page 20114)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnReceive (see page 20114)	Occurs after a socket receives data, but before it passes the data to the application.
	OnSend (see page 20114)	Occurs just before a client socket writes information to the socket connection.

Published Properties

	Name	Description
	Active (see page 20110)	Indicates whether the socket connection is open and available for communication with other machines.
	BlockMode (see page 20110)	Sets or returns the blocking mode of the socket.
	Connected (see page 20111)	Indicates whether the socket connection is open and available for communication with other machines.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RemoteHost (see page 20111)	Specifies the name of the remote system.
	RemotePort (see page 20111)	Specifies the ID number of the port used by the RemoteHost to form the socket connection.
	Tag (see page 2808)	Stores an integer value as part of a component.

148.1.9.2 TTcpClient Properties

The properties of the TTcpClient class are listed here.

Published Properties

	Name	Description
	Active (see page 20110)	Indicates whether the socket connection is open and available for communication with other machines.
	BlockMode (see page 20110)	Sets or returns the blocking mode of the socket.
	Connected (see page 20111)	Indicates whether the socket connection is open and available for communication with other machines.
	RemoteHost (see page 20111)	Specifies the name of the remote system.
	RemotePort (see page 20111)	Specifies the ID number of the port used by the RemoteHost to form the socket connection.

148.1.9.2.1 TTcpClient.Active Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before attempting to use or change the socket connection, read Active to determine whether the connection is open and ready. For client sockets, setting Active opens or shuts down a socket connection to another machine. For server sockets, setting Active opens or shuts down a listening connection that makes the socket available for client requests.

At design time, set Active to **true** to make the socket open a connection when the application starts running (the default value is false). At runtime, use the Open or Close method to open or close the connection.

See Also

Close (see page 20047)

Open (see page 20050)

148.1.9.2.2 TTcpClient.BlockMode Property

Sets or returns the blocking mode of the socket.

Pascal

```
property BlockMode: TSocketBlockMode;
```

C++

```
__property TSocketBlockMode BlockMode;
```

Description

Use BlockMode to set or return the blocking mode for the socket. By default, the socket is set to bmBlocking.

The TSocketBlockMode type defines the set of possible socket flags for the BlockMode property.

See Also

TSocketBlockMode (see page 20141)

OnReceive (see page 20058)

OnSend (see page 20058)

148.1.9.2.3 TTcpClient.Connected Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Read Connected before trying to use or change the socket connection. Connected indicates whether the socket connection has been established. When Connected is **true**, the socket is open and available for use. When Connected is **false**, the socket is closed and can be changed.

To open a socket, use the Open method. To close a socket, use the Closemethod.

See Also

Close (see page 20068)

Open (see page 20070)

OnConnect (see page 20071)

148.1.9.2.4 TTcpClient.RemoteHost Property

Specifies the name of the remote system.

Pascal

```
property RemoteHost: TSocketHost;
```

C++

```
__property TSocketHost RemoteHost;
```

Description

Use RemoteHost to get the name of the system on the other end of the socket connection. RemoteHost is a string containing the domain name and service of the remote endpoint of the socket connection, such as http://www.wSite.Com.

See Also

RemotePort (see page 20093)

LocalHostAddr (see page 20088)

LocalHostName (see page 20088)

LookupHostAddr (see page 20089)

LookupHostName (see page 20089)

148.1.9.2.5 TTcpClient.RemotePort Property

Specifies the ID number of the port used by the RemoteHost to form the socket connection.

Pascal

```
property RemotePort: TSocketPort;
```

C++

```
__property TSocketPort RemotePort;
```

Description

Use RemotePort to determine the port number used by the socket on the other end of the socket connection.

Port numbers allow a single system, identified by the RemoteHost property, to host multiple connections simultaneously. Each combination of RemotePort and RemoteHost can only be bound to a single socket connection.

Many port numbers are associated by convention with a particular service such as ftp or http. To determine whether the value of RemotePort is associated with a specific service, use the LookupProtocol method.

Note: If a client socket requests a specific port to indicate a desired service, the value of RemotePort for the actual connection may differ from the requested port number. Most server sockets listen on the port associated with a service, but switch to an arbitrary available port number for forming connections.

See Also

RemoteHost (see page 20093)

LookupPort (see page 20089)

LookupProtocol (see page 20090)

148.1.9.3 TTcpClient Events

The events of the TTcpClient class are listed here.

Published Events

	Name	Description
	OnConnect (see page 20112)	Occurs on client sockets just after the connection to the server is opened.
	OnCreateHandle (see page 20113)	Occurs when the handle to a socket becomes active.
	OnDestroyHandle (see page 20113)	Occurs when a socket is deactivated.
	OnDisconnect (see page 20113)	Occurs on client sockets just after the connection to the server is closed.
	OnError (see page 20114)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnReceive (see page 20114)	Occurs after a socket receives data, but before it passes the data to the application.
	OnSend (see page 20114)	Occurs just before a client socket writes information to the socket connection.

148.1.9.3.1 TTcpClient.OnConnect Event

Occurs on client sockets just after the connection to the server is opened.

Pascal

```
property OnConnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnConnect;
```

Description

Write an OnConnect event handler for a client socket to take specific action after the connection to a server socket has been established. Depending on the service, this may be the point when the socket should start reading or writing over the connection.

See Also

Connected (see page 20071)

OnDisconnect (see page 20072)

148.1.9.3.2 TTcpClient.OnCreateHandle Event

Occurs when the handle to a socket becomes active.

Pascal

```
property OnCreateHandle: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnCreateHandle;
```

Description

Write an OnCreateHandle event handler to take specific action when the handle to a socket becomes active.

See Also

Active (see page 20054)

Handle (see page 20056)

148.1.9.3.3 TTcpClient.OnDestroyHandle Event

Occurs when a socket is deactivated.

Pascal

```
property OnDestroyHandle: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnDestroyHandle;
```

Description

Write an OnDestroyHandle event handler to take specific action when the socket is deactivated.

148.1.9.3.4 TTcpClient.OnDisconnect Event

Occurs on client sockets just after the connection to the server is closed.

Pascal

```
property OnDisconnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnDisconnect;
```

Description

Write an OnDisconnect event handler for a client socket to take specific action just after the connection to a server socket is terminated.

See Also

Connected (see page 20071)

OnConnect (see page 20071)

148.1.9.3.5 TTcpClient.OnError Event

Occurs when the socket fails in making, using, or shutting down a connection.

Pascal

```
property OnError: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnError;
```

Description

Write an OnError event handler to respond to errors that arise with the socket connection. Set the **ErrorCode** parameter to 0 if the OnError event handler successfully deals with the error condition, to prevent an ESocketError exception from being raised.

See Also

ESocketError (see page 20041)

148.1.9.3.6 TTcpClient.OnReceive Event

Occurs after a socket receives data, but before it passes the data to the application.

Pascal

```
property OnReceive: TSocketDataEvent;
```

C++

```
__property TSocketDataEvent OnReceive;
```

Description

Write an OnReceive event handler to read from the socket connection. Use the OnReceive event to filter data before passing it back to the client application. If the socket is a blocking socket, use a TWinSocketStream object to read from the connection. Otherwise, use the methods of the **Socket** parameter to perform the actual reading.

See Also

TWinSocketStream (see page 18876)

BytesReceived (see page 20055)

ReceiveBuf (see page 20051)

ReceiveIn (see page 20051)

148.1.9.3.7 TTcpClient.OnSend Event

Occurs just before a client socket writes information to the socket connection.

Pascal

```
property OnSend: TSocketDataEvent;
```

C++

```
__property TSocketDataEvent OnSend;
```

Description

Write an OnSend event handler to perform actions just prior to sending data. Use OnSend to monitor the data stream and change it (for example, by removing linefeeds). If the socket is a blocking socket, use a TWinSocketStream object to write to the

connection. Otherwise, use the methods of the **Socket** parameter to perform the actual writing.

See Also

TWinSocketStream (see page 18876)

SendBuf (see page 20052)

SendLn (see page 20052)

148.1.10 TTcpServer Class

TTcpServer is the TCP server component.

Class Hierarchy

Pascal

```
TTcpServer = class(TCustomTcpServer);
```

C++

```
class TTcpServer : public TCustomTcpServer;
```

File

Sockets

Description

Use TTcpServer to create TCP server applications.

TTcpServer publishes properties and events from its ancestor socket components.

See Also

TCustomTcpServer

TTcpClient

148.1.10.1 TTcpServer Members

The following tables list the members exposed by TTcpServer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Bind (see page 20087)	This is Bind, a member of class TIpSocket.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20078)	This is DoAccept, a member of class TCustomTcpServer.
	DoCreateHandle (see page 20047)	This is DoCreateHandle, a member of class TBaseSocket.
	DoDestroyHandle (see page 20047)	This is DoDestroyHandle, a member of class TBaseSocket.
	DoHandleError (see page 20048)	This is DoHandleError, a member of class TBaseSocket.
V	DoReceive (see page 20048)	This is DoReceive, a member of class TBaseSocket.
V	DoSend (see page 20048)	This is DoSend, a member of class TBaseSocket.
V	ErrorCheck (see page 20048)	This is ErrorCheck, a member of class TBaseSocket.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Listen (see page 20079)	This is Listen, a member of class TCustomTcpServer.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 20049)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBytesReceived (see page 20053)	This is SetBytesReceived, a member of class TBaseSocket.
	SetBytesSent (see page 20053)	This is SetBytesSent, a member of class TBaseSocket.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnError (see page 20058)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnReceive (see page 20058)	Occurs after a socket receives data, but before it passes the data to the application.
	OnSend (see page 20058)	Occurs just before a client socket writes information to the socket connection.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Accept (see page 20077)	This is the overview for the Accept method overload.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Close (see page 20047)	Shuts down the socket connection.
V	Close (see page 20078)	Shuts down the socket connection.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 20046)	Creates an instance of TBaseSocket (see page 20042).
V	Create (see page 20076)	Creates an instance of TCustomTcpServer (see page 20072).
V	Create (see page 20086)	Creates an instance of TIpSocket (see page 20082).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20046)	Frees the memory associated with the TBaseSocket (see page 20042) object.
V	Destroy (see page 20077)	Frees the memory associated with the TCustomTcpServer (see page 20072) object.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetSocketAddr (see page 20087)	Builds a valid network socket address.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LocalDomainName (see page 20088)	Returns the domain name for the local host.
	LocalHostAddr (see page 20088)	Returns the local IP address for the host machine.
	LocalHostName (see page 20088)	Returns the local host name.
	LookupHostAddr (see page 20089)	Looks up the host address based on the host name.
	LookupHostName (see page 20089)	Looks up the host name based on the IP address.
	LookupPort (see page 20089)	Returns the port number.
	LookupProtocol (see page 20090)	Returns the protocol number.
	MapDomain (see page 20049)	Maps the domain.
	MapSockType (see page 20050)	Maps the socket type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Open (see page 20050)	Creates the socket connection.
V	Open (see page 20079)	Opens the socket connection.
	PeekBuf (see page 20050)	Reads the buffer.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReceiveBuf (see page 20051)	Reads data buffers of to the socket.
	ReceiveFrom (see page 20090)	Receives a packet of information.
	ReceiveIn (see page 20051)	Reads delimited lines of data from the socket.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Select (see page 20051)	Tests for socket activity.
	SendBuf (see page 20052)	Writes data buffers of size bufsize from the socket.
	SendIn (see page 20052)	Writes delimited lines of data to the socket.
	SendStream (see page 20053)	Writes a stream of data to the socket.
	SendTo (see page 20091)	Sends a packet of information.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WaitForConnection (see page 20079)	Listens for TCP connections.
	WaitForData (see page 20053)	Waits for the socket connection to be ready to transfer data.

Public Properties

	Name	Description
R	BytesReceived (see page 20055)	Returns the number of bytes received by the socket.
R	BytesSent (see page 20055)	Returns the number of bytes sent from the socket.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.

R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Domain (see page 20055)	Sets or returns the protocol family used by the socket.
	Domain (see page 20091)	Sets or returns the protocol family used by the socket.
R	Handle (see page 20056)	Provides access to the unique-4 byte identifier that represents the instance of the socket object.
R	Listening (see page 20080)	Sets the server application to listen for client requests.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Protocol (see page 20056)	Sets or returns the protocol used by the socket.
	RemoteHost (see page 20093)	Specifies the name of the remote system.
	RemotePort (see page 20093)	Specifies the ID number of the port used by the RemoteHost (see page 20093) to form the socket connection.
	ServerSocketThread (see page 20080)	Specifies the TServerSocketThread (see page 20099) in use.
	SockType (see page 20056)	Sets or returns the socket type.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnAccept (see page 20122)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnCreateHandle (see page 20122)	Occurs when the handle to a socket becomes active.
	OnDestroyHandle (see page 20122)	Occurs when a socket is deactivated.
	OnGetThread (see page 20123)	A wrapper for the TServerSocketThread event of the same name.
	OnListening (see page 20123)	Occurs when a server socket begins listening for connections.

Published Properties

	Name	Description
	Active (see page 20120)	Indicates whether the socket connection is open and available for communication with other machines.
	BlockMode (see page 20120)	Sets or returns the blocking mode of the socket.
	LocalHost (see page 20120)	Specifies the name of the local system.
	LocalPort (see page 20121)	Specifies the ID number of the port used by the socket connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

148.1.10.2 TTcpServer Properties

The properties of the TTcpServer class are listed here.

Published Properties

	Name	Description
	Active (see page 20120)	Indicates whether the socket connection is open and available for communication with other machines.
	BlockMode (see page 20120)	Sets or returns the blocking mode of the socket.
	LocalHost (see page 20120)	Specifies the name of the local system.
	LocalPort (see page 20121)	Specifies the ID number of the port used by the socket connection.

148.1.10.2.1 TTcpServer.Active Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before attempting to use or change the socket connection, read Active to determine whether the connection is open and ready. For client sockets, setting Active opens or shuts down a socket connection to another machine. For server sockets, setting Active opens or shuts down a listening connection that makes the socket available for client requests.

At design time, set Active to **true** to make the socket open a connection when the application starts running (the default value is false). At runtime, use the Open or Close method to open or close the connection.

See Also

Close (see page 20047)

Open (see page 20050)

148.1.10.2.2 TTcpServer.BlockMode Property

Sets or returns the blocking mode of the socket.

Pascal

```
property BlockMode: TSocketBlockMode;
```

C++

```
__property TServerSocketBlockMode BlockMode;__property TSocketBlockMode BlockMode;
```

Description

Use BlockMode to set or return the blocking mode for the socket. By default, the socket is set to bmThreadBlocking.

The TServerSocketBlockMode type defines the set of possible socket flags for the BlockMode property.

See Also

OnReceive (see page 20058)

OnSend (see page 20058)

TServerSocketBlockMode (see page 20136)

148.1.10.2.3 TTcpServer.LocalHost Property

Specifies the name of the local system.

Pascal

```
property LocalHost: TSocketHost;
```

C++

```
__property TSocketHost LocalHost;
```

Description

Use LocalHost to get the name of the system that is running the application that uses the socket. LocalHost is a string containing the domain name and service of the local socket endpoint, such as http://www.wSite.Com.

Port numbers allow a single system, identified by the LocalHostAddr function, to host multiple connections simultaneously. Each combination of LocalPort and LocalHostAddr can only be bound to a single socket connection.

LocalHost provides an alias for the local IP address given in the LocalHostAddr function. Most Intranets provide host names for the IP addresses of systems on the net. For more information on defining a host name for a given system, contact your network administrator.

See Also

LocalPort (see page 20092)

RemoteHost (see page 20093)

LocalHostAddr (see page 20088)

LookupHostName (see page 20089)

LookupPort (see page 20089)

148.1.10.2.4 TTcpServer.LocalPort Property

Specifies the ID number of the port used by the socket connection.

Pascal

```
property LocalPort: TSocketPort;
```

C++

```
__property TSocketPort LocalPort;
```

Description

Use LocalPort to determine the port number that is bound to the socket connection. For server endpoints of listening connections, LocalPort is the ID associated with the service the server socket provides. For client or server endpoints of connections to another socket, LocalPort is usually an arbitrary value picked when the connection was made.

Many values of LocalPort are associated by convention with a particular service such as FTP or HTTP.

See Also

LocalHost (see page 20092)

RemotePort (see page 20093)

LookupPort (see page 20089)

148.1.10.3 TTcpServer Events

The events of the TTcpServer class are listed here.

Published Events

	Name	Description
	OnAccept (see page 20122)	Occurs on server sockets just after the connection to a client socket is accepted.
	OnCreateHandle (see page 20122)	Occurs when the handle to a socket becomes active.
	OnDestroyHandle (see page 20122)	Occurs when a socket is deactivated.

	OnGetThread (see page 20123)	A wrapper for the TServerSocketThread event of the same name.
	OnListening (see page 20123)	Occurs when a server socket begins listening for connections.

148.1.10.3.1 TTcpServer.OnAccept Event

Occurs on server sockets just after the connection to a client socket is accepted.

Pascal

```
property OnAccept: TSocketAcceptEvent;
```

C++

```
__property TSocketAcceptEvent OnAccept;
```

Description

Write an OnAccept event handler for a server socket to take specific action after the connection to a client socket has been accepted. This is the first point when information is available about the local port and IP address that is used in the server endpoint of the connection. The port number, and possibly the IP address, differs from those of the listening socket.

Server sockets open a socket connection for listening to establish a queue to hold client requests. After a request from the queue is accepted by the server socket, an OnAccept event occurs. After the server socket accepts the connection, the client socket completes the connection, and an OnConnect event occurs for the client socket.

See Also

Active

OnConnect (see page 20071)

OnListening

148.1.10.3.2 TTcpServer.OnCreateHandle Event

Occurs when the handle to a socket becomes active.

Pascal

```
property OnCreateHandle: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnCreateHandle;
```

Description

Write an OnCreateHandle event handler to take specific action when the handle to a socket becomes active.

See Also

Active (see page 20054)

Handle (see page 20056)

148.1.10.3.3 TTcpServer.OnDestroyHandle Event

Occurs when a socket is deactivated.

Pascal

```
property OnDestroyHandle: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnDestroyHandle;
```

Description

Write an OnDestroyHandle event handler to take specific action when the socket is deactivated.

148.1.10.3.4 TTcpServer.OnGetThread Event

A wrapper for the TServerSocketThread event of the same name.

Pascal

```
property OnGetThread: TGetThreadEvent;
```

C++

```
__property TGetThreadEvent OnGetThread;
```

Description

This event is exactly the same as the OnGetThread event of the TServerSocketThread object referenced in ServerSocketThread.

See Also

TServerSocketThread (see page 20099)

ServerSocketThread (see page 20063)

OnGetThread (see page 20105)

148.1.10.3.5 TTcpServer.OnListening Event

Occurs when a server socket begins listening for connections.

Pascal

```
property OnListening: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnListening;
```

Description

Write an OnListening event to take specific action when a server begins listening for a connection.

See Also

Listening (see page 20080)

TNotifyEvent (see page 3298)

148.1.11 TUdpSocket Class

UDP component.

Class Hierarchy

Pascal

```
TUdpSocket = class(TCustomIpClient);
```

C++

```
class TUdpSocket : public TCustomIpClient;
```

File

Sockets

Description

Use TUdpSocket to create UDP-based applications. Add a TUdpSocket object to a form or data module to turn an application into a UDP/IP client and server. TUdpSocket specifies a desired connection to a UDP/IP server, manages the connection when it is open, and terminates the connection when the application is through. It also listens for requests for UDP/IP connections from other machines and establishes connections when requests are received.

148.1.11.1 TUdpSocket Members

The following tables list the members exposed by TUdpSocket.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Bind (see page 20087)	This is Bind, a member of class TIpSocket.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 20069)	This is DoConnect, a member of class TCustomIpClient.
	DoCreateHandle (see page 20047)	This is DoCreateHandle, a member of class TBaseSocket.
	DoDestroyHandle (see page 20047)	This is DoDestroyHandle, a member of class TBaseSocket.
V	DoDisconnect (see page 20070)	This is DoDisconnect, a member of class TCustomIpClient.
	DoHandleError (see page 20048)	This is DoHandleError, a member of class TBaseSocket.
V	DoReceive (see page 20048)	This is DoReceive, a member of class TBaseSocket.
V	DoSend (see page 20048)	This is DoSend, a member of class TBaseSocket.
V	ErrorCheck (see page 20048)	This is ErrorCheck, a member of class TBaseSocket.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 20049)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBytesReceived (see page 20053)	This is SetBytesReceived, a member of class TBaseSocket.
	SetBytesSent (see page 20053)	This is SetBytesSent, a member of class TBaseSocket.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Close (see page 20047)	Shuts down the socket connection.
V	Close (see page 20068)	Shuts down the socket connection.
	Connect (see page 20069)	Connects the local socket to the remote socket.
V	Create (see page 20128)	Creates an instance of TUdpSocket (see page 20123).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20046)	Frees the memory associated with the TBaseSocket (see page 20042) object.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Disconnect (see page 20069)	Disconnects the local socket from the remote socket.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetSocketAddr (see page 20087)	Builds a valid network socket address.
	GetThreadObject (see page 20070)	Returns a reference to the TThread object for the currently executing thread.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LocalDomainName (see page 20088)	Returns the domain name for the local host.
	LocalHostAddr (see page 20088)	Returns the local IP address for the host machine.
	LocalHostName (see page 20088)	Returns the local host name.
	LookupHostAddr (see page 20089)	Looks up the host address based on the host name.
	LookupHostName (see page 20089)	Looks up the host name based on the IP address.
	LookupPort (see page 20089)	Returns the port number.
	LookupProtocol (see page 20090)	Returns the protocol number.
	MapDomain (see page 20049)	Maps the domain.
	MapSockType (see page 20050)	Maps the socket type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Open (see page 20050)	Creates the socket connection.
V	Open (see page 20070)	Creates the socket connection.
	PeekBuf (see page 20050)	Reads the buffer.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReceiveBuf (see page 20051)	Reads data buffers of to the socket.
	ReceiveFrom (see page 20090)	Receives a packet of information.
	ReceiveIn (see page 20051)	Reads delimited lines of data from the socket.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Select (see page 20051)	Tests for socket activity.
	SendBuf (see page 20052)	Writes data buffers of size bufsize from the socket.
	SendIn (see page 20052)	Writes delimited lines of data to the socket.
	SendStream (see page 20053)	Writes a stream of data to the socket.
	SendTo (see page 20091)	Sends a packet of information.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WaitForData (see page 20053)	Waits for the socket connection to be ready to transfer data.

Public Properties

	Name	Description
R	BytesReceived (see page 20055)	Returns the number of bytes received by the socket.
R	BytesSent (see page 20055)	Returns the number of bytes sent from the socket.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Connected (see page 20071)	Indicates whether the socket connection is open and available for communication with other machines.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Domain (see page 20055)	Sets or returns the protocol family used by the socket.
	Domain (see page 20091)	Sets or returns the protocol family used by the socket.
R	Handle (see page 20056)	Provides access to the unique-4 byte identifier that represents the instance of the socket object.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Protocol (see page 20056)	Sets or returns the protocol used by the socket.
	SockType (see page 20056)	Sets or returns the socket type.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnConnect (see page 20131)	Occurs on client sockets just after the connection to the server is opened.
	OnCreateHandle (see page 20132)	Occurs when the handle to a socket becomes active.
	OnDestroyHandle (see page 20132)	Occurs when a socket is deactivated.
	OnDisconnect (see page 20132)	Occurs on client sockets just after the connection to the server is closed.
	OnError (see page 20133)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnReceive (see page 20133)	Occurs after a socket receives data, but before it passes the data to the application.
	OnSend (see page 20133)	Occurs just before a client socket writes information to the socket connection.

Published Properties

	Name	Description
	Active (see page 20128)	Indicates whether the socket connection is open and available for communication with other machines.
	BlockMode (see page 20129)	Sets or returns the blocking mode of the socket.
	LocalHost (see page 20129)	Specifies the name of the local system.
	LocalPort (see page 20130)	Specifies the ID number of the port used by the socket connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	RemoteHost (see page 20130)	Specifies the name of the remote system.
	RemotePort (see page 20130)	Specifies the ID number of the port used by the RemoteHost to form the socket connection.
	Tag (see page 2808)	Stores an integer value as part of a component.

148.1.11.2 TUdpSocket.Create Constructor

Creates an instance of TUdpSocket (see page 20123).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TUdpSocket(TComponent * AOwner);
```

Description

For C++, call Create indirectly, using the **new** keyword, to instantiate a TUdpSocket (see page 20123) object.

148.1.11.3 TUdpSocket Properties

The properties of the TUdpSocket class are listed here.

Published Properties

	Name	Description
	Active (see page 20128)	Indicates whether the socket connection is open and available for communication with other machines.
	BlockMode (see page 20129)	Sets or returns the blocking mode of the socket.
	LocalHost (see page 20129)	Specifies the name of the local system.
	LocalPort (see page 20130)	Specifies the ID number of the port used by the socket connection.
	RemoteHost (see page 20130)	Specifies the name of the remote system.
	RemotePort (see page 20130)	Specifies the ID number of the port used by the RemoteHost to form the socket connection.

148.1.11.3.1 TUdpSocket.Active Property

Indicates whether the socket connection is open and available for communication with other machines.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before attempting to use or change the socket connection, read Active to determine whether the connection is open and ready. For client sockets, setting Active opens or shuts down a socket connection to another machine. For server sockets, setting Active opens or shuts down a listening connection that makes the socket available for client requests.

At design time, set Active to **true** to make the socket open a connection when the application starts running (the default value is false). At runtime, use the Open or Close method to open or close the connection.

See Also

Close (see page 20047)

Open (see page 20050)

148.1.11.3.2 TUdpSocket.BlockMode Property

Sets or returns the blocking mode of the socket.

Pascal

```
property BlockMode: TSocketBlockMode;
```

C++

```
__property TSocketBlockMode BlockMode;
```

Description

Use BlockMode to set or return the blocking mode for the socket. By default, the socket is set to bmBlocking.

The TSocketBlockMode type defines the set of possible socket flags for the BlockMode property.

See Also

TSocketBlockMode (see page 20141)

OnReceive (see page 20058)

OnSend (see page 20058)

148.1.11.3.3 TUdpSocket.LocalHost Property

Specifies the name of the local system.

Pascal

```
property LocalHost: TSocketHost;
```

C++

```
__property TSocketHost LocalHost;
```

Description

Use LocalHost to get the name of the system that is running the application that uses the socket. LocalHost is a string containing the domain name and service of the local socket endpoint, such as http://www.wSite.Com.

Port numbers allow a single system, identified by the LocalHostAddr function, to host multiple connections simultaneously. Each combination of LocalPort and LocalHostAddr can only be bound to a single socket connection.

LocalHost provides an alias for the local IP address given in the LocalHostAddr function. Most Intranets provide host names for the IP addresses of systems on the net. For more information on defining a host name for a given system, contact your network administrator.

See Also

LocalPort (see page 20092)

RemoteHost (see page 20093)

LocalHostAddr (see page 20088)

LookupHostName (see page 20089)

LookupPort (see page 20089)

148.1.11.3.4 TUdpSocket.LocalPort Property

Specifies the ID number of the port used by the socket connection.

Pascal

```
property LocalPort: TSocketPort;
```

C++

```
__property TSocketPort LocalPort;
```

Description

Use LocalPort to determine the port number that is bound to the socket connection. For server endpoints of listening connections, LocalPort is the ID associated with the service the server socket provides. For client or server endpoints of connections to another socket, LocalPort is usually an arbitrary value picked when the connection was made.

Many values of LocalPort are associated by convention with a particular service such as FTP or HTTP.

See Also

LocalHost (see page 20092)

RemotePort (see page 20093)

LookupPort (see page 20089)

148.1.11.3.5 TUdpSocket.RemoteHost Property

Specifies the name of the remote system.

Pascal

```
property RemoteHost: TSocketHost;
```

C++

```
__property TSocketHost RemoteHost;
```

Description

Use RemoteHost to get the name of the system on the other end of the socket connection. RemoteHost is a string containing the domain name and service of the remote endpoint of the socket connection, such as http://www.wSite.Com.

See Also

RemotePort (see page 20093)

LocalHostAddr (see page 20088)

LocalHostName (see page 20088)

LookupHostAddr (see page 20089)

LookupHostName (see page 20089)

148.1.11.3.6 TUdpSocket.RemotePort Property

Specifies the ID number of the port used by the RemoteHost to form the socket connection.

Pascal

```
property RemotePort: TSocketPort;
```

C++

```
__property TSocketPort RemotePort;
```

Description

Use RemotePort to determine the port number used by the socket on the other end of the socket connection.

Port numbers allow a single system, identified by the RemoteHost property, to host multiple connections simultaneously. Each combination of RemotePort and RemoteHost can only be bound to a single socket connection.

Many port numbers are associated by convention with a particular service such as ftp or http. To determine whether the value of RemotePort is associated with a specific service, use the LookupProtocol method.

Note: If a client socket requests a specific port to indicate a desired service, the value of RemotePort for the actual connection may differ from the requested port number. Most server sockets listen on the port associated with a service, but switch to an arbitrary available port number for forming connections.

See Also

RemoteHost (see page 20093)

LookupPort (see page 20089)

LookupProtocol (see page 20090)

148.1.11.4 TUdpSocket Events

The events of the TUdpSocket class are listed here.

Published Events

	Name	Description
	OnConnect (see page 20131)	Occurs on client sockets just after the connection to the server is opened.
	OnCreateHandle (see page 20132)	Occurs when the handle to a socket becomes active.
	OnDestroyHandle (see page 20132)	Occurs when a socket is deactivated.
	OnDisconnect (see page 20132)	Occurs on client sockets just after the connection to the server is closed.
	OnError (see page 20133)	Occurs when the socket fails in making, using, or shutting down a connection.
	OnReceive (see page 20133)	Occurs after a socket receives data, but before it passes the data to the application.
	OnSend (see page 20133)	Occurs just before a client socket writes information to the socket connection.

148.1.11.4.1 TUdpSocket.OnConnect Event

Occurs on client sockets just after the connection to the server is opened.

Pascal

```
property OnConnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnConnect;
```

Description

Write an OnConnect event handler for a client socket to take specific action after the connection to a server socket has been established. Depending on the service, this may be the point when the socket should start reading or writing over the connection.

See Also

Connected (see page 20071)

OnDisconnect (see page 20072)

148.1.11.4.2 TUdpSocket.OnCreateHandle Event

Occurs when the handle to a socket becomes active.

Pascal

```
property OnCreateHandle: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnCreateHandle;
```

Description

Write an OnCreateHandle event handler to take specific action when the handle to a socket becomes active.

See Also

Active (see page 20054)

Handle (see page 20056)

148.1.11.4.3 TUdpSocket.OnDestroyHandle Event

Occurs when a socket is deactivated.

Pascal

```
property OnDestroyHandle: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnDestroyHandle;
```

Description

Write an OnDestroyHandle event handler to take specific action when the socket is deactivated.

148.1.11.4.4 TUdpSocket.OnDisconnect Event

Occurs on client sockets just after the connection to the server is closed.

Pascal

```
property OnDisconnect: TSocketNotifyEvent;
```

C++

```
__property TSocketNotifyEvent OnDisconnect;
```

Description

Write an OnDisconnect event handler for a client socket to take specific action just after the connection to a server socket is terminated.

See Also

Connected (see page 20071)

OnConnect (see page 20071)

148.1.11.4.5 TUdpSocket.OnError Event

Occurs when the socket fails in making, using, or shutting down a connection.

Pascal

```
property OnError: TSocketErrorEvent;
```

C++

```
__property TSocketErrorEvent OnError;
```

Description

Write an OnError event handler to respond to errors that arise with the socket connection. Set the **ErrorCode** parameter to 0 if the OnError event handler successfully deals with the error condition, to prevent an ESocketError exception from being raised.

See Also

ESocketError (see page 20041)

148.1.11.4.6 TUdpSocket.OnReceive Event

Occurs after a socket receives data, but before it passes the data to the application.

Pascal

```
property OnReceive: TSocketDataEvent;
```

C++

```
__property TSocketDataEvent OnReceive;
```

Description

Write an OnReceive event handler to read from the socket connection. Use the OnReceive event to filter data before passing it back to the client application. If the socket is a blocking socket, use a TWinSocketStream object to read from the connection. Otherwise, use the methods of the **Socket** parameter to perform the actual reading.

See Also

TWinSocketStream (see page 18876)

BytesReceived (see page 20055)

ReceiveBuf (see page 20051)

ReceiveIn (see page 20051)

148.1.11.4.7 TUdpSocket.OnSend Event

Occurs just before a client socket writes information to the socket connection.

Pascal

```
property OnSend: TSocketDataEvent;
```

C++

```
__property TSocketDataEvent OnSend;
```

Description

Write an OnSend event handler to perform actions just prior to sending data. Use OnSend to monitor the data stream and change it (for example, by removing linefeeds). If the socket is a blocking socket, use a TWinSocketStream object to write to the

connection. Otherwise, use the methods of the **Socket** parameter to perform the actual writing.

See Also

TWinSocketStream (see page 18876)

SendBuf (see page 20052)

SendIn (see page 20052)

148.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TServerSocketBlockMode (see page 20136)	Defines the set of possible socket flags for block mode.
	TSocketDomain (see page 20136)	Set of possible protocol family types used by a socket.
	TSocketType (see page 20138)	The TSocketType type defines the set of possible socket types.

Records

	Name	Description
	TIPHeader (see page 20135)	This is record Sockets.TIPHeader.

148.2.1 Sockets.TIPHeader Record

Pascal

```
TIPHeader = packed record
  iph_verlen: byte;
  iph_tos: byte;
  iph_length: word;
  iph_id: word;
  iph_offset: word;
  iph_ttl: byte;
  iph_protocol: byte;
  iph_xsum: word;
  iph_src: longword;
  iph_dest: longword;
end;
```

C++

```
struct TIPHeader {
  byte iph_verlen;
  byte iph_tos;
  word iph_length;
  word iph_id;
  word iph_offset;
  byte iph_ttl;
  byte iph_protocol;
  word iph_xsum;
  longword iph_src;
  longword iph_dest;
};
```

File

Sockets

Description

This is record Sockets.TIPHeader.

148.2.2 Sockets.TServerSocketBlockMode Enumeration

Defines the set of possible socket flags for block mode.

Pascal

```
TServerSocketBlockMode = (
  bmBlocking,
  bmNonBlocking,
  bmThreadBlocking
);
```

C++

```
enum TServerSocketBlockMode {
  bmBlocking,
  bmNonBlocking,
  bmThreadBlocking
};
```

File

Sockets

Description

The following table lists the possible values for the TServerSocketBlockMode type and the meaning corresponding to each value:

Value	Socket state
bmBlocking	The socket is set to block mode.
bmNonBlocking	The socket is set to non-blocking mode.
bmThreadBlocking	A separate thread is created so that listening can be performed in the background without blocking the entire server application.

148.2.3 Sockets.TSocketDomain Enumeration

Set of possible protocol family types used by a socket.

Pascal

```
TSocketDomain = (
  pfUnspec,
  pfUnix,
  pfInet,
  pfImpLink,
  pfPup,
  pfChaos,
  pfIpx,
  pfNs,
  pfIso,
  pfOsi,
  pfEcma,
  pfDataKit,
  pfCcitt,
  pfSna,
  pfDecNet,
```

```
    pfDli,
    pfLat,
    pfHylink,
    pfAppleTalk,
    pfVoiceView,
    pfFireFox,
    pfUnknown1,
    pfBan,
    pfMax
  );
```

C++

```
  enum TSocketDomain {
    pfUnspec,
    pfUnix,
    pfInet,
    pfImpLink,
    pfPup,
    pfChaos,
    pfIpx,
    pfNs,
    pfIso,
    pfOsi,
    pfEcma,
    pfDataKit,
    pfCcitt,
    pfSna,
    pfDecNet,
    pfDli,
    pfLat,
    pfHylink,
    pfAppleTalk,
    pfVoiceView,
    pfFireFox,
    pfUnknown1,
    pfBan,
    pfMax
  };
```

File

Sockets

Description

The following table lists the possible values for the TSocketDomain type and the meaning corresponding to each value:

Value	Description
pfAppleTalk	AppleTalk DDP
pfBan	Banyan Vines
pfCcitt	CCIT (International Telegraph and Telephone Consultative)
pfChaos	
pfDataKit	DataKit
pfDecNet	Reserved for DECnet project
pfDli	
pfEcma	EcmaScript
pfFireFox	FireFox
pfHylink	Hyperlink
pfImpLink	Imported link

pfInet	IP protocol family
pfIpx	Novell Interner Protocol
pfIso	International Standards Organization (ISO)
pfLat	
pfMax	Maximum protocol family number
pfNs	Network Services Protocol (used with DECnet)
pfOsi	Open Systems Interconnection (OSI)
pfPup	PUP protocol
pfSna	Linux SNA project
pfUnix	Local to host (old BSD name for local)
pfUnknown1	Unknown
pfUnspec	Unspecified
pfVoiceView	VoiceView

148.2.4 Sockets.TSocketType Enumeration

The TSocketType type defines the set of possible socket types.

Pascal

```
TSocketType = (
  stStream,
  stDgram,
  stRaw,
  stRdm,
  stSeqPacket
);
```

C++

```
enum TSocketType {
  stStream,
  stDgram,
  stRaw,
  stRdm,
  stSeqPacket
};
```

File

Sockets

Description

The following table lists the possible values for the TSocketType type and the meaning corresponding to each value:

Value	Description
stDgram	Single datagram packets, not used by IP. Non-reliable.
stRaw	The socket sends and receives raw datagram packets. Used by IP.
stRdm	Reliably delivered message.
stSeqPacket	Sequenced packet stream sends and receives any type of IP packet.

stStream	Reliable streaming data packets. Used by TCP.

148.3 Types

The following table lists types in this documentation.

Types

Name	Description
TGetThreadEvent (see page 20140)	This is type Sockets.TGetThreadEvent.
TSocketAcceptEvent (see page 20140)	This is type Sockets.TSocketAcceptEvent.
TSocketBlockMode (see page 20141)	Defines the set of possible flags for blocking mode of the socket.
TSocketDataEvent (see page 20141)	This is type Sockets.TSocketDataEvent.
TSocketErrorEvent (see page 20141)	This is type Sockets.TSocketErrorEvent.
TSocketHost (see page 20142)	This is type Sockets.TSocketHost.
TSocketNotifyEvent (see page 20142)	This is type Sockets.TSocketNotifyEvent.
TSocketPort (see page 20142)	This is type Sockets.TSocketPort.
TSocketProtocol (see page 20143)	This is type Sockets.TSocketProtocol.

148.3.1 Sockets.TGetThreadEvent Type

Pascal

```
TGetThreadEvent = procedure (Sender: TObject; var ClientSocketThread: TClientSocketThread) of
object;
```

C++

```
(Sender: TObject; var ClientSocketThread: TClientSocketThread) ( TGetThreadEvent)();
```

File

Sockets

Description

This is type Sockets.TGetThreadEvent.

148.3.2 Sockets.TSocketAcceptEvent Type

Pascal

```
TSocketAcceptEvent = procedure (Sender: TObject; ClientSocket: TCustomIpClient) of object;
```

C++

```
(Sender: TObject; ClientSocket: TCustomIpClient) ( TSocketAcceptEvent)();
```

File

Sockets

Description

This is type Sockets.TSocketAcceptEvent.

148.3.3 Sockets.TSocketBlockMode Type

Defines the set of possible flags for blocking mode of the socket.

Pascal

```
TSocketBlockMode = bmBlocking..bmNonBlocking;
```

C++

```
bmBlocking..bmNonBlocking TSocketBlockMode;
```

File

Sockets

Description

The following table describes TSocketBlockMode values.

Value	Socket state
bmBlocking	The socket is set to block mode.
bmNonBlocking	The socket is set to non-blocking mode.

148.3.4 Sockets.TSocketDataEvent Type

Pascal

```
TSocketDataEvent = procedure (Sender: TObject; Buf: pchar; var DataLen: Integer) of object;
```

C++

```
(Sender: TObject; Buf: pchar; var DataLen: Integer) ( TSocketDataEvent)();
```

File

Sockets

Description

This is type Sockets.TSocketDataEvent.

148.3.5 Sockets.TSocketErrorEvent Type

Pascal

```
TSocketErrorEvent = procedure (Sender: TObject; SocketError: Integer) of object;
```

C++

```
(Sender: TObject; SocketError: Integer) ( TSocketErrorEvent)();
```

File

Sockets

Description

This is type Sockets.TSocketErrorEvent.

148.3.6 Sockets.TSocketHost Type

Pascal

```
TSocketHost = type string;
```

C++

```
type string TSocketHost;
```

File

Sockets

Description

This is type Sockets.TSocketHost.

148.3.7 Sockets.TSocketNotifyEvent Type

Pascal

```
TSocketNotifyEvent = procedure (Sender: TObject) of object;
```

C++

```
(Sender: TObject) ( TSocketNotifyEvent)();
```

File

Sockets

Description

This is type Sockets.TSocketNotifyEvent.

148.3.8 Sockets.TSocketPort Type

Pascal

```
TSocketPort = type string;
```

C++

```
type string TSocketPort;
```

File

Sockets

Description

This is type Sockets.TSocketPort.

148.3.9 Sockets.TSocketProtocol Type

Pascal

```
TSocketProtocol = Word;
```

C++

```
Word TSocketProtocol;
```

File

Sockets

Description

This is type Sockets.TSocketProtocol.

148.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CRLF (see page 20144)	This is constant Sockets.CRLF.

148.4.1 Sockets.CRLF Constant

Pascal

```
CRLF = #13#10;
```

C++

```
CRLF = #13#10;
```

File

Sockets

Description

This is constant Sockets.CRLF.

149 SqlExpr Namespace

This is namespace SqlExpr.

Topics

Name	Description
Classes (see page 20147)	The following table lists classes in this documentation.
Functions (see page 20361)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 20364)	The following table lists structs, records, enums in this documentation.
Types (see page 20371)	The following table lists types in this documentation.
Constants (see page 20375)	The following table lists constants in this documentation.

Classes

	Name	Description
	SPParamDesc (see page 20147)	SPParamDesc describes a parameter to a stored procedure that is accessed using dbExpress.
	TCustomSQLDataSet (see page 20150)	TCustomSQLDataSet is the base class for all dbExpress dataset components.
	TFLDDesc (see page 20205)	This is class SqlExpr.TFLDDesc.
	TSQLBlobStream (see page 20213)	TSQLBlobStream lets applications read from or write to BLOB fields in a client dataset.
	TSQLConnection (see page 20217)	TSQLConnection encapsulates a dbExpress connection to a database server.
	TSQLDataLink (see page 20260)	TSQLDataLink allows a unidirectional dataset act as the detail in a master/detail relationship.
	TSQLDataSet (see page 20265)	TSQLDataSet represents data retrieved using dbExpress.
	TSQLMonitor (see page 20285)	TSQLMonitor intercepts messages that pass between an SQL connection component and a database server and saves them in a string list.
	TSQLQuery (see page 20298)	TSQLQuery represents a query that is executed using dbExpress.
	TSQLStoredProc (see page 20318)	TSQLStoredProc represents a stored procedure that is executed using dbExpress.
	TSQLTable (see page 20337)	TSQLTable represents a database table that is accessed using dbExpress.
	TTransactionItem (see page 20359)	This is class SqlExpr.TTransactionItem.

Constants

Name	Description
BlobTypeMap (see page 20375)	This is constant SqlExpr.BlobTypeMap.
DataTypeMap (see page 20376)	This is constant SqlExpr.DataTypeMap.
DefaultCursor (see page 20376)	This is constant SqlExpr.DefaultCursor.
DefaultMaxBlobSize (see page 20376)	This is constant SqlExpr.DefaultMaxBlobSize.

DefaultRowsetSize (see page 20377)	This is constant SqlExpr.DefaultRowsetSize.
FldSubTypeMap (see page 20377)	This is constant SqlExpr.FldSubTypeMap.
FldTypeMap (see page 20377)	This is constant SqlExpr.FldTypeMap.
HourGlassCursor (see page 20378)	This is constant SqlExpr.HourGlassCursor.
SAnd (see page 20378)	This is constant SqlExpr.SAnd.
SOrderBy (see page 20379)	This is constant SqlExpr.SOrderBy.
SParam (see page 20379)	This is constant SqlExpr.SParam.
SSelect (see page 20379)	This is constant SqlExpr.SSelect.
SSelectSpaces (see page 20380)	This is constant SqlExpr.SSelectSpaces.
SSelectStar (see page 20380)	This is constant SqlExpr.SSelectStar.
SSelectStarFrom (see page 20380)	This is constant SqlExpr.SSelectStarFrom.
SUB_TYPE_MEMO (see page 20381)	This is constant SqlExpr.SUB_TYPE_MEMO.
SWhere (see page 20381)	This is constant SqlExpr.SWhere.
TErrorMessageSize (see page 20381)	This is constant SqlExpr.TErrorMessageSize.

Functions

	Name	Description
	FreeProcParams (see page 20361)	Frees a list of procedure parameters that is allocated by GetProcedureParams.
	GetConnectionNames (see page 20361)	This is function SqlExpr.GetConnectionNames.
	GetConnectionRegistryFile (see page 20362)	This is function SqlExpr.GetConnectionRegistryFile.
	GetDriverNames (see page 20362)	Populates a string list with the names of all available dbExpress drivers.
	GetDriverRegistryFile (see page 20363)	This is function SqlExpr.GetDriverRegistryFile.
	LoadParamListItems (see page 20363)	Fills a TParams object with information from a list of parameter descriptors.

Structs, Records, Enums

	Name	Description
	EConnectFlag (see page 20364)	This is record SqlExpr.EConnectFlag.
	TConnectionState (see page 20365)	TConnectionState describes the state of a TSQLConnection (see page 20217) component.
	TConnectionUserType (see page 20365)	This is record SqlExpr.TConnectionUserType.
	TSchemaType (see page 20366)	TSchemaType and TSchemaInfo describe schema information (metadata) to access using dbXpress.
	TSQLExceptionType (see page 20367)	TSQLExceptionType indicates the type of operation that leads to an ESQLException exception.
	TSQLSchemaInfo (see page 20368)	This is record SqlExpr.TSQLSchemaInfo.
	TTableScope (see page 20368)	TTableScopes (see page 20374) and TTableScopess indicate the types of tables for which to fetch metadata.
	TTransactionDesc (see page 20369)	This is record SqlExpr.TTransactionDesc.
	TTransIsolationLevel (see page 20369)	This enumerated type (in C++) or type (in Delphi) identifies degree to which transactions are isolated from each other.

Types

Name	Description
TFieldDescList (see page 20371)	This is type SqlExpr.TFieldDescList.
TFieldList (see page 20371)	This is type SqlExpr.TFieldList.
TGetDriverFunc (see page 20372)	This is type SqlExpr.TGetDriverFunc.
TLocale (see page 20372)	This is type SqlExpr.TLocale.
TLocaleCode (see page 20372)	This is type SqlExpr.TLocaleCode.
TParseInsertSqlEvent (see page 20373)	This is type SqlExpr.TParseInsertSqlEvent.
TParseSqlEvent (see page 20373)	This is type SqlExpr.TParseSqlEvent.
TSQLConnectionLoginEvent (see page 20373)	This is type SqlExpr.TSQLConnectionLoginEvent.
TTableScopes (see page 20374)	This is type SqlExpr.TTableScopes.
TTraceEvent (see page 20374)	This is type SqlExpr.TTraceEvent.
TTraceLogEvent (see page 20374)	This is type SqlExpr.TTraceLogEvent.

149.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	SPParamDesc (see page 20147)	SPParamDesc describes a parameter to a stored procedure that is accessed using dbExpress.
	TCustomSQLDataSet (see page 20150)	TCustomSQLDataSet is the base class for all dbExpress dataset components.
	TFLDDesc (see page 20205)	This is class SqlExpr.TFLDDesc.
	TSQLBlobStream (see page 20213)	TSQLBlobStream lets applications read from or write to BLOB fields in a client dataset.
	TSQLConnection (see page 20217)	TSQLConnection encapsulates a dbExpress connection to a database server.
	TSQLDataLink (see page 20260)	TSQLDataLink allows a unidirectional dataset act as the detail in a master/detail relationship.
	TSQLDataSet (see page 20265)	TSQLDataSet represents data retrieved using dbExpress.
	TSQLMonitor (see page 20285)	TSQLMonitor intercepts messages that pass between an SQL connection component and a database server and saves them in a string list.
	TSQLQuery (see page 20298)	TSQLQuery represents a query that is executed using dbExpress.
	TSQLStoredProc (see page 20318)	TSQLStoredProc represents a stored procedure that is executed using dbExpress.
	TSQLTable (see page 20337)	TSQLTable represents a database table that is accessed using dbExpress.
	TTransactionItem (see page 20359)	This is class SqlExpr.TTransactionItem.

149.1.1 SPParamDesc Class

SPParamDesc describes a parameter to a stored procedure that is accessed using dbExpress.

Class Hierarchy

SqlExpr.SPParamDesc

Pascal

```
SPParamDesc = class;
```

C++

```
class SPParamDesc;
```

File

SqlExpr

Description

PSPParamDesc is a pointer to a parameter descriptor. SPParamDesc is a parameter descriptor that describes a parameter for a stored procedure. SPParamDesc includes the following members:

Member	Meaning
iParamNum (see page 20149)	The ordinal position of the parameter.
szName (see page 20150)	The name of the parameter

iArgType (see page 20148)	The type of the parameter (input, output, and so on)
iDataType (see page 20149)	The data type of the parameter
iUnits1 (see page 20149)	The size for the datatype (number of characters, digits, etc)
iUnits2 (see page 20150)	Number of decimal places if datatype is BCD
iLen (see page 20149)	The number of bytes needed to store a parameter value

See Also

TSQLConnection

149.1.1.1 SPParamDesc Members

The following tables list the members exposed by SPParamDesc.

Public Fields

	Name	Description
	iArgType (see page 20148)	This is iArgType, a member of class SPParamDesc.
	iDataType (see page 20149)	This is iDataType, a member of class SPParamDesc.
	iLen (see page 20149)	This is iLen, a member of class SPParamDesc.
	iParamNum (see page 20149)	This is iParamNum, a member of class SPParamDesc.
	iUnits1 (see page 20149)	This is iUnits1, a member of class SPParamDesc.
	iUnits2 (see page 20150)	This is iUnits2, a member of class SPParamDesc.
	szName (see page 20150)	This is szName, a member of class SPParamDesc.

149.1.1.2 SPParamDesc Fields

The fields of the SPParamDesc class are listed here.

Public Fields

	Name	Description
	iArgType (see page 20148)	This is iArgType, a member of class SPParamDesc.
	iDataType (see page 20149)	This is iDataType, a member of class SPParamDesc.
	iLen (see page 20149)	This is iLen, a member of class SPParamDesc.
	iParamNum (see page 20149)	This is iParamNum, a member of class SPParamDesc.
	iUnits1 (see page 20149)	This is iUnits1, a member of class SPParamDesc.
	iUnits2 (see page 20150)	This is iUnits2, a member of class SPParamDesc.
	szName (see page 20150)	This is szName, a member of class SPParamDesc.

149.1.1.2.1 SPParamDesc.iArgType Field

Pascal

```
iArgType: TParamType;
```

C++

```
TParamType iArgType;
```

Description

This is iArgType, a member of class SPParamDesc.

149.1.1.2.2 SPParamDesc.iDataType Field

Pascal

```
iDataType: TFieldType;
```

C++

```
TFieldType iDataType;
```

Description

This is iDataType, a member of class SPParamDesc.

149.1.1.2.3 SPParamDesc.iLen Field

Pascal

```
iLen: LongWord;
```

C++

```
LongWord iLen;
```

Description

This is iLen, a member of class SPParamDesc.

149.1.1.2.4 SPParamDesc.iParamNum Field

Pascal

```
iParamNum: Word;
```

C++

```
Word iParamNum;
```

Description

This is iParamNum, a member of class SPParamDesc.

149.1.1.2.5 SPParamDesc.iUnits1 Field

Pascal

```
iUnits1: SmallInt;
```

C++

```
SmallInt iUnits1;
```

Description

This is iUnits1, a member of class SPParamDesc.

149.1.1.2.6 SPParamDesc.iUnits2 Field

Pascal

```
iUnits2: SmallInt;
```

C++

```
SmallInt iUnits2;
```

Description

This is iUnits2, a member of class SPParamDesc.

149.1.1.2.7 SPParamDesc.szName Field

Pascal

```
szName: WideString;
```

C++

```
BSTR szName;
```

Description

This is szName, a member of class SPParamDesc.

149.1.2 TCustomSQLDataSet Class

TCustomSQLDataSet is the base class for all dbExpress dataset components.

Class Hierarchy

Pascal

```
TCustomSQLDataSet = class(TWideDataSet);
```

C++

```
class TCustomSQLDataSet : public TWideDataSet;
```

File

SqlExpr

Description

TCustomSQLDataSet encapsulates the properties, events, and methods for working with data accessed through dbExpress. Applications should not instantiate TCustomSQLDataSet objects. Instead, instantiate one of the descendant classes: TSQLDataSet (see page 20265), TSQLTable (see page 20337), TSQLQuery (see page 20298), or TSQLStoredProc (see page 20318).

TCustomSQLDataSet and its descendants represent unidirectional datasets. Unlike other datasets, unidirectional datasets do

not buffer multiple records in memory. Because of this, they have the following limitations:

There is no searching or navigation support except for moving to the first record or moving to the next record.

There is no built-in editing support. The data underlying an SQL dataset can only be edited by explicitly creating an SQL UPDATE command or by connecting the SQL dataset to a client dataset using a provider.

There is no support for filtering records or for lookup fields.

See Also

TSQLDataSet (see page 20265)

TSQLQuery (see page 20298)

TSQLStoredProc (see page 20318)

TSQLTable (see page 20337)

TSQLConnection (see page 20217)

TClientDataSEt

TDataSEtProvider

149.1.2.1 TCustomSQLDataSet Members

The following tables list the members exposed by TCustomSQLDataSet.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	AddFieldDesc (see page 20163)	This is AddFieldDesc, a member of class TCustomSQLDataSet.
	AddIndexDefs (see page 20163)	This is AddIndexDefs, a member of class TCustomSQLDataSet.
V	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
V	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
V	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
V	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
V	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
	CheckPrepareError (see page 20164)	This is CheckPrepareError, a member of class TCustomSQLDataSet.
V	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
V	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
	ClearIndexDefs (see page 20164)	This is ClearIndexDefs, a member of class TCustomSQLDataSet.
V	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
V	CloseCursor (see page 20164)	This is CloseCursor, a member of class TCustomSQLDataSet.

	CloseStatement (see page 20164)	This is CloseStatement, a member of class TCustomSQLDataSet.
	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
	DataEvent (see page 6924)	This is DataEvent, a member of class TDataSet.
	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
	DefineProperties (see page 20165)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	ExecSQL (see page 20165)	This is ExecSQL, a member of class TCustomSQLDataSet.
	ExecuteStatement (see page 20166)	This is ExecuteStatement, a member of class TCustomSQLDataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.
	FreeBuffers (see page 20166)	This is FreeBuffers, a member of class TCustomSQLDataSet.
	FreeCommand (see page 20166)	This is FreeCommand, a member of class TCustomSQLDataSet.
	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeReader (see page 20166)	This is FreeReader, a member of class TCustomSQLDataSet.
	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.
	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.
	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
	GetCanModify (see page 20167)	This is GetCanModify, a member of class TCustomSQLDataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
	GetDataSource (see page 20167)	This is GetDataSource, a member of class TCustomSQLDataSet.
	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).

	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
V	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
V	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
V	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
	GetObjectTypeNames (see page 20169)	This is GetObjectTypeNames, a member of class TCustomSQLDataSet.
	GetOutputParams (see page 20169)	This is GetOutputParams, a member of class TCustomSQLDataSet.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
V	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
V	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
V	GetRecord (see page 20170)	This is GetRecord, a member of class TCustomSQLDataSet.
V	GetRecordCount (see page 20170)	This is GetRecordCount, a member of class TCustomSQLDataSet.
V	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
	GetSortFieldNames (see page 20170)	This is GetSortFieldNames, a member of class TCustomSQLDataSet.
V	GetStateFieldValue (see page 6956)	This is GetStateFieldValue, a member of class TDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
V	InitRecord (see page 20170)	This is InitRecord, a member of class TCustomSQLDataSet.
V	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
V	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
V	InternalClose (see page 20171)	This is InternalClose, a member of class TCustomSQLDataSet.
V	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
V	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.
V	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
V	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
V	InternalHandleException (see page 20171)	This is InternalHandleException, a member of class TCustomSQLDataSet.
V	InternalInitFieldDefs (see page 20171)	This is InternalInitFieldDefs, a member of class TCustomSQLDataSet.
V	InternalInitRecord (see page 6965)	This is InternalInitRecord, a member of class TDataSet.
V	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
V	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
V	InternalOpen (see page 20171)	This is InternalOpen, a member of class TCustomSQLDataSet.
V	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
V	InternalRefresh (see page 20171)	This is InternalRefresh, a member of class TCustomSQLDataSet.
V	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsCursorOpen (see page 20172)	This is IsCursorOpen, a member of class TCustomSQLDataSet.
V	Loaded (see page 20172)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 20173)	This is LocateRecord, a member of class TCustomSQLDataSet.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	OpenCursor (see page 20174)	This is OpenCursor, a member of class TCustomSQLDataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
V	OpenSchema (see page 20174)	This is OpenSchema, a member of class TCustomSQLDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 20175)	This is PropertyChanged, a member of class TCustomSQLDataSet.
V	PSEndTransaction (see page 20175)	Ends a transaction that was started by a call to PSStartTransaction.
V	PSExecute (see page 20176)	Executes the SQL command associated with the dataset.
V	PSExecuteStatement (see page 20176)	This is PSExecuteStatement, a member of class TCustomSQLDataSet.
V	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
V	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.

	PSGetAttributes (see page 20176)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 20177)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 20177)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 20178)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 20178)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 20179)	This is PSGetKeyFieldsW, a member of class TCustomSQLDataSet.
	PSGetParams (see page 20179)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 20179)	This is PSGetQuoteCharW, a member of class TCustomSQLDataSet.
	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 20179)	This is PSGetTableNameW, a member of class TCustomSQLDataSet.
	PSGetUpdateException (see page 20180)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 20180)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 20180)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 20181)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 20181)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 20182)	Assigns a specified SQL command to be executed by PSExecute.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 20182)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 20182)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 20183)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 20184)	This is SetBufListSize, a member of class TCustomSQLDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 20184)	This is SetCommandText, a member of class TCustomSQLDataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFCommandText (see page 20184)	This is SetFCommandText, a member of class TCustomSQLDataSet.
	SetFieldData (see page 20184)	This is SetFieldData, a member of class TCustomSQLDataSet.

V	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
V	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
V	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.
V	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetMaxBlobSize (see page 20184)	This is SetMaxBlobSize, a member of class TCustomSQLDataSet.
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
V	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetParamsFromCursor (see page 20185)	This is SetParamsFromCursor, a member of class TCustomSQLDataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
	SetSortFieldNames (see page 20186)	This is SetSortFieldNames, a member of class TCustomSQLDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
V	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateIndexDefs (see page 20186)	This is UpdateIndexDefs, a member of class TCustomSQLDataSet.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
	BlobBuffer (see page 20189)	Reserves a buffer for storing BLOB values.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
	CommandType (see page 20190)	Indicates the meaning of the CommandText (see page 20189) property.
	Constraints (see page 7013)	Specifies record-level constraints that must be met when editing the data.
	CurrentBlobSize (see page 20191)	Indicates the size of the most recently read BLOB field.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
R	DataLink (see page 20191)	Identifies the datalink that manages communication between the SQL dataset and another, master dataset.
	DataSource (see page 20192)	Links the SQL dataset to another (master) dataset.

	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	InternalConnection (see page 20194)	Indicates the component that connects the dataset to its database server, taking into account whether the connection was cloned.
	LastError (see page 20194)	Saves the error message for the last error returned by dbExpress.
	MaxBlobSize (see page 20194)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.
	NativeCommand (see page 20195)	Represents the SQL command that is sent to the server.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
	ParamCheck (see page 20196)	Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.
R	ParamCount (see page 20197)	Indicates the number of parameters listed by the Params (see page 20197) property.
	Params (see page 20197)	Represents the parameters for a query or stored procedure.
	ProcParams (see page 20199)	ProcParams lists the parameter descriptors obtained from the server for any stored procedure parameters.
	Reserved (see page 7035)	For internal use only.
R	RowsAffected (see page 20200)	Indicates the number of rows operated on by the latest query execution.
	SchemaInfo (see page 20200)	Identifies the metadata with which to populate the dataset.
	SortFieldNames (see page 20201)	Indicates the sort order when CommandType (see page 20190) is ctTable.

Public Events

	Name	Description
	AfterCancel (see page 7038)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterDelete (see page 7041)	Occurs after an application deletes a record.
	AfterEdit (see page 7044)	Occurs after an application starts editing a record.
	AfterInsert (see page 7044)	Occurs after an application inserts a new record.
	AfterPost (see page 7046)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	BeforeCancel (see page 7048)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeDelete (see page 7049)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 7049)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 7050)	Occurs before an application enters insert mode.
	BeforePost (see page 7052)	Occurs before an application posts changes for the active record to the database or change log.
	OnDeleteError (see page 7054)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 7054)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 7055)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 7056)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 7056)	Occurs when an application attempts to modify or insert a record and an exception is raised.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.

	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.
	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
	Close (see page 6920)	Closes a dataset.
	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
	Create (see page 20160)	Creates an instance of a TCustomSQLDataSet (see page 20150) component.
	CreateBlobStream (see page 20164)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
	Destroy (see page 20161)	Destroys the TCustomSQLDataSet (see page 20150) instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetBlobFieldData (see page 20166)	Retrieves the current value of a BLOB field into a buffer.
	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.

	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
	GetDetailLinkFields (see page 20167)	Lists the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
	GetFieldData (see page 20168)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyFieldNames (see page 20169)	Fills a list with the names of all fields in all indexes defined for the dataset.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetQuoteChar (see page 20169)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
	IsSequenced (see page 20172)	Indicates whether the dataset can use record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
	Locate (see page 20173)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
	Lookup (see page 20174)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	Open (see page 6976)	Opens the dataset.
	ParamByName (see page 20175)	This is ParamByName, a member of class TCustomSQLDataSet.
	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
	PrepareStatement (see page 20175)	Performs a prepare on the SQL statement.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.

	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetSchemaInfo (see page 20185)	Indicates whether the dataset represents metadata from the server, and if so, what kind.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.

Public Properties

	Name	Description
R	AggFields (see page 7006)	Contains any aggregate fields.
	AutoCalcFields (see page 7006)	Determines when the OnCalcFields (see page 7053) event is triggered and when lookup field values are calculated.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
	CommandText (see page 20189)	Specifies the command the dataset executes.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSetField (see page 7013)	Indicates the persistent TDataSetField (see page 7060) object that owns a nested dataset.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignerData (see page 20192)	Stores custom data.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
	FieldDefs (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset
	Filter (see page 7026)	Specifies the text of the current filter for a dataset.
	Filtered (see page 7027)	Specifies whether or not filtering is active for a dataset.

	FilterOptions (see page 7027)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
	IndexDefs (see page 20193)	Contains the definitions of all indexes defined on the server for the dataset.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
R	Modified (see page 7029)	Indicates whether the active record is modified.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Prepared (see page 20198)	Specifies whether the command is prepared before execution.
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 20199)	Indicates the total number of records associated with the dataset.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
	SQLConnection (see page 20201)	Specifies the SQL connection component that connects the dataset to a database server.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	TransactionLevel (see page 20202)	Indicates the transaction to which this dataset belongs.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterClose (see page 20203)	Occurs after a data source connection is closed.
	AfterOpen (see page 20203)	Occurs after the connection to a data source is opened.
	AfterRefresh (see page 20203)	Occurs after a DataSet has been changed and is refreshed.
	AfterScroll (see page 20204)	Occurs after a result set is scrolled.
	BeforeClose (see page 20204)	Occurs just before a data connection is closed.
	BeforeOpen (see page 20204)	Occurs just before a data connection is opened, but after an open operation has been initiated.
	BeforeRefresh (see page 20204)	Occurs before a DataSet refresh occurs.
	BeforeScroll (see page 20204)	Occurs when a DataSet scroll operation has been initiated but before the scrolling actually takes place.
	OnCalcFields (see page 20204)	Occurs when calculated or derived fields are updated.
	ParseDeleteSql (see page 20205)	Occurs when an application attempts to parse the DELETE statement stored in the CommandText (see page 20189) property.
	ParseInsertSql (see page 20205)	Occurs when an application attempts to parse the INSERT statement stored in the CommandText (see page 20189) property.
	ParseSelectSql (see page 20205)	Occurs when an application attempts to parse the SELECT statement specified in the CommandText (see page 20189) property.
	ParseUpdateSql (see page 20205)	Occurs when an application attempts to parse a SQL UPDATE statement stored in the CommandText (see page 20189) property.

Published Properties

	Name	Description
	Active (see page 20187)	Specifies whether or not a dataset is open.
	GetMetadata (see page 20193)	Specifies whether the SQL dataset fetches metadata information along with the data.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NumericMapping (see page 20195)	Maps fldBCD to either ftFMTBCD or ftBCD field types.
	ObjectView (see page 20196)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	SchemaName (see page 20201)	Specifies the name of the database schema.
	Tag (see page 2808)	Stores an integer value as part of a component.

149.1.2.2 TCustomSQLDataSet.Create Constructor

Creates an instance of a TCustomSQLDataSet (see page 20150) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomSQLDataSet(TComponent * AOwner);
```

Description

Call Create to instantiate an SQL dataset component at runtime. SQL datasets placed in forms or data modules at design time are created automatically.

TCustomSQLDataSet (see page 20150) is rarely used directly in applications because many of its properties are protected. Instead, applications instantiate TCustomSQLDataSet (see page 20150) descendants such as TSQLDataSet (see page 20265), TSQLTable (see page 20337), TSQLQuery (see page 20298), or TSQLStoredProc (see page 20318).

AOwner is the component that is responsible for freeing the dataset. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

Create (see page 6904)

TSQLDataSet (see page 20265)

TSQLStoredProc (see page 20318)

TSQLTable (see page 20337)

TSQLQuery (see page 20298)

149.1.2.3 TCustomSQLDataSet.Destroy Destructor

Destroys the TCustomSQLDataSet (see page 20150) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomSQLDataSet();
```

Description

Do not call Destroy directly in an application. Usually destruction of datasets is handled automatically. If an application creates its own instances of a dataset, however, and does not assign an Owner that is responsible for freeing the dataset, then the application should call Free, which verifies that the dataset reference is not nil before calling Destroy.

See Also

Owner (see page 2807)

Create (see page 20160)

Free (see page 22300)

149.1.2.4 TCustomSQLDataSet Methods

The methods of the TCustomSQLDataSet class are listed here.

Protected Methods

	Name	Description
	AddFieldDesc (see page 20163)	This is AddFieldDesc, a member of class TCustomSQLDataSet.
	AddIndexDefs (see page 20163)	This is AddIndexDefs, a member of class TCustomSQLDataSet.
	CheckPrepareError (see page 20164)	This is CheckPrepareError, a member of class TCustomSQLDataSet.
	ClearIndexDefs (see page 20164)	This is ClearIndexDefs, a member of class TCustomSQLDataSet.
V	CloseCursor (see page 20164)	This is CloseCursor, a member of class TCustomSQLDataSet.
	CloseStatement (see page 20164)	This is CloseStatement, a member of class TCustomSQLDataSet.
V	DefineProperties (see page 20165)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	ExecSQL (see page 20165)	This is ExecSQL, a member of class TCustomSQLDataSet.
	ExecuteStatement (see page 20166)	This is ExecuteStatement, a member of class TCustomSQLDataSet.
	FreeBuffers (see page 20166)	This is FreeBuffers, a member of class TCustomSQLDataSet.
	FreeCommand (see page 20166)	This is FreeCommand, a member of class TCustomSQLDataSet.
	FreeReader (see page 20166)	This is FreeReader, a member of class TCustomSQLDataSet.
V	GetCanModify (see page 20167)	This is GetCanModify, a member of class TCustomSQLDataSet.
V	GetDataSource (see page 20167)	This is GetDataSource, a member of class TCustomSQLDataSet.
	GetObjectTypeNames (see page 20169)	This is GetObjectTypeNames, a member of class TCustomSQLDataSet.
	GetOutputParams (see page 20169)	This is GetOutputParams, a member of class TCustomSQLDataSet.
V	GetRecord (see page 20170)	This is GetRecord, a member of class TCustomSQLDataSet.
V	GetRecordCount (see page 20170)	This is GetRecordCount, a member of class TCustomSQLDataSet.
	GetSortFieldNames (see page 20170)	This is GetSortFieldNames, a member of class TCustomSQLDataSet.
V	InitRecord (see page 20170)	This is InitRecord, a member of class TCustomSQLDataSet.
V	InternalClose (see page 20171)	This is InternalClose, a member of class TCustomSQLDataSet.
V	InternalHandleException (see page 20171)	This is InternalHandleException, a member of class TCustomSQLDataSet.
V	InternalInitFieldDefs (see page 20171)	This is InternalInitFieldDefs, a member of class TCustomSQLDataSet.
V	InternalOpen (see page 20171)	This is InternalOpen, a member of class TCustomSQLDataSet.
V	InternalRefresh (see page 20171)	This is InternalRefresh, a member of class TCustomSQLDataSet.
V	IsCursorOpen (see page 20172)	This is IsCursorOpen, a member of class TCustomSQLDataSet.
V	Loaded (see page 20172)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 20173)	This is LocateRecord, a member of class TCustomSQLDataSet.
V	OpenCursor (see page 20174)	This is OpenCursor, a member of class TCustomSQLDataSet.
V	OpenSchema (see page 20174)	This is OpenSchema, a member of class TCustomSQLDataSet.
	PropertyChanged (see page 20175)	This is PropertyChanged, a member of class TCustomSQLDataSet.
V	PSEndTransaction (see page 20175)	Ends a transaction that was started by a call to PSStartTransaction.
V	PSExecute (see page 20176)	Executes the SQL command associated with the dataset.
V	PSExecuteStatement (see page 20176)	This is PSExecuteStatement, a member of class TCustomSQLDataSet.
V	PSGetAttributes (see page 20176)	Returns information that is stored in data packets as Name/Value pairs.
V	PSGetCommandText (see page 20177)	Gets the SQL command to be executed by PSExecute.
V	PSGetCommandType (see page 20177)	Gets the command type to be executed by PSExecute.
V	PSGetDefaultOrder (see page 20178)	Returns the definition of an index that imposes the default order on the data included in data packets.
V	PSGetIndexDefs (see page 20178)	Returns the definitions of all specified indexes defined for the dataset.
V	PSGetKeyFieldsW (see page 20179)	This is PSGetKeyFieldsW, a member of class TCustomSQLDataSet.
V	PSGetParams (see page 20179)	Returns the current parameter values of the dataset.
V	PSGetQuoteCharW (see page 20179)	This is PSGetQuoteCharW, a member of class TCustomSQLDataSet.
V	PSGetTableNameW (see page 20179)	This is PSGetTableNameW, a member of class TCustomSQLDataSet.
V	PSGetUpdateException (see page 20180)	Generates an EUpdateError object based on another exception object.
V	PSInTransaction (see page 20180)	Indicates whether actions against the dataset occur in the context of a transaction.
V	PSIsSQLBased (see page 20180)	Indicates whether the dataset includes native SQL support.
V	PSIsSQLSupported (see page 20181)	Indicates whether the dataset can execute SQL statements.
V	PSReset (see page 20181)	Resets the dataset so that it is positioned on the first record.
V	PSSetCommandText (see page 20182)	Assigns a specified SQL command to be executed by PSExecute.
V	PSSetParams (see page 20182)	Assigns the specified parameter values to the dataset.

	PSStartTransaction (see page 20182)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 20183)	Applies a single update to the underlying database table or tables.
	SetBufListSize (see page 20184)	This is SetBufListSize, a member of class TCustomSQLDataSet.
	SetCommandText (see page 20184)	This is SetCommandText, a member of class TCustomSQLDataSet.
	SetFCommandText (see page 20184)	This is SetFCommandText, a member of class TCustomSQLDataSet.
	SetFieldData (see page 20184)	This is SetFieldData, a member of class TCustomSQLDataSet.
	SetMaxBlobSize (see page 20184)	This is SetMaxBlobSize, a member of class TCustomSQLDataSet.
	SetParamsFromCursor (see page 20185)	This is SetParamsFromCursor, a member of class TCustomSQLDataSet.
	SetSortFieldNames (see page 20186)	This is SetSortFieldNames, a member of class TCustomSQLDataSet.
	UpdateIndexDefs (see page 20186)	This is UpdateIndexDefs, a member of class TCustomSQLDataSet.

Public Methods

	Name	Description
	CreateBlobStream (see page 20164)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.
	GetBlobFieldData (see page 20166)	Retrieves the current value of a BLOB field into a buffer.
	GetDetailLinkFields (see page 20167)	Lists the field components that link this dataset as a detail of a master dataset.
	GetFieldData (see page 20168)	This is the overview for the GetFieldData method overload.
	GetKeyFieldNames (see page 20169)	Fills a list with the names of all fields in all indexes defined for the dataset.
	GetQuoteChar (see page 20169)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	IsSequenced (see page 20172)	Indicates whether the dataset can use record numbers to indicate the order of records.
	Locate (see page 20173)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
	Lookup (see page 20174)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	ParamByName (see page 20175)	This is ParamByName, a member of class TCustomSQLDataSet.
	PrepareStatement (see page 20175)	Performs a prepare on the SQL statement.
	SetSchemaInfo (see page 20185)	Indicates whether the dataset represents metadata from the server, and if so, what kind.

149.1.2.4.1 TCustomSQLDataSet.AddFieldDesc Method

Pascal

```
procedure AddFieldDesc(FieldDescs: TFieldDescList; DescNo: Integer; var FieldID: Integer;
RequiredFields: TBits; FieldDefs: TFieldDefs);
```

C++

```
__fastcall AddFieldDesc(TFieldDescList FieldDescs, int DescNo, int FieldID, TBits
RequiredFields, TFieldDefs FieldDefs);
```

Description

This is AddFieldDesc, a member of class TCustomSQLDataSet.

149.1.2.4.2 TCustomSQLDataSet.AddIndexDefs Method

Pascal

```
procedure AddIndexDefs(SourceDS: TCustomSQLDataSet; IndexName: string = '');
```

C++

```
__fastcall AddIndexDefs(TCustomSQLDataSet SourceDS, AnsiString IndexName = '');
```

Description

This is AddIndexDefs, a member of class TCustomSQLDataSet.

149.1.2.4.3 TCustomSQLDataSet.CheckPrepareError Method

Pascal

```
procedure CheckPrepareError;
```

C++

```
__fastcall CheckPrepareError();
```

Description

This is CheckPrepareError, a member of class TCustomSQLDataSet.

149.1.2.4.4 TCustomSQLDataSet.ClearIndexDefs Method

Pascal

```
procedure ClearIndexDefs;
```

C++

```
__fastcall ClearIndexDefs();
```

Description

This is ClearIndexDefs, a member of class TCustomSQLDataSet.

149.1.2.4.5 TCustomSQLDataSet.CloseCursor Method

Pascal

```
procedure CloseCursor; override;
```

C++

```
virtual __fastcall CloseCursor();
```

Description

This is CloseCursor, a member of class TCustomSQLDataSet.

149.1.2.4.6 TCustomSQLDataSet.CloseStatement Method

Pascal

```
procedure CloseStatement;
```

C++

```
__fastcall CloseStatement();
```

Description

This is CloseStatement, a member of class TCustomSQLDataSet.

149.1.2.4.7 TCustomSQLDataSet.CreateBlobStream Method

Creates a blob stream for a Binary large object (BLOB) field in the dataset.

Pascal

```
function CreateBlobStream(Field: TField; Mode: TBlobStreamMode): TStream; override;
```

C++

```
virtual __fastcall TStream CreateBlobStream(TField Field, TBlobStreamMode Mode);
```

Description

Call CreateBlobStream to obtain a stream for reading and writing the value of the field specified by the Field parameter.

Field is a string containing the name of the BLOB field in the dataset. It must be an instance of TBlobField or one of its descendants.

Mode indicates whether the stream will be used for reading the field's value (bmRead), writing the field's value (bmWrite), or both (bmReadWrite).

CreateBlobStream returns the stream you can use for reading or writing data.

See Also

TSQLBlobStream (see page 20213)

TBlobField (see page 6801)

149.1.2.4.8 TCustomSQLDataSet.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

See Also

Ancestor (see page 2839)

DefineBinaryProperty (see page 2837)

DefineProperties (see page 2931)

DefineProperty (see page 2838)

149.1.2.4.9 TCustomSQLDataSet.ExecSQL Method

Pascal

```
function ExecSQL(ExecDirect: Boolean = False): Integer; virtual;
```

C++

```
virtual __fastcall int ExecSQL(Boolean ExecDirect = False);
```

Description

This is ExecSQL, a member of class TCustomSQLDataSet.

149.1.2.4.10 TCustomSQLDataSet.ExecuteStatement Method

Pascal

```
procedure ExecuteStatement;
```

C++

```
__fastcall ExecuteStatement();
```

Description

This is ExecuteStatement, a member of class TCustomSQLDataSet.

149.1.2.4.11 TCustomSQLDataSet.FreeBuffers Method

Pascal

```
procedure FreeBuffers;
```

C++

```
__fastcall FreeBuffers();
```

Description

This is FreeBuffers, a member of class TCustomSQLDataSet.

149.1.2.4.12 TCustomSQLDataSet.FreeCommand Method

Pascal

```
procedure FreeCommand;
```

C++

```
__fastcall FreeCommand();
```

Description

This is FreeCommand, a member of class TCustomSQLDataSet.

149.1.2.4.13 TCustomSQLDataSet.FreeReader Method

Pascal

```
procedure FreeReader;
```

C++

```
__fastcall FreeReader();
```

Description

This is FreeReader, a member of class TCustomSQLDataSet.

149.1.2.4.14 TCustomSQLDataSet.GetBlobFieldData Method

Retrieves the current value of a BLOB field into a buffer.

Pascal

```
function GetBlobFieldData(FieldNo: Integer; var Buffer: TBlobByteData): Integer; override;
```

C++

```
virtual __fastcall int GetBlobFieldData(int FieldNo, TBlobByteData Buffer);
```

Description

This method is used internally to read BLOB data from the field specified by FieldNo into a Buffer. The buffer is a dynamic array of bytes, so that it can grow to accommodate the size of the BLOB data. GetBlobFieldData returns the size of the buffer.

GetBlobFieldData is intended primarily for internal use. Applications should use the BLOB stream returned by the CreateBlobStream (see page 20164) method to access BLOB data.

See Also

GetFieldData (see page 20168)

IsBlob (see page 7136)

CreateBlobStream (see page 20164)

GetBlobSize

149.1.2.4.15 TCustomSQLDataSet.GetCanModify Method

Pascal

```
function GetCanModify: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetCanModify();
```

Description

This is GetCanModify, a member of class TCustomSQLDataSet.

149.1.2.4.16 TCustomSQLDataSet.GetDataSource Method

Pascal

```
function GetDataSource: TDataSource; override;
```

C++

```
virtual __fastcall TDataSource GetDataSource();
```

Description

This is GetDataSource, a member of class TCustomSQLDataSet.

149.1.2.4.17 TCustomSQLDataSet.GetDetailLinkFields Method

Lists the field components that link this dataset as a detail of a master dataset.

Pascal

```
procedure GetDetailLinkFields(MasterFields: TList; DetailFields: TList); override;
```

C++

```
virtual __fastcall GetDetailLinkFields(TList MasterFields, TList DetailFields);
```

Description

GetDetailLInkFIelds fills the two lists with field components that define a master-detail relationship between this dataset and another (master) dataset. The MasterFields list is filled with fields from the master table whose values must equal the values of the fields in the DetailFields list. The DetailFields list is filled with fields from this dataset.

Applications seldom call GetDetailLinkFields. It is used internally by the Field Link designer when setting up master/detail relationships.

See Also

DataSource (see page 20192)

MasterFields (see page 20356)

MasterSource (see page 20357)

149.1.2.4.18 GetFieldData Method

This is the overview for the GetFieldData method overload.

Overload List

	Name	Description
	TCustomSQLDataSet.GetFieldData (Integer, Pointer) (see page 20168)	Retrieves the current value of a field into a buffer.
	TCustomSQLDataSet.GetFieldData (TField, Pointer) (see page 20168)	Retrieves the current value of a field into a buffer.

149.1.2.4.18.1 TCustomSQLDataSet.GetFieldData Method (Integer, Pointer)

Retrieves the current value of a field into a buffer.

Pascal

```
function GetFieldData(FieldNo: Integer; Buffer: Pointer): Boolean; override; overload;
function GetFieldData(Field: TField; Buffer: Pointer): Boolean; override; overload;
```

C++

```
virtual __fastcall Boolean GetFieldData(int FieldNo, void * Buffer);
virtual __fastcall Boolean GetFieldData(TField Field, void * Buffer);
```

Description

Most applications do not need to call GetFieldData. TField objects call this method to implement their GetData method.

The Field or FieldNo parameter indicates the field whose data should be fetched. Field specifies the component itself, while FieldNo indicates its field number.

Buffer is a memory buffer with sufficient space to accept the value of the field as it exists in the database (unformatted and untranslated). GetFieldData returns a value that indicates whether the data was successfully fetched.

GetFieldData returns a value that indicates whether the data was successfully fetched.

See Also

GetBlobFieldData (see page 20166)

IsBlob (see page 7136)

GetData (see page 7131)

149.1.2.4.19 TCustomSQLDataSet.GetKeyFieldNames Method

Fills a list with the names of all fields in all indexes defined for the dataset.

Pascal

```
function GetKeyFieldNames(List: TWideStrings): Integer; overload;
```

C++

```
__fastcall int GetKeyFieldNames(TWideStrings List);
```

Description

Call GetKeyFieldNames to fill a string list with information about the indexes that are available on the database server for this dataset.

For every index defined on the server for the dataset, GetKeyFieldNames adds a string to the string list specified by List. Each string is a semicolon-delimited set of field names that lists the fields in a single index.

TCustomSQLDataSet (see page 20150) does not explicitly use these indexes. GetKeyFieldNames can be useful for composing SQL commands dynamically that need to use an index to access fields.

See Also

IndexDefs (see page 20193)

149.1.2.4.20 TCustomSQLDataSet.GetObjectTypeNames Method

Pascal

```
procedure GetObjectTypeNames(Fields: TFields);
```

C++

```
__fastcall GetObjectTypeNames(TFields Fields);
```

Description

This is GetObjectTypeNames, a member of class TCustomSQLDataSet.

149.1.2.4.21 TCustomSQLDataSet.GetOutputParams Method

Pascal

```
procedure GetOutputParams(AProcParams: TList = nil);
```

C++

```
__fastcall GetOutputParams(TList AProcParams = nil);
```

Description

This is GetOutputParams, a member of class TCustomSQLDataSet.

149.1.2.4.22 TCustomSQLDataSet.GetQuoteChar Method

Returns the character or characters to use in generated SQL statements to enclose quoted strings.

Pascal

```
function GetQuoteChar: WideString; virtual;
```

C++

```
virtual __fastcall BSTR GetQuoteChar();
```

Description

GetQuoteChar returns the character or characters that delimit quoted strings in automatically generated SQL statements. This string appears both before and after quoted strings.

149.1.2.4.23 TCustomSQLDataSet.GetRecord Method

Pascal

```
function GetRecord(Buffer: TRecordBuffer; GetMode: TGetMode; DoCheck: Boolean): TGetResult;
override;
```

C++

```
virtual __fastcall TGetResult GetRecord(TRecordBuffer Buffer, TGetMode GetMode, Boolean
DoCheck);
```

Description

This is GetRecord, a member of class TCustomSQLDataSet.

149.1.2.4.24 TCustomSQLDataSet.GetRecordCount Method

Pascal

```
function GetRecordCount: Integer; override;
```

C++

```
virtual __fastcall int GetRecordCount();
```

Description

This is GetRecordCount, a member of class TCustomSQLDataSet.

149.1.2.4.25 TCustomSQLDataSet.GetSortFieldNames Method

Pascal

```
function GetSortFieldNames: WideString;
```

C++

```
__fastcall BSTR GetSortFieldNames();
```

Description

This is GetSortFieldNames, a member of class TCustomSQLDataSet.

149.1.2.4.26 TCustomSQLDataSet.InitRecord Method

Pascal

```
procedure InitRecord(Buffer: TRecordBuffer); override;
```

C++

```
virtual __fastcall InitRecord(TRecordBuffer Buffer);
```

Description

This is InitRecord, a member of class TCustomSQLDataSet.

149.1.2.4.27 TCustomSQLDataSet.InternalClose Method

Pascal

```
procedure InternalClose; override;
```

C++

```
virtual __fastcall InternalClose();
```

Description

This is InternalClose, a member of class TCustomSQLDataSet.

149.1.2.4.28 TCustomSQLDataSet.InternalHandleException Method

Pascal

```
procedure InternalHandleException; override;
```

C++

```
virtual __fastcall InternalHandleException();
```

Description

This is InternalHandleException, a member of class TCustomSQLDataSet.

149.1.2.4.29 TCustomSQLDataSet.InternalInitFieldDefs Method

Pascal

```
procedure InternalInitFieldDefs; override;
```

C++

```
virtual __fastcall InternalInitFieldDefs();
```

Description

This is InternalInitFieldDefs, a member of class TCustomSQLDataSet.

149.1.2.4.30 TCustomSQLDataSet.InternalOpen Method

Pascal

```
procedure InternalOpen; override;
```

C++

```
virtual __fastcall InternalOpen();
```

Description

This is InternalOpen, a member of class TCustomSQLDataSet.

149.1.2.4.31 TCustomSQLDataSet.InternalRefresh Method

Pascal

```
procedure InternalRefresh; override;
```

C++

```
virtual __fastcall InternalRefresh();
```

Description

This is InternalRefresh, a member of class TCustomSQLDataSet.

149.1.2.4.32 TCustomSQLDataSet.IsCursorOpen Method

Pascal

```
function IsCursorOpen: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCursorOpen();
```

Description

This is IsCursorOpen, a member of class TCustomSQLDataSet.

149.1.2.4.33 TCustomSQLDataSet.IsSequenced Method

Indicates whether the dataset can use record numbers to indicate the order of records.

Pascal

```
function IsSequenced: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsSequenced();
```

Description

Datasets use IsSequenced to indicate whether the RecNo property corresponds to the order of records. When IsSequenced returns true, applications can safely use the RecNo property to navigate to records in the dataset.

Note: For TCustomSQLDataSet (see page 20150), IsSequenced always returns false because TCustomSQLDataSet (see page 20150) descendants do not support record numbers at all.

See Also

RecNo (see page 7031)

RecordCount (see page 20199)

149.1.2.4.34 TCustomSQLDataSet.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the

components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

See Also

ComponentState (see page 2804)

Create (see page 2766)

TReader (see page 2933)

149.1.2.4.35 TCustomSQLDataSet.Locate Method

Implements a virtual method for searching a dataset for a specified record and making it the active record.

Pascal

```
function Locate(const KeyFields: string; const KeyValues: Variant; Options: TLocateOptions):
Boolean; override;
```

C++

```
virtual __fastcall Boolean Locate(const AnsiString KeyFields, const Variant KeyValues,
TLocateOptions Options);
```

Description

This function:

Checks whether the dataset is unidirectional, and if so, raises an EDatabaseError exception.

Returns false, indicating that a matching record was not found and the active record was not changed.

Descendant classes that are not unidirectional override this method so that it locates the record where the fields identified by the semicolon-separated list of fields in KeyFields have the values specified by the Variant or Variant array KeyValues. Options indicates whether the search is case insensitive and whether partial matches are supported. Locate returns true if a record is found that matches the specified criteria and that record is now active.

See Also

FindField (see page 6938)

Lookup (see page 6970)

149.1.2.4.36 TCustomSQLDataSet.LocateRecord Method

Pascal

```
function LocateRecord(const KeyFields: string; const KeyValues: Variant; Options:
TLocateOptions; SyncCursor: Boolean): Boolean;
```

C++

```
__fastcall Boolean LocateRecord(const AnsiString KeyFields, const Variant KeyValues,
TLocateOptions Options, Boolean SyncCursor);
```

Description

This is LocateRecord, a member of class TCustomSQLDataSet.

149.1.2.4.37 TCustomSQLDataSet.Lookup Method

Implements a virtual method to retrieve field values from a record that matches specified search values.

Pascal

```
function Lookup(const KeyFields: string; const KeyValues: Variant; const ResultFields:
string): Variant; override;
```

C++

```
virtual __fastcall Variant Lookup(const AnsiString KeyFields, const Variant KeyValues, const
AnsiString ResultFields);
```

Description

This function:

Checks whether the dataset is unidirectional, and if so, raises an EDatabaseError exception.

Returns a Variant with the value false, indicating that a matching record was not found.

Descendant classes that are not unidirectional override this method so that it locates the record where the fields identified by the comma-delimited string KeyFields have the values specified by the Variant or Variant array KeyValues. In classes that implement Lookup, it returns a Variant or Variant array that contains the value or values of the fields specified by the comma-delimited string ResultFields on the specified record.

See Also

Locate (see page 20173)

149.1.2.4.38 TCustomSQLDataSet.OpenCursor Method

Pascal

```
procedure OpenCursor(InfoQuery: Boolean); override;
```

C++

```
virtual __fastcall OpenCursor(Boolean InfoQuery);
```

Description

This is OpenCursor, a member of class TCustomSQLDataSet.

149.1.2.4.39 TCustomSQLDataSet.OpenSchema Method

Pascal

```
procedure OpenSchema; virtual;
```

C++

```
virtual __fastcall OpenSchema();
```

Description

This is OpenSchema, a member of class TCustomSQLDataSet.

149.1.2.4.40 TCustomSQLDataSet.ParamByName Method

Pascal

```
function ParamByName(const Value: string): TParam;
```

C++

```
__fastcall TParam ParamByName(const AnsiString Value);
```

Description

This is ParamByName, a member of class TCustomSQLDataSet.

149.1.2.4.41 TCustomSQLDataSet.PrepareStatement Method

Performs a prepare on the SQL statement.

Pascal

```
procedure PrepareStatement; virtual;
```

C++

```
virtual __fastcall PrepareStatement();
```

Description

The prepare operation is a type of pre-compile that checks the performance of the SQL statement. Some databases support a prepare statement that creates an execution plan that speeds processing.

149.1.2.4.42 TCustomSQLDataSet.PropertyChanged Method

Pascal

```
procedure PropertyChanged;
```

C++

```
__fastcall PropertyChanged();
```

Description

This is PropertyChanged, a member of class TCustomSQLDataSet.

149.1.2.4.43 TCustomSQLDataSet.PSEndTransaction Method

Ends a transaction that was started by a call to PSStartTransaction.

Pascal

```
procedure PSEndTransaction(Commit: Boolean); override;
```

C++

```
virtual __fastcall PSEndTransaction(Boolean Commit);
```

Description

The provider component applies updates within a transaction, if possible. To do so, it uses PSEndTransaction in conjunction with the PSStartTransaction method.

The Commit parameter indicates whether the dataset should commit the current transaction (Commit is true), or roll it back (Commit is false).

Note: TDataSetProvider only starts a transaction (Using PSStartTransaction) if the PSInTransaction method indicates that there is no transaction already established. That is, it does not assume nested transaction support is available. Thus, there is no need to ensure that PSEndTransaction does not terminate a transaction that was not started by the provider.

See Also

PSStartTransaction (see page 7586)

PSInTransaction (see page 7583)

applyupdates (see page 18459)

149.1.2.4.44 TCustomSQLDataSet.PSExecute Method

Executes the SQL command associated with the dataset.

Pascal

```
procedure PSExecute; override;
```

C++

```
virtual __fastcall PSExecute();
```

Description

The provider component calls PSExecute to implement its Execute method. If the dataset represents a query or stored procedure that does not return a cursor, this method executes the query or stored procedure. If the provider Options includes poAllowCommandText and the dataset supports the PSSetCommandText method, the statement specified by PSSetCommandText may be executed instead.

If there is not statement to execute, PSExecute raises an EDatabaseError exception.

See Also

PSSetCommandText (see page 7585)

Execute (see page 18466)

Options (see page 18440)

149.1.2.4.45 TCustomSQLDataSet.PSExecuteStatement Method

Pascal

```
function PSExecuteStatement(const ASQL: WideString; AParams: TParams; ResultSet: TPSResult =
nil): Integer; override;
```

C++

```
virtual __fastcall int PSExecuteStatement(const BSTR ASQL, TParams AParams, TPSResult
ResultSet = nil);
```

Description

This is PSExecuteStatement, a member of class TCustomSQLDataSet.

149.1.2.4.46 TCustomSQLDataSet.PSGetAttributes Method

Returns information that is stored in data packets as Name/Value pairs.

Pascal

```
procedure PSGetAttributes(List: TList); override;
```

C++

```
virtual __fastcall PSGetAttributes(TList List);
```

Description

The provider component calls PSGetAttributes to add information about the dataset to the metadata stored with generated data packets. This information is stored as Name/Value pairs that are added to the list specified by the List parameter.

See Also

DoGetProviderAttributes (see page 18521)

149.1.2.4.47 TCustomSQLDataSet.PSGetCommandText Method

Gets the SQL command to be executed by PSExecute.

Pascal

```
function PSGetCommandText: string; override;
```

C++

```
virtual __fastcall AnsiString PSGetCommandText();
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText, and subsequently executed by a call to PSExecute.

See Also

CommandText (see page 8465)

PSExecute (see page 7578)

PSSetCommandText (see page 7585)

GetRecords (see page 18468)

Execute (see page 18466)

Options (see page 18440)

149.1.2.4.48 TCustomSQLDataSet.PSGetCommandType Method

Gets the command type to be executed by PSExecute.

Pascal

```
function PSGetCommandType: TPSCommandType; override;
```

C++

```
virtual __fastcall TPSCommandType PSGetCommandType();
```

Description

PSGetCommandType gets the command type executed by PSExecute. The type may be a type of SQL command or other command types, such as stored procedures.

See Also

CommandText (see page 8465)

PSExecute (see page 7578)

PSGetCommandText (see page 7579)

Execute (see page 18466)

Options (see page 18440)

149.1.2.4.49 TCustomSQLDataSet.PSGetDefaultOrder Method

Returns the definition of an index that imposes the default order on the data included in data packets.

Pascal

```
function PSGetDefaultOrder: TIndexDef; override;
```

C++

```
virtual __fastcall TIndexDef PSGetDefaultOrder();
```

Description

The provider component calls PSGetDefaultOrder to generate a default index, called DEFAULT_ORDER, for the records that appear in data packets. This index defines the default sort order for records when they appear in the client dataset on the client.

PSGetDefaultOrder creates a TIndexDef object to describe the default index. The provider that calls PSGetDefaultOrder subsequently frees this TIndexDef object.

See Also

CreateDataPacket (see page 18518)

149.1.2.4.50 TCustomSQLDataSet.PSGetIndexDefs Method

Returns the definitions of all specified indexes defined for the dataset.

Pascal

```
function PSGetIndexDefs(IndexTypes: TIndexOptions): TIndexDefs; override;
```

C++

```
virtual __fastcall TIndexDefs PSGetIndexDefs(TIndexOptions IndexTypes);
```

Description

The provider component calls PSGetIndexDefs to locate an index that contains information it needs. For example, it uses PSGetIndexDefs to locate an index that contains the key fields returned by PSGetKeyFields. This information allows the provider to locate the records that need to change when it applies updates. The provider also calls this method to locate indexes that it adds to the metadata of data packets.

IndexTypes indicates the options required of the returned indexes. PSGetIndexDefs returns all indexes whose Options property includes the specified flags.

PSGetIndexDefs returns a TIndexDefs object that contains all the indexes of the dataset that match the IndexTypes parameter.

See Also

Options (see page 7291)

PSGetKeyFields (see page 7581)

PSGetDefaultOrder (see page 7580)

149.1.2.4.51 TCustomSQLDataSet.PSGetKeyFieldsW Method

Pascal

```
function PSGetKeyFieldsW: WideString; override;
```

C++

```
virtual __fastcall BSTR PSGetKeyFieldsW();
```

Description

This is PSGetKeyFieldsW, a member of class TCustomSQLDataSet.

149.1.2.4.52 TCustomSQLDataSet.PSGetParams Method

Returns the current parameter values of the dataset.

Pascal

```
function PSGetParams: TParams; override;
```

C++

```
virtual __fastcall TParams PSGetParams();
```

Description

The provider component calls PSGetParams to implement its GetParams method.

PSGetParams returns a TParams object that describes the current values of all parameters of the dataset. If the dataset does not have any parameters, PSGetParams returns nil (Delphi) or NULL (C++).

Note: The PSGetParams method should not create a new instance of TParams for the return value. The provider that calls PSGetParams does not free the returned value.

See Also

GetParams (see page 18467)

149.1.2.4.53 TCustomSQLDataSet.PSGetQuoteCharW Method

Pascal

```
function PSGetQuoteCharW: WideString; override;
```

C++

```
virtual __fastcall BSTR PSGetQuoteCharW();
```

Description

This is PSGetQuoteCharW, a member of class TCustomSQLDataSet.

149.1.2.4.54 TCustomSQLDataSet.PSGetTableNameW Method

Pascal

```
function PSGetTableNameW: WideString; override;
```

C++

```
virtual __fastcall BSTR PSGetTableNameW();
```

Description

This is PSGetTableNameW, a member of class TCustomSQLDataSet.

149.1.2.4.55 TCustomSQLDataSet.PSGetUpdateException Method

Generates an EUpdateError object based on another exception object.

Pascal

```
function PSGetUpdateException(E: Exception; Prev: EUpdateError): EUpdateError; override;
```

C++

```
virtual __fastcall EUpdateError PSGetUpdateException(Exception E, EUpdateError Prev);
```

Description

The provider component calls PSGetUpdateException when the exception E occurs while applying updates. This method allows the provider to create a single EUpdateError object that encapsulates all the exceptions that occur in an update operation.

PSGetUpdateError determines the error message, context string, and error code from the exception specified by E and creates a new EUpdateError exception that includes that information as well as the information about a previous error as specified by Prev. The context string and error code for E may be specific to the Exception class associated with the dataset. By default, TDataSet generates an EUpdateError with an error code of 1 and an empty context string.

See Also

Create (see page 6733)

149.1.2.4.56 TCustomSQLDataSet.PSInTransaction Method

Indicates whether actions against the dataset occur in the context of a transaction.

Pascal

```
function PSInTransaction: Boolean; override;
```

C++

```
virtual __fastcall Boolean PSInTransaction();
```

Description

The provider component applies updates within a transaction, if possible. To do so, it first checks whether a transaction is already underway, and if not, generates one using PSStartTransaction. To determine whether a transaction is already underway, the provider calls PSInTransaction.

PSInTransaction returns true if there is a transaction underway, and false otherwise.

See Also

PSStartTransaction (see page 7586)

PSEndTransaction (see page 7578)

149.1.2.4.57 TCustomSQLDataSet.PSIsSQLBased Method

Indicates whether the dataset includes native SQL support.

Pascal

```
function PSIsSQLBased: Boolean; override;
```

C++

```
virtual __fastcall Boolean PSIsSQLBased();
```

Description

The provider calls PSIsSQLBased to determine whether the dataset supports some form of native SQL. This information is used when generating SQL commands that are executed by PSExecuteStatement.

Even if the dataset is not SQL-based, it may still allow the provider to execute SQL statements for applying updates. For example, BDE-enabled local databases such as Paradox and DBASE provide SQL support via the BDE's local SQL engine, but are not SQL-based. However, table and field names are not specified in the same way for the local SQL engine as they are for native SQL. The provider uses PSIsSQLBased to determine how these names should appear in generated SQL.

Note: The PSIsSQLSupported method indicates whether the dataset can execute SQL commands at all, regardless of whether the dataset is SQL-based.

See Also

PSIsSQLSupported (see page 7584)

PSExecuteStatement (see page 7579)

149.1.2.4.58 TCustomSQLDataSet.PSIsSQLSupported Method

Indicates whether the dataset can execute SQL statements.

Pascal

```
function PSIsSQLSupported: Boolean; override;
```

C++

```
virtual __fastcall Boolean PSIsSQLSupported();
```

Description

PSIsSQLSupported indicates whether the provider can call PSExecuteStatement to execute an SQL statement. When PSIsSQLSupported returns false, calling PSExecuteStatement generates an exception. The provider can still work with a dataset that returns false from PSIsSQLSupported, but it must set the ResolveToDataSet property to true, or provide data on a read-only basis.

See Also

PSIsSQLBased (see page 7584)

PSExecuteStatement (see page 7579)

ResolveToDataSet (see page 18531)

149.1.2.4.59 TCustomSQLDataSet.PSReset Method

Resets the dataset so that it is positioned on the first record.

Pascal

```
procedure PSReset; override;
```

C++

```
virtual __fastcall PSReset();
```

Description

The provider calls PSReset to reposition the dataset on the first record before fetching records.

See Also

GetRecords (see page 18468)

AS_GetRecords (see page 16455)

149.1.2.4.60 TCustomSQLDataSet.PSSetCommandText Method

Assigns a specified SQL command to be executed by PSExecute.

Pascal

```
procedure PSSetCommandText(const ACommandText: WideString); override;
```

C++

```
virtual __fastcall PSSetCommandText(const BSTR ACommandText);
```

Description

If the provider's Options property includes poAllowCommandText, clients can supply an SQL command along with a call to GetRecords or Execute. This command is passed to the dataset by a call to PSSetCommandText, and subsequently executed by a call to PSExecute.

The value of the CommandText parameter replaces the dataset's SQL statement (if it has one), or replaces the name of an underlying database table or stored procedure.

See Also

CommandText (see page 8465)

PSExecute (see page 7590)

GetRecords (see page 18468)

Execute (see page 18466)

Options (see page 18440)

149.1.2.4.61 TCustomSQLDataSet.PSSetParams Method

Assigns the specified parameter values to the dataset.

Pascal

```
procedure PSSetParams(AParams: TParams); override;
```

C++

```
virtual __fastcall PSSetParams(TParams AParams);
```

Description

PSSetParams assigns the parameter values specified by AParams to the parameters of the dataset.

See Also

Params (see page 8489)

PSGetParams (see page 7582)

149.1.2.4.62 TCustomSQLDataSet.PSStartTransaction Method

Starts a transaction that encapsulates all activity until a call to PSEndTransaction.

Pascal

```
procedure PSStartTransaction; override;
```

C++

```
virtual __fastcall PSStartTransaction();
```

Description

The provider component applies updates within a transaction, if possible. To do so, it calls PSStartTransaction to start a transaction before applying updates, and calls PSEndTransaction when all updates are applied or too many errors are encountered.

Note: TDataSetProvider only starts a transaction (Using PSStartTransaction) if the PSInTransaction method indicates that there is no transaction already established. That is, it does not assume nested transaction support is available.

See Also

PSEndTransaction (see page 7578)

PSInTransaction (see page 7583)

applyupdates (see page 18459)

149.1.2.4.63 TCustomSQLDataSet.PSUpdateRecord Method

Applies a single update to the underlying database table or tables.

Pascal

```
function PSUpdateRecord(UpdateKind: TUpdateKind; Delta: TDataSet): Boolean; override;
```

C++

```
virtual __fastcall Boolean PSUpdateRecord(TUpdateKind UpdateKind, TDataSet Delta);
```

Description

Before the provider generates SQL statements to apply an update, it calls PSUpdateRecord to let the dataset apply the update in some other fashion. For example, BDE-enabled datasets generate an OnUpdateRecord to allow the application to apply the update and, if the OnUpdateRecord event handler does not apply the update, uses any associated TUpdateSQL object to apply the update.

UpdateKind indicates whether the update is an insertion (ukInsert), deletion (ukDelete), or modification (ukModify).

Delta is the delta datapacket. The current record represents the record to be updated.

PSUpdateRecord returns true if it updates the record, false otherwise. If PSUpdateRecord returns false, the provider generates dynamic SQL to perform the update and calls PSExecuteStatement.

Note: PSUpdateRecord is only called if the provider's ResolveToDataSet property is false.

See Also

OnUpdateRecord (see page 9957)

TUpdateSQL (see page 10229)

applyupdates (see page 18459)

ResolveToDataSet (see page 18531)

PSExecuteStatement (see page 7579)

149.1.2.4.64 TCustomSQLDataSet.SetBufListSize Method

Pascal

```
procedure SetBufListSize(Value: Integer); override;
```

C++

```
virtual __fastcall SetBufListSize(int Value);
```

Description

This is SetBufListSize, a member of class TCustomSQLDataSet.

149.1.2.4.65 TCustomSQLDataSet.SetCommandText Method

Pascal

```
procedure SetCommandText(const Value: WideString); virtual;
```

C++

```
virtual __fastcall SetCommandText(const BSTR Value);
```

Description

This is SetCommandText, a member of class TCustomSQLDataSet.

149.1.2.4.66 TCustomSQLDataSet.SetFCommandText Method

Pascal

```
procedure SetFCommandText(const Value: string);
```

C++

```
__fastcall SetFCommandText(const AnsiString Value);
```

Description

This is SetFCommandText, a member of class TCustomSQLDataSet.

149.1.2.4.67 TCustomSQLDataSet.SetFieldData Method

Pascal

```
procedure SetFieldData(Field: TField; Buffer: Pointer); override;
```

C++

```
virtual __fastcall SetFieldData(TField Field, void * Buffer);
```

Description

This is SetFieldData, a member of class TCustomSQLDataSet.

149.1.2.4.68 TCustomSQLDataSet.SetMaxBlobSize Method

Pascal

```
procedure SetMaxBlobSize(MaxSize: Integer);
```

C++

```
__fastcall SetMaxBlobSize(int MaxSize);
```

Description

This is SetMaxBlobSize, a member of class TCustomSQLDataSet.

149.1.2.4.69 TCustomSQLDataSet.SetParamsFromCursor Method

Pascal

```
procedure SetParamsFromCursor;
```

C++

```
__fastcall SetParamsFromCursor();
```

Description

This is SetParamsFromCursor, a member of class TCustomSQLDataSet.

149.1.2.4.70 TCustomSQLDataSet.SetSchemaInfo Method

Indicates whether the dataset represents metadata from the server, and if so, what kind.

Pascal

```
procedure SetSchemaInfo(SchemaType: TSchemaType; SchemaObjectName: WideString; SchemaPattern:
WideString; PackageName: WideString = '');
```

C++

```
__fastcall SetSchemaInfo(TSchemaType SchemaType, BSTR SchemaObjectName, BSTR SchemaPattern,
BSTR PackageName = '');
```

Description

Call SetSchemaInfo to indicate whether the SQL dataset represents the results of an SQL command (specified by CommandText (see page 20189)) or whether it represents a table of schema information (metadata).

The SchemaType parameter identifies the type of information you want. It can have any of the following values:

Value	Description
stNoSchema	No schema information. The SQL dataset is populated with the results of its query or stored procedure rather than metadata from the server.
stTables	Information about all the data tables on the database server that match the criteria specified by the SQL connection's TableScope property.
stSysTables	Information about all of the system tables on the database server. Not all servers use system tables to store metadata. Requesting a list of system tables from a server that does not use them results in an empty dataset.
stProcedures	Information about all of the stored procedures on the database server.
stColumns	Information about all of the columns (fields) in a specified table.
stProcedureParams	Information about all of the parameters of a specified stored procedure.
stIndexes	Information about all of the indexes defined for a specified table.

SchemaObjectName is the name of the table or stored procedure about whose columns, indexes, or parameters you want information. When SchemaType is stColumns or stIndexes, SchemaObjectName is the name of a table. When SchemaType is stProcedureParams, SchemaObjectName is the name of a stored procedure. When SchemaType is stNoSchema, stTables, stSysTables, or stProcedures, or stPackages, SchemaObjectName is ignored.

SchemaPattern is an SQL pattern mask that filters the resulting dataset. The name of each item (table, stored procedure, field, parameter, or index) must match this pattern mask or it does not appear as a record when the SQL dataset is opened. SchemaPattern uses the wildcards '%' (to match a string of arbitrary characters of any length) and '_' (to match a single arbitrary character). To use a literal percent or underscore in a pattern, the character is doubled (%% or __). If you do not want to use a pattern, set Pattern to nil (Delphi) or NULL (C++).

PackageName is the name of an Oracle package in which to find the stored procedure when SchemaType is stProcedures or stProcedureParams. If the server is not an Oracle server, or if the stored procedure is not defined in a package, PackageName should be an empty string.

After a call to SetSchemaInfo, opening the dataset results in a dataset populated with the specified information. If SchemaType is stNoSchema, the dataset reverts to the command specified by CommandText (see page 20189).

Note: When you change the CommandText (see page 20189) property, the dataset automatically reverts to a SchemaType of stNoSchema.

Open (see page 6976)

CommandText (see page 20189)

TableScope (see page 20255)

Fetching Metadata into a Unidirectional Dataset

Accessing Schema Information

149.1.2.4.71 TCustomSQLDataSet.SetSortFieldNames Method

Pascal

```
procedure SetSortFieldNames(Value: WideString);
```

C++

```
__fastcall SetSortFieldNames(BSTR Value);
```

Description

This is SetSortFieldNames, a member of class TCustomSQLDataSet.

149.1.2.4.72 TCustomSQLDataSet.UpdateIndexDefs Method

Pascal

```
procedure UpdateIndexDefs; override;
```

C++

```
virtual __fastcall UpdateIndexDefs();
```

Description

This is UpdateIndexDefs, a member of class TCustomSQLDataSet.

149.1.2.5 TCustomSQLDataSet Properties

The properties of the TCustomSQLDataSet class are listed here.

Protected Properties

	Name	Description
	BlobBuffer (see page 20189)	Reserves a buffer for storing BLOB values.
	CommandType (see page 20190)	Indicates the meaning of the CommandText (see page 20189) property.
	CurrentBlobSize (see page 20191)	Indicates the size of the most recently read BLOB field.
R	DataLink (see page 20191)	Identifies the datalink that manages communication between the SQL dataset and another, master dataset.
	DataSource (see page 20192)	Links the SQL dataset to another (master) dataset.
R	InternalConnection (see page 20194)	Indicates the component that connects the dataset to its database server, taking into account whether the connection was cloned.
	LastError (see page 20194)	Saves the error message for the last error returned by dbExpress.
	MaxBlobSize (see page 20194)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.
	NativeCommand (see page 20195)	Represents the SQL command that is sent to the server.
	ParamCheck (see page 20196)	Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.
R	ParamCount (see page 20197)	Indicates the number of parameters listed by the Params (see page 20197) property.
	Params (see page 20197)	Represents the parameters for a query or stored procedure.
	ProcParams (see page 20199)	ProcParams lists the parameter descriptors obtained from the server for any stored procedure parameters.
R	RowsAffected (see page 20200)	Indicates the number of rows operated on by the latest query execution.
	SchemaInfo (see page 20200)	Identifies the metadata with which to populate the dataset.
	SortFieldNames (see page 20201)	Indicates the sort order when CommandType (see page 20190) is ctTable.

Public Properties

	Name	Description
	CommandText (see page 20189)	Specifies the command the dataset executes.
	DesignerData (see page 20192)	Stores custom data.
	IndexDefs (see page 20193)	Contains the definitions of all indexes defined on the server for the dataset.
	Prepared (see page 20198)	Specifies whether the command is prepared before execution.
R	RecordCount (see page 20199)	Indicates the total number of records associated with the dataset.
	SQLConnection (see page 20201)	Specifies the SQL connection component that connects the dataset to a database server.
	TransactionLevel (see page 20202)	Indicates the transaction to which this dataset belongs.

Published Properties

	Name	Description
	Active (see page 20187)	Specifies whether or not a dataset is open.
	GetMetadata (see page 20193)	Specifies whether the SQL dataset fetches metadata information along with the data.
	NumericMapping (see page 20195)	Maps fldBCD to either ftFMTBCD or ftBCD field types.
	ObjectView (see page 20196)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	SchemaName (see page 20201)	Specifies the name of the database schema.

149.1.2.5.1 TCustomSQLDataSet.Active Property

Specifies whether or not a dataset is open.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Use Active to determine or set whether a dataset is populated with data. When Active is false, the dataset is closed; the dataset cannot read or write data and data-aware controls can not use it to fetch data or post edits. When Active is true, the dataset can be populated with data. It can read data from a database or other source (such as a provider). Depending on the CanModify property, active datasets can post changes.

Setting Active to true:

1. Generates a BeforeOpen event.
2. Sets the dataset state to dsBrowse.
3. Establishes a way to fetch data (typically by opening a cursor).
4. Generates an AfterOpen event.

If an error occurs while opening the dataset, dataset state is set to dsInactive, and any cursor is closed.

Setting Active to false:

1. Triggers a BeforeClose event.
2. Sets the State property to dsInactive.
3. Closes the cursor.
4. Triggers an AfterClose event.

An application must set Active to false before changing other properties that affect the status of a database or the controls that display data in an application.

Note: Calling the Open method sets Active to true; calling the Close method sets Active to false.

Delphi Examples:

```
{
This example requires a database with the following name or
in the form of a *.DB file in the following path.  The table
should be closed when changing the database.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Customers.Active := False;
  try
  { First try to use an alias }
    Customers.DatabaseName := 'DBDEMOS';
    Customers.Active := True;
  except
    on EDatabaseError do
    begin
      { If that fails, try to use the drive and directory }
      Customers.TableName := 'Flights';
      Customers.DatabaseName :=
        'c:\Documents and Settings\All Users\Documents\RAD
Studio\5.0\Demos\IntraWeb\Win32\FlightInformation\Data';
      Customers.Active := True;
    end;
  end;
end;
```

Making the Table a Detail of Another Dataset

Opening and Closing Datasets

Fetching the Data

149.1.2.5.2 TCustomSQLDataSet.BlobBuffer Property

Reserves a buffer for storing BLOB values.

Pascal

```
property BlobBuffer: TBlobByteData;
```

C++

```
__property TBlobByteData BlobBuffer;
```

Description

SQL datasets use the BlobBuffer property to allocate a special buffer for holding BLOB data. Applications do not access this protected property.

See Also

MaxBlobSize (see page 20194)

GetBlobFieldData (see page 6947)

149.1.2.5.3 TCustomSQLDataSet.CommandText Property

Specifies the command the dataset executes.

Pascal

```
property CommandText: WideString;
```

C++

```
__property BSTR CommandText;
```

Description

The value of CommandText depends on the CommandType (see page 20190) property:

When CommandType (see page 20190) is ctQuery, CommandText is an SQL statement that the dataset executes. If the statement is a SELECT statement, the SQL dataset executes the statement when it is opened. If the statement does not return a result set, the SQL dataset executes the statement when the ExecSQL (see page 20165) method is called.

When CommandType (see page 20190) is ctStoredProc, CommandText is the name of a stored procedure. The SQL dataset

executes the stored procedure when it is opened or when the ExecSQL (see page 20165) method is called, depending on whether the stored procedure returns a set of records.

When CommandType (see page 20190) is ctTable, CommandText is the name of a table on the database server. The SQL dataset automatically generates a SELECT statement to fetch all the records on all the fields in this table, sorting by the fields listed in the SortFieldNames (see page 20201) property. The generated statement is executed when the dataset is opened.

If CommandText is an SQL statement that includes parameters or the name of a stored procedure that has parameters, use the Params (see page 20197) property to supply parameter values.

149.1.2.5.4 TCustomSQLDataSet.CommandType Property

Indicates the meaning of the CommandText (see page 20189) property.

Pascal

```
property CommandType: TSQLCommandType;
```

C++

```
__property TSQLCommandType CommandType;
```

Description

CommandType indicates the type of command that is contained in the CommandText (see page 20189) property. TCustomSQLDataSet (see page 20150) descendants set this value to the way in which they specify a query or stored procedure.

The following table lists the possible values:

CommandType	Corresponding CommandText (see page 20189)
ctQuery	An SQL statement that the dataset executes.
ctStoredProc	The name of a stored procedure.

ctTable	The name of a table on the database server. The SQL dataset automatically generates a SELECT statement to fetch all the records on all the fields in this table.

149.1.2.5.5 TCustomSQLDataSet.CurrentBlobSize Property

Indicates the size of the most recently read BLOB field.

Pascal

```
property CurrentBlobSize: Int64;
```

C++

```
__property Int64 CurrentBlobSize;
```

Description

Applications can't use this protected property. TCustomSQLDataSet (see page 20150) uses CurrentBlobSize internally to determine the size needed for BlobBuffer (see page 20189). When the dataset reads a BLOB field, it sets CurrentBlobSize to the number of bytes in the BLOB field, as reported by the database driver.

See Also

MaxBlobSize (see page 20194)

BlobBuffer (see page 20189)

149.1.2.5.6 TCustomSQLDataSet.DataLink Property

Identifies the datalink that manages communication between the SQL dataset and another, master dataset.

Pascal

```
property DataLink: TDataLink;
```

C++

```
__property TDataLink DataLink;
```

Description

The protected DataLink property is used internally when the SQL dataset acts as the detail dataset in a master/detail relationship that is not based on nested datasets. The datalink object manages communication between another (master) dataset and this

SQL dataset. For example, it is the datalink that tells this SQL dataset to refresh its data when the active record of the master dataset changes.

Do not use DataLink to establish the relationship between an SQL dataset and another (master) dataset from which it obtains parameter values. Instead, use the DataSource (see page 20192) property, or, if the dataset is TSQLTable (see page 20337), the MasterSource property.

See Also

DataSource (see page 20192)

TSQLDataLink (see page 20260)

MasterSource (see page 20357)

149.1.2.5.7 TCustomSQLDataSet.DataSource Property

Links the SQL dataset to another (master) dataset.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;
```

Description

DataSource links this SQL dataset to another (master) dataset that supplies values for this dataset's parameters.

When the SQL dataset's CommandText (see page 20189) (or SQL) property specifies a parameterized query but the application does not provide values for the corresponding parameters in the Params (see page 20197) property, the SQL dataset fetches parameter values from the dataset identified with the specified data source. When the current record in the dataset associated with DataSource changes, the SQL dataset refreshes its data to reflect the new parameter values.

See Also

CommandText (see page 20189)

SQL (see page 20316)

Params (see page 20197)

MasterSource (see page 20357)

149.1.2.5.8 TCustomSQLDataSet.DesignerData Property

Stores custom data.

Pascal

```
property DesignerData: string;
```

C++

```
__property AnsiString DesignerData;
```

Description

DesignerData has no predefined meaning. Application developers can use the DesignerData property to associate application-specific information with an SQL dataset instance.

See Also

Tag (see page 2808)

149.1.2.5.9 TCustomSQLDataSet.GetMetadata Property

Specifies whether the SQL dataset fetches metadata information along with the data.

Pascal

```
property GetMetadata: Boolean;
```

C++

```
__property Boolean GetMetadata;
```

Description

Use GetMetadata to turn on or off the fetching of metadata on a database object. Setting GetMetadata to False will improve performance because no additional SQL will execute in order to get index information. However, setting GetMetadata to False might slow any attempts to update data using a client dataset that is linked via a dataset provider because the resolver might not generate optimized SQL to perform the update.

GetMetadata must be True to perform any operations that require an index. These operations include setting up master/detail relationships, updating data from a client dataset when the provider's UpdateMode is not upWhereAll, and delayed fetching of BLOB data.

Set GetMetadata to False if you are fetching a dataset for read-only purposes.

See Also

TClientDataset

TDataSetProvider (see page 18508)

Fetching the Data using TSQLDataSet

149.1.2.5.10 TCustomSQLDataSet.IndexDefs Property

Contains the definitions of all indexes defined on the server for the dataset.

Pascal

```
property IndexDefs: TIndexDefs;
```

C++

```
__property TIndexDefs IndexDefs;
```

Description

Read IndexDefs to obtain information about what indexes are available on the database server for this dataset.

TCustomSQLDataSet (see page 20150) does not explicitly use the information in IndexDefs. The order of its records is determined by the ORDER BY clause of its SQL statement.

If the SQL dataset is an instance of TSQLTable (see page 20337), you can use IndexDefs to identify the index to use for the IndexName property. Even with other TCustomSQLDataSet (see page 20150) descendants, IndexDefs can be useful for composing SQL commands dynamically that need to use an index on the server. For example, provider components use the index information to uniquely identify records when composing update commands.

GetKeyFieldNames (see page 20169)

149.1.2.5.11 TCustomSQLDataSet.InternalConnection Property

Indicates the component that connects the dataset to its database server, taking into account whether the connection was cloned.

Pascal

```
property InternalConnection: TSqlConnection;
```

C++

```
__property TSqlConnection InternalConnection;
```

Description

Applications can't use this protected property. Instead, SQL datasets use InternalConnection internally when they need to access the dbExpress interfaces for the connection to the database server. Unlike the published SQLConnection (see page 20201) property, InternalConnection handles the case when the dataset must use a clone of the primary connection because the server limits the number of active statements that the connection supports.

It is not necessary to use InternalConnection except when using the connection component to reference its dbExpress interfaces.

See Also

CloneConnection (see page 20225)

AutoClone (see page 20243)

SQLConnection (see page 20201)

149.1.2.5.12 TCustomSQLDataSet.LastError Property

Saves the error message for the last error returned by dbExpress.

Pascal

```
property LastError: TDBXError;
```

C++

```
__property TDBXError LastError;
```

Description

When the SQL dataset encounters an error in a call to dbExpress, it caches the error message. This allows it to continue until it is in an appropriate state to raise the associated exception. The message is used to raise an exception with the error message when it is safe to do so.

149.1.2.5.13 TCustomSQLDataSet.MaxBlobSize Property

Indicates the maximum number of bytes fetched for any BLOB field in the dataset.

Pascal

```
property MaxBlobSize: Integer;
```

C++

```
__property int MaxBlobSize;
```

Description

MaxBlobSize limits the amount of data that can be fetched from Binary Large Object (BLOB) fields. BLOB fields can hold an indefinite amount of data. However, SQL datasets read that data into a memory buffer. By limiting the amount of data that can be fetched from a BLOB field, you limit the size of the buffer.

If MaxBlobSize is –1, the dataset imposes no maximum BLOB size. If MaxBlobSize is 0, the dataset uses the parameters of the associated SQL connection, if any, to determine the maximum BLOB size.

Note: MaxBlobSize should agree with any parameters on the associated SQL connection component that limit the size of BLOB data.

See Also

GetBlobFieldData (see page 20166)

Params (see page 20253)

SQLConnection (see page 20201)

149.1.2.5.14 TCustomSQLDataSet.NativeCommand Property

Represents the SQL command that is sent to the server.

Pascal

```
property NativeCommand: WideString;
```

C++

```
__property BSTR NativeCommand;
```

Description

SQL datasets sometimes need to alter a query before it can be sent to the dbExpress driver. For example, dbExpress does not support named parameters, so the SQL dataset converts named parameters to unnamed parameters before sending off a command.

NativeCommand is the adjusted command that is sent to the dbExpress driver. It is based on the value of CommandText (see page 20189).

See Also

CommandText (see page 20189)

149.1.2.5.15 TCustomSQLDataSet.NumericMapping Property

Maps fldBCD to either ftFMTBCD or ftBCD field types.

Pascal

```
property NumericMapping: Boolean;
```

C++

```
__property Boolean NumericMapping;
```

Description

Use NumericMapping to control how to map fldBCD (dbExpress Core logical type) to eitheir ftFMTBCD or ftBCD field types. The default is False. If True, all dbExpress fldBCD types will map to ftFMTBCD across all dbExpress drivers for field type

compatibility.

See Also

TFieldType (see page 7612)

149.1.2.5.16 TCustomSQLDataSet.ObjectView Property

Specifies whether fields are stored hierarchically or flattened out in the Fields property.

Pascal

```
property ObjectView: Boolean;
```

C++

```
__property Boolean ObjectView;
```

Description

ObjectView affects the way the Fields property stores object fields and the way data-aware grids display ADT and array fields.

When ObjectView is true, the fields are stored hierarchically in the Fields property, meaning any child fields of an object field are referenced by the object field and don't appear sequentially after the object field in the TFields:: .Fields array. When ObjectView is false, the fields are stored sequentially in the Fields property, meaning any child fields of an object field are stored after the object field as siblings in the Fields array.

When ObjectView is false, object field types, such as TADTField, are not created. This switch is provided for increased compatibility with older data-aware controls, which may not handle object field types properly. The default is false for TBDEDataSet, and true for TClientDataSet.

Note: If the ObjectView property of the dataset provided to a TClientDataSet is false, then the TClientDataSet's ObjectView property always acts as false, since the data received is already flattened.

Working with Array Fields

149.1.2.5.17 TCustomSQLDataSet.ParamCheck Property

Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

By default, the Params (see page 20197) property is updated automatically to reflect any parameters that appear in the query

specified by the CommandText (see page 20189) property (or the SQL property for TSQLQuery (see page 20298)) at runtime. That is, whenever the CommandText (see page 20189) property changes, the Params (see page 20197) property is regenerated to reflect the new set of parameters.

There are times when you want to override this default behavior. For example, when specifying a data definition language (DDL) statement that defines a stored procedure, the resulting SQL command may include parameters. These parameters, however, should not be used as parameters of the SQL dataset, because they are not parameters of the DDL command, but rather, they are parameters of the stored procedure that the command creates.

In order to override the default generation of the Params (see page 20197) property in response to changes in CommandText (see page 20189), set ParamCheck to false.

See Also

Params (see page 20197)

CommandText (see page 20189)

SQL (see page 20316)

149.1.2.5.18 TCustomSQLDataSet.ParamCount Property

Indicates the number of parameters listed by the Params (see page 20197) property.

Pascal

```
property ParamCount: Integer;
```

C++

```
__property int ParamCount;
```

Description

ParamCount is the number of parameters listed in the Params (see page 20197) property. Applications can't use this protected property. It is used internally when preparing SQL statements for execution.

See Also

Params (see page 20197)

Prepared (see page 20198)

149.1.2.5.19 TCustomSQLDataSet.Params Property

Represents the parameters for a query or stored procedure.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

Params is a collection of TParam objects that represent the parameters of a query or stored procedure specified by the SQL dataset. When you specify a query by setting the CommandText (see page 20189) property (or the SQL property in TSQLQuery (see page 20298)), the SQL dataset automatically parse the query and fills Params with a TParam object for every parameter in the query. Similarly, when you specify a stored procedure by setting the CommandText (see page 20189) property (or the StoredProcName property in TSQLStoredProc (see page 20318)), the SQL dataset automatically asks the server for a list of stored procedure parameters and fills Params with a TParam object for every parameter of the stored

procedure.

At design-time, use the Params property editor to access the individual TParam objects. For queries, use this property editor to check the DataType property of each parameter and to assign values to the parameters. For stored procedures, you may need to do more, changing the type or number of parameters if the server does not supply complete information about stored procedure parameters.

You can also use Params to assign parameter properties in code at runtime.

Note: If you do not assign values to input parameters before opening the dataset, it fetches values from the dataset identified by the DataSource (see page 20192) property. However, this only works if the individual TParam objects have the same names as fields in the master dataset.

Configuring TSQL Connection

Connecting to Databases with TDatabase

Using TQuery

Using TSimpleDataSet

149.1.2.5.20 TCustomSQLDataSet.Prepared Property

Specifies whether the command is prepared before execution.

Pascal

```
property Prepared: Boolean;
```

C++

```
__property Boolean Prepared;
```

Description

SQL datasets are automatically prepared when you call Open or ExecSQL (see page 20165) (or ExecProc). When a SQL dataset is prepared, dbExpress and the server allocate resources for the SQL statement and its parameters. If CommandType (see page 20190) is ctTable, the dataset generates its SELECT query when it is prepared. Any parameters that are not bound by the server are folded into a query when it is prepared.

If you execute the query or stored procedure more than once, you can improve performance by setting Prepared to true before opening the dataset. Setting Prepared to true prepares the dataset at once, rather than waiting until the dataset is opened.

Conversely, set Prepared to false if you want to ensure that the dataset is re-prepared before it executes (for example, if you change a parameter value or the SortFieldNames (see page 20201) property).

See Also

Params (see page 20197)

ExecSQL (see page 20278)

Open (see page 6976)

Executing the Command

Fetching the Data

149.1.2.5.21 TCustomSQLDataSet.ProcParams Property

ProcParams lists the parameter descriptors obtained from the server for any stored procedure parameters.

Pascal

```
property ProcParams: TList;
```

C++

```
__property TList ProcParams;
```

Description

When the SQL dataset represents a stored procedure, it fetches information about stored procedure parameters from the server as a list of parameter descriptors. It stores this list as the value of ProcParams.

Applications never use the protected ProcParams directly. Instead, the information from the list is used to initialize the Params (see page 20197) property.

See Also

Params (see page 20197)

GetProcedureParams (see page 20233)

149.1.2.5.22 TCustomSQLDataSet.RecordCount Property

Indicates the total number of records associated with the dataset.

Pascal

```
property RecordCount: Integer;
```

C++

```
__property int RecordCount;
```

Description

Read RecordCount to determine the total number of records in the dataset. An application can read RecordCount even if the dataset is not active.

Reading RecordCount will generate an exception if the dataset can't determine the number of records. Do not read RecordCount if

The dataset represents stored procedure.

The dataset represents a query that contains parameters.

The dataset represents a multi-table join.

See Also

RecNo (see page 7031)

Eof (see page 7015)

149.1.2.5.23 TCustomSQLDataSet.RowsAffected Property

Indicates the number of rows operated on by the latest query execution.

Pascal

```
property RowsAffected: Integer;
```

C++

```
__property int RowsAffected;
```

Description

When the SQL dataset represents a query that does not return a result set, you can't use the RecordCount (see page 20199) property to ascertain the number of records affected by the query. In such cases, read RowsAffected to determine how many rows were updated or deleted by the query when it executed. If no rows were updated or deleted, RowsAffected is zero. RowsAffected is –1 if the SQL statement could not be executed due to an error condition. (This latter situation typically follows the throwing of an exception.)

See Also

ExecSQL (see page 20278)

RecordCount (see page 20199)

ExecProc (see page 20331)

149.1.2.5.24 TCustomSQLDataSet.SchemaInfo Property

Identifies the metadata with which to populate the dataset.

Pascal

```
property SchemaInfo: TSQLSchemaInfo;
```

C++

```
__property TSQLSchemaInfo SchemaInfo;
```

Description

SQL datasets can be used to represent metadata from the database server rather than the results of a query or stored procedure. SchemaInfo controls whether the dataset represents metadata, and if so, what kind.

When SchemaInfo specifies that the dataset represents schema information, the dataset is populated with that information when it is opened. Each record in the resulting dataset represents a single entity (a single table, stored procedure, field, parameter, or index).

Each type of schema information results in a different set of columns (fields), so it is not advisable to use persistent fields when accessing metadata through an SQL dataset.

Applications do not work directly with the protected SchemaInfo property. Instead, they specify the desired schema information by calling the SetSchemaInfo (see page 20185) method.

See Also

SetSchemaInfo (see page 20185)

Open (see page 6976)

149.1.2.5.25 TCustomSQLDataSet.SchemaName Property

Specifies the name of the database schema.

Pascal

```
property SchemaName: string;
```

C++

```
__property AnsiString SchemaName;
```

Description

This name will be available in the appropriate drop down list box after you have connected to a given data source.

149.1.2.5.26 TCustomSQLDataSet.SortFieldNames Property

Indicates the sort order when CommandType (see page 20190) is ctTable.

Pascal

```
property SortFieldNames: WideString;
```

C++

```
__property BSTR SortFieldNames;
```

Description

Use SortFieldNames to specify the fields that should be used to order the records in the dataset. SortFieldNames is only used when CommandType (see page 20190) is ctTable.

SortFieldNames is a semicolon-delimited list of field names. These names are used to generate the ORDER BY clause of the SQL statement the dataset creates to fetch data from a server table. Records are sorted by the first named field, and within that sort order, by the second named field, and so on.

See Also

CommandType (see page 20190)

Representing the Records in a Table

Specifying the Data to Display using TSQLDataSet

149.1.2.5.27 TCustomSQLDataSet.SQLConnection Property

Specifies the SQL connection component that connects the dataset to a database server.

Pascal

```
property SQLConnection: TSQLConnection;
```

C++

```
__property TSQLConnection SQLConnection;
```

Description

Use SQLConnection to specify an SQL connection object that connects the dataset to a database server.

At design-time, select from the list of available TSQLConnection (see page 20217) components in the Object Inspector. At runtime, set SQLConnection to reference an existing TSQLConnection (see page 20217) object.

SQLConnection should be the first property you set on the dataset. Only after the SQLConnection property is set can you use the Command Text editor to specify a query for the CommandText (see page 20189) property or populate the dataset with data by setting Active (see page 20187) to true. Similarly, SQLConnection must be set before the dataset can initialize the Params (see page 20197) property when you set CommandText (see page 20189).

Connecting Directly to a Database Server

Connecting to the Database Server

149.1.2.5.28 TCustomSQLDataSet.TransactionLevel Property

Indicates the transaction to which this dataset belongs.

Pascal

```
property TransactionLevel: SmallInt;
```

C++

```
__property SmallInt TransactionLevel;
```

Description

Use TransactionLevel to indicate the active transaction to use when opening this dataset or using it to execute commands. TransactionLevel is the same as the transaction identifier that is supplied to the connection's StartTransaction method. If TransactionLevel is unspecified (0), the dataset fetches its records or executes commands in the context of the most recently started transaction.

Note: Most applications do not need to use TransactionLevel because most database servers require that SQL commands belong to the most recently started transaction. However, the InterBase server allows multiple overlapping transactions to be active simultaneously.

Managing Transactions

149.1.2.6 TCustomSQLDataSet Events

The events of the TCustomSQLDataSet class are listed here.

Published Events

	Name	Description
	AfterClose (see page 20203)	Occurs after a data source connection is closed.
	AfterOpen (see page 20203)	Occurs after the connection to a data source is opened.
	AfterRefresh (see page 20203)	Occurs after a DataSet has been changed and is refreshed.
	AfterScroll (see page 20204)	Occurs after a result set is scrolled.
	BeforeClose (see page 20204)	Occurs just before a data connection is closed.
	BeforeOpen (see page 20204)	Occurs just before a data connection is opened, but after an open operation has been initiated.
	BeforeRefresh (see page 20204)	Occurs before a DataSet refresh occurs.
	BeforeScroll (see page 20204)	Occurs when a DataSet scroll operation has been initiated but before the scrolling actually takes place.
	OnCalcFields (see page 20204)	Occurs when calculated or derived fields are updated.
	ParseDeleteSql (see page 20205)	Occurs when an application attempts to parse the DELETE statement stored in the CommandText (see page 20189) property.
	ParseInsertSql (see page 20205)	Occurs when an application attempts to parse the INSERT statement stored in the CommandText (see page 20189) property.
	ParseSelectSql (see page 20205)	Occurs when an application attempts to parse the SELECT statement specified in the CommandText (see page 20189) property.
	ParseUpdateSql (see page 20205)	Occurs when an application attempts to parse a SQL UPDATE statement stored in the CommandText (see page 20189) property.

149.1.2.6.1 TCustomSQLDataSet.AfterClose Event

Occurs after a data source connection is closed.

Pascal

```
property AfterClose: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterClose;
```

149.1.2.6.2 TCustomSQLDataSet.AfterOpen Event

Occurs after the connection to a data source is opened.

Pascal

```
property AfterOpen: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterOpen;
```

149.1.2.6.3 TCustomSQLDataSet.AfterRefresh Event

Occurs after a DataSet has been changed and is refreshed.

Pascal

```
property AfterRefresh: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterRefresh;
```

149.1.2.6.4 TCustomSQLDataSet.AfterScroll Event

Occurs after a result set is scrolled.

Pascal

```
property AfterScroll: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent AfterScroll;
```

149.1.2.6.5 TCustomSQLDataSet.BeforeClose Event

Occurs just before a data connection is closed.

Pascal

```
property BeforeClose: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeClose;
```

149.1.2.6.6 TCustomSQLDataSet.BeforeOpen Event

Occurs just before a data connection is opened, but after an open operation has been initiated.

Pascal

```
property BeforeOpen: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeOpen;
```

149.1.2.6.7 TCustomSQLDataSet.BeforeRefresh Event

Occurs before a DataSet refresh occurs.

Pascal

```
property BeforeRefresh: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeRefresh;
```

149.1.2.6.8 TCustomSQLDataSet.BeforeScroll Event

Occurs when a DataSet scroll operation has been initiated but before the scrolling actually takes place.

Pascal

```
property BeforeScroll: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent BeforeScroll;
```

149.1.2.6.9 TCustomSQLDataSet.OnCalcFields Event

Occurs when calculated or derived fields are updated.

Pascal

```
property OnCalcFields: TDataSetNotifyEvent;
```

C++

```
__property TDataSetNotifyEvent OnCalcFields;
```

149.1.2.6.10 TCustomSQLDataSet.ParseDeleteSql Event

Occurs when an application attempts to parse the DELETE statement stored in the CommandText (see page 20189) property.

Pascal

```
property ParseDeleteSql: TParseSqlEvent;
```

C++

```
__property TParseSqlEvent ParseDeleteSql;
```

149.1.2.6.11 TCustomSQLDataSet.ParseInsertSql Event

Occurs when an application attempts to parse the INSERT statement stored in the CommandText (see page 20189) property.

Pascal

```
property ParseInsertSql: TParseInsertSqlEvent;
```

C++

```
__property TParseInsertSqlEvent ParseInsertSql;
```

149.1.2.6.12 TCustomSQLDataSet.ParseSelectSql Event

Occurs when an application attempts to parse the SELECT statement specified in the CommandText (see page 20189) property.

Pascal

```
property ParseSelectSql: TParseSqlEvent;
```

C++

```
__property TParseSqlEvent ParseSelectSql;
```

149.1.2.6.13 TCustomSQLDataSet.ParseUpdateSql Event

Occurs when an application attempts to parse a SQL UPDATE statement stored in the CommandText (see page 20189) property.

Pascal

```
property ParseUpdateSql: TParseSqlEvent;
```

C++

```
__property TParseSqlEvent ParseUpdateSql;
```

149.1.3 TFLDDesc Class

Class Hierarchy

SqlExpr.TFLDDesc

Pascal

```
TFLDDesc = class;
```

C++

```
class TFLDDesc;
```

File

SqlExpr

Description

This is class SqlExpr.TFLDDesc.

149.1.3.1 TFLDDesc Members

The following tables list the members exposed by TFLDDesc.

Public Fields

	Name	Description
	FCalcField (see page 20207)	This is FCalcField, a member of class TFLDDesc.
	FFldNum (see page 20207)	This is FFldNum, a member of class TFLDDesc.
	FFLDRights (see page 20207)	This is FFLDRights, a member of class TFLDDesc.
	FFldType (see page 20208)	This is FFldType, a member of class TFLDDesc.
	FFLDVchk (see page 20208)	This is FFLDVchk, a member of class TFLDDesc.
	FLen (see page 20208)	This is FLen, a member of class TFLDDesc.
	FName (see page 20208)	This is FName, a member of class TFLDDesc.
	FNullOffset (see page 20208)	This is FNullOffset, a member of class TFLDDesc.
	FOffset (see page 20209)	This is FOffset, a member of class TFLDDesc.
	FSubType (see page 20209)	This is FSubType, a member of class TFLDDesc.
	FUnits1 (see page 20209)	This is FUnits1, a member of class TFLDDesc.
	FUnits2 (see page 20209)	This is FUnits2, a member of class TFLDDesc.

Public Properties

	Name	Description
	bCalcField (see page 20210)	This is bCalcField, a member of class TFLDDesc.
	efldrRights (see page 20210)	This is efldrRights, a member of class TFLDDesc.
	efldvVchk (see page 20210)	This is efldvVchk, a member of class TFLDDesc.
	iFldNum (see page 20211)	This is iFldNum, a member of class TFLDDesc.
	iFldType (see page 20211)	This is iFldType, a member of class TFLDDesc.
	iLen (see page 20211)	This is iLen, a member of class TFLDDesc.
	iNullOffset (see page 20211)	This is iNullOffset, a member of class TFLDDesc.
	iOffset (see page 20211)	This is iOffset, a member of class TFLDDesc.
	iSubType (see page 20212)	This is iSubType, a member of class TFLDDesc.
	iUnits1 (see page 20212)	This is iUnits1, a member of class TFLDDesc.
	iUnits2 (see page 20212)	This is iUnits2, a member of class TFLDDesc.
	szName (see page 20212)	This is szName, a member of class TFLDDesc.

149.1.3.2 TFLDDesc Fields

The fields of the TFLDDesc class are listed here.

Public Fields

	Name	Description
	FCalcField (see page 20207)	This is FCalcField, a member of class TFLDDesc.
	FFldNum (see page 20207)	This is FFldNum, a member of class TFLDDesc.
	FFLDRights (see page 20207)	This is FFLDRights, a member of class TFLDDesc.
	FFldType (see page 20208)	This is FFldType, a member of class TFLDDesc.
	FFLDVchk (see page 20208)	This is FFLDVchk, a member of class TFLDDesc.
	FLen (see page 20208)	This is FLen, a member of class TFLDDesc.
	FName (see page 20208)	This is FName, a member of class TFLDDesc.
	FNullOffset (see page 20208)	This is FNullOffset, a member of class TFLDDesc.
	FOffset (see page 20209)	This is FOffset, a member of class TFLDDesc.
	FSubType (see page 20209)	This is FSubType, a member of class TFLDDesc.
	FUnits1 (see page 20209)	This is FUnits1, a member of class TFLDDesc.
	FUnits2 (see page 20209)	This is FUnits2, a member of class TFLDDesc.

149.1.3.2.1 TFLDDesc.FCalcField Field

Pascal

```
FCalcField: WordBool;
```

C++

```
WordBool FCalcField;
```

Description

This is FCalcField, a member of class TFLDDesc.

149.1.3.2.2 TFLDDesc.FFldNum Field

Pascal

```
FFldNum: Word;
```

C++

```
Word FFldNum;
```

Description

This is FFldNum, a member of class TFLDDesc.

149.1.3.2.3 TFLDDesc.FFLDRights Field

Pascal

```
FFLDRights: FLDRights;
```

C++

```
FLDRights FFLDRights;
```

Description

This is FFLDRights, a member of class TFLDDesc.

149.1.3.2.4 TFLDDesc.FFldType Field

Pascal

```
FFldType: Word;
```

C++

```
Word FFldType;
```

Description

This is FFldType, a member of class TFLDDesc.

149.1.3.2.5 TFLDDesc.FFLDVchk Field

Pascal

```
FFLDVchk: FLDVchk;
```

C++

```
FLDVchk FFLDVchk;
```

Description

This is FFLDVchk, a member of class TFLDDesc.

149.1.3.2.6 TFLDDesc.FLen Field

Pascal

```
FLen: LongWord;
```

C++

```
LongWord FLen;
```

Description

This is FLen, a member of class TFLDDesc.

149.1.3.2.7 TFLDDesc.FName Field

Pascal

```
FName: WideString;
```

C++

```
BSTR FName;
```

Description

This is FName, a member of class TFLDDesc.

149.1.3.2.8 TFLDDesc.FNullOffset Field

Pascal

```
FNullOffset: Word;
```

C++

```
Word FNullOffset;
```

Description

This is FNullOffset, a member of class TFLDDesc.

149.1.3.2.9 TFLDDesc.FOffset Field

Pascal

```
FOffset: Word;
```

C++

```
Word FOffset;
```

Description

This is FOffset, a member of class TFLDDesc.

149.1.3.2.10 TFLDDesc.FSubType Field

Pascal

```
FSubType: Word;
```

C++

```
Word FSubType;
```

Description

This is FSubType, a member of class TFLDDesc.

149.1.3.2.11 TFLDDesc.FUnits1 Field

Pascal

```
FUnits1: SmallInt;
```

C++

```
SmallInt FUnits1;
```

Description

This is FUnits1, a member of class TFLDDesc.

149.1.3.2.12 TFLDDesc.FUnits2 Field

Pascal

```
FUnits2: SmallInt;
```

C++

```
SmallInt FUnits2;
```

Description

This is FUnits2, a member of class TFLDDesc.

149.1.3.3 TFLDDesc Properties

The properties of the TFLDDesc class are listed here.

Public Properties

	Name	Description
	bCalcField (see page 20210)	This is bCalcField, a member of class TFLDDesc.
	efldrRights (see page 20210)	This is efldrRights, a member of class TFLDDesc.
	efldvVchk (see page 20210)	This is efldvVchk, a member of class TFLDDesc.
	iFldNum (see page 20211)	This is iFldNum, a member of class TFLDDesc.
	iFldType (see page 20211)	This is iFldType, a member of class TFLDDesc.
	iLen (see page 20211)	This is iLen, a member of class TFLDDesc.
	iNullOffset (see page 20211)	This is iNullOffset, a member of class TFLDDesc.
	iOffset (see page 20211)	This is iOffset, a member of class TFLDDesc.
	iSubType (see page 20212)	This is iSubType, a member of class TFLDDesc.
	iUnits1 (see page 20212)	This is iUnits1, a member of class TFLDDesc.
	iUnits2 (see page 20212)	This is iUnits2, a member of class TFLDDesc.
	szName (see page 20212)	This is szName, a member of class TFLDDesc.

149.1.3.3.1 TFLDDesc.bCalcField Property

Pascal

```
property bCalcField: WordBool;
```

C++

```
__property WordBool bCalcField;
```

Description

This is bCalcField, a member of class TFLDDesc.

149.1.3.3.2 TFLDDesc.efldrRights Property

Pascal

```
property efldrRights: FLDRights;
```

C++

```
__property FLDRights efldrRights;
```

Description

This is efldrRights, a member of class TFLDDesc.

149.1.3.3.3 TFLDDesc.efldvVchk Property

Pascal

```
property efldvVchk: FLDVchk;
```

C++

```
__property FLDVchk efldvVchk;
```

Description

This is efldvVchk, a member of class TFLDDesc.

149.1.3.3.4 TFLDDesc.iFldNum Property

Pascal

```
property iFldNum: Word;
```

C++

```
__property Word iFldNum;
```

Description

This is iFldNum, a member of class TFLDDesc.

149.1.3.3.5 TFLDDesc.iFldType Property

Pascal

```
property iFldType: Word;
```

C++

```
__property Word iFldType;
```

Description

This is iFldType, a member of class TFLDDesc.

149.1.3.3.6 TFLDDesc.iLen Property

Pascal

```
property iLen: LongWord;
```

C++

```
__property LongWord iLen;
```

Description

This is iLen, a member of class TFLDDesc.

149.1.3.3.7 TFLDDesc.iNullOffset Property

Pascal

```
property iNullOffset: Word;
```

C++

```
__property Word iNullOffset;
```

Description

This is iNullOffset, a member of class TFLDDesc.

149.1.3.3.8 TFLDDesc.iOffset Property

Pascal

```
property iOffset: Word;
```

C++

```
__property Word iOffset;
```

Description

This is iOffset, a member of class TFLDDesc.

149.1.3.3.9 TFLDDesc.iSubType Property

Pascal

```
property iSubType: Word;
```

C++

```
__property Word iSubType;
```

Description

This is iSubType, a member of class TFLDDesc.

149.1.3.3.10 TFLDDesc.iUnits1 Property

Pascal

```
property iUnits1: SmallInt;
```

C++

```
__property SmallInt iUnits1;
```

Description

This is iUnits1, a member of class TFLDDesc.

149.1.3.3.11 TFLDDesc.iUnits2 Property

Pascal

```
property iUnits2: SmallInt;
```

C++

```
__property SmallInt iUnits2;
```

Description

This is iUnits2, a member of class TFLDDesc.

149.1.3.3.12 TFLDDesc.szName Property

Pascal

```
property szName: WideString;
```

C++

```
__property BSTR szName;
```

Description

This is szName, a member of class TFLDDesc.

149.1.4 TSQLBlobStream Class

TSQLBlobStream lets applications read from or write to BLOB fields in a client dataset.

Class Hierarchy

Pascal

```
TSQLBlobStream = class(TMemoryStream);
```

C++

```
class TSQLBlobStream : public TMemoryStream;
```

File

SqlExpr

Description

Use TSQLBlobStream to read the value of a Binary Large Object (BLOB) field in a dbExpress dataset (TSQLLDataSet, TSQLTable (see page 20337), TSQLQuery (see page 20298), or TSQLStoredProc (see page 20318)). BLOB fields are TBlobField objects and descendants of TBlobField such as TGraphicField and TMemoField. BLOB fields in client datasets use client BLOB streams to implement many of their data access properties and methods.

TSQLBlobStream allows objects that have no specialized knowledge of how data is stored in a BLOB field to read such data by employing the uniform stream interface.

To use an SQL BLOB stream, create an instance of TSQLBlobStream, use the methods of the stream to read the data, and then free the BLOB stream. If you use the same instance of TSQLBlobStream to access data from more than one record, you must call the ReadBlobData (see page 20216) method to update the stream when the current record changes.

Warning: Although TSQLBlobStream inherits several write methods from TMemoryStream, it can't be used to write data back to the dataset because dbExpress datasets are read-only. Writing to TSQLBlobStream simply alters the in-memory buffer that contains a BLOB field's data.

TBlobField (see page 6801)

TGraphicField (see page 7257)

TMemoField (see page 7348)

TCustomSQLDataSet (see page 20150)

TSQLDataSet (see page 20265)

TSQLTable (see page 20337)

TSQLQuery (see page 20298)

TSQLStoredProc (see page 20318)

149.1.4.1 TSQLBlobStream Members

The following tables list the members exposed by TSQLBlobStream.

Protected Methods

	Name	Description
	GetSize (see page 2982)	This is GetSize, a member of class TStream.
	Realloc (see page 2910)	This is Realloc, a member of class TMemoryStream.
	SetPointer (see page 2823)	Replaces the memory buffer associated with the memory stream.
	SetSize (see page 2989)	This is the overview for the SetSize method overload.

Protected Properties

	Name	Description
	Capacity (see page 2912)	This is Capacity, a member of class TMemoryStream.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2909)	Frees the memory buffer, discarding all data associated with the memory stream.
	CopyFrom (see page 2979)	Copies a specified number of bytes from one stream to another.
	Create (see page 20215)	Creates and initializes an instance of TSQLBlobStream (see page 20213).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 20216)	Frees an instance of TSQLBlobStream (see page 20213).
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FixupResourceHeader (see page 2981)	Patches the resource header for a resource that has been written to the stream.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	LoadFromFile (see page 2909)	Loads the entire contents of a file into the memory buffer.
	LoadFromStream (see page 2909)	Loads the entire contents of a stream into the memory buffer.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Read (see page 2817)	Reads up to Count bytes from the memory stream into Buffer and advances the current position of the stream by the number of bytes read.
	Read (see page 2982)	Introduces an abstract or pure virtual method responsible for reading from the stream.
	ReadBlobData (see page 20216)	Fills the BLOB stream's memory buffer with the contents of the associated BLOB field.
	ReadBuffer (see page 2983)	Reads bytes from the stream into Buffer.
	ReadComponent (see page 2983)	Initiates streaming of components and their properties.

	ReadComponentRes (see page 2987)	Reads components and their properties from a stream in a resource file format.
	ReadResHeader (see page 2987)	Reads a resource-file header from the stream.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 2818)	Writes the entire contents of the memory stream to the file with a given file name.
	SaveToStream (see page 2818)	Writes the entire contents of the memory stream to the stream object specified by Stream.
V	Seek (see page 2819)	Moves the current position of the stream by Offset bytes, relative to the origin specified by Origin.
V	Seek (see page 2988)	This is the overview for the Seek method overload.
V	SetSize (see page 2910)	Sets the Size (see page 2997) property of the memory stream.
V	Write (see page 2911)	Writes Count bytes from Buffer to the current position in the memory buffer and updates the current position by Count bytes.
A	Write (see page 2989)	Introduces a pure virtual method for writing to the stream.
	WriteBuffer (see page 2990)	Writes Count bytes from Buffer onto the stream and advances the current position of the stream by Count bytes.
	WriteComponent (see page 2990)	Initiates the writing of components and their properties to a stream.
	WriteComponentRes (see page 2994)	Writes components and their properties to a stream from a resource file format.
	WriteDescendent (see page 2994)	Streams components and their properties in inherited forms.
	WriteDescendentRes (see page 2995)	Streams components and their properties in inherited forms.
	WriteResourceHeader (see page 2995)	Writes a resource-file header to the stream.

Public Properties

	Name	Description
R	Memory (see page 2823)	Provides direct access to the memory pool allocated for the memory stream.
	Position (see page 2996)	Indicates the current offset into the stream for reading and writing.
	Size (see page 2997)	Indicates the size in bytes of the stream.

149.1.4.2 TSQLBlobStream.Create Constructor

Creates and initializes an instance of TSQLBlobStream (see page 20213).

Pascal

```
constructor Create(Field: TBlobField; Mode: TBlobStreamMode = bmRead);
```

C++

```
__fastcall TSQLBlobStream(TBlobField Field, TBlobStreamMode Mode = bmRead);
```

Description

Call Create to obtain an instance of TSQLBlobStream (see page 20213) for reading from a specific TBlobField object in a TCustomSQLDataSet (see page 20150) descendant.

Field specifies the BLOB field from which to read data.

The Mode parameter is provided for compatibility with other BLOB stream constructors. However, in TSQLBlobStream (see page 20213), the Mode parameter is ignored because dbExpress datasets are read-only. SQL Blob streams can only be used to read BLOB data.

Create links the TSQLBlobStream (see page 20213) to the field object specified by the Field parameter. It then calls ReadBlobData (see page 20216) to read the information from the BLOB field into a memory buffer, where it is available for reading.

Warning: If you write to the SQLBlobStream using inherited methods, you are overwriting the in-memory buffer that is filled by the constructor. This will cause subsequent read operations to provide inaccurate information, because the BLOB stream no longer accurately reflects the contents of the BLOB field.

Instead of calling the TSQLBlobStream (see page 20213) constructor, you can also use the dataset's CreateBlobStream method.

See Also

CreateBlobStream (see page 20164)

ReadBlobData (see page 20216)

149.1.4.3 TSQLBlobStream.Destroy Destructor

Frees an instance of TSQLBlobStream (see page 20213).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSQLBlobStream();
```

Description

Do not call Destroy directly in an application. Instead call Free. Free verifies that the TBlobStream object is not nil and only then calls Destroy.

Destroy the TSQLBlobStream (see page 20213) object by calling Free when it is no longer needed for reading from the BLOB field. BLOB streams should be destroyed when the dataset changes the current record.

See Also

Free (see page 22300)

OnDataChange (see page 9497)

149.1.4.4 TSQLBlobStream Methods

The methods of the TSQLBlobStream class are listed here.

Public Methods

	Name	Description
	ReadBlobData (see page 20216)	Fills the BLOB stream's memory buffer with the contents of the associated BLOB field.

149.1.4.4.1 TSQLBlobStream.ReadBlobData Method

Fills the BLOB stream's memory buffer with the contents of the associated BLOB field.

Pascal

```
procedure ReadBlobData;
```

C++

```
__fastcall ReadBlobData();
```

Description

Call ReadBlobData to refresh the contents of the BLOB stream when the current record in the dataset changes. ReadBlobData reads the contents of a BLOB field into the SQL BLOB stream's in-memory buffer and sets the Size property to the number of bytes of BLOB data. It then sets Position to 0 so that the stream is ready for you to read the BLOB data.

Note: It is not necessary to call ReadBlobData when you first create a SQL BLOB stream, because the constructor already performs this task. You need only call ReadBlobData when the current record changes, so that the stream reflects the BLOB

data for the new record.

Size (see page 2997)

Position (see page 2996)

Create (see page 20215)

149.1.5 TSQLConnection Class

TSQLConnection encapsulates a dbExpress connection to a database server.

Class Hierarchy

Pascal

```
TSQLConnection = class(TCustomConnection);
```

C++

```
class TSQLConnection : public TCustomConnection;
```

File

SqlExpr

Description

Use TSQLConnection to represent a dbExpress database connection. The connection provided by a single TSQLConnection component can be shared by multiple SQL dataset components through their SQLConnection (see page 20255) properties.

TSQLConnection interacts with a dbExpress driver and two files. The first, dbxdrivers.ini on Windows or dbxdrivers on Linux, lists the installed driver types (Interbase, Oracle, and so on) and, for each driver, lists the libraries (DLLs or shared objects) it requires as well as the default settings for all connection parameters. The second file, dbxconnections.ini on Windows or dbxconnections on Linux, lists named sets of connection configurations. Each configuration represents a set of settings for TSQLConnection and describes a particular database connection.

You can use TSQLConnection to choose one of the named configurations in dbxconnections.ini and use it to connect to a database or to define new configurations and add them to dbxconnections.ini. To perform either of these tasks, double-click on a TSQLConnection component and use the Connection (see page 20244) Builder.

In addition to describing and establishing database connections, TSQLConnection surfaces properties, methods, and events for controlling server login, managing transactions, and fetching metadata from the server.

149.1.5.1 TSQLConnection Members

The following tables list the members exposed by TSQLConnection.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckConnection (see page 20225)	This is CheckConnection, a member of class TSQLConnection.
V	CheckDisconnect (see page 20225)	This is CheckDisconnect, a member of class TSQLConnection.
V	ConnectionOptions (see page 20227)	This is ConnectionOptions, a member of class TSQLConnection.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoConnect (see page 20227)	Provides the interface for a method that opens a connection.
V	DoDisconnect (see page 20227)	Provides the interface for a method that terminates the connection.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetConnected (see page 20229)	Returns the value of the Connected property.
	GetDataSet (see page 20229)	Returns a dataset, given its index in the DataSets property array.
V	GetDataSetCount (see page 6865)	Returns the value of the DataSetCount (see page 6869) property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 20235)	Initializes the connection component after all objects in the form or data module have been loaded.
V	Notification (see page 20237)	Forwards notification messages to all owned components.
	OpenSchema (see page 20237)	This is the overview for the OpenSchema method overload.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.

V	RegisterClient (see page 20238)	Registers an object that uses the connection component.
	SendConnectEvent (see page 6867)	Informs all registered clients that use the connection component when a connection is opened or closed.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetConnected (see page 6867)	Changes the value of the Connected (see page 6868) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SQLError (see page 20240)	This is SQLError, a member of class TSQLConnection.
V	UnRegisterClient (see page 20241)	Removes a registered client so that it is no longer associated with the connection component.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Connection (see page 20244)	This is Connection, a member of class TSQLConnection.
R	ConnectionRegistryFile (see page 20245)	This is ConnectionRegistryFile, a member of class TSQLConnection.
R	DriverRegistryFile (see page 20247)	This is DriverRegistryFile, a member of class TSQLConnection.
	LastError (see page 20248)	This is LastError, a member of class TSQLConnection.
R	QuoteChar (see page 20254)	This is QuoteChar, a member of class TSQLConnection.
	SQLDllHandle (see page 20255)	This is SQLDllHandle, a member of class TSQLConnection.
	StreamedConnected (see page 6874)	Indicates whether the Connected (see page 6868) property was true when the connection component was loaded from a stream.

Public Events

	Name	Description
R	TraceCallbackEvent (see page 20260)	Provides access to the callback function that executes for every SQL command passed to or from the server.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginTransaction (see page 20224)	Initiates a new transaction in the associated database.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CloneConnection (see page 20225)	Returns a copy of the SQL connection object.
	Close (see page 6863)	Closes the connection.
	CloseDataSets (see page 20225)	Closes all datasets associated with the SQL connection object component without disconnecting from the database.
	Commit (see page 20226)	Commits an open transaction.
	CommitAndFree (see page 20226)	This is CommitAndFree, a member of class TSQLConnection.
V	Create (see page 20222)	Creates and initializes an instance TSQLConnection (see page 20217).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 20222)	Destroys the SQL connection object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 20227)	Executes an SQL command on the server.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteDirect (see page 20228)	Executes an SQL command that does not include parameters.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDefaultSchemaName (see page 20229)	Returns the default schema name of the current object.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldNames (see page 20229)	This is the overview for the GetFieldNames method overload.
	GetIndexNames (see page 20230)	This is the overview for the GetIndexNames method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetLoginUsername (see page 20231)	Returns the username that is logged in on the current connection.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetPackageNames (see page 20231)	Populates a string list with the names of all packages defined on the server.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProcedureNames (see page 20232)	This is the overview for the GetProcedureNames method overload.
	GetProcedureParams (see page 20233)	This is the overview for the GetProcedureParams method overload.
	GetSchemaNames (see page 20234)	Returns the schema names for all objects in the given data source.
	GetTableNames (see page 20234)	This is the overview for the GetTableNames method overload.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LoadParamsFromIniFile (see page 20236)	Sets the DriverName (see page 20246) and Params (see page 20253) properties to the values associated with the ConnectionName (see page 20244) property.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Open (see page 6866)	Opens the connection.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Rollback (see page 20238)	Cancels all updates, insertions, and deletions for a specified transaction and ends the transaction.
	RollbackAndFree (see page 20239)	This is RollbackAndFree, a member of class TSQLConnection.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTraceEvent (see page 20239)	Associates the SQL connection with a callback function that executes for every SQL command passed to or from the server.
	StartTransaction (see page 20240)	Initiates a new transaction in the associated database.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActiveStatements (see page 20242)	Indicates the number of statements currently active with the database server.
	AutoClone (see page 20243)	Specifies whether the SQL connection automatically clones database connections when they are needed.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	ConnectionState (see page 20245)	Indicates the current state of the TSQLConnection (see page 20217) object.
R	DataSetCount (see page 6869)	Indicates the number of datasets associated with the connection component.
R	DataSets (see page 20245)	Lists all active datasets for the connection component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	InTransaction (see page 20247)	Indicates whether a transaction is in progress.
	LocaleCode (see page 20250)	Identifies the locale that is used for sorting items from datasets that use this connection.
R	MaxStmtsPerConn (see page 20251)	Indicates the server limit on the number of statements supported by a single database connection.
R	MetaData (see page 20252)	Provides an interface to the dbExpress object that supplies server metadata.
R	MultipleTransactionsSupported (see page 20253)	Indicates whether the database server supports multiple transactions.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParamsLoaded (see page 20254)	Indicates when parameter values have been loaded from dbxconnections.ini.
	SQLConnection (see page 20255)	This is SQLConnection, a member of class TSQLConnection.
	SQLHourGlass (see page 20255)	Specifies whether the cursor should change to crSQLWait during lengthy operations.
R	TransactionsSupported (see page 20256)	Indicates whether the database server supports transactions.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterConnect (see page 20258)	Occurs after a connection is established.

	AfterDisconnect (see page 20258)	Occurs after the connection closes.
	BeforeConnect (see page 20258)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 20259)	Occurs immediately before the connection closes.
	OnLogin (see page 20259)	Occurs after the BeforeConnect (see page 20258) event and before a connection is established.

Published Properties

	Name	Description
	Connected (see page 20243)	Specifies whether the connection is active.
	ConnectionName (see page 20244)	Names the connection configuration.
	DriverName (see page 20246)	Specifies the database driver associated with the SQL connection.
	GetDriverFunc (see page 20247)	Specifies the function that returns the top-level dbExpress driver.
	KeepConnection (see page 20248)	Specifies whether the connection stays active when no datasets are open.
	LibraryName (see page 20248)	Specifies the dbExpress driver that TSQLConnection (see page 20217) uses to establish a connection.
	LoadParamsOnConnect (see page 20249)	Specifies whether the TSQLConnection (see page 20217) component loads the configuration named by ConnectionName (see page 20244) immediately before connecting to the server.
	LoginPrompt (see page 20250)	Specifies whether a login dialog appears immediately before opening a new connection.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Params (see page 20253)	Lists the connection parameters.
	TableScope (see page 20255)	Indicates what types of tables are returned when fetching schema information about tables.
	Tag (see page 2808)	Stores an integer value as part of a component.
	VendorLib (see page 20257)	Specifies the client software library (DLL or shared object) supplied by the database vendor.

149.1.5.2 TSQLConnection.Create Constructor

Creates and initializes an instance TSQLConnection (see page 20217).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSQLConnection(TComponent * AOwner);
```

Description

Use Create to instantiate TSQLConnection (see page 20217) at runtime. SQL connections added to forms or data modules at design time are created automatically.

The AOwner parameter is the component, typically a form or data module, that is responsible for freeing the SQL connection.

See Also

Destroy (see page 20222)

Owner (see page 2807)

149.1.5.3 TSQLConnection.Destroy Destructor

Destroys the SQL connection object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSQLConnection();
```

Description

To free a TSQLConnection (see page 20217) instance, do not call Destroy. Instead, call Free. Free verifies that the ADO connection is not nil, and only then calls Destroy.

There is no need to explicitly free instances of TSQLConnection (see page 20217) that were created with an Owner.

See Also

Owner (see page 2807)

Create (see page 20222)

delete

Free (see page 22300)

149.1.5.4 TSQLConnection Methods

The methods of the TSQLConnection class are listed here.

Protected Methods

	Name	Description
	CheckConnection (see page 20225)	This is CheckConnection, a member of class TSQLConnection.
V	CheckDisconnect (see page 20225)	This is CheckDisconnect, a member of class TSQLConnection.
V	ConnectionOptions (see page 20227)	This is ConnectionOptions, a member of class TSQLConnection.
V	DoConnect (see page 20227)	Provides the interface for a method that opens a connection.
V	DoDisconnect (see page 20227)	Provides the interface for a method that terminates the connection.
V	GetConnected (see page 20229)	Returns the value of the Connected property.
	GetDataSet (see page 20229)	Returns a dataset, given its index in the DataSets property array.
V	Loaded (see page 20235)	Initializes the connection component after all objects in the form or data module have been loaded.
V	Notification (see page 20237)	Forwards notification messages to all owned components.
	OpenSchema (see page 20237)	This is the overview for the OpenSchema method overload.
V	RegisterClient (see page 20238)	Registers an object that uses the connection component.
	SQLError (see page 20240)	This is SQLError, a member of class TSQLConnection.
V	UnRegisterClient (see page 20241)	Removes a registered client so that it is no longer associated with the connection component.

Public Methods

	Name	Description
	BeginTransaction (see page 20224)	Initiates a new transaction in the associated database.
	CloneConnection (see page 20225)	Returns a copy of the SQL connection object.
	CloseDataSets (see page 20225)	Closes all datasets associated with the SQL connection object component without disconnecting from the database.
	Commit (see page 20226)	Commits an open transaction.
	CommitAndFree (see page 20226)	This is CommitAndFree, a member of class TSQLConnection.
	Execute (see page 20227)	Executes an SQL command on the server.
	ExecuteDirect (see page 20228)	Executes an SQL command that does not include parameters.
	GetDefaultSchemaName (see page 20229)	Returns the default schema name of the current object.
	GetFieldNames (see page 20229)	This is the overview for the GetFieldNames method overload.
	GetIndexNames (see page 20230)	This is the overview for the GetIndexNames method overload.
	GetLoginUsername (see page 20231)	Returns the username that is logged in on the current connection.
	GetPackageNames (see page 20231)	Populates a string list with the names of all packages defined on the server.

	GetProcedureNames (see page 20232)	This is the overview for the GetProcedureNames method overload.
	GetProcedureParams (see page 20233)	This is the overview for the GetProcedureParams method overload.
	GetSchemaNames (see page 20234)	Returns the schema names for all objects in the given data source.
	GetTableNames (see page 20234)	This is the overview for the GetTableNames method overload.
	LoadParamsFromIniFile (see page 20236)	Sets the DriverName (see page 20246) and Params (see page 20253) properties to the values associated with the ConnectionName (see page 20244) property.
	Rollback (see page 20238)	Cancels all updates, insertions, and deletions for a specified transaction and ends the transaction.
	RollbackAndFree (see page 20239)	This is RollbackAndFree, a member of class TSQLConnection.
	SetTraceEvent (see page 20239)	Associates the SQL connection with a callback function that executes for every SQL command passed to or from the server.
	StartTransaction (see page 20240)	Initiates a new transaction in the associated database.

149.1.5.4.1 TSQLConnection.BeginTransaction Method

Initiates a new transaction in the associated database.

Pascal

```
function BeginTransaction: TDBXTransaction;
```

C++

```
__fastcall TDBXTransaction BeginTransaction();
```

Description

Call BeginTransaction to start a new transaction against a database server that supports transactions. (MySQL servers do not support transactions.) You can check the TransactionsSupported (see page 20256) property to determine whether the server supports transactions. If the server does not support transactions, BeginTransaction does nothing.

The method returns a TDBXTransactioninstance.

If the transaction is successfully started, BeginTransaction sets the InTransaction (see page 20247) property to true.

Updates, insertions, and deletions that take place after a call to BeginTransaction are enlisted in that transaction until another overlapping transaction is started or until the application calls CommitFreeAndNil to save the changes or RollbackFreeAndNil to cancel them.

Tip: If the server does not support multiple transactions, check the status of the InTransaction (see page 20247) property to be sure that another transaction is not already in progress.

Tip: When working with overlapped transactions, you can indicate the transaction to which a dataset belongs by setting its TransactionLevel property to the transaction identifier you assign in this method.

See Also

InTransaction (see page 20247)

CommitFreeAndNil

RollbackFreeAndNil

Params (see page 20253)

TransactionsSupported (see page 20256)

TransactionLevel (see page 20202)

149.1.5.4.2 TSQLConnection.CheckConnection Method

Pascal

```
procedure CheckConnection(eFlag: eConnectFlag);
```

C++

```
__fastcall CheckConnection(eConnectFlag eFlag);
```

Description

This is CheckConnection, a member of class TSQLConnection.

149.1.5.4.3 TSQLConnection.CheckDisconnect Method

Pascal

```
procedure CheckDisconnect; virtual;
```

C++

```
virtual __fastcall CheckDisconnect();
```

Description

This is CheckDisconnect, a member of class TSQLConnection.

149.1.5.4.4 TSQLConnection.CloneConnection Method

Returns a copy of the SQL connection object.

Pascal

```
function CloneConnection: TSQLConnection;
```

C++

```
__fastcall TSQLConnection CloneConnection();
```

Description

Call CloneConnection to create a duplicate of this SQLConnection (see page 20255) object. CloneConnection instantiates a new TSQLConnection (see page 20217) object and assigns its properties to match those of this SQLConnection (see page 20255) object.

The returned SQLConnection (see page 20255) is owned by this TSQLConnection (see page 20217). That is, this SQL connection component frees the clone from its own destructor.

See Also

AutoClone (see page 20243)

149.1.5.4.5 TSQLConnection.CloseDataSets Method

Closes all datasets associated with the SQL connection object component without disconnecting from the database.

Pascal

```
procedure CloseDataSets;
```

C++

```
__fastcall CloseDataSets();
```

Description

Call CloseDataSets to close all active datasets without disconnecting from the database server. Ordinarily, when an application calls Close, all datasets are closed, and the connection to the database server is dropped. Calling CloseDataSets instead of Close ensures that an application can close all active datasets without having to reconnect to the database server at a later time.

See Also

Close (see page 6863)

Close (see page 6920)

DataSets (see page 20245)

KeepConnection (see page 20248)

149.1.5.4.6 TSQLConnection.Commit Method

Commits an open transaction.

Pascal

```
procedure Commit(TransDesc: TTransactionDesc); deprecated;
```

C++

```
__fastcall Commit(TTransactionDesc TransDesc);
```

Description

Call Commit to save any changes made during the transaction described by TransDesc and to end that transaction.

TransDesc is the transaction descriptor supplied to the StartTransaction (see page 20240) method when starting the transaction.

If the specified transaction is the only current transaction, Commit sets the InTransaction (see page 20247) property to false after committing the transaction.

Note: This method has been deprecated.

See Also

InTransaction (see page 20247)

StartTransaction (see page 20240)

Rollback (see page 20238)

TransactionsSupported (see page 20256)

TransactionLevel (see page 20202)

149.1.5.4.7 TSQLConnection.CommitAndFree Method

Pascal

```
procedure CommitAndFree(Transaction: TDBXTransaction);
```

C++

```
__fastcall CommitAndFree(TDBXTransaction Transaction);
```

Description

This is CommitAndFree, a member of class TSQLConnection.

149.1.5.4.8 TSQLConnection.ConnectionOptions Method

Pascal

```
procedure ConnectionOptions; virtual;
```

C++

```
virtual __fastcall ConnectionOptions();
```

Description

This is ConnectionOptions, a member of class TSQLConnection.

149.1.5.4.9 TSQLConnection.DoConnect Method

Provides the interface for a method that opens a connection.

Pascal

```
procedure DoConnect; override;
```

C++

```
virtual __fastcall DoConnect();
```

Description

The Connected property uses DoConnect to establish a connection. Descendant classes override the DoConnect method to establish their connection as appropriate. As implemented in TCustomConnection, DoConnect does nothing.

See Also

Connected (see page 6868)

DoDisconnect (see page 6864)

149.1.5.4.10 TSQLConnection.DoDisconnect Method

Provides the interface for a method that terminates the connection.

Pascal

```
procedure DoDisconnect; override;
```

C++

```
virtual __fastcall DoDisconnect();
```

Description

The Connected property uses DoDisconnect to close a connection. Descendant classes override the DoDisconnect method to drop a connection. As implemented in TCustomConnection, DoDisconnect does nothing.

See Also

Connected (see page 6868)

DoConnect (see page 6864)

149.1.5.4.11 TSQLConnection.Execute Method

Executes an SQL command on the server.

Pascal

```
function Execute(const SQL: WideString; Params: TParams; ResultSet: TPSResult = nil): Integer;
```

C++

```
__fastcall int Execute(const BSTR SQL, TParams Params, TPSResult ResultSet = nil);
```

Description

Call Execute to execute a single command on the server without the overhead of using an SQL dataset. Execute is especially useful for statements that do not return a result set such as data definition language (DDL) statements.

SQL is the command to execute.

Params (see page 20253) is a TParams object that contains any parameters used by the SQL statement. Parameter binding is by index only (not by name), so the order of parameters is important and the order of the TParam objects in Params (see page 20253) corresponds to the order of the parameters in the SQL statement. Use properties and methods of TParams to create a TParams object, add TParam objects for each parameter, and assign parameter properties such as datatype and value. If the SQL statement does not include any parameters, pass a nil (Delphi) or NULL (C++) value for Params (see page 20253).

ResultSet is a pointer to a variable of type TCustomSQLDataSet (see page 20150)*. If the SQL statement returns a cursor, Execute creates a new TCustomSQLDataSet (see page 20150) instance and populates it with the result set. The new TCustomSQLDataSet (see page 20150) reference is returned as the value to which ResultSet points. If the SQL statement does not return a result set, pass a nil (Delphi) or NULL (C++) value for ResultSet. TPSResult is is set to Pointer for native code and TObject for managed code.

Execute returns the number of records affected by executing the SQL statement.

Tip: If the SQL statement does not include any parameters, you can use the ExecuteDirect (see page 20228) method instead.

See Also

ExecSQL (see page 20278)

ExecuteDirect (see page 20228)

149.1.5.4.12 TSQLConnection.ExecuteDirect Method

Executes an SQL command that does not include parameters.

Pascal

```
function ExecuteDirect(const SQL: WideString): Integer;
```

C++

```
__fastcall int ExecuteDirect(const BSTR SQL);
```

Description

Call ExecuteDirect to execute a single parameterless command on the server without the overhead of using an SQL dataset or preparing the statement before it executes. If the statement ordinarily returns a cursor, ExecuteDirect executes the statement, but does not return a cursor.

SQL is the command to execute.

ExecuteDirect returns 0 if the command was successfully executed. Otherwise, it returns a dbExpress error code.

Note: To execute an SQL statement that includes parameters or that returns a cursor, use the Execute (see page 20227) method instead.

See Also

ExecSQL (see page 20278)

Execute (see page 20227)

149.1.5.4.13 TSQLConnection.GetConnected Method

Returns the value of the Connected property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected read implementation of the Connected property. Descendant classes override this method to return true if a connection is open and false otherwise. As defined in TCustomConnection, GetConnected always returns false.

See Also

Connected (see page 6868)

SetConnected (see page 6867)

149.1.5.4.14 TSQLConnection.GetDataSet Method

Returns a dataset, given its index in the DataSets property array.

Pascal

```
function GetDataSet(Index: Integer): TCustomSQLDataSet; reintroduce;
```

C++

```
__fastcall TCustomSQLDataSet GetDataSet(int Index);
```

Description

GetDataSet is the protected read implementation of the DataSets property.

See Also

DataSets (see page 6870)

149.1.5.4.15 TSQLConnection.GetDefaultSchemaName Method

Returns the default schema name of the current object.

Pascal

```
function GetDefaultSchemaName: WideString;
```

C++

```
__fastcall BSTR GetDefaultSchemaName();
```

149.1.5.4.16 GetFieldNames Method

This is the overview for the GetFieldNames method overload.

Overload List

	Name	Description
	TSQLConnection.GetFieldNames (WideString, TWideStrings) (see page 20230)	Populates a string list with the names of fields in a table.
	TSQLConnection.GetFieldNames (WideString, WideString, TWideStrings) (see page 20230)	Populates a string list with the names of fields in a table.

149.1.5.4.16.1 TSQLConnection.GetFieldNames Method (WideString, TWideStrings)

Populates a string list with the names of fields in a table.

Pascal

```
procedure GetFieldNames(const TableName: WideString; SchemaName: WideString; List:
TWideStrings); overload;
procedure GetFieldNames(const TableName: WideString; List: TWideStrings); overload;
```

C++

```
__fastcall GetFieldNames(const BSTR TableName, BSTR SchemaName, TWideStrings List);
__fastcall GetFieldNames(const BSTR TableName, TWideStrings List);
```

Description

Call GetFieldNames to retrieve a list of fields in a table.

TableName names the table whose field names you want added to the list.

List is a TStrings descendant that receives the field names. Any existing strings are deleted from the list before GetFieldNames adds the names of all the fields in TableName.

For example, the following line fills a list box with the names of all fields in the Employee table:

```
SQLConnection1.GetFieldNames('Employee', ListBox1.Items);
SQLConnection1->GetFieldNames("Employee", ListBox1->Items);
```

See Also

GetProcedureNames (see page 20232)

GetPackageNames (see page 20231)

GetTableNames (see page 20235)

GetIndexNames (see page 20231)

SetSchemaInfo (see page 20185)

149.1.5.4.17 GetIndexNames Method

This is the overview for the GetIndexNames method overload.

Overload List

	Name	Description
	TSQLConnection.GetIndexNames (WideString, TWideStrings) (see page 20231)	Populates a string list with the names of indexes on a table.

	TSQLConnection.GetIndexNames (WideString, WideString, TWideStrings) (see page 20231)	Populates a string list with the names of indexes on a table.

149.1.5.4.17.1 TSQLConnection.GetIndexNames Method (WideString, TWideStrings)

Populates a string list with the names of indexes on a table.

Pascal

```
procedure GetIndexNames(const TableName: WideString; List: TWideStrings); overload;
procedure GetIndexNames(const TableName: WideString; const SchemaName: WideString; List:
TWideStrings); overload;
```

C++

```
__fastcall GetIndexNames(const BSTR TableName, TWideStrings List);
__fastcall GetIndexNames(const BSTR TableName, const BSTR SchemaName, TWideStrings List);
```

Description

Call GetIndexNames to retrieve a list of the indexes defined for a table.

List is a TStrings descendant that receives the index names. Any existing strings are deleted from the list before GetIndexNames adds the names of all the indexes on TableName.

TableName names the table whose indexes you want added to the list.

For example, the following line fills a list box with the names of all indexes on the Employee table:

```
SQLConnection1.GetIndexNames('Employee', ListBox1.Items);
SQLConnection1->GetIndexNames("Employee", ListBox1->Items);
```

See Also

GetProcedureNames (see page 20232)

GetTableNames (see page 20235)

GetPackageNames (see page 20231)

GetFieldNames (see page 20230)

GetProcedureParams (see page 20233)

SetSchemaInfo (see page 20185)

Obtaining Information About Indexes

149.1.5.4.18 TSQLConnection.GetLoginUsername Method

Returns the username that is logged in on the current connection.

Pascal

```
function GetLoginUsername: WideString;
```

C++

```
__fastcall BSTR GetLoginUsername();
```

149.1.5.4.19 TSQLConnection.GetPackageNames Method

Populates a string list with the names of all packages defined on the server.

Pascal

```
procedure GetPackageNames(List: TWideStrings); overload;
```

C++

```
__fastcall GetPackageNames(TWideStrings List);
```

Description

Call GetPackageNames to retrieve a list of packages defined on the associated database. This method is only relevant to Oracle servers.

List is a TStrings descendant that receives the package names. Any existing strings are deleted from the list before GetPackageNames adds the names of all packages that the database defines.

The following example fills a list box with the names of all packages defined by the database:

```
SQLConnection1.GetPackageNames(ListBox1.Items);
SQLConnection1->GetPackageNames(ListBox1->Items);
```

See Also

GetIndexNames (see page 20231)

SetSchemaInfo (see page 20185)

149.1.5.4.20 GetProcedureNames Method

This is the overview for the GetProcedureNames method overload.

Overload List

	Name	Description
	TSQLConnection.GetProcedureNames (TWideStrings) (see page 20232)	Populates a string list with the names of stored procedures in the database.
	TSQLConnection.GetProcedureNames (Widestring, TWideStrings) (see page 20232)	Populates a string list with the names of stored procedures in the database.
	TSQLConnection.GetProcedureNames (WideString, WideString, TWideStrings) (see page 20232)	Populates a string list with the names of stored procedures in the database.

149.1.5.4.20.1 TSQLConnection.GetProcedureNames Method (TWideStrings)

Populates a string list with the names of stored procedures in the database.

Pascal

```
procedure GetProcedureNames(List: TWideStrings); overload;
procedure GetProcedureNames(const PackageName: Widestring; List: TWideStrings); overload;
procedure GetProcedureNames(const PackageName: WideString; const SchemaName: WideString; List:
TWideStrings); overload;
```

C++

```
__fastcall GetProcedureNames(TWideStrings List);
__fastcall GetProcedureNames(const BSTR PackageName, TWideStrings List);
__fastcall GetProcedureNames(const BSTR PackageName, const BSTR SchemaName, TWideStrings List);
```

Description

Call GetProcedureNames to retrieve a list of stored procedures in the associated database.

List is a TStrings descendant that receives the stored procedure names. Any existing strings are deleted from the list before GetProcedureNames adds the names of all stored procedures in the database.

PackageName is the name of an Oracle package that contains the stored procedures. This syntax should only be used with Oracle servers when you only want the stored procedures from a specific package.

The following example fills a list box with the names of all stored procedures in the database:

```
SQLConnection1.GetProcedureNames(ListBox1.Items);
SQLConnection1->GetProcedureNames(ListBox1->Items);
```

See Also

GetIndexNames (see page 20231)

GetTableNames (see page 20235)

GetPackageNames (see page 20231)

GetFieldNames (see page 20230)

SetSchemaInfo (see page 20185)

149.1.5.4.21 GetProcedureParams Method

This is the overview for the GetProcedureParams method overload.

Overload List

	Name	Description
	TSQLConnection.GetProcedureParams (WideString, TList) (see page 20233)	Populates a list with parameter descriptors for the parameters in a stored procedure.
	TSQLConnection.GetProcedureParams (WideString, WideString, TList) (see page 20233)	Populates a list with parameter descriptors for the parameters in a stored procedure.
	TSQLConnection.GetProcedureParams (Widestring, Widestring, Widestring, TList) (see page 20233)	Populates a list with parameter descriptors for the parameters in a stored procedure.

149.1.5.4.21.1 TSQLConnection.GetProcedureParams Method (WideString, TList)

Populates a list with parameter descriptors for the parameters in a stored procedure.

Pascal

```
procedure GetProcedureParams(ProcedureName: WideString; List: TList); overload;
procedure GetProcedureParams(ProcedureName: WideString; PackageName: WideString; List: TList);
overload;
procedure GetProcedureParams(ProcedureName: Widestring; PackageName: Widestring; SchemaName:
Widestring; List: TList); overload;
```

C++

```
__fastcall GetProcedureParams(BSTR ProcedureName, TList List);
__fastcall GetProcedureParams(BSTR ProcedureName, BSTR PackageName, TList List);
__fastcall GetProcedureParams(BSTR ProcedureName, BSTR PackageName, BSTR SchemaName, TList
List);
```

Description

Call GetProcedureParams to retrieve information about the parameters of a specified stored procedure.

ProcedureName is the name of the stored procedure for whose parameters you want descriptions.

PackageName is the name of the Oracle package to which the stored procedure belongs. This parameter should only be used if TSQLConnection (see page 20217) connects to an Oracle server.

List is a TList object that receives the parameter descriptions. It should be an empty list on entry. For each parameter, GetProcedureParams adds a reference to an SPParamDesc (see page 20147) class (Delphi) or structure (C++). Each SPParamDesc (see page 20147) entity describes a parameter of a specified stored procedure, including its name, index, parameter type, field type, and so on. You are responsible for freeing the individual SPPParamDesc entities that GetProcedureParams dynamically allocates. (You can use FreeProcParams (see page 20361) to free all the entries and the list object as well).

Note: You can convert the list of SPParamDesc (see page 20147) entities to the more familiar TParams object by calling the global LoadParamListItems (see page 20363) procedure.

See Also

GetIndexNames (see page 20231)

GetTableNames (see page 20235)

GetPackageNames (see page 20231)

LoadParamListItems

FreeProcParams

149.1.5.4.22 TSQLConnection.GetSchemaNames Method

Returns the schema names for all objects in the given data source.

Pascal

```
procedure GetSchemaNames(List: TWideStrings); overload;
```

C++

```
__fastcall GetSchemaNames(TWideStrings List);
```

149.1.5.4.23 GetTableNames Method

This is the overview for the GetTableNames method overload.

Overload List

	Name	Description
	TSQLConnection.GetTableNames (TWideStrings, Boolean) (see page 20235)	Populates a string list with the names of tables in the database.
	TSQLConnection.GetTableNames (TWideStrings, WideString, Boolean) (see page 20235)	Populates a string list with the names of tables in the database.

149.1.5.4.23.1 TSQLConnection.GetTableNames Method (TWideStrings, Boolean)

Populates a string list with the names of tables in the database.

Pascal

```
procedure GetTableNames(List: TWideStrings; SchemaName: WideString; SystemTables: Boolean =
False); overload;
procedure GetTableNames(List: TWideStrings; SystemTables: Boolean = False); overload;
```

C++

```
__fastcall GetTableNames(TWideStrings List, BSTR SchemaName, Boolean SystemTables = False);
__fastcall GetTableNames(TWideStrings List, Boolean SystemTables = False);
```

Description

Call GetTableNames to retrieve a list of tables in the associated database.

List is a TStrings descendant that receives the table names. Any existing strings are deleted from the list before GetTableNames adds the names of all tables in the database.

SystemTables specifies whether the list of table names should include only the database's system tables. If SystemTables is true, only the system tables are added to List. If SystemTables is false, the list is filled with any tables that match the criteria specified by the TableScope (see page 20255) property.

For example, the following line fills a list box with the names of all data tables in the database:

```
SQLConnection1.GetTableNames(ListBox1.Items, False);
SQLConnection1->GetTableNames(ListBox1->Items, false);
```

See Also

GetIndexNames (see page 20231)

GetProcedureParams (see page 20233)

GetFieldNames (see page 20230)

GetProcedureNames (see page 20232)

GetPackageNames (see page 20231)

SetSchemaInfo (see page 20185)

TableScope (see page 20255)

149.1.5.4.24 TSQLConnection.Loaded Method

Initializes the connection component after all objects in the form or data module have been loaded.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. It is called automatically after the form or data module that contains the connection component has loaded all its owned objects. TCustomConnection overrides the inherited method to establish a connection if the Connected property is true.

See Also

StreamedConnected (see page 6874)

Loaded (see page 2782)

149.1.5.4.25 TSQLConnection.LoadParamsFromIniFile Method

Sets the DriverName (see page 20246) and Params (see page 20253) properties to the values associated with the ConnectionName (see page 20244) property.

Pascal

```
procedure LoadParamsFromIniFile(FFileName: WideString = '');
```

C++

```
__fastcall LoadParamsFromIniFile(BSTR FFileName = '');
```

Description

Call LoadParamsFromIniFile to ensure that the DriverName (see page 20246) and Params (see page 20253) properties accurately reflect the connection configuration for the ConnectionName (see page 20244) property that is stored in the file specified by the AFileName parameter. If the AFileName parameter is omitted, LoadParamsFromIniFile uses the dbxconnections.ini file. Otherwise, itis a fully-qualified path name to a file that has the same format as the dbxconnections.ini file. Typically, this file is created by making a copy of the dbxconnections.ini file under a different name.

In most cases, it is unnecessary to load connection configurations at runtime because when you set ConnectionName (see page 20244) at design time, the DriverName (see page 20246) and Params (see page 20253) properties are automatically set as well. However, LoadParamsFromIniFile lets you use a customized set of connection configurations at runtime that differ from those stored in the dbxconnections.ini file, or to temporarily override the DriverName (see page 20246) or connection parameter values at design time and then reestablish the defaults at runtime.

Note: Do not set the LoadParamsOnConnect (see page 20249) property to true if your application calls LoadParamsFromIniFile and specifies an alternate connections file. When LoadParamsOnConnect (see page 20249) is true, it loads the connection configuration from the dbxconnections.ini

file immediately before opening a connection, overriding any values loaded by this method.

See Also

ConnectionName (see page 20244)

LoadParamsOnConnect (see page 20249)

DriverName (see page 20246)

Params (see page 20253)

Setting Up TSQLConnection

Configuring TSQL Connection

149.1.5.4.26 TSQLConnection.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

149.1.5.4.27 OpenSchema Method

This is the overview for the OpenSchema method overload.

Overload List

	Name	Description
	TSQLConnection.OpenSchema (TSchemaType, Widestring, TWideStrings) (see page 20238)	This is OpenSchema, a member of class TSQLConnection.
	TSQLConnection.OpenSchema (TSchemaType, WideString, WideString, TWideStrings) (see page 20237)	This is OpenSchema, a member of class TSQLConnection.

149.1.5.4.27.1 TSQLConnection.OpenSchema Method (TSchemaType, WideString, WideString, TWideStrings)

Pascal

```
procedure OpenSchema(eKind: TSchemaType; sInfo: WideString; SSchemaName: WideString; List:
TWideStrings); overload;
```

C++

```
__fastcall OpenSchema(TSchemaType eKind, BSTR sInfo, BSTR SSchemaName, TWideStrings List);
```

Description

This is OpenSchema, a member of class TSQLConnection.

149.1.5.4.27.2 TSQLConnection.OpenSchema Method (TSchemaType, Widestring, TWideStrings)

Pascal

```
procedure OpenSchema(eKind: TSchemaType; sInfo: Widestring; List: TWideStrings); overload;
```

C++

```
__fastcall OpenSchema(TSchemaType eKind, BSTR sInfo, TWideStrings List);
```

Description

This is OpenSchema, a member of class TSQLConnection.

149.1.5.4.28 TSQLConnection.RegisterClient Method

Registers an object that uses the connection component.

Pascal

```
procedure RegisterClient(Client: TObject; Event: TConnectChangeEvent = nil); override;
```

C++

```
virtual __fastcall RegisterClient(TObject * Client, TConnectChangeEvent Event = nil);
```

Description

RegisterClient is used internally to associate objects with the connection component. Registered components can supply an event handler that responds when the connection is created or terminated.

Client is the object to register. If Client is a dataset, it is added to the DataSets property.

Event is an event handler that is called after the connection is established or before it is terminated.

Datasets call this method when they start using the connection component. For BDE-enabled datasets, ADO datasets, and dbExpress datasets, this is when they are activated. For client datasets, this is when the RemoteServer property is assigned.

See Also

DataSets (see page 6870)

UnRegisterClient (see page 6868)

149.1.5.4.29 TSQLConnection.Rollback Method

Cancels all updates, insertions, and deletions for a specified transaction and ends the transaction.

Pascal

```
procedure Rollback(TransDesc: TTransactionDesc); deprecated;
```

C++

```
__fastcall Rollback(TTransactionDesc TransDesc);
```

Description

Call Rollback to cancel any changes made during the transaction described by TransDesc and to end it.

TransDesc is the transaction descriptor supplied to the StartTransaction (see page 20240) method when starting the transaction.

If the specified transaction is the only current transaction, Rollback sets the InTransaction (see page 20247) property to false after canceling the transaction.

Note: This method has been deprecated.

See Also

InTransaction (see page 20247)

StartTransaction (see page 20240)

Commit (see page 20226)

TransactionsSupported (see page 20256)

TransactionLevel (see page 20202)

149.1.5.4.30 TSQLConnection.RollbackAndFree Method

Pascal

```
procedure RollbackAndFree(Transaction: TDBXTransaction);
```

C++

```
__fastcall RollbackAndFree(TDBXTransaction Transaction);
```

Description

This is RollbackAndFree, a member of class TSQLConnection.

149.1.5.4.31 TSQLConnection.SetTraceEvent Method

Associates the SQL connection with a callback function that executes for every SQL command passed to or from the server.

Pascal

```
procedure SetTraceEvent(Event: TDBXTraceEvent);
```

C++

```
__fastcall SetTraceEvent(TDBXTraceEvent Event);
```

Description

Call SetTraceEvent to assign a callback that responds every time an SQL command passes between the associated dbExpress driver and the database server. The callback function becomes the value of the TraceCallbackEvent (see page 20260) property.

Event is the TDBXTraceEvent event that is called for every message that passes between the dbExpress driver and the SQL server.

Tip: Read the TraceCallbackEvent (see page 20260) property to determine whether a callback is already assigned before calling the SetTraceEvent method. That way, you can avoid interfering with an existing callback when assigning a new one.

See Also

TSQLMonitor (see page 20285)

TraceCallbackEvent (see page 20260)

Debugging dbExpress Applications

Debugging dbExpress Applications using TSQLMonitor

149.1.5.4.32 TSQLConnection.SQLError Method

Pascal

```
procedure SQLError(Error: TDBXError);
```

C++

```
__fastcall SQLError(TDBXError Error);
```

Description

This is SQLError, a member of class TSQLConnection.

149.1.5.4.33 TSQLConnection.StartTransaction Method

Initiates a new transaction in the associated database.

Pascal

```
procedure StartTransaction(TransDesc: TTransactionDesc); deprecated;
```

C++

```
__fastcall StartTransaction(TTransactionDesc TransDesc);
```

Description

Call StartTransaction to start a new transaction against a database server that supports transactions. (MySQL servers do not support transactions.) You can check the TransactionsSupported (see page 20256) property to determine whether the server supports transactions. If the server does not support transactions, StartTransaction does nothing.

TransDesc describes the transaction you are starting. It lets you specify

A user-defined transaction identifier. If the server supports nested or overlapped transactions, you can initiate multiple transactions by calling StartTransaction and providing each transaction with its own unique identifier.

The transaction isolation level. This indicates the degree to which this transaction can "see" changes made by other transactions.

If the transaction is successfully started, StartTransaction sets the InTransaction (see page 20247) property to true.

Updates, insertions, and deletions that take place after a call to StartTransaction are enlisted in that transaction until another overlapping transaction is started or until the application calls Commit (see page 20226) to save the changes or Rollback (see page 20238) to cancel them.

Tip: If the server does not support multiple transactions, check the status of the InTransaction (see page 20247) property to be sure that another transaction is not already in progress.

Tip: When working with overlapped transactions, you can indicate the transaction to which a dataset belongs by setting its TransactionLevel property to the transaction identifier you assign in this method.

Note: This method has been deprecated.

See Also

InTransaction (see page 20247)

Commit (see page 20226)

Rollback (see page 20238)

Params (see page 20253)

TransactionsSupported (see page 20256)

TransactionLevel (see page 20202)

149.1.5.4.34 TSQLConnection.UnRegisterClient Method

Removes a registered client so that it is no longer associated with the connection component.

Pascal

```
procedure UnRegisterClient(Client: TObject); override;
```

C++

```
virtual __fastcall UnRegisterClient(TObject * Client);
```

Description

UnRegisterClient is used internally to remove objects from the internal list of objects that are informed when a connection is created or terminated.

Client is the object that is removed from the list. It should be an object that was previously registered by a call to RegisterClient. If Client is a dataset, it is removed from the DataSets property list.

Datasets call this method when they stop using the connection component. For BDE-enabled datasets, ADO datasets, and dbExpress datasets, this is when they are deactivated. For client datasets, this is when the RemoteServer property is changed.

See Also

DataSets (see page 6870)

RegisterClient (see page 6866)

149.1.5.5 TSQLConnection Properties

The properties of the TSQLConnection class are listed here.

Protected Properties

	Name	Description
R	Connection (see page 20244)	This is Connection, a member of class TSQLConnection.
R	ConnectionRegistryFile (see page 20245)	This is ConnectionRegistryFile, a member of class TSQLConnection.
R	DriverRegistryFile (see page 20247)	This is DriverRegistryFile, a member of class TSQLConnection.
	LastError (see page 20248)	This is LastError, a member of class TSQLConnection.
R	QuoteChar (see page 20254)	This is QuoteChar, a member of class TSQLConnection.
	SQLDllHandle (see page 20255)	This is SQLDllHandle, a member of class TSQLConnection.

Public Properties

	Name	Description
R	ActiveStatements (see page 20242)	Indicates the number of statements currently active with the database server.
	AutoClone (see page 20243)	Specifies whether the SQL connection automatically clones database connections when they are needed.
	ConnectionState (see page 20245)	Indicates the current state of the TSQLConnection (see page 20217) object.
R	DataSets (see page 20245)	Lists all active datasets for the connection component.
R	InTransaction (see page 20247)	Indicates whether a transaction is in progress.
	LocaleCode (see page 20250)	Identifies the locale that is used for sorting items from datasets that use this connection.
R	MaxStmtsPerConn (see page 20251)	Indicates the server limit on the number of statements supported by a single database connection.
R	MetaData (see page 20252)	Provides an interface to the dbExpress object that supplies server metadata.
R	MultipleTransactionsSupported (see page 20253)	Indicates whether the database server supports multiple transactions.
	ParamsLoaded (see page 20254)	Indicates when parameter values have been loaded from dbxconnections.ini.

	SQLConnection (see page 20255)	This is SQLConnection, a member of class TSQLConnection.
	SQLHourGlass (see page 20255)	Specifies whether the cursor should change to crSQLWait during lengthy operations.
R	TransactionsSupported (see page 20256)	Indicates whether the database server supports transactions.

Published Properties

	Name	Description
	Connected (see page 20243)	Specifies whether the connection is active.
	ConnectionName (see page 20244)	Names the connection configuration.
	DriverName (see page 20246)	Specifies the database driver associated with the SQL connection.
	GetDriverFunc (see page 20247)	Specifies the function that returns the top-level dbExpress driver.
	KeepConnection (see page 20248)	Specifies whether the connection stays active when no datasets are open.
	LibraryName (see page 20248)	Specifies the dbExpress driver that TSQLConnection (see page 20217) uses to establish a connection.
	LoadParamsOnConnect (see page 20249)	Specifies whether the TSQLConnection (see page 20217) component loads the configuration named by ConnectionName (see page 20244) immediately before connecting to the server.
	LoginPrompt (see page 20250)	Specifies whether a login dialog appears immediately before opening a new connection.
	Params (see page 20253)	Lists the connection parameters.
	TableScope (see page 20255)	Indicates what types of tables are returned when fetching schema information about tables.
	VendorLib (see page 20257)	Specifies the client software library (DLL or shared object) supplied by the database vendor.

149.1.5.5.1 TSQLConnection.ActiveStatements Property

Indicates the number of statements currently active with the database server.

Pascal

```
property ActiveStatements: LongWord;
```

C++

```
__property LongWord ActiveStatements;
```

Description

Read ActiveStatements to determine how many statements are currently executing using the database connection. While a dataset is prepared, it creates an active statement that lasts until the dataset is unprepared. When you set a dataset's Prepared property to true, the statement remains active until you change the Prepared property to false. When the Prepared property is false, the dataset implicitly prepares its statement when you open the dataset, and the statement remains active until you close the dataset. In addition, executing an SQL statement (for example, using the Execute (see page 20227) method) creates an active statement temporarily, until the statement finishes executing.

Use ActiveStatements to check whether an application has reached the server-imposed limit on the number of active statements allowed to a connection (the MaxStmtsPerConn (see page 20251) property). This is especially important if AutoClone (see page 20243) is false, because if you exceed MaxStmtsPerConn (see page 20251) when AutoClone (see page 20243) is false, the SQL connection raises an exception. To avoid exceeding the server-imposed limit, do not open any datasets or execute SQL statements when ActiveStatements is the same as MaxStmtsPerConn (see page 20251) (unless MaxStmtsPerConn (see page 20251) is 0).

See Also

DataSets (see page 20245)

Execute (see page 20227)

MaxStmtsPerConn (see page 20251)

Prepared (see page 20198)

AutoClone (see page 20243)

149.1.5.5.2 TSQLConnection.AutoClone Property

Specifies whether the SQL connection automatically clones database connections when they are needed.

Pascal

```
property AutoClone: Boolean;
```

C++

```
__property Boolean AutoClone;
```

Description

AutoClone controls whether the TSQLConnection (see page 20217) component automatically creates duplicate database connections when the number of statements allowed by the database server is exceeded. By default, AutoClone is true, meaning that when the ActiveStatements (see page 20242) property is the same as MaxStmtsPerConn (see page 20251), trying to execute another statement (open another dataset or call the Execute (see page 20227) method) causes TSQLConnection (see page 20217) to open a secondary (cloned) connection. The result behaves just like a connection to a server that does not limit the number of statements, except that it consumes more resources (for the additional, cloned connections).

Change AutoClone to false to prevent TSQLConnection (see page 20217) from cloning the database connection when the application attempts to exceed the maximum number of statements. When AutoClone is false, attempts to exceed MaxStmtsPerConn (see page 20251) result in an exception.

Tip: When AutoClone is false, you can check the ActiveStatements (see page 20242) property to ensure that you do not exceed the server-imposed limit on the number of statements. If you are about to exceed that limit, you can explicitly call CloneConnection (see page 20225) to clone the connection yourself.

MaxStmtsPerConn (see page 20251)

ActiveStatements (see page 20242)

CloneConnection (see page 20225)

Connecting to the Database Server

149.1.5.5.3 TSQLConnection.Connected Property

Specifies whether the connection is active.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Set Connected to trueto establish a connection to the database server. When a dataset that uses the TSQLConnection (see page 20217) object is activated, it automatically sets Connected to true. Set Connected to false to close a connection.

Setting Connected to true generates a BeforeConnect (see page 20258) event, establishes the connection, and generates an AfterConnect (see page 20258) event. In addition, when setting Connected to true, TSQLConnection (see page 20217) may display a login dialog, depending on the value of LoginPrompt (see page 20250).

Setting Connected to false generates a BeforeDisconnect (see page 20259) event, drops the connection, and generates an

AfterDisconnect (see page 20258) event.

See Also

Close (see page 6863)

ConnectionState (see page 20245)

BeforeConnect (see page 6875)

AfterConnect (see page 6874)

BeforeDisconnect (see page 6875)

AfterDisconnect (see page 6875)

LoginPrompt (see page 6872)

149.1.5.5.4 TSQLConnection.Connection Property

Pascal

```
property Connection: TDBXConnection;
```

C++

```
__property TDBXConnection Connection;
```

Description

This is Connection, a member of class TSQLConnection.

149.1.5.5.5 TSQLConnection.ConnectionName Property

Names the connection configuration.

Pascal

```
property ConnectionName: string;
```

C++

```
__property AnsiString ConnectionName;
```

Description

Set ConnectionName to use a named connection configuration. Setting ConnectionName automatically sets the DriverName (see page 20246) and Params (see page 20253) properties to reflect the driver and connection parameters stored under that name in the dbxconnections.ini file.

Tip: You can define new connection configurations using the Connection (see page 20244) Editor. To launch the Connection (see page 20244) Editor, double-click on the TSQLConnection (see page 20217) component.

If you are using a different dbxconnections.ini file at design time than the one used at runtime, you can force the configuration to reload at runtime by setting the LoadParamsOnConnect (see page 20249) property or calling LoadParamsFromIniFile (see page 20236). In most cases, however, this is unnecessary, because the DriverName (see page 20246) and Params (see page 20253) property settings that are loaded when you set ConnectionName are saved in the form file. In fact, unless you set LoadParamsOnConnect (see page 20249) or call LoadParamsFromIniFile (see page 20236), you do not need to deploy the dbxconnections.ini file with your application even if you are using named connections.

See Also

LoadParamsOnConnect (see page 20249)

LoadParamsFromIniFile (see page 20236)

DriverName (see page 20246)

Params (see page 20253)

Setting Up a Simple Dataset

Setting Up TSQLConnection

Configuring TSQL Connection

149.1.5.5.6 TSQLConnection.ConnectionRegistryFile Property

Pascal

```
property ConnectionRegistryFile: string;
```

C++

```
__property AnsiString ConnectionRegistryFile;
```

Description

This is ConnectionRegistryFile, a member of class TSQLConnection.

149.1.5.5.7 TSQLConnection.ConnectionState Property

Indicates the current state of the TSQLConnection (see page 20217) object.

Pascal

```
property ConnectionState: TConnectionState;
```

C++

```
__property TConnectionState ConnectionState;
```

Description

Read ConnectionState at runtime to determine the activity being performed, if any, by the connection at a specific point in time. Use ConnectionState to coordinate the activities of the connection component, so that you do not start one activity while it is currently engaged in another.

See Also

Open (see page 6866)

Connected (see page 20243)

Close (see page 6863)

Execute (see page 20227)

149.1.5.5.8 TSQLConnection.DataSets Property

Lists all active datasets for the connection component.

Pascal

```
property DataSets [Index: Integer]: TCustomSQLDataSet;
```

C++

```
__property TCustomSQLDataSet DataSets[int Index];
```

Description

Use DataSets to access active datasets associated with a connection component. An active dataset is one that is currently open.

The Index parameter ranges between 0 and DataSetCount.

The value of DataSets changes as the datasets that use this TSQLConnection (see page 20217) component open and close.

Note: If a TSQLClientDataSet uses the connection component to connect to a database server, DataSets lists the internal dataset that the client dataset creates to access data, not the client dataset itself.

See Also

DataSetCount (see page 6869)

Active (see page 7004)

MaxStmtsPerConn (see page 20251)

TSQLClientDataSet

149.1.5.5.9 TSQLConnection.DriverName Property

Specifies the database driver associated with the SQL connection.

Pascal

```
property DriverName: string;
```

C++

```
__property AnsiString DriverName;
```

Description

If you are not using named connections, set DriverName to the name of an installed dbExpress driver such as INTERBASE, MYSQL, INFORMIX, ORACLE, or DB2. Installed drivers are listed in the dbxdrivers.ini file, and their names can be retrieved using the GetDriverNames (see page 20362) function.

If you are using named connections, the DriverName property is automatically set when you set the ConnectionName (see page 20244) property.

When you set DriverName, TSQLConnection (see page 20217) automatically sets the LibraryName (see page 20248) and VendorLib (see page 20257) properties to the names of the libraries (DLLs or shared objects) that implement the specified driver.

See Also

LibraryName (see page 20248)

VendorLib (see page 20257)

ConnectionName (see page 20244)

GetDriverNames (see page 20362)

Setting Up TSQLConnection

Configuring TSQL Connection

Connecting to Databases with TDatabase

149.1.5.5.10 TSQLConnection.DriverRegistryFile Property

Pascal

```
property DriverRegistryFile: string;
```

C++

```
__property AnsiString DriverRegistryFile;
```

Description

This is DriverRegistryFile, a member of class TSQLConnection.

149.1.5.5.11 TSQLConnection.GetDriverFunc Property

Specifies the function that returns the top-level dbExpress driver.

Pascal

```
property GetDriverFunc: string;
```

C++

```
__property AnsiString GetDriverFunc;
```

Description

GetDriverFunc is the name of a function in the dbExpress driver specified by the LibraryName (see page 20248) property. The specified function returns the top-level dbExpress interface. Typically, this property is set to the function name that is stored in the dbxdrivers.ini file.

Note: The GetDriverFunc, LibraryName (see page 20248), and VenderLib properties all reflect the values in the dbxdrivers.ini

file. Because these property values are published (stored with the connection component), it is possible to deploy an application without deploying the dbxdrivers.ini file.

See Also

LibraryName (see page 20248)

VendorLib (see page 20257)

149.1.5.5.12 TSQLConnection.InTransaction Property

Indicates whether a transaction is in progress.

Pascal

```
property InTransaction: Boolean;
```

C++

```
__property Boolean InTransaction;
```

Description

Read InTransaction at runtime to ascertain whether a transaction is currently active for the SQL connection component. If the connection component is currently in a transaction, all communication with the server that passes through the connection is enlisted in that transaction.

InTransaction is true if there is an active transaction. If no transaction is active, InTransaction is false.

A transaction begins when the application calls BeginTransaction (see page 20224) and lasts until the application calls CommitFreeAndNil, RollbackFreeAndNil, or RollbackIncompleteFreeAndNi. If there are multiple transactions, InTransaction

remains true until all transactions are either committed or rolled back.

See Also

BeginTransaction (see page 20224)

CommitFreeAndNil

RollbackFreeAndNil

RollbackIncompleteFreeAndNi

TransactionsSupported (see page 20256)

TransactionLevel (see page 20202)

MultipleTransactionsSupported (see page 20253)

149.1.5.5.13 TSQLConnection.KeepConnection Property

Specifies whether the connection stays active when no datasets are open.

Pascal

```
property KeepConnection: Boolean;
```

C++

```
__property Boolean KeepConnection;
```

Description

Use KeepConnection to specify whether TSQLConnection (see page 20217) maintains an open database connection even if no associated dataset components are currently active. When KeepConnection is true (the default) the connection is maintained. For connections to remote database servers, or in applications that frequently open and close datasets, set KeepConnection to true to reduce network traffic, speed up applications, and avoid logging in to the server each time the connection is reestablished.

When KeepConnection is false a connection is dropped when there are no open datasets. Dropping a connection releases system resources allocated to the connection, but if a dataset is later opened that uses the database, the connection must be reestablished and initialized.

See Also

DataSets (see page 20245)

Connected (see page 20243)

149.1.5.5.14 TSQLConnection.LastError Property

Pascal

```
property LastError: TDBXError;
```

C++

```
__property TDBXError LastError;
```

Description

This is LastError, a member of class TSQLConnection.

149.1.5.5.15 TSQLConnection.LibraryName Property

Specifies the dbExpress driver that TSQLConnection (see page 20217) uses to establish a connection.

Pascal

```
property LibraryName: string;
```

C++

```
__property AnsiString LibraryName;
```

Description

LibraryName is the dbExpress library associated with the driver specified by DriverName (see page 20246). Most applications do not need to use LibraryName directly, because this property is set automatically when the DriverName (see page 20246) property is set.

Note: The association between a dbExpress library and a driver name is stored in the dbxdrivers.ini

file when you install the dbExpress driver. The file named by this property is the only dbExpress file that must be deployed with your application.

Note: The LibraryName, GetDriverFunc (see page 20247), and VenderLib properties all reflect the values in the dbxdrivers.ini

file. Because these property values are published (stored with the connection component), it is possible to deploy an application without deploying the dbxdrivers.ini file.

See Also

DriverName (see page 20246)

VendorLib (see page 20257)

GetDriverFunc (see page 20247)

Setting Up TSQLConnection

Configuring TSQL Connection

149.1.5.5.16 TSQLConnection.LoadParamsOnConnect Property

Specifies whether the TSQLConnection (see page 20217) component loads the configuration named by ConnectionName (see page 20244) immediately before connecting to the server.

Pascal

```
property LoadParamsOnConnect: Boolean;
```

C++

```
__property Boolean LoadParamsOnConnect;
```

Description

Set LoadParamsOnConnect to true if you want the TSQLConnection (see page 20217) object to load the connection configuration (DriverName (see page 20246) and Params (see page 20253) properties) associated with ConnectionName (see page 20244) at runtime. Typically, this is unnecessary because when you set ConnectionName (see page 20244) at design time, the DriverName (see page 20246) and Params (see page 20253) properties are automatically set as well. However, if you use a different dbxconnections.ini file at runtime, or if you temporarily override the DriverName (see page 20246) or any connection parameter values at design time, setting LoadParamsOnConnect to true ensures that at runtime the connection is established using the configuration associated with ConnectionName (see page 20244) in the dbxconnections.ini file.

Note: If you set LoadParamsOnConnect to true, you must be sure to deploy the dbxconnections.ini

file with your application. When you rely on the design-time associations, dbxconnections.ini is not needed at runtime.

Warning: If you set LoadParamsOnConnect to true, you must specify a valid connection name as the value for

ConnectionName (see page 20244).

See Also

ConnectionName (see page 20244)

LoadParamsFromIniFile (see page 20236)

DriverName (see page 20246)

Params (see page 20253)

Setting Up TSQLConnection

Configuring TSQL Connection

149.1.5.5.17 TSQLConnection.LocaleCode Property

Identifies the locale that is used for sorting items from datasets that use this connection.

Pascal

```
property LocaleCode: TLocaleCode;
```

C++

```
__property TLocaleCode LocaleCode;
```

Description

LocaleCode represents the locale that client datasets use to sort strings when they are provided in fields from a dataset associated with this connection. By default, this value is 0, which signals that strings should be sorted without regard to a locale. Changing LocaleCode can affect performance, because sorting is slower when it must take locale into account. Therefore, it is recommended that you only change LocaleCode if the data is known to contain extended characters that will affect the sort order.

Note: Locale codes are treated as connection parameters: they are stored in the dbxconnections.ini

file along with the other parameters, and appear in the Params (see page 20253) property list. Changes to this property change the entry in the Params (see page 20253) property list.

Params (see page 20253)

LoadParamsOnConnect (see page 20249)

TClientDataSet (see page 8289)

149.1.5.5.18 TSQLConnection.LoginPrompt Property

Specifies whether a login dialog appears immediately before opening a new connection.

Pascal

```
property LoginPrompt: Boolean;
```

C++

```
__property Boolean LoginPrompt;
```

Description

Set LoginPrompt to true to provide login support when establishing a connection. LoginPrompt controls two things: the occurrence of the OnLogin event, and the appearance of a default login dialog that prompts users for a name and password when you include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). When the OnLogin event occurs and when the default login dialog appears depend on the type of connection component:

For TDatabase, TIBDatabase, and TSQLConnection, the dialog appears after the BeforeConnect event and before the AfterConnect event, unless you supply an OnLogin event handler. If there is an OnLogin event handler, that event occurs in place of the login dialog, and there is no need to include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi). If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For TADOConnection components, the dialog appears after the OnWillConnect event and before the BeforeConnect event. If there is an OnLogin event handler, that event occurs after the login dialog. If you do not include DBLogDlg.hpp in your unit (C++) or add DBLogDlg to your uses clause (Delphi), the OnLogin event occurs but there is no default login dialog. If correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler, the connection fails. The OnLogin event does not fire unless LoginPrompt is set to true.

For DataSnap SOAP connection components, the dialog appears after the OnGetUsername event and before the BeforeConnect, AfterConnect, and OnLogin events. If the user cancels from the login dialog, no attempt is made to open a connection.

When LoginPrompt is false, the application must supply user name and password values programmatically:

For TDatabase, the user name and password can be supplied as USER NAME and PASSWORD parameters in the Params property.

For TADOConnection, the user name and password can be supplied as the ConnectionString property.

For TSQLConnection, the user name, password, and database can be supplied as UserName, Password, and Database parameters in the Params property, or provided as connection parameters associated with the connection name.

For DataSnap SOAP connection components, there is no built-in use for the user name and password supplied by the login dialog. (The UserName and Password properties of TWebConnection are unrelated).

Warning: Storing hard-coded user name and password entries as property values or in code for an OnLogin event handler can compromise server security.

OnLogin (see page 9994)

Controlling Server Login

149.1.5.5.19 TSQLConnection.MaxStmtsPerConn Property

Indicates the server limit on the number of statements supported by a single database connection.

Pascal

```
property MaxStmtsPerConn: LongWord;
```

C++

```
__property LongWord MaxStmtsPerConn;
```

Description

Read MaxStmtsPerConn when a connection is active to determine whether the database server imposes a limit on the number of statements that can be executed using the current connection. When MaxStmtsPerConn is 0, the server imposes no restrictions: a single database connection can be used to fetch multiple datasets and execute statements while there are active datasets. When MaxStmtsPerConn is greater than 0, the database server limits the number of statements that can execute. The server allows only MaxStmtsPerConn datasets to be opened using a single connection, and when that number of datasets are open, no more statements can be executed (for example, using the Execute (see page 20227) method).

By default, when MaxStmtsPerConn is greater than 0, TSQLConnection (see page 20217) clones the database connection when this server-imposed limit is reached. For example, if MaxStmtsPerConn is 1, then trying to open a second dataset using the same TSQLConnection (see page 20217) component causes TSQLConnection (see page 20217) to establish a second database connection for the second dataset. If AutoClone (see page 20243) is false, however, TSQLConnection (see page 20217) does not clone connections, but rather generates an exception when the application tries to exceed MaxStmtsPerConn.

Note: The value of MaxStmtsPerConn is only valid when the Connected (see page 20243) property is true.

See Also

DataSets (see page 20245)

Execute (see page 20227)

Connected (see page 20243)

AutoClone (see page 20243)

ActiveStatements (see page 20242)

Connecting to the Database Server

149.1.5.5.20 TSQLConnection.MetaData Property

Provides an interface to the dbExpress object that supplies server metadata.

Pascal

```
property MetaData: TDBXMetaData;
```

C++

```
__property TDBXMetaData MetaData;
```

Description

Typically, applications do not use the MetaData property to work directly with the dbExpress MetaData interface. Instead, they use one of methods that assembles schema information into a list (GetFieldNames (see page 20230), GetIndexNames (see page 20231), GetProcedureNames (see page 20232), GetProcedureParams (see page 20233), or GetTableNames (see page 20235)). When more detailed metadata is required, you can also use the SQL dataset's SetSchemaInfo method to populate an SQL dataset with metadata.

See Also

GetFieldNames (see page 20230)

GetIndexNames (see page 20231)

GetProcedureNames (see page 20232)

GetProcedureParams (see page 20233)

GetTableNames (see page 20235)

SetSchemaInfo (see page 20185)

149.1.5.5.21 TSQLConnection.MultipleTransactionsSupported Property

Indicates whether the database server supports multiple transactions.

Pascal

```
property MultipleTransactionsSupported: LongBool;
```

C++

```
__property LongBool MultipleTransactionsSupported;
```

Description

Read MultipleTransactionsSupported at runtime to ascertain whether the database server supports multiple transactions (either nested or overlapping).

Note: To determine whether the server supports transactions at all, use the TransactionsSupported (see page 20256) property. If a server supports only a single transaction at a time, TransactionsSupported (see page 20256) is true, and MultipleTransactionsSupported is false.

See Also

CommitFreeAndNil

BeginTransaction (see page 20224)

RollbackFreeAndNil

InTransaction (see page 20247)

TransactionsSupported (see page 20256)

149.1.5.5.22 TSQLConnection.Params Property

Lists the connection parameters.

Pascal

```
property Params: TWideStrings;
```

C++

```
__property TWideStrings Params;
```

Description

Params is a TStrings object listing the connection parameters. Each entry in the string list has the form

```
Name=Value
```

where Name is the name of the parameter and Value is its value. If you are using named connection configurations (the ConnectionName (see page 20244) property), the values for each parameter are loaded from the dbxconnections.ini file when you set ConnectName.

At design time, you can set parameter values using the string list editor by double clicking on the Params property in the Object Inspector. Any new values you set override the values loaded when you set ConnectionName (see page 20244) unless you

load the connection configuration at runtime using LoadParamsFromIniFile (see page 20236) or LoadParamsOnConnect (see page 20249).

The particular parameters that appear depend on the database server. The Params property is initialized to include a string for each parameter when you set the DriverName (see page 20246) property. One particular parameter, Database, is required for all servers. Its value depends on the server you are using. For example, with InterBase, Database is the name of the .gdb file, while with MySQL, it is the database name that was assigned by the CREATE DATABASE command.

Other typical parameters include HostName (the machine name or IP address of where the server is located), and TransIsolation (the degree to which transactions are isolated from changes made by other users of the database).

See Also

ConnectionName (see page 20244)

LoadParamsFromIniFile (see page 20236)

LoadParamsOnConnect (see page 20249)

DriverName (see page 20246)

LocaleCode (see page 20250)

Setting Up TSQLConnection

149.1.5.5.23 TSQLConnection.ParamsLoaded Property

Indicates when parameter values have been loaded from dbxconnections.ini.

Pascal

```
property ParamsLoaded: Boolean;
```

C++

```
__property Boolean ParamsLoaded;
```

Description

Do not use the ParamsLoaded property. It is used internally by the Connections Editor to keep track of when parameter values have been loaded from the dbxconnections.ini file.

See Also

Params (see page 20253)

LoadParamsFromIniFile (see page 20236)

LoadParamsOnConnect (see page 20249)

149.1.5.5.24 TSQLConnection.QuoteChar Property

Pascal

```
property QuoteChar: WideString;
```

C++

```
__property BSTR QuoteChar;
```

Description

This is QuoteChar, a member of class TSQLConnection.

149.1.5.5.25 TSQLConnection.SQLConnection Property

Pascal

```
property SQLConnection: TDBXConnection;
```

C++

```
__property TDBXConnection SQLConnection;
```

Description

This is SQLConnection, a member of class TSQLConnection.

149.1.5.5.26 TSQLConnection.SQLDllHandle Property

Pascal

```
property SQLDllHandle: THandle;
```

C++

```
__property THandle SQLDllHandle;
```

Description

This is SQLDllHandle, a member of class TSQLConnection.

149.1.5.5.27 TSQLConnection.SQLHourGlass Property

Specifies whether the cursor should change to crSQLWait during lengthy operations.

Pascal

```
property SQLHourGlass: Boolean;
```

C++

```
__property Boolean SQLHourGlass;
```

Description

Set SQLHourGlass to true to specify that the cursor should indicate when the connection is performing a potentially lengthy operation. Such operations include

Establishing a connection to the database server.

Fetching metadata from the database server.

Executing a statement using the Execute (see page 20227) method.

When SQLHourGlass is false, the cursor is not changed when the SQL connection performs such operations.

See Also

Execute (see page 20227)

Open (see page 6866)

TCursorType

149.1.5.5.28 TSQLConnection.TableScope Property

Indicates what types of tables are returned when fetching schema information about tables.

Pascal

```
property TableScope: TTableScopes;
```

C++

```
__property TTableScopes TableScope;
```

Description

Set TableScope to determine the type of tables listed by the GetTableNames (see page 20235) method or that populate an SQL dataset after calling its SetSchemaInfo method with a parameter of stTables. TableScope lets you request information about a combination of table types. By default, TableScope requests only ordinary tables and views (tsTable and tsView).

Note: TableScope only affects GetTableNames (see page 20235) when the SystemTables parameter is false and only affects SetSchemaInfo when the SchemaType parameter is stTables. If an application calls GetTablesNames with SystemTables set to true, or calls SetSchemaInfo with SchemaType set to stSysTables, system tables, and only system tables are returned, regardless of the value of TableScope.

See Also

GetTableNames (see page 20235)

SetSchemaInfo (see page 20185)

Fetching Metadata into a Unidirectional Dataset

149.1.5.5.29 TSQLConnection.TransactionsSupported Property

Indicates whether the database server supports transactions.

Pascal

```
property TransactionsSupported: LongBool;
```

C++

```
__property LongBool TransactionsSupported;
```

Description

Read TransactionsSupported at runtime to ascertain whether the database server supports transactions. If TransactionsSupported is false, then the BeginTransaction (see page 20224), CommitFreeAndNil, RollbackFreeAndNil, and RollbackIncompleteFreeAndNil methods do nothing. If TransactionsSupported is true, you can use the SQL connection component to manage transactions.

Note: Some servers support multiple transactions (either nested or overlapping). When TransactionsSupported is true, you can test whether the server supports multiple transactions by reading the MultipleTransactionsSupported (see page 20253) property.

See Also

BeginTransaction (see page 20224)

CommitFreeAndNil

RollbackFreeAndNil

RollbackIncompleteFreeAndNil

InTransaction (see page 20247)

MultipleTransactionsSupported (see page 20253)

149.1.5.5.30 TSQLConnection.VendorLib Property

Specifies the client software library (DLL or shared object) supplied by the database vendor.

Pascal

```
property VendorLib: string;
```

C++

```
__property AnsiString VendorLib;
```

Description

VendorLib is the library supplied by the database vendor to support client-side use of the database. Most applications do not need to use VendorLib directly, because this property is set automatically when the DriverName (see page 20246) property is set.

Note: The association between a vendor library and a driver name is stored in the dbxdrivers.ini

file when you install the associated dbExpress driver. The file named by this property must be running on the same system as your application when it is deployed. Typically, it is installed when the database is installed rather than with your application.

Note: The VendorLib, LibraryName (see page 20248), and GetDriverFunc (see page 20247) properties all reflect the values in the dbxdrivers.ini

file. Because these property values are published (stored with the connection component), it is possible to deploy an application without deploying the dbxdrivers.ini file.

See Also

DriverName (see page 20246)

VendorLib

GetDriverFunc (see page 20247)

Setting Up TSQLConnection

Configuring TSQL Connection

149.1.5.6 TSQLConnection Events

The events of the TSQLConnection class are listed here.

Public Events

	Name	Description
R	TraceCallbackEvent (see page 20260)	Provides access to the callback function that executes for every SQL command passed to or from the server.

Published Events

	Name	Description
	AfterConnect (see page 20258)	Occurs after a connection is established.
	AfterDisconnect (see page 20258)	Occurs after the connection closes.
	BeforeConnect (see page 20258)	Occurs immediately before establishing a connection.
	BeforeDisconnect (see page 20259)	Occurs immediately before the connection closes.
	OnLogin (see page 20259)	Occurs after the BeforeConnect (see page 20258) event and before a connection is established.

149.1.5.6.1 TSQLConnection.AfterConnect Event

Occurs after a connection is established.

Pascal

```
property AfterConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterConnect;
```

Description

Write an AfterConnect event handler to take application-specific actions immediately after the connection component opens a connection to the remote source of database information.

See Also

BeforeConnect (see page 6875)

Connected (see page 6868)

Connecting to a Database Server

149.1.5.6.2 TSQLConnection.AfterDisconnect Event

Occurs after the connection closes.

Pascal

```
property AfterDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterDisconnect;
```

Description

Write an AfterDisconnect event handler to take application-specific actions after the connection component drops a connection.

See Also

BeforeDisconnect (see page 6875)

Connected (see page 6868)

Disconnecting from a Database Server

149.1.5.6.3 TSQLConnection.BeforeConnect Event

Occurs immediately before establishing a connection.

Pascal

```
property BeforeConnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeConnect;
```

Description

Write a BeforeConnect event handler to take application-specific actions before the connection component opens a connection to the remote source of database information.

See Also

AfterConnect (see page 6874)

Connected (see page 6868)

Connecting to a Database Server

149.1.5.6.4 TSQLConnection.BeforeDisconnect Event

Occurs immediately before the connection closes.

Pascal

```
property BeforeDisconnect: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeDisconnect;
```

Description

Write a BeforeDisconnect event handler to take application-specific actions before dropping a connection.

Delphi Examples:

```
{
This BeforeDisconnect event handler makes sure that the
client dataset has applied all its pending updates before
terminating the connection to the server.
}
procedure TForm1.RemoteServer1BeforeDisconnect(Sender: TObject);
begin
  if (ClientDataSet1.ChangeCount > 0) then
    ClientDataSet1.ApplyUpdates(-1);
end;
```

See Also

AfterDisconnect (see page 6875)

Connected (see page 6868)

Disconnecting from a Database Server

149.1.5.6.5 TSQLConnection.OnLogin Event

Occurs after the BeforeConnect (see page 20258) event and before a connection is established.

Pascal

```
property OnLogin: TSQLConnectionLoginEvent;
```

C++

```
__property TSQLConnectionLoginEvent OnLogin;
```

Description

Use the OnLogin event to assign values to the User_Name, Password, and Database parameters immediately before TSQLConnection (see page 20217) attempts to connect to the database server. OnLogin only occurs if the LoginPrompt (see page 20250) property is true. If LoginPrompt (see page 20250) is true but there is no OnLogin event handler, a default login dialog appears in which the user can enter a user name and password. The connection fails if correct values for the user name and password are not supplied in the dialog or by the OnLogin event handler.

See Also

Params (see page 20253)

LoginPrompt (see page 6872)

BeforeConnect (see page 6875)

149.1.5.6.6 TSQLConnection.TraceCallbackEvent Event

Provides access to the callback function that executes for every SQL command passed to or from the server.

Pascal

```
property TraceCallbackEvent: TDBXTraceEvent;
```

C++

```
__property TDBXTraceEvent TraceCallbackEvent;
```

Description

Read TraceCallbackEvent to determine whether the SQL connection is monitoring communication between the application and the SQL server to which it connects. For example, if the application uses a TSQLMonitor (see page 20285) component, that component assigns a value to TraceCallbackEvent, which it uses to monitor SQL commands. Changing the value of the callback would then interfere with the operation of the TSQLMonitor (see page 20285) component.

TraceCallbackEvent is a read-only property. To assign a callback for monitoring SQL commands, use the SetTraceEvent (see page 20239) method.

See Also

SetTraceEvent (see page 20239)

149.1.6 TSQLDataLink Class

TSQLDataLink allows a unidirectional dataset act as the detail in a master/detail relationship.

Class Hierarchy

Pascal

```
TSQLDataLink = class(TDetailDataLink);
```

C++

```
class TSQLDataLink : public TDetailDataLink;
```

File

SqlExpr

Description

SQL datasets use TSQLDataLink to coordinate with another (master) dataset when they represent the detail records for that other dataset. TSQLDataLink passes on data events to the data source that owns it. It is also used to implement the DataSource or MasterSource property of the dataset that owns it.

Do not confuse the dataset that is the value of the TSQLDataLink object's DataSet property with the dataset that uses TSQLDataLink to link to a master dataset. The DataSet property is the master dataset, while the dataset that owns the

TSQLDataLink object is the detail set.

See Also

TSQLDataSet (see page 20265)

TSQLTable (see page 20337)

TMasterDataLink (see page 7339)

TCustomSQLDataSet (see page 20150)

TSQLTable (see page 20337)

149.1.6.1 TSQLDataLink Members

The following tables list the members exposed by TSQLDataLink.

Protected Methods

	Name	Description
	ActiveChanged (see page 20263)	Refreshes the parameter values of the detail dataset and re-executes it.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CheckBrowseMode (see page 20264)	Informs the dataset that owns the TSQLDataLink (see page 20260) object when the current record in the source dataset is about to change.
	DataEvent (see page 6881)	Responds to various events that occur while working with data.
	DataSetChanged (see page 6881)	Responds to changes in the dataset.
	DataSetScrolled (see page 6882)	Allows a response to scrolling the representation of the dataset within the data-aware object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EditingChanged (see page 6883)	Responds to changes in the editing state of the data source.
	FocusControl (see page 6884)	Provides the interface for a method to force focus to the data-aware component associated with the TDataLink (see page 6876).
	GetActiveRecord (see page 6884)	This is GetActiveRecord, a member of class TDataLink.
	GetBOF (see page 6884)	This is GetBOF, a member of class TDataLink.
	GetBufferCount (see page 6884)	This is GetBufferCount, a member of class TDataLink.
	GetDetailDataSet (see page 20264)	Returns the value of the DetailDataSet property.
	GetEOF (see page 6885)	This is GetEOF, a member of class TDataLink.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRecordCount (see page 6885)	This is GetRecordCount, a member of class TDataLink.
	LayoutChanged (see page 6885)	Responds to changes in the representation of the data by the data-aware object.
	MoveBy (see page 6885)	Repositions the dataset to another record relative to its active record.
	RecordChanged (see page 20264)	Refreshes the parameter values of the detail dataset and re-executes it.
	SetActiveRecord (see page 6886)	This is SetActiveRecord, a member of class TDataLink.
	SetBufferCount (see page 6887)	This is SetBufferCount, a member of class TDataLink.
	UpdateData (see page 6887)	Provides an interface for writing edits to a record in the dataset.

Protected Properties

	Name	Description
	VisualControl (see page 6894)	Indicates whether a visual control uses the datalink.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 20263)	Creates an instance of TSQLDataLink (see page 20260).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6879)	Destroys an instance of TDataLink (see page 6876).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6882)	Attempts to drive the data source into an editing state if it is not already in one.
	ExecuteAction (see page 6883)	Invokes an action with the datasource as its target.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	UpdateAction (see page 6887)	Updates an action to reflect the current state of the TDataLink (see page 6876).
	UpdateRecord (see page 6888)	Responds to notifications that edits should be posted to the dataset.

Public Properties

	Name	Description
R	Active (see page 6888)	Specifies whether the dataset that TDataLink (see page 6876) manages is active.
	ActiveRecord (see page 6889)	Specifies the index of the current record within the internal record buffer maintained by the dataset for the Owner of the TDataLink (see page 6876) object.
R	BOF (see page 6889)	Indicates whether the first record in a dataset is active.
	BufferCount (see page 6890)	Specifies the number of records cached by the dataset for the Owner of the TDataLink (see page 6876) object.
R	DataSet (see page 6890)	Specifies the TDataSet (see page 6894) object that represents the data that this TDataLink (see page 6876) is tracking.
	DataSource (see page 6891)	Specifies the TDataSource (see page 7070) object that the Owner of the TDataLink (see page 6876) uses to connect to the dataset.
	DataSourceFixed (see page 6891)	Indicates whether the DataSource (see page 6891) property can be set.
R	DetailDataSet (see page 7114)	Indicates the detail dataset in the master/detail relationship.
R	Editing (see page 6892)	Indicates whether the DataSource (see page 6891) is in edit mode.
R	Eof (see page 6892)	Indicates whether the last record in a dataset is active.
	ReadOnly (see page 6893)	Indicates whether the dataset for this TDataLink (see page 6876) can be modified.

	RecordCount (see page 6893)	Indicates the number of records in the internal record buffer maintained by the dataset.

149.1.6.2 TSQLDataLink.Create Constructor

Creates an instance of TSQLDataLink (see page 20260).

Pascal

```
constructor Create(ADataSet: TCustomSQLDataSet);
```

C++

```
__fastcall TSQLDataLink(TCustomSQLDataSet ADataSet);
```

Description

Do not create instances of TSQLDataLink (see page 20260). It is instantiated by the SQL dataset that uses it to link to a master dataset. The ADataSet parameter is the dataset that creates and owns this SQL datalink. It becomes the value of the DetailDataSet property.

See Also

DetailDataSet

149.1.6.3 TSQLDataLink Methods

The methods of the TSQLDataLink class are listed here.

Protected Methods

	Name	Description
	ActiveChanged (see page 20263)	Refreshes the parameter values of the detail dataset and re-executes it.
	CheckBrowseMode (see page 20264)	Informs the dataset that owns the TSQLDataLink (see page 20260) object when the current record in the source dataset is about to change.
	GetDetailDataSet (see page 20264)	Returns the value of the DetailDataSet property.
	RecordChanged (see page 20264)	Refreshes the parameter values of the detail dataset and re-executes it.

149.1.6.3.1 TSQLDataLink.ActiveChanged Method

Refreshes the parameter values of the detail dataset and re-executes it.

Pascal

```
procedure ActiveChanged; override;
```

C++

```
virtual __fastcall ActiveChanged();
```

Description

SQL datasets establish master/detail relationships by supplying parameter values from the master dataset. ActiveChanged updates these parameter values on the detail dataset to reflect the current values of the master dataset and then refreshes the dataset so that it is populated with the new detail set.

See Also

Active (see page 6888)

Params (see page 20197)

DetailDataSet

149.1.6.3.2 TSQLDataLink.CheckBrowseMode Method

Informs the dataset that owns the TSQLDataLink (see page 20260) object when the current record in the source dataset is about to change.

Pascal

```
procedure CheckBrowseMode; override;
```

C++

```
virtual __fastcall CheckBrowseMode();
```

Description

Applications cannot call the protected CheckBrowseMode procedure. CheckBrowseMode is called immediately before the current record in the source dataset changes. It calls the CheckBrowseMode method of the dataset that owns the TSQLDataLink (see page 20260) object.

See Also

CheckBrowseMode (see page 6918)

149.1.6.3.3 TSQLDataLink.GetDetailDataSet Method

Returns the value of the DetailDataSet property.

Pascal

```
function GetDetailDataSet: TDataSet; override;
```

C++

```
virtual __fastcall TDataSet GetDetailDataSet();
```

Description

GetDetailDataSet is the protected read implementation of the DetailDataSet property.

See Also

DetailDataSet

149.1.6.3.4 TSQLDataLink.RecordChanged Method

Refreshes the parameter values of the detail dataset and re-executes it.

Pascal

```
procedure RecordChanged(Field: TField); override;
```

C++

```
virtual __fastcall RecordChanged(TField Field);
```

Description

Applications cannot call the protected RecordChanged method. It is called automatically when the contents of the current record change. The Field parameter indicates which field in the current record has changed. If Field is nil (Delphi) or NULL (C++), the entire record has changed.

SQL datasets establish master/detail relationships by supplying parameter values from the master dataset. RecordChanged updates these parameter values on the detail dataset to reflect the current values of the master dataset and then refreshes the dataset so that it is populated with the new detail set.

See Also

Params (see page 20197)

DetailDataSet

149.1.7 TSQLDataSet Class

TSQLDataSet represents data retrieved using dbExpress.

Class Hierarchy

Pascal

```
TSQLDataSet = class(TCustomSQLDataSet);
```

C++

```
class TSQLDataSet : public TCustomSQLDataSet;
```

File

SqlExpr

Description

TSQLDataSet is a general-purpose unidirectional dataset for accessing database information using dbExpress. You can add a TSQLDataSet component to a form or data module at design time, or create one dynamically at runtime.

Use TSQLDataSet to

Represent the records in a database table, the result set of a SELECT query, or the result set returned by a stored procedure.

Execute a query or stored procedure that does not return a result set.

Represent metadata that describes what is available on the database server (tables, stored procedures, fields in a table, and so on).

TSQLDataSet is a unidirectional dataset. Unlike other datasets, unidirectional datasets do not buffer multiple records in memory. Because of this, you can only navigate using the First and Next methods. There is no built-in editing support: you can only edit the data in an SQL dataset by explicitly creating an SQL UPDATE command or by connecting the dataset to a client dataset using a provider. Features that require buffering multiple records, such as filters or lookup fields, are not available.

Before you can use a TSQLDataSet component, it must be connected to the database server. Therefore, the first step to take when working with TSQLDataSet is to set the SQLConnection (see page 20284) property.

Once the dataset is connected to a server, you can use the Command Text editor to set the CommandText (see page 20279) property if you are using the dataset to execute a query. To execute a stored procedure or represent a single database table, set the CommandType (see page 20280) property and then choose the table or stored procedure name from a drop-down list on the CommandText (see page 20279) property. If you want to access metadata with the SQL dataset, you must specify the metadata you want at runtime by calling the SetSchemaInfo (see page 20185) method.

DefaultRowsetSize (see page 20377) is 20 (DefaultRowsetSize (see page 20377) = 20). To use a different RowSetSize for

existing Oracle database connections, manually add the RowSetSize property (for example, RowsetSize = 200) to dbxconnections.ini (Windows) or dbxconnections.conf (Linux). To have the RowSetSize property included in new connections, manually add the RowSetSize property to dbxdrivers.ini (Windows) or dbxdrivers.conf (Linux). RowsetSize can also be modified in code (for example, SQLConnection1.Params.Values['RowsetSize'] := '200'). Currently, only Oracle databases support this feature.

149.1.7.1 TSQLDataSet Members

The following tables list the members exposed by TSQLDataSet.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	AddFieldDesc (see page 20163)	This is AddFieldDesc, a member of class TCustomSQLDataSet.
	AddIndexDefs (see page 20163)	This is AddIndexDefs, a member of class TCustomSQLDataSet.
V	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
V	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
V	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
V	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
V	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
	CheckPrepareError (see page 20164)	This is CheckPrepareError, a member of class TCustomSQLDataSet.

	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
	ClearIndexDefs (see page 20164)	This is ClearIndexDefs, a member of class TCustomSQLDataSet.
	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.
	CloseCursor (see page 20164)	This is CloseCursor, a member of class TCustomSQLDataSet.
	CloseStatement (see page 20164)	This is CloseStatement, a member of class TCustomSQLDataSet.
	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
	DataEvent (see page 6924)	This is DataEvent, a member of class TDataSet.
	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 20165)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	ExecuteStatement (see page 20166)	This is ExecuteStatement, a member of class TCustomSQLDataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.
	FreeBuffers (see page 20166)	This is FreeBuffers, a member of class TCustomSQLDataSet.
	FreeCommand (see page 20166)	This is FreeCommand, a member of class TCustomSQLDataSet.
	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeReader (see page 20166)	This is FreeReader, a member of class TCustomSQLDataSet.
	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.
	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.
	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
	GetCanModify (see page 6950)	This is GetCanModify, a member of class TDataSet.
	GetCanModify (see page 20167)	This is GetCanModify, a member of class TCustomSQLDataSet.

	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
V	GetDataSource (see page 6951)	This is GetDataSource, a member of class TDataSet.
V	GetDataSource (see page 20167)	This is GetDataSource, a member of class TCustomSQLDataSet.
V	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
V	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
V	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
V	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
V	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
	GetObjectTypeNames (see page 20169)	This is GetObjectTypeNames, a member of class TCustomSQLDataSet.
	GetOutputParams (see page 20169)	This is GetOutputParams, a member of class TCustomSQLDataSet.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
V	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
V	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
A	GetRecord (see page 6956)	This is GetRecord, a member of class TDataSet.
V	GetRecord (see page 20170)	This is GetRecord, a member of class TCustomSQLDataSet.
V	GetRecordCount (see page 6956)	This is GetRecordCount, a member of class TDataSet.
V	GetRecordCount (see page 20170)	This is GetRecordCount, a member of class TCustomSQLDataSet.
V	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
	GetSortFieldNames (see page 20170)	This is GetSortFieldNames, a member of class TCustomSQLDataSet.
V	GetStateFieldValue (see page 6956)	This is GetStateFieldValue, a member of class TDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
V	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
V	InitRecord (see page 20170)	This is InitRecord, a member of class TCustomSQLDataSet.
V	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
V	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
A	InternalClose (see page 6963)	This is InternalClose, a member of class TDataSet.
V	InternalClose (see page 20171)	This is InternalClose, a member of class TCustomSQLDataSet.
V	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
V	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.
V	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
V	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
A	InternalHandleException (see page 6964)	This is InternalHandleException, a member of class TDataSet.
V	InternalHandleException (see page 20171)	This is InternalHandleException, a member of class TCustomSQLDataSet.
A	InternalInitFieldDefs (see page 6965)	This is InternalInitFieldDefs, a member of class TDataSet.
V	InternalInitFieldDefs (see page 20171)	This is InternalInitFieldDefs, a member of class TCustomSQLDataSet.
V	InternalInitRecord (see page 6965)	This is InternalInitRecord, a member of class TDataSet.
V	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
V	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
A	InternalOpen (see page 6966)	This is InternalOpen, a member of class TDataSet.
V	InternalOpen (see page 20171)	This is InternalOpen, a member of class TCustomSQLDataSet.
V	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
V	InternalRefresh (see page 6966)	This is InternalRefresh, a member of class TDataSet.

	InternalRefresh (see page 20171)	This is InternalRefresh, a member of class TCustomSQLDataSet.
	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsCursorOpen (see page 6966)	This is IsCursorOpen, a member of class TDataSet.
	IsCursorOpen (see page 20172)	This is IsCursorOpen, a member of class TCustomSQLDataSet.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 6969)	Initializes the component after the form file has been read into memory.
	Loaded (see page 20172)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 20173)	This is LocateRecord, a member of class TCustomSQLDataSet.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	OpenCursor (see page 6976)	This is OpenCursor, a member of class TDataSet.
	OpenCursor (see page 20174)	This is OpenCursor, a member of class TCustomSQLDataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
	OpenSchema (see page 20174)	This is OpenSchema, a member of class TCustomSQLDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 20175)	This is PropertyChanged, a member of class TCustomSQLDataSet.
	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.
	PSEndTransaction (see page 20175)	Ends a transaction that was started by a call to PSStartTransaction.
	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
	PSExecute (see page 20176)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 20176)	This is PSExecuteStatement, a member of class TCustomSQLDataSet.
	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 20176)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 6982)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 7537)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 20177)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 6982)	Gets the command type to be executed by PSExecute.
	PSGetCommandType (see page 20177)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 20178)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 6983)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 20178)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 6984)	This is PSGetKeyFieldsW, a member of class TDataSet.
	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
	PSGetKeyFieldsW (see page 20179)	This is PSGetKeyFieldsW, a member of class TCustomSQLDataSet.
	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
	PSGetParams (see page 20179)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 6985)	This is PSGetQuoteCharW, a member of class TDataSet.
	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
	PSGetQuoteCharW (see page 20179)	This is PSGetQuoteCharW, a member of class TCustomSQLDataSet.

	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 6986)	This is PSGetTableNameW, a member of class TDataSet.
	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
	PSGetTableNameW (see page 20179)	This is PSGetTableNameW, a member of class TCustomSQLDataSet.
	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
	PSGetUpdateException (see page 20180)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 20180)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 20180)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 20181)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 20181)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 20182)	Assigns a specified SQL command to be executed by PSExecute.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 20182)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSStartTransaction (see page 20182)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 20183)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetBufListSize (see page 20184)	This is SetBufListSize, a member of class TCustomSQLDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 20184)	This is SetCommandText, a member of class TCustomSQLDataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFCommandText (see page 20184)	This is SetFCommandText, a member of class TCustomSQLDataSet.
	SetFieldData (see page 20184)	This is SetFieldData, a member of class TCustomSQLDataSet.
	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.
	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetMaxBlobSize (see page 20184)	This is SetMaxBlobSize, a member of class TCustomSQLDataSet.
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
V	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetParamsFromCursor (see page 20185)	This is SetParamsFromCursor, a member of class TCustomSQLDataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
	SetSortFieldNames (see page 20186)	This is SetSortFieldNames, a member of class TCustomSQLDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
V	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateIndexDefs (see page 7002)	This is UpdateIndexDefs, a member of class TDataSet.
V	UpdateIndexDefs (see page 20186)	This is UpdateIndexDefs, a member of class TCustomSQLDataSet.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
	BlobBuffer (see page 20189)	Reserves a buffer for storing BLOB values.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
	Constraints (see page 7013)	Specifies record-level constraints that must be met when editing the data.
	CurrentBlobSize (see page 20191)	Indicates the size of the most recently read BLOB field.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
R	DataLink (see page 20191)	Identifies the datalink that manages communication between the SQL dataset and another, master dataset.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	InternalConnection (see page 20194)	Indicates the component that connects the dataset to its database server, taking into account whether the connection was cloned.
	LastError (see page 20194)	Saves the error message for the last error returned by dbExpress.
	NativeCommand (see page 20195)	Represents the SQL command that is sent to the server.

	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
R	ParamCount (see page 20197)	Indicates the number of parameters listed by the Params (see page 20197) property.
	ProcParams (see page 20199)	ProcParams lists the parameter descriptors obtained from the server for any stored procedure parameters.
	Reserved (see page 7035)	For internal use only.
R	RowsAffected (see page 20200)	Indicates the number of rows operated on by the latest query execution.
	SchemaInfo (see page 20200)	Identifies the metadata with which to populate the dataset.

Public Events

	Name	Description
	AfterCancel (see page 7038)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 7040)	Occurs after an application closes a dataset.
	AfterDelete (see page 7041)	Occurs after an application deletes a record.
	AfterEdit (see page 7044)	Occurs after an application starts editing a record.
	AfterInsert (see page 7044)	Occurs after an application inserts a new record.
	AfterOpen (see page 7045)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 7046)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 7047)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 7047)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 7048)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 7048)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 7049)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 7049)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 7050)	Occurs before an application enters insert mode.
	BeforeOpen (see page 7051)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 7052)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 7052)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 7053)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 7053)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 7054)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 7054)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 7055)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 7056)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 7056)	Occurs when an application attempts to modify or insert a record and an exception is raised.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.

	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
	Close (see page 6920)	Closes a dataset.
	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
	Create (see page 20278)	Creates an instance of a TSQLDataSet (see page 20265) component.
	CreateBlobStream (see page 6922)	Provides the interface for a method that creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CreateBlobStream (see page 20164)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 6904)	Destroys the TDataSet (see page 6894) instance.
	Destroy (see page 20161)	Destroys the TCustomSQLDataSet (see page 20150) instance.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
	ExecSQL (see page 20278)	Executes a query or stored procedure that does not return a set of records.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.
	GetBlobFieldData (see page 20166)	Retrieves the current value of a BLOB field into a buffer.
	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
	GetDetailLinkFields (see page 20167)	Lists the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
	GetFieldData (see page 20168)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyFieldNames (see page 20169)	Fills a list with the names of all fields in all indexes defined for the dataset.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetQuoteChar (see page 20169)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	IsSequenced (see page 20172)	Indicates whether the dataset can use record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
	Locate (see page 6970)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
	Locate (see page 20173)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
	Lookup (see page 6970)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	Lookup (see page 20174)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	Open (see page 6976)	Opens the dataset.

	ParamByName (see page 20175)	This is ParamByName, a member of class TCustomSQLDataSet.
V	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
V	PrepareStatement (see page 20175)	Performs a prepare on the SQL statement.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 7579)	Gets the SQL command to be executed by PSExecute (see page 7578).
	PSGetCommandText (see page 7591)	Gets the SQL command to be executed by PSExecute (see page 7590).
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).

	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetSchemaInfo (see page 20185)	Indicates whether the dataset represents metadata from the server, and if so, what kind.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.

Public Properties

	Name	Description
	Active (see page 7004)	Specifies whether or not a dataset is open.
R	AggFields (see page 7006)	Contains any aggregate fields.
	AutoCalcFields (see page 7006)	Determines when the OnCalcFields (see page 7053) event is triggered and when lookup field values are calculated.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSetField (see page 7013)	Indicates the persistent TDataSetField (see page 7060) object that owns a nested dataset.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignerData (see page 20192)	Stores custom data.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
	FieldDefs (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset

	Filter (see page 7026)	Specifies the text of the current filter for a dataset.
	Filtered (see page 7027)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 7027)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
	IndexDefs (see page 20193)	Contains the definitions of all indexes defined on the server for the dataset.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
R	Modified (see page 7029)	Indicates whether the active record is modified.
	ObjectView (see page 7031)	Specifies whether fields are stored hierarchically or flattened out in the Fields (see page 7023) property.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Prepared (see page 20198)	Specifies whether the command is prepared before execution.
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
R	RecordCount (see page 20199)	Indicates the total number of records associated with the dataset.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	TransactionLevel (see page 20202)	Indicates the transaction to which this dataset belongs.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterClose (see page 20203)	Occurs after a data source connection is closed.
	AfterOpen (see page 20203)	Occurs after the connection to a data source is opened.
	AfterRefresh (see page 20203)	Occurs after a DataSet has been changed and is refreshed.
	AfterScroll (see page 20204)	Occurs after a result set is scrolled.
	BeforeClose (see page 20204)	Occurs just before a data connection is closed.
	BeforeOpen (see page 20204)	Occurs just before a data connection is opened, but after an open operation has been initiated.
	BeforeRefresh (see page 20204)	Occurs before a DataSet refresh occurs.
	BeforeScroll (see page 20204)	Occurs when a DataSet scroll operation has been initiated but before the scrolling actually takes place.
	OnCalcFields (see page 20204)	Occurs when calculated or derived fields are updated.
	ParseDeleteSql (see page 20205)	Occurs when an application attempts to parse the DELETE statement stored in the CommandText (see page 20189) property.
	ParseInsertSql (see page 20205)	Occurs when an application attempts to parse the INSERT statement stored in the CommandText (see page 20189) property.
	ParseSelectSql (see page 20205)	Occurs when an application attempts to parse the SELECT statement specified in the CommandText (see page 20189) property.
	ParseUpdateSql (see page 20205)	Occurs when an application attempts to parse a SQL UPDATE statement stored in the CommandText (see page 20189) property.

Published Properties

	Name	Description
	Active (see page 20187)	Specifies whether or not a dataset is open.
	CommandText (see page 20279)	Specifies the command the dataset executes.
	CommandType (see page 20280)	Command type of CommandText (see page 20279) property.
	DataSource (see page 20281)	Links the SQL dataset to another (master) dataset.
	GetMetadata (see page 20193)	Specifies whether the SQL dataset fetches metadata information along with the data.
	MaxBlobSize (see page 20282)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NumericMapping (see page 20195)	Maps fldBCD to either ftFMTBCD or ftBCD field types.
	ObjectView (see page 20196)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.

	ParamCheck (see page 20282)	Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.
	Params (see page 20283)	Represents the parameters for a query or stored procedure.
	SchemaName (see page 20201)	Specifies the name of the database schema.
	SortFieldNames (see page 20284)	Indicates the sort order when CommandType (see page 20280) is ctTable.
	SQLConnection (see page 20284)	Specifies the SQL connection component that connects the dataset to a database server.
	Tag (see page 2808)	Stores an integer value as part of a component.

149.1.7.2 TSQLDataSet.Create Constructor

Creates an instance of a TSQLDataSet (see page 20265) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSQLDataSet(TComponent * AOwner);
```

Description

Call Create to instantiate an SQL dataset component at runtime. SQL datasets placed in forms or data modules at design time are created automatically.

AOwner is the component, typically the form or data module, that is responsible for freeing the dataset. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

149.1.7.3 TSQLDataSet Methods

The methods of the TSQLDataSet class are listed here.

Public Methods

	Name	Description
	ExecSQL (see page 20278)	Executes a query or stored procedure that does not return a set of records.

149.1.7.3.1 TSQLDataSet.ExecSQL Method

Executes a query or stored procedure that does not return a set of records.

Pascal

```
function ExecSQL(ExecDirect: Boolean = False): Integer; override;
```

C++

```
virtual __fastcall int ExecSQL(Boolean ExecDirect = False);
```

Description

Call ExecSQL to execute an SQL command that does not return a set of records. This command is a query other than a SELECT query, such as an INSERT, UPDATE, DELETE, or CREATE TABLE query.

ExecDirect indicates that the query does not need to be prepared before it is executed. This parameter can be set to true if the query does not include any parameters. When ExecDirect is false, the query will be prepared before it is executed. Even when

ExecDirect is false, you can avoid preparing the query every time ExecSQL is called by setting the Prepared (see page 20198) property to true before calling ExecSQL the first time.

ExecSQL returns the number of rows affected by the executed command. This becomes the value of the RowsAffected (see page 20200) property.

Note: Do not use ExecSQL for commands that return data. These include any use of the ctTable command type, SELECT queries, and stored procedures that return a cursor. When the command returns data, use the Open method or set the Active (see page 20187) property to true.

See Also

CommandText (see page 20189)

RowsAffected (see page 20200)

Open (see page 6976)

Active (see page 7004)

Prepared (see page 20198)

ExecuteDirect (see page 20228)

Executing the Command

149.1.7.4 TSQLDataSet Properties

The properties of the TSQLDataSet class are listed here.

Published Properties

	Name	Description
	CommandText (see page 20279)	Specifies the command the dataset executes.
	CommandType (see page 20280)	Command type of CommandText (see page 20279) property.
	DataSource (see page 20281)	Links the SQL dataset to another (master) dataset.
	MaxBlobSize (see page 20282)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.
	ParamCheck (see page 20282)	Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.
	Params (see page 20283)	Represents the parameters for a query or stored procedure.
	SortFieldNames (see page 20284)	Indicates the sort order when CommandType (see page 20280) is ctTable.
	SQLConnection (see page 20284)	Specifies the SQL connection component that connects the dataset to a database server.

149.1.7.4.1 TSQLDataSet.CommandText Property

Specifies the command the dataset executes.

Pascal

```
property CommandText: WideString;
```

C++

```
__property BSTR CommandText;
```

Description

The value of CommandText depends on the CommandType (see page 20280) property:

When CommandType (see page 20280) is ctQuery, CommandText is an SQL statement that the dataset executes. If the statement is a SELECT statement, the SQL dataset executes the statement when it is opened. If the statement does not return a

result set, the SQL dataset executes the statement when the ExecSQL (see page 20278) method is called.

When CommandType (see page 20280) is ctStoredProc, CommandText is the name of a stored procedure. The SQL dataset executes the stored procedure when it is opened or when the ExecSQL (see page 20278) method is called, depending on whether the stored procedure returns a set of records.

When CommandType (see page 20280) is ctTable, CommandText is the name of a table on the database server. The SQL dataset automatically generates a SELECT statement to fetch all the records on all the fields in this table, sorting by the fields listed in the SortFieldNames (see page 20284) property. The generated statement is executed when the dataset is opened.

If CommandText is an SQL statement that includes parameters or the name of a stored procedure that has parameters, use the Params (see page 20283) property to supply parameter values.

This command is passed on to the TDBXCommand.Text property.

149.1.7.4.2 TSQLDataSet.CommandType Property

Command type of CommandText (see page 20279) property.

Pascal

```
property CommandType: TSQLCommandType;
```

C++

```
__property TSQLCommandType CommandType;
```

Description

CommandType indicates the command type of the CommandText (see page 20279) property.

The following table lists the possible values:

CommandType	Corresponding CommandText (see page 20279)
ctQuery	An SQL statement that the dataset executes.
ctStoredProc	The name of a stored procedure.
ctTable	The name of a table on the database server. The SQL dataset automatically generates a SELECT statement to fetch all the records on all the fields in this table.

Note: Changing CommandType automatically changes the DbxCommandType property and vice versa. The additional settings supported by DbxCommandType are converted to ctQuery for CommandType.

149.1.7.4.3 TSQLDataSet.DataSource Property

Links the SQL dataset to another (master) dataset.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;__property TDataSource DataSource;
```

Description

DataSource links this SQL dataset to another (master) dataset that supplies values for this dataset's parameters.

When the SQL dataset's CommandText (see page 20279) (or SQL) property specifies a parameterized query but the application does not provide values for the corresponding parameters in the Params (see page 20283) property, the SQL dataset fetches parameter values from the dataset identified with the specified data source. When the current record in the dataset associated with DataSource changes, the SQL dataset refreshes its data to reflect the new parameter values.

CommandText (see page 20279)

SQL (see page 20316)

Params (see page 20283)

MasterSource (see page 20357)

149.1.7.4.4 TSQLDataSet.MaxBlobSize Property

Indicates the maximum number of bytes fetched for any BLOB field in the dataset.

Pascal

```
property MaxBlobSize: Integer;
```

C++

```
__property int MaxBlobSize;
```

Description

MaxBlobSize limits the amount of data that can be fetched from Binary Large Object (BLOB) fields. BLOB fields can hold an indefinite amount of data. However, SQL datasets read that data into a memory buffer. By limiting the amount of data that can be fetched from a BLOB field, you limit the size of the buffer.

If MaxBlobSize is –1, the dataset imposes no maximum BLOB size. If MaxBlobSize is 0, the dataset uses the parameters of the associated SQL connection, if any, to determine the maximum BLOB size.

Note: MaxBlobSize should agree with any parameters on the associated SQL connection component that limit the size of BLOB data.

SQLConnection (see page 20284)

149.1.7.4.5 TSQLDataSet.ParamCheck Property

Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

By default, the Params (see page 20283) property is updated automatically to reflect any parameters that appear in the query specified by the CommandText (see page 20279) property (or the SQL property for TSQLQuery (see page 20298)). That is, whenever the CommandText (see page 20279) property changes, the Params (see page 20283) property is regenerated to reflect the new set of parameters.

There are times when you want to override this default behavior. For example, when specifying a data definition language (DDL) statement that defines a stored procedure, the resulting SQL command may include parameters. These parameters, however, should not be used as parameters of the SQL dataset, because they are not parameters of the DDL command, but rather, they are parameters of the stored procedure that the command creates.

In order to override the default generation of the Params (see page 20283) property in response to changes in CommandText (see page 20279), set ParamCheck to false.

See Also

Params (see page 20283)

CommandText (see page 20279)

SQL (see page 20316)

149.1.7.4.6 TSQLDataSet.Params Property

Represents the parameters for a query or stored procedure.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

Params is a collection of TParam objects that represent the parameters of a query or stored procedure specified by the SQL dataset. When you specify a query by setting the CommandText (see page 20279) property (or the SQL property in TSQLQuery (see page 20298)), the SQL dataset automatically parse the query and fills Params with a TParam object for every parameter in the query. Similarly, when you specify a stored procedure by setting the CommandText (see page 20279) property (or the StoredProcName property in TSQLStoredProc (see page 20318)), the SQL dataset automatically asks the server for a list of stored procedure parameters and fills Params with a TParam object for every parameter of the stored procedure.

At design-time, use the Params property editor to access the individual TParam objects. For queries, use this property editor to check the DataType property of each parameter and to assign values to the parameters. For stored procedures, you may need to do more, changing the type or number of parameters if the server does not supply complete information about stored procedure parameters.

You can also use Params to assign parameter properties in code at runtime.

Note: If you do not assign values to input parameters before opening the dataset, it fetches values from the dataset identified by the DataSource (see page 20281) property. However, this only works if the individual TParam objects have the same names as fields in the master dataset.

Using TSimpleDataSet

149.1.7.4.7 TSQLDataSet.SortFieldNames Property

Indicates the sort order when CommandType (see page 20280) is ctTable.

Pascal

```
property SortFieldNames: WideString;
```

C++

```
__property BSTR SortFieldNames;
```

Description

Use SortFieldNames to specify the fields that should be used to order the records in the dataset. SortFieldNames is only used when CommandType (see page 20280) is ctTable.

SortFieldNames is a semicolon-delimited list of field names. These names are used to generate the ORDER BY clause of the SQL statement the dataset creates to fetch data from a server table. Records are sorted by the first named field, and within that sort order, by the second named field, and so on.

See Also

CommandType (see page 20280)

Representing the Records in a Table

Specifying the Data to Display using TSQLDataSet

149.1.7.4.8 TSQLDataSet.SQLConnection Property

Specifies the SQL connection component that connects the dataset to a database server.

Pascal

```
property SQLConnection: TSQLConnection;
```

C++

```
__property TSQLConnection SQLConnection;
```

Description

Use SQLConnection to specify an SQL connection object that connects the dataset to a database server.

At design-time, select from the list of available TSQLConnection (see page 20217) components in the Object Inspector. At runtime, set SQLConnection to reference an existing TSQLConnection (see page 20217) object.

SQLConnection should be the first property you set on the dataset. Only after the SQLConnection property is set can you use the Command Text editor to specify a query for the CommandText (see page 20279) property or populate the dataset with data by setting Active (see page 20187) to true. Similarly, SQLConnection must be set before the dataset can initialize the Params (see page 20283) property when you set CommandText (see page 20279).

149.1.8 TSQLMonitor Class

TSQLMonitor intercepts messages that pass between an SQL connection component and a database server and saves them in a string list.

Class Hierarchy

Pascal

```
TSQLMonitor = class(TComponent);
```

C++

```
class TSQLMonitor : public TComponent;
```

File

SqlExpr

Description

Use TSQLMonitor when debugging the communication between your application and a database server. Each TSQLMonitor instance logs the SQL commands from a particular SQL connection component, adding them to a string list. This allows you to see not only the commands you explicitly add to a SQL dataset or SQL connection component, but also any commands that are generated on your behalf, such as those created by a dataset provider. Use the TraceList (see page 20296) property to access the list of SQL commands that has already been logged. The TraceList (see page 20296) property is automatically updated when the connection component passes a message to the database server.

Note: TSQLMonitor uses the TraceCallbackEvent property of the SQL connection component whose messages it monitors. If you assign your own callback to that property, the SQL monitor instance will cease to function.

149.1.8.1 TSQLMonitor Members

The following tables list the members exposed by TSQLMonitor.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	InvokeCallBack (see page 20290)	This is InvokeCallBack, a member of class TSQLMonitor.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActive (see page 20291)	This is SetActive, a member of class TSQLMonitor.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFileName (see page 20291)	This is SetFileName, a member of class TSQLMonitor.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetSQLConnection (see page 20291)	This is SetSQLConnection, a member of class TSQLMonitor.
	SetStreamedActive (see page 20291)	This is SetStreamedActive, a member of class TSQLMonitor.
	SetTraceList (see page 20292)	This is SetTraceList, a member of class TSQLMonitor.
	SwitchConnection (see page 20292)	This is SwitchConnection, a member of class TSQLMonitor.
V	Trace (see page 20292)	This is Trace, a member of class TSQLMonitor.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateTraceCallBack (see page 20292)	This is UpdateTraceCallBack, a member of class TSQLMonitor.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 20288)	Creates and initializes new TSQLMonitor (see page 20285) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 20289)	Frees the memory associated with the TSQLMonitor (see page 20285) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LoadFromFile (see page 20290)	Sets the contents of TraceList (see page 20296) to the strings contained in a file.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 20290)	Saves the contents of TraceList (see page 20296) to a file.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	MaxTraceCount (see page 20295)	Indicates the maximum number of messages that can be logged.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	TraceCount (see page 20295)	Indicates the number of messages currently logged.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnLogTrace (see page 20297)	Occurs immediately after a new message is logged to the list.
	OnTrace (see page 20297)	Occurs when a message is detected but before it is logged to the list.

Published Properties

	Name	Description
	Active (see page 20293)	Starts or stops the monitor from recording SQL commands passed to the database server.
	AutoSave (see page 20294)	Specifies whether the monitored messages are automatically saved to a file.
	FileName (see page 20294)	Specifies the default file to which monitored messages are saved.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SQLConnection (see page 20295)	Specifies the connection components whose messages are to be monitored.
	Tag (see page 2808)	Stores an integer value as part of a component.
	TraceList (see page 20296)	Lists the messages that have passed between SQLConnection (see page 20295) and the database server.

149.1.8.2 TSQLMonitor.Create Constructor

Creates and initializes new TSQLMonitor (see page 20285) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSQLMonitor(TComponent * AOwner);
```

Description

Call Create to create a TSQLMonitor (see page 20285) component at runtime. SQL monitors added to forms or data modules at design time are created automatically.

The Owner parameter specifies the component (usually the form or data module) that is responsible for freeing the SQL monitor.

See Also

Owner (see page 2807)

149.1.8.3 TSQLMonitor.Destroy Destructor

Frees the memory associated with the TSQLMonitor (see page 20285) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSQLMonitor();
```

Description

Do not call Destroy directly. Instead, call Free, which verifies that the SQL monitor instance is not nil before calling Destroy.

See Also

Free (see page 22300)

149.1.8.4 TSQLMonitor Methods

The methods of the TSQLMonitor class are listed here.

Protected Methods

	Name	Description
	InvokeCallBack (see page 20290)	This is InvokeCallBack, a member of class TSQLMonitor.
	SetActive (see page 20291)	This is SetActive, a member of class TSQLMonitor.
	SetFileName (see page 20291)	This is SetFileName, a member of class TSQLMonitor.
	SetSQLConnection (see page 20291)	This is SetSQLConnection, a member of class TSQLMonitor.
	SetStreamedActive (see page 20291)	This is SetStreamedActive, a member of class TSQLMonitor.
	SetTraceList (see page 20292)	This is SetTraceList, a member of class TSQLMonitor.
	SwitchConnection (see page 20292)	This is SwitchConnection, a member of class TSQLMonitor.
V	Trace (see page 20292)	This is Trace, a member of class TSQLMonitor.
	UpdateTraceCallBack (see page 20292)	This is UpdateTraceCallBack, a member of class TSQLMonitor.

Public Methods

	Name	Description
	LoadFromFile (see page 20290)	Sets the contents of TraceList (see page 20296) to the strings contained in a file.
	SaveToFile (see page 20290)	Saves the contents of TraceList (see page 20296) to a file.

149.1.8.4.1 TSQLMonitor.InvokeCallBack Method

Pascal

```
function InvokeCallBack(TraceInfo: TDBXTraceInfo): CBRType;
```

C++

```
__fastcall CBRType InvokeCallBack(TDBXTraceInfo TraceInfo);
```

Description

This is InvokeCallBack, a member of class TSQLMonitor.

149.1.8.4.2 TSQLMonitor.LoadFromFile Method

Sets the contents of TraceList (see page 20296) to the strings contained in a file.

Pascal

```
procedure LoadFromFile(AFileName: string);
```

C++

```
__fastcall LoadFromFile(AnsiString AFileName);
```

Description

Call LoadFromFile to initialize the message log with the contents of a file. This method can be used to start the log with standard header information you have saved in a file, or to pre-load the list with a log you saved previously using the SaveToFile (see page 20290) method.

AFileName is the file from which to load the contents of the message log. If AFileName is an empty string, LoadFromFile uses the value of the FileName (see page 20294) property.

Note: Any information currently in TraceList (see page 20296) is lost when you call LoadFromFile.

See Also

TraceList (see page 20296)

SaveToFile (see page 20290)

FileName (see page 20294)

149.1.8.4.3 TSQLMonitor.SaveToFile Method

Saves the contents of TraceList (see page 20296) to a file.

Pascal

```
procedure SaveToFile(AFileName: string);
```

C++

```
__fastcall SaveToFile(AnsiString AFileName);
```

Description

Call SaveToFile to save all of the currently logged messages to a file.

AFileName specifies the file to which the strings in TraceList (see page 20296) are saved. If AFileName is an empty string, SaveToFile uses the value of the FileName (see page 20294) property.

Note: If the AutoSave (see page 20294) property is true, SaveToFile is called automatically whenever a message is added to

TraceList (see page 20296).

See Also

TraceList (see page 20296)

LoadFromFile (see page 20290)

FileName (see page 20294)

AutoSave (see page 20294)

149.1.8.4.4 TSQLMonitor.SetActive Method

Pascal

```
procedure SetActive(Value: Boolean);
```

C++

```
__fastcall SetActive(Boolean Value);
```

Description

This is SetActive, a member of class TSQLMonitor.

149.1.8.4.5 TSQLMonitor.SetFileName Method

Pascal

```
procedure SetFileName(const Value: String);
```

C++

```
__fastcall SetFileName(const AnsiString Value);
```

Description

This is SetFileName, a member of class TSQLMonitor.

149.1.8.4.6 TSQLMonitor.SetSQLConnection Method

Pascal

```
procedure SetSQLConnection(Value: TSQLConnection);
```

C++

```
__fastcall SetSQLConnection(TSQLConnection Value);
```

Description

This is SetSQLConnection, a member of class TSQLMonitor.

149.1.8.4.7 TSQLMonitor.SetStreamedActive Method

Pascal

```
procedure SetStreamedActive;
```

C++

```
__fastcall SetStreamedActive();
```

Description

This is SetStreamedActive, a member of class TSQLMonitor.

149.1.8.4.8 TSQLMonitor.SetTraceList Method

Pascal

```
procedure SetTraceList(Value: TWideStrings);
```

C++

```
__fastcall SetTraceList(TWideStrings Value);
```

Description

This is SetTraceList, a member of class TSQLMonitor.

149.1.8.4.9 TSQLMonitor.SwitchConnection Method

Pascal

```
procedure SwitchConnection(const Value: TSQLConnection);
```

C++

```
__fastcall SwitchConnection(const TSQLConnection Value);
```

Description

This is SwitchConnection, a member of class TSQLMonitor.

149.1.8.4.10 TSQLMonitor.Trace Method

Pascal

```
procedure Trace(TraceInfo: TDBXTraceInfo; LogTrace: Boolean); virtual;
```

C++

```
virtual __fastcall Trace(TDBXTraceInfo TraceInfo, Boolean LogTrace);
```

Description

This is Trace, a member of class TSQLMonitor.

149.1.8.4.11 TSQLMonitor.UpdateTraceCallBack Method

Pascal

```
procedure UpdateTraceCallBack;
```

C++

```
__fastcall UpdateTraceCallBack();
```

Description

This is UpdateTraceCallBack, a member of class TSQLMonitor.

149.1.8.5 TSQLMonitor Properties

The properties of the TSQLMonitor class are listed here.

Public Properties

	Name	Description
	MaxTraceCount (see page 20295)	Indicates the maximum number of messages that can be logged.
R	TraceCount (see page 20295)	Indicates the number of messages currently logged.

Published Properties

	Name	Description
	Active (see page 20293)	Starts or stops the monitor from recording SQL commands passed to the database server.
	AutoSave (see page 20294)	Specifies whether the monitored messages are automatically saved to a file.
	FileName (see page 20294)	Specifies the default file to which monitored messages are saved.
	SQLConnection (see page 20295)	Specifies the connection components whose messages are to be monitored.
	TraceList (see page 20296)	Lists the messages that have passed between SQLConnection (see page 20295) and the database server.

149.1.8.5.1 TSQLMonitor.Active Property

Starts or stops the monitor from recording SQL commands passed to the database server.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Set Active to true to start monitoring the communication between SQLConnection (see page 20295) and its database server. Set Active to false to stop the monitoring.

When you set Active to true, TSQLMonitor (see page 20285) sets the TraceCallbackEvent property of the associated SQL connection component. This causes all commands sent to the database server that match the criteria established by TraceFlags to be added to the monitor's string list.

When you set Active to false, TSQLMonitor (see page 20285) clears the TraceCallbackEvent property of the associated SQL connection component. No subsequent commands are added to TraceList (see page 20296), but the list is not cleared. That is, any commands currently in the list remain there until you explicitly clear the list.

Using TSimpleDataSet

Using TSQLQuery

Using TSQLStoredProc

149.1.8.5.2 TSQLMonitor.AutoSave Property

Specifies whether the monitored messages are automatically saved to a file.

Pascal

```
property AutoSave: Boolean;
```

C++

```
__property Boolean AutoSave;
```

Description

Set AutoSave to true to automatically save all messages that match the criteria established by TraceFlags to the file specified by the FileName (see page 20294) property. The FileName (see page 20294) property must be set to a valid file name.

When AutoSave is false, messages that match the criteria specified by TraceFlags are automatically added to TraceList (see page 20296), but are not saved to a file.

See Also

FileName (see page 20294)

TraceList (see page 20296)

TraceFlags

SaveToFile (see page 20290)

Debugging dbExpress Applications

149.1.8.5.3 TSQLMonitor.FileName Property

Specifies the default file to which monitored messages are saved.

Pascal

```
property FileName: string;
```

C++

```
__property AnsiString FileName;
```

Description

Set FileName to the name of a file to which the messages listed in TraceList (see page 20296) are saved. FileName can be a fully-qualified path name.

Once FileName is specified, setting AutoSave (see page 20294) to true causes all monitored messages to be automatically saved to the specified file. Even if AutoSave (see page 20294) is false, FileName specifies the default file name used by the LoadFromFile (see page 20290) and SaveToFile (see page 20290) methods when they are called with an empty string for the AFileName parameter.

See Also

AutoSave (see page 20294)

SaveToFile (see page 20290)

TraceList (see page 20296)

Debugging dbExpress Applications

149.1.8.5.4 TSQLMonitor.MaxTraceCount Property

Indicates the maximum number of messages that can be logged.

Pascal

```
property MaxTraceCount: Integer;
```

C++

```
__property int MaxTraceCount;
```

Description

Set MaxTraceCount to limit the number of messages that can be added to the TraceList (see page 20296) property. When MaxTraceCount is 0 or greater, the SQL monitor logs every message until the limit specified by MaxTraceCount. Once that limit has been reached, the SQL monitor discards messages until the number of messages in TraceList (see page 20296) has been reduced or the value of MaxTraceCount is changed.

If MaxTraceCount is –1, there is no limit on the number of messages that can be added to TraceList (see page 20296).

If MaxTraceCount is 0, the SQL monitor does not log any messages.

Note: Setting MaxTraceCount affects whether messages can be added to TraceList (see page 20296), but does not affect messages that have already been logged. Thus, if you set MaxTraceCount to a value less than the number of strings currently in TraceList (see page 20296), the number of logged messages will exceed MaxTraceCount.

See Also

TraceList (see page 20296)

TraceCount (see page 20295)

149.1.8.5.5 TSQLMonitor.SQLConnection Property

Specifies the connection components whose messages are to be monitored.

Pascal

```
property SQLConnection: TSQLConnection;
```

C++

```
__property TSQLConnection SQLConnection;
```

Description

Set SQLConnection to identify the TSQLConnection (see page 20217) component whose communication with a database server you want to monitor.

Note: Changing the value of SQLConnection automatically sets the Active (see page 20293) property to false.

See Also

Active (see page 20293)

Debugging dbExpress Applications

149.1.8.5.6 TSQLMonitor.TraceCount Property

Indicates the number of messages currently logged.

Pascal

```
property TraceCount: Integer;
```

C++

```
__property int TraceCount;
```

Description

TraceCount indicates the number of messages listed by the TraceList (see page 20296) property.

See Also

TraceList (see page 20296)

MaxTraceCount (see page 20295)

149.1.8.5.7 TSQLMonitor.TraceList Property

Lists the messages that have passed between SQLConnection (see page 20295) and the database server.

Pascal

```
property TraceList: TWideStrings;
```

C++

```
__property TWideStrings TraceList;
```

Description

Use the TraceList property to access the list of SQL commands that has already been logged. While the SQL monitor is active, the TraceList property is automatically updated when the connection component passes a message to the database server.

Only messages that meet the criteria specified by the TraceFlags property are added to TraceList.

TraceList is a TStrings descendant. As such, you can use its methods to

Clear the list.

Access the individual commands in the list.

Add your own comments to the list. For example, you may want to indicate when your application initiates certain actions so that you can see clearly what SQL messages correspond to what actions.

149.1.8.6 TSQLMonitor Events

The events of the TSQLMonitor class are listed here.

Published Events

	Name	Description
	OnLogTrace (see page 20297)	Occurs immediately after a new message is logged to the list.
	OnTrace (see page 20297)	Occurs when a message is detected but before it is logged to the list.

149.1.8.6.1 TSQLMonitor.OnLogTrace Event

Occurs immediately after a new message is logged to the list.

Pascal

```
property OnLogTrace: TTraceLogEvent;
```

C++

```
__property TTraceLogEvent OnLogTrace;
```

Description

Write an OnLogTrace event handler to respond immediately after a new string is added to the TraceList (see page 20296) property. For example, you can use this event to periodically save the contents of the list to a file and clear the list so that it does not get prohibitively long. OnLogTrace occurs after the message is added to TraceList (see page 20296) but before the list is saved to a file when AutoSave (see page 20294) is true.

Note: OnLogTrace occurs only after logging messages that meet the criteria specified by TraceFlags.

See Also

TraceList (see page 20296)

OnTrace (see page 20297)

TraceFlags

AutoSave (see page 20294)

Debugging dbExpress Applications

149.1.8.6.2 TSQLMonitor.OnTrace Event

Occurs when a message is detected but before it is logged to the list.

Pascal

```
property OnTrace: TTraceEvent;
```

C++

```
__property TTraceEvent OnTrace;
```

Description

Write an OnTrace event handler to screen or edit messages before they are added to TraceList (see page 20296). OnTrace occurs for every message that passes between the dbExpress driver and the database server, not just those that meet the criteria specified by TraceFlags.

See Also

TraceList (see page 20296)

OnLogTrace (see page 20297)

149.1.9 TSQLQuery Class

TSQLQuery represents a query that is executed using dbExpress.

Class Hierarchy

Pascal

```
TSQLQuery = class(TCustomSQLDataSet);
```

C++

```
class TSQLQuery : public TCustomSQLDataSet;
```

File

SqlExpr

Description

Use TSQLQuery to execute an SQL (see page 20316) command on a database server that is accessed via TSQLConnection (see page 20217). TSQLQuery can represent the results of a SELECT statement or perform actions on the database server using statements such as INSERT, DELETE, UPDATE, ALTER TABLE, and so on. You can add a TSQLQuery component to a form or data module at design time, or create one dynamically at runtime.

TSQLQuery is a unidirectional dataset. Unlike other datasets, unidirectional datasets do not buffer multiple records in memory. Because of this, you can only navigate using the First and Next methods. There is no built-in editing support: you can only edit the data in an SQL (see page 20316) query by explicitly creating an SQL (see page 20316) UPDATE command or by connecting the dataset to a client dataset using a provider. Features that require buffering multiple records, such as filters or lookup fields, are not available.

Before you can use a TSQLQuery component, it must be connected to the database server. Therefore, the first step to take when working with TSQLQuery is to set the SQLConnection (see page 20317) property. Once the query is connected to a server, use the SQL (see page 20316) property to specify the command your query executes.

149.1.9.1 TSQLQuery Members

The following tables list the members exposed by TSQLQuery.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	AddFieldDesc (see page 20163)	This is AddFieldDesc, a member of class TCustomSQLDataSet.
	AddIndexDefs (see page 20163)	This is AddIndexDefs, a member of class TCustomSQLDataSet.
V	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
V	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
V	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
V	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
V	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
	CheckPrepareError (see page 20164)	This is CheckPrepareError, a member of class TCustomSQLDataSet.
V	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
V	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
	ClearIndexDefs (see page 20164)	This is ClearIndexDefs, a member of class TCustomSQLDataSet.
V	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
V	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.
V	CloseCursor (see page 20164)	This is CloseCursor, a member of class TCustomSQLDataSet.
	CloseStatement (see page 20164)	This is CloseStatement, a member of class TCustomSQLDataSet.
V	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
V	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
V	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
V	DataEvent (see page 6924)	This is DataEvent, a member of class TDataSet.
V	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 20165)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
V	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
V	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
V	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
V	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
V	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
V	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
V	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.

	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	ExecuteStatement (see page 20166)	This is ExecuteStatement, a member of class TCustomSQLDataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.
	FreeBuffers (see page 20166)	This is FreeBuffers, a member of class TCustomSQLDataSet.
	FreeCommand (see page 20166)	This is FreeCommand, a member of class TCustomSQLDataSet.
	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeReader (see page 20166)	This is FreeReader, a member of class TCustomSQLDataSet.
	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.
	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.
	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
	GetCanModify (see page 6950)	This is GetCanModify, a member of class TDataSet.
	GetCanModify (see page 20167)	This is GetCanModify, a member of class TCustomSQLDataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
	GetDataSource (see page 6951)	This is GetDataSource, a member of class TDataSet.
	GetDataSource (see page 20167)	This is GetDataSource, a member of class TCustomSQLDataSet.
	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
	GetObjectTypeNames (see page 20169)	This is GetObjectTypeNames, a member of class TCustomSQLDataSet.
	GetOutputParams (see page 20169)	This is GetOutputParams, a member of class TCustomSQLDataSet.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
	GetRecord (see page 6956)	This is GetRecord, a member of class TDataSet.
	GetRecord (see page 20170)	This is GetRecord, a member of class TCustomSQLDataSet.
	GetRecordCount (see page 6956)	This is GetRecordCount, a member of class TDataSet.
	GetRecordCount (see page 20170)	This is GetRecordCount, a member of class TCustomSQLDataSet.

V	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
	GetSortFieldNames (see page 20170)	This is GetSortFieldNames, a member of class TCustomSQLDataSet.
V	GetStateFieldValue (see page 6956)	This is GetStateFieldValue, a member of class TDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
V	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
V	InitRecord (see page 20170)	This is InitRecord, a member of class TCustomSQLDataSet.
V	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
V	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
A	InternalClose (see page 6963)	This is InternalClose, a member of class TDataSet.
V	InternalClose (see page 20171)	This is InternalClose, a member of class TCustomSQLDataSet.
V	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
V	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.
V	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
V	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
A	InternalHandleException (see page 6964)	This is InternalHandleException, a member of class TDataSet.
V	InternalHandleException (see page 20171)	This is InternalHandleException, a member of class TCustomSQLDataSet.
A	InternalInitFieldDefs (see page 6965)	This is InternalInitFieldDefs, a member of class TDataSet.
V	InternalInitFieldDefs (see page 20171)	This is InternalInitFieldDefs, a member of class TCustomSQLDataSet.
V	InternalInitRecord (see page 6965)	This is InternalInitRecord, a member of class TDataSet.
V	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
V	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
A	InternalOpen (see page 6966)	This is InternalOpen, a member of class TDataSet.
V	InternalOpen (see page 20171)	This is InternalOpen, a member of class TCustomSQLDataSet.
V	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
V	InternalRefresh (see page 6966)	This is InternalRefresh, a member of class TDataSet.
V	InternalRefresh (see page 20171)	This is InternalRefresh, a member of class TCustomSQLDataSet.
V	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
A	IsCursorOpen (see page 6966)	This is IsCursorOpen, a member of class TDataSet.
V	IsCursorOpen (see page 20172)	This is IsCursorOpen, a member of class TCustomSQLDataSet.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 6969)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 20172)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 20173)	This is LocateRecord, a member of class TCustomSQLDataSet.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	OpenCursor (see page 6976)	This is OpenCursor, a member of class TDataSet.
V	OpenCursor (see page 20174)	This is OpenCursor, a member of class TCustomSQLDataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
V	OpenSchema (see page 20174)	This is OpenSchema, a member of class TCustomSQLDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 20175)	This is PropertyChanged, a member of class TCustomSQLDataSet.
V	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.
V	PSEndTransaction (see page 20175)	Ends a transaction that was started by a call to PSStartTransaction.
V	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
V	PSExecute (see page 20176)	Executes the SQL command associated with the dataset.
V	PSExecuteStatement (see page 20176)	This is PSExecuteStatement, a member of class TCustomSQLDataSet.
V	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
V	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
V	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.

	PSGetAttributes (see page 20176)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 6982)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 7537)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 20177)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 6982)	Gets the command type to be executed by PSExecute.
	PSGetCommandType (see page 20177)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 20178)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 6983)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 20178)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 6984)	This is PSGetKeyFieldsW, a member of class TDataSet.
	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
	PSGetKeyFieldsW (see page 20179)	This is PSGetKeyFieldsW, a member of class TCustomSQLDataSet.
	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
	PSGetParams (see page 20179)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 6985)	This is PSGetQuoteCharW, a member of class TDataSet.
	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
	PSGetQuoteCharW (see page 20179)	This is PSGetQuoteCharW, a member of class TCustomSQLDataSet.
	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 6986)	This is PSGetTableNameW, a member of class TDataSet.
	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
	PSGetTableNameW (see page 20179)	This is PSGetTableNameW, a member of class TCustomSQLDataSet.
	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
	PSGetUpdateException (see page 20180)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 20180)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 20180)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 20181)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 20181)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 20182)	Assigns a specified SQL command to be executed by PSExecute.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 20182)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSStartTransaction (see page 20182)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 20183)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.

	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetBufListSize (see page 20184)	This is SetBufListSize, a member of class TCustomSQLDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 20184)	This is SetCommandText, a member of class TCustomSQLDataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFCommandText (see page 20184)	This is SetFCommandText, a member of class TCustomSQLDataSet.
	SetFieldData (see page 20184)	This is SetFieldData, a member of class TCustomSQLDataSet.
	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.
	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetMaxBlobSize (see page 20184)	This is SetMaxBlobSize, a member of class TCustomSQLDataSet.
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetParamsFromCursor (see page 20185)	This is SetParamsFromCursor, a member of class TCustomSQLDataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
	SetSortFieldNames (see page 20186)	This is SetSortFieldNames, a member of class TCustomSQLDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateIndexDefs (see page 7002)	This is UpdateIndexDefs, a member of class TDataSet.
	UpdateIndexDefs (see page 20186)	This is UpdateIndexDefs, a member of class TCustomSQLDataSet.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.

	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
	BlobBuffer (see page 20189)	Reserves a buffer for storing BLOB values.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
	CommandType (see page 20190)	Indicates the meaning of the CommandText (see page 20189) property.
	Constraints (see page 7013)	Specifies record-level constraints that must be met when editing the data.
	CurrentBlobSize (see page 20191)	Indicates the size of the most recently read BLOB field.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
R	DataLink (see page 20191)	Identifies the datalink that manages communication between the SQL dataset and another, master dataset.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	InternalConnection (see page 20194)	Indicates the component that connects the dataset to its database server, taking into account whether the connection was cloned.
	LastError (see page 20194)	Saves the error message for the last error returned by dbExpress.
	NativeCommand (see page 20195)	Represents the SQL command that is sent to the server.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
R	ParamCount (see page 20197)	Indicates the number of parameters listed by the Params (see page 20197) property.
	ProcParams (see page 20199)	ProcParams lists the parameter descriptors obtained from the server for any stored procedure parameters.
	Reserved (see page 7035)	For internal use only.
	SchemaInfo (see page 20200)	Identifies the metadata with which to populate the dataset.
	SortFieldNames (see page 20201)	Indicates the sort order when CommandType (see page 20190) is ctTable.

Public Events

	Name	Description
	AfterCancel (see page 7038)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 7040)	Occurs after an application closes a dataset.
	AfterDelete (see page 7041)	Occurs after an application deletes a record.
	AfterEdit (see page 7044)	Occurs after an application starts editing a record.
	AfterInsert (see page 7044)	Occurs after an application inserts a new record.
	AfterOpen (see page 7045)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 7046)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 7047)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 7047)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 7048)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 7048)	Occurs immediately before the dataset closes.

	BeforeDelete (see page 7049)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 7049)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 7050)	Occurs before an application enters insert mode.
	BeforeOpen (see page 7051)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 7052)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 7052)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 7053)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 7053)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 7054)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 7054)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 7055)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 7056)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 7056)	Occurs when an application attempts to modify or insert a record and an exception is raised.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.
V	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
	Close (see page 6920)	Closes a dataset.
V	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
V	Create (see page 20310)	Creates an instance of a TSQLQuery (see page 20298) component.
V	CreateBlobStream (see page 6922)	Provides the interface for a method that creates a blob stream for a Binary large object (BLOB) field in the dataset.
V	CreateBlobStream (see page 20164)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
V	Destroy (see page 20311)	Destroys the TSQLQuery (see page 20298) instance.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
V	ExecSQL (see page 20311)	Executes a query that does not return a set of records.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.
V	GetBlobFieldData (see page 20166)	Retrieves the current value of a BLOB field into a buffer.
V	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
V	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
V	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
V	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
V	GetDetailLinkFields (see page 20167)	Lists the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
V	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
V	GetFieldData (see page 20168)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
V	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyFieldNames (see page 20169)	Fills a list with the names of all fields in all indexes defined for the dataset.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetQuoteChar (see page 20169)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
V	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
V	IsSequenced (see page 20172)	Indicates whether the dataset can use record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
V	Locate (see page 6970)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
V	Locate (see page 20173)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
V	Lookup (see page 6970)	Implements a virtual method to retrieve field values from a record that matches specified search values.
V	Lookup (see page 20174)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	Open (see page 6976)	Opens the dataset.
	ParamByName (see page 20175)	This is ParamByName, a member of class TCustomSQLDataSet.
V	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
V	PrepareStatement (see page 20312)	Prepares the query for execution.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 7579)	Gets the SQL command to be executed by PSExecute (see page 7578).
	PSGetCommandText (see page 7591)	Gets the SQL command to be executed by PSExecute (see page 7590).
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.

	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).
	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetSchemaInfo (see page 20185)	Indicates whether the dataset represents metadata from the server, and if so, what kind.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.

Public Properties

	Name	Description
	Active (see page 7004)	Specifies whether or not a dataset is open.
R	AggFields (see page 7006)	Contains any aggregate fields.

	AutoCalcFields (see page 7006)	Determines when the OnCalcFields (see page 7053) event is triggered and when lookup field values are calculated.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
	CommandText (see page 20189)	Specifies the command the dataset executes.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSetField (see page 7013)	Indicates the persistent TDataSetField (see page 7060) object that owns a nested dataset.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignerData (see page 20192)	Stores custom data.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
	FieldDefs (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset
	Filter (see page 7026)	Specifies the text of the current filter for a dataset.
	Filtered (see page 7027)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 7027)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
	IndexDefs (see page 20193)	Contains the definitions of all indexes defined on the server for the dataset.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
R	Modified (see page 7029)	Indicates whether the active record is modified.
	ObjectView (see page 7031)	Specifies whether fields are stored hierarchically or flattened out in the Fields (see page 7023) property.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Prepared (see page 20198)	Specifies whether the command is prepared before execution.
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
R	RecordCount (see page 20199)	Indicates the total number of records associated with the dataset.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
	RowsAffected (see page 20316)	Indicates the number of rows operated on by the latest query execution.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
R	Text (see page 20318)	Indicates the SQL (see page 20316) statement as a single string.
	TransactionLevel (see page 20202)	Indicates the transaction to which this dataset belongs.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterClose (see page 20203)	Occurs after a data source connection is closed.

	AfterOpen (see page 20203)	Occurs after the connection to a data source is opened.
	AfterRefresh (see page 20203)	Occurs after a DataSet has been changed and is refreshed.
	AfterScroll (see page 20204)	Occurs after a result set is scrolled.
	BeforeClose (see page 20204)	Occurs just before a data connection is closed.
	BeforeOpen (see page 20204)	Occurs just before a data connection is opened, but after an open operation has been initiated.
	BeforeRefresh (see page 20204)	Occurs before a DataSet refresh occurs.
	BeforeScroll (see page 20204)	Occurs when a DataSet scroll operation has been initiated but before the scrolling actually takes place.
	OnCalcFields (see page 20204)	Occurs when calculated or derived fields are updated.
	ParseDeleteSql (see page 20205)	Occurs when an application attempts to parse the DELETE statement stored in the CommandText (see page 20189) property.
	ParseInsertSql (see page 20205)	Occurs when an application attempts to parse the INSERT statement stored in the CommandText (see page 20189) property.
	ParseSelectSql (see page 20205)	Occurs when an application attempts to parse the SELECT statement specified in the CommandText (see page 20189) property.
	ParseUpdateSql (see page 20205)	Occurs when an application attempts to parse a SQL UPDATE statement stored in the CommandText (see page 20189) property.

Published Properties

	Name	Description
	Active (see page 20187)	Specifies whether or not a dataset is open.
	DataSource (see page 20313)	Links the SQL dataset to another (master) dataset.
	GetMetadata (see page 20313)	Specifies whether the SQL dataset fetches metadata information along with the data.
	MaxBlobSize (see page 20314)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NumericMapping (see page 20195)	Maps fldBCD to either ftFMTBCD or ftBCD field types.
	ObjectView (see page 20196)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	ParamCheck (see page 20314)	Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.
	Params (see page 20315)	Represents the parameters for a query or stored procedure.
	SchemaName (see page 20201)	Specifies the name of the database schema.
	SQL (see page 20316)	Specifies the SQL statement to execute on the database server.
	SQLConnection (see page 20317)	Specifies the SQL connection component that connects the dataset to a database server.
	Tag (see page 2808)	Stores an integer value as part of a component.

149.1.9.2 TSQLQuery.Create Constructor

Creates an instance of a TSQLQuery (see page 20298) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSQLQuery(TComponent * AOwner);
```

Description

Call Create to instantiate an SQL (see page 20316) query component at runtime. SQL (see page 20316) queries placed in forms or data modules at design time are created automatically.

See Also

Create (see page 6904)

149.1.9.3 TSQLQuery.Destroy Destructor

Destroys the TSQLQuery (see page 20298) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSQLQuery();
```

Description

Do not call Destroy directly in an application. Usually destruction of datasets is handled automatically. If an application creates its own instances of a dataset, however, and does not assign an Owner that is responsible for freeing the dataset, then the application should call Free, which verifies that the dataset reference is not nil before calling Destroy.

See Also

Owner (see page 2807)

Create (see page 20310)

Free (see page 22300)

149.1.9.4 TSQLQuery Methods

The methods of the TSQLQuery class are listed here.

Public Methods

	Name	Description
	ExecSQL (see page 20311)	Executes a query that does not return a set of records.
	PrepareStatement (see page 20312)	Prepares the query for execution.

149.1.9.4.1 TSQLQuery.ExecSQL Method

Executes a query that does not return a set of records.

Pascal

```
function ExecSQL(ExecDirect: Boolean = False): Integer; override;
```

C++

```
virtual __fastcall int ExecSQL(Boolean ExecDirect = False);
```

Description

Call ExecSQL to execute an SQL (see page 20316) command that does not return a set of records. This command is a query other than a SELECT query, such as an INSERT, UPDATE, DELETE, or CREATE TABLE query.

ExecDirect indicates that the query does not need to be prepared before it is executed. This parameter can be set to true if the query does not include any parameters. When ExecDirect is false, the query will be prepared before it is executed. Even when ExecDirect is false, you can avoid preparing the query every time ExecSQL is called by setting the Prepared (see page 20198) property to true before calling ExecSQL the first time.

ExecSQL returns the number of rows affected by the executed command. This becomes the value of the RowsAffected (see page 20316) property.

Note: Do not use ExecSQL for commands such as SELECT queries that return data. When the command returns data, use the Open method or set the Active (see page 20187) property to true.

See Also

SQL (see page 20316)

RowsAffected (see page 20200)

Open (see page 6976)

Active (see page 7004)

Prepared (see page 20198)

ExecuteDirect (see page 20228)

149.1.9.4.2 TSQLQuery.PrepareStatement Method

Prepares the query for execution.

Pascal

```
procedure PrepareStatement; override;
```

C++

```
virtual __fastcall PrepareStatement();
```

Description

PrepareStatement performs most of the necessary tasks for preparing a query to be executed on the server. It ensures the dbExpress and the database server have allocated any resources they need for executing the query and binding its parameters. Any named parameters are temporarily converted to unnamed parameters because dbExpress does not support named parameters.

Do not call PrepareStatement when preparing a query for execution. Instead, set the Prepared (see page 20198) property to true. When you use the Prepared (see page 20198) property instead, the query keeps track of the fact that it has already been prepared and need not repeat the process every time it executes the query. In addition, when you set the Prepared (see page 20198) property, the query initializes internal properties that keep track of the number of rows affected by the query.

See Also

Prepared (see page 20198)

149.1.9.5 TSQLQuery Properties

The properties of the TSQLQuery class are listed here.

Public Properties

	Name	Description
	RowsAffected (see page 20316)	Indicates the number of rows operated on by the latest query execution.
R	Text (see page 20318)	Indicates the SQL (see page 20316) statement as a single string.

Published Properties

	Name	Description
	DataSource (see page 20313)	Links the SQL dataset to another (master) dataset.
	GetMetadata (see page 20313)	Specifies whether the SQL dataset fetches metadata information along with the data.
	MaxBlobSize (see page 20314)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.

	ParamCheck (see page 20314)	Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.
	Params (see page 20315)	Represents the parameters for a query or stored procedure.
	SQL (see page 20316)	Specifies the SQL statement to execute on the database server.
	SQLConnection (see page 20317)	Specifies the SQL connection component that connects the dataset to a database server.

149.1.9.5.1 TSQLQuery.DataSource Property

Links the SQL dataset to another (master) dataset.

Pascal

```
property DataSource: TDataSource;
```

C++

```
__property TDataSource DataSource;__property TDataSource DataSource;
```

Description

DataSource links this SQL dataset to another (master) dataset that supplies values for this dataset's parameters.

When the SQL dataset's CommandText (or SQL) property specifies a parameterized query but the application does not provide values for the corresponding parameters in the Params property, the SQL dataset fetches parameter values from the dataset identified with the specified data source. When the current record in the dataset associated with DataSource changes, the SQL dataset refreshes its data to reflect the new parameter values.

See Also

CommandText (see page 20189)

SQL (see page 20316)

Params (see page 20197)

MasterSource (see page 20357)

149.1.9.5.2 TSQLQuery.GetMetadata Property

Specifies whether the SQL dataset fetches metadata information along with the data.

Pascal

```
property GetMetadata: Boolean;
```

C++

```
__property Boolean GetMetadata;
```

Description

Use GetMetadata to turn on or off the fetching of metadata on a database object. Setting GetMetadata to False will improve performance because no additional SQL will execute in order to get index information. However, setting GetMetadata to False might slow any attempts to update data using a client dataset that is linked via a dataset provider because the resolver might not generate optimized SQL to perform the update.

GetMetadata must be True to perform any operations that require an index. These operations include setting up master/detail relationships, updating data from a client dataset when the provider's UpdateMode is not upWhereAll, and delayed fetching of BLOB data.

Set GetMetadata to False if you are fetching a dataset for read-only purposes.

See Also

TClientDataset

TDataSetProvider (see page 18508)

Fetching the Data using TSQLDataSet

149.1.9.5.3 TSQLQuery.MaxBlobSize Property

Indicates the maximum number of bytes fetched for any BLOB field in the dataset.

Pascal

```
property MaxBlobSize: Integer;
```

C++

```
__property int MaxBlobSize;
```

Description

MaxBlobSize limits the amount of data that can be fetched from Binary Large Object (BLOB) fields. BLOB fields can hold an indefinite amount of data. However, SQL datasets read that data into a memory buffer. By limiting the amount of data that can be fetched from a BLOB field, you limit the size of the buffer.

If MaxBlobSize is –1, the dataset imposes no maximum BLOB size. If MaxBlobSize is 0, the dataset uses the parameters of the associated SQL connection, if any, to determine the maximum BLOB size.

Note: MaxBlobSize should agree with any parameters on the associated SQL connection component that limit the size of BLOB data.

See Also

GetBlobFieldData (see page 20166)

Params (see page 20253)

SQLConnection (see page 20201)

149.1.9.5.4 TSQLQuery.ParamCheck Property

Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

By default, the Params property is updated automatically to reflect any parameters that appear in the query specified by the CommandText property (or the SQL property for TSQLQuery) at runtime. That is, whenever the CommandText property changes, the Params property is regenerated to reflect the new set of parameters.

There are times when you want to override this default behavior. For example, when specifying a data definition language (DDL) statement that defines a stored procedure, the resulting SQL command may include parameters. These parameters, however, should not be used as parameters of the SQL dataset, because they are not parameters of the DDL command, but rather, they are parameters of the stored procedure that the command creates.

In order to override the default generation of the Params property in response to changes in CommandText, set ParamCheck to

false.

See Also

Params (see page 20197)

CommandText (see page 20189)

SQL (see page 20316)

149.1.9.5.5 TSQLQuery.Params Property

Represents the parameters for a query or stored procedure.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

Params is a collection of TParam objects that represent the parameters of a query or stored procedure specified by the SQL dataset. When you specify a query by setting the CommandText property (or the SQL property in TSQLQuery), the SQL dataset automatically parse the query and fills Params with a TParam object for every parameter in the query. Similarly, when you specify a stored procedure by setting the CommandText property (or the StoredProcName property in TSQLStoredProc), the SQL dataset automatically asks the server for a list of stored procedure parameters and fills Params with a TParam object for every parameter of the stored procedure.

At design-time, use the Params property editor to access the individual TParam objects. For queries, use this property editor to check the DataType property of each parameter and to assign values to the parameters. For stored procedures, you may need to do more, changing the type or number of parameters if the server does not supply complete information about stored procedure parameters.

You can also use Params to assign parameter properties in code at runtime.

Note: If you do not assign values to input parameters before opening the dataset, it fetches values from the dataset identified by the DataSource property. However, this only works if the individual TParam objects have the same names as fields in the master dataset.

See Also

ParamCheck (see page 20196)

Configuring TSQL Connection

Connecting to Databases with TDatabase

Using TQuery

Using TSimpleDataSet

149.1.9.5.6 TSQLQuery.RowsAffected Property

Indicates the number of rows operated on by the latest query execution.

Pascal

```
property RowsAffected: Integer;
```

C++

```
__property int RowsAffected;
```

Description

When the SQL dataset represents a query that does not return a result set, you can't use the RecordCount property to ascertain the number of records affected by the query. In such cases, read RowsAffected to determine how many rows were updated or deleted by the query when it executed. If no rows were updated or deleted, RowsAffected is zero. RowsAffected is –1 if the SQL statement could not be executed due to an error condition. (This latter situation typically follows the throwing of an exception.)

See Also

ExecSQL (see page 20278)

RecordCount (see page 20199)

ExecProc (see page 20331)

149.1.9.5.7 TSQLQuery.SQL Property

Specifies the SQL statement to execute on the database server.

Pascal

```
property SQL: TWideStrings;
```

C++

```
__property TWideStrings SQL;
```

Description

Use the properties and methods of SQL to specify the query that should be executed on the database server. If SQL is a SELECT statement, the query executes the statement when you call Open or set the Active (see page 20187) property to true. If the statement does not return a result set, call the ExecSQL (see page 20311) method to execute the statement.

When you set the SQL property, TSQLQuery (see page 20298) checks the statement for parameters and initializes the Params (see page 20315) property to reflect any parameters in the statement. You can subsequently use the Params (see page 20315) property to adjust the datatype of any parameters and supply values for the parameters.

At design-time, edit the SQL statement using the property editor that appears when you click the ellipsis button for the property in the Object Inspector. At runtime, use properties and methods of TStrings to clear the current contents, add new contents, or to modify existing contents:

SQLQuery1.SQL.Clear;

```
SQLQuery1.SQL.Add('SELECT ' + Edit1.Text + ' FROM ' + Edit2.Text);
if Length(Edit3.Text) <> 0 then
```

SQLQuery1.SQL.Add('ORDER BY ' + Edit3.Text (see page 20318))

SQLQuery1->SQL->Clear();

```
SQLQuery1->SQL->Add("SELECT " + Edit1->Text + " FROM " + Edit2.Text);
```

```
if (!Edit3->Text->IsEmpty())
SQLQuery1->SQL->Add("ORDER BY " + Edit3.Text (see page 20318));
```

You can also use the methods of SQL to load a query from a file.

Note: The SQL you supply for this property must be valid for the database server to which the TSQLQuery (see page 20298) object is connected.

See Also

Add (see page 3033)

Active (see page 7004)

Open (see page 6976)

ExecSQL (see page 20311)

Params (see page 20197)

Text (see page 20318)

Representing the Results of a Query

Specifying the Command to Execute

149.1.9.5.8 TSQLQuery.SQLConnection Property

Specifies the SQL connection component that connects the dataset to a database server.

Pascal

```
property SQLConnection: TSQLConnection;
```

C++

```
__property TSQLConnection SQLConnection;
```

Description

Use SQLConnection to specify an SQL connection object that connects the dataset to a database server.

At design-time, select from the list of available TSQLConnection components in the Object Inspector. At runtime, set SQLConnection to reference an existing TSQLConnection object.

SQLConnection should be the first property you set on the dataset. Only after the SQLConnection property is set can you use the Command Text editor to specify a query for the CommandText property or populate the dataset with data by setting Active to true. Similarly, SQLConnection must be set before the dataset can initialize the Params property when you set CommandText.

See Also

Active (see page 7004)

CommandText (see page 20189)

Params (see page 20197)

Using Query-type Datasets

Using Stored Procedure-type Datasets

Using Table Type Datasets

Connecting Directly to a Database Server

Connecting to the Database Server

149.1.9.5.9 TSQLQuery.Text Property

Indicates the SQL (see page 20316) statement as a single string.

Pascal

```
property Text: string;
```

C++

```
__property AnsiString Text;
```

Description

Use Text as a convenient way to read the entire SQL (see page 20316) query as a single string, rather than using the SQL (see page 20316) property, which may divide the query into substrings. Text is the same as the Text property of the TStrings object that implements the SQL (see page 20316) property.

Text (see page 3084)

149.1.10 TSQLStoredProc Class

TSQLStoredProc represents a stored procedure that is executed using dbExpress.

Class Hierarchy

Pascal

```
TSQLStoredProc = class(TCustomSQLDataSet);
```

C++

```
class TSQLStoredProc : public TCustomSQLDataSet;
```

File

SqlExpr

Description

Use TSQLStoredProc to execute a stored procedure on a database server that is accessed via TSQLConnection (see page 20217). TSQLStoredProc can represent the result set if the stored procedure returns a cursor. You can add a TSQLStoredProc component to a form or data module at design time, or create one dynamically at runtime.

TSQLStoredProc is a unidirectional dataset. Unlike other datasets, unidirectional datasets do not buffer multiple records in memory. Because of this, you can only navigate using the First and Next methods. There is no built-in editing support: you can only edit the data in an SQL stored procedure by explicitly creating an SQL UPDATE command or by connecting the dataset to a client dataset using a provider. Features that require buffering multiple records, such as filters or lookup fields, are not available.

Before you can use a TSQLStoredProc component, it must be connected to the database server. Therefore, the first step to take

when working with TSQLStoredProc is to set the SQLConnection (see page 20335) property. Once the dataset is connected to a server, use the StoredProcName (see page 20336) property to specify the stored procedure to execute.

Types of Unidirectional Datasets

149.1.10.1 TSQLStoredProc Members

The following tables list the members exposed by TSQLStoredProc.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	AddFieldDesc (see page 20163)	This is AddFieldDesc, a member of class TCustomSQLDataSet.
	AddIndexDefs (see page 20163)	This is AddIndexDefs, a member of class TCustomSQLDataSet.
V	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
V	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
V	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
V	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
V	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
	CheckPrepareError (see page 20164)	This is CheckPrepareError, a member of class TCustomSQLDataSet.
V	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
V	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
	ClearIndexDefs (see page 20164)	This is ClearIndexDefs, a member of class TCustomSQLDataSet.
V	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
V	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.

	CloseCursor (see page 20164)	This is CloseCursor, a member of class TCustomSQLDataSet.
	CloseStatement (see page 20164)	This is CloseStatement, a member of class TCustomSQLDataSet.
	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
	DataEvent (see page 6924)	This is DataEvent, a member of class TDataSet.
	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 20165)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.
	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	ExecSQL (see page 20165)	This is ExecSQL, a member of class TCustomSQLDataSet.
	ExecuteStatement (see page 20166)	This is ExecuteStatement, a member of class TCustomSQLDataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.
	FreeBuffers (see page 20166)	This is FreeBuffers, a member of class TCustomSQLDataSet.
	FreeCommand (see page 20166)	This is FreeCommand, a member of class TCustomSQLDataSet.
	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeReader (see page 20166)	This is FreeReader, a member of class TCustomSQLDataSet.
	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.
	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.
	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
	GetCanModify (see page 6950)	This is GetCanModify, a member of class TDataSet.
	GetCanModify (see page 20167)	This is GetCanModify, a member of class TCustomSQLDataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.

	GetDataSource (see page 6951)	This is GetDataSource, a member of class TDataSet.
	GetDataSource (see page 20167)	This is GetDataSource, a member of class TCustomSQLDataSet.
	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
	GetObjectTypeNames (see page 20169)	This is GetObjectTypeNames, a member of class TCustomSQLDataSet.
	GetOutputParams (see page 20169)	This is GetOutputParams, a member of class TCustomSQLDataSet.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
	GetRecord (see page 6956)	This is GetRecord, a member of class TDataSet.
	GetRecord (see page 20170)	This is GetRecord, a member of class TCustomSQLDataSet.
	GetRecordCount (see page 6956)	This is GetRecordCount, a member of class TDataSet.
	GetRecordCount (see page 20170)	This is GetRecordCount, a member of class TCustomSQLDataSet.
	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
	GetSortFieldNames (see page 20170)	This is GetSortFieldNames, a member of class TCustomSQLDataSet.
	GetStateFieldValue (see page 6956)	This is GetStateFieldValue, a member of class TDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
	InitRecord (see page 20170)	This is InitRecord, a member of class TCustomSQLDataSet.
	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
	InternalClose (see page 6963)	This is InternalClose, a member of class TDataSet.
	InternalClose (see page 20171)	This is InternalClose, a member of class TCustomSQLDataSet.
	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.
	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
	InternalHandleException (see page 6964)	This is InternalHandleException, a member of class TDataSet.
	InternalHandleException (see page 20171)	This is InternalHandleException, a member of class TCustomSQLDataSet.
	InternalInitFieldDefs (see page 6965)	This is InternalInitFieldDefs, a member of class TDataSet.
	InternalInitFieldDefs (see page 20171)	This is InternalInitFieldDefs, a member of class TCustomSQLDataSet.
	InternalInitRecord (see page 6965)	This is InternalInitRecord, a member of class TDataSet.
	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
	InternalOpen (see page 6966)	This is InternalOpen, a member of class TDataSet.
	InternalOpen (see page 20171)	This is InternalOpen, a member of class TCustomSQLDataSet.
	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
	InternalRefresh (see page 6966)	This is InternalRefresh, a member of class TDataSet.
	InternalRefresh (see page 20171)	This is InternalRefresh, a member of class TCustomSQLDataSet.
	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsCursorOpen (see page 6966)	This is IsCursorOpen, a member of class TDataSet.

	IsCursorOpen (see page 20172)	This is IsCursorOpen, a member of class TCustomSQLDataSet.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 6969)	Initializes the component after the form file has been read into memory.
	Loaded (see page 20172)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 20173)	This is LocateRecord, a member of class TCustomSQLDataSet.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	OpenCursor (see page 6976)	This is OpenCursor, a member of class TDataSet.
	OpenCursor (see page 20174)	This is OpenCursor, a member of class TCustomSQLDataSet.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
	OpenSchema (see page 20174)	This is OpenSchema, a member of class TCustomSQLDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 20175)	This is PropertyChanged, a member of class TCustomSQLDataSet.
	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.
	PSEndTransaction (see page 20175)	Ends a transaction that was started by a call to PSStartTransaction.
	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
	PSExecute (see page 20176)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 20176)	This is PSExecuteStatement, a member of class TCustomSQLDataSet.
	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 20176)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 6982)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 7537)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 20177)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 6982)	Gets the command type to be executed by PSExecute.
	PSGetCommandType (see page 20177)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 20178)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 6983)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 20178)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 6984)	This is PSGetKeyFieldsW, a member of class TDataSet.
	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
	PSGetKeyFieldsW (see page 20179)	This is PSGetKeyFieldsW, a member of class TCustomSQLDataSet.
	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
	PSGetParams (see page 20179)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 6985)	This is PSGetQuoteCharW, a member of class TDataSet.
	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
	PSGetQuoteCharW (see page 20179)	This is PSGetQuoteCharW, a member of class TCustomSQLDataSet.
	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 6986)	This is PSGetTableNameW, a member of class TDataSet.
	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
	PSGetTableNameW (see page 20179)	This is PSGetTableNameW, a member of class TCustomSQLDataSet.

	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
	PSGetUpdateException (see page 20180)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 20180)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 20180)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 20181)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 20181)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 20182)	Assigns a specified SQL command to be executed by PSExecute.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 20182)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSStartTransaction (see page 20182)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 20183)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetBufListSize (see page 20184)	This is SetBufListSize, a member of class TCustomSQLDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 20184)	This is SetCommandText, a member of class TCustomSQLDataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFCommandText (see page 20184)	This is SetFCommandText, a member of class TCustomSQLDataSet.
	SetFieldData (see page 20184)	This is SetFieldData, a member of class TCustomSQLDataSet.
	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.
	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetMaxBlobSize (see page 20184)	This is SetMaxBlobSize, a member of class TCustomSQLDataSet.
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 6999)	Sets the value of the Name property.

	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
V	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetParamsFromCursor (see page 20185)	This is SetParamsFromCursor, a member of class TCustomSQLDataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
	SetSortFieldNames (see page 20186)	This is SetSortFieldNames, a member of class TCustomSQLDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
V	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateIndexDefs (see page 7002)	This is UpdateIndexDefs, a member of class TDataSet.
V	UpdateIndexDefs (see page 20186)	This is UpdateIndexDefs, a member of class TCustomSQLDataSet.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
	BlobBuffer (see page 20189)	Reserves a buffer for storing BLOB values.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
	CommandType (see page 20190)	Indicates the meaning of the CommandText (see page 20189) property.
	Constraints (see page 7013)	Specifies record-level constraints that must be met when editing the data.
	CurrentBlobSize (see page 20191)	Indicates the size of the most recently read BLOB field.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
R	DataLink (see page 20191)	Identifies the datalink that manages communication between the SQL dataset and another, master dataset.
	DataSource (see page 20192)	Links the SQL dataset to another (master) dataset.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	InternalConnection (see page 20194)	Indicates the component that connects the dataset to its database server, taking into account whether the connection was cloned.
	LastError (see page 20194)	Saves the error message for the last error returned by dbExpress.
	NativeCommand (see page 20195)	Represents the SQL command that is sent to the server.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
R	ParamCount (see page 20197)	Indicates the number of parameters listed by the Params (see page 20197) property.

	ProcParams (see page 20199)	ProcParams lists the parameter descriptors obtained from the server for any stored procedure parameters.
	Reserved (see page 7035)	For internal use only.
R	RowsAffected (see page 20200)	Indicates the number of rows operated on by the latest query execution.
	SchemaInfo (see page 20200)	Identifies the metadata with which to populate the dataset.
	SortFieldNames (see page 20201)	Indicates the sort order when CommandType (see page 20190) is ctTable.

Public Events

	Name	Description
	AfterCancel (see page 7038)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 7040)	Occurs after an application closes a dataset.
	AfterDelete (see page 7041)	Occurs after an application deletes a record.
	AfterEdit (see page 7044)	Occurs after an application starts editing a record.
	AfterInsert (see page 7044)	Occurs after an application inserts a new record.
	AfterOpen (see page 7045)	Occurs after an application completes opening a dataset and before any data access occurs.
	AfterPost (see page 7046)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 7047)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 7047)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 7048)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 7048)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 7049)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 7049)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 7050)	Occurs before an application enters insert mode.
	BeforeOpen (see page 7051)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 7052)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 7052)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 7053)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 7053)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 7054)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 7054)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 7055)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 7056)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 7056)	Occurs when an application attempts to modify or insert a record and an exception is raised.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.
V	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
	Close (see page 6920)	Closes a dataset.
V	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
V	Create (see page 20331)	Creates an instance of a TSQLStoredProc (see page 20318) component.
V	CreateBlobStream (see page 6922)	Provides the interface for a method that creates a blob stream for a Binary large object (BLOB) field in the dataset.
V	CreateBlobStream (see page 20164)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.
	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 6904)	Destroys the TDataSet (see page 6894) instance.
V	Destroy (see page 20161)	Destroys the TCustomSQLDataSet (see page 20150) instance.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
V	ExecProc (see page 20331)	Executes the stored procedure when it does not return a cursor.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
V	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.
V	GetBlobFieldData (see page 20166)	Retrieves the current value of a BLOB field into a buffer.

	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
	GetDetailLinkFields (see page 20167)	Lists the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
	GetFieldData (see page 20168)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyFieldNames (see page 20169)	Fills a list with the names of all fields in all indexes defined for the dataset.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetQuoteChar (see page 20169)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	IsSequenced (see page 20172)	Indicates whether the dataset can use record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
	Locate (see page 6970)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
	Locate (see page 20173)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
	Lookup (see page 6970)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	Lookup (see page 20174)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	NextRecordSet (see page 20332)	Provides access to a secondary recordset.
	Open (see page 6976)	Opens the dataset.
	ParamByName (see page 20175)	This is ParamByName, a member of class TCustomSQLDataSet.

V	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
V	PrepareStatement (see page 20332)	Prepares the stored procedure for execution.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 7579)	Gets the SQL command to be executed by PSExecute (see page 7578).
	PSGetCommandText (see page 7591)	Gets the SQL command to be executed by PSExecute (see page 7590).
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).

	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetSchemaInfo (see page 20185)	Indicates whether the dataset represents metadata from the server, and if so, what kind.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.
	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.

Public Properties

	Name	Description
	Active (see page 7004)	Specifies whether or not a dataset is open.
R	AggFields (see page 7006)	Contains any aggregate fields.
	AutoCalcFields (see page 7006)	Determines when the OnCalcFields (see page 7053) event is triggered and when lookup field values are calculated.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
	CommandText (see page 20189)	Specifies the command the dataset executes.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSetField (see page 7013)	Indicates the persistent TDataSetField (see page 7060) object that owns a nested dataset.
R	DataSource (see page 7014)	Represents the data source of another dataset that supplies values to the dataset.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignerData (see page 20192)	Stores custom data.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
	FieldDefs (see page 7019)	Points to the list of field definitions for the dataset.

R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset
	Filter (see page 7026)	Specifies the text of the current filter for a dataset.
	Filtered (see page 7027)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 7027)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
	IndexDefs (see page 20193)	Contains the definitions of all indexes defined on the server for the dataset.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
R	Modified (see page 7029)	Indicates whether the active record is modified.
	ObjectView (see page 7031)	Specifies whether fields are stored hierarchically or flattened out in the Fields (see page 7023) property.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Prepared (see page 20198)	Specifies whether the command is prepared before execution.
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
R	RecordCount (see page 20199)	Indicates the total number of records associated with the dataset.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.
	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	TransactionLevel (see page 20202)	Indicates the transaction to which this dataset belongs.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterClose (see page 20203)	Occurs after a data source connection is closed.
	AfterOpen (see page 20203)	Occurs after the connection to a data source is opened.
	AfterRefresh (see page 20203)	Occurs after a DataSet has been changed and is refreshed.
	AfterScroll (see page 20204)	Occurs after a result set is scrolled.
	BeforeClose (see page 20204)	Occurs just before a data connection is closed.
	BeforeOpen (see page 20204)	Occurs just before a data connection is opened, but after an open operation has been initiated.
	BeforeRefresh (see page 20204)	Occurs before a DataSet refresh occurs.
	BeforeScroll (see page 20204)	Occurs when a DataSet scroll operation has been initiated but before the scrolling actually takes place.
	OnCalcFields (see page 20204)	Occurs when calculated or derived fields are updated.
	ParseDeleteSql (see page 20205)	Occurs when an application attempts to parse the DELETE statement stored in the CommandText (see page 20189) property.
	ParseInsertSql (see page 20205)	Occurs when an application attempts to parse the INSERT statement stored in the CommandText (see page 20189) property.
	ParseSelectSql (see page 20205)	Occurs when an application attempts to parse the SELECT statement specified in the CommandText (see page 20189) property.
	ParseUpdateSql (see page 20205)	Occurs when an application attempts to parse a SQL UPDATE statement stored in the CommandText (see page 20189) property.

Published Properties

	Name	Description
	Active (see page 20187)	Specifies whether or not a dataset is open.
	GetMetadata (see page 20193)	Specifies whether the SQL dataset fetches metadata information along with the data.
	MaxBlobSize (see page 20333)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NumericMapping (see page 20195)	Maps fldBCD to either ftFMTBCD or ftBCD field types.
	ObjectView (see page 20196)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.

	PackageName (see page 20334)	Specifies the name of the Oracle package to which the stored procedure belongs.
	ParamCheck (see page 20334)	Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.
	Params (see page 20334)	Represents the parameters for a query or stored procedure.
	SchemaName (see page 20201)	Specifies the name of the database schema.
	SQLConnection (see page 20335)	Specifies the SQL connection component that connects the dataset to a database server.
	StoredProcName (see page 20336)	Specifies the SQL statement to execute on the database server.
	Tag (see page 2808)	Stores an integer value as part of a component.

149.1.10.2 TSQLStoredProc.Create Constructor

Creates an instance of a TSQLStoredProc (see page 20318) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSQLStoredProc(TComponent * AOwner);
```

Description

Call Create to instantiate an SQL stored procedure component at runtime. SQL stored procedures placed in forms or data modules at design time are created automatically.

AOwner is the component, typically a form or data module, that is responsible for freeing the TSQLStoredProc (see page 20318) instance. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

Create (see page 6904)

149.1.10.3 TSQLStoredProc Methods

The methods of the TSQLStoredProc class are listed here.

Public Methods

	Name	Description
	ExecProc (see page 20331)	Executes the stored procedure when it does not return a cursor.
	NextRecordSet (see page 20332)	Provides access to a secondary recordset.
	PrepareStatement (see page 20332)	Prepares the stored procedure for execution.

149.1.10.3.1 TSQLStoredProc.ExecProc Method

Executes the stored procedure when it does not return a cursor.

Pascal

```
function ExecProc: Integer; virtual;
```

C++

```
virtual __fastcall int ExecProc();
```

Description

Call ExecProc to execute the stored procedure specified by StoredProcName (see page 20336) if it does not return a cursor.

ExecProc returns the number of rows affected by the stored procedure. This becomes the value of the RowsAffected (see page 20200) property.

To speed performance, an application should ordinarily prepare the stored procedure by setting the Prepared (see page 20198) property to true before calling ExecProc the first time.

Note: Do not use ExecProc for stored procedures that return a cursor. When the stored procedure returns data, use the Open method or set the Active (see page 20187) property to true.

See Also

StoredProcName (see page 20336)

RowsAffected (see page 20200)

Prepared (see page 20198)

Executing the Command

149.1.10.3.2 TSQLStoredProc.NextRecordSet Method

Provides access to a secondary recordset.

Pascal

```
function NextRecordSet: TCustomSQLDataSet;
```

C++

```
__fastcall TCustomSQLDataSet NextRecordSet();
```

Description

Call NextRecordSet to obtain secondary datasets when accessing the results of a stored procedure that returns multiple sets of records. Opening the dataset fetches the first set of records. NextRecordSet provides access to the subsequent sets.

NextRecordSet returns a newly created TCustomSQLDataSet (see page 20150) component that provides access to the next set of records. The first time you call NextRecordSet, it returns a dataset for the second set of records. The next call returns a third dataset, and so on, until there are no more sets of records. When there are no additional datasets, NextRecordSet returns nil (Delphi) or NULL (C++).

Fetching the Data

Fetching the Data using TSQLDataSet

149.1.10.3.3 TSQLStoredProc.PrepareStatement Method

Prepares the stored procedure for execution.

Pascal

```
procedure PrepareStatement; override;
```

C++

```
virtual __fastcall PrepareStatement();
```

Description

PrepareStatement performs most of the necessary tasks for preparing a stored procedure to be executed on the server. It ensures that dbExpress and the database server have allocated any resources they need for executing the stored procedure and binding its parameters.

Do not call PrepareStatement when preparing a stored procedure for execution. Instead, set the Prepared (see page 20198) property to true. When you use the Prepared (see page 20198) property instead, the stored procedure component keeps track of the fact that it has already been prepared and need not repeat the process every time it executes. In addition, when you set the Prepared (see page 20198) property, the component initializes internal properties that keep track of the number of rows affected by the stored procedure.

See Also

Prepared (see page 20198)

149.1.10.4 TSQLStoredProc Properties

The properties of the TSQLStoredProc class are listed here.

Published Properties

	Name	Description
	MaxBlobSize (see page 20333)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.
	PackageName (see page 20334)	Specifies the name of the Oracle package to which the stored procedure belongs.
	ParamCheck (see page 20334)	Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.
	Params (see page 20334)	Represents the parameters for a query or stored procedure.
	SQLConnection (see page 20335)	Specifies the SQL connection component that connects the dataset to a database server.
	StoredProcName (see page 20336)	Specifies the SQL statement to execute on the database server.

149.1.10.4.1 TSQLStoredProc.MaxBlobSize Property

Indicates the maximum number of bytes fetched for any BLOB field in the dataset.

Pascal

```
property MaxBlobSize: Integer;
```

C++

```
__property int MaxBlobSize;
```

Description

MaxBlobSize limits the amount of data that can be fetched from Binary Large Object (BLOB) fields. BLOB fields can hold an indefinite amount of data. However, SQL datasets read that data into a memory buffer. By limiting the amount of data that can be fetched from a BLOB field, you limit the size of the buffer.

If MaxBlobSize is –1, the dataset imposes no maximum BLOB size. If MaxBlobSize is 0, the dataset uses the parameters of the associated SQL connection, if any, to determine the maximum BLOB size.

Note: MaxBlobSize should agree with any parameters on the associated SQL connection component that limit the size of BLOB data.

GetBlobFieldData (see page 20166)

Params (see page 20253)

SQLConnection (see page 20201)

149.1.10.4.2 TSQLStoredProc.PackageName Property

Specifies the name of the Oracle package to which the stored procedure belongs.

Pascal

```
property PackageName: WideString;
```

C++

```
__property BSTR PackageName;
```

Description

Set PackageName to specify the name of the Oracle package that contains the stored procedure which the StoredProcName (see page 20336) property specifies. This property is only used when the stored procedure is defined on an Oracle server.

If the stored procedure does not belong to a package, the value of PackageName is an empty string.

See Also

StoredProcName (see page 20336)

GetPackageNames (see page 20231)

149.1.10.4.3 TSQLStoredProc.ParamCheck Property

Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.

Pascal

```
property ParamCheck: Boolean;
```

C++

```
__property Boolean ParamCheck;
```

Description

By default, the Params property is updated automatically to reflect any parameters that appear in the query specified by the CommandText property (or the SQL property for TSQLQuery) at runtime. That is, whenever the CommandText property changes, the Params property is regenerated to reflect the new set of parameters.

There are times when you want to override this default behavior. For example, when specifying a data definition language (DDL) statement that defines a stored procedure, the resulting SQL command may include parameters. These parameters, however, should not be used as parameters of the SQL dataset, because they are not parameters of the DDL command, but rather, they are parameters of the stored procedure that the command creates.

In order to override the default generation of the Params property in response to changes in CommandText, set ParamCheck to false.

See Also

Params (see page 20197)

CommandText (see page 20189)

SQL (see page 20316)

149.1.10.4.4 TSQLStoredProc.Params Property

Represents the parameters for a query or stored procedure.

Pascal

```
property Params: TParams;
```

C++

```
__property TParams Params;
```

Description

Params is a collection of TParam objects that represent the parameters of a query or stored procedure specified by the SQL dataset. When you specify a query by setting the CommandText property (or the SQL property in TSQLQuery), the SQL dataset automatically parse the query and fills Params with a TParam object for every parameter in the query. Similarly, when you specify a stored procedure by setting the CommandText property (or the StoredProcName property in TSQLStoredProc), the SQL dataset automatically asks the server for a list of stored procedure parameters and fills Params with a TParam object for every parameter of the stored procedure.

At design-time, use the Params property editor to access the individual TParam objects. For queries, use this property editor to check the DataType property of each parameter and to assign values to the parameters. For stored procedures, you may need to do more, changing the type or number of parameters if the server does not supply complete information about stored procedure parameters.

You can also use Params to assign parameter properties in code at runtime.

Note: If you do not assign values to input parameters before opening the dataset, it fetches values from the dataset identified by the DataSource property. However, this only works if the individual TParam objects have the same names as fields in the master dataset.

Configuring TSQL Connection

Connecting to Databases with TDatabase

Using TQuery

Using TSimpleDataSet

149.1.10.4.5 TSQLStoredProc.SQLConnection Property

Specifies the SQL connection component that connects the dataset to a database server.

Pascal

```
property SQLConnection: TSQLConnection;
```

C++

```
__property TSQLConnection SQLConnection;
```

Description

Use SQLConnection to specify an SQL connection object that connects the dataset to a database server.

At design-time, select from the list of available TSQLConnection components in the Object Inspector. At runtime, set SQLConnection to reference an existing TSQLConnection object.

SQLConnection should be the first property you set on the dataset. Only after the SQLConnection property is set can you use the Command Text editor to specify a query for the CommandText property or populate the dataset with data by setting Active to true. Similarly, SQLConnection must be set before the dataset can initialize the Params property when you set CommandText.

Connecting to the Database Server

149.1.10.4.6 TSQLStoredProc.StoredProcName Property

Specifies the SQL statement to execute on the database server.

Pascal

```
property StoredProcName: WideString;
```

C++

```
__property BSTR StoredProcName;
```

Description

Set StoredProcName to specify the name of the stored procedure to call on the server. If StoredProcName does not match the name of an existing stored procedure on the server, an exception is raised.

When you set the StoredProcName property, TSQLStoredProc (see page 20318) queries the database server to ascertain the parameters of the specified stored procedure. It uses this information to initialize the Params (see page 20334) property. You can subsequently use the Params (see page 20334) property to adjust the properties of any parameters and supply values for the parameters. Some servers do not supply information about stored procedure parameters. In those cases, you must explicitly add the parameters.

149.1.11 TSQLTable Class

TSQLTable represents a database table that is accessed using dbExpress.

Class Hierarchy

Pascal

```
TSQLTable = class(TCustomSQLDataSet);
```

C++

```
class TSQLTable : public TCustomSQLDataSet;
```

File

SqlExpr

Description

Use TSQLTable to represent a table on a database server that is accessed via TSQLConnection (see page 20217). TSQLTable generates a query to fetch all of the rows and columns in a table you specify. You can add a TSQLTable component to a form or data module at design time, or create one dynamically at runtime.

TSQLTable is a unidirectional dataset. Unlike other datasets, unidirectional datasets do not buffer multiple records in memory. Because of this, you can only navigate using the First and Next methods. There is no built-in editing support: you can only edit the data in an SQL table by explicitly creating an SQL UPDATE command or by connecting the table to a client dataset using a provider. Features that require buffering multiple records, such as filters or lookup fields, are not available.

Before you can use a TSQLTable component, it must be connected to the database server. Therefore, the first step to take when working with TSQLTable is to set the SQLConnection (see page 20358) property. Once the dataset is connected to a server, use the TableName (see page 20359) property to specify the table this component represents.

Types of Datasets

Types of Unidirectional Datasets

149.1.11.1 TSQLTable Members

The following tables list the members exposed by TSQLTable.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActivateBuffers (see page 6909)	This is ActivateBuffers, a member of class TDataSet.
	AddFieldDesc (see page 20163)	This is AddFieldDesc, a member of class TCustomSQLDataSet.
	AddIndexDefs (see page 20163)	This is AddIndexDefs, a member of class TCustomSQLDataSet.
V	AllocRecordBuffer (see page 6909)	This is AllocRecordBuffer, a member of class TDataSet.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	BindFields (see page 6915)	This is BindFields, a member of class TDataSet.
V	BlockReadNext (see page 6915)	This is BlockReadNext, a member of class TDataSet.
	BookmarkAvailable (see page 6916)	This is BookmarkAvailable, a member of class TDataSet.
V	CalculateFields (see page 6916)	This is CalculateFields, a member of class TDataSet.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CheckActive (see page 6917)	This is CheckActive, a member of class TDataSet.
	CheckBiDirectional (see page 6918)	This is CheckBiDirectional, a member of class TDataSet.
V	CheckFieldCompatibility (see page 6919)	This is CheckFieldCompatibility, a member of class TDataSet.
V	CheckInactive (see page 6919)	This is CheckInactive, a member of class TDataSet.
	CheckPrepareError (see page 20164)	This is CheckPrepareError, a member of class TCustomSQLDataSet.
V	ClearBuffers (see page 6919)	This is ClearBuffers, a member of class TDataSet.
V	ClearCalcFields (see page 6919)	This is ClearCalcFields, a member of class TDataSet.
	ClearIndexDefs (see page 20164)	This is ClearIndexDefs, a member of class TCustomSQLDataSet.
V	CloseBlob (see page 6921)	This is CloseBlob, a member of class TDataSet.
V	CloseCursor (see page 6921)	This is CloseCursor, a member of class TDataSet.
V	CloseCursor (see page 20164)	This is CloseCursor, a member of class TCustomSQLDataSet.
	CloseStatement (see page 20164)	This is CloseStatement, a member of class TCustomSQLDataSet.
V	CreateFields (see page 6923)	This is CreateFields, a member of class TDataSet.
V	CreateNestedDataSet (see page 6923)	This is CreateNestedDataSet, a member of class TDataSet.
V	DataConvert (see page 6924)	This is DataConvert, a member of class TDataSet.
V	DataEvent (see page 6924)	This is DataEvent, a member of class TDataSet.
V	DefChanged (see page 6924)	This is DefChanged, a member of class TDataSet.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 20165)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DestroyFields (see page 6925)	This is DestroyFields, a member of class TDataSet.
V	DoAfterCancel (see page 6927)	This is DoAfterCancel, a member of class TDataSet.
V	DoAfterClose (see page 6927)	This is DoAfterClose, a member of class TDataSet.
V	DoAfterDelete (see page 6928)	This is DoAfterDelete, a member of class TDataSet.
V	DoAfterEdit (see page 6928)	This is DoAfterEdit, a member of class TDataSet.
V	DoAfterInsert (see page 6928)	This is DoAfterInsert, a member of class TDataSet.
V	DoAfterOpen (see page 6928)	This is DoAfterOpen, a member of class TDataSet.
V	DoAfterPost (see page 6929)	This is DoAfterPost, a member of class TDataSet.

	DoAfterRefresh (see page 6929)	This is DoAfterRefresh, a member of class TDataSet.
	DoAfterScroll (see page 6929)	This is DoAfterScroll, a member of class TDataSet.
	DoBeforeCancel (see page 6929)	This is DoBeforeCancel, a member of class TDataSet.
	DoBeforeClose (see page 6929)	This is DoBeforeClose, a member of class TDataSet.
	DoBeforeDelete (see page 6930)	This is DoBeforeDelete, a member of class TDataSet.
	DoBeforeEdit (see page 6930)	This is DoBeforeEdit, a member of class TDataSet.
	DoBeforeInsert (see page 6930)	This is DoBeforeInsert, a member of class TDataSet.
	DoBeforeOpen (see page 6930)	This is DoBeforeOpen, a member of class TDataSet.
	DoBeforePost (see page 6931)	This is DoBeforePost, a member of class TDataSet.
	DoBeforeRefresh (see page 6931)	This is DoBeforeRefresh, a member of class TDataSet.
	DoBeforeScroll (see page 6931)	This is DoBeforeScroll, a member of class TDataSet.
	DoOnCalcFields (see page 6931)	This is DoOnCalcFields, a member of class TDataSet.
	DoOnNewRecord (see page 6931)	This is DoOnNewRecord, a member of class TDataSet.
	ExecSQL (see page 20165)	This is ExecSQL, a member of class TCustomSQLDataSet.
	ExecuteStatement (see page 20166)	This is ExecuteStatement, a member of class TCustomSQLDataSet.
	FieldByNumber (see page 6938)	This is FieldByNumber, a member of class TDataSet.
	FindRecord (see page 6942)	This is FindRecord, a member of class TDataSet.
	FreeBuffers (see page 20166)	This is FreeBuffers, a member of class TCustomSQLDataSet.
	FreeCommand (see page 20166)	This is FreeCommand, a member of class TCustomSQLDataSet.
	FreeFieldBuffers (see page 6946)	This is FreeFieldBuffers, a member of class TDataSet.
	FreeReader (see page 20166)	This is FreeReader, a member of class TCustomSQLDataSet.
	FreeRecordBuffer (see page 6947)	This is FreeRecordBuffer, a member of class TDataSet.
	GetAggRecordCount (see page 6947)	This is GetAggRecordCount, a member of class TDataSet.
	GetAggregateValue (see page 6947)	This is GetAggregateValue, a member of class TDataSet.
	GetBookmarkData (see page 6949)	This is GetBookmarkData, a member of class TDataSet.
	GetBookmarkFlag (see page 6949)	This is GetBookmarkFlag, a member of class TDataSet.
	GetBookmarkStr (see page 6949)	This is GetBookmarkStr, a member of class TDataSet.
	GetCalcFields (see page 6950)	This is GetCalcFields, a member of class TDataSet.
	GetCanModify (see page 6950)	This is GetCanModify, a member of class TDataSet.
	GetCanModify (see page 20167)	This is GetCanModify, a member of class TCustomSQLDataSet.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6950)	This is GetChildren, a member of class TDataSet.
	GetDataSource (see page 6951)	This is GetDataSource, a member of class TDataSet.
	GetDataSource (see page 20167)	This is GetDataSource, a member of class TCustomSQLDataSet.
	GetFieldClass (see page 6952)	This is GetFieldClass, a member of class TDataSet.
	GetFieldFullName (see page 6953)	This is GetFieldFullName, a member of class TDataSet.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIndexDefs (see page 6954)	This is GetIndexDefs, a member of class TDataSet.
	GetIsIndexField (see page 6954)	This is GetIsIndexField, a member of class TDataSet.
	GetNextRecord (see page 6955)	This is GetNextRecord, a member of class TDataSet.
	GetNextRecords (see page 6955)	This is GetNextRecords, a member of class TDataSet.
	GetObjectTypeNames (see page 20169)	This is GetObjectTypeNames, a member of class TCustomSQLDataSet.
	GetOutputParams (see page 20169)	This is GetOutputParams, a member of class TCustomSQLDataSet.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPriorRecord (see page 6955)	This is GetPriorRecord, a member of class TDataSet.
	GetPriorRecords (see page 6955)	This is GetPriorRecords, a member of class TDataSet.
	GetRecNo (see page 6956)	This is GetRecNo, a member of class TDataSet.
	GetRecord (see page 6956)	This is GetRecord, a member of class TDataSet.
	GetRecord (see page 20170)	This is GetRecord, a member of class TCustomSQLDataSet.
	GetRecordCount (see page 6956)	This is GetRecordCount, a member of class TDataSet.

V	GetRecordCount (see page 20170)	This is GetRecordCount, a member of class TCustomSQLDataSet.
V	GetRecordSize (see page 6956)	This is GetRecordSize, a member of class TDataSet.
	GetSortFieldNames (see page 20170)	This is GetSortFieldNames, a member of class TCustomSQLDataSet.
V	GetStateFieldValue (see page 6956)	This is GetStateFieldValue, a member of class TDataSet.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	InitFieldDefs (see page 6958)	This is InitFieldDefs, a member of class TDataSet.
	InitFieldDefsFromFields (see page 6959)	This is InitFieldDefsFromFields, a member of class TDataSet.
V	InitRecord (see page 6959)	This is InitRecord, a member of class TDataSet.
V	InitRecord (see page 20170)	This is InitRecord, a member of class TCustomSQLDataSet.
V	InternalAddRecord (see page 6963)	This is InternalAddRecord, a member of class TDataSet.
V	InternalCancel (see page 6963)	This is InternalCancel, a member of class TDataSet.
A	InternalClose (see page 6963)	This is InternalClose, a member of class TDataSet.
V	InternalClose (see page 20171)	This is InternalClose, a member of class TCustomSQLDataSet.
V	InternalDelete (see page 6964)	This is InternalDelete, a member of class TDataSet.
V	InternalEdit (see page 6964)	This is InternalEdit, a member of class TDataSet.
V	InternalFirst (see page 6964)	This is InternalFirst, a member of class TDataSet.
V	InternalGotoBookmark (see page 6964)	This is InternalGotoBookmark, a member of class TDataSet.
A	InternalHandleException (see page 6964)	This is InternalHandleException, a member of class TDataSet.
V	InternalHandleException (see page 20171)	This is InternalHandleException, a member of class TCustomSQLDataSet.
A	InternalInitFieldDefs (see page 6965)	This is InternalInitFieldDefs, a member of class TDataSet.
V	InternalInitFieldDefs (see page 20171)	This is InternalInitFieldDefs, a member of class TCustomSQLDataSet.
V	InternalInitRecord (see page 6965)	This is InternalInitRecord, a member of class TDataSet.
V	InternalInsert (see page 6965)	This is InternalInsert, a member of class TDataSet.
V	InternalLast (see page 6965)	This is InternalLast, a member of class TDataSet.
A	InternalOpen (see page 6966)	This is InternalOpen, a member of class TDataSet.
V	InternalOpen (see page 20171)	This is InternalOpen, a member of class TCustomSQLDataSet.
V	InternalPost (see page 6966)	This is InternalPost, a member of class TDataSet.
V	InternalRefresh (see page 6966)	This is InternalRefresh, a member of class TDataSet.
V	InternalRefresh (see page 20171)	This is InternalRefresh, a member of class TCustomSQLDataSet.
V	InternalSetToRecord (see page 6966)	This is InternalSetToRecord, a member of class TDataSet.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
A	IsCursorOpen (see page 6966)	This is IsCursorOpen, a member of class TDataSet.
V	IsCursorOpen (see page 20172)	This is IsCursorOpen, a member of class TCustomSQLDataSet.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 6969)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 20172)	Initializes the component after the form file has been read into memory.
	LocateRecord (see page 20173)	This is LocateRecord, a member of class TCustomSQLDataSet.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	OpenCursor (see page 20351)	This is OpenCursor, a member of class TSQLTable.
	OpenCursorComplete (see page 6977)	This is OpenCursorComplete, a member of class TDataSet.
	OpenParentDataSet (see page 6977)	This is OpenParentDataSet, a member of class TDataSet.
V	OpenSchema (see page 20174)	This is OpenSchema, a member of class TCustomSQLDataSet.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PropertyChanged (see page 20175)	This is PropertyChanged, a member of class TCustomSQLDataSet.
V	PSEndTransaction (see page 6979)	Ends a transaction that was started by a call to PSStartTransaction.
V	PSEndTransaction (see page 20175)	Ends a transaction that was started by a call to PSStartTransaction.
V	PSExecute (see page 6980)	Executes the SQL command associated with the dataset.
V	PSExecute (see page 20176)	Executes the SQL command associated with the dataset.
V	PSExecuteStatement (see page 20176)	This is PSExecuteStatement, a member of class TCustomSQLDataSet.
V	PSExecuteStatement (see page 6980)	This is the overview for the PSExecuteStatement method overload.
V	PSExecuteStatement (see page 7535)	This is the overview for the PSExecuteStatement method overload.
V	PSGetAttributes (see page 6981)	Returns information that is stored in data packets as Name/Value pairs.

	PSGetAttributes (see page 20176)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 6982)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 7537)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandText (see page 20177)	Gets the SQL command to be executed by PSExecute.
	PSGetCommandTextW (see page 6982)	This is PSGetCommandTextW, a member of class TDataSet.
	PSGetCommandTextW (see page 7537)	This is PSGetCommandTextW, a member of class TWideDataSet.
	PSGetCommandType (see page 6982)	Gets the command type to be executed by PSExecute.
	PSGetCommandType (see page 20177)	Gets the command type to be executed by PSExecute.
	PSGetDefaultOrder (see page 6983)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 20178)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetIndexDefs (see page 6983)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 20178)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 6984)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7538)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFieldsW (see page 6984)	This is PSGetKeyFieldsW, a member of class TDataSet.
	PSGetKeyFieldsW (see page 7538)	This is PSGetKeyFieldsW, a member of class TWideDataSet.
	PSGetKeyFieldsW (see page 20179)	This is PSGetKeyFieldsW, a member of class TCustomSQLDataSet.
	PSGetParams (see page 6984)	Returns the current parameter values of the dataset.
	PSGetParams (see page 20179)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 6985)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7538)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteCharW (see page 6985)	This is PSGetQuoteCharW, a member of class TDataSet.
	PSGetQuoteCharW (see page 7539)	This is PSGetQuoteCharW, a member of class TWideDataSet.
	PSGetQuoteCharW (see page 20179)	This is PSGetQuoteCharW, a member of class TCustomSQLDataSet.
	PSGetTableName (see page 6985)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7539)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableNameW (see page 6986)	This is PSGetTableNameW, a member of class TDataSet.
	PSGetTableNameW (see page 7539)	This is PSGetTableNameW, a member of class TWideDataSet.
	PSGetTableNameW (see page 20179)	This is PSGetTableNameW, a member of class TCustomSQLDataSet.
	PSGetUpdateException (see page 6986)	Generates an EUpdateError object based on another exception object.
	PSGetUpdateException (see page 20180)	Generates an EUpdateError object based on another exception object.
	PSInTransaction (see page 6987)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 20180)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 6987)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 20180)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 6987)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 20181)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 6988)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 20181)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 20182)	Assigns a specified SQL command to be executed by PSExecute.
	PSSetCommandText (see page 6988)	This is the overview for the PSSetCommandText method overload.
	PSSetCommandText (see page 7540)	This is the overview for the PSSetCommandText method overload.
	PSSetParams (see page 6989)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 20182)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 6989)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSStartTransaction (see page 20182)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction.
	PSUpdateRecord (see page 6990)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 20183)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.

	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RefreshInternalCalcFields (see page 6993)	This is RefreshInternalCalcFields, a member of class TDataSet.
	ResetAggField (see page 6993)	This is ResetAggField, a member of class TDataSet.
	RestoreState (see page 6993)	This is RestoreState, a member of class TDataSet.
	SetActive (see page 6994)	This is SetActive, a member of class TDataSet.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetBlockReadSize (see page 6994)	This is SetBlockReadSize, a member of class TDataSet.
	SetBookmarkData (see page 6994)	This is SetBookmarkData, a member of class TDataSet.
	SetBookmarkFlag (see page 6995)	This is SetBookmarkFlag, a member of class TDataSet.
	SetBookmarkStr (see page 6995)	This is SetBookmarkStr, a member of class TDataSet.
	SetBufListSize (see page 6995)	This is SetBufListSize, a member of class TDataSet.
	SetBufListSize (see page 20184)	This is SetBufListSize, a member of class TCustomSQLDataSet.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6995)	This is SetChildOrder, a member of class TDataSet.
	SetCommandText (see page 20184)	This is SetCommandText, a member of class TCustomSQLDataSet.
	SetCurrentRecord (see page 6996)	This is SetCurrentRecord, a member of class TDataSet.
	SetDataSetField (see page 6996)	This is SetDataSetField, a member of class TDataSet.
	SetDefaultFields (see page 6996)	This is SetDefaultFields, a member of class TDataSet.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFCommandText (see page 20184)	This is SetFCommandText, a member of class TCustomSQLDataSet.
	SetFieldData (see page 20184)	This is SetFieldData, a member of class TCustomSQLDataSet.
	SetFieldData (see page 6996)	This is the overview for the SetFieldData method overload.
	SetFiltered (see page 6997)	This is SetFiltered, a member of class TDataSet.
	SetFilterOptions (see page 6998)	This is SetFilterOptions, a member of class TDataSet.
	SetFilterText (see page 6998)	This is SetFilterText, a member of class TDataSet.
	SetFound (see page 6998)	This is SetFound, a member of class TDataSet.
	SetIndexField (see page 20352)	This is SetIndexField, a member of class TSQLTable.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetMaxBlobSize (see page 20184)	This is SetMaxBlobSize, a member of class TCustomSQLDataSet.
	SetModified (see page 6998)	This is SetModified, a member of class TDataSet.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 6999)	Sets the value of the Name property.
	SetObjectView (see page 6999)	This is SetObjectView, a member of class TDataSet.
	SetOnFilterRecord (see page 6999)	This is SetOnFilterRecord, a member of class TDataSet.
	SetParamsFromCursor (see page 20185)	This is SetParamsFromCursor, a member of class TCustomSQLDataSet.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetRecNo (see page 6999)	This is SetRecNo, a member of class TDataSet.
	SetSortFieldNames (see page 20186)	This is SetSortFieldNames, a member of class TCustomSQLDataSet.
	SetState (see page 7000)	This is SetState, a member of class TDataSet.
	SetStateFieldValue (see page 7000)	This is SetStateFieldValue, a member of class TDataSet.
	SetTempState (see page 7000)	This is SetTempState, a member of class TDataSet.
	SetUniDirectional (see page 7000)	This is SetUniDirectional, a member of class TDataSet.
	TempBuffer (see page 7001)	This is TempBuffer, a member of class TDataSet.
	UpdateBufferCount (see page 7001)	This is UpdateBufferCount, a member of class TDataSet.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateIndexDefs (see page 7002)	This is UpdateIndexDefs, a member of class TDataSet.
	UpdateIndexDefs (see page 20186)	This is UpdateIndexDefs, a member of class TCustomSQLDataSet.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.

	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveRecord (see page 7005)	Indicates the index of the active record in the internal cache of records.
	BlobBuffer (see page 20189)	Reserves a buffer for storing BLOB values.
R	BlobFieldCount (see page 7007)	Indicates the number of columns in the dataset that represent Binary large object (BLOB) fields.
	BookmarkSize (see page 7010)	Indicates the number of bytes used to represent a bookmark.
R	BufferCount (see page 7010)	Indicates the number of records in the internal cache.
R	Buffers (see page 7011)	Provides indexed access to the record buffers in the internal cache.
R	CalcBuffer (see page 7011)	Points to the record buffer used during an OnCalcFields (see page 7053) event.
R	CalcFieldsSize (see page 7012)	Indicates the number of bytes in a record buffer dedicated to storing calculated fields and lookup fields.
	CommandType (see page 20190)	Indicates the meaning of the CommandText (see page 20189) property.
	Constraints (see page 7013)	Specifies record-level constraints that must be met when editing the data.
	CurrentBlobSize (see page 20191)	Indicates the size of the most recently read BLOB field.
R	CurrentRecord (see page 7013)	Indicates the index of the current record in the internal cache of record buffers.
R	DataLink (see page 20191)	Identifies the datalink that manages communication between the SQL dataset and another, master dataset.
	DataSource (see page 20192)	Links the SQL dataset to another (master) dataset.
	FieldNoOfs (see page 7022)	Specifies the offset needed to convert indexes in the Fields (see page 7023) property to field numbers.
R	InternalCalcFields (see page 7028)	Indicates whether the dataset includes internally calculated fields.
R	InternalConnection (see page 20194)	Indicates the component that connects the dataset to its database server, taking into account whether the connection was cloned.
	LastError (see page 20194)	Saves the error message for the last error returned by dbExpress.
R	MasterLink (see page 20357)	This is MasterLink, a member of class TSQLTable.
	NativeCommand (see page 20195)	Represents the SQL command that is sent to the server.
	NestedDataSetClass (see page 7030)	Indicates the class type to use when creating nested datasets.
R	NestedDataSets (see page 7030)	Lists all nested datasets.
	ParamCheck (see page 20196)	Specifies whether the parameter list for an SQL dataset is regenerated when the SQL command changes.
R	ParamCount (see page 20197)	Indicates the number of parameters listed by the Params (see page 20197) property.
	Params (see page 20197)	Represents the parameters for a query or stored procedure.
	ProcParams (see page 20199)	ProcParams lists the parameter descriptors obtained from the server for any stored procedure parameters.
	Reserved (see page 7035)	For internal use only.
R	RowsAffected (see page 20200)	Indicates the number of rows operated on by the latest query execution.
	SchemaInfo (see page 20200)	Identifies the metadata with which to populate the dataset.
	SortFieldNames (see page 20201)	Indicates the sort order when CommandType (see page 20190) is ctTable.

Public Events

	Name	Description
	AfterCancel (see page 7038)	Occurs after an application completes a request to cancel modifications to the active record.
	AfterClose (see page 7040)	Occurs after an application closes a dataset.
	AfterDelete (see page 7041)	Occurs after an application deletes a record.
	AfterEdit (see page 7044)	Occurs after an application starts editing a record.
	AfterInsert (see page 7044)	Occurs after an application inserts a new record.
	AfterOpen (see page 7045)	Occurs after an application completes opening a dataset and before any data access occurs.

	AfterPost (see page 7046)	Occurs after an application writes the active record to the database or change log and returns to browse state.
	AfterRefresh (see page 7047)	Occurs after an application refreshes the data in the dataset.
	AfterScroll (see page 7047)	Occurs after an application scrolls from one record to another.
	BeforeCancel (see page 7048)	Occurs before an application executes a request to cancel changes to the active record.
	BeforeClose (see page 7048)	Occurs immediately before the dataset closes.
	BeforeDelete (see page 7049)	Occurs before an application attempts to delete the active record.
	BeforeEdit (see page 7049)	Occurs before an application enters edit mode for the active record.
	BeforeInsert (see page 7050)	Occurs before an application enters insert mode.
	BeforeOpen (see page 7051)	Occurs before an application executes a request to open a dataset.
	BeforePost (see page 7052)	Occurs before an application posts changes for the active record to the database or change log.
	BeforeRefresh (see page 7052)	Occurs immediately before an application refreshes the data in the dataset.
	BeforeScroll (see page 7053)	Occurs before an application scrolls from one record to another.
	OnCalcFields (see page 7053)	Occurs when an application recalculates calculated fields.
	OnDeleteError (see page 7054)	Occurs when an application attempts to delete a record and an exception is raised.
	OnEditError (see page 7054)	Occurs when an application attempts to modify or insert a record and an exception is raised.
	OnFilterRecord (see page 7055)	Occurs each time a different record in the dataset becomes the active record and filtering is enabled.
	OnNewRecord (see page 7056)	Occurs when an application inserts or appends a new dataset record.
	OnPostError (see page 7056)	Occurs when an application attempts to modify or insert a record and an exception is raised.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	ActiveBuffer (see page 6909)	Returns a pointer to the buffer for the active record.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 6910)	Adds a new, empty record to the end of the dataset.
	AppendRecord (see page 6911)	Adds a new, populated record to the end of the dataset and posts it.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BookmarkValid (see page 6916)	Indicates the validity of a specified bookmark.
V	Cancel (see page 6916)	Cancels modifications to the active record if those changes are not yet posted.
	CheckBrowseMode (see page 6918)	Automatically posts or cancels data changes when the active record changes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearFields (see page 6919)	Clears the contents of all fields for the active record.
	Close (see page 6920)	Closes a dataset.
V	CompareBookmarks (see page 6921)	Implements a virtual function to compare two bookmarks.
	ControlsDisabled (see page 6921)	Indicates whether data-aware controls update their display to reflect changes to the dataset.
	CopyFields (see page 6922)	This is CopyFields, a member of class TDataSet.
V	Create (see page 20349)	Creates an instance of a TSQLTable (see page 20337) component.
V	CreateBlobStream (see page 6922)	Provides the interface for a method that creates a blob stream for a Binary large object (BLOB) field in the dataset.
V	CreateBlobStream (see page 20164)	Creates a blob stream for a Binary large object (BLOB) field in the dataset.

	CursorPosChanged (see page 6923)	Marks the internal cursor position as invalid.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 6924)	Deletes the active record and positions the dataset on the next record.
	DeleteRecords (see page 20350)	Empties the underlying database table.
	Destroy (see page 20350)	Destroys the TSQLTable (see page 20337) instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableControls (see page 6925)	Disables data display in data-aware controls associated with the dataset.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Edit (see page 6932)	Enables editing of data in the dataset.
	EnableControls (see page 6934)	Re-enables data display in data-aware controls associated with the dataset.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FieldByName (see page 6936)	Finds a field based on its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 6938)	Searches for a specified field in the dataset.
	FindFirst (see page 6939)	Implements a virtual method for positioning the dataset on the first record, respecting any filters.
	FindLast (see page 6940)	Implements a virtual method for positioning the dataset on the last record, respecting any filters.
	FindNext (see page 6940)	Implements a virtual method for positioning the dataset on the next record, respecting any filters.
	FindPrior (see page 6941)	Implements a virtual method for positioning the dataset on the previous record, respecting any filters.
	First (see page 6942)	Moves to the first record in the dataset.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeBookmark (see page 6945)	Frees the resources allocated for a specified bookmark.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetBlobFieldData (see page 6947)	Reads BLOB data into a buffer.
	GetBlobFieldData (see page 20166)	Retrieves the current value of a BLOB field into a buffer.
	GetBookmark (see page 6948)	Allocates a bookmark for the active record in the dataset.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentRecord (see page 6950)	Implements a virtual function to retrieve the current record in a buffer.
	GetDetailDataSets (see page 6951)	Fills a list with a dataset for every detail dataset that is not the value of a nested dataset field.
	GetDetailLinkFields (see page 6951)	Introduces a method to list the field components that link this dataset as a detail of a master dataset.
	GetDetailLinkFields (see page 20167)	Lists the field components that link this dataset as a detail of a master dataset.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldData (see page 6952)	This is the overview for the GetFieldData method overload.
	GetFieldData (see page 20168)	This is the overview for the GetFieldData method overload.
	GetFieldList (see page 6953)	Retrieves a specified set of field objects into a list.
	GetFieldNames (see page 6953)	This is the overview for the GetFieldNames method overload.
	GetIndexNames (see page 20351)	Retrieves a list of available indexes defined for the table.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetKeyFieldNames (see page 20169)	Fills a list with the names of all fields in all indexes defined for the dataset.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.

	GetQuoteChar (see page 20169)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	GotoBookmark (see page 6957)	Implements a virtual method to position the dataset on the record to which a specified bookmark points.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 6959)	Inserts a new, empty record in the dataset.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertRecord (see page 6961)	Inserts a new, populated record to the dataset and posts it.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmpty (see page 6967)	Indicates whether the dataset contains no records.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsLinkedTo (see page 6967)	Indicates whether a dataset is linked to a specified data source.
	IsSequenced (see page 6967)	Indicates whether the underlying database table uses record numbers to indicate the order of records.
	IsSequenced (see page 20172)	Indicates whether the dataset can use record numbers to indicate the order of records.
	Last (see page 6968)	Moves to the last record in the dataset.
	Locate (see page 6970)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
	Locate (see page 20173)	Implements a virtual method for searching a dataset for a specified record and making it the active record.
	Lookup (see page 6970)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	Lookup (see page 20174)	Implements a virtual method to retrieve field values from a record that matches specified search values.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MoveBy (see page 6971)	Moves to another record relative to the active record in the dataset.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Next (see page 6973)	Moves to the next record in the dataset.
	Open (see page 6976)	Opens the dataset.
	ParamByName (see page 20175)	This is ParamByName, a member of class TCustomSQLDataSet.
	Post (see page 6977)	Implements a virtual method to write a modified record to the database or change log.
	PrepareStatement (see page 20351)	Generates the query that TSQLTable (see page 20337) uses to fetch data from the database server.
	Prior (see page 6979)	Moves to the previous record in the dataset.
	PSEndTransaction (see page 7578)	Ends a transaction that was started by a call to PSStartTransaction (see page 7586).
	PSEndTransaction (see page 7589)	Ends a transaction that was started by a call to PSStartTransaction (see page 7597).
	PSExecute (see page 7578)	Executes the SQL command associated with the dataset.
	PSExecute (see page 7590)	Executes the SQL command associated with the dataset.
	PSExecuteStatement (see page 7579)	Executes a specified SQL command.
	PSExecuteStatement (see page 7590)	Executes a specified SQL command.
	PSGetAttributes (see page 7579)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetAttributes (see page 7591)	Returns information that is stored in data packets as Name/Value pairs.
	PSGetCommandText (see page 7579)	Gets the SQL command to be executed by PSExecute (see page 7578).
	PSGetCommandText (see page 7591)	Gets the SQL command to be executed by PSExecute (see page 7590).
	PSGetCommandType (see page 7580)	Gets the command type to be executed by PSExecute (see page 7578).
	PSGetCommandType (see page 7591)	Gets the command type to be executed by PSExecute (see page 7590).
	PSGetDefaultOrder (see page 7580)	Returns the definition of an index that imposes the default order on the data included in data packets.
	PSGetDefaultOrder (see page 7592)	Returns the definition of an index that imposes the default order on the data included in data packets.

	PSGetIndexDefs (see page 7581)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetIndexDefs (see page 7592)	Returns the definitions of all specified indexes defined for the dataset.
	PSGetKeyFields (see page 7581)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetKeyFields (see page 7593)	Returns the names of all fields required to uniquely identify records in the data packet.
	PSGetParams (see page 7582)	Returns the current parameter values of the dataset.
	PSGetParams (see page 7593)	Returns the current parameter values of the dataset.
	PSGetQuoteChar (see page 7582)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetQuoteChar (see page 7594)	Returns the character or characters to use in generated SQL statements to enclose quoted strings.
	PSGetTableName (see page 7583)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetTableName (see page 7594)	Returns the name of the dataset table that appears in generated SQL statements.
	PSGetUpdateException (see page 7583)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSGetUpdateException (see page 7594)	Generates an EUpdateError (see page 6732) object based on another exception object.
	PSInTransaction (see page 7583)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSInTransaction (see page 7595)	Indicates whether actions against the dataset occur in the context of a transaction.
	PSIsSQLBased (see page 7584)	Indicates whether the dataset includes native SQL support.
	PSIsSQLBased (see page 7595)	Indicates whether the dataset includes native SQL support.
	PSIsSQLSupported (see page 7584)	Indicates whether the dataset can execute SQL statements.
	PSIsSQLSupported (see page 7596)	Indicates whether the dataset can execute SQL statements.
	PSReset (see page 7585)	Resets the dataset so that it is positioned on the first record.
	PSReset (see page 7596)	Resets the dataset so that it is positioned on the first record.
	PSSetCommandText (see page 7585)	Assigns a specified SQL command to be executed by PSExecute (see page 7578).
	PSSetCommandText (see page 7596)	Assigns a specified SQL command to be executed by PSExecute (see page 7590).
	PSSetParams (see page 7586)	Assigns the specified parameter values to the dataset.
	PSSetParams (see page 7597)	Assigns the specified parameter values to the dataset.
	PSStartTransaction (see page 7586)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7578).
	PSStartTransaction (see page 7597)	Starts a transaction that encapsulates all activity until a call to PSEndTransaction (see page 7589).
	PSUpdateRecord (see page 7586)	Applies a single update to the underlying database table or tables.
	PSUpdateRecord (see page 7598)	Applies a single update to the underlying database table or tables.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 6991)	Re-fetches data from the database to update a dataset's view of data.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Resync (see page 6994)	Re-fetches the active record and the records that precede and follow it.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetFields (see page 6997)	Sets the values for all fields in a record
	SetSchemaInfo (see page 20185)	Indicates whether the dataset represents metadata from the server, and if so, what kind.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
V	Translate (see page 7001)	Implements a virtual procedure to copy a data string from a source to a destination, optionally performing character translation during the copy.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateCursorPos (see page 7001)	Positions the cursor on the active record.

	UpdateRecord (see page 7002)	Ensures that data-aware controls and detail datasets reflect record updates.
V	UpdateStatus (see page 7002)	Reports the update status for the active record.

Public Properties

	Name	Description
R	AggFields (see page 7006)	Contains any aggregate fields.
	AutoCalcFields (see page 7006)	Determines when the OnCalcFields (see page 7053) event is triggered and when lookup field values are calculated.
	BlockReadSize (see page 7007)	Determines how many record buffers are read in each block.
R	Bof (see page 7008)	Indicates whether the first record in the dataset is active.
	Bookmark (see page 7009)	Specifies the current bookmark in the dataset.
R	CanModify (see page 7012)	Indicates whether the dataset permits write access to data.
	CommandText (see page 20189)	Specifies the command the dataset executes.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DataSetField (see page 7013)	Indicates the persistent TDataSetField (see page 7060) object that owns a nested dataset.
R	DataSource (see page 7014)	Represents the data source of another dataset that supplies values to the dataset.
R	DefaultFields (see page 7014)	Indicates whether a dataset's underlying field components are generated dynamically when the dataset is opened.
R	Designer (see page 7015)	Returns a pointer to the Dataset designer for the dataset.
	DesignerData (see page 20192)	Stores custom data.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Eof (see page 7015)	Indicates whether a dataset is positioned at the last record.
R	FieldCount (see page 7017)	Indicates the number of field components associated with the dataset.
R	FieldDefList (see page 7019)	Points to the list of field definitions for the dataset.
	FieldDefs (see page 7019)	Points to the list of field definitions for the dataset.
R	FieldList (see page 7022)	Lists the field components of a dataset.
R	Fields (see page 7023)	Lists all non-aggregate field components of the dataset.
	FieldValues (see page 7025)	Provides access to the values for all fields in the active record for the dataset
	Filter (see page 7026)	Specifies the text of the current filter for a dataset.
	Filtered (see page 7027)	Specifies whether or not filtering is active for a dataset.
	FilterOptions (see page 7027)	Specifies whether or not filtering is case insensitive, and whether or not partial comparisons are permitted when filtering records.
R	Found (see page 7028)	Indicates whether or not moving to a different record is successful.
	IndexDefs (see page 20193)	Contains the definitions of all indexes defined on the server for the dataset.
R	IndexFieldCount (see page 20354)	Indicates the number of fields that make up the current index.
	IndexFields (see page 20355)	Specifies the fields associated with the current index.
R	IsUniDirectional (see page 7029)	Indicates whether the dataset is unidirectional.
R	Modified (see page 7029)	Indicates whether the active record is modified.
	ObjectView (see page 7031)	Specifies whether fields are stored hierarchically or flattened out in the Fields (see page 7023) property.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Prepared (see page 20198)	Specifies whether the command is prepared before execution.
	RecNo (see page 7031)	Indicates the active record in the dataset.
R	RecordCount (see page 7032)	Indicates the total number of records associated with the dataset.
R	RecordCount (see page 20199)	Indicates the total number of records associated with the dataset.
R	RecordSize (see page 7035)	Indicates the size of a record in the dataset.

	SparseArrays (see page 7036)	Determines whether a unique TField (see page 7115) object is created for each element of an array field.
R	State (see page 7036)	Indicates the current operating mode of the dataset.
	TransactionLevel (see page 20202)	Indicates the transaction to which this dataset belongs.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterClose (see page 20203)	Occurs after a data source connection is closed.
	AfterOpen (see page 20203)	Occurs after the connection to a data source is opened.
	AfterRefresh (see page 20203)	Occurs after a DataSet has been changed and is refreshed.
	AfterScroll (see page 20204)	Occurs after a result set is scrolled.
	BeforeClose (see page 20204)	Occurs just before a data connection is closed.
	BeforeOpen (see page 20204)	Occurs just before a data connection is opened, but after an open operation has been initiated.
	BeforeRefresh (see page 20204)	Occurs before a DataSet refresh occurs.
	BeforeScroll (see page 20204)	Occurs when a DataSet scroll operation has been initiated but before the scrolling actually takes place.
	OnCalcFields (see page 20204)	Occurs when calculated or derived fields are updated.
	ParseDeleteSql (see page 20205)	Occurs when an application attempts to parse the DELETE statement stored in the CommandText (see page 20189) property.
	ParseInsertSql (see page 20205)	Occurs when an application attempts to parse the INSERT statement stored in the CommandText (see page 20189) property.
	ParseSelectSql (see page 20205)	Occurs when an application attempts to parse the SELECT statement specified in the CommandText (see page 20189) property.
	ParseUpdateSql (see page 20205)	Occurs when an application attempts to parse a SQL UPDATE statement stored in the CommandText (see page 20189) property.

Published Properties

	Name	Description
	Active (see page 20353)	Specifies whether or not a dataset is open.
	GetMetadata (see page 20193)	Specifies whether the SQL dataset fetches metadata information along with the data.
	IndexFieldNames (see page 20355)	Lists the fields to use for sorting records and for linking in master/detail relationships.
	IndexName (see page 20356)	Identifies an index to use for sorting records and for linking the table as the detail of a master/detail relationship.
	MasterFields (see page 20356)	Identifies the fields from the master dataset to use for linking this table as the detail of a master/detail relationship.
	MasterSource (see page 20357)	Identifies the master dataset to use when linking this table as the detail of a master/detail relationship.
	MaxBlobSize (see page 20358)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NumericMapping (see page 20195)	Maps fldBCD to either ftFMTBCD or ftBCD field types.
	ObjectView (see page 20196)	Specifies whether fields are stored hierarchically or flattened out in the Fields property.
	SchemaName (see page 20201)	Specifies the name of the database schema.
	SQLConnection (see page 20358)	Specifies the SQL connection component that connects the dataset to a database server.
	TableName (see page 20359)	Specifies the table on the database server represented by this component.
	Tag (see page 2808)	Stores an integer value as part of a component.

149.1.11.2 TSQLTable.Create Constructor

Creates an instance of a TSQLTable (see page 20337) component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSQLTable(TComponent * AOwner);
```

Description

Call Create to instantiate an SQL table at runtime. SQL tables placed in forms or data modules at design time are created automatically.

See Also

Create (see page 6904)

149.1.11.3 TSQLTable.Destroy Destructor

Destroys the TSQLTable (see page 20337) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSQLTable();
```

Description

Usually destruction of datasets is handled automatically by Delphi. If an application creates its own instances of a dataset, however, and does not assign an Owner that is responsible for freeing the dataset, then the application should call Free, which verifies that the dataset reference is not nil before calling Destroy.

See Also

Owner (see page 2807)

Create (see page 20349)

Free (see page 22300)

149.1.11.4 TSQLTable Methods

The methods of the TSQLTable class are listed here.

Protected Methods

	Name	Description
	OpenCursor (see page 20351)	This is OpenCursor, a member of class TSQLTable.
	SetIndexField (see page 20352)	This is SetIndexField, a member of class TSQLTable.

Public Methods

	Name	Description
	DeleteRecords (see page 20350)	Empties the underlying database table.
	GetIndexNames (see page 20351)	Retrieves a list of available indexes defined for the table.
	PrepareStatement (see page 20351)	Generates the query that TSQLTable (see page 20337) uses to fetch data from the database server.

149.1.11.4.1 TSQLTable.DeleteRecords Method

Empties the underlying database table.

Pascal

```
procedure DeleteRecords;
```

C++

```
__fastcall DeleteRecords();
```

Description

Call DeleteRecords to delete all the records in the underlying database table.

See Also

RecordCount (see page 7032)

149.1.11.4.2 TSQLTable.GetIndexNames Method

Retrieves a list of available indexes defined for the table.

Pascal

```
procedure GetIndexNames(List: TWideStrings);
```

C++

```
__fastcall GetIndexNames(TWideStrings List);
```

Description

Call GetIndexNames to retrieve a list of all indexes on the server defined for the table. List is a string list object, created and maintained by the application, into which to retrieve the index names.

See Also

IndexName (see page 20356)

IndexDefs (see page 20193)

Obtaining Information About Indexes

149.1.11.4.3 TSQLTable.OpenCursor Method

Pascal

```
procedure OpenCursor(InfoQuery: Boolean); override;
```

C++

```
virtual __fastcall OpenCursor(Boolean InfoQuery);
```

Description

This is OpenCursor, a member of class TSQLTable.

149.1.11.4.4 TSQLTable.PrepareStatement Method

Generates the query that TSQLTable (see page 20337) uses to fetch data from the database server.

Pascal

```
procedure PrepareStatement; override;
```

C++

```
virtual __fastcall PrepareStatement();
```

Description

PrepareStatement generates a SELECT query to fetch the records from the table specified by TableName (see page 20359), ordering by the fields in IndexFieldNames (see page 20355) or the index in IndexName (see page 20356). If you have specified a master/detail relationship, PrepareStatement sets that up as well.

Do not call PrepareStatement in your applications. Instead, set the Prepared (see page 20198) property to true. When you use the Prepared (see page 20198) property instead, the SQL table keeps track of the fact that it has already been prepared and need not repeat the process every time it executes.

See Also

Prepared (see page 20198)

TableName (see page 20359)

IndexName (see page 20356)

IndexFieldNames (see page 20355)

149.1.11.4.5 TSQLTable.SetIndexField Method

Pascal

```
procedure SetIndexField(Index: Integer; Value: TField);
```

C++

```
__fastcall SetIndexField(int Index, TField Value);
```

Description

This is SetIndexField, a member of class TSQLTable.

149.1.11.5 TSQLTable Properties

The properties of the TSQLTable class are listed here.

Protected Properties

	Name	Description
R	MasterLink (see page 20357)	This is MasterLink, a member of class TSQLTable.

Public Properties

	Name	Description
R	IndexFieldCount (see page 20354)	Indicates the number of fields that make up the current index.
	IndexFields (see page 20355)	Specifies the fields associated with the current index.

Published Properties

	Name	Description
	Active (see page 20353)	Specifies whether or not a dataset is open.
	IndexFieldNames (see page 20355)	Lists the fields to use for sorting records and for linking in master/detail relationships.
	IndexName (see page 20356)	Identifies an index to use for sorting records and for linking the table as the detail of a master/detail relationship.
	MasterFields (see page 20356)	Identifies the fields from the master dataset to use for linking this table as the detail of a master/detail relationship.
	MasterSource (see page 20357)	Identifies the master dataset to use when linking this table as the detail of a master/detail relationship.
	MaxBlobSize (see page 20358)	Indicates the maximum number of bytes fetched for any BLOB field in the dataset.

	SQLConnection (see page 20358)	Specifies the SQL connection component that connects the dataset to a database server.
	TableName (see page 20359)	Specifies the table on the database server represented by this component.

149.1.11.5.1 TSQLTable.Active Property

Specifies whether or not a dataset is open.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Use Active to determine or set whether a dataset is populated with data. When Active is false, the dataset is closed; the dataset cannot read or write data and data-aware controls can not use it to fetch data or post edits. When Active is true, the dataset can be populated with data. It can read data from a database or other source (such as a provider). Depending on the CanModify property, active datasets can post changes.

Setting Active to true:

1. Generates a BeforeOpen event.
2. Sets the dataset state to dsBrowse.
3. Establishes a way to fetch data (typically by opening a cursor).
4. Generates an AfterOpen event.

If an error occurs while opening the dataset, dataset state is set to dsInactive, and any cursor is closed.

Setting Active to false:

1. Triggers a BeforeClose event.
2. Sets the State property to dsInactive.
3. Closes the cursor.
4. Triggers an AfterClose event.

An application must set Active to false before changing other properties that affect the status of a database or the controls that display data in an application.

Note: Calling the Open method sets Active to true; calling the Close method sets Active to false.

Delphi Examples:

```
{
This example requires a database with the following name or
in the form of a *.DB file in the following path.  The table
should be closed when changing the database.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Customers.Active := False;
  try
  { First try to use an alias }
    Customers.DatabaseName := 'DBDEMOS';
    Customers.Active := True;
  except
    on EDatabaseError do
```

```
      begin
        { If that fails, try to use the drive and directory }
        Customers.TableName := 'Flights';
        Customers.DatabaseName :=
          'c:\Documents and Settings\All Users\Documents\RAD
Studio\5.0\Demos\IntraWeb\Win32\FlightInformation\Data';
        Customers.Active := True;
      end;
    end;
  end;
```

Using Datasets with Decision Support Components

Making the Table a Detail of Another Dataset

Opening and Closing Datasets

Fetching the Data

149.1.11.5.2 TSQLTable.IndexFieldCount Property

Indicates the number of fields that make up the current index.

Pascal

```
property IndexFieldCount: Integer;
```

C++

```
__property int IndexFieldCount;
```

Description

Check IndexFieldCount to determine how many fields are in the current index. If the IndexName (see page 20356) property is not set, IndexFieldCount is 0.

See Also

IndexFieldNames (see page 20355)

IndexDefs (see page 20193)

IndexName (see page 20356)

149.1.11.5.3 TSQLTable.IndexFieldNames Property

Lists the fields to use for sorting records and for linking in master/detail relationships.

Pascal

```
property IndexFieldNames: WideString;
```

C++

```
__property BSTR IndexFieldNames;
```

Description

IndexFieldNames is a semicolon-delimited set of field names, where each name specifies a field in the table.

Use IndexFieldNames to identify the fields in the SQL table that are used to sort records in the table. IndexFieldNames are used to generate the ORDER BY clause of the SQL statement automatically generated to fetch records for the dataset.

IndexFieldNames is also used to link this table as the detail in a master/detail relationship. Each of these fields must be matched to a corresponding field from the MasterFields (see page 20356) property.

Instead of explicitly setting the sorting and linking fields using IndexFieldNames, you can indicate them using an existing index. To specify the sorting and linking fields implicitly through an index, use the IndexName (see page 20356) property instead.

Note: The IndexName (see page 20356) and IndexFieldNames properties are mutually exclusive. Setting one automatically clears the other.

See Also

IndexName (see page 20356)

MasterFields (see page 20356)

MasterSource (see page 20357)

Creating an Index with IndexFieldNames

Representing the Records in a Table

149.1.11.5.4 TSQLTable.IndexFields Property

Specifies the fields associated with the current index.

Pascal

```
property IndexFields [Index: Integer]: TField;
```

C++

```
__property TField IndexFields[int Index];
```

Description

IndexFields is a zero-based array of field objects, each of which corresponds to a field in the current index. Index is an ordinal value indicating the position of a field in the index. The first field in the index is IndexFields[0], the second is IndexFields[1], and so on.

Note: Do not set IndexFields directly. Instead use the IndexFieldNames (see page 20355) property to specify the sort order for records in the table.

See Also

IndexDefs (see page 20193)

IndexFieldNames (see page 20355)

IndexName (see page 20356)

149.1.11.5.5 TSQLTable.IndexName Property

Identifies an index to use for sorting records and for linking the table as the detail of a master/detail relationship.

Pascal

```
property IndexName: WideString;
```

C++

```
__property BSTR IndexName;
```

Description

Use IndexName to specify an existing index that is defined for the underlying database table.

IndexName is used to sort records in the table by appearing in the ORDER BY clause of the SQL statement automatically generated to fetch records for the dataset.

IndexName is also used to link this table as the detail in a master/detail relationship. Each of the fields in the index must be matched to a corresponding field from the MasterFields (see page 20356) property.

Note: The IndexName and IndexFieldNames (see page 20355) properties are mutually exclusive. Setting one automatically clears the other.

See Also

IndexFieldNames (see page 20355)

MasterSource (see page 20357)

GetIndexNames (see page 20351)

Representing the Records in a Table

149.1.11.5.6 TSQLTable.MasterFields Property

Identifies the fields from the master dataset to use for linking this table as the detail of a master/detail relationship.

Pascal

```
property MasterFields: WideString;
```

C++

```
__property BSTR MasterFields;
```

Description

Use MasterFields to identify the fields in another (master) dataset that can be used as link fields in a master/detail relationship. MasterFields is a semicolon-delimited set of field names, where each name identifies a field in the master dataset. The master dataset is the dataset associated with the datasource specified by MasterSource (see page 20357). Each of the fields in MasterFields must be matched to a corresponding field from the IndexFieldNames (see page 20355) property.

At design-time, double-click on the MasterFields property in the Object Inspector to use the Field Link designer to help you define the master/detail relationship. You can only use the Field Link designer if you have already specified the IndexName (see page 20356) or IndexFieldNames (see page 20355) property and the MasterSource (see page 20357) property.

See Also

IndexFieldNames (see page 20355)

IndexName (see page 20356)

MasterSource (see page 20357)

Making the Table a Detail of Another Dataset

Setting Up Master/detail Linked Cursors

149.1.11.5.7 TSQLTable.MasterLink Property

Pascal

```
property MasterLink: TMasterDataLink;
```

C++

```
__property TMasterDataLink MasterLink;
```

Description

This is MasterLink, a member of class TSQLTable.

149.1.11.5.8 TSQLTable.MasterSource Property

Identifies the master dataset to use when linking this table as the detail of a master/detail relationship.

Pascal

```
property MasterSource: TDataSource;
```

C++

```
__property TDataSource MasterSource;
```

Description

Use MasterSource to indicate the dataset that serves as a master table when establishing a master/detail relationship. Specify a TDataSource component whose DataSet property identifies the desired master dataset.

A master/detail relationship is established when you set the MasterSource property to identify a master dataset, the MasterFields (see page 20356) property to identify the fields in that master dataset whose values must be matched by linking fields in this (detail) SQL table, and the IndexName (see page 20356) or IndexFieldNames (see page 20355) property to identify the linking fields in this SQL table.

MasterSource is the same as the DataSource (see page 20192) property, except that it is published.

See Also

IndexFieldNames (see page 20355)

IndexName (see page 20356)

MasterFields (see page 20356)

DataSource (see page 20192)

DataSet (see page 7078)

Making the Table a Detail of Another Dataset

Setting Up Master/detail Linked Cursors

149.1.11.5.9 TSQLTable.MaxBlobSize Property

Indicates the maximum number of bytes fetched for any BLOB field in the dataset.

Pascal

```
property MaxBlobSize: Integer;
```

C++

```
__property int MaxBlobSize;
```

Description

MaxBlobSize limits the amount of data that can be fetched from Binary Large Object (BLOB) fields. BLOB fields can hold an indefinite amount of data. However, SQL datasets read that data into a memory buffer. By limiting the amount of data that can be fetched from a BLOB field, you limit the size of the buffer.

If MaxBlobSize is –1, the dataset imposes no maximum BLOB size. If MaxBlobSize is 0, the dataset uses the parameters of the associated SQL connection, if any, to determine the maximum BLOB size.

Note: MaxBlobSize should agree with any parameters on the associated SQL connection component that limit the size of BLOB data.

See Also

GetBlobFieldData (see page 20166)

Params (see page 20253)

SQLConnection (see page 20201)

149.1.11.5.10 TSQLTable.SQLConnection Property

Specifies the SQL connection component that connects the dataset to a database server.

Pascal

```
property SQLConnection: TSQLConnection;
```

C++

```
__property TSQLConnection SQLConnection;
```

Description

Use SQLConnection to specify an SQL connection object that connects the dataset to a database server.

At design-time, select from the list of available TSQLConnection components in the Object Inspector. At runtime, set SQLConnection to reference an existing TSQLConnection object.

SQLConnection should be the first property you set on the dataset. Only after the SQLConnection property is set can you use the Command Text editor to specify a query for the CommandText property or populate the dataset with data by setting Active to true. Similarly, SQLConnection must be set before the dataset can initialize the Params property when you set CommandText.

See Also

Active (see page 7004)

CommandText (see page 20189)

Params (see page 20197)

Using Query-type Datasets

Using Stored Procedure-type Datasets

Using Table Type Datasets

Connecting Directly to a Database Server

Connecting to the Database Server

149.1.11.5.11 TSQLTable.TableName Property

Specifies the table on the database server represented by this component.

Pascal

```
property TableName: WideString;
```

C++

```
__property BSTR TableName;
```

Description

Set TableName to the name of a table on the database server. TSQLTable (see page 20337) automatically generates an SQL query to fetch all of the records and all of the fields in that table.

Note: In the automatically generated SQL query, the ORDER BY clause is determined by the IndexName (see page 20356) or IndexFieldNames (see page 20355) property.

149.1.12 TTransactionItem Class

Class Hierarchy

SqlExpr.TTransactionItem

Pascal

```
TTransactionItem = class;
```

C++

```
class TTransactionItem;
```

File

SqlExpr

Description

This is class SqlExpr.TTransactionItem.

149.1.12.1 TTransactionItem Members

The following tables list the members exposed by TTransactionItem.

Public Fields

	Name	Description
	FNext (see page 20360)	This is FNext, a member of class TTransactionItem.
	FTransaction (see page 20360)	This is FTransaction, a member of class TTransactionItem.
	FTransactionDesc (see page 20360)	This is FTransactionDesc, a member of class TTransactionItem.

149.1.12.2 TTransactionItem Fields

The fields of the TTransactionItem class are listed here.

Public Fields

	Name	Description
	FNext (see page 20360)	This is FNext, a member of class TTransactionItem.
	FTransaction (see page 20360)	This is FTransaction, a member of class TTransactionItem.
	FTransactionDesc (see page 20360)	This is FTransactionDesc, a member of class TTransactionItem.

149.1.12.2.1 TTransactionItem.FNext Field

Pascal

```
FNext: TTransactionItem;
```

C++

```
TTransactionItem FNext;
```

Description

This is FNext, a member of class TTransactionItem.

149.1.12.2.2 TTransactionItem.FTransaction Field

Pascal

```
FTransaction: TDBXTransaction;
```

C++

```
TDBXTransaction FTransaction;
```

Description

This is FTransaction, a member of class TTransactionItem.

149.1.12.2.3 TTransactionItem.FTransactionDesc Field

Pascal

```
FTransactionDesc: TTransactionDesc;
```

C++

```
TTransactionDesc FTransactionDesc;
```

Description

This is FTransactionDesc, a member of class TTransactionItem.

149.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	FreeProcParams (see page 20361)	Frees a list of procedure parameters that is allocated by GetProcedureParams.
	GetConnectionNames (see page 20361)	This is function SqlExpr.GetConnectionNames.
	GetConnectionRegistryFile (see page 20362)	This is function SqlExpr.GetConnectionRegistryFile.
	GetDriverNames (see page 20362)	Populates a string list with the names of all available dbExpress drivers.
	GetDriverRegistryFile (see page 20363)	This is function SqlExpr.GetDriverRegistryFile.
	LoadParamListItems (see page 20363)	Fills a TParams object with information from a list of parameter descriptors.

149.2.1 SqlExpr.FreeProcParams Function

Frees a list of procedure parameters that is allocated by GetProcedureParams.

Pascal

```
procedure FreeProcParams(var ProcParams: TList);
```

C++

```
FreeProcParams(TList ProcParams);
```

File

SqlExpr

Description

Use FreeProcParams to free a list of stored procedure parameters after using them. FreeProcParams takes a single parameter, ProcParams, which is a list of parameter information that was returned from a call to the GetProcedureParams method of TSQLConnection (see page 20217). It frees all of the parameter structures in the list, and then frees the list itself, changing the parameter that was passed in to nil (Delphi) or NULL (C++).

See Also

TSQLConnection (see page 20217)

LoadParamListItems (see page 20363)

149.2.2 SqlExpr.GetConnectionNames Function

Pascal

```
procedure GetConnectionNames(List: TStrings; Driver: string = ''; DesignMode: Boolean = True);
```

C++

```
GetConnectionNames(TStrings List, AnsiString Driver = '', Boolean DesignMode = True);
```

File

SqlExpr

Description

This is function SqlExpr.GetConnectionNames.

149.2.3 SqlExpr.GetConnectionRegistryFile Function

Pascal

```
function GetConnectionRegistryFile(DesignMode: Boolean = False): string;
```

C++

```
AnsiString GetConnectionRegistryFile(Boolean DesignMode = False);
```

File

SqlExpr

Description

This is function SqlExpr.GetConnectionRegistryFile.

149.2.4 SqlExpr.GetDriverNames Function

Populates a string list with the names of all available dbExpress drivers.

Pascal

```
procedure GetDriverNames(List: TStrings; DesignMode: Boolean = True);
```

C++

```
GetDriverNames(TStrings List, Boolean DesignMode = True);
```

File

SqlExpr

Description

GetDriverNames fills the string list specified by List with the names of all installed dbExpress drivers. GetDriverNames fetches the names of Installed drivers from the drivers.ini file.

List is a string list object, created and maintained by the application, into which to store the driver names.

DesignMode indicates whether the names are fetched at design time (true) or at runtime (false).

See Also

TSQLConnection (see page 20217)

149.2.5 SqlExpr.GetDriverRegistryFile Function

Pascal

```
function GetDriverRegistryFile(DesignMode: Boolean = False): string;
```

C++

```
AnsiString GetDriverRegistryFile(Boolean DesignMode = False);
```

File

SqlExpr

Description

This is function SqlExpr.GetDriverRegistryFile.

149.2.6 SqlExpr.LoadParamListItems Function

Fills a TParams object with information from a list of parameter descriptors.

Pascal

```
procedure LoadParamListItems(Params: TParams; ProcParams: TList);
```

C++

```
LoadParamListItems(TParams Params, TList ProcParams);
```

File

SqlExpr

Description

Call LoadParamListItems to convert the list of parameter descriptors that is returned from the GetProcedureParams method of TSQLConnection (see page 20217) to a collection of TParam objects.

Params is an empty TParams collection that the procedure fills with information from the list of parameter descriptors.

ProcParams is the list of parameter descriptors that GetProcedureParams returns.

See Also

FreeProcParams (see page 20361)

TSQLConnection (see page 20217)

149.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	EConnectFlag (see page 20364)	This is record SqlExpr.EConnectFlag.
	TConnectionState (see page 20365)	TConnectionState describes the state of a TSQLConnection (see page 20217) component.
	TConnectionUserType (see page 20365)	This is record SqlExpr.TConnectionUserType.
	TSchemaType (see page 20366)	TSchemaType and TSchemaInfo describe schema information (metadata) to access using dbXpress.
	TSQLExceptionType (see page 20367)	TSQLExceptionType indicates the type of operation that leads to an ESQLException exception.
	TTableScope (see page 20368)	TTableScopes (see page 20374) and TTableScopess indicate the types of tables for which to fetch metadata.
	TTransIsolationLevel (see page 20369)	This enumerated type (in C++) or type (in Delphi) identifies degree to which transactions are isolated from each other.

Records

	Name	Description
	TSQLSchemaInfo (see page 20368)	This is record SqlExpr.TSQLSchemaInfo.
	TTransactionDesc (see page 20369)	This is record SqlExpr.TTransactionDesc.

149.3.1 SqlExpr.EConnectFlag Enumeration

Pascal

```
EConnectFlag = (
  eConnect,
  eReconnect,
  eDisconnect
);
```

C++

```
enum EConnectFlag {
  eConnect,
  eReconnect,
  eDisconnect
};
```

File

SqlExpr

Description

This is record SqlExpr.EConnectFlag.

149.3.2 SqlExpr.TConnectionState Enumeration

TConnectionState describes the state of a TSQLConnection (see page 20217) component.

Pascal

```
TConnectionState = (
  csStateClosed,
  csStateOpen,
  csStateConnecting,
  csStateExecuting,
  csStateFetching,
  csStateDisconnecting
);
```

C++

```
enum TConnectionState {
  csStateClosed,
  csStateOpen,
  csStateConnecting,
  csStateExecuting,
  csStateFetching,
  csStateDisconnecting
};
```

File

SqlExpr

Description

TConnectionState can have any of the following values:

Value	Meaning
csStateClosed	The connection is closed. (The Connected property is false)
csStateOpen	The connection is open. (The Connected property is true)
csStateConnecting	The component is establishing a connection but has not completed the process.
csStateExecuting	The component has passed an SQL command to the server and it is currently executing.
csStateFetching	The component is fetching database information from the server.
csStateDisconnecting	The component is terminating a connection but has not completed the process.

149.3.3 SqlExpr.TConnectionUserType Enumeration

Pascal

```
TConnectionUserType = (
  eUserMonitor,
  eUserDataSet
);
```

C++

```
enum TConnectionUserType {
  eUserMonitor,
```

```
  eUserDataSet
};
```

File

SqlExpr

Description

This is record SqlExpr.TConnectionUserType.

149.3.4 SqlExpr.TSchemaType Enumeration

TSchemaType and TSchemaInfo describe schema information (metadata) to access using dbXpress.

Pascal

```
TSchemaType = (
  stNoSchema,
  stTables,
  stSysTables,
  stProcedures,
  stColumns,
  stProcedureParams,
  stIndexes,
  stPackages,
  stUserNames
);
```

C++

```
enum TSchemaType {
  stNoSchema,
  stTables,
  stSysTables,
  stProcedures,
  stColumns,
  stProcedureParams,
  stIndexes,
  stPackages,
  stUserNames
};
```

File

SqlExpr

Description

Use TSchemaInfo to describe the metadata you want to fetch from a database server when you are using an SQL dataset. TSchemaInfo has three members: FType, ObjectName, and Pattern, which are described below.

Use TSchemaInfo to describe the metadata you want to fetch from a database server when you are using an SQL dataset. TSchemaInfo has four members: FType, ObjectName, Pattern, and PackageName, which are described below.

FType is of type TSchemaType. It identifies the type of information you want. It can have any of the following values:

Value	Description
stNoSchema	No schema information. When FType is stNoSchema, the SQL dataset is populated with the results of its query or stored procedure rather than metadata from the server.
stTables	Information about all the data tables on the database server that match the criteria specified by the SQL connection's TableScope property.

stSysTables	Information about all of the system tables on the database server. Not all servers use system tables to store metadata. Requesting a list of system tables from a server that does not use them results in an empty dataset.
stProcedures	Information about all of the stored procedures on the database server.
stColumns	Information about all of the columns (fields) in a specified table.
stProcedureParams	Information about all of the parameters of a specified stored procedure.
stIndexes	Information about all of the indexes defined for a specified table.
stPackages	Information about all of the packages defined on the database server (Oracle only).

ObjectName is the name of the table or stored procedure about whose columns, indexes, or parameters you want information. When FType is stColumns or stIndexes, ObjectName is the name of a table. When FType is stProcedureParams, ObjectName is the name of a stored procedure. When FType is stNone, stTables, stSysTables, or stProcedures, ObjectName is ignored.

Pattern is an SQL pattern mask that limits the items returned. The name of each item (table, stored procedure, field, parameter, or index) must match this pattern mask or it does not appear as a record when the SQL dataset is opened. Pattern uses the wildcards '%' (to match a string of arbitrary characters of any length) and '_' (to match a single arbitrary character). To use a literal percent or underscore in a pattern, the character is doubled (%% or __). If you do not want to use a pattern, set Pattern to nil (Delphi) or NULL (C++).

PackageName is the name of an Oracle package that contains the stored procedure about which you are requesting information. This member is used when FType is stProcedures or stProcedureParams. PackageName is ignored if the server is not an Oracle database.

149.3.5 SqlExpr.TSQLExceptionType Enumeration

TSQLExceptionType indicates the type of operation that leads to an ESQLException exception.

Pascal

```
TSQLExceptionType = (
  exceptConnection,
  exceptCommand,
  exceptCursor,
  exceptMetaData,
  exceptUseLast
);
```

C++

```
enum TSQLExceptionType {
  exceptConnection,
  exceptCommand,
  exceptCursor,
  exceptMetaData,
  exceptUseLast
};
```

File

SqlExpr

Description

ESQLException objects use TSQLExceptionType to identify the dbExpress object from which an error code originated. By identifying the underlying dbExpress object, ESQLException identifies that object's interface, which it then uses to obtain an error message.

TSQLExceptionType includes the following values:

Value	Description
exceptConnection	Error arose when establishing a connection to the database server, obtaining an interface for sending a command, fetching server metadata, or controlling a transaction.
exceptCommand	Error occurred while preparing or executing an SQL command.
exceptCursor	Error occurred while fetching data from a dbExpress cursor.
exceptMetaData	Error occurred while trying to fetch metadata (schema information).
exceptUseLast	The error is cached by the TSQLConnection (see page 20217) component.

149.3.6 SqlExpr.TSQLSchemaInfo Record

Pascal

```
TSQLSchemaInfo = record
  FType: TSchemaType;
  ObjectName: WideString;
  Pattern: WideString;
  PackageName: WideString;
end;
```

C++

```
struct TSQLSchemaInfo {
  TSchemaType FType;
  BSTR ObjectName;
  BSTR Pattern;
  BSTR PackageName;
};
```

File

SqlExpr

Description

This is record SqlExpr.TSQLSchemaInfo.

149.3.7 SqlExpr.TTableScope Enumeration

TTableScopes (see page 20374) and TTableScopess indicate the types of tables for which to fetch metadata.

Pascal

```
TTableScope = (
  tsSynonym,
  tsSysTable,
  tsTable,
  tsView
);
```

C++

```
enum TTableScope {
  tsSynonym,
  tsSysTable,
```

```
    tsTable,
    tsView
  };
```

File

SqlExpr

Description

TTableScopess is a set that indicates the types of tables for which to fetch metadata. It is a set of TTableScopes (see page 20374) values. The following table describes the possible values:

Value	Meaning
tsSynonym	synonyms
tsSysTable	system tables
tsTable	ordinary tables
tsView	views

149.3.8 SqlExpr.TTransactionDesc Record

Pascal

```
  TTransactionDesc = packed record
    TransactionID: LongWord;
    GlobalID: LongWord;
    IsolationLevel: TTransIsolationLevel;
    CustomIsolation: LongWord;
  end;
```

C++

```
  struct TTransactionDesc {
    LongWord TransactionID;
    LongWord GlobalID;
    TTransIsolationLevel IsolationLevel;
    LongWord CustomIsolation;
  };
```

File

SqlExpr

Description

This is record SqlExpr.TTransactionDesc.

149.3.9 SqlExpr.TTransIsolationLevel Enumeration

This enumerated type (in C++) or type (in Delphi) identifies degree to which transactions are isolated from each other.

Pascal

```
  TTransIsolationLevel = (
    xilREADCOMMITTED,
    xilREPEATABLEREAD,
    xilDIRTYREAD,
```

```
    xilCUSTOM
  );
```

C++

```
  enum TTransIsolationLevel {
    xilREADCOMMITTED,
    xilREPEATABLEREAD,
    xilDIRTYREAD,
    xilCUSTOM
  };
```

File

SqlExpr

Description

The following table describes the possible values.

Element	Description
xilDIRTYREAD	Current transaction sees all changes made by other transactions, even if they have not yet been committed. This option is not available for the Oracle driver.
xilREADCOMMITTED	Current transaction sees only changes that have been committed, but can receive an inconsistent view of the data if additional changes are committed before the transaction ends.
xilREPEATABLEREAD	Current transaction is guaranteed a consistent view of the data, which includes only changes committed by other transactions at the start of the transaction.
xilCUSTOM	Current transaction uses a database-specific isolation level. When the eConnTxnIsoLevel option is xilCUSTOM, the transaction descriptor gives the actual isolation level. This is not currently supported by any drivers, but allows future drivers the ability to expand the number of isolation levels.

149.4 Types

The following table lists types in this documentation.

Types

Name	Description
TFieldDescList (see page 20371)	This is type SqlExpr.TFieldDescList.
TFieldList (see page 20371)	This is type SqlExpr.TFieldList.
TGetDriverFunc (see page 20372)	This is type SqlExpr.TGetDriverFunc.
TLocale (see page 20372)	This is type SqlExpr.TLocale.
TLocaleCode (see page 20372)	This is type SqlExpr.TLocaleCode.
TParseInsertSqlEvent (see page 20373)	This is type SqlExpr.TParseInsertSqlEvent.
TParseSqlEvent (see page 20373)	This is type SqlExpr.TParseSqlEvent.
TSQLConnectionLoginEvent (see page 20373)	This is type SqlExpr.TSQLConnectionLoginEvent.
TTableScopes (see page 20374)	This is type SqlExpr.TTableScopes.
TTraceEvent (see page 20374)	This is type SqlExpr.TTraceEvent.
TTraceLogEvent (see page 20374)	This is type SqlExpr.TTraceLogEvent.

149.4.1 SqlExpr.TFieldDescList Type

Pascal

```
TFieldDescList = array of TFLDDesc;
```

C++

```
array of TFLDDesc TFieldDescList;
```

File

SqlExpr

Description

This is type SqlExpr.TFieldDescList.

149.4.2 SqlExpr.TFieldList Type

Pascal

```
TFieldList = TList;
```

C++

```
TList TFieldList;
```

File

SqlExpr

Description

This is type SqlExpr.TFieldList.

149.4.3 SqlExpr.TGetDriverFunc Type

Pascal

```
TGetDriverFunc = function (SVendorLib, SResourceFile: PChar; out Obj): TDBXErrorCode;
```

C++

```
(SVendorLib, SResourceFile: PChar; out Obj): TDBXErrorCode ( TGetDriverFunc)();
```

File

SqlExpr

Description

This is type SqlExpr.TGetDriverFunc.

149.4.4 SqlExpr.TLocale Type

Pascal

```
TLocale = Pointer;
```

C++

```
void * TLocale;
```

File

SqlExpr

Description

This is type SqlExpr.TLocale.

149.4.5 SqlExpr.TLocaleCode Type

Pascal

```
TLocaleCode = Integer;
```

C++

```
int TLocaleCode;
```

File

SqlExpr

Description

This is type SqlExpr.TLocaleCode.

149.4.6 SqlExpr.TParseInsertSqlEvent Type

Pascal

```
TParseInsertSqlEvent = procedure (var FieldNames: TWideStrings; SQL: WideString; var
BindAllFields: Boolean; var TableName: WideString) of object;
```

C++

```
(var FieldNames: TWideStrings; SQL: WideString; var BindAllFields: Boolean; var TableName:
WideString) ( TParseInsertSqlEvent)();
```

File

SqlExpr

Description

This is type SqlExpr.TParseInsertSqlEvent.

149.4.7 SqlExpr.TParseSqlEvent Type

Pascal

```
TParseSqlEvent = procedure (var FieldNames: TWideStrings; SQL: WideString; var TableName:
WideString) of object;
```

C++

```
(var FieldNames: TWideStrings; SQL: WideString; var TableName: WideString) ( TParseSqlEvent)();
```

File

SqlExpr

Description

This is type SqlExpr.TParseSqlEvent.

149.4.8 SqlExpr.TSQLConnectionLoginEvent Type

Pascal

```
TSQLConnectionLoginEvent = procedure (Database: TSQLConnection; LoginParams: TWideStrings) of
object;
```

C++

```
(Database: TSQLConnection; LoginParams: TWideStrings) ( TSQLConnectionLoginEvent)();
```

File

SqlExpr

Description

This is type SqlExpr.TSQLConnectionLoginEvent.

149.4.9 SqlExpr.TTableScopes Type

Pascal

```
TTableScopes = set of TTableScope;
```

C++

```
TTableScope TTableScopes;
```

File

SqlExpr

Description

This is type SqlExpr.TTableScopes.

149.4.10 SqlExpr.TTraceEvent Type

Pascal

```
TTraceEvent = procedure (Sender: TObject; TraceInfo: TDBXTraceInfo; var LogTrace: Boolean) of
object;
```

C++

```
(Sender: TObject; TraceInfo: TDBXTraceInfo; var LogTrace: Boolean) ( TTraceEvent)();
```

File

SqlExpr

Description

This is type SqlExpr.TTraceEvent.

149.4.11 SqlExpr.TTraceLogEvent Type

Pascal

```
TTraceLogEvent = procedure (Sender: TObject; TraceInfo: TDBXTraceInfo) of object;
```

C++

```
(Sender: TObject; TraceInfo: TDBXTraceInfo) ( TTraceLogEvent)();
```

File

SqlExpr

Description

This is type SqlExpr.TTraceLogEvent.

149.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
BlobTypeMap (see page 20375)	This is constant SqlExpr.BlobTypeMap.
DataTypeMap (see page 20376)	This is constant SqlExpr.DataTypeMap.
DefaultCursor (see page 20376)	This is constant SqlExpr.DefaultCursor.
DefaultMaxBlobSize (see page 20376)	This is constant SqlExpr.DefaultMaxBlobSize.
DefaultRowsetSize (see page 20377)	This is constant SqlExpr.DefaultRowsetSize.
FldSubTypeMap (see page 20377)	This is constant SqlExpr.FldSubTypeMap.
FldTypeMap (see page 20377)	This is constant SqlExpr.FldTypeMap.
HourGlassCursor (see page 20378)	This is constant SqlExpr.HourGlassCursor.
SAnd (see page 20378)	This is constant SqlExpr.SAnd.
SOrderBy (see page 20379)	This is constant SqlExpr.SOrderBy.
SParam (see page 20379)	This is constant SqlExpr.SParam.
SSelect (see page 20379)	This is constant SqlExpr.SSelect.
SSelectSpaces (see page 20380)	This is constant SqlExpr.SSelectSpaces.
SSelectStar (see page 20380)	This is constant SqlExpr.SSelectStar.
SSelectStarFrom (see page 20380)	This is constant SqlExpr.SSelectStarFrom.
SUB_TYPE_MEMO (see page 20381)	This is constant SqlExpr.SUB_TYPE_MEMO.
SWhere (see page 20381)	This is constant SqlExpr.SWhere.
TErrorMessageSize (see page 20381)	This is constant SqlExpr.TErrorMessageSize.

149.5.1 SqlExpr.BlobTypeMap Constant

Pascal

```
BlobTypeMap: array[SUB_TYPE_MEMO..TDBXTypes.BFileSubType] of TFieldType = ( ftMemo, ftBlob,
ftFmtMemo, ftParadoxOle, ftGraphic, ftDBaseOle, ftTypedBinary, ftBlob, ftBlob, ftBlob,
ftWideMemo, ftOraClob, ftOraBlob, ftBlob, ftBlob);
```

C++

```
array[SUB_TYPE_MEMO..TDBXTypes.BFileSubType] of TFieldType BlobTypeMap = ( ftMemo, ftBlob,
ftFmtMemo, ftParadoxOle, ftGraphic, ftDBaseOle, ftTypedBinary, ftBlob, ftBlob, ftBlob,
ftWideMemo, ftOraClob, ftOraBlob, ftBlob, ftBlob);
```

File

SqlExpr

Description

This is constant SqlExpr.BlobTypeMap.

149.5.2 SqlExpr.DataTypeMap Constant

Pascal

```
DataTypeMap: array[0..TDBXTypes.MaxBaseTypes - 1] of TFieldType = ( ftUnknown, ftString,
ftDate, ftBlob, ftBoolean, ftSmallint, ftInteger, ftFloat, ftFMTBCD, ftBytes, ftTime,
ftDateTime, ftWord, ftInteger, ftUnknown, ftVarBytes, ftUnknown, ftCursor, ftLargeInt,
ftLargeInt, ftADT, ftArray, ftReference, ftDataSet, ftTimeStamp, ftFMTBCD, ftWideString);
```

C++

```
array[0..TDBXTypes.MaxBaseTypes - 1] of TFieldType DataTypeMap = ( ftUnknown, ftString,
ftDate, ftBlob, ftBoolean, ftSmallint, ftInteger, ftFloat, ftFMTBCD, ftBytes, ftTime,
ftDateTime, ftWord, ftInteger, ftUnknown, ftVarBytes, ftUnknown, ftCursor, ftLargeInt,
ftLargeInt, ftADT, ftArray, ftReference, ftDataSet, ftTimeStamp, ftFMTBCD, ftWideString);
```

File

SqlExpr

Description

This is constant SqlExpr.DataTypeMap.

149.5.3 SqlExpr.DefaultCursor Constant

Pascal

```
DefaultCursor = 0;
```

C++

```
DefaultCursor = 0;
```

File

SqlExpr

Description

This is constant SqlExpr.DefaultCursor.

149.5.4 SqlExpr.DefaultMaxBlobSize Constant

Pascal

```
DefaultMaxBlobSize = -1;
```

C++

```
DefaultMaxBlobSize = -1;
```

File

SqlExpr

Description

This is constant SqlExpr.DefaultMaxBlobSize.

149.5.5 SqlExpr.DefaultRowsetSize Constant

Pascal

```
DefaultRowsetSize = 20;
```

C++

```
DefaultRowsetSize = 20;
```

File

SqlExpr

Description

This is constant SqlExpr.DefaultRowsetSize.

149.5.6 SqlExpr.FldSubTypeMap Constant

Pascal

```
FldSubTypeMap: array[TFieldType] of Word = ( 0, 0, 0, 0, 0, 0, 0, TDBXTypes.MoneySubType, 0,
0, 0, 0, 0, 0, TDBXTypes.AutoIncSubType, TDBXTypes.BinarySubType, TDBXTypes.MemoSubType, 0, 0,
0, 0, 0, 0, TDBXTypes.FixedSubType, 0, 0, 0, 0, 0, 0, TDBXTypes.HBinarySubType,
TDBXTypes.HMemoSubType, 0, 0, 0, 0, 0, 0, TDBXTypes.FixedSubType, TDBXTypes.WideMemoSubType,
TDBXTypes.OracleTimeStampSubType, TDBXTypes.OracleIntervalSubType);
```

C++

```
array[TFieldType] of Word FldSubTypeMap = ( 0, 0, 0, 0, 0, 0, 0, TDBXTypes.MoneySubType, 0, 0,
0, 0, 0, 0, TDBXTypes.AutoIncSubType, TDBXTypes.BinarySubType, TDBXTypes.MemoSubType, 0, 0, 0,
0, 0, 0, TDBXTypes.FixedSubType, 0, 0, 0, 0, 0, 0, TDBXTypes.HBinarySubType,
TDBXTypes.HMemoSubType, 0, 0, 0, 0, 0, 0, TDBXTypes.FixedSubType, TDBXTypes.WideMemoSubType,
TDBXTypes.OracleTimeStampSubType, TDBXTypes.OracleIntervalSubType);
```

File

SqlExpr

Description

This is constant SqlExpr.FldSubTypeMap.

149.5.7 SqlExpr.FldTypeMap Constant

Pascal

```
FldTypeMap: TFieldMap = ( TDBXTypes.UnknownType, TDBXTypes.ZStringType, TDBXTypes.Int16Type,
TDBXTypes.Int32Type, TDBXTypes.UInt16Type, TDBXTypes.BoolType, TDBXTypes.FloatType,
TDBXTypes.FloatType, TDBXTypes.BcdType, TDBXTypes.DateType, TDBXTypes.TimeType, 0,
TDBXTypes.BytesType, TDBXTypes.VarBytesType, TDBXTypes.Int32Type, TDBXTypes.BlobType,
TDBXTypes.BlobType, TDBXTypes.BlobType, TDBXTypes.BlobType, TDBXTypes.BlobType,
TDBXTypes.BlobType, TDBXTypes.BlobType, TDBXTypes.CursorType, TDBXTypes.ZStringType,
TDBXTypes.WideStringType, TDBXTypes.Int64Type, TDBXTypes.AdtType, TDBXTypes.ArrayType,
TDBXTypes.RefType, TDBXTypes.TableType, TDBXTypes.BlobType, TDBXTypes.BlobType,
TDBXTypes.UnknownType, TDBXTypes.UnknownType, TDBXTypes.UnknownType, TDBXTypes.ZStringType,
```

```
TDBXTypes.TimeStampType, TDBXTypes.BcdType, TDBXTypes.WideStringType, TDBXTypes.BlobType,
TDBXTypes.TimeStampType, TDBXTypes.ZStringType);
```

C++

```
TFieldMap FldTypeMap = ( TDBXTypes.UnknownType, TDBXTypes.ZStringType, TDBXTypes.Int16Type,
TDBXTypes.Int32Type, TDBXTypes.UInt16Type, TDBXTypes.BoolType, TDBXTypes.FloatType,
TDBXTypes.FloatType, TDBXTypes.BcdType, TDBXTypes.DateType, TDBXTypes.TimeType, 0,
TDBXTypes.BytesType, TDBXTypes.VarBytesType, TDBXTypes.Int32Type, TDBXTypes.BlobType,
TDBXTypes.BlobType, TDBXTypes.BlobType, TDBXTypes.BlobType, TDBXTypes.BlobType,
TDBXTypes.BlobType, TDBXTypes.BlobType, TDBXTypes.CursorType, TDBXTypes.ZStringType,
TDBXTypes.WideStringType, TDBXTypes.Int64Type, TDBXTypes.AdtType, TDBXTypes.ArrayType,
TDBXTypes.RefType, TDBXTypes.TableType, TDBXTypes.BlobType, TDBXTypes.BlobType,
TDBXTypes.UnknownType, TDBXTypes.UnknownType, TDBXTypes.UnknownType, TDBXTypes.ZStringType,
TDBXTypes.TimeStampType, TDBXTypes.BcdType, TDBXTypes.WideStringType, TDBXTypes.BlobType,
TDBXTypes.TimeStampType, TDBXTypes.ZStringType);
```

File

SqlExpr

Description

This is constant SqlExpr.FldTypeMap.

149.5.8 SqlExpr.HourGlassCursor Constant

Pascal

```
HourGlassCursor = -11;
```

C++

```
HourGlassCursor = -11;
```

File

SqlExpr

Description

This is constant SqlExpr.HourGlassCursor.

149.5.9 SqlExpr.SAnd Constant

Pascal

```
SAnd = ' and ';
```

C++

```
SAnd = ' and ';
```

File

SqlExpr

Description

This is constant SqlExpr.SAnd.

149.5.10 SqlExpr.SOrderBy Constant

Pascal

```
SOrderBy = ' order by ';
```

C++

```
SOrderBy = ' order by ';
```

File

SqlExpr

Description

This is constant SqlExpr.SOrderBy.

149.5.11 SqlExpr.SParam Constant

Pascal

```
SParam = '?';
```

C++

```
SParam = '?';
```

File

SqlExpr

Description

This is constant SqlExpr.SParam.

149.5.12 SqlExpr.SSelect Constant

Pascal

```
SSelect = 'select';
```

C++

```
SSelect = 'select';
```

File

SqlExpr

Description

This is constant SqlExpr.SSelect.

149.5.13 SqlExpr.SSelectSpaces Constant

Pascal

```
SSelectSpaces = ' select ';
```

C++

```
SSelectSpaces = ' select ';
```

File

SqlExpr

Description

This is constant SqlExpr.SSelectSpaces.

149.5.14 SqlExpr.SSelectStar Constant

Pascal

```
SSelectStar = ' select * ';
```

C++

```
SSelectStar = ' select * ';
```

File

SqlExpr

Description

This is constant SqlExpr.SSelectStar.

149.5.15 SqlExpr.SSelectStarFrom Constant

Pascal

```
SSelectStarFrom = ' select * from ';
```

C++

```
SSelectStarFrom = ' select * from ';
```

File

SqlExpr

Description

This is constant SqlExpr.SSelectStarFrom.

149.5.16 SqlExpr.SUB_TYPE_MEMO Constant

Pascal

```
SUB_TYPE_MEMO = TDBXTypes.MemoSubType;
```

C++

```
SUB_TYPE_MEMO = TDBXTypes.MemoSubType;
```

File

SqlExpr

Description

This is constant SqlExpr.SUB_TYPE_MEMO.

149.5.17 SqlExpr.SWhere Constant

Pascal

```
SWhere = ' where ';
```

C++

```
SWhere = ' where ';
```

File

SqlExpr

Description

This is constant SqlExpr.SWhere.

149.5.18 SqlExpr.TErrorMessageSize Constant

Pascal

```
TErrorMessageSize = 2048;
```

C++

```
TErrorMessageSize = 2048;
```

File

SqlExpr

Description

This is constant SqlExpr.TErrorMessageSize.

150 SqlTimSt Namespace

This is namespace SqlTimSt.

Topics

Name	Description
Functions (see page 20385)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 20392)	The following table lists structs, records, enums in this documentation.
Types (see page 20394)	The following table lists types in this documentation.
Constants (see page 20395)	The following table lists constants in this documentation.

Constants

Name	Description
NullSQLTimeStamp (see page 20395)	This is constant SqlTimSt.NullSQLTimeStamp.

Functions

	Name	Description
	CheckSqlTimeStamp (see page 20385)	Checks whether a TSQLTimeStamp (see page 20392) value represents a valid date and time.
	DateTimeToSQLTimeStamp (see page 20386)	Converts a TDateTime value to a TSQLTimeStamp (see page 20392) value.
	SQLDayOfWeek (see page 20386)	Indicates the day of the week when a specified TSQLTimeStamp (see page 20392) value occurs.
	SQLTimeStampToDateTime (see page 20387)	Converts a TSQLTimeStamp (see page 20392) value to a TDateTime value.
	SQLTimeStampToStr (see page 20387)	Converts a TSQLTimeStamp (see page 20392) value to a string.
	StrToSQLTimeStamp (see page 20388)	Converts a string to a TSQLTimeStamp (see page 20392) value.
	TryStrToSQLTimeStamp (see page 20388)	Converts a string to a TSQLTimeStamp (see page 20392) value.
	VarIsSQLTimeStamp (see page 20389)	Indicates whether a specified Variant represents a TSQLTimeStamp (see page 20392) value.
	VarSQLTimeStamp (see page 20389)	Returns the TVarType constant that identifies the internal type of a Variant as a TSQLTimeStamp (see page 20392) value.
	VarSQLTimeStampCreate (see page 20390)	Creates a new Variant that stores its value internally as a TSQLTimeStamp (see page 20392) value.
	VarSQLTimeStampCreate (see page 20390)	Creates a new Variant that stores its value internally as a TSQLTimeStamp (see page 20392) value.
	VarSQLTimeStampCreate (see page 20390)	Creates a new Variant that stores its value internally as a TSQLTimeStamp (see page 20392) value.
	VarSQLTimeStampCreate (see page 20390)	Creates a new Variant that stores its value internally as a TSQLTimeStamp (see page 20392) value.

	VarSQLTimeStampCreate (see page 20390)	Creates a new Variant that stores its value internally as a TSQLTimeStamp (see page 20392) value.
	VarToSQLTimeStamp (see page 20391)	Converts a Variant that represents a TSQLTimeStamp (see page 20392) value to the corresponding TSQLTimeStamp (see page 20392).

Structs, Records, Enums

	Name	Description
	TSQLTimeStamp (see page 20392)	TSQLTimeStamp represents time and date values with a high degree of accuracy.

Types

Name	Description
PSQLTimeStamp (see page 20394)	This is type SqlTimSt.PSQLTimeStamp.

150.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CheckSqlTimeStamp (see page 20385)	Checks whether a TSQLTimeStamp (see page 20392) value represents a valid date and time.
	DateTimeToSQLTimeStamp (see page 20386)	Converts a TDateTime value to a TSQLTimeStamp (see page 20392) value.
	SQLDayOfWeek (see page 20386)	Indicates the day of the week when a specified TSQLTimeStamp (see page 20392) value occurs.
	SQLTimeStampToDateTime (see page 20387)	Converts a TSQLTimeStamp (see page 20392) value to a TDateTime value.
	SQLTimeStampToStr (see page 20387)	Converts a TSQLTimeStamp (see page 20392) value to a string.
	StrToSQLTimeStamp (see page 20388)	Converts a string to a TSQLTimeStamp (see page 20392) value.
	TryStrToSQLTimeStamp (see page 20388)	Converts a string to a TSQLTimeStamp (see page 20392) value.
	VarIsSQLTimeStamp (see page 20389)	Indicates whether a specified Variant represents a TSQLTimeStamp (see page 20392) value.
	VarSQLTimeStamp (see page 20389)	Returns the TVarType constant that identifies the internal type of a Variant as a TSQLTimeStamp (see page 20392) value.
	VarSQLTimeStampCreate (see page 20390)	Creates a new Variant that stores its value internally as a TSQLTimeStamp (see page 20392) value.
	VarSQLTimeStampCreate (see page 20390)	Creates a new Variant that stores its value internally as a TSQLTimeStamp (see page 20392) value.
	VarSQLTimeStampCreate (see page 20390)	Creates a new Variant that stores its value internally as a TSQLTimeStamp (see page 20392) value.
	VarSQLTimeStampCreate (see page 20390)	Creates a new Variant that stores its value internally as a TSQLTimeStamp (see page 20392) value.
	VarSQLTimeStampCreate (see page 20390)	Creates a new Variant that stores its value internally as a TSQLTimeStamp (see page 20392) value.
	VarToSQLTimeStamp (see page 20391)	Converts a Variant that represents a TSQLTimeStamp (see page 20392) value to the corresponding TSQLTimeStamp (see page 20392).

150.1.1 SqlTimSt.CheckSqlTimeStamp Function

Checks whether a TSQLTimeStamp (see page 20392) value represents a valid date and time.

Pascal

```
procedure CheckSqlTimeStamp(const ASQLTimeStamp: TSQLTimeStamp);
```

C++

```
CheckSqlTimeStamp(const TSQLTimeStamp ASQLTimeStamp);
```

File

SqlTimSt

Description

CheckSqlTimeStamp checks that the specified TSQLTimeStamp (see page 20392) value represents a valid date and time. If the fields of the ASQLTimeStamp parameter are out of the valid range, CheckSqlTimeStamp raises an EConversionError exception.

See Also

EConvertError

150.1.2 SqlTimSt.DateTimeToSQLTimeStamp Function

Converts a TDateTime value to a TSQLTimeStamp (see page 20392) value.

Pascal

```
function DateTimeToSQLTimeStamp(const DateTime: TDateTime): TSQLTimeStamp;
```

C++

```
TSQLTimeStamp DateTimeToSQLTimeStamp(const TDateTime DateTime);
```

File

SqlTimSt

Description

Use DateTimeToSQLTimeStamp to convert the TDateTime value specified by DateTime to a TSQLTimeStamp (see page 20392) value.

See Also

SQLTimeStampToDateTime (see page 20387)

SQLTimeStampToStr (see page 20387)

StrToSQLTimeStamp (see page 20388)

TSQLTimeStampField

150.1.3 SqlTimSt.SQLDayOfWeek Function

Indicates the day of the week when a specified TSQLTimeStamp (see page 20392) value occurs.

Pascal

```
function SQLDayOfWeek(const DateTime: TSQLTimeStamp): integer;
```

C++

```
int SQLDayOfWeek(const TSQLTimeStamp DateTime);
```

File

SqlTimSt

Description

SQLDayOfWeek returns the day of the week of the specified date as an integer between 1 and 7, where Sunday is the first day of the week and Saturday is the seventh.

See Also

DayOfWeek

150.1.4 SqlTimSt.SQLTimeStampToDateTime Function

Converts a TSQLTimeStamp (see page 20392) value to a TDateTime value.

Pascal

```
function SQLTimeStampToDateTime(const DateTime: TSQLTimeStamp): TDateTime;
```

C++

```
TDateTime SQLTimeStampToDateTime(const TSQLTimeStamp DateTime);
```

File

SqlTimSt

Description

Use SQLTimeStampToDateTime to convert the TSQLTimeStamp (see page 20392) value specified by DateTime to a TDateTime value.

See Also

DateTimeToSQLTimeStamp (see page 20386)

SQLTimeStampToStr (see page 20387)

StrToSQLTimeStamp (see page 20388)

TSQLTimeStampField

150.1.5 SqlTimSt.SQLTimeStampToStr Function

Converts a TSQLTimeStamp (see page 20392) value to a string.

Pascal

```
function SQLTimeStampToStr(const Format: string; DateTime: TSQLTimeStamp): string;
```

C++

```
AnsiString SQLTimeStampToStr(const AnsiString Format, TSQLTimeStamp DateTime);
```

File

SqlTimSt

Description

Use SQLTimeStampToStr to convert a TSQLTimeStamp (see page 20392) value to a string an AnsiString.

DateTimeToStr converts the TSQLTimeStamp (see page 20392) value given by DateTime using the format given by Format and returns the resulting string.

If the string specified by the Format parameter is empty, the TSQLTimeStamp (see page 20392) value is formatted using the ShortDateFormat global variable followed by the LongTimeFormat global variable. The time is not displayed if all time fields in the DateTime parameter are 0.

To create a format string for the Format parameter, use the standard date-time format specifiers:

SQLTimeStampToDateTime (see page 20387)

StrToSQLTimeStamp (see page 20388)

TSQLTimeStampField

CurrencyAndDatetimeFormatting

TryStrToSQLTimeStamp (see page 20388)

150.1.6 SqlTimSt.StrToSQLTimeStamp Function

Converts a string to a TSQLTimeStamp (see page 20392) value.

Pascal

```
function StrToSQLTimeStamp(const S: string): TSQLTimeStamp;
```

C++

```
TSQLTimeStamp StrToSQLTimeStamp(const AnsiString S);
```

File

SqlTimSt

Description

Use StrToSQLTimeStamp to convert the string S to a TSQLTimeStamp (see page 20392) value. If S does not represent a valid date-and-time value, StrToSQLTimeStamp raises an EConvertError exception.

Tip: To convert strings to TSQLTimeStamp (see page 20392) values without raising an exception when the string is not a valid date-and-time, use TryStrToSQLTimeStamp (see page 20388) instead.

See Also

DateTimeToSQLTimeStamp (see page 20386)

SQLTimeStampToStr (see page 20387)

SQLTimeStampToDateTime (see page 20387)

TSQLTimeStampField

EConvertError

TryStrToSQLTimeStamp (see page 20388)

150.1.7 SqlTimSt.TryStrToSQLTimeStamp Function

Converts a string to a TSQLTimeStamp (see page 20392) value.

Pascal

```
function TryStrToSQLTimeStamp(const S: string; var TimeStamp: TSQLTimeStamp): Boolean;
```

C++

```
Boolean TryStrToSQLTimeStamp(const AnsiString S, TSQLTimeStamp TimeStamp);
```

File

SqlTimSt

Description

Use TryStrToSQLTimeStamp to convert the string S to a TSQLTimeStamp (see page 20392) value.

If S can be converted to a TSQLTimeStamp (see page 20392) value, the result is returned as the TimeStamp parameter and TryStrToSQLTimeStamp returns true.

If S can't be converted to a TSQLTimeStamp (see page 20392) value, TimeStamp is set to NullSQLTimeStamp (see page 20395) and TryStrToSQLTimeStamp returns false.

See Also

DateTimeToSQLTimeStamp (see page 20386)

SQLTimeStampToStr (see page 20387)

SQLTimeStampToDateTime (see page 20387)

NullSQLTimeStamp (see page 20395)

StrToSQLTimeStamp (see page 20388)

150.1.8 SqlTimSt.VarIsSQLTimeStamp Function

Indicates whether a specified Variant represents a TSQLTimeStamp (see page 20392) value.

Pascal

```
function VarIsSQLTimeStamp(const aValue: Variant): Boolean; overload;
```

C++

```
Boolean VarIsSQLTimeStamp(const Variant aValue);
```

File

SqlTimSt

Description

VarIsSQLTimeStamp returns true if the Variant aValue stores its value internally as a TSQLTimeStamp (see page 20392) value. VarIsSQLTimeStamp returns false otherwise.

See Also

VarToSQLTimeStamp (see page 20391)

TSQLTimeStamp (see page 20392)

150.1.9 SqlTimSt.VarSQLTimeStamp Function

Returns the TVarType constant that identifies the internal type of a Variant as a TSQLTimeStamp (see page 20392) value.

Pascal

```
function VarSQLTimeStamp: TVarType;
```

C++

```
TVarType VarSQLTimeStamp();
```

File

SqlTimSt

Description

VarSQLTimeStamp returns the TVarType constant that identifies a TSQLTimeStamp (see page 20392)-valued Variant. This is the value that the VarType function returns when the Variant stores its value as a TSQLTimeStamp (see page 20392) value.

The Variant type codes for custom Variants (see page 23567) are dynamically allocated when the application loads the unit that implements them. VarSQLTimeStamp allows the application to identify the Variant type code that is currently used for custom Variants (see page 23567) that represent an SQL time stamp. This value, however, may not match the type code used by another application that uses a different set of custom Variant types.

VarIsSQLTimeStamp (see page 20389)

VarType

TSQLTimeStamp (see page 20392)

VarToSQLTimeStamp (see page 20391)

150.1.10 SqlTimSt.VarSQLTimeStampCreate Function

Creates a new Variant that stores its value internally as a TSQLTimeStamp (see page 20392) value.

Pascal

```
procedure VarSQLTimeStampCreate(var aDest: Variant; const ASQLTimeStamp: TSQLTimeStamp);
overload;
function VarSQLTimeStampCreate: Variant; overload;
function VarSQLTimeStampCreate(const AValue: string): Variant; overload;
function VarSQLTimeStampCreate(const AValue: TDateTime): Variant; overload;
function VarSQLTimeStampCreate(const ASQLTimeStamp: TSQLTimeStamp): Variant; overload;
```

C++

```
VarSQLTimeStampCreate(Variant aDest, const TSQLTimeStamp ASQLTimeStamp);
Variant VarSQLTimeStampCreate();
Variant VarSQLTimeStampCreate(const AnsiString AValue);
Variant VarSQLTimeStampCreate(const TDateTime AValue);
Variant VarSQLTimeStampCreate(const TSQLTimeStamp ASQLTimeStamp);
```

File

SqlTimSt

Description

Call VarSQLTimeStampCreate to obtain a Variant that stores its value as a TSQLTimeStamp (see page 20392) value.

Using the first syntax, the Variant returned as aDest has the same value as ASQLTimeStamp.

Using the second syntax (passing no arguments), the returned Variant has a value of NullSQLTimeStamp (see page 20395).

Using the third syntax, the returned Variant has the same value as ASQLTimeStamp.

Using the fourth syntax, the returned Variant represents the same date and time as the TDateTime value AValue.

See Also

VarIsSQLTimeStamp (see page 20389)

VarToSQLTimeStamp (see page 20391)

NullSQLTimeStamp (see page 20395)

150.1.11 SqlTimSt.VarToSQLTimeStamp Function

Converts a Variant that represents a TSQLTimeStamp (see page 20392) value to the corresponding TSQLTimeStamp (see page 20392).

Pascal

```
function VarToSQLTimeStamp(const aValue: Variant): TSQLTimeStamp;
```

C++

```
TSQLTimeStamp VarToSQLTimeStamp(const Variant aValue);
```

File

SqlTimSt

Description

Use VarToSQLTimeStamp to obtain a TSQLTimeStamp (see page 20392) from a variant whose value represents a date-and-time value. If the Variant is a Null Variant, VarToSQLTimeStamp returns NullSQLTimeStamp (see page 20395).

See Also

VarIsSQLTimeStamp (see page 20389)

TSQLTimeStamp (see page 20392)

NullSQLTimeStamp (see page 20395)

150.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TSQLTimeStamp (see page 20392)	TSQLTimeStamp represents time and date values with a high degree of accuracy.

150.2.1 SqlTimSt.TSQLTimeStamp Record

TSQLTimeStamp represents time and date values with a high degree of accuracy.

Pascal

```
TSQLTimeStamp = packed record
  Year: SmallInt;
  Month: Word;
  Day: Word;
  Hour: Word;
  Minute: Word;
  Second: Word;
  Fractions: LongWord;
end;
```

C++

```
struct TSQLTimeStamp {
  SmallInt Year;
  Word Month;
  Word Day;
  Word Hour;
  Word Minute;
  Word Second;
  LongWord Fractions;
};
```

File

SqlTimSt

Description

The dbExpress database drivers use TSQLTimeStamp when working with date and time information. Year specifies a year from 1 to 9999. Month specifies a month from 1 to 12. Day specifies a day of the month, from 1 through 28, 29, 30, or 31, depending on the Month value. Hour specifies the hour from 0 to 23. Minute and Second can range from 0 to 59. Fractions specifies milliseconds from 0 to 999.

You can create a Variant that represents a TSQLTimeStamp value using the VarSQLTimeStampCreate (see page 20390) function. In fact, the easiest way to manipulate TSQLTimeStamp values is to create such a Variant and use the built-in operators provided by the Variant type.

150.3 Types

The following table lists types in this documentation.

Types

Name	Description
PSQLTimeStamp (see page 20394)	This is type SqlTimSt.PSQLTimeStamp.

150.3.1 SqlTimSt.PSQLTimeStamp Type

Pascal

```
PSQLTimeStamp = ^TSQLTimeStamp;
```

C++

```
^TSQLTimeStamp PSQLTimeStamp;
```

File

SqlTimSt

Description

This is type SqlTimSt.PSQLTimeStamp.

150.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
NullSQLTimeStamp (see page 20395)	This is constant SqlTimSt.NullSQLTimeStamp.

150.4.1 SqlTimSt.NullSQLTimeStamp Constant

Pascal

```
NullSQLTimeStamp: TSQLTimeStamp = (Year: 0; Month: 0; Day: 0; Hour: 0; Minute: 0; Second: 0;
Fractions: 0);
```

C++

```
TSQLTimeStamp NullSQLTimeStamp = (Year: 0; Month: 0; Day: 0; Hour: 0; Minute: 0; Second: 0;
Fractions: 0);
```

File

SqlTimSt

Description

This is constant SqlTimSt.NullSQLTimeStamp.

Classes

	Name	Description
	TStandardAddRemoveItem (see page 20398)	TStandardAddRemoveItem is the ActionBand menu class for customizing action bands.
	TStandardButtonControl (see page 20408)	This is class StdActnMenus.TStandardButtonControl.
	TStandardCustomizePopup (see page 20418)	This is class StdActnMenus.TStandardCustomizePopup.
	TStandardDropDownButton (see page 20434)	This is class StdActnMenus.TStandardDropDownButton.
	TStandardMenuButton (see page 20444)	TStandardMenuButton is the standard ActionBand menu button class.
	TStandardMenuExpandBtn (see page 20455)	This is class StdActnMenus.TStandardMenuExpandBtn.
	TStandardMenuItem (see page 20465)	TStandardMenuItem is the default class for menu items in an action band.
	TStandardMenuPopup (see page 20478)	TStandardMenuPopup is the default menu popup style.
	TStandardToolScrollBtn (see page 20494)	This is class StdActnMenus.TStandardToolScrollBtn.

Functions

	Name	Description
	RegisterStandardMenus (see page 20504)	This is function StdActnMenus.RegisterStandardMenus.

151.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TStandardAddRemoveItem (see page 20398)	TStandardAddRemoveItem is the ActionBand menu class for customizing action bands.
	TStandardButtonControl (see page 20408)	This is class StdActnMenus.TStandardButtonControl.
	TStandardCustomizePopup (see page 20418)	This is class StdActnMenus.TStandardCustomizePopup.
	TStandardDropDownButton (see page 20434)	This is class StdActnMenus.TStandardDropDownButton.
	TStandardMenuButton (see page 20444)	TStandardMenuButton is the standard ActionBand menu button class.
	TStandardMenuExpandBtn (see page 20455)	This is class StdActnMenus.TStandardMenuExpandBtn.
	TStandardMenuItem (see page 20465)	TStandardMenuItem is the default class for menu items in an action band.
	TStandardMenuPopup (see page 20478)	TStandardMenuPopup is the default menu popup style.
	TStandardToolScrollBtn (see page 20494)	This is class StdActnMenus.TStandardToolScrollBtn.

151.1.1 TStandardAddRemoveItem Class

TStandardAddRemoveItem is the ActionBand menu class for customizing action bands.

Class Hierarchy

Pascal

```
TStandardAddRemoveItem = class(TCustomAddRemoveItem);
```

C++

```
class TStandardAddRemoveItem : public TCustomAddRemoveItem;
```

File

StdActnMenus

Description

TStandardAddRemoveItem is the standard ActionBand menu for customizing action bands at runtime.

Do not create instances of TStandardAddRemoveItem as this will be done for you automatically if the class is the default customization menu. If you would like to replace the standard customization menu, use the class TCustomAddRemoveItem as a parent class for your replacement class. To make the change for your application, set the value of MenuAddRemoveItemClass (a global variable) to your own subclass of TCustomAddRemoveItem instead of TStandardAddRemoveItem.

See Also

TCustomAddRemoveItem (see page 745)

151.1.1.1 TStandardAddRemoveItem Members

The following tables list the members exposed by TStandardAddRemoveItem.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FNoPrefix (see page 826)	This is FNoPrefix, a member of class TCustomMenuItem.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.

	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CalcLayout (see page 827)	This is CalcLayout, a member of class TCustomMenuItem.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
V	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
V	DoDragDrop (see page 828)	This is DoDragDrop, a member of class TCustomMenuItem.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 521)	OnDragOver event dispatcher.
V	DragOver (see page 828)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawBackground (see page 20407)	Draws a background image on the customization menu.
V	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
V	DrawEdge (see page 829)	This is DrawEdge, a member of class TCustomMenuItem.
V	DrawGlyph (see page 20408)	Draws a symbol on the control.

	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
	DrawShadowedText (see page 829)	This is DrawShadowedText, a member of class TCustomMenuItem.
	DrawSubMenuGlyph (see page 829)	This is DrawSubMenuGlyph, a member of class TCustomMenuItem.
	DrawText (see page 523)	Draws text on the control.
	DrawText (see page 829)	This is DrawText, a member of class TCustomMenuItem.
	DrawUnusedEdges (see page 830)	This is DrawUnusedEdges, a member of class TCustomMenuItem.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionVisible (see page 755)	Indicates whether the add/remove item is visible in the menu of the customize dialog.
	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 755)	Responds when the user releases the mouse button when the mouse cursor is on this menu item.
	MouseUp (see page 830)	OnMouseUp event dispatcher.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.

	Paint (see page 526)	Render control surface.
	Paint (see page 831)	Render control surface.
	Paint (see page 6052)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionChanged (see page 831)	This is PositionChanged, a member of class TCustomMenuItem.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
	SetEnabled (see page 756)	Sets the value of the Enabled property.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetSelected (see page 831)	This is SetSelected, a member of class TCustomMenuItem.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.

	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Menu (see page 832)	This is Menu, a member of class TCustomMenuItem.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseSelected (see page 832)	This is MouseSelected, a member of class TCustomMenuItem.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ShortCutBounds (see page 832)	This is ShortCutBounds, a member of class TCustomMenuItem.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 518)	Calculates the size of the control.

	CalcBounds (see page 754)	Calculates the size of the add/remove menu item.
	CalcBounds (see page 827)	Calculates the size of the menu item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Click (see page 518)	Executes the control's function in response to a mouse click.
	Click (see page 827)	Executes the control's function.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	Create (see page 515)	Creates an instance of TCustomActionControl (see page 507).
	Create (see page 825)	Creates an instance of TCustomMenuItem (see page 816).
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 5731)	Creates an instance of TControl (see page 5724).
	Create (see page 6051)	Creates an instance of TGraphicControl (see page 6044).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 516)	Destroys an instance of TCustomActionControl (see page 507).
	Destroy (see page 825)	Destroys an instance of TCustomMenuItem (see page 816).
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 828)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
V	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
V	Keyed (see page 830)	Executes the menu item's function in response to a user's keyboard command.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.

V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Edges (see page 832)	Dictates which edges are drawn when the menu item is drawn.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	Selected (see page 533)	Indicates whether the control is currently selected.

R	Separator (see page 533)	Indicates whether the control is a separator.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

151.1.1.2 TStandardAddRemoveItem Methods

The methods of the TStandardAddRemoveItem class are listed here.

Protected Methods

	Name	Description
V	DrawBackground (see page 20407)	Draws a background image on the customization menu.
V	DrawGlyph (see page 20408)	Draws a symbol on the control.

151.1.1.2.1 TStandardAddRemoveItem.DrawBackground Method

Draws a background image on the customization menu.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

This method is largely the same as the inherited method, with some modifications to account for the method of selection. See the inherited method for more details.

See Also

DrawBackground (see page 521)

DrawGlyph (see page 20408)

DrawText

151.1.1.2.2 TStandardAddRemoveItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

DrawGlyph performs the same function as the method it inherits from, and it does call the inherited method. The override sets many of the draw parameters based on the present state of the menu and how it has been selected.

See Also

DrawGlyph (see page 522)

DrawBackground (see page 20407)

DrawText

151.1.2 TStandardButtonControl Class

Class Hierarchy

Pascal

```
TStandardButtonControl = class(TCustomButtonControl);
```

C++

```
class TStandardButtonControl : public TCustomButtonControl;
```

File

StdActnMenus

Description

This is class StdActnMenus.TStandardButtonControl.

151.1.2.1 TStandardButtonControl Members

The following tables list the members exposed by TStandardButtonControl.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFlat (see page 178)	This is FFlat, a member of class TCustomButtonControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FState (see page 178)	This is FState, a member of class TCustomButtonControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.

	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMDialogChar (see page 180)	This is CMDialogChar, a member of class TCustomButtonControl.
	CMEnabledChanged (see page 180)	This is CMEnabledChanged, a member of class TCustomButtonControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
	CMMouseEnter (see page 180)	This is CMMouseEnter, a member of class TCustomButtonControl.
	CMMouseLeave (see page 180)	This is CMMouseLeave, a member of class TCustomButtonControl.
	CMTextChanged (see page 180)	This is CMTextChanged, a member of class TCustomButtonControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
V	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 521)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawBackground (see page 181)	Draws a background image on the control.
V	DrawBackground (see page 521)	Draws a background image on the control.
V	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.

	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
V	DrawFrame (see page 20417)	This is DrawFrame, a member of class TStandardButtonControl.
V	DrawGlyph (see page 20418)	Draws a symbol on the control.
V	DrawLargeGlyph (see page 181)	This is DrawLargeGlyph, a member of class TCustomButtonControl.
V	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
V	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
V	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
V	DrawText (see page 20418)	This is DrawText, a member of class TStandardButtonControl.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
V	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
V	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
V	GetShowShortCut (see page 181)	This is GetShowShortCut, a member of class TCustomButtonControl.
V	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
V	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
V	Loaded (see page 182)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
V	MouseDown (see page 182)	OnMouseDown event dispatcher.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
V	MouseMove (see page 183)	Respond to mouse moving over control area..
	MouseMove (see page 5773)	Respond to mouse moving over control area..
V	MouseUp (see page 183)	OnMouseUp event dispatcher.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.

	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Paint (see page 184)	Render control surface.
	Paint (see page 526)	Render control surface.
	Paint (see page 6052)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 184)	This is SetActionClient, a member of class TCustomButtonControl.
	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetGlyphLayout (see page 185)	This is SetGlyphLayout, a member of class TCustomButtonControl.
	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelected (see page 185)	This is SetSelected, a member of class TCustomButtonControl.
	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMLButtonDblClk (see page 185)	This is WMLButtonDblClk, a member of class TCustomButtonControl.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseInControl (see page 189)	This is MouseInControl, a member of class TCustomButtonControl.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 179)	Calculates the size of the control.

	CalcBounds (see page 518)	Calculates the size of the control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Click (see page 179)	Executes the control's function.
	Click (see page 518)	Executes the control's function in response to a mouse click.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	Create (see page 177)	Creates an instance of TCustomButtonControl (see page 168).
	Create (see page 515)	Creates an instance of TCustomActionControl (see page 507).
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 5731)	Creates an instance of TControl (see page 5724).
	Create (see page 6051)	Creates an instance of TGraphicControl (see page 6044).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 516)	Destroys an instance of TCustomActionControl (see page 507).
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
	SetBounds (see page 184)	Sets the Left, Top, Width, and Height properties all at once.
	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.

	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	AllowAllUp (see page 186)	Indicates whether all the buttons in a given group can be up at the same time.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 186)	Specifies a text string that identifies the control to the user.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Down (see page 189)	Tells whether the button is down (selected) or up (unselected).
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	Flat (see page 189)	Dictates whether the button should have a 2D look instead of the usual 3D look.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	Selected (see page 533)	Indicates whether the control is currently selected.

R	Separator (see page 533)	Indicates whether the control is a separator.
	ShowCaption (see page 189)	Indicates whether the control's caption should be shown.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
	ShowShortCut (see page 190)	Indicates whether the control's short cut should be shown.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	State (see page 190)	Describes the current state of the button.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	TrackButton (see page 190)	Specifies which mouse button activates the button control.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

151.1.2.2 TStandardButtonControl Methods

The methods of the TStandardButtonControl class are listed here.

Protected Methods

	Name	Description
V	DrawFrame (see page 20417)	This is DrawFrame, a member of class TStandardButtonControl.
V	DrawGlyph (see page 20418)	Draws a symbol on the control.
V	DrawText (see page 20418)	This is DrawText, a member of class TStandardButtonControl.

151.1.2.2.1 TStandardButtonControl.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); override;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TStandardButtonControl.

151.1.2.2.2 TStandardButtonControl.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground (see page 521)

DrawText (see page 523)

151.1.2.2.3 TStandardButtonControl.DrawText Method

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: String); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, AnsiString Text);
```

Description

This is DrawText, a member of class TStandardButtonControl.

151.1.3 TStandardCustomizePopup Class

Class Hierarchy

Pascal

```
TStandardCustomizePopup = class(TCustomizeActionToolBar);
```

C++

```
class TStandardCustomizePopup : public TCustomizeActionToolBar;
```

File

StdActnMenus

Description

This is class StdActnMenus.TStandardCustomizePopup.

151.1.3.1 TStandardCustomizePopup Members

The following tables list the members exposed by TStandardCustomizePopup.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.

	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FCachedMenu (see page 699)	This is FCachedMenu, a member of class TCustomActionMenuBar.
	FChildMenu (see page 699)	This is FChildMenu, a member of class TCustomActionMenuBar.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefaultColorMap (see page 460)	This is FDefaultColorMap, a member of class TCustomActionBar.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExpandTimer (see page 700)	This is FExpandTimer, a member of class TCustomActionMenuBar.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FPopupTimer (see page 700)	This is FPopupTimer, a member of class TCustomActionMenuBar.
	FSavedWrapState (see page 460)	This is FSavedWrapState, a member of class TCustomActionBar.
	FSelectedItem (see page 700)	This is FSelectedItem, a member of class TCustomActionMenuBar.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AddEdges (see page 737)	This is AddEdges, a member of class TCustomActionPopupMenu.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 462)	Aligns any controls for which the control is the parent within a specified area of the control.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	Animate (see page 701)	This is Animate, a member of class TCustomActionMenuBar.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
V	AutoSizingChanged (see page 462)	This is AutoSizingChanged, a member of class TCustomActionBar.
	BackgroundSize (see page 462)	This is BackgroundSize, a member of class TCustomActionBar.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcInsertPosition (see page 462)	This is CalcInsertPosition, a member of class TCustomActionBar.
V	CanAutoSize (see page 20433)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CleanupStack (see page 701)	This is CleanupStack, a member of class TCustomActionMenuBar.

	Clear (see page 463)	This is Clear, a member of class TCustomActionBar.
	Clear (see page 778)	This is Clear, a member of class TCustomizeActionToolBar.
	ClearSubMenus (see page 702)	This is ClearSubMenus, a member of class TCustomActionMenuBar.
	Click (see page 5743)	Respond to user click.
	CMBorderChanged (see page 23285)	This is CMBorderChanged, a member of class TToolWindow.
	CMCtl3DChanged (see page 23286)	This is CMCtl3DChanged, a member of class TToolWindow.
	CMMouseLeave (see page 738)	This is CMMouseLeave, a member of class TCustomActionPopupMenu.
	CMVisibleChanged (see page 738)	This is CMVisibleChanged, a member of class TCustomActionPopupMenu.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateControl (see page 463)	This is CreateControl, a member of class TCustomActionBar.
	CreateControl (see page 702)	This is CreateControl, a member of class TCustomActionMenuBar.
	CreateControl (see page 738)	This is CreateControl, a member of class TCustomActionPopupMenu.
	CreateControls (see page 463)	This is CreateControls, a member of class TCustomActionBar.
	CreateControls (see page 738)	This is CreateControls, a member of class TCustomActionPopupMenu.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 739)	Initializes a window-creation parameter data structure.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreatePopup (see page 702)	This is CreatePopup, a member of class TCustomActionMenuBar.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 463)	Returns placement order of custom-aligned child control.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 464)	Returns aligned position of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 465)	This is DesignWndProc, a member of class TCustomActionBar.
	DesignWndProc (see page 739)	This is DesignWndProc, a member of class TCustomActionPopupMenu.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DisplayShadow (see page 739)	This is DisplayShadow, a member of class TCustomActionPopupMenu.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoControlCreated (see page 465)	This is DoControlCreated, a member of class TCustomActionBar.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoDropActions (see page 465)	This is DoDropActions, a member of class TCustomActionBar.
	DoDropCategory (see page 465)	This is DoDropCategory, a member of class TCustomActionBar.

	DoDropItem (see page 466)	This is DoDropItem, a member of class TCustomActionBar.
	DoEndDock (see page 146)	OnEndDock event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetControlClass (see page 466)	This is DoGetControlClass, a member of class TCustomActionBar.
	DoGetPopupClass (see page 703)	This is DoGetPopupClass, a member of class TCustomActionMenuBar.
	DoItemClicked (see page 703)	This is DoItemClicked, a member of class TCustomActionMenuBar.
	DoItemClicked (see page 778)	This is DoItemClicked, a member of class TCustomizeActionToolBar.
	DoItemKeyed (see page 703)	This is DoItemKeyed, a member of class TCustomActionMenuBar.
	DoItemSelected (see page 703)	This is DoItemSelected, a member of class TCustomActionMenuBar.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMenuDelay (see page 703)	This is DoMenuDelay, a member of class TCustomActionMenuBar.
	DoMouseIdle (see page 704)	This is DoMouseIdle, a member of class TCustomActionMenuBar.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoneMenuLoop (see page 704)	This is DoneMenuLoop, a member of class TCustomActionMenuBar.
	DoPopup (see page 704)	This is DoPopup, a member of class TCustomActionMenuBar.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 147)	OnStartDock event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 466)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawBackground (see page 467)	This is DrawBackground, a member of class TCustomActionBar.
	DrawBackground (see page 740)	This is DrawBackground, a member of class TCustomActionPopupMenu.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	ExecAction (see page 704)	This is ExecAction, a member of class TCustomActionMenuBar.
	ExecAction (see page 740)	This is ExecAction, a member of class TCustomActionPopupMenu.
	Expand (see page 704)	Causes the menu bar to show all items, including the hidden ones.
	ExpandClick (see page 740)	This is ExpandClick, a member of class TCustomActionPopupMenu.
	ExpandTimer (see page 705)	This is ExpandTimer, a member of class TCustomActionMenuBar.
	FindAccelItem (see page 467)	This is FindAccelItem, a member of class TCustomActionBar.
	FindItemAt (see page 468)	This is FindItemAt, a member of class TCustomActionBar.
	FindItemCaption (see page 468)	This is FindItemCaption, a member of class TCustomActionBar.
	FindLast (see page 468)	This is FindLast, a member of class TCustomActionBar.
	FindLeastUsedItem (see page 469)	This is FindLeastUsedItem, a member of class TCustomActionBar.
	FindNearestControl (see page 469)	This is FindNearestControl, a member of class TCustomActionBar.
	FindNext (see page 470)	This is FindNext, a member of class TCustomActionBar.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FindNextVisibleItem (see page 470)	This is FindNextVisibleItem, a member of class TCustomActionBar.
	FindPrevious (see page 470)	This is FindPrevious, a member of class TCustomActionBar.
	FindPreviousVisibleItem (see page 470)	This is FindPreviousVisibleItem, a member of class TCustomActionBar.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.

	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionControl (see page 471)	This is GetActionControl, a member of class TCustomActionBar.
	GetActionControl (see page 779)	This is GetActionControl, a member of class TCustomizeActionToolBar.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetAddRemoveItemClass (see page 779)	This is GetAddRemoveItemClass, a member of class TCustomizeActionToolBar.
	GetBannerWidth (see page 471)	This is GetBannerWidth, a member of class TCustomActionBar.
	GetBarHeight (see page 471)	This is GetBarHeight, a member of class TCustomActionBar.
	GetBarWidth (see page 471)	This is GetBarWidth, a member of class TCustomActionBar.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 741)	Returns the value of the ClientRect property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlClass (see page 471)	This is GetControlClass, a member of class TCustomActionBar.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDefaultColorMapClass (see page 472)	This is GetDefaultColorMapClass, a member of class TCustomActionBar.
	GetDefaultSounds (see page 705)	This is GetDefaultSounds, a member of class TCustomActionMenuBar.
	GetDesignMode (see page 472)	This is GetDesignMode, a member of class TCustomActionBar.
	GetDesignMode (see page 705)	This is GetDesignMode, a member of class TCustomActionMenuBar.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetExpandBtnClass (see page 741)	This is GetExpandBtnClass, a member of class TCustomActionPopupMenu.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 147)	Returns the class used for the control when it is floating.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetMouseHoverItem (see page 705)	This is GetMouseHoverItem, a member of class TCustomActionMenuBar.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupClass (see page 706)	This is GetPopupClass, a member of class TCustomActionMenuBar.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetPopupMenuClass (see page 472)	This is GetPopupMenuClass, a member of class TCustomActionBar.
	GetSelected (see page 706)	This is GetSelected, a member of class TCustomActionMenuBar.
	GetSiteInfo (see page 147)	Generates an OnGetSiteInfo event
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetSubMenuControlClass (see page 779)	This is GetSubMenuControlClass, a member of class TCustomizeActionToolBar.
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasItems (see page 472)	This is HasItems, a member of class TCustomActionBar.

	HideShadow (see page 741)	This is HideShadow, a member of class TCustomActionPopupMenu.
	Idle (see page 706)	This is Idle, a member of class TCustomActionMenuBar.
	InitMenuLoop (see page 706)	This is InitMenuLoop, a member of class TCustomActionMenuBar.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsDesignMsg (see page 707)	This is IsDesignMsg, a member of class TCustomActionMenuBar.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	ItemCount (see page 473)	This is ItemCount, a member of class TCustomActionBar.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 148)	Initializes the control after it is loaded from a stream.
	Loaded (see page 473)	Initializes the control after it is loaded from a stream.
	Loaded (see page 707)	Initializes the control after it is loaded from a stream.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 707)	This is MouseActivate, a member of class TCustomActionMenuBar.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	NCPaint (see page 20434)	This is NCPaint, a member of class TStandardCustomizePopup.
	NewPopup (see page 707)	This is NewPopup, a member of class TCustomActionMenuBar.
	NewPopup (see page 741)	This is NewPopup, a member of class TCustomActionPopupMenu.
	NewPopup (see page 780)	This is NewPopup, a member of class TCustomizeActionToolBar.
	Notification (see page 473)	Responds to notifications that components are being created or destroyed.
	Notification (see page 708)	Responds to notifications that components are being created or destroyed.
	Notification (see page 742)	Responds to notifications that components are being created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 474)	This is Paint, a member of class TCustomActionBar.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 474)	Renders the image of a windowed control.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	PositionPopup (see page 20434)	This is PositionPopup, a member of class TStandardCustomizePopup.
	ProcessMenuLoop (see page 708)	This is ProcessMenuLoop, a member of class TCustomActionMenuBar.
	ProcessMessage (see page 708)	This is ProcessMessage, a member of class TCustomActionMenuBar.
	ProcessMessages (see page 709)	This is ProcessMessages, a member of class TCustomActionMenuBar.
	ProcessMouseMsg (see page 709)	This is ProcessMouseMsg, a member of class TCustomActionMenuBar.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.

	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Reset (see page 475)	This is Reset, a member of class TCustomActionBar.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Select (see page 709)	This is Select, a member of class TCustomActionMenuBar.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectItem (see page 710)	This is SelectItem, a member of class TCustomActionMenuBar.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 475)	This is SetActionClient, a member of class TCustomActionBar.
	SetActionClient (see page 780)	This is SetActionClient, a member of class TCustomizeActionToolBar.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetAutoSizing (see page 475)	This is SetAutoSizing, a member of class TCustomActionBar.
	SetBiDiMode (see page 475)	Sets the control's bi-directional mode.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetColorMap (see page 476)	This is SetColorMap, a member of class TCustomActionBar.
	SetColorMap (see page 743)	This is SetColorMap, a member of class TCustomActionPopupMenu.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignMode (see page 476)	This is SetDesignMode, a member of class TCustomActionBar.
	SetDesignMode (see page 710)	Specifies whether the whether the action band is being customized or being used in the IDE.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetOrientation (see page 477)	This is SetOrientation, a member of class TCustomActionBar.
	SetOrientation (see page 743)	This is SetOrientation, a member of class TCustomActionPopupMenu.
	SetParent (see page 710)	Sets the parent of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetPersistentHotKeys (see page 477)	This is SetPersistentHotKeys, a member of class TCustomActionBar.

V	SetPersistentHotKeys (see page 711)	This is SetPersistentHotKeys, a member of class TCustomActionMenuBar.
V	SetSpacing (see page 477)	This is SetSpacing, a member of class TCustomActionBar.
	SetupDefaultColorMap (see page 477)	This is SetupDefaultColorMap, a member of class TCustomActionBar.
	SetupExpandBtn (see page 743)	This is SetupExpandBtn, a member of class TCustomActionPopupMenu.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	VisibleChanging (see page 478)	Provides the interface for a method that responds to changes in the control's visibility.
V	VisibleChanging (see page 743)	Provides the interface for a method that responds to changes in the control's visibility.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMKeyDown (see page 744)	This is WMKeyDown, a member of class TCustomActionPopupMenu.
	WMNCCalcSize (see page 23286)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCPaint (see page 23286)	This is WMNCPaint, a member of class TToolWindow.
	WMPrint (see page 744)	This is WMPrint, a member of class TCustomActionPopupMenu.
	WMPrintClient (see page 744)	This is WMPrintClient, a member of class TCustomActionPopupMenu.
V	WndProc (see page 711)	Provides specific message responses for the control.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
R	AddlItem (see page 780)	This is AddlItem, a member of class TCustomizeActionToolBar.
	AnimateDuration (see page 716)	This is AnimateDuration, a member of class TCustomActionMenuBar.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.

	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DelayItem (see page 717)	This is DelayItem, a member of class TCustomActionMenuBar.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Expandable (see page 717)	This is Expandable, a member of class TCustomActionMenuBar.
	Expanded (see page 718)	This is Expanded, a member of class TCustomActionMenuBar.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
R	HRowCount (see page 488)	Indicates the number of columns of items that the action band displays.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Items (see page 488)	Lists the action clients that correspond to the child controls of this action band.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	MouseControl (see page 718)	This is MouseControl, a member of class TCustomActionMenuBar.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentMenu (see page 719)	This is ParentMenu, a member of class TCustomActionMenuBar.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
R	PopupStack (see page 719)	This is PopupStack, a member of class TCustomActionMenuBar.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
R	Selected (see page 719)	This is Selected, a member of class TCustomActionMenuBar.
	Text (see page 5842)	Contains a text string associated with the control.
R	VRowCount (see page 490)	Indicates the number of rows of items that the action band displays.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
R	Widest (see page 491)	This is Widest, a member of class TCustomActionBar.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnControlCreated (see page 491)	Occurs when a control is created on the action band.
	OnEnterMenuLoop (see page 720)	Occurs when an ActionBand menu loop has begun.
	OnExitMenuLoop (see page 721)	Occurs when an ActionBand menu loop has ended and the menu is closed.
	OnGetControlClass (see page 492)	Occurs when an item is to be placed on the action band.
	OnGetPopupClass (see page 721)	Occurs prior to an ActionBand popupmenu appearing on screen.
	OnPaint (see page 492)	Occurs when the action band is painted.
	OnPopup (see page 721)	Occurs just before the pop-up menu appears.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.

	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CalcDockedWidth (see page 146)	This is CalcDockedWidth, a member of class TCustomActionDockBar.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	CloseMenu (see page 702)	Closes the menu currently being displayed.
	CloseMenu (see page 737)	Closes the menu currently being displayed.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 145)	Creates and initializes a TCustomActionDockBar (see page 133) instance.
	Create (see page 459)	Creates and initializes a TCustomActionBar (see page 447) instance.
	Create (see page 698)	Creates and initializes a TCustomActionMenuBar (see page 685) instance.
	Create (see page 735)	Creates and initializes a TCustomActionPopupMenu (see page 721) instance.
	Create (see page 777)	Creates and initializes a TCustomActionPopupMenu instance.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 5731)	Creates an instance of TControl (see page 5724).
	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 23285)	Creates and initializes a TToolWindow (see page 23274) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 459)	Destroys an instance of TCustomActionBar (see page 447).
	Destroy (see page 698)	Destroys an instance of TCustomActionMenuBar (see page 685).
	Destroy (see page 736)	Destroys an instance of TCustomActionMenuBar (see page 685).
	Destroy (see page 777)	Destroys an instance of TCustomActionMenuBar.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 146)	Used internally to dock the action band.
	Dock (see page 5749)	Used internally to dock the control.

	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
V	DragDrop (see page 466)	Generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	Expand (see page 740)	Performs the same kinds of functions as the inherited method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
V	FindFirst (see page 467)	Finds the first TActionClientItem (see page 374) in the Items (see page 488) list.
	FindFirstVisibleItem (see page 468)	Finds the first visible TActionClientItem (see page 374) in the Items (see page 488) list.
	FindLastVisibleItem (see page 469)	Finds the last visibleTActionClientItem in the Items (see page 488) list.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.

	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ItemCount (see page 779)	This is ItemCount, a member of class TCustomizeActionToolBar.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	Popup (see page 742)	Causes the popup menu to appear.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	RecreateControls (see page 475)	Destroys and recreates all of the action band's action client controls.
	RecreateControls (see page 709)	Destroys and recreates all of the action band's action client controls.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
	SetBounds (see page 476)	Sets the bounds based on whether the popup is expanded or not
	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetDesignVisible (see page 6178)	Makes a control visible at design time.
	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Style (see page 477)	Identifies the style object that gives the application its default look and feel.
	Style (see page 711)	Retrieves the style used by the ActionBand menu that started the menu loop so the submenus have a consistent appearance.
	TrackMenu (see page 711)	Executes the action associated with the menu item.
	Update (see page 5789)	Processes any pending paint messages immediately.
	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.

	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	ActionClient (see page 479)	Specifies the action client associated with this action band.
R	ActionControls (see page 479)	Lists the controls on the action band.
	ActionManager (see page 480)	Specifies the action manager component that is associated with the action band.
R	AdditionalItem (see page 780)	This is AdditionalItem, a member of class TCustomizeActionToolBar.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AllowHiding (see page 480)	Determines whether the action band can be hidden.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AnimationStyle (see page 716)	Specifies the type of animation the menu bar will display as it opens.
	AutoFocus (see page 717)	This is AutoFocus, a member of class TCustomActionMenuBar.
	AutoSizing (see page 480)	Specifies whether the action band adjusts its size automatically to fit around its child controls.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 481)	Represents the drawing surface of the action band.
	Caption (see page 481)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 483)	Specifies the background color of the control.
	ColorMap (see page 484)	Indicates the colormap for individual action band components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ContextBar (see page 485)	Indicates whether items shown in this action band represent the items in a popup menu.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Designable (see page 485)	Specifies whether the action band can be customized (used internally by the IDE).
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignMode (see page 486)	Specifies whether the action band is being customized or being used in the IDE.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.

	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	EdgeBorders (see page 23287)	Determines which sides of the control have visible borders.
	EdgeInner (see page 23287)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 23288)	Determines the border style for the control's outer edge.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
	ExpandBtn (see page 744)	Refers to the popup menu's expand button.
	ExpandDelay (see page 717)	Specifies, in milliseconds, the delay period that a menu action band uses before showing hidden or unused items.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	Font (see page 486)	Controls the attributes of text written on or in the control.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HorzMargin (see page 487)	Specifies the width of the horizontal margins in pixels.
	HorzSeparator (see page 487)	Indicates whether a horizontal separator bar appears between item lines.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	InMenuLoop (see page 718)	Indicates whether items in the menu can be selected.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	Orientation (see page 488)	Specifies how the action band lays out its child items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentControl (see page 718)	Refers to the parent object of the TCustomActionBarControl.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	PersistentHotKeys (see page 489)	Specifies whether keyboard accelerator shortcuts are always displayed.
	RootMenu (see page 719)	Refers to the root menu of the ActionBand menu.
	Shadow (see page 745)	Refers to the popup menu's shadow.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	Spacing (see page 489)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	UseSystemFont (see page 720)	Specifies whether the default system font for menu items is used.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	VertMargin (see page 490)	Specifies the width of the vertical margins in pixels.
	VertSeparator (see page 490)	Indicates whether a vertical separator bar should appear between item lines.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

151.1.3.2 TStandardCustomizePopup Methods

The methods of the TStandardCustomizePopup class are listed here.

Protected Methods

	Name	Description
	CanAutoSize (see page 20433)	Indicates how the control can be resized.
	NCPaint (see page 20434)	This is NCPaint, a member of class TStandardCustomizePopup.
	PositionPopup (see page 20434)	This is PositionPopup, a member of class TStandardCustomizePopup.

151.1.3.2.1 TStandardCustomizePopup.CanAutoSize Method

Indicates how the control can be resized.

Pascal

```
function CanAutoSize(var NewWidth: Integer; var NewHeight: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanAutoSize(int NewWidth, int NewHeight);
```

Description

CanAutoSize is called automatically when the AutoSize property is true and an attempt is made to resize the control. It allows controls to implement the AutoSize property before the resize sequence that begins with the OnCanResize and OnConstrainedResize events and ends with the OnResize event.

When CanAutoSize is called, the NewWidth and NewHeight parameters indicate the proposed new dimensions of the control. CanAutoSize adjusts these values so that the control's size adjusts to its contents. If the adjustment results in values of NewWidth and NewHeight that differ from the control's current width and height, CanAutoSize returns true, indicating that the resize sequence should proceed. If, after adjustment, NewWidth and NewHeight equal Width and Height, CanAutoSize returns false, and the resize sequence is aborted.

As implemented in TWinControl, CanAutoSize returns true, adjusting NewWidth and NewHeight so that all the control's children fit.

See Also

Constraints (see page 5812)

ConstrainedResize (see page 6133)

AdjustSize (see page 6129)

151.1.3.2.2 TStandardCustomizePopup.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TStandardCustomizePopup.

151.1.3.2.3 TStandardCustomizePopup.PositionPopup Method

Pascal

```
procedure PositionPopup(AnOwner: TCustomActionBar; ParentItem: TCustomActionControl); override;
```

C++

```
virtual __fastcall PositionPopup(TCustomActionBar AnOwner, TCustomActionControl ParentItem);
```

Description

This is PositionPopup, a member of class TStandardCustomizePopup.

151.1.4 TStandardDropDownButton Class

Class Hierarchy

Pascal

```
TStandardDropDownButton = class(TCustomDropDownButton);
```

C++

```
class TStandardDropDownButton : public TCustomDropDownButton;
```

File

StdActnMenus

Description

This is class StdActnMenus.TStandardDropDownButton.

151.1.4.1 TStandardDropDownButton Members

The following tables list the members exposed by TStandardDropDownButton.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFlat (see page 178)	This is FFlat, a member of class TCustomButtonControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FState (see page 178)	This is FState, a member of class TCustomButtonControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.

	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMDialogChar (see page 180)	This is CMDialogChar, a member of class TCustomButtonControl.
	CMEnabledChanged (see page 180)	This is CMEnabledChanged, a member of class TCustomButtonControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
	CMMouseEnter (see page 180)	This is CMMouseEnter, a member of class TCustomButtonControl.
	CMMouseLeave (see page 180)	This is CMMouseLeave, a member of class TCustomButtonControl.
	CMTextChanged (see page 180)	This is CMTextChanged, a member of class TCustomButtonControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
V	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 521)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawBackground (see page 181)	Draws a background image on the control.
V	DrawBackground (see page 521)	Draws a background image on the control.
V	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.

	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
V	DrawFrame (see page 20444)	This is DrawFrame, a member of class TStandardDropDownButton.
V	DrawGlyph (see page 522)	Draws a symbol on the control.
V	DrawLargeGlyph (see page 181)	This is DrawLargeGlyph, a member of class TCustomButtonControl.
V	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
V	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
V	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
V	DrawText (see page 523)	Draws text on the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
V	GetPopupClass (see page 20444)	This is GetPopupClass, a member of class TStandardDropDownButton.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
V	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
V	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
V	GetShowShortCut (see page 181)	This is GetShowShortCut, a member of class TCustomButtonControl.
V	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
V	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
V	Loaded (see page 182)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
V	MouseDown (see page 182)	OnMouseDown event dispatcher.
V	MouseDown (see page 216)	OnMouseDown event dispatcher.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
V	MouseMove (see page 183)	Respond to mouse moving over control area..
	MouseMove (see page 5773)	Respond to mouse moving over control area..

	MouseOverDropDown (see page 216)	This is MouseOverDropDown, a member of class TCustomDropDownButton.
V	MouseUp (see page 183)	OnMouseUp event dispatcher.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 184)	Render control surface.
V	Paint (see page 216)	Render control surface.
V	Paint (see page 526)	Render control surface.
V	Paint (see page 6052)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
V	SetActionClient (see page 184)	This is SetActionClient, a member of class TCustomButtonControl.
V	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
V	SetGlyphLayout (see page 185)	This is SetGlyphLayout, a member of class TCustomButtonControl.
V	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetSelected (see page 185)	This is SetSelected, a member of class TCustomButtonControl.
V	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMLButtonDblClk (see page 185)	This is WMLButtonDblClk, a member of class TCustomButtonControl.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
R	DroppedDown (see page 217)	This is DroppedDown, a member of class TCustomDropDownButton.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseInControl (see page 189)	This is MouseInControl, a member of class TCustomButtonControl.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.

	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	CalcBounds (see page 179)	Calculates the size of the control.
	CalcBounds (see page 214)	Calculates the size of the control.
	CalcBounds (see page 518)	Calculates the size of the control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Click (see page 179)	Executes the control's function.
	Click (see page 215)	Executes the control's function.
	Click (see page 518)	Executes the control's function in response to a mouse click.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	Create (see page 177)	Creates an instance of TCustomButtonControl (see page 168).
	Create (see page 515)	Creates an instance of TCustomActionControl (see page 507).
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 5731)	Creates an instance of TControl (see page 5724).
	Create (see page 6051)	Creates an instance of TGraphicControl (see page 6044).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 516)	Destroys an instance of TCustomActionControl (see page 507).
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	DropDownClick (see page 215)	This is DropDownClick, a member of class TCustomDropDownButton.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
V	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 184)	Sets the Left, Top, Width, and Height properties all at once.

V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	AllowAllUp (see page 186)	Indicates whether all the buttons in a given group can be up at the same time.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 186)	Specifies a text string that identifies the control to the user.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Down (see page 189)	Tells whether the button is down (selected) or up (unselected).
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	Flat (see page 189)	Dictates whether the button should have a 2D look instead of the usual 3D look.
R	Floating (see page 5823)	Indicates whether the control is floating.

	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
	ShowCaption (see page 189)	Indicates whether the control's caption should be shown.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
	ShowShortCut (see page 190)	Indicates whether the control's short cut should be shown.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	State (see page 190)	Describes the current state of the button.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	TrackButton (see page 190)	Specifies which mouse button activates the button control.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

151.1.4.2 TStandardDropDownButton Methods

The methods of the TStandardDropDownButton class are listed here.

Protected Methods

	Name	Description
	DrawFrame (see page 20444)	This is DrawFrame, a member of class TStandardDropDownButton.
	GetPopupClass (see page 20444)	This is GetPopupClass, a member of class TStandardDropDownButton.

151.1.4.2.1 TStandardDropDownButton.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); override;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TStandardDropDownButton.

151.1.4.2.2 TStandardDropDownButton.GetPopupClass Method

Pascal

```
function GetPopupClass: TCustomActionBarClass; override;
```

C++

```
virtual __fastcall TCustomActionBarClass GetPopupClass();
```

Description

This is GetPopupClass, a member of class TStandardDropDownButton.

151.1.5 TStandardMenuButton Class

TStandardMenuButton is the standard ActionBand menu button class.

Class Hierarchy

Pascal

```
TStandardMenuButton = class(TCustomMenuButton);
```

C++

```
class TStandardMenuButton : public TCustomMenuButton;
```

File

StdActnMenus

Description

TStandardMenuButton is the standard menu button class. If you would like to replace the standard menu button behaviors, use the class TCustomMenuButton as a parent class for your replacement class. To make the change for your application, set the value of MenuButtonControlClass (a global variable) to your own subclass of TCustomMenuButton instead of

TStandardMenuButton.

See Also

TCustomMenuButton (see page 790)

151.1.5.1 TStandardMenuButton Members

The following tables list the members exposed by TStandardMenuButton.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFlat (see page 178)	This is FFlat, a member of class TCustomButtonControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FState (see page 178)	This is FState, a member of class TCustomButtonControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
V	BeginAutoDrag (see page 801)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMDialogChar (see page 180)	This is CMDialogChar, a member of class TCustomButtonControl.
	CMEnabledChanged (see page 180)	This is CMEnabledChanged, a member of class TCustomButtonControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
	CMMouseEnter (see page 180)	This is CMMouseEnter, a member of class TCustomButtonControl.
	CMMouseEnter (see page 801)	This is CMMouseEnter, a member of class TCustomMenuButton.
	CMMouseLeave (see page 180)	This is CMMouseLeave, a member of class TCustomButtonControl.
	CMTextChanged (see page 180)	This is CMTextChanged, a member of class TCustomButtonControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
V	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
V	DoDragDrop (see page 802)	This is DoDragDrop, a member of class TCustomMenuButton.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.

	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 521)	OnDragOver event dispatcher.
V	DragOver (see page 802)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawBackground (see page 20454)	Draws a background image on the control.
V	DrawDesignFocus (see page 20454)	This is DrawDesignFocus, a member of class TStandardMenuButton.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
V	DrawFrame (see page 20454)	This is DrawFrame, a member of class TStandardMenuButton.
V	DrawGlyph (see page 522)	Draws a symbol on the control.
V	DrawLargeGlyph (see page 181)	This is DrawLargeGlyph, a member of class TCustomButtonControl.
V	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
V	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
V	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
V	DrawText (see page 20455)	This is DrawText, a member of class TStandardMenuButton.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
V	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
V	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
V	GetShowShortCut (see page 181)	This is GetShowShortCut, a member of class TCustomButtonControl.
V	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
V	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
V	Loaded (see page 182)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.

	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
V	MouseDown (see page 182)	OnMouseDown event dispatcher.
V	MouseDown (see page 803)	OnMouseDown event dispatcher.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
V	MouseMove (see page 183)	Respond to mouse moving over control area..
	MouseMove (see page 5773)	Respond to mouse moving over control area..
V	MouseUp (see page 183)	OnMouseUp event dispatcher.
V	MouseUp (see page 804)	OnMouseUp event dispatcher.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 184)	Render control surface.
V	Paint (see page 526)	Render control surface.
V	Paint (see page 804)	Render control surface.
V	Paint (see page 6052)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
V	SetActionClient (see page 184)	This is SetActionClient, a member of class TCustomButtonControl.
V	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
V	SetGlyphLayout (see page 185)	This is SetGlyphLayout, a member of class TCustomButtonControl.
V	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetSelected (see page 185)	This is SetSelected, a member of class TCustomButtonControl.
V	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.

	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMLButtonDblClk (see page 185)	This is WMLButtonDblClk, a member of class TCustomButtonControl.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Menu (see page 805)	This is Menu, a member of class TCustomMenuButton.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseInControl (see page 189)	This is MouseInControl, a member of class TCustomButtonControl.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 179)	Calculates the size of the control.
V	CalcBounds (see page 518)	Calculates the size of the control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 179)	Executes the control's function.
V	Click (see page 518)	Executes the control's function in response to a mouse click.
V	Click (see page 801)	Executes the control's function.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 177)	Creates an instance of TCustomButtonControl (see page 168).
V	Create (see page 515)	Creates an instance of TCustomActionControl (see page 507).
V	Create (see page 799)	Creates an instance of TCustomMenuButton (see page 790).
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6051)	Creates an instance of TGraphicControl (see page 6044).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 516)	Destroys an instance of TCustomActionControl (see page 507).
V	Destroy (see page 800)	Destroys an instance of TCustomMenuButton (see page 790).
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
V	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.

	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
V	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
V	Keyed (see page 803)	Executes the button's function in response to a keyboard command.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.

	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 184)	Sets the Left, Top, Width, and Height properties all at once.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	AllowAllUp (see page 186)	Indicates whether all the buttons in a given group can be up at the same time.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 186)	Specifies a text string that identifies the control to the user.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Down (see page 189)	Tells whether the button is down (selected) or up (unselected).
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.

R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	Flat (see page 189)	Dictates whether the button should have a 2D look instead of the usual 3D look.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
	ShowCaption (see page 189)	Indicates whether the control's caption should be shown.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
	ShowShortCut (see page 190)	Indicates whether the control's short cut should be shown.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	State (see page 190)	Describes the current state of the button.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	TrackButton (see page 190)	Specifies which mouse button activates the button control.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

151.1.5.2 TStandardMenuButton Methods

The methods of the TStandardMenuButton class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 20454)	Draws a background image on the control.
	DrawDesignFocus (see page 20454)	This is DrawDesignFocus, a member of class TStandardMenuButton.
	DrawFrame (see page 20454)	This is DrawFrame, a member of class TStandardMenuButton.
	DrawText (see page 20455)	This is DrawText, a member of class TStandardMenuButton.

151.1.5.2.1 TStandardMenuButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph (see page 522)

DrawText (see page 523)

151.1.5.2.2 TStandardMenuButton.DrawDesignFocus Method

Pascal

```
procedure DrawDesignFocus(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawDesignFocus(TRect PaintRect);
```

Description

This is DrawDesignFocus, a member of class TStandardMenuButton.

151.1.5.2.3 TStandardMenuButton.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); override;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TStandardMenuButton.

151.1.5.2.4 TStandardMenuButton.DrawText Method

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: String); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, AnsiString Text);
```

Description

This is DrawText, a member of class TStandardMenuButton.

151.1.6 TStandardMenuExpandBtn Class

Class Hierarchy

Pascal

```
TStandardMenuExpandBtn = class(TCustomMenuExpandBtn);
```

C++

```
class TStandardMenuExpandBtn : public TCustomMenuExpandBtn;
```

File

StdActnMenus

Description

This is class StdActnMenus.TStandardMenuExpandBtn.

151.1.6.1 TStandardMenuExpandBtn Members

The following tables list the members exposed by TStandardMenuExpandBtn.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFlat (see page 178)	This is FFlat, a member of class TCustomButtonControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FState (see page 178)	This is FState, a member of class TCustomButtonControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMDialogChar (see page 180)	This is CMDialogChar, a member of class TCustomButtonControl.

	CMEnabledChanged (see page 180)	This is CMEnabledChanged, a member of class TCustomButtonControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
	CMMouseEnter (see page 180)	This is CMMouseEnter, a member of class TCustomButtonControl.
	CMMouseEnter (see page 238)	This is CMMouseEnter, a member of class TCustomUtilityButton.
	CMMouseLeave (see page 180)	This is CMMouseLeave, a member of class TCustomButtonControl.
	CMMouseLeave (see page 239)	This is CMMouseLeave, a member of class TCustomUtilityButton.
	CMTextChanged (see page 180)	This is CMTextChanged, a member of class TCustomButtonControl.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
V	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 521)	OnDragOver event dispatcher.
V	DragOver (see page 815)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawArrows (see page 239)	This is DrawArrows, a member of class TCustomUtilityButton.
V	DrawBackground (see page 20464)	Draws a background image on the control.
V	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
V	DrawFrame (see page 20465)	This is DrawFrame, a member of class TStandardMenuExpandBtn.
V	DrawGlyph (see page 522)	Draws a symbol on the control.
V	DrawLargeGlyph (see page 181)	This is DrawLargeGlyph, a member of class TCustomButtonControl.
V	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
V	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
V	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
V	DrawText (see page 523)	Draws text on the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.

	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
	GetShowShortCut (see page 181)	This is GetShowShortCut, a member of class TCustomButtonControl.
	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
	Loaded (see page 182)	Initializes the control after it is loaded from a stream.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 182)	OnMouseDown event dispatcher.
	MouseDown (see page 239)	OnMouseDown event dispatcher.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 183)	Respond to mouse moving over control area..
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 183)	OnMouseUp event dispatcher.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	OnDelay (see page 240)	This is OnDelay, a member of class TCustomUtilityButton.
	Paint (see page 184)	Render control surface.
	Paint (see page 240)	Render control surface.
	Paint (see page 526)	Render control surface.
	Paint (see page 6052)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.

	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
V	SetActionClient (see page 184)	This is SetActionClient, a member of class TCustomButtonControl.
V	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
V	SetGlyphLayout (see page 185)	This is SetGlyphLayout, a member of class TCustomButtonControl.
V	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetSelected (see page 185)	This is SetSelected, a member of class TCustomButtonControl.
V	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMLButtonDblClk (see page 185)	This is WMLButtonDblClk, a member of class TCustomButtonControl.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.

	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Menu (see page 816)	This is Menu, a member of class TCustomMenuExpandBtn.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseInControl (see page 189)	This is MouseInControl, a member of class TCustomButtonControl.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 243)	Occurs when the user clicks the control.
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 179)	Calculates the size of the control.
V	CalcBounds (see page 518)	Calculates the size of the control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 179)	Executes the control's function.
V	Click (see page 238)	Executes the control's function.
V	Click (see page 518)	Executes the control's function in response to a mouse click.

	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 177)	Creates an instance of TCustomButtonControl (see page 168).
V	Create (see page 237)	Creates an instance of TCustomButtonControl.
V	Create (see page 515)	Creates an instance of TCustomActionControl (see page 507).
V	Create (see page 814)	Creates an instance of TCustomButtonControl.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6051)	Creates an instance of TGraphicControl (see page 6044).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 237)	Destroys an instance of TCustomActionControl.
V	Destroy (see page 516)	Destroys an instance of TCustomActionControl (see page 507).
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
V	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
	SetBounds (see page 184)	Sets the Left, Top, Width, and Height properties all at once.
	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control

	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	AllowAllUp (see page 186)	Indicates whether all the buttons in a given group can be up at the same time.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	ArrowSize (see page 240)	This is ArrowSize, a member of class TCustomUtilityButton.
	ArrowType (see page 241)	This is ArrowType, a member of class TCustomUtilityButton.
	AutoScroll (see page 241)	This is AutoScroll, a member of class TCustomUtilityButton.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 186)	Specifies a text string that identifies the control to the user.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 241)	Specifies the background color of the control.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Direction (see page 242)	This is Direction, a member of class TCustomUtilityButton.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Down (see page 189)	Tells whether the button is down (selected) or up (unselected).
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	Flat (see page 189)	Dictates whether the button should have a 2D look instead of the usual 3D look.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	RepeatRate (see page 242)	This is RepeatRate, a member of class TCustomUtilityButton.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.

	ShowCaption (see page 189)	Indicates whether the control's caption should be shown.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
	ShowShortCut (see page 190)	Indicates whether the control's short cut should be shown.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	State (see page 190)	Describes the current state of the button.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	TrackButton (see page 190)	Specifies which mouse button activates the button control.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

151.1.6.2 TStandardMenuExpandBtn Methods

The methods of the TStandardMenuExpandBtn class are listed here.

Protected Methods

	Name	Description
V	DrawBackground (see page 20464)	Draws a background image on the control.
V	DrawFrame (see page 20465)	This is DrawFrame, a member of class TStandardMenuExpandBtn.

151.1.6.2.1 TStandardMenuExpandBtn.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph (see page 522)

DrawText (see page 523)

151.1.6.2.2 TStandardMenuExpandBtn.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); override;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TStandardMenuExpandBtn.

151.1.7 TStandardMenuItem Class

TStandardMenuItem is the default class for menu items in an action band.

Class Hierarchy

Pascal

```
TStandardMenuItem = class(TCustomMenuItem);
```

C++

```
class TStandardMenuItem : public TCustomMenuItem;
```

File

StdActnMenus

Description

TStandardMenuItem is the class that action bands use to generate child controls that are menu items. Do not create instances of TStandardMenuItem. The action manager automatically handles the creating of TStandardMenuItem instances to represent the actions it contains.

If you want to replace the class used for menu items, derive your own replacement class from TCustomMenuItem. To substitute your replacement class, set the value of the global MenuItemControlClass variable to your TCustomMenuItem descendant.

TStandardMenuButton (see page 20444)

TStandardMenuPopup (see page 20478)

MenuItemControlClass

151.1.7.1 TStandardMenuItem Members

The following tables list the members exposed by TStandardMenuItem.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FNoPrefix (see page 826)	This is FNoPrefix, a member of class TCustomMenuItem.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CalcLayout (see page 827)	This is CalcLayout, a member of class TCustomMenuItem.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
	CMTextchanged (see page 20475)	Responds when this menu item's caption changes.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
V	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
V	DoDragDrop (see page 828)	This is DoDragDrop, a member of class TCustomMenuItem.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
V	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 521)	OnDragOver event dispatcher.
V	DragOver (see page 828)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.

	DrawBackground (see page 20475)	Draws the background of the menu item.
	DrawDesignFocus (see page 20475)	This is DrawDesignFocus, a member of class TStandardMenuItem.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
	DrawEdge (see page 20476)	This is DrawEdge, a member of class TStandardMenuItem.
	DrawGlyph (see page 20476)	Draws a symbol on the menu item.
	DrawGlyphFrame (see page 20476)	This is DrawGlyphFrame, a member of class TStandardMenuItem.
	DrawLargeGlyph (see page 20476)	This is DrawLargeGlyph, a member of class TStandardMenuItem.
	DrawSeparator (see page 20477)	Draws a separator.
	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
	DrawShadowedText (see page 829)	This is DrawShadowedText, a member of class TCustomMenuItem.
	DrawSubMenuGlyph (see page 829)	This is DrawSubMenuGlyph, a member of class TCustomMenuItem.
	DrawText (see page 20477)	Draws the menu item's text.
	DrawUnusedEdges (see page 830)	This is DrawUnusedEdges, a member of class TCustomMenuItem.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 830)	OnMouseUp event dispatcher.

	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 526)	Render control surface.
V	Paint (see page 831)	Render control surface.
V	Paint (see page 6052)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
V	PositionChanged (see page 831)	This is PositionChanged, a member of class TCustomMenuItem.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
V	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
V	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
V	SetSelected (see page 831)	This is SetSelected, a member of class TCustomMenuItem.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Menu (see page 832)	This is Menu, a member of class TCustomMenuItem.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseSelected (see page 832)	This is MouseSelected, a member of class TCustomMenuItem.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ShortCutBounds (see page 832)	This is ShortCutBounds, a member of class TCustomMenuItem.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.

	CalcBounds (see page 518)	Calculates the size of the control.
	CalcBounds (see page 827)	Calculates the size of the menu item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Click (see page 518)	Executes the control's function in response to a mouse click.
	Click (see page 827)	Executes the control's function.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	Create (see page 515)	Creates an instance of TCustomActionControl (see page 507).
	Create (see page 825)	Creates an instance of TCustomMenuItem (see page 816).
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 5731)	Creates an instance of TControl (see page 5724).
	Create (see page 6051)	Creates an instance of TGraphicControl (see page 6044).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 516)	Destroys an instance of TCustomActionControl (see page 507).
	Destroy (see page 825)	Destroys an instance of TCustomMenuItem (see page 816).
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 828)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
V	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
V	Keyed (see page 830)	Executes the menu item's function in response to a user's keyboard command.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.

V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Edges (see page 832)	Dictates which edges are drawn when the menu item is drawn.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	Selected (see page 533)	Indicates whether the control is currently selected.

R	Separator (see page 533)	Indicates whether the control is a separator.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TextBounds (see page 534)	A bounding rectangle for the control caption.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

151.1.7.2 TStandardMenuItem Methods

The methods of the TStandardMenuItem class are listed here.

Protected Methods

	Name	Description
	CMTextchanged (see page 20475)	Responds when this menu item's caption changes.
V	DrawBackground (see page 20475)	Draws the background of the menu item.
V	DrawDesignFocus (see page 20475)	This is DrawDesignFocus, a member of class TStandardMenuItem.
V	DrawEdge (see page 20476)	This is DrawEdge, a member of class TStandardMenuItem.
V	DrawGlyph (see page 20476)	Draws a symbol on the menu item.
	DrawGlyphFrame (see page 20476)	This is DrawGlyphFrame, a member of class TStandardMenuItem.
V	DrawLargeGlyph (see page 20476)	This is DrawLargeGlyph, a member of class TStandardMenuItem.
V	DrawSeparator (see page 20477)	Draws a separator.
V	DrawText (see page 20477)	Draws the menu item's text.

151.1.7.2.1 TStandardMenuItem.CMTextchanged Method

Responds when this menu item's caption changes.

Pascal

```
procedure CMTextchanged(var Message: TMessage); message CM_TEXTCHANGED;
```

C++

```
__fastcall CMTextchanged(TMessage Message);
```

Description

This method is called automatically in response to Windows messages containing a notification that the text of this menu item has changed.

Message represents the Windows message that notifies this menu item of a change to its text.

CMTextchanged recalculates the string it displays when the menu item is not underlining its accelerator key.

See Also

PersistentHotKeys (see page 489)

151.1.7.2.2 TStandardMenuItem.DrawBackground Method

Draws the background of the menu item.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

This method is called automatically when the menu item needs to render its background (everything except the text and glyph).

PaintRect indicates the dimensions of the menu item on its canvas.

DrawBackground paints the background of the menu item so that its color reflects whether the item currently has focus, adjusting PaintRect to accommodate any glyph or checkmark that appears on the menu item.

See Also

DrawBackground (see page 521)

DrawGlyph (see page 20476)

DrawText (see page 20477)

151.1.7.2.3 TStandardMenuItem.DrawDesignFocus Method

Pascal

```
procedure DrawDesignFocus(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawDesignFocus(TRect PaintRect);
```

Description

This is DrawDesignFocus, a member of class TStandardMenuItem.

151.1.7.2.4 TStandardMenuItem.DrawEdge Method

Pascal

```
procedure DrawEdge(Edges: TMenuEdges); override;
```

C++

```
virtual __fastcall DrawEdge(TMenuEdges Edges);
```

Description

This is DrawEdge, a member of class TStandardMenuItem.

151.1.7.2.5 TStandardMenuItem.DrawGlyph Method

Draws a symbol on the menu item.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

DrawGlyph is called automatically when the menu item needs to render its glyph. This occurs if the menu item is checked or if the associated action client item specifies a glyph for this menu item using its ImageIndex property.

Location is the position on this menu item's canvas for the upper left corner of the glyph.

See Also

DrawGlyph (see page 522)

DrawBackground (see page 20475)

DrawText (see page 20477)

ImageIndex (see page 385)

151.1.7.2.6 TStandardMenuItem.DrawGlyphFrame Method

Pascal

```
procedure DrawGlyphFrame(const Location: TPoint);
```

C++

```
__fastcall DrawGlyphFrame(const TPoint Location);
```

Description

This is DrawGlyphFrame, a member of class TStandardMenuItem.

151.1.7.2.7 TStandardMenuItem.DrawLargeGlyph Method

Pascal

```
procedure DrawLargeGlyph(Location: TPoint); override;
```

C++

```
virtual __fastcall DrawLargeGlyph(TPoint Location);
```

Description

This is DrawLargeGlyph, a member of class TStandardMenuItem.

151.1.7.2.8 TStandardMenuItem.DrawSeparator Method

Draws a separator.

Pascal

```
procedure DrawSeparator(const Offset: Integer); override;
```

C++

```
virtual __fastcall DrawSeparator(const int Offset);
```

Description

DrawSeparator is called automatically when the menu item represents a separator bar in the menu and it needs to paint itself. This method paints the separator bar.

Offset indicates the offset of the separator, in pixels, from the top of the menu item. DrawSeparator ignores this value and always uses a fixed value for menu items.

151.1.7.2.9 TStandardMenuItem.DrawText Method

Draws the menu item's text.

Pascal

```
procedure DrawText(var Rect: TRect; var Flags: Cardinal; Text: String); override;
```

C++

```
virtual __fastcall DrawText(TRect Rect, unsigned Flags, AnsiString Text);
```

Description

DrawText is called automatically when the menu item needs to render its text.

ARect indicates the rectangle on the menu item's canvas where the text label should appear.

Flags supplies the value to use for the TextFlags property of the canvas.

Text is the text of the menu item.

DrawText checks whether the menu item should display underlines on accelerator keys, and draws the text accordingly, using a font color that reflects whether the menu item is selected and whether it is enabled.

See Also

DrawText (see page 523)

DrawBackground (see page 20475)

DrawGlyph (see page 20476)

PersistentHotKeys (see page 489)

TextFlags (see page 14495)

151.1.8 TStandardMenuPopup Class

TStandardMenuPopup is the default menu popup style.

Class Hierarchy

Pascal

```
TStandardMenuPopup = class(TCustomActionPopupMenu);
```

C++

```
class TStandardMenuPopup : public TCustomActionPopupMenu;
```

File

StdActnMenus

Description

TStandardMenuPopup is the default menu popup style. If you would like to replace it with a style of your own, subclass TCustomActionPopupMenu to provide your own behaviors. To make the change for your application, set the value of MenuPopupClass (a global variable) to your own subclass of TCustomActionPopupMenu instead of TStandardMenuPopup.

See Also

TActionMainMenuBar (see page 585)

TStandardMenuButton (see page 20444)

TStandardMenuItem (see page 20465)

151.1.8.1 TStandardMenuPopup Members

The following tables list the members exposed by TStandardMenuPopup.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FCachedMenu (see page 699)	This is FCachedMenu, a member of class TCustomActionMenuBar.
	FChildMenu (see page 699)	This is FChildMenu, a member of class TCustomActionMenuBar.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefaultColorMap (see page 460)	This is FDefaultColorMap, a member of class TCustomActionBar.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExpandTimer (see page 700)	This is FExpandTimer, a member of class TCustomActionMenuBar.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FPopupTimer (see page 700)	This is FPopupTimer, a member of class TCustomActionMenuBar.
	FSavedWrapState (see page 460)	This is FSavedWrapState, a member of class TCustomActionBar.
	FSelectedItem (see page 700)	This is FSelectedItem, a member of class TCustomActionMenuBar.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.

	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
	AddEdges (see page 737)	This is AddEdges, a member of class TCustomActionPopupMenu.
	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 462)	Aligns any controls for which the control is the parent within a specified area of the control.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	Animate (see page 701)	This is Animate, a member of class TCustomActionMenuBar.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	AutoSizingChanged (see page 462)	This is AutoSizingChanged, a member of class TCustomActionBar.
	BackgroundSize (see page 462)	This is BackgroundSize, a member of class TCustomActionBar.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CalcInsertPosition (see page 462)	This is CalcInsertPosition, a member of class TCustomActionBar.
	CanAutoSize (see page 20492)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	CleanupStack (see page 701)	This is CleanupStack, a member of class TCustomActionMenuBar.
	Clear (see page 463)	This is Clear, a member of class TCustomActionBar.
	ClearSubMenus (see page 702)	This is ClearSubMenus, a member of class TCustomActionMenuBar.
	Click (see page 5743)	Respond to user click.
	CMBorderChanged (see page 23285)	This is CMBorderChanged, a member of class TToolWindow.
	CMCtl3DChanged (see page 23286)	This is CMCtl3DChanged, a member of class TToolWindow.
	CMMouseLeave (see page 738)	This is CMMouseLeave, a member of class TCustomActionPopupMenu.
	CMVisibleChanged (see page 738)	This is CMVisibleChanged, a member of class TCustomActionPopupMenu.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateControl (see page 463)	This is CreateControl, a member of class TCustomActionBar.
	CreateControl (see page 702)	This is CreateControl, a member of class TCustomActionMenuBar.
	CreateControl (see page 738)	This is CreateControl, a member of class TCustomActionPopupMenu.
	CreateControls (see page 463)	This is CreateControls, a member of class TCustomActionBar.
	CreateControls (see page 738)	This is CreateControls, a member of class TCustomActionPopupMenu.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 739)	Initializes a window-creation parameter data structure.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreatePopup (see page 702)	This is CreatePopup, a member of class TCustomActionMenuBar.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 463)	Returns placement order of custom-aligned child control.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.

	CustomAlignPosition (see page 464)	Returns aligned position of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 465)	This is DesignWndProc, a member of class TCustomActionBar.
	DesignWndProc (see page 739)	This is DesignWndProc, a member of class TCustomActionPopupMenu.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DisplayShadow (see page 739)	This is DisplayShadow, a member of class TCustomActionPopupMenu.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoControlCreated (see page 465)	This is DoControlCreated, a member of class TCustomActionBar.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoDropActions (see page 465)	This is DoDropActions, a member of class TCustomActionBar.
	DoDropCategory (see page 465)	This is DoDropCategory, a member of class TCustomActionBar.
	DoDropItem (see page 466)	This is DoDropItem, a member of class TCustomActionBar.
	DoEndDock (see page 146)	OnEndDock event dispatcher.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetControlClass (see page 466)	This is DoGetControlClass, a member of class TCustomActionBar.
	DoGetPopupClass (see page 703)	This is DoGetPopupClass, a member of class TCustomActionMenuBar.
	DoItemClicked (see page 703)	This is DoItemClicked, a member of class TCustomActionMenuBar.
	DoItemKeyed (see page 703)	This is DoItemKeyed, a member of class TCustomActionMenuBar.
	DoItemSelected (see page 703)	This is DoItemSelected, a member of class TCustomActionMenuBar.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMenuDelay (see page 703)	This is DoMenuDelay, a member of class TCustomActionMenuBar.
	DoMouseIdle (see page 704)	This is DoMouseIdle, a member of class TCustomActionMenuBar.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoneMenuLoop (see page 704)	This is DoneMenuLoop, a member of class TCustomActionMenuBar.
	DoPopup (see page 704)	This is DoPopup, a member of class TCustomActionMenuBar.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 147)	OnStartDock event dispatcher.

	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragOver (see page 466)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
V	DrawBackground (see page 467)	This is DrawBackground, a member of class TCustomActionBar.
V	DrawBackground (see page 740)	This is DrawBackground, a member of class TCustomActionPopupMenu.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
V	ExecAction (see page 704)	This is ExecAction, a member of class TCustomActionMenuBar.
V	ExecAction (see page 740)	This is ExecAction, a member of class TCustomActionPopupMenu.
V	Expand (see page 704)	Causes the menu bar to show all items, including the hidden ones.
	ExpandClick (see page 740)	This is ExpandClick, a member of class TCustomActionPopupMenu.
	ExpandTimer (see page 705)	This is ExpandTimer, a member of class TCustomActionMenuBar.
	FindAccelItem (see page 467)	This is FindAccelItem, a member of class TCustomActionBar.
	FindItemAt (see page 468)	This is FindItemAt, a member of class TCustomActionBar.
	FindItemCaption (see page 468)	This is FindItemCaption, a member of class TCustomActionBar.
V	FindLast (see page 468)	This is FindLast, a member of class TCustomActionBar.
	FindLeastUsedItem (see page 469)	This is FindLeastUsedItem, a member of class TCustomActionBar.
	FindNearestControl (see page 469)	This is FindNearestControl, a member of class TCustomActionBar.
V	FindNext (see page 470)	This is FindNext, a member of class TCustomActionBar.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FindNextVisibleItem (see page 470)	This is FindNextVisibleItem, a member of class TCustomActionBar.
V	FindPrevious (see page 470)	This is FindPrevious, a member of class TCustomActionBar.
	FindPreviousVisibleItem (see page 470)	This is FindPreviousVisibleItem, a member of class TCustomActionBar.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
V	GetActionControl (see page 471)	This is GetActionControl, a member of class TCustomActionBar.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
V	GetBannerWidth (see page 471)	This is GetBannerWidth, a member of class TCustomActionBar.
V	GetBarHeight (see page 471)	This is GetBarHeight, a member of class TCustomActionBar.
V	GetBarWidth (see page 471)	This is GetBarWidth, a member of class TCustomActionBar.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 741)	Returns the value of the ClientRect property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlClass (see page 471)	This is GetControlClass, a member of class TCustomActionBar.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDefaultColorMapClass (see page 472)	This is GetDefaultColorMapClass, a member of class TCustomActionBar.
	GetDefaultSounds (see page 705)	This is GetDefaultSounds, a member of class TCustomActionMenuBar.
V	GetDesignMode (see page 472)	This is GetDesignMode, a member of class TCustomActionBar.
V	GetDesignMode (see page 705)	This is GetDesignMode, a member of class TCustomActionMenuBar.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.

	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetExpandBtnClass (see page 20493)	This is GetExpandBtnClass, a member of class TStandardMenuPopup.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 147)	Returns the class used for the control when it is floating.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetMouseHoverItem (see page 705)	This is GetMouseHoverItem, a member of class TCustomActionMenuBar.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupClass (see page 706)	This is GetPopupClass, a member of class TCustomActionMenuBar.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetPopupMenuClass (see page 472)	This is GetPopupMenuClass, a member of class TCustomActionBar.
	GetSelected (see page 706)	This is GetSelected, a member of class TCustomActionMenuBar.
	GetSiteInfo (see page 147)	Generates an OnGetSiteInfo event
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasItems (see page 472)	This is HasItems, a member of class TCustomActionBar.
	HideShadow (see page 741)	This is HideShadow, a member of class TCustomActionPopupMenu.
	Idle (see page 706)	This is Idle, a member of class TCustomActionMenuBar.
	InitMenuLoop (see page 706)	This is InitMenuLoop, a member of class TCustomActionMenuBar.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsDesignMsg (see page 707)	This is IsDesignMsg, a member of class TCustomActionMenuBar.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	ItemCount (see page 473)	This is ItemCount, a member of class TCustomActionBar.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 148)	Initializes the control after it is loaded from a stream.
	Loaded (see page 473)	Initializes the control after it is loaded from a stream.
	Loaded (see page 707)	Initializes the control after it is loaded from a stream.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 707)	This is MouseActivate, a member of class TCustomActionMenuBar.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	NCPaint (see page 20493)	This is NCPaint, a member of class TStandardMenuPopup.
	NewPopup (see page 707)	This is NewPopup, a member of class TCustomActionMenuBar.
	NewPopup (see page 741)	This is NewPopup, a member of class TCustomActionPopupMenu.
	Notification (see page 473)	Responds to notifications that components are being created or destroyed.

	Notification (see page 708)	Responds to notifications that components are being created or destroyed.
	Notification (see page 742)	Responds to notifications that components are being created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	Paint (see page 474)	This is Paint, a member of class TCustomActionBar.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 474)	Renders the image of a windowed control.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	PositionPopup (see page 20493)	This is PositionPopup, a member of class TStandardMenuPopup.
	ProcessMenuLoop (see page 708)	This is ProcessMenuLoop, a member of class TCustomActionMenuBar.
	ProcessMessage (see page 708)	This is ProcessMessage, a member of class TCustomActionMenuBar.
	ProcessMessages (see page 709)	This is ProcessMessages, a member of class TCustomActionMenuBar.
	ProcessMouseMsg (see page 709)	This is ProcessMouseMsg, a member of class TCustomActionMenuBar.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Reset (see page 475)	This is Reset, a member of class TCustomActionBar.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Select (see page 709)	This is Select, a member of class TCustomActionMenuBar.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectItem (see page 710)	This is SelectItem, a member of class TCustomActionMenuBar.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 475)	This is SetActionClient, a member of class TCustomActionBar.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetAutoSizing (see page 475)	This is SetAutoSizing, a member of class TCustomActionBar.
	SetBiDiMode (see page 475)	Sets the control's bi-directional mode.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetColorMap (see page 476)	This is SetColorMap, a member of class TCustomActionBar.

	SetColorMap (see page 743)	This is SetColorMap, a member of class TCustomActionPopupMenu.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignMode (see page 476)	This is SetDesignMode, a member of class TCustomActionBar.
	SetDesignMode (see page 710)	Specifies whether the whether the action band is being customized or being used in the IDE.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetOrientation (see page 477)	This is SetOrientation, a member of class TCustomActionBar.
	SetOrientation (see page 743)	This is SetOrientation, a member of class TCustomActionPopupMenu.
	SetParent (see page 710)	Sets the parent of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetPersistentHotKeys (see page 477)	This is SetPersistentHotKeys, a member of class TCustomActionBar.
	SetPersistentHotKeys (see page 711)	This is SetPersistentHotKeys, a member of class TCustomActionMenuBar.
	SetSpacing (see page 477)	This is SetSpacing, a member of class TCustomActionBar.
	SetupDefaultColorMap (see page 477)	This is SetupDefaultColorMap, a member of class TCustomActionBar.
	SetupExpandBtn (see page 743)	This is SetupExpandBtn, a member of class TCustomActionPopupMenu.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 478)	Provides the interface for a method that responds to changes in the control's visibility.
	VisibleChanging (see page 743)	Provides the interface for a method that responds to changes in the control's visibility.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.

	WMKeyDown (see page 744)	This is WMKeyDown, a member of class TCustomActionPopupMenu.
	WMNCCalcSize (see page 23286)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCPaint (see page 23286)	This is WMNCPaint, a member of class TToolWindow.
	WMPrint (see page 744)	This is WMPrint, a member of class TCustomActionPopupMenu.
	WMPrintClient (see page 744)	This is WMPrintClient, a member of class TCustomActionPopupMenu.
V	WndProc (see page 711)	Provides specific message responses for the control.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AnimateDuration (see page 716)	This is AnimateDuration, a member of class TCustomActionMenuBar.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DelayItem (see page 717)	This is DelayItem, a member of class TCustomActionMenuBar.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Expandable (see page 717)	This is Expandable, a member of class TCustomActionMenuBar.
	Expanded (see page 718)	This is Expanded, a member of class TCustomActionMenuBar.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
R	HRowCount (see page 488)	Indicates the number of columns of items that the action band displays.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	Items (see page 488)	Lists the action clients that correspond to the child controls of this action band.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	MouseControl (see page 718)	This is MouseControl, a member of class TCustomActionMenuBar.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentMenu (see page 719)	This is ParentMenu, a member of class TCustomActionMenuBar.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
R	PopupStack (see page 719)	This is PopupStack, a member of class TCustomActionMenuBar.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.

R	Selected (see page 719)	This is Selected, a member of class TCustomActionMenuBar.
	Text (see page 5842)	Contains a text string associated with the control.
R	VRowCount (see page 490)	Indicates the number of rows of items that the action band displays.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
R	Widest (see page 491)	This is Widest, a member of class TCustomActionBar.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnControlCreated (see page 491)	Occurs when a control is created on the action band.
	OnEnterMenuLoop (see page 720)	Occurs when an ActionBand menu loop has begun.
	OnExitMenuLoop (see page 721)	Occurs when an ActionBand menu loop has ended and the menu is closed.
	OnGetControlClass (see page 492)	Occurs when an item is to be placed on the action band.
	OnGetPopupClass (see page 721)	Occurs prior to an ActionBand popupmenu appearing on screen.
	OnPaint (see page 492)	Occurs when the action band is painted.
	OnPopup (see page 721)	Occurs just before the pop-up menu appears.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
V	CalcDockedWidth (see page 146)	This is CalcDockedWidth, a member of class TCustomActionDockBar.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	CloseMenu (see page 702)	Closes the menu currently being displayed.
V	CloseMenu (see page 737)	Closes the menu currently being displayed.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 145)	Creates and initializes a TCustomActionDockBar (see page 133) instance.
V	Create (see page 459)	Creates and initializes a TCustomActionBar (see page 447) instance.
V	Create (see page 698)	Creates and initializes a TCustomActionMenuBar (see page 685) instance.
V	Create (see page 735)	Creates and initializes a TCustomActionPopupMenu (see page 721) instance.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23285)	Creates and initializes a TToolWindow (see page 23274) instance.

	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 459)	Destroys an instance of TCustomActionBar (see page 447).
V	Destroy (see page 698)	Destroys an instance of TCustomActionMenuBar (see page 685).
V	Destroy (see page 736)	Destroys an instance of TCustomActionMenuBar (see page 685).
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Dock (see page 146)	Used internally to dock the action band.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
V	DragDrop (see page 466)	Generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	Expand (see page 740)	Performs the same kinds of functions as the inherited method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
V	FindFirst (see page 467)	Finds the first TActionClientItem (see page 374) in the Items (see page 488) list.
	FindFirstVisibleItem (see page 468)	Finds the first visible TActionClientItem (see page 374) in the Items (see page 488) list.
	FindLastVisibleItem (see page 469)	Finds the last visibleTActionClientItem in the Items (see page 488) list.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	Popup (see page 742)	Causes the popup menu to appear.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	RecreateControls (see page 475)	Destroys and recreates all of the action band's action client controls.
	RecreateControls (see page 709)	Destroys and recreates all of the action band's action client controls.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.

	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 476)	Sets the bounds based on whether the popup is expanded or not
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Style (see page 477)	Identifies the style object that gives the application its default look and feel.
V	Style (see page 711)	Retrieves the style used by the ActionBand menu that started the menu loop so the submenus have a consistent appearance.
V	TrackMenu (see page 711)	Executes the action associated with the menu item.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	ActionClient (see page 479)	Specifies the action client associated with this action band.
R	ActionControls (see page 479)	Lists the controls on the action band.
	ActionManager (see page 480)	Specifies the action manager component that is associated with the action band.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	AllowHiding (see page 480)	Determines whether the action band can be hidden.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AnimationStyle (see page 716)	Specifies the type of animation the menu bar will display as it opens.
	AutoFocus (see page 717)	This is AutoFocus, a member of class TCustomActionMenuBar.
	AutoSizing (see page 480)	Specifies whether the action band adjusts its size automatically to fit around its child controls.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 481)	Represents the drawing surface of the action band.
	Caption (see page 481)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 483)	Specifies the background color of the control.
	ColorMap (see page 484)	Indicates the colormap for individual action band components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ContextBar (see page 485)	Indicates whether items shown in this action band represent the items in a popup menu.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Designable (see page 485)	Specifies whether the action band can be customized (used internally by the IDE).
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignMode (see page 486)	Specifies whether the action band is being customized or being used in the IDE.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	EdgeBorders (see page 23287)	Determines which sides of the control have visible borders.
	EdgeInner (see page 23287)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 23288)	Determines the border style for the control's outer edge.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
	ExpandBtn (see page 744)	Refers to the popup menu's expand button.
	ExpandDelay (see page 717)	Specifies, in milliseconds, the delay period that a menu action band uses before showing hidden or unused items.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	Font (see page 486)	Controls the attributes of text written on or in the control.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HorzMargin (see page 487)	Specifies the width of the horizontal margins in pixels.
	HorzSeparator (see page 487)	Indicates whether a horizontal separator bar appears between item lines.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	InMenuLoop (see page 718)	Indicates whether items in the menu can be selected.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	Orientation (see page 488)	Specifies how the action band lays out its child items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentControl (see page 718)	Refers to the parent object of the TCustomActionBarControl.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	PersistentHotKeys (see page 489)	Specifies whether keyboard accelerator shortcuts are always displayed.
	RootMenu (see page 719)	Refers to the root menu of the ActionBand menu.
	Shadow (see page 745)	Refers to the popup menu's shadow.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.

R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	Spacing (see page 489)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	UseSystemFont (see page 720)	Specifies whether the default system font for menu items is used.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	VertMargin (see page 490)	Specifies the width of the vertical margins in pixels.
	VertSeparator (see page 490)	Indicates whether a vertical separator bar should appear between item lines.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

151.1.8.2 TStandardMenuPopup Methods

The methods of the TStandardMenuPopup class are listed here.

Protected Methods

	Name	Description
V	CanAutoSize (see page 20492)	Indicates how the control can be resized.
V	GetExpandBtnClass (see page 20493)	This is GetExpandBtnClass, a member of class TStandardMenuPopup.
V	NCPaint (see page 20493)	This is NCPaint, a member of class TStandardMenuPopup.
V	PositionPopup (see page 20493)	This is PositionPopup, a member of class TStandardMenuPopup.

151.1.8.2.1 TStandardMenuPopup.CanAutoSize Method

Indicates how the control can be resized.

Pascal

```
function CanAutoSize(var NewWidth: Integer; var NewHeight: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanAutoSize(int NewWidth, int NewHeight);
```

Description

CanAutoSize is called automatically when the AutoSize property is true and an attempt is made to resize the control. It allows controls to implement the AutoSize property before the resize sequence that begins with the OnCanResize and OnConstrainedResize events and ends with the OnResize event.

When CanAutoSize is called, the NewWidth and NewHeight parameters indicate the proposed new dimensions of the control. CanAutoSize adjusts these values so that the control's size adjusts to its contents. If the adjustment results in values of NewWidth and NewHeight that differ from the control's current width and height, CanAutoSize returns true, indicating that the resize sequence should proceed. If, after adjustment, NewWidth and NewHeight equal Width and Height, CanAutoSize returns false, and the resize sequence is aborted.

As implemented in TWinControl, CanAutoSize returns true, adjusting NewWidth and NewHeight so that all the control's children fit.

See Also

Constraints (see page 5812)

ConstrainedResize (see page 6133)

AdjustSize (see page 6129)

151.1.8.2.2 TStandardMenuPopup.GetExpandBtnClass Method

Pascal

```
function GetExpandBtnClass: TCustomMenuExpandBtnClass; override;
```

C++

```
virtual __fastcall TCustomMenuExpandBtnClass GetExpandBtnClass();
```

Description

This is GetExpandBtnClass, a member of class TStandardMenuPopup.

151.1.8.2.3 TStandardMenuPopup.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TStandardMenuPopup.

151.1.8.2.4 TStandardMenuPopup.PositionPopup Method

Pascal

```
procedure PositionPopup(AnOwner: TCustomActionBar; ParentItem: TCustomActionControl); override;
```

C++

```
virtual __fastcall PositionPopup(TCustomActionBar AnOwner, TCustomActionControl ParentItem);
```

Description

This is PositionPopup, a member of class TStandardMenuPopup.

151.1.9 TStandardToolScrollBtn Class

Class Hierarchy

Pascal

```
TStandardToolScrollBtn = class(TCustomToolScrollBtn);
```

C++

```
class TStandardToolScrollBtn : public TCustomToolScrollBtn;
```

File

StdActnMenus

Description

This is class StdActnMenus.TStandardToolScrollBtn.

151.1.9.1 TStandardToolScrollBtn Members

The following tables list the members exposed by TStandardToolScrollBtn.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFlat (see page 178)	This is FFlat, a member of class TCustomButtonControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FState (see page 178)	This is FState, a member of class TCustomButtonControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	BeginAutoDrag (see page 517)	Begin Automatic Drag.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CalcLayout (see page 518)	This is CalcLayout, a member of class TCustomActionControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
	CMDesignHitTest (see page 519)	This is CMDesignHitTest, a member of class TCustomActionControl.
	CMDialogChar (see page 180)	This is CMDialogChar, a member of class TCustomButtonControl.
	CMEnabledChanged (see page 180)	This is CMEnabledChanged, a member of class TCustomButtonControl.
	CMFontChanged (see page 519)	This is CMFontChanged, a member of class TCustomActionControl.
	CMItemDropPoint (see page 519)	This is CMItemDropPoint, a member of class TCustomActionControl.
	CMItemSelected (see page 519)	This is CMItemSelected, a member of class TCustomActionControl.
	CMMouseEnter (see page 180)	This is CMMouseEnter, a member of class TCustomButtonControl.
	CMMouseEnter (see page 238)	This is CMMouseEnter, a member of class TCustomUtilityButton.
	CMMouseLeave (see page 180)	This is CMMouseLeave, a member of class TCustomButtonControl.
	CMMouseLeave (see page 239)	This is CMMouseLeave, a member of class TCustomUtilityButton.
	CMTextChanged (see page 180)	This is CMTextChanged, a member of class TCustomButtonControl.

	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DesignWndProc (see page 519)	This is DesignWndProc, a member of class TCustomActionControl.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDragDrop (see page 520)	This is DoDragDrop, a member of class TCustomActionControl.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 520)	OnStartDrag event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 521)	OnDragOver event dispatcher.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawArrows (see page 227)	This is DrawArrows, a member of class TCustomToolScrollBtn.
	DrawArrows (see page 239)	This is DrawArrows, a member of class TCustomUtilityButton.
	DrawBackground (see page 181)	Draws a background image on the control.
	DrawBackground (see page 521)	Draws a background image on the control.
	DrawDesignFocus (see page 521)	This is DrawDesignFocus, a member of class TCustomActionControl.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DrawDragDropPoint (see page 522)	This is DrawDragDropPoint, a member of class TCustomActionControl.
	DrawFrame (see page 20503)	This is DrawFrame, a member of class TStandardToolScrollBtn.
	DrawGlyph (see page 522)	Draws a symbol on the control.
	DrawLargeGlyph (see page 181)	This is DrawLargeGlyph, a member of class TCustomButtonControl.
	DrawLargeGlyph (see page 522)	This is DrawLargeGlyph, a member of class TCustomActionControl.
	DrawSeparator (see page 522)	This is DrawSeparator, a member of class TCustomActionControl.
	DrawShadowedText (see page 523)	This is DrawShadowedText, a member of class TCustomActionControl.
	DrawText (see page 523)	Draws text on the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 523)	This is GetAction, a member of class TCustomActionControl.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.

	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetImageSize (see page 523)	This is GetImageSize, a member of class TCustomActionControl.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSeparator (see page 524)	This is GetSeparator, a member of class TCustomActionControl.
	GetShowCaption (see page 524)	This is GetShowCaption, a member of class TCustomActionControl.
	GetShowShortCut (see page 181)	This is GetShowShortCut, a member of class TCustomButtonControl.
	GetShowShortCut (see page 524)	This is GetShowShortCut, a member of class TCustomActionControl.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HasGlyph (see page 524)	This is HasGlyph, a member of class TCustomActionControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsChecked (see page 525)	This is IsChecked, a member of class TCustomActionControl.
	IsGrouped (see page 525)	This is IsGrouped, a member of class TCustomActionControl.
	Loaded (see page 182)	Initializes the control after it is loaded from a stream.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 182)	OnMouseDown event dispatcher.
	MouseDown (see page 239)	OnMouseDown event dispatcher.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 183)	Respond to mouse moving over control area..
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 183)	OnMouseUp event dispatcher.
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	OnDelay (see page 240)	This is OnDelay, a member of class TCustomUtilityButton.
	Paint (see page 184)	Render control surface.
	Paint (see page 240)	Render control surface.
	Paint (see page 526)	Render control surface.
	Paint (see page 6052)	Render control surface.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionChanged (see page 526)	This is PositionChanged, a member of class TCustomActionControl.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetUsageData (see page 526)	This is ResetUsageData, a member of class TCustomActionControl.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetActionClient (see page 184)	This is SetActionClient, a member of class TCustomButtonControl.
	SetActionClient (see page 526)	This is SetActionClient, a member of class TCustomActionControl.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.

V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropPoint (see page 527)	This is SetDropPoint, a member of class TCustomActionControl.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
V	SetGlyphLayout (see page 185)	This is SetGlyphLayout, a member of class TCustomButtonControl.
V	SetGlyphLayout (see page 527)	This is SetGlyphLayout, a member of class TCustomActionControl.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetSelected (see page 185)	This is SetSelected, a member of class TCustomButtonControl.
V	SetSelected (see page 527)	This is SetSelected, a member of class TCustomActionControl.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateSelection (see page 527)	This is UpdateSelection, a member of class TCustomActionControl.
	UpdateTextBounds (see page 527)	This is UpdateTextBounds, a member of class TCustomActionControl.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WMLButtonDblClk (see page 185)	This is WMLButtonDblClk, a member of class TCustomButtonControl.
	WMSetText (see page 528)	This is WMSetText, a member of class TCustomActionControl.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.

	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	GlyphPos (see page 532)	This is GlyphPos, a member of class TCustomActionControl.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
R	MouseInControl (see page 189)	This is MouseInControl, a member of class TCustomButtonControl.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	OnClick (see page 243)	Occurs when the user clicks the control.
	OnClick (see page 535)	Occurs when the user clicks the control.
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
V	CalcBounds (see page 179)	Calculates the size of the control.
V	CalcBounds (see page 518)	Calculates the size of the control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 179)	Executes the control's function.
V	Click (see page 238)	Executes the control's function.
V	Click (see page 518)	Executes the control's function in response to a mouse click.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 177)	Creates an instance of TCustomButtonControl (see page 168).
V	Create (see page 227)	Creates an instance of TCustomButtonControl.
V	Create (see page 237)	Creates an instance of TCustomButtonControl.
V	Create (see page 515)	Creates an instance of TCustomActionControl (see page 507).
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6051)	Creates an instance of TGraphicControl (see page 6044).

	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 237)	Destroys an instance of TCustomActionControl.
V	Destroy (see page 516)	Destroys an instance of TCustomActionControl (see page 507).
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
V	DragDrop (see page 520)	Performs actions and generates an OnDragDrop event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 524)	Calls the action client's Update method if the control is associated with an action client.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
V	Keyed (see page 525)	Executes the control's function in response to a keyboard action.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 184)	Sets the Left, Top, Width, and Height properties all at once.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	ActionBar (see page 528)	The ActionBand object which contains the custom action control
	ActionClient (see page 529)	Refers to the control's action client
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	AllowAllUp (see page 186)	Indicates whether all the buttons in a given group can be up at the same time.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	ArrowSize (see page 240)	This is ArrowSize, a member of class TCustomUtilityButton.
	ArrowType (see page 241)	This is ArrowType, a member of class TCustomUtilityButton.
	AutoScroll (see page 241)	This is AutoScroll, a member of class TCustomUtilityButton.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.

	Caption (see page 186)	Specifies a text string that identifies the control to the user.
	Caption (see page 529)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
	Color (see page 241)	Specifies the background color of the control.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Direction (see page 242)	This is Direction, a member of class TCustomUtilityButton.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Down (see page 189)	Tells whether the button is down (selected) or up (unselected).
	DropPoint (see page 532)	This is DropPoint, a member of class TCustomActionControl.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
	Flat (see page 189)	Dictates whether the button should have a 2D look instead of the usual 3D look.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	GlyphLayout (see page 532)	Describes where the image should be on the control
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Margins (see page 532)	Describes the boundaries of the control for drawing purposes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	RepeatRate (see page 242)	This is RepeatRate, a member of class TCustomUtilityButton.
	Selected (see page 533)	Indicates whether the control is currently selected.
R	Separator (see page 533)	Indicates whether the control is a separator.
	ShowCaption (see page 189)	Indicates whether the control's caption should be shown.
R	ShowCaption (see page 533)	Indicates whether the control's caption should be shown.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
	ShowShortCut (see page 190)	Indicates whether the control's short cut should be shown.
R	ShowShortCut (see page 533)	Indicates whether the control's short cut should be shown.
	SmallIcon (see page 534)	Indicates whether the control's small icon should be shown.
	Spacing (see page 534)	Controls (see page 5711) the separation between the control's icon and caption.
	State (see page 190)	Describes the current state of the button.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.

	TextBounds (see page 534)	A bounding rectangle for the control caption.
	TrackButton (see page 190)	Specifies which mouse button activates the button control.
	Transparent (see page 534)	Shows whether the control is transparent or not.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

151.1.9.2 TStandardToolScrollBtn Methods

The methods of the TStandardToolScrollBtn class are listed here.

Protected Methods

	Name	Description
	DrawFrame (see page 20503)	This is DrawFrame, a member of class TStandardToolScrollBtn.

151.1.9.2.1 TStandardToolScrollBtn.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); override;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TStandardToolScrollBtn.

151.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	RegisterStandardMenus (see page 20504)	This is function StdActnMenus.RegisterStandardMenus.

151.2.1 StdActnMenus.RegisterStandardMenus Function

Pascal

```
procedure RegisterStandardMenus; deprecated;
```

C++

```
RegisterStandardMenus();
```

File

StdActnMenus

Description

This is function StdActnMenus.RegisterStandardMenus.

152 StdActns Namespace

This is namespace StdActns.

Topics

Name	Description
Classes (see page 20507)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 20822)	The following table lists structs, records, enums in this documentation.
Types (see page 20824)	The following table lists types in this documentation.

Classes

	Name	Description
	TBrowseForFolder (see page 20508)	This is class StdActns.TBrowseForFolder.
	TColorSelect (see page 20521)	TColorSelect is the standard action for displaying a color selection dialog.
	TCommonDialogAction (see page 20533)	TCommonDialogAction is the base class for action objects that display a dialog.
	TEditAction (see page 20544)	TEditAction is the base class for action objects that perform standard edits on an edit control.
	TEditCopy (see page 20552)	TEditCopy copies the selected text in a target edit control to the Windows clipboard.
	TEditCut (see page 20557)	TEditCut cuts the selected text in a target edit or memo control to the Windows clipboard.
	TEditDelete (see page 20563)	TEditDelete deletes the selected text in a target edit or memo control.
	TEditPaste (see page 20570)	TEditPaste pastes text from the clipboard into the active edit or memo control.
	TEditSelectAll (see page 20576)	TEditSelectAll selects all text in an active text control.
	TEditUndo (see page 20582)	TEditUndo backs out the last change in an edit control.
	TFileAction (see page 20588)	TFileAction is the base class for action objects that display a file selection dialog.
	TFileExit (see page 20594)	TFileExit is the standard action for shutting down an application.
	TFileOpen (see page 20605)	TFileOpen is the standard action for displaying a file open dialog.
	TFileOpenWith (see page 20619)	TFileOpenWith is the standard action for displaying the dialog that lets users choose what application to user for opening a file.
	TFilePageSetup (see page 20629)	TFilePageSetup is the standard action for displaying a page setup dialog.
	TFilePrintSetup (see page 20642)	TFilePrintSetup is the standard action for displaying a printer setup dialog.
	TFileSaveAs (see page 20654)	TFileSaveAs is the standard action for displaying a file save as dialog.
	TFontEdit (see page 20666)	TFontEdit is the standard action for displaying a font selection dialog.
	THelpAction (see page 20678)	THelpAction is the base class for action objects that interact with the help system.
	THelpContents (see page 20684)	THelpContents brings up the contents for the default help system.
	THelpContextAction (see page 20690)	THelpContextAction brings up the help topic for the active control.
	THelpOnHelp (see page 20696)	THelpOnHelp brings up a help topic on how to use Help.

	THelpTopicSearch (see page 20701)	THelpTopicSearch brings up the help index.
	THintAction (see page 20707)	THintAction is the action that executes when the user pauses the mouse over a control or menu item that has a hint.
	TPrintDlg (see page 20713)	TPrintDlg is the standard action for displaying a print dialog.
	TSearchAction (see page 20725)	TSearchAction is the base class for action objects that display a search or search and replace dialog.
	TSearchFind (see page 20734)	TSearchFind is the standard action for displaying a find dialog.
	TSearchFindFirst (see page 20747)	TSearchFindFirst is the standard action for displaying a find dialog that looks for the first occurrence of a string.
	TSearchFindNext (see page 20753)	TSearchFindNext is the standard action for locating the next instance of a string in an edit control.
	TSearchReplace (see page 20765)	TSearchReplace is the standard action for displaying a find-and-replace dialog.
	TWindowAction (see page 20779)	TWindowAction is the base class for action objects that work with MDI forms.
	TWindowArrange (see page 20786)	TWindowArrange arranges the icons of minimized MDI child forms.
	TWindowCascade (see page 20792)	TWindowCascade cascades the MDI child forms.
	TWindowClose (see page 20798)	TWindowClose closes the active MDI child form.
	TWindowMinimizeAll (see page 20804)	TWindowMinimizeAll minimizes all MDI child forms.
	TWindowTileHorizontal (see page 20809)	TWindowTileHorizontal arranges MDI child forms so that they are all the same size, tiled horizontally.
	TWindowTileVertical (see page 20815)	TWindowTileVertical arranges MDI child forms so that they are all the same size, tiled vertically.

Structs, Records, Enums

	Name	Description
	TBrowseForFolderOption (see page 20822)	This is record StdActns.TBrowseForFolderOption.

Types

Name	Description
TBrowseForFolderCallbackEvent (see page 20824)	This is type StdActns.TBrowseForFolderCallbackEvent.
TBrowseOptions (see page 20824)	This is type StdActns.TBrowseOptions.
TCommonDialogClass (see page 20825)	This is type StdActns.TCommonDialogClass.

152.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TBrowseForFolder (see page 20508)	This is class StdActns.TBrowseForFolder.
	TColorSelect (see page 20521)	TColorSelect is the standard action for displaying a color selection dialog.
	TCommonDialogAction (see page 20533)	TCommonDialogAction is the base class for action objects that display a dialog.
	TEditAction (see page 20544)	TEditAction is the base class for action objects that perform standard edits on an edit control.
	TEditCopy (see page 20552)	TEditCopy copies the selected text in a target edit control to the Windows clipboard.
	TEditCut (see page 20557)	TEditCut cuts the selected text in a target edit or memo control to the Windows clipboard.
	TEditDelete (see page 20563)	TEditDelete deletes the selected text in a target edit or memo control.
	TEditPaste (see page 20570)	TEditPaste pastes text from the clipboard into the active edit or memo control.
	TEditSelectAll (see page 20576)	TEditSelectAll selects all text in an active text control.
	TEditUndo (see page 20582)	TEditUndo backs out the last change in an edit control.
	TFileAction (see page 20588)	TFileAction is the base class for action objects that display a file selection dialog.
	TFileExit (see page 20594)	TFileExit is the standard action for shutting down an application.
	TFileOpen (see page 20605)	TFileOpen is the standard action for displaying a file open dialog.
	TFileOpenWith (see page 20619)	TFileOpenWith is the standard action for displaying the dialog that lets users choose what application to user for opening a file.
	TFilePageSetup (see page 20629)	TFilePageSetup is the standard action for displaying a page setup dialog.
	TFilePrintSetup (see page 20642)	TFilePrintSetup is the standard action for displaying a printer setup dialog.
	TFileSaveAs (see page 20654)	TFileSaveAs is the standard action for displaying a file save as dialog.
	TFontEdit (see page 20666)	TFontEdit is the standard action for displaying a font selection dialog.
	THelpAction (see page 20678)	THelpAction is the base class for action objects that interact with the help system.
	THelpContents (see page 20684)	THelpContents brings up the contents for the default help system.
	THelpContextAction (see page 20690)	THelpContextAction brings up the help topic for the active control.
	THelpOnHelp (see page 20696)	THelpOnHelp brings up a help topic on how to use Help.
	THelpTopicSearch (see page 20701)	THelpTopicSearch brings up the help index.
	THintAction (see page 20707)	THintAction is the action that executes when the user pauses the mouse over a control or menu item that has a hint.
	TPrintDlg (see page 20713)	TPrintDlg is the standard action for displaying a print dialog.
	TSearchAction (see page 20725)	TSearchAction is the base class for action objects that display a search or search and replace dialog.
	TSearchFind (see page 20734)	TSearchFind is the standard action for displaying a find dialog.
	TSearchFindFirst (see page 20747)	TSearchFindFirst is the standard action for displaying a find dialog that looks for the first occurrence of a string.
	TSearchFindNext (see page 20753)	TSearchFindNext is the standard action for locating the next instance of a string in an edit control.
	TSearchReplace (see page 20765)	TSearchReplace is the standard action for displaying a find-and-replace dialog.
	TWindowAction (see page 20779)	TWindowAction is the base class for action objects that work with MDI forms.
	TWindowArrange (see page 20786)	TWindowArrange arranges the icons of minimized MDI child forms.
	TWindowCascade (see page 20792)	TWindowCascade cascades the MDI child forms.
	TWindowClose (see page 20798)	TWindowClose closes the active MDI child form.
	TWindowMinimizeAll (see page 20804)	TWindowMinimizeAll minimizes all MDI child forms.
	TWindowTileHorizontal (see page 20809)	TWindowTileHorizontal arranges MDI child forms so that they are all the same size, tiled horizontally.
	TWindowTileVertical (see page 20815)	TWindowTileVertical arranges MDI child forms so that they are all the same size, tiled vertically.

152.1.1 TBrowseForFolder Class

Class Hierarchy

Pascal

```
TBrowseForFolder = class(TCommonDialogAction);
```

C++

```
class TBrowseForFolder : public TCommonDialogAction;
```

File

StdActns

Description

This is class StdActns.TBrowseForFolder.

152.1.1.1 TBrowseForFolder Members

The following tables list the members exposed by TBrowseForFolder.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
	DoCallback (see page 20513)	This is DoCallback, a member of class TBrowseForFolder.

	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	DoValidate (see page 20513)	This is DoValidate, a member of class TBrowseForFolder.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDialogClass (see page 20514)	This is GetDialogClass, a member of class TBrowseForFolder.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20541)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 20538)	Creates an instance of TCommonDialogAction.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20538)	Frees an instance of TCustomAction.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 20513)	Executes the associated dialog and generates an OnAccept or OnCancel event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.

	Folder (see page 20515)	This is Folder, a member of class TBrowseForFolder.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	BeforeExecute (see page 20519)	Occurs immediately before the dialog appears.
	OnAccept (see page 20520)	This is OnAccept, a member of class TBrowseForFolder.
	OnCallback (see page 20520)	This is OnCallback, a member of class TBrowseForFolder.
	OnCancel (see page 20520)	This is OnCancel, a member of class TBrowseForFolder.
	OnHint (see page 20520)	Occurs when the mouse pauses over a client control or menu item.
	OnValidate (see page 20521)	This is OnValidate, a member of class TBrowseForFolder.

Published Properties

	Name	Description
	BrowseOptions (see page 20514)	This is BrowseOptions, a member of class TBrowseForFolder.
	Caption (see page 20514)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	DialogCaption (see page 20515)	This is DialogCaption, a member of class TBrowseForFolder.
	Enabled (see page 20515)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20516)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20516)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20517)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20517)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20517)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RootDir (see page 20518)	This is RootDir, a member of class TBrowseForFolder.
	SecondaryShortCuts (see page 20518)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20518)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 20519)	Specifies the Visible property for client controls and menu items.

152.1.1.2 TBrowseForFolder Methods

The methods of the TBrowseForFolder class are listed here.

Protected Methods

	Name	Description
	DoCallback (see page 20513)	This is DoCallback, a member of class TBrowseForFolder.
	DoValidate (see page 20513)	This is DoValidate, a member of class TBrowseForFolder.
V	GetDialogClass (see page 20514)	This is GetDialogClass, a member of class TBrowseForFolder.

Public Methods

	Name	Description
V	ExecuteTarget (see page 20513)	Executes the associated dialog and generates an OnAccept or OnCancel event.

152.1.1.2.1 TBrowseForFolder.DoCallback Method

Pascal

```
function DoCallback(Wnd: HWND; uMsg: UINT; lParam: LPARAM; lpData: LPARAM): Integer;
```

C++

```
__fastcall int DoCallback(HWND Wnd, UINT uMsg, LPARAM lParam, LPARAM lpData);
```

Description

This is DoCallback, a member of class TBrowseForFolder.

152.1.1.2.2 TBrowseForFolder.DoValidate Method

Pascal

```
function DoValidate(Wnd: HWND; uMsg: UINT; lParam: LPARAM; lpData: LPARAM): Integer;
```

C++

```
__fastcall int DoValidate(HWND Wnd, UINT uMsg, LPARAM lParam, LPARAM lpData);
```

Description

This is DoValidate, a member of class TBrowseForFolder.

152.1.1.2.3 TBrowseForFolder.ExecuteTarget Method

Executes the associated dialog and generates an OnAccept or OnCancel event.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget ignores the Target parameter and

1. Generates a BeforeExecute event, so that the application can initialize the associated dialog according to current conditions.
2. Calls the Execute method of the dialog.
3. Generates an OnAccept event or an OnCancel event, depending on the value returned by the Execute method. You can write code to make use of the results from executing the dialog in these event handlers.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

Execute (see page 11283)

BeforeExecute (see page 20543)

152.1.1.2.4 TBrowseForFolder.GetDialogClass Method

Pascal

```
function GetDialogClass: TCommonDialogClass; override;
```

C++

```
virtual __fastcall TCommonDialogClass GetDialogClass();
```

Description

This is GetDialogClass, a member of class TBrowseForFolder.

152.1.1.3 TBrowseForFolder Properties

The properties of the TBrowseForFolder class are listed here.

Public Properties

	Name	Description
	Folder (see page 20515)	This is Folder, a member of class TBrowseForFolder.

Published Properties

	Name	Description
	BrowseOptions (see page 20514)	This is BrowseOptions, a member of class TBrowseForFolder.
	Caption (see page 20514)	Represents the caption of client controls and menu items.
	DialogCaption (see page 20515)	This is DialogCaption, a member of class TBrowseForFolder.
	Enabled (see page 20515)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20516)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20516)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20517)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20517)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20517)	Indicates the ImageIndex property for client controls and menu items.
	RootDir (see page 20518)	This is RootDir, a member of class TBrowseForFolder.
	SecondaryShortCuts (see page 20518)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20518)	Specifies the ShortCut property for client menu items.
	Visible (see page 20519)	Specifies the Visible property for client controls and menu items.

152.1.1.3.1 TBrowseForFolder.BrowseOptions Property

Pascal

```
property BrowseOptions: TBrowseOptions;
```

C++

```
__property TBrowseOptions BrowseOptions;
```

Description

This is BrowseOptions, a member of class TBrowseForFolder.

152.1.1.3.2 TBrowseForFolder.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

152.1.1.3.3 TBrowseForFolder.DialogCaption Property

Pascal

```
property DialogCaption: string;
```

C++

```
__property AnsiString DialogCaption;
```

Description

This is DialogCaption, a member of class TBrowseForFolder.

152.1.1.3.4 TBrowseForFolder.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

152.1.1.3.5 TBrowseForFolder.Folder Property

Pascal

```
property Folder: string;
```

C++

```
__property AnsiString Folder;
```

Description

This is Folder, a member of class TBrowseForFolder.

152.1.1.3.6 TBrowseForFolder.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

152.1.1.3.7 TBrowseForFolder.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

152.1.1.3.8 TBrowseForFolder.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

152.1.1.3.9 TBrowseForFolder.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

152.1.1.3.10 TBrowseForFolder.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

152.1.1.3.11 TBrowseForFolder.RootDir Property

Pascal

```
property RootDir: string;
```

C++

```
__property AnsiString RootDir;
```

Description

This is RootDir, a member of class TBrowseForFolder.

152.1.1.3.12 TBrowseForFolder.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

152.1.1.3.13 TBrowseForFolder.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

152.1.1.3.14 TBrowseForFolder.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

152.1.1.4 TBrowseForFolder Events

The events of the TBrowseForFolder class are listed here.

Published Events

	Name	Description
	BeforeExecute (see page 20519)	Occurs immediately before the dialog appears.
	OnAccept (see page 20520)	This is OnAccept, a member of class TBrowseForFolder.
	OnCallback (see page 20520)	This is OnCallback, a member of class TBrowseForFolder.
	OnCancel (see page 20520)	This is OnCancel, a member of class TBrowseForFolder.
	OnHint (see page 20520)	Occurs when the mouse pauses over a client control or menu item.
	OnValidate (see page 20521)	This is OnValidate, a member of class TBrowseForFolder.

152.1.1.4.1 TBrowseForFolder.BeforeExecute Event

Occurs immediately before the dialog appears.

Pascal

```
property BeforeExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to initialize the dialog immediately before it executes. When the action fires, it generates a BeforeExecute event, and then executes its associated dialog.

See Also

ExecuteTarget (see page 20540)

Execute (see page 11283)

PropertyName

152.1.1.4.2 TBrowseForFolder.OnAccept Event

Pascal

```
property OnAccept: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAccept;
```

Description

This is OnAccept, a member of class TBrowseForFolder.

152.1.1.4.3 TBrowseForFolder.OnCallback Event

Pascal

```
property OnCallback: TBrowseForFolderCallbackEvent;
```

C++

```
__property TBrowseForFolderCallbackEvent OnCallback;
```

Description

This is OnCallback, a member of class TBrowseForFolder.

152.1.1.4.4 TBrowseForFolder.OnCancel Event

Pascal

```
property OnCancel: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCancel;
```

Description

This is OnCancel, a member of class TBrowseForFolder.

152.1.1.4.5 TBrowseForFolder.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The

OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

152.1.1.4.6 TBrowseForFolder.OnValidate Event

Pascal

```
property OnValidate: TBrowseForFolderCallbackEvent;
```

C++

```
__property TBrowseForFolderCallbackEvent OnValidate;
```

Description

This is OnValidate, a member of class TBrowseForFolder.

152.1.2 TColorSelect Class

TColorSelect is the standard action for displaying a color selection dialog.

Class Hierarchy

Pascal

```
TColorSelect = class(TCommonDialogAction);
```

C++

```
class TColorSelect : public TCommonDialogAction;
```

File

StdActns

Description

Add TColorSelect to an action list to add a modal color selection dialog to your application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to display the color selection dialog when invoked. Use the OnAccept (see page 20531) event to respond after the user selects a color using the dialog or the OnCancel (see page 20532) event to respond if the user cancels from the dialog. In the event handler for these events, you can read the color from the dialog specified by the Dialog (see page 20527) property.

See Also

TColorDialog (see page 11270)

152.1.2.1 TColorSelect Members

The following tables list the members exposed by TColorSelect.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
V	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDialogClass (see page 20526)	This is GetDialogClass, a member of class TColorSelect.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20541)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.

	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20538)	Creates an instance of TCommonDialogAction.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20538)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
V	ExecuteTarget (see page 20540)	Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.

V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	BeforeExecute (see page 20531)	Occurs immediately before the dialog appears.
	OnAccept (see page 20531)	This is OnAccept, a member of class TColorSelect.
	OnCancel (see page 20532)	This is OnCancel, a member of class TColorSelect.
	OnHint (see page 20532)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20532)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 20526)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
R	Dialog (see page 20527)	Provides access the color selection dialog that the action executes.
	Enabled (see page 20527)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20527)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20528)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20528)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20529)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20529)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 20530)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20530)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 20530)	Specifies the Visible property for client controls and menu items.

152.1.2.2 TColorSelect Methods

The methods of the TColorSelect class are listed here.

Protected Methods

	Name	Description
V	GetDialogClass (see page 20526)	This is GetDialogClass, a member of class TColorSelect.

152.1.2.2.1 TColorSelect.GetDialogClass Method

Pascal

```
function GetDialogClass: TCommonDialogClass; override;
```

C++

```
virtual __fastcall TCommonDialogClass GetDialogClass();
```

Description

This is GetDialogClass, a member of class TColorSelect.

152.1.2.3 TColorSelect Properties

The properties of the TColorSelect class are listed here.

Published Properties

	Name	Description
	Caption (see page 20526)	Represents the caption of client controls and menu items.
R	Dialog (see page 20527)	Provides access the color selection dialog that the action executes.
	Enabled (see page 20527)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20527)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20528)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20528)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20529)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20529)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 20530)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20530)	Specifies the ShortCut property for client menu items.
	Visible (see page 20530)	Specifies the Visible property for client controls and menu items.

152.1.2.3.1 TColorSelect.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

152.1.2.3.2 TColorSelect.Dialog Property

Provides access the color selection dialog that the action executes.

Pascal

```
property Dialog: TColorDialog;
```

C++

```
__property TColorDialog Dialog;
```

Description

Use Dialog to configure the color selection dialog before the action fires or to read the selected color after the action executes the dialog. For example, you can set the initially selected color in the dialog at design time using the Object Inspector or read the dialog's Color property in an OnAccept (see page 20531) event handler to make use of the selected color.

When using a color select action, you do not place a TColorDialog component on the form or data module at design time. Instead, you add the TColorSelect (see page 20521) to your action list and then use the Dialog property. The color selection dialog component is created by the TColorSelect (see page 20521) constructor.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

Color (see page 11275)

152.1.2.3.3 TColorSelect.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

152.1.2.3.4 TColorSelect.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

152.1.2.3.5 TColorSelect.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

152.1.2.3.6 TColorSelect.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

152.1.2.3.7 TColorSelect.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

152.1.2.3.8 TColorSelect.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

152.1.2.3.9 TColorSelect.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

152.1.2.3.10 TColorSelect.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

152.1.2.3.11 TColorSelect.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

152.1.2.4 TColorSelect Events

The events of the TColorSelect class are listed here.

Published Events

	Name	Description
	BeforeExecute (see page 20531)	Occurs immediately before the dialog appears.
	OnAccept (see page 20531)	This is OnAccept, a member of class TColorSelect.
	OnCancel (see page 20532)	This is OnCancel, a member of class TColorSelect.
	OnHint (see page 20532)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20532)	Occurs when the application is idle or when the action list updates.

152.1.2.4.1 TColorSelect.BeforeExecute Event

Occurs immediately before the dialog appears.

Pascal

```
property BeforeExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to initialize the dialog immediately before it executes. When the action fires, it generates a BeforeExecute event, and then executes its associated dialog.

See Also

ExecuteTarget (see page 20540)

Execute (see page 11283)

PropertyName

152.1.2.4.2 TColorSelect.OnAccept Event

Pascal

```
property OnAccept: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAccept;
```

Description

This is OnAccept, a member of class TColorSelect.

152.1.2.4.3 TColorSelect.OnCancel Event

Pascal

```
property OnCancel: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCancel;
```

Description

This is OnCancel, a member of class TColorSelect.

152.1.2.4.4 TColorSelect.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

152.1.2.4.5 TColorSelect.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
```

```
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

152.1.3 TCommonDialogAction Class

TCommonDialogAction is the base class for action objects that display a dialog.

Class Hierarchy

Pascal

```
TCommonDialogAction = class(TCustomAction);
```

C++

```
class TCommonDialogAction : public TCustomAction;
```

File

StdActns

Description

TCommonDialogAction implements the common behavior for actions that display a dialog when executed. Each descendant class represents a specific dialog. Do not use TCommonDialogAction directly in an application. Instead, use the specific TCommonDialogAction descendant that represents the type of dialog you want to execute. The various TCommonDialogAction descendants are listed in the See also list.

TCommonDialogAction objects do not require a specific type of control to be active: they handle any target. When executed, the dialog action displays its dialog, and then generates an OnAccept (see page 20543) or OnCancel (see page 20543) event, which you can use to process the results from the dialog.

When using TCommonDialogAction desendants, there is no need to place the dialog component in your form or data module. The action object creates its own dialog component.

See Also

152.1.3.1 TCommonDialogAction Members

The following tables list the members exposed by TCommonDialogAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDialogClass (see page 20541)	This is GetDialogClass, a member of class TCommonDialogAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 20541)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	BeforeExecute (see page 20543)	Occurs immediately before the dialog appears.
	OnAccept (see page 20543)	This is OnAccept, a member of class TCommonDialogAction.
	OnCancel (see page 20543)	This is OnCancel, a member of class TCommonDialogAction.
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 20538)	Creates an instance of TCommonDialogAction.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 20538)	Frees an instance of TCustomAction.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 20540)	Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.

R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Properties

	Name	Description
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

152.1.3.2 TCommonDialogAction.Create Constructor

Creates an instance of TCommonDialogAction.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCommonDialogAction(TComponent * AOwner);
```

Description

Most applications do not need to call the TCommonDialogAction constructor because actions are added at design time to an action list or action manager.

The TCommonDialogAction constructor creates an instance of its associated dialog, which descendant classes make available through the Dialog property.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TCommonDialogAction instance.

See Also

Owner (see page 2807)

Actions (see page 325)

152.1.3.3 TCommonDialogAction.Destroy Destructor

Frees an instance of TCustomAction.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCommonDialogAction();
```

Description

Do not call the destructor directly in an application. Instead, call Free. Free ensures that the action is not nil before calling the destructor.

If the action is contained in an action list or action manager, Destroy removes the action from that list.

See Also

Create (see page 301)

Actions (see page 325)

152.1.3.4 TCommonDialogAction Fields

The fields of the TCommonDialogAction class are listed here.

Protected Fields

	Name	Description
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.

152.1.3.4.1 TCommonDialogAction.FDialog Field

Pascal

```
FDialog: TCommonDialog;
```

C++

```
TCommonDialog FDialog;
```

Description

This is FDialog, a member of class TCommonDialogAction.

152.1.3.5 TCommonDialogAction Methods

The methods of the TCommonDialogAction class are listed here.

Protected Methods

	Name	Description
	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetDialogClass (see page 20541)	This is GetDialogClass, a member of class TCommonDialogAction.
	Notification (see page 20541)	Responds when components are created or destroyed.
	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.

Public Methods

	Name	Description
	ExecuteTarget (see page 20540)	Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.

	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.

152.1.3.5.1 TCommonDialogAction.DoAccept Method

Pascal

```
procedure DoAccept; virtual;
```

C++

```
virtual __fastcall DoAccept();
```

Description

This is DoAccept, a member of class TCommonDialogAction.

152.1.3.5.2 TCommonDialogAction.DoCancel Method

Pascal

```
procedure DoCancel; virtual;
```

C++

```
virtual __fastcall DoCancel();
```

Description

This is DoCancel, a member of class TCommonDialogAction.

152.1.3.5.3 TCommonDialogAction.ExecuteTarget Method

Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget ignores the Target parameter and

1. Generates a BeforeExecute (see page 20543) event, so that the application can initialize the associated dialog according to current conditions.
2. Calls the Execute method of the dialog.
3. Generates an OnAccept (see page 20543) event or an OnCancel (see page 20543) event, depending on the value returned by the Execute method. You can write code to make use of the results from executing the dialog in these event handlers.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

Execute (see page 11283)

BeforeExecute (see page 20543)

152.1.3.5.4 TCommonDialogAction.GetDialogClass Method

Pascal

```
function GetDialogClass: TCommonDialogClass; virtual;
```

C++

```
virtual __fastcall TCommonDialogClass GetDialogClass();
```

Description

This is GetDialogClass, a member of class TCommonDialogAction.

152.1.3.5.5 TCommonDialogAction.HandlesTarget Method

Indicates whether the action can execute its dialog.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method lets the action object indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

Target is the currently active object.

HandlesTarget always returns true, because the execution of the dialog does not depend on any target object.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

Execute (see page 11283)

152.1.3.5.6 TCommonDialogAction.Notification Method

Responds when components are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation.

TBasicAction overrides the Notification method to check whether the component that is the value of the ActionComponent

property is about to be freed. If so, it sets the ActionComponent property to nil (Delphi) or NULL (C++).

See Also

ActionComponent (see page 2715)

152.1.3.5.7 TCommonDialogAction.SetupDialog Method

Pascal

```
procedure SetupDialog; virtual;
```

C++

```
virtual __fastcall SetupDialog();
```

Description

This is SetupDialog, a member of class TCommonDialogAction.

152.1.3.6 TCommonDialogAction Properties

The properties of the TCommonDialogAction class are listed here.

Public Properties

	Name	Description
	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.

152.1.3.6.1 TCommonDialogAction.ExecuteResult Property

Indicates the result of executing the associated dialog.

Pascal

```
property ExecuteResult: Boolean;
```

C++

```
__property Boolean ExecuteResult;
```

Description

When the dialog action fires, it executes the dialog specified by the CommonDialog property and sets ExecuteResult the value returned by that dialog's Execute method. Thus, ExecuteResult is false if the dialog has not executed or the user canceled when the dialog executed, and true if the user exited the dialog by clicking OK.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

Execute (see page 11283)

152.1.3.7 TCommonDialogAction Events

The events of the TCommonDialogAction class are listed here.

Public Events

	Name	Description
	BeforeExecute (see page 20543)	Occurs immediately before the dialog appears.
	OnAccept (see page 20543)	This is OnAccept, a member of class TCommonDialogAction.
	OnCancel (see page 20543)	This is OnCancel, a member of class TCommonDialogAction.

152.1.3.7.1 TCommonDialogAction.BeforeExecute Event

Occurs immediately before the dialog appears.

Pascal

```
property BeforeExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to initialize the dialog immediately before it executes. When the action fires, it generates a BeforeExecute event, and then executes its associated dialog.

See Also

ExecuteTarget (see page 20540)

Execute (see page 11283)

PropertyName

152.1.3.7.2 TCommonDialogAction.OnAccept Event

Pascal

```
property OnAccept: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAccept;
```

Description

This is OnAccept, a member of class TCommonDialogAction.

152.1.3.7.3 TCommonDialogAction.OnCancel Event

Pascal

```
property OnCancel: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCancel;
```

Description

This is OnCancel, a member of class TCommonDialogAction.

152.1.4 TEditAction Class

TEditAction is the base class for action objects that perform standard edits on an edit control.

Class Hierarchy

Pascal

```
TEditAction = class(TAction);
```

C++

```
class TEditAction : public TAction;
```

File

StdActns

Description

TEditAction is the common base class for actions that work with edit controls. Each descendant class performs a specific type of edit on the target edit control. Do not use TEditAction directly in an application. Instead, use a TEditAction descendant that performs a specific function (for example, Cut, Copy, Paste, Delete, Select All, or Undo). The various TEditAction descendants are listed in the See also list.

See Also

TEditCopy (see page 20552)

TEditCut (see page 20557)

TEditDelete (see page 20563)

TEditPaste (see page 20570)

TEditSelectAll (see page 20576)

TEditUndo (see page 20582)

TEditRedo

TCustomEdit (see page 21232)

TRichEditBold (see page 12017)

TRichEditItalic (see page 12029)

TRichEditUnderline (see page 12042)

TRichEditAlignCenter (see page 11998)

TRIchEditAlignLeft

TRichEditAlignRight (see page 12011)

TRichEditBullets (see page 12023)

TRichEditStrikeOut (see page 12036)

152.1.4.1 TEditAction Members

The following tables list the members exposed by TEditAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 20549)	Frees an instance of TCustomAction.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
	Update (see page 295)	Indicates whether the action updates itself.
	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateTarget (see page 20551)	Enables or disables the action, depending on the currently active control in the form.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.

	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.4.2 TEditAction.Destroy Destructor

Frees an instance of TCustomAction.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TEditAction();
```

Description

Do not call the destructor directly in an application. Instead, call Free. Free ensures that the action is not nil before calling the destructor.

If the action is contained in an action list or action manager, Destroy removes the action from that list.

See Also

Create (see page 301)

Actions (see page 325)

152.1.4.3 TEditAction Methods

The methods of the TEditAction class are listed here.

Protected Methods

	Name	Description
	GetControl (see page 20549)	Returns the target of the edit action.
	Notification (see page 20550)	Responds when objects are added or removed.

Public Methods

	Name	Description
	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
	UpdateTarget (see page 20551)	Enables or disables the action, depending on the currently active control in the form.

152.1.4.3.1 TEditAction.GetControl Method

Returns the target of the edit action.

Pascal

```
function GetControl(Target: TObject): TCustomEdit; virtual;
```

C++

```
virtual __fastcall TCustomEdit GetControl(TObject * Target);
```

Description

TEditAction (see page 20544) uses the protected GetControl method internally to obtain the target of the action.

Target is the currently active object, or the value of the Control (see page 20551) property.

GetControl returns the target object as an edit control.

See Also

ExecuteTarget (see page 2712)

Control (see page 20551)

152.1.4.3.2 TEditAction.HandlesTarget Method

Indicates whether the action can execute its function.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method provides the action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

Target is the currently active object.

HandlesTarget checks that the target of is a TCustomEdit descendant (or that the EditControl (see page 20551) property is set if Target is nil (Delphi) or NULL (C++)). HandlesTarget returns true if there is an edit control to act as target, false otherwise.

See Also

ExecuteTarget (see page 2712)

TCustomEdit (see page 21232)

EditControl

152.1.4.3.3 TEditAction.Notification Method

Responds when objects are added or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation.

TEditAction (see page 20544) responds to notifications that the target edit control (as specified by the Control (see page 20551) property) is about to be freed by setting Control (see page 20551) to nil (Delphi) or NULL (C++).

See Also

ExecuteTarget (see page 2712)

Control (see page 20551)

152.1.4.3.4 TEditAction.UpdateTarget Method

Enables or disables the action, depending on the currently active control in the form.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the potential target changes so that actions can update themselves accordingly.

In TEditAction (see page 20544), UpdateTarget checks whether the current target object (specified by the Target parameter) is an edit control and, if the action's function requires it, that some of its text is selected. If so, UpdateTarget sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

152.1.4.4 TEditAction Properties

The properties of the TEditAction class are listed here.

Public Properties

	Name	Description
	Control (see page 20551)	Provides access to the target of the action.

152.1.4.4.1 TEditAction.Control Property

Provides access to the target of the action.

Pascal

```
property Control: TCustomEdit;
```

C++

```
__property TCustomEdit Control;
```

Description

EditControl is the edit control on which the action performs its function. Set the value of Control to limit the action so that it only operates on a specific edit control. If Control is unassigned, the action dynamically locates the target edit control when it executes.

See Also

ExecuteTarget (see page 2712)

152.1.5 TEditCopy Class

TEditCopy copies the selected text in a target edit control to the Windows clipboard.

Class Hierarchy

Pascal

```
TEditCopy = class(TEditAction);
```

C++

```
class TEditCopy : public TEditAction;
```

File

StdActns

Description

Add TEditCopy to an action list to allow users to copy selected text to the clipboard using menu items or toolbar buttons. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to copy the currently selected text in an active text control to the clipboard.

TEditCopy is designed to work with an edit control (TCustomEdit descendant) as a target. It automatically disables itself if the active control in a form is not an edit control or if that edit control does not have any text selected.

See Also

TEditCut (see page 20557)

TEditDelete (see page 20563)

TEditPaste (see page 20570)

TEditSelectAll (see page 20576)

TEditUndo (see page 20582)

TEditRedo

TCustomEdit (see page 21232)

TRichEditBold (see page 12017)

TRichEditItalic (see page 12029)

TRichEditUnderline (see page 12042)

TSearchReplace (see page 20765)

152.1.5.1 TEditCopy Members

The following tables list the members exposed by TEditCopy.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.

	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20549)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.

	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 20557)	Copies selected text in the target control to the Windows clipboard.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 20551)	Enables or disables the action, depending on the currently active control in the form.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.

	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.5.2 TEditCopy Methods

The methods of the TEditCopy class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 20557)	Copies selected text in the target control to the Windows clipboard.

152.1.5.2.1 TEditCopy.ExecuteTarget Method

Copies selected text in the target control to the Windows clipboard.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget checks that Target is an edit control (TCustomEdit descendant), and if so, calls its CopyToClipboard method, copying the selected text to the clipboard.

TCustomEdit (see page 21232)

CopyToClipboard (see page 21246)

152.1.6 TEditCut Class

TEditCut cuts the selected text in a target edit or memo control to the Windows clipboard.

Class Hierarchy

Pascal

```
TEditCut = class(TEditAction);
```

C++

```
class TEditCut : public TEditAction;
```

File

StdActns

Description

Add TEditCut to an action list to allow users to cut selected text to the clipboard using menu items or toolbar buttons. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to cut the currently selected text in an active text control to the clipboard.

TEditCut is designed to work with an edit control (TCustomEdit or TCustomMemo descendant) as a target. It automatically disables itself if the active control in a form is not an edit control or if that edit control does not have a selection to cut.

152.1.6.1 TEditCut Members

The following tables list the members exposed by TEditCut.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20549)	Frees an instance of TCustomAction.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.

	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 20563)	Cuts selected text in the target control to the Windows clipboard.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 20551)	Enables or disables the action, depending on the currently active control in the form.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.

	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.6.2 TEditCut Methods

The methods of the TEditCut class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 20563)	Cuts selected text in the target control to the Windows clipboard.

152.1.6.2.1 TEditCut.ExecuteTarget Method

Cuts selected text in the target control to the Windows clipboard.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget checks that Target is an edit control (TCustomEditControl descendant), and if so, calls its CutToClipboard method, cutting the selected text to the clipboard.

See Also

TCustomEdit (see page 21232)

CutToClipboard (see page 21249)

152.1.7 TEditDelete Class

TEditDelete deletes the selected text in a target edit or memo control.

Class Hierarchy

Pascal

```
TEditDelete = class(TEditAction);
```

C++

```
class TEditDelete : public TEditAction;
```

File

StdActns

Description

Add TEditDelete to an action list to let users delete selected text using menu items or toolbar buttons. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to delete the currently selected text in an active text control.

TEditDelete is designed to work with an edit control (TCustomEdit or TCustomMemo descendant) as a target. It automatically disables itself if the active control in a form is not an edit control or if the active edit control does not have any selected text.

152.1.7.1 TEditDelete Members

The following tables list the members exposed by TEditDelete.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20549)	Frees an instance of TCustomAction.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 20569)	Deletes selected text in the target control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 20569)	Enables or disables the action, depending on the currently active control in the form.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.

	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.7.2 TEditDelete Methods

The methods of the TEditDelete class are listed here.

Public Methods

	Name	Description
V	ExecuteTarget (see page 20569)	Deletes selected text in the target control.

	UpdateTarget (see page 20569)	Enables or disables the action, depending on the currently active control in the form.

152.1.7.2.1 TEditDelete.ExecuteTarget Method

Deletes selected text in the target control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget checks that Target is a TCustomEdit descendant, and if so, calls its ClearSelection method, deleting the selected text.

See Also

TCustomEdit (see page 21232)

EditControl

MemoControl

ClearSelection (see page 21245)

152.1.7.2.2 TEditDelete.UpdateTarget Method

Enables or disables the action, depending on the currently active control in the form.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

In TEditDelete (see page 20563), UpdateTarget checks whether the current target object (specified by the Target parameter) is an edit control that has some of its text selected. If so, UpdateTarget sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

152.1.8 TEditPaste Class

TEditPaste pastes text from the clipboard into the active edit or memo control.

Class Hierarchy

Pascal

```
TEditPaste = class(TEditAction);
```

C++

```
class TEditPaste : public TEditAction;
```

File

StdActns

Description

Add TEditPaste to an action list to enable users to paste text from the clipboard using menu items or toolbar buttons. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to paste text from the clipboard into an active text control.

TEditPaste is designed to work with an edit control (TCustomEdit or TCustomMemo descendant) as a target. It automatically disables itself if the clipboard does not contain text.

See Also

TEditCopy (see page 20552)

TEditCut (see page 20557)

TEditDelete (see page 20563)

TEditSelectAll (see page 20576)

TEditUndo (see page 20582)

TCustomEdit (see page 21232)

TRichEditBold (see page 12017)

TRichEditItalic (see page 12029)

TRichEditUnderline (see page 12042)

TSearchReplace (see page 20765)

152.1.8.1 TEditPaste Members

The following tables list the members exposed by TEditPaste.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.

	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20549)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.

	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 20575)	Pastes text from the clipboard into the target edit control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 20575)	Enables or disables the action, depending on the contents of the clipboard.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.

	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.8.2 TEditPaste Methods

The methods of the TEditPaste class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 20575)	Pastes text from the clipboard into the target edit control.
	UpdateTarget (see page 20575)	Enables or disables the action, depending on the contents of the clipboard.

152.1.8.2.1 TEditPaste.ExecuteTarget Method

Pastes text from the clipboard into the target edit control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget checks that Target is a TCustomEdit descendant, and if so, calls its PasteFromClipboard method, pasting in any text on the clipboard.

See Also

TCustomEdit (see page 21232)

EditControl

MemoControl

PasteFromClipboard (see page 21254)

152.1.8.2.2 TEditPaste.UpdateTarget Method

Enables or disables the action, depending on the contents of the clipboard.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TEditPaste (see page 20570), UpdateTarget checks whether the clipboard contains text. If so, UpdateTarget sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

152.1.9 TEditSelectAll Class

TEditSelectAll selects all text in an active text control.

Class Hierarchy

Pascal

```
TEditSelectAll = class(TEditAction);
```

C++

```
class TEditSelectAll : public TEditAction;
```

File

StdActns

Description

Add TEditSelectAll to an action list to allow users to select all the text in a text control using menu items or toolbar buttons. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to select all text in an active text control.

TEditSelectAll is designed to work with an edit control (TCustomEdit descendant) as a target. It automatically disables itself if the active control in a form is not an edit control or if the edit control does not have any text.

TEditRedo

TCustomEdit (see page 21232)

TRichEditBold (see page 12017)

TRichEditItalic (see page 12029)

TRichEditUnderline (see page 12042)

TSearchReplace (see page 20765)

152.1.9.1 TEditSelectAll Members

The following tables list the members exposed by TEditSelectAll.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.

	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.

	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20549)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 20581)	Selects all text in the target edit control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 20582)	Enables or disables the action, depending on the contents of the target edit control.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.

	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.9.2 TEditSelectAll Methods

The methods of the TEditSelectAll class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 20581)	Selects all text in the target edit control.
	UpdateTarget (see page 20582)	Enables or disables the action, depending on the contents of the target edit control.

152.1.9.2.1 TEditSelectAll.ExecuteTarget Method

Selects all text in the target edit control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget checks that Target is a TCustomEdit descendant, and if so, calls its SelectAll method, selecting all of its text.

See Also

TCustomEdit (see page 21232)

EditControl

MemoControl

SelectAll

152.1.9.2.2 TEditSelectAll.UpdateTarget Method

Enables or disables the action, depending on the contents of the target edit control.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TEditSelectAll (see page 20576), UpdateTarget checks whether Target is a text control that contains text. If so, UpdateTarget sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

152.1.10 TEditUndo Class

TEditUndo backs out the last change in an edit control.

Class Hierarchy

Pascal

```
TEditUndo = class(TEditAction);
```

C++

```
class TEditUndo : public TEditAction;
```

File

StdActns

Description

Add TEditUndo to an action list to allow users to back out edits using menu items or toolbar buttons. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to undo the last edit in an active text control.

TEditUndo is designed to work with an edit control (TCustomEdit descendant) as a target. It automatically disables itself if the active control in a form is not an edit control that can back out the last edit.

See Also

TEditCopy (see page 20552)

TEditCut (see page 20557)

TEditPaste (see page 20570)

TEditSelectAll (see page 20576)

TEditDelete (see page 20563)

TCustomEdit (see page 21232)

TRichEditBold (see page 12017)

TRichEditItalic (see page 12029)

TRichEditUnderline (see page 12042)

TSearchReplace (see page 20765)

152.1.10.1 TEditUndo Members

The following tables list the members exposed by TEditUndo.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetControl (see page 20549)	Returns the target of the edit action.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20550)	Responds when objects are added or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20549)	Frees an instance of TCustomAction.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 20587)	Backs out the last edit from the target control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20550)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 20588)	Enables or disables the action, depending on the currently active control in the form.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Control (see page 20551)	Provides access to the target of the action.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.

	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.10.2 TEditUndo Methods

The methods of the TEditUndo class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 20587)	Backs out the last edit from the target control.
	UpdateTarget (see page 20588)	Enables or disables the action, depending on the currently active control in the form.

152.1.10.2.1 TEditUndo.ExecuteTarget Method

Backs out the last edit from the target control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget checks that Target is a TCustomEdit descendant, and if so, calls its Undo method, backing out the last change.

See Also

TCustomEdit (see page 21232)

Undo (see page 21259)

152.1.10.2.2 TEditUndo.UpdateTarget Method

Enables or disables the action, depending on the currently active control in the form.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TEditUndo (see page 20582), UpdateTarget checks whether the current target object (specified by the Target parameter) is an edit control that is in a state where it can back out changes. If so, UpdateTarget sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

CanUndo (see page 21262)

152.1.11 TFileAction Class

TFileAction is the base class for action objects that display a file selection dialog.

Class Hierarchy

Pascal

```
TFileAction = class(TCommonDialogAction);
```

C++

```
class TFileAction : public TCommonDialogAction;
```

File

StdActns

Description

TFileAction implements the FileName (see page 20593) property that is common to action objects that display a file selection object.

See Also

TFileOpen (see page 20605)

TFileSaveAs (see page 20654)

TOpenDialog (see page 11407)

152.1.11.1 TFileAction Members

The following tables list the members exposed by TFileAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
V	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDialog (see page 20593)	This is GetDialog, a member of class TFileAction.
V	GetDialogClass (see page 20541)	This is GetDialogClass, a member of class TCommonDialogAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.

	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20541)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	FileName (see page 20593)	Specifies the file name for the file selection dialog.
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	BeforeExecute (see page 20543)	Occurs immediately before the dialog appears.
	OnAccept (see page 20543)	This is OnAccept, a member of class TCommonDialogAction.
	OnCancel (see page 20543)	This is OnCancel, a member of class TCommonDialogAction.
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20538)	Creates an instance of TCommonDialogAction.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20538)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	ExecuteTarget (see page 20540)	Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.

	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.

R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Properties

	Name	Description
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

152.1.11.2 TFileAction Methods

The methods of the TFileAction class are listed here.

Protected Methods

	Name	Description
	GetDialog (see page 20593)	This is GetDialog, a member of class TFileAction.

152.1.11.2.1 TFileAction.GetDialog Method

Pascal

```
function GetDialog: TOpenDialog;
```

C++

```
__fastcall TOpenDialog GetDialog();
```

Description

This is GetDialog, a member of class TFileAction.

152.1.11.3 TFileAction Properties

The properties of the TFileAction class are listed here.

Protected Properties

	Name	Description
	FileName (see page 20593)	Specifies the file name for the file selection dialog.

152.1.11.3.1 TFileAction.FileName Property

Specifies the file name for the file selection dialog.

Pascal

```
property FileName: TFileName;
```

C++

```
__property TFileName FileName;
```

Description

Applications can't use the protected FileName property. To access the name of the file selected by the user, use the Dialog property of a TFileAction (see page 20588) descendant.

FileName is the same as the FileName property of the associated dialog.

See Also

FileName (see page 11424)

onaccept (see page 20543)

Dialog (see page 20612)

Dialog (see page 20660)

152.1.12 TFileExit Class

TFileExit is the standard action for shutting down an application.

Class Hierarchy

Pascal

```
TFileExit = class(TCustomAction);
```

C++

```
class TFileExit : public TCustomAction;
```

File

StdActns

Description

Add TFileExit to an action list to let users shut down the application using a menu or tool bar. Controls (see page 5711) linked to this action cause the application to shut down by closing the main form.

See Also

TCustomForm (see page 13849)

TAPplication

152.1.12.1 TFileExit Members

The following tables list the members exposed by TFileExit.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.

	ExecuteTarget (see page 20598)	Shuts down the main form of the application.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 20599)	Indicates whether the action can execute.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
	Update (see page 295)	Indicates whether the action updates itself.
	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.

R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnHint (see page 20604)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20604)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 20600)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 20600)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20600)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20601)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20601)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20602)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20602)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 20602)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20603)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 20603)	Specifies the Visible property for client controls and menu items.

152.1.12.2 TFileExit Methods

The methods of the TFileExit class are listed here.

Public Methods

	Name	Description
V	ExecuteTarget (see page 20598)	Shuts down the main form of the application.
V	HandlesTarget (see page 20599)	Indicates whether the action can execute.

152.1.12.2.1 TFileExit.ExecuteTarget Method

Shuts down the main form of the application.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget ignores the Target parameter and calls the Close method of the application's main form. This causes the application to shut down.

See Also

MainForm (see page 13718)

Close (see page 13867)

152.1.12.2.2 TFileExit.HandlesTarget Method

Indicates whether the action can execute.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method provides the action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

Target is the currently active object.

HandlesTarget always returns true, because shutting down the application does not depend on any target object.

152.1.12.3 TFileExit Properties

The properties of the TFileExit class are listed here.

Published Properties

	Name	Description
	Caption (see page 20600)	Represents the caption of client controls and menu items.
	Enabled (see page 20600)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20600)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20601)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20601)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20602)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20602)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 20602)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20603)	Specifies the ShortCut property for client menu items.
	Visible (see page 20603)	Specifies the Visible property for client controls and menu items.

152.1.12.3.1 TFileExit.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

152.1.12.3.2 TFileExit.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

152.1.12.3.3 TFileExit.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

152.1.12.3.4 TFileExit.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

152.1.12.3.5 TFileExit.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

152.1.12.3.6 TFileExit.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

152.1.12.3.7 TFileExit.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

152.1.12.3.8 TFileExit.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key

combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

152.1.12.3.9 TFileExit.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

152.1.12.3.10 TFileExit.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

152.1.12.4 TFileExit Events

The events of the TFileExit class are listed here.

Published Events

	Name	Description
	OnHint (see page 20604)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20604)	Occurs when the application is idle or when the action list updates.

152.1.12.4.1 TFileExit.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

152.1.12.4.2 TFileExit.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
```

```
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

152.1.13 TFileOpen Class

TFileOpen is the standard action for displaying a file open dialog.

Class Hierarchy

Pascal

```
TFileOpen = class(TFileAction);
```

C++

```
class TFileOpen : public TFileAction;
```

File

StdActns

Description

Add TFileOpen to an action list to add a common file open dialog to your application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to display a file open dialog when invoked. Use the OnAccept (see page 20617) event to respond after the user selects a file name in the file open dialog or the OnCancel (see page 20617) event to respond when the user cancels from the dialog. In the event handler for these events, you can read the file name from the dialog specified by the Dialog (see page 20612) property.

See Also

TFileOpenWith (see page 20619)

TFileSaveAs (see page 20654)

TOpenDialog (see page 11407)

TOpenPicture (see page 11965)

152.1.13.1 TFileOpen Members

The following tables list the members exposed by TFileOpen.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
V	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDialog (see page 20593)	This is GetDialog, a member of class TFileAction.
V	GetDialogClass (see page 20611)	This is GetDialogClass, a member of class TFileOpen.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20541)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	FileName (see page 20593)	Specifies the file name for the file selection dialog.
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 20610)	Creates an instance of TFileOpen (see page 20605).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20538)	Frees an instance of TCustomAction.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 20610)	Executes the associated dialog and generates an OnAccept or OnCancel event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	BeforeExecute (see page 20617)	Occurs immediately before the dialog appears.
	OnAccept (see page 20617)	This is OnAccept, a member of class TFileOpen.
	OnCancel (see page 20617)	This is OnCancel, a member of class TFileOpen.
	OnHint (see page 20617)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20618)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 20612)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
R	Dialog (see page 20612)	Provides access the open dialog that the action executes.
	Enabled (see page 20612)	Indicates whether client controls and menu items are enabled.

	HelpContext (see page 20613)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20613)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20614)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20614)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20615)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 20615)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20615)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	UseDefaultApp (see page 20616)	Use the default application to open the file.
	Visible (see page 20616)	Specifies the Visible property for client controls and menu items.

152.1.13.2 TFileOpen.Create Constructor

Creates an instance of TFileOpen (see page 20605).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TFileOpen(TComponent * AOwner);
```

Description

Most applications do not need to call the TFileOpen (see page 20605) constructor because actions are added at design time to an action manager or action list.

The TFileOpen (see page 20605) constructor creates an instance of its associated dialog and assigns that component as the value of the Dialog (see page 20612) property.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TFileOpen (see page 20605) instance.

See Also

Dialog (see page 20612)

Owner (see page 2807)

152.1.13.3 TFileOpen Methods

The methods of the TFileOpen class are listed here.

Protected Methods

	Name	Description
	GetDialogClass (see page 20611)	This is GetDialogClass, a member of class TFileOpen.

Public Methods

	Name	Description
	ExecuteTarget (see page 20610)	Executes the associated dialog and generates an OnAccept or OnCancel event.

152.1.13.3.1 TFileOpen.ExecuteTarget Method

Executes the associated dialog and generates an OnAccept or OnCancel event.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget ignores the Target parameter and

1. Generates a BeforeExecute event, so that the application can initialize the associated dialog according to current conditions.
2. Calls the Execute method of the dialog.
3. Generates an OnAccept event or an OnCancel event, depending on the value returned by the Execute method. You can write code to make use of the results from executing the dialog in these event handlers.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

Execute (see page 11283)

BeforeExecute (see page 20543)

152.1.13.3.2 TFileOpen.GetDialogClass Method

Pascal

```
function GetDialogClass: TCommonDialogClass; override;
```

C++

```
virtual __fastcall TCommonDialogClass GetDialogClass();
```

Description

This is GetDialogClass, a member of class TFileOpen.

152.1.13.4 TFileOpen Properties

The properties of the TFileOpen class are listed here.

Published Properties

	Name	Description
	Caption (see page 20612)	Represents the caption of client controls and menu items.
R	Dialog (see page 20612)	Provides access the open dialog that the action executes.
	Enabled (see page 20612)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20613)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20613)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20614)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20614)	Indicates the Help hint for client controls and menu items.

	ImageIndex (see page 20615)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 20615)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20615)	Specifies the ShortCut property for client menu items.
	UseDefaultApp (see page 20616)	Use the default application to open the file.
	Visible (see page 20616)	Specifies the Visible property for client controls and menu items.

152.1.13.4.1 TFileOpen.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

152.1.13.4.2 TFileOpen.Dialog Property

Provides access the open dialog that the action executes.

Pascal

```
property Dialog: TOpenDialog;
```

C++

```
__property TOpenDialog Dialog;
```

Description

Use Dialog to configure the open dialog before the action fires. For example, you can set the open dialog's default extension or initially selected file at design time using the Object Inspector. From an OnAccept (see page 20617) event handler, use Dialog to read the selected file name.

When using a file open action, you do not place a TOpenDialog component on the form or data module at design time. Instead, you add the TFileOpen (see page 20605) action to your action list and then use the Dialog property. The open dialog component is created by the TFileOpen (see page 20605) constructor.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

FileName (see page 11424)

152.1.13.4.3 TFileOpen.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

152.1.13.4.4 TFileOpen.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

152.1.13.4.5 TFileOpen.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

152.1.13.4.6 TFileOpen.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

152.1.13.4.7 TFileOpen.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

152.1.13.4.8 TFileOpen.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

152.1.13.4.9 TFileOpen.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

152.1.13.4.10 TFileOpen.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

152.1.13.4.11 TFileOpen.UseDefaultApp Property

Use the default application to open the file.

Pascal

```
property UseDefaultApp: Boolean;
```

C++

```
__property Boolean UseDefaultApp;
```

Description

When set to True, UseDefaultApp automatically uses the default application as specified in the registry to open the file. Otherwise, TFileOpen (see page 20605) displays the FileOpen dialog. The default is False.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

FileName (see page 11424)

152.1.13.4.12 TFileOpen.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

152.1.13.5 TFileOpen Events

The events of the TFileOpen class are listed here.

Published Events

	Name	Description
	BeforeExecute (see page 20617)	Occurs immediately before the dialog appears.
	OnAccept (see page 20617)	This is OnAccept, a member of class TFileOpen.
	OnCancel (see page 20617)	This is OnCancel, a member of class TFileOpen.

	OnHint (see page 20617)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20618)	Occurs when the application is idle or when the action list updates.

152.1.13.5.1 TFileOpen.BeforeExecute Event

Occurs immediately before the dialog appears.

Pascal

```
property BeforeExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to initialize the dialog immediately before it executes. When the action fires, it generates a BeforeExecute event, and then executes its associated dialog.

See Also

ExecuteTarget (see page 20540)

Execute (see page 11283)

PropertyName

152.1.13.5.2 TFileOpen.OnAccept Event

Pascal

```
property OnAccept: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAccept;
```

Description

This is OnAccept, a member of class TFileOpen.

152.1.13.5.3 TFileOpen.OnCancel Event

Pascal

```
property OnCancel: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCancel;
```

Description

This is OnCancel, a member of class TFileOpen.

152.1.13.5.4 TFileOpen.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

152.1.13.5.5 TFileOpen.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
```

```
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

152.1.14 TFileOpenWith Class

TFileOpenWith is the standard action for displaying the dialog that lets users choose what application to user for opening a file.

Class Hierarchy

Pascal

```
TFileOpenWith = class(TFileOpen);
```

C++

```
class TFileOpenWith : public TFileOpen;
```

File

StdActns

Description

Add TFileOpenWith to an action list to add the Open With dialog to your application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to display the Open With dialog and then use the chosen application to open the file specified by the FileName (see page 20625) property. If the FileName (see page 20625) property was not previously set, TFileOpenWith first displays an Open dialog in which the user can select a file name before displaying the Open With dialog for the user to specify what application to use when opening that file.

Note: TFileOpenWith always displays the Open With dialog, even if the specified file already has an extension with a registered association. To let users open a file by letting Windows choose the application based on the extension (or bring up the Open With dialog automatically when there is no association for the extension), use the TFileRun action instead.

You do not need to do anything to launch the selected application. TFileOpenWith automatically opens the file using the application that the user selects.

Note: The Dialog (see page 20612) property of TFileOpenWith represents the Open dialog in which a user selects the file to

open, not the Open With dialog in which they choose the application to user for opening that file. Similarly, the OnAccept (see page 20617) and OnCancel (see page 20617) events do not occur after the action displays the Open With dialog – rather, they occur after the Open dialog that appears when the FileName (see page 20625) property is not preset.

TFileSaveAs (see page 20654)

TFileOpen (see page 20605)

TOpenPicture (see page 11965)

TFileRun (see page 11872)

152.1.14.1 TFileOpenWith Members

The following tables list the members exposed by TFileOpenWith.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
V	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDialog (see page 20593)	This is GetDialog, a member of class TFileAction.
V	GetDialogClass (see page 20541)	This is GetDialogClass, a member of class TCommonDialogAction.
V	GetDialogClass (see page 20611)	This is GetDialogClass, a member of class TFileOpen.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20541)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnAccept (see page 20543)	This is OnAccept, a member of class TCommonDialogAction.
	OnCancel (see page 20543)	This is OnCancel, a member of class TCommonDialogAction.
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20538)	Creates an instance of TCommonDialogAction.
	Create (see page 20610)	Creates an instance of TFileOpen (see page 20605).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20538)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 20624)	Displays the Open With dialog and then opens a file with the application the user selects.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.

V	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.

	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	AfterOpen (see page 20627)	Occurs after an application completes opening an Open With dialog.
	BeforeExecute (see page 20628)	Occurs immediately before the dialog appears.
	OnAccept (see page 20617)	This is OnAccept, a member of class TFileOpen.
	OnCancel (see page 20617)	This is OnCancel, a member of class TFileOpen.
	OnHint (see page 20617)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20628)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 20612)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
R	Dialog (see page 20612)	Provides access the open dialog that the action executes.
	Enabled (see page 20612)	Indicates whether client controls and menu items are enabled.
	FileName (see page 20625)	Specifies the file to be opened when the action executes.
	HelpContext (see page 20626)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20626)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20627)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20614)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20615)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 20615)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20615)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	UseDefaultApp (see page 20616)	Use the default application to open the file.
	Visible (see page 20616)	Specifies the Visible property for client controls and menu items.

152.1.14.2 TFileOpenWith Methods

The methods of the TFileOpenWith class are listed here.

Public Methods

	Name	Description
V	ExecuteTarget (see page 20624)	Displays the Open With dialog and then opens a file with the application the user selects.

152.1.14.2.1 TFileOpenWith.ExecuteTarget Method

Displays the Open With dialog and then opens a file with the application the user selects.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget ignores the Target parameter and does the following:

1. If the FileName (see page 20625) property is not set, it displays the Open dialog (specified by the Dialog (see page 20612) property) to let the user select a file to open.
2. If it displays the Open dialog, it generates an OnAccept (see page 20617) or OnCancel (see page 20617) event, depending on whether the user exited the Open dialog by clicking OK or Cancel.
3. It displays the Open With dialog for the user to choose an application with which to view the file specified by FileName (see page 20625) or selected in the Open dialog.
4. It launches the selected application, displaying the specified File.

See Also

FileName (see page 20625)

Dialog (see page 20612)

onaccept (see page 20543)

oncancel (see page 20543)

152.1.14.3 TFileOpenWith Properties

The properties of the TFileOpenWith class are listed here.

Published Properties

	Name	Description
	FileName (see page 20625)	Specifies the file to be opened when the action executes.
	HelpContext (see page 20626)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20626)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20627)	Indicates the mechanism for client controls and menu items to use when invoking help.

152.1.14.3.1 TFileOpenWith.FileName Property

Specifies the file to be opened when the action executes.

Pascal

```
property FileName: TFileName;
```

C++

```
__property TFileName FileName;
```

Description

Set FileName to specify the file to open with the application that the user selects in the Open With dialog. If the FileName property is not set, then when the action executes, it displays an Open dialog (specified by the Dialog (see page 20612) property) in which the user can select a file before displaying the Open With dialog.

Note: When the action displays the Open dialog, it uses the selected file to set FileName. Thus, if you want to let the user select

a file the next time the action executes, you must clear the FileName property in an OnAccept (see page 20617) event handler.

See Also

Dialog (see page 20612)

ExecuteTarget (see page 20624)

onaccept (see page 20543)

152.1.14.3.2 TFileOpenWith.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

152.1.14.3.3 TFileOpenWith.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

152.1.14.3.4 TFileOpenWith.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

152.1.14.4 TFileOpenWith Events

The events of the TFileOpenWith class are listed here.

Published Events

	Name	Description
	AfterOpen (see page 20627)	Occurs after an application completes opening an Open With dialog.
	BeforeExecute (see page 20628)	Occurs immediately before the dialog appears.
	OnUpdate (see page 20628)	Occurs when the application is idle or when the action list updates.

152.1.14.4.1 TFileOpenWith.AfterOpen Event

Occurs after an application completes opening an Open With dialog.

Pascal

```
property AfterOpen: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterOpen;
```

Description

Write an AfterOpen event handler to take specific action immediately after an application opens the Open With dialog, but before the user responds to the dialog.

152.1.14.4.2 TFileOpenWith.BeforeExecute Event

Occurs immediately before the dialog appears.

Pascal

```
property BeforeExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to initialize the dialog immediately before it executes. When the action fires, it generates a BeforeExecute event, and then executes its associated dialog.

See Also

ExecuteTarget (see page 20540)

Execute (see page 11283)

PropertyName

152.1.14.4.3 TFileOpenWith.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
```

```
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

UpdateAction (see page 2790)

152.1.15 TFilePageSetup Class

TFilePageSetup is the standard action for displaying a page setup dialog.

Class Hierarchy

Pascal

```
TFilePageSetup = class(TCommonDialogAction);
```

C++

```
class TFilePageSetup : public TCommonDialogAction;
```

File

StdActns

Description

Add TFilePageSetup to an action list to add a common page setup dialog to your application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to display the page setup dialog when invoked. Because the page setup dialog automatically configures the pages as specified when the user clicks OK, there is usually no need to write an OnAccept (see page 20640) or OnCancel (see page 20640) event handler to continue processing after the dialog shuts down.

See Also

TPrinterSetupDialog (see page 11478)

TPrintDlg (see page 20713)

152.1.15.1 TFilePageSetup Members

The following tables list the members exposed by TFilePageSetup.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
V	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDialogClass (see page 20634)	This is GetDialogClass, a member of class TFilePageSetup.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20541)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20538)	Creates an instance of TCommonDialogAction.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20538)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	ExecuteTarget (see page 20540)	Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.

	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	BeforeExecute (see page 20639)	Occurs immediately before the dialog appears.
	OnAccept (see page 20640)	This is OnAccept, a member of class TFilePageSetup.

	OnCancel (see page 20640)	This is OnCancel, a member of class TFilePageSetup.
	OnHint (see page 20640)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20640)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 20635)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
R	Dialog (see page 20635)	Provides access the page setup dialog that the action executes.
	Enabled (see page 20635)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20636)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20636)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20637)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20637)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20638)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 20638)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20638)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 20639)	Specifies the Visible property for client controls and menu items.

152.1.15.2 TFilePageSetup Methods

The methods of the TFilePageSetup class are listed here.

Protected Methods

	Name	Description
V	GetDialogClass (see page 20634)	This is GetDialogClass, a member of class TFilePageSetup.

152.1.15.2.1 TFilePageSetup.GetDialogClass Method

Pascal

```
function GetDialogClass: TCommonDialogClass; override;
```

C++

```
virtual __fastcall TCommonDialogClass GetDialogClass();
```

Description

This is GetDialogClass, a member of class TFilePageSetup.

152.1.15.3 TFilePageSetup Properties

The properties of the TFilePageSetup class are listed here.

Published Properties

	Name	Description
	Caption (see page 20635)	Represents the caption of client controls and menu items.
R	Dialog (see page 20635)	Provides access the page setup dialog that the action executes.
	Enabled (see page 20635)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20636)	Indicates the help context ID for client controls and menu items.

	HelpKeyword (see page 20636)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20637)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20637)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20638)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 20638)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20638)	Specifies the ShortCut property for client menu items.
	Visible (see page 20639)	Specifies the Visible property for client controls and menu items.

152.1.15.3.1 TFilePageSetup.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

152.1.15.3.2 TFilePageSetup.Dialog Property

Provides access the page setup dialog that the action executes.

Pascal

```
property Dialog: TPageSetupDialog;
```

C++

```
__property TPageSetupDialog Dialog;
```

Description

When using a file page setup action, you do not place a TPageSetupDialog component on the form or data module at design time. Instead, you add the TFilePageSetup (see page 20629) action to your action list. If you want to configure the dialog, for example to assign a help context, you can access the dialog component using the Dialog property. The page setup dialog component is created by the TFilePageSetup (see page 20629) constructor.

See Also

Create (see page 20538)

Create

152.1.15.3.3 TFilePageSetup.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

152.1.15.3.4 TFilePageSetup.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

152.1.15.3.5 TFilePageSetup.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

152.1.15.3.6 TFilePageSetup.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

152.1.15.3.7 TFilePageSetup.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

152.1.15.3.8 TFilePageSetup.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

152.1.15.3.9 TFilePageSetup.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

152.1.15.3.10 TFilePageSetup.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

152.1.15.3.11 TFilePageSetup.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

152.1.15.4 TFilePageSetup Events

The events of the TFilePageSetup class are listed here.

Published Events

	Name	Description
	BeforeExecute (see page 20639)	Occurs immediately before the dialog appears.
	OnAccept (see page 20640)	This is OnAccept, a member of class TFilePageSetup.
	OnCancel (see page 20640)	This is OnCancel, a member of class TFilePageSetup.
	OnHint (see page 20640)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20640)	Occurs when the application is idle or when the action list updates.

152.1.15.4.1 TFilePageSetup.BeforeExecute Event

Occurs immediately before the dialog appears.

Pascal

```
property BeforeExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to initialize the dialog immediately before it executes. When the action fires, it generates a BeforeExecute event, and then executes its associated dialog.

See Also

ExecuteTarget (see page 20540)

Execute (see page 11283)

PropertyName

152.1.15.4.2 TFilePageSetup.OnAccept Event

Pascal

```
property OnAccept: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAccept;
```

Description

This is OnAccept, a member of class TFilePageSetup.

152.1.15.4.3 TFilePageSetup.OnCancel Event

Pascal

```
property OnCancel: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCancel;
```

Description

This is OnCancel, a member of class TFilePageSetup.

152.1.15.4.4 TFilePageSetup.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

152.1.15.4.5 TFilePageSetup.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

152.1.16 TFilePrintSetup Class

TFilePrintSetup is the standard action for displaying a printer setup dialog.

Class Hierarchy

Pascal

```
TFilePrintSetup = class(TCommonDialogAction);
```

C++

```
class TFilePrintSetup : public TCommonDialogAction;
```

File

StdActns

Description

Add TFilePrintSetup to an action list to add a common printer setup dialog to your application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to display the printer setup dialog when invoked. Because the printer setup dialog automatically configures the printers as specified when the user clicks OK, there is usually no need to write an OnAccept (see page 20652) or OnCancel (see page 20652) event handler to continue processing after the dialog shuts down.

See Also

TPrinterSetupDialog (see page 11478)

TPrintDlg (see page 20713)

152.1.16.1 TFilePrintSetup Members

The following tables list the members exposed by TFilePrintSetup.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.

	AssignTo (see page 303)	Copies the properties of this action to a destination object.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDialogClass (see page 20647)	This is GetDialogClass, a member of class TFilePrintSetup.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20541)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.

	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20538)	Creates an instance of TCommonDialogAction.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20538)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	ExecuteTarget (see page 20540)	Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	BeforeExecute (see page 20652)	Occurs immediately before the dialog appears.
	OnAccept (see page 20652)	This is OnAccept, a member of class TFilePrintSetup.
	OnCancel (see page 20652)	This is OnCancel, a member of class TFilePrintSetup.
	OnHint (see page 20652)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20653)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 20647)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
R	Dialog (see page 20647)	Provides access the printer setup dialog that the action executes.
	Enabled (see page 20648)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20648)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20649)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20649)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20650)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20650)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 20650)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20651)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 20651)	Specifies the Visible property for client controls and menu items.

152.1.16.2 TFilePrintSetup Methods

The methods of the TFilePrintSetup class are listed here.

Protected Methods

	Name	Description
V	GetDialogClass (see page 20647)	This is GetDialogClass, a member of class TFilePrintSetup.

152.1.16.2.1 TFilePrintSetup.GetDialogClass Method

Pascal

```
function GetDialogClass: TCommonDialogClass; override;
```

C++

```
virtual __fastcall TCommonDialogClass GetDialogClass();
```

Description

This is GetDialogClass, a member of class TFilePrintSetup.

152.1.16.3 TFilePrintSetup Properties

The properties of the TFilePrintSetup class are listed here.

Published Properties

	Name	Description
	Caption (see page 20647)	Represents the caption of client controls and menu items.
R	Dialog (see page 20647)	Provides access the printer setup dialog that the action executes.
	Enabled (see page 20648)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20648)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20649)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20649)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20650)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20650)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 20650)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20651)	Specifies the ShortCut property for client menu items.
	Visible (see page 20651)	Specifies the Visible property for client controls and menu items.

152.1.16.3.1 TFilePrintSetup.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

152.1.16.3.2 TFilePrintSetup.Dialog Property

Provides access the printer setup dialog that the action executes.

Pascal

```
property Dialog: TPrinterSetupDialog;
```

C++

```
__property TPrinterSetupDialog Dialog;
```

Description

When using a file print setup action, you do not place a TPrinterSetupDialog component on the form or data module at design time. Instead, you add the TFilePrintSetup (see page 20642) action to your action list. If you want to configure the dialog, for example to assign a help context, you can access the dialog component using the Dialog property. The printer setup dialog component is created by the TFilePrintSetup (see page 20642) constructor.

See Also

Create (see page 20538)

Create_c

152.1.16.3.3 TFilePrintSetup.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

152.1.16.3.4 TFilePrintSetup.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

152.1.16.3.5 TFilePrintSetup.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

152.1.16.3.6 TFilePrintSetup.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

152.1.16.3.7 TFilePrintSetup.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

152.1.16.3.8 TFilePrintSetup.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

152.1.16.3.9 TFilePrintSetup.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key

combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

152.1.16.3.10 TFilePrintSetup.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

152.1.16.3.11 TFilePrintSetup.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

152.1.16.4 TFilePrintSetup Events

The events of the TFilePrintSetup class are listed here.

Published Events

	Name	Description
	BeforeExecute (see page 20652)	Occurs immediately before the dialog appears.
	OnAccept (see page 20652)	This is OnAccept, a member of class TFilePrintSetup.

	OnCancel (see page 20652)	This is OnCancel, a member of class TFilePrintSetup.
	OnHint (see page 20652)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20653)	Occurs when the application is idle or when the action list updates.

152.1.16.4.1 TFilePrintSetup.BeforeExecute Event

Occurs immediately before the dialog appears.

Pascal

```
property BeforeExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to initialize the dialog immediately before it executes. When the action fires, it generates a BeforeExecute event, and then executes its associated dialog.

See Also

ExecuteTarget (see page 20540)

Execute (see page 11283)

PropertyName

152.1.16.4.2 TFilePrintSetup.OnAccept Event

Pascal

```
property OnAccept: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAccept;
```

Description

This is OnAccept, a member of class TFilePrintSetup.

152.1.16.4.3 TFilePrintSetup.OnCancel Event

Pascal

```
property OnCancel: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCancel;
```

Description

This is OnCancel, a member of class TFilePrintSetup.

152.1.16.4.4 TFilePrintSetup.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

152.1.16.4.5 TFilePrintSetup.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
```

```
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

152.1.17 TFileSaveAs Class

TFileSaveAs is the standard action for displaying a file save as dialog.

Class Hierarchy

Pascal

```
TFileSaveAs = class(TFileAction);
```

C++

```
class TFileSaveAs : public TFileAction;
```

File

StdActns

Description

Add TFileSaveAs to an action list to add a common file save dialog to your application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to display a file save dialog when invoked. Use the OnAccept (see page 20664) event to respond after the user selects a file name in the file save dialog or the OnCancel (see page 20664) event to respond when the user cancels from the dialog. In the event handler for these events, you can read the file name from the dialog specified by the Dialog (see page 20660) property.

See Also

TFileOpen (see page 20605)

TSaveDialog (see page 11489)

TSavePicture (see page 12048)

152.1.17.1 TFileSaveAs Members

The following tables list the members exposed by TFileSaveAs.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
V	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDialog (see page 20593)	This is GetDialog, a member of class TFileAction.
V	GetDialogClass (see page 20659)	This is GetDialogClass, a member of class TFileSaveAs.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20541)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.

	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	FileName (see page 20593)	Specifies the file name for the file selection dialog.
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 20659)	Creates an instance of TFileSaveAs (see page 20654).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).

	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20538)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	ExecuteTarget (see page 20540)	Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	BeforeExecute (see page 20663)	Occurs immediately before the dialog appears.
	OnAccept (see page 20664)	This is OnAccept, a member of class TFileSaveAs.
	OnCancel (see page 20664)	This is OnCancel, a member of class TFileSaveAs.
	OnHint (see page 20664)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20665)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 20660)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
R	Dialog (see page 20660)	Provides access the save dialog that the action executes.
	Enabled (see page 20661)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20661)	Indicates the help context ID for client controls and menu items.
	Hint (see page 20661)	Indicates the Help hint for client controls and menu items.

	ImageIndex (see page 20662)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 20662)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20663)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 20663)	Specifies the Visible property for client controls and menu items.

152.1.17.2 TFileSaveAs.Create Constructor

Creates an instance of TFileSaveAs (see page 20654).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TFileSaveAs(TComponent * AOwner);
```

Description

Most applications do not need to call the TFileSaveAs (see page 20654) constructor because actions are added at design time to an action manager or action list.

The TFileSaveAs (see page 20654) constructor creates an instance of its associated dialog and assigns that component as the value of the Dialog (see page 20660) property.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TFileSaveAs (see page 20654) instance.

See Also

Dialog (see page 20660)

Owner (see page 2807)

152.1.17.3 TFileSaveAs Methods

The methods of the TFileSaveAs class are listed here.

Protected Methods

	Name	Description
	GetDialogClass (see page 20659)	This is GetDialogClass, a member of class TFileSaveAs.

152.1.17.3.1 TFileSaveAs.GetDialogClass Method

Pascal

```
function GetDialogClass: TCommonDialogClass; override;
```

C++

```
virtual __fastcall TCommonDialogClass GetDialogClass();
```

Description

This is GetDialogClass, a member of class TFileSaveAs.

152.1.17.4 TFileSaveAs Properties

The properties of the TFileSaveAs class are listed here.

Published Properties

	Name	Description
	Caption (see page 20660)	Represents the caption of client controls and menu items.
R	Dialog (see page 20660)	Provides access the save dialog that the action executes.
	Enabled (see page 20661)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20661)	Indicates the help context ID for client controls and menu items.
	Hint (see page 20661)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20662)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 20662)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20663)	Specifies the ShortCut property for client menu items.
	Visible (see page 20663)	Specifies the Visible property for client controls and menu items.

152.1.17.4.1 TFileSaveAs.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

152.1.17.4.2 TFileSaveAs.Dialog Property

Provides access the save dialog that the action executes.

Pascal

```
property Dialog: TSaveDialog;
```

C++

```
__property TSaveDialog Dialog;
```

Description

Use Dialog to configure the save as dialog before the action fires. For example, you can set the save as dialog's default extension at design time using the Object Inspector. Dialog is also useful for reading the selected file name from an OnAccept (see page 20664) event handler.

When using a file save as action, you do not place a TSaveDialog component on the form or data module at design time. Instead, you add the TFileSaveAs (see page 20654) to your action list and then use the Dialog property. The save dialog component is created by the TFileSaveAs (see page 20654) constructor.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

152.1.17.4.3 TFileSaveAs.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

152.1.17.4.4 TFileSaveAs.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

152.1.17.4.5 TFileSaveAs.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

152.1.17.4.6 TFileSaveAs.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

152.1.17.4.7 TFileSaveAs.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

152.1.17.4.8 TFileSaveAs.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

152.1.17.4.9 TFileSaveAs.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

152.1.17.5 TFileSaveAs Events

The events of the TFileSaveAs class are listed here.

Published Events

	Name	Description
	BeforeExecute (see page 20663)	Occurs immediately before the dialog appears.
	OnAccept (see page 20664)	This is OnAccept, a member of class TFileSaveAs.
	OnCancel (see page 20664)	This is OnCancel, a member of class TFileSaveAs.
	OnHint (see page 20664)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20665)	Occurs when the application is idle or when the action list updates.

152.1.17.5.1 TFileSaveAs.BeforeExecute Event

Occurs immediately before the dialog appears.

Pascal

```
property BeforeExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to initialize the dialog immediately before it executes. When the action fires, it generates a BeforeExecute event, and then executes its associated dialog.

See Also

ExecuteTarget (see page 20540)

Execute (see page 11283)

PropertyName

152.1.17.5.2 TFileSaveAs.OnAccept Event

Pascal

```
property OnAccept: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAccept;
```

Description

This is OnAccept, a member of class TFileSaveAs.

152.1.17.5.3 TFileSaveAs.OnCancel Event

Pascal

```
property OnCancel: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCancel;
```

Description

This is OnCancel, a member of class TFileSaveAs.

152.1.17.5.4 TFileSaveAs.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

152.1.17.5.5 TFileSaveAs.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
```

```
  }
  procedure TMainForm.Action1Update(Sender: TObject);
  begin
    if ((Sender as TAction).Checked <> ToolBar1.Visible) then
      lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
      { Indicate whether ToolBar1 is currently visible }
      (Sender as TAction).Checked := ToolBar1.Visible;
  end;
```

See Also

UpdateAction (see page 2790)

152.1.18 TFontEdit Class

TFontEdit is the standard action for displaying a font selection dialog.

Class Hierarchy

Pascal

```
TFontEdit = class(TCommonDialogAction);
```

C++

```
class TFontEdit : public TCommonDialogAction;
```

File

StdActns

Description

Add TFontEdit to an action list to add a modal font selection dialog to your application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to display a font dialog when invoked. Use the OnAccept (see page 20676) event to respond after the user selects a font in the dialog or the OnCancel (see page 20676) event to respond when the user cancels from the dialog. In the event handler, you can read the selected font from the dialog specified by the Dialog (see page 20672) property.

See Also

TFontDialog (see page 11394)

152.1.18.1 TFontEdit Members

The following tables list the members exposed by TFontEdit.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.

	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
V	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDialogClass (see page 20671)	This is GetDialogClass, a member of class TFontEdit.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20541)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 20538)	Creates an instance of TCommonDialogAction.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20538)	Frees an instance of TCustomAction.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".

	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	ExecuteTarget (see page 20540)	Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
	Update (see page 295)	Indicates whether the action updates itself.
	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	BeforeExecute (see page 20676)	Occurs immediately before the dialog appears.
	OnAccept (see page 20676)	This is OnAccept, a member of class TFontEdit.
	OnCancel (see page 20676)	This is OnCancel, a member of class TFontEdit.
	OnHint (see page 20677)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20677)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 20671)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
R	Dialog (see page 20672)	Provides access the font selection dialog that the action executes.
	Enabled (see page 20672)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20672)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20673)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20673)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20674)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20674)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 20674)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20675)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 20675)	Specifies the Visible property for client controls and menu items.

152.1.18.2 TFontEdit Methods

The methods of the TFontEdit class are listed here.

Protected Methods

	Name	Description
V	GetDialogClass (see page 20671)	This is GetDialogClass, a member of class TFontEdit.

152.1.18.2.1 TFontEdit.GetDialogClass Method

Pascal

```
function GetDialogClass: TCommonDialogClass; override;
```

C++

```
virtual __fastcall TCommonDialogClass GetDialogClass();
```

Description

This is GetDialogClass, a member of class TFontEdit.

152.1.18.3 TFontEdit Properties

The properties of the TFontEdit class are listed here.

Published Properties

	Name	Description
	Caption (see page 20671)	Represents the caption of client controls and menu items.
R	Dialog (see page 20672)	Provides access the font selection dialog that the action executes.
	Enabled (see page 20672)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20672)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20673)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20673)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20674)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20674)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 20674)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20675)	Specifies the ShortCut property for client menu items.
	Visible (see page 20675)	Specifies the Visible property for client controls and menu items.

152.1.18.3.1 TFontEdit.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

152.1.18.3.2 TFontEdit.Dialog Property

Provides access the font selection dialog that the action executes.

Pascal

```
property Dialog: TFontDialog;
```

C++

```
__property TFontDialog Dialog;
```

Description

Use Dialog to configure the font selection dialog before the action fires or to read the selected font after the action executes the dialog. For example, you can set the font dialog's target device or limit the available font sizes at design time using the Object Inspector or read the Font property in an OnAccept (see page 20676) event handler to make use of the font that the user selects.

When using a font edit action, you do not place a TFontDialog component on the form or data module at design time. Instead, you add the TFontEdit (see page 20666) to your action list and then use the Dialog property. The font selection dialog component is created by the TFontEdit (see page 20666) constructor.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

Font (see page 11401)

152.1.18.3.3 TFontEdit.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

152.1.18.3.4 TFontEdit.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

152.1.18.3.5 TFontEdit.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

152.1.18.3.6 TFontEdit.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

152.1.18.3.7 TFontEdit.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

152.1.18.3.8 TFontEdit.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

152.1.18.3.9 TFontEdit.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

152.1.18.3.10 TFontEdit.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

152.1.18.3.11 TFontEdit.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

152.1.18.4 TFontEdit Events

The events of the TFontEdit class are listed here.

Published Events

	Name	Description
	BeforeExecute (see page 20676)	Occurs immediately before the dialog appears.
	OnAccept (see page 20676)	This is OnAccept, a member of class TFontEdit.
	OnCancel (see page 20676)	This is OnCancel, a member of class TFontEdit.
	OnHint (see page 20677)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20677)	Occurs when the application is idle or when the action list updates.

152.1.18.4.1 TFontEdit.BeforeExecute Event

Occurs immediately before the dialog appears.

Pascal

```
property BeforeExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to initialize the dialog immediately before it executes. When the action fires, it generates a BeforeExecute event, and then executes its associated dialog.

See Also

ExecuteTarget (see page 20540)

Execute (see page 11283)

PropertyName

152.1.18.4.2 TFontEdit.OnAccept Event

Pascal

```
property OnAccept: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAccept;
```

Description

This is OnAccept, a member of class TFontEdit.

152.1.18.4.3 TFontEdit.OnCancel Event

Pascal

```
property OnCancel: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCancel;
```

Description

This is OnCancel, a member of class TFontEdit.

152.1.18.4.4 TFontEdit.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

152.1.18.4.5 TFontEdit.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
```

```
        lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
      }
      pa->Checked = ToolBar1->Visible;
    }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

152.1.19 THelpAction Class

THelpAction is the base class for action objects that interact with the help system.

Class Hierarchy

Pascal

```
THelpAction = class(TAction);
```

C++

```
class THelpAction : public TAction;
```

File

StdActns

Description

THelpAction implements the common behavior for actions that work the help system. Each descendant class performs a specific help function. Do not use THelpAction directly in an application. Instead, use a THelpAction descendant such as THelpContents (see page 20684), THelpContextAction (see page 20690), THelpOnHelp (see page 20696), or THelpTopicSearch (see

page 20701).

THelpAction ensures that the action is enabled as long as there is an application object to pass commands on to a registered help system. THelpAction descendants override the ExecuteTarget method to execute their specific help command.

See Also

THelpContents (see page 20684)

THelpContextAction (see page 20690)

THelpOnHelp (see page 20696)

THelpTopicSearch (see page 20701)

TApplication (see page 13660)

152.1.19.1 THelpAction Members

The following tables list the members exposed by THelpAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 20683)	Creates and initializes a TAction object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 20684)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 20684)	Enables or disables the action, depending on the availability of the Application object.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.19.2 THelpAction.Create Constructor

Creates and initializes a TAction object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall THelpAction(TComponent * AOwner);
```

Description

Applications do not usually create action objects explicitly. Actions are created automatically when you add them to an action manager or action list component at design time. When instantiating TAction at runtime, assign a TActionList or TActionManager component to the new action's ActionList property after calling Create.

See Also

ActionList (see page 295)

152.1.19.3 THelpAction Methods

The methods of the THelpAction class are listed here.

Public Methods

	Name	Description
	HandlesTarget (see page 20684)	Indicates whether the action can execute its function.
	UpdateTarget (see page 20684)	Enables or disables the action, depending on the availability of the Application object.

152.1.19.3.1 THelpAction.HandlesTarget Method

Indicates whether the action can execute its function.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method provides the action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

As implemented in THelpAction (see page 20678), HandlesTarget ignores the Target parameter and always returns true, because the help actions do not rely on a specific target object.

152.1.19.3.2 THelpAction.UpdateTarget Method

Enables or disables the action, depending on the availability of the Application object.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In THelpAction (see page 20678), UpdateTarget checks whether the global Application variable is assigned, because this object is required to pass help commands on to WinHelp HyperHelp. If Application is assigned, UpdateTarget sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

Application (see page 14383)

152.1.20 THelpContents Class

THelpContents brings up the contents for the default help system.

Class Hierarchy

Pascal

```
THelpContents = class(THelpAction);
```

C++

```
class THelpContents : public THelpAction;
```

File

StdActns

Description

Add THelpContents to an action list to allow users to bring up the help contents by using menu items or toolbar buttons. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to send the default help system a command to show the help contents.

On WinHelp, THelpContents displays the Help Topics dialog on the tab (Contents, Index or Find) that was last used.

See Also

THelpContextAction (see page 20690)

THelpOnHelp (see page 20696)

THelpTopicSearch (see page 20701)

152.1.20.1 THelpContents Members

The following tables list the members exposed by THelpContents.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.

	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 20683)	Creates and initializes a TAction object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 20690)	Displays a dialog that lists the help topics.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.

	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20684)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 20684)	Enables or disables the action, depending on the availability of the Application object.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.

	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.20.2 THelpContents Methods

The methods of the THelpContents class are listed here.

Public Methods

	Name	Description
V	ExecuteTarget (see page 20690)	Displays a dialog that lists the help topics.

152.1.20.2.1 THelpContents.ExecuteTarget Method

Displays a dialog that lists the help topics.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget calls the application's HelpCommand method, telling it to list the help topics.

152.1.21 THelpContextAction Class

THelpContextAction brings up the help topic for the active control.

Class Hierarchy

Pascal

```
THelpContextAction = class(THelpAction);
```

C++

```
class THelpContextAction : public THelpAction;
```

File

StdActns

Description

Add THelpContextAction to an action list to allow users to bring up the help for an active control. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to send the help engine a command to display the help topic specified by the active control's HelpContext property.

152.1.21.1 THelpContextAction Members

The following tables list the members exposed by THelpContextAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 20683)	Creates and initializes a TAction object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.

	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 20695)	Displays the help topic associated with the active control's HelpContext property.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 20684)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 20695)	Enables or disables the action, depending on whether there is an active object.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.

	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.21.2 THelpContextAction Methods

The methods of the THelpContextAction class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 20695)	Displays the help topic associated with the active control's HelpContext property.
	UpdateTarget (see page 20695)	Enables or disables the action, depending on whether there is an active object.

152.1.21.2.1 THelpContextAction.ExecuteTarget Method

Displays the help topic associated with the active control's HelpContext property.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget calls the application's HelpCommand method, telling it to display the topic specified by the active control's HelpContext property. ExecuteTarget gets the active control from the global Screen object rather than using the Target parameter.

See Also

HelpCommand (see page 13678)

ActiveControl (see page 14206)

HelpContext (see page 5826)

152.1.21.2.2 THelpContextAction.UpdateTarget Method

Enables or disables the action, depending on whether there is an active object.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In THelpContextAction (see page 20690), UpdateTarget checks whether the global Screen object's ActiveConrol property is assigned. If there is an active control, UpdateTarget sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

ActiveControl (see page 14206)

152.1.22 THelpOnHelp Class

THelpOnHelp brings up a help topic on how to use Help.

Class Hierarchy

Pascal

```
THelpOnHelp = class(THelpAction);
```

C++

```
class THelpOnHelp : public THelpAction;
```

File

StdActns

Description

Add THelpOnHelp to an action list to allow users to bring up the help system that describes how to use help. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to send the default help system a command to display its help.

Note that on recent versions of Windows with a default help system of WinHelp, this brings up an HTML help file that does not describe the WinHelp system.

THelpContents (see page 20684)

THelpContextAction (see page 20690)

THelpTopicSearch (see page 20701)

152.1.22.1 THelpOnHelp Members

The following tables list the members exposed by THelpOnHelp.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20683)	Creates and initializes a TAction object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.

	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 20701)	Brings up the help system's help file.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 20684)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 20684)	Enables or disables the action, depending on the availability of the Application object.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.

	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.22.2 THelpOnHelp Methods

The methods of the THelpOnHelp class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 20701)	Brings up the help system's help file.

152.1.22.2.1 THelpOnHelp.ExecuteTarget Method

Brings up the help system's help file.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget calls the application's HelpCommand method, telling it to display the Help system's own help file.

See Also

HelpCommand (see page 13678)

152.1.23 THelpTopicSearch Class

THelpTopicSearch brings up the help index.

Class Hierarchy

Pascal

```
THelpTopicSearch = class(THelpAction);
```

C++

```
class THelpTopicSearch : public THelpAction;
```

File

StdActns

Description

Add THelpTopicSearch to an action list to allow users to bring up the help index. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to send the default help system a command to display the help index.

See Also

THelpTopicSearch

THelpContextAction (see page 20690)

THelpOnHelp (see page 20696)

THelpTopicSearch

152.1.23.1 THelpTopicSearch Members

The following tables list the members exposed by THelpTopicSearch.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.

	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 20683)	Creates and initializes a TAction object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 20707)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20684)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 20684)	Enables or disables the action, depending on the availability of the Application object.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.

	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.23.2 THelpTopicSearch Methods

The methods of the THelpTopicSearch class are listed here.

Public Methods

	Name	Description
V	ExecuteTarget (see page 20707)	Introduces an interface for invoking an action on a target client component or control.

152.1.23.2.1 THelpTopicSearch.ExecuteTarget Method

Introduces an interface for invoking an action on a target client component or control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

ExecuteTarget does nothing in TBasicAction. ExecuteTarget was introduced in TBasicAction so that descendants can override it to initiate the action on the target. For example, an edit action that performs copying might copy the contents of an edit control to the clipboard.

See Also

OnExecute (see page 2716)

HandlesTarget (see page 2713)

152.1.24 THintAction Class

THintAction is the action that executes when the user pauses the mouse over a control or menu item that has a hint.

Class Hierarchy

Pascal

```
THintAction = class(TCustomAction);
```

C++

```
class THintAction : public TCustomAction;
```

File

StdActns

Description

Do not use THintAction in an action manager or action list the way you would use other predefined actions. THintAction is not intended to work with a client control. Rather, it is used by the application object.

When the user pauses the mouse over a control or menu item that defines its Hint (see page 20713) property, the application responds in one of two ways:

If the application has an OnHint event handler, it generates an OnHint event.

If there is no OnHint event handler, the application executes a THintAction object.

When THintAction executes, it calls the ExecuteAction method of potential target controls until a control is found to respond to the action. Some controls, such as TStatusBar, override the ExecuteAction method to respond to THintAction.

Component writers can override the ExecuteAction method of a new component to respond to THintAction by displaying hint

messages. Such an ExecuteAction method might look like the following:

```
function TMyControl.ExecuteAction(Action: TBasicAction): Boolean;
var
  HintText: string;
begin
if Action is THintAction then
begin
    HintText := THintAction(Action).Hint;
    { do something to display the hint text }
    Result := True;
end
else Result := inherited ExecuteAction(Action);
end;
bool __fastcall TMyControl::ExecuteAction(TBasicAction *Action)
{
  THintAction *pHint = dynamic_cast<THintAction *>(Action);
if (pHint)
  {
    // do something to display pHint->Hint
returntrue;
  }
return TComponent::ExecuteAction(Action);
}
```

See Also

TControl (see page 5724)

TMenuItem (see page 16102)

TComponent (see page 2762)

TApplication (see page 13660)

152.1.24.1 THintAction Members

The following tables list the members exposed by THintAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.

	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 20712)	Creates an instance of THintAction (see page 20707).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.

	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Properties

	Name	Description
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Hint (see page 20713)	Indicates the Help hint for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

152.1.24.2 THintAction.Create Constructor

Creates an instance of THintAction (see page 20707).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall THintAction(TComponent * AOwner);
```

Description

Typically, you do not need to create THintAction (see page 20707) instances. THintAction (see page 20707) is created by the application object when it detects the need to display a hint.

You can, however, create a THintAction (see page 20707) object, set its Hint (see page 20713) property, and then call its Execute method to cause other controls in the application (such as status bars) to display a message for some application-generated condition (such as a status message).

AOwner is the component, typically the application object, that is responsible for freeing the THintAction (see page 20707) object.

See Also

Owner (see page 2807)

Hint (see page 312)

Execute (see page 304)

152.1.24.3 THintAction Properties

The properties of the THintAction class are listed here.

Published Properties

	Name	Description
	Hint (see page 20713)	Indicates the Help hint for client controls and menu items.

152.1.24.3.1 THintAction.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

152.1.25 TPrintDlg Class

TPrintDlg is the standard action for displaying a print dialog.

Class Hierarchy

Pascal

```
TPrintDlg = class(TCommonDialogAction);
```

C++

```
class TPrintDlg : public TCommonDialogAction;
```

File

StdActns

Description

Add TPrintDlg to an action list to add a print dialog to your application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to display the print dialog (TPrintDialog) when invoked. Write an OnAccept (see page 20724) event handler to perform the actual printing when the user clicks OK. You can read details about the user's selections in the dialog from the Dialog (see page 20719) property.

See Also

TPrintDialog (see page 11458)

TFilePrintSetup (see page 20642)

152.1.25.1 TPrintDlg Members

The following tables list the members exposed by TPrintDlg.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
V	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDialogClass (see page 20718)	This is GetDialogClass, a member of class TPrintDlg.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20541)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.

	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 20538)	Creates an instance of TCommonDialogAction.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20538)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	ExecuteTarget (see page 20540)	Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.

	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	BeforeExecute (see page 20723)	Occurs immediately before the dialog appears.
	OnAccept (see page 20724)	This is OnAccept, a member of class TPrintDlg.
	OnCancel (see page 20724)	This is OnCancel, a member of class TPrintDlg.
	OnHint (see page 20724)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20724)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 20718)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
R	Dialog (see page 20719)	Provides access the print dialog that the action executes.
	Enabled (see page 20719)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20720)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20720)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20721)	Indicates the mechanism for client controls and menu items to use when invoking help.

	Hint (see page 20721)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20721)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 20722)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20722)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 20723)	Specifies the Visible property for client controls and menu items.

152.1.25.2 TPrintDlg Methods

The methods of the TPrintDlg class are listed here.

Protected Methods

	Name	Description
V	GetDialogClass (see page 20718)	This is GetDialogClass, a member of class TPrintDlg.

152.1.25.2.1 TPrintDlg.GetDialogClass Method

Pascal

```
function GetDialogClass: TCommonDialogClass; override;
```

C++

```
virtual __fastcall TCommonDialogClass GetDialogClass();
```

Description

This is GetDialogClass, a member of class TPrintDlg.

152.1.25.3 TPrintDlg Properties

The properties of the TPrintDlg class are listed here.

Published Properties

	Name	Description
	Caption (see page 20718)	Represents the caption of client controls and menu items.
R	Dialog (see page 20719)	Provides access the print dialog that the action executes.
	Enabled (see page 20719)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20720)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20720)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20721)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20721)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20721)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 20722)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20722)	Specifies the ShortCut property for client menu items.
	Visible (see page 20723)	Specifies the Visible property for client controls and menu items.

152.1.25.3.1 TPrintDlg.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

152.1.25.3.2 TPrintDlg.Dialog Property

Provides access the print dialog that the action executes.

Pascal

```
property Dialog: TPrintDialog;
```

C++

```
__property TPrintDialog Dialog;
```

Description

When using a print dialog action, you do not place a TPrintDialog component on the form or data module at design time. Instead, you add the TPrintDlg (see page 20713) action to your action list. If you want to configure the dialog, for example to set the Options that are available to users, you can access the dialog component using the Dialog property. From an OnAccept (see page 20724) event handler, use Dialog to read the choices that the user made in the print dialog and then perform the printing based on those choices.

The print dialog component is created by the TPrintDlg (see page 20713) constructor.

See Also

Create_d

Create_c

Create

Options (see page 11471)

onaccept (see page 20543)

152.1.25.3.3 TPrintDlg.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

152.1.25.3.4 TPrintDlg.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

152.1.25.3.5 TPrintDlg.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

152.1.25.3.6 TPrintDlg.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

152.1.25.3.7 TPrintDlg.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

152.1.25.3.8 TPrintDlg.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

152.1.25.3.9 TPrintDlg.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

152.1.25.3.10 TPrintDlg.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

152.1.25.3.11 TPrintDlg.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

152.1.25.4 TPrintDlg Events

The events of the TPrintDlg class are listed here.

Published Events

	Name	Description
	BeforeExecute (see page 20723)	Occurs immediately before the dialog appears.
	OnAccept (see page 20724)	This is OnAccept, a member of class TPrintDlg.
	OnCancel (see page 20724)	This is OnCancel, a member of class TPrintDlg.
	OnHint (see page 20724)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20724)	Occurs when the application is idle or when the action list updates.

152.1.25.4.1 TPrintDlg.BeforeExecute Event

Occurs immediately before the dialog appears.

Pascal

```
property BeforeExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to initialize the dialog immediately before it executes. When the action fires, it generates a BeforeExecute event, and then executes its associated dialog.

See Also

ExecuteTarget (see page 20540)

Execute (see page 11283)

PropertyName

152.1.25.4.2 TPrintDlg.OnAccept Event

Pascal

```
property OnAccept: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAccept;
```

Description

This is OnAccept, a member of class TPrintDlg.

152.1.25.4.3 TPrintDlg.OnCancel Event

Pascal

```
property OnCancel: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCancel;
```

Description

This is OnCancel, a member of class TPrintDlg.

152.1.25.4.4 TPrintDlg.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

152.1.25.4.5 TPrintDlg.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;

152.1.26 TSearchAction Class

TSearchAction is the base class for action objects that display a search or search and replace dialog.

Class Hierarchy

Pascal

```
TSearchAction = class(TCommonDialogAction);
```

C++

```
class TSearchAction : public TCommonDialogAction;
```

File

StdActns

Description

TSearchAction implements the common behavior for actions that display a modeless dialog where the user can enter a search string for searching an edit control. Do not use TSearchAction directly in an application. Instead, use one of the TSearchAction descendants: TSearchFind (see page 20734) or TSearchFindFirst (see page 20747) for a simple locate dialog, TSearchReplace (see page 20765) for a locate-and-replace dialog.

TSearchAction descendants are designed to work with an edit control (TCustomEdit descendant) as a target. They automatically disable themselves if the active control in a form is not an edit control.

Unlike other dialog actions, search actions represent a modeless dialog. As a result, the OnAccept (see page 20543) event occurs not when the user exits the dialog, but when the dialog first appears or comes into focus. When the user directs the dialog to search for or replace a string, the search action automatically performs that search, selecting or replacing text in the target edit control.

152.1.26.1 TSearchAction Members

The following tables list the members exposed by TSearchAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FControl (see page 20731)	This is FControl, a member of class TSearchAction.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FFindFirst (see page 20731)	This is FFindFirst, a member of class TSearchAction.

	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
V	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDialogClass (see page 20541)	This is GetDialogClass, a member of class TCommonDialogAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 20733)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	BeforeExecute (see page 20543)	Occurs immediately before the dialog appears.
	OnAccept (see page 20543)	This is OnAccept, a member of class TCommonDialogAction.
	OnCancel (see page 20543)	This is OnCancel, a member of class TCommonDialogAction.
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 20730)	Creates and initializes an instance of TSearchAction (see page 20725).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 20731)	Frees an instance of TCustomAction.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 20732)	Launches the associated dialog.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 20733)	Indicates whether the action can execute its dialog.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Search (see page 20733)	Selects the next occurrence of the search string in the target edit control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 20734)	Enables or disables the action, depending on the currently active control in the form.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.

R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Properties

	Name	Description
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

152.1.26.2 TSearchAction.Create Constructor

Creates and initializes an instance of TSearchAction (see page 20725).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSearchAction(TComponent * AOwner);
```

Description

Most applications do not need to call the TSearchAction (see page 20725) constructor because actions are added at design time to action lists or action managers.

The TSearchAction (see page 20725) constructor creates an instance of its associated dialog, which descendant classes surface as the Dialog property. It then assigns the Search (see page 20733) method as an event handler for the dialog's OnFind event, so that the action responds automatically when user's direct the dialog to search for a specified text string.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TSearchAction (see page 20725) instance.

See Also

Dialog (see page 20740)

Dialog (see page 20772)

Owner (see page 2807)

Search (see page 20733)

OnFind (see page 11392)

152.1.26.3 TSearchAction.Destroy Destructor

Frees an instance of TCustomAction.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSearchAction();
```

Description

Do not call the destructor directly in an application. Instead, call Free. Free ensures that the action is not nil before calling the destructor.

If the action is contained in an action list or action manager, Destroy removes the action from that list.

See Also

Create (see page 301)

Actions (see page 325)

152.1.26.4 TSearchAction Fields

The fields of the TSearchAction class are listed here.

Protected Fields

	Name	Description
	FControl (see page 20731)	This is FControl, a member of class TSearchAction.
	FFindFirst (see page 20731)	This is FFindFirst, a member of class TSearchAction.

152.1.26.4.1 TSearchAction.FControl Field

Pascal

```
FControl: TCustomEdit;
```

C++

```
TCustomEdit FControl;
```

Description

This is FControl, a member of class TSearchAction.

152.1.26.4.2 TSearchAction.FFindFirst Field

Pascal

```
FFindFirst: Boolean;
```

C++

```
Boolean FFindFirst;
```

Description

This is FFindFirst, a member of class TSearchAction.

152.1.26.5 TSearchAction Methods

The methods of the TSearchAction class are listed here.

Protected Methods

	Name	Description
	Notification (see page 20733)	Responds when components are created or destroyed.

Public Methods

	Name	Description
	ExecuteTarget (see page 20732)	Launches the associated dialog.
	HandlesTarget (see page 20733)	Indicates whether the action can execute its dialog.
	Search (see page 20733)	Selects the next occurrence of the search string in the target edit control.
	UpdateTarget (see page 20734)	Enables or disables the action, depending on the currently active control in the form.

152.1.26.5.1 TSearchAction.ExecuteTarget Method

Launches the associated dialog.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget first launches its search or search and replace dialog. This is a modeless dialog, so the result of the dialog's Execute method simply indicates whether the dialog successfully appeared or was brought into focus. This result is set as the value of the ExecuteResult (see page 20542) property, and an OnAccept (see page 20543) or OnCancel (see page 20543) event occurs, depending on whether the dialog was brought into focus.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

Execute (see page 11381)

ExecuteResult (see page 20542)

152.1.26.5.2 TSearchAction.HandlesTarget Method

Indicates whether the action can execute its dialog.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method lets the action object indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

HandlesTarget returns true if the target is an edit control that has keyboard focus.

152.1.26.5.3 TSearchAction.Notification Method

Responds when components are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation.

TBasicAction overrides the Notification method to check whether the component that is the value of the ActionComponent property is about to be freed. If so, it sets the ActionComponent property to nil (Delphi) or NULL (C++).

See Also

ActionComponent (see page 2715)

152.1.26.5.4 TSearchAction.Search Method

Selects the next occurrence of the search string in the target edit control.

Pascal

```
procedure Search(Sender: TObject); virtual;
```

C++

```
virtual __fastcall Search(TObject * Sender);
```

Description

Most applications have no need to call the Search method: the TSearchAction (see page 20725) constructor automatically assigns Search as the OnFind event handler of its associated dialog. The dialog's OnFind event occurs when the user directs the dialog to find a specified string.

Search searches the target edit control for the string that is the FindText property of the search dialog, using the options specified by the dialog's Options property. If it finds the specified string, it selects it in the edit control. Otherwise, it displays a

message to the user indicating that the string was not found.

Note: If the search action is an instance of TSearchFind (see page 20734), Search looks for the first occurrence of FindText after the current selection in the edit control. If the search action is an instance of TSearchFindFirst (see page 20747), Search looks for the first occurrence of FindText, regardless of the current selection.

See Also

OnFind (see page 11392)

Options (see page 11386)

FindText (see page 11384)

152.1.26.5.5 TSearchAction.UpdateTarget Method

Enables or disables the action, depending on the currently active control in the form.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the application is idle so that actions can update themselves according to current conditions.

In TSearchAction (see page 20725), UpdateTarget checks whether the current target object (specified by the Target parameter) is an edit control. If so, UpdateTarget sets Enabled to true. If not, UpdateTarget sets Enabled to false.

See Also

Enabled (see page 310)

152.1.27 TSearchFind Class

TSearchFind is the standard action for displaying a find dialog.

Class Hierarchy

Pascal

```
TSearchFind = class(TSearchAction);
```

C++

```
class TSearchFind : public TSearchAction;
```

File

StdActns

Description

Add TSearchFind to an action list to add a modeless find dialog to your application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to display the find dialog or bring it to the fore.

TSearchFind is designed to work with an edit control (TCustomEdit descendant) as a target. It automatically disables itself if the active control in a form is not an edit control.

Search (see page 20733) actions represent a modeless dialog. As a result, the OnAccept (see page 20745) event occurs not when the user exits the dialog, but when the dialog first appears or comes into focus. When the user directs the dialog to search for a string, TSearchFind automatically performs that search, selecting the specified text in the target edit control.

See Also

TFindDialog (see page 11376)

TSearchReplace (see page 20765)

TSearchFindNext (see page 20753)

TCustomEdit (see page 21232)

TSearchFindFirst (see page 20747)

152.1.27.1 TSearchFind Members

The following tables list the members exposed by TSearchFind.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FControl (see page 20731)	This is FControl, a member of class TSearchAction.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FFindFirst (see page 20731)	This is FFindFirst, a member of class TSearchAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
V	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.

	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDialogClass (see page 20740)	This is GetDialogClass, a member of class TSearchFind.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20541)	Responds when components are created or destroyed.
	Notification (see page 20733)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 20538)	Creates an instance of TCommonDialogAction.
V	Create (see page 20730)	Creates and initializes an instance of TSearchAction (see page 20725).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 20538)	Frees an instance of TCustomAction.
V	Destroy (see page 20731)	Frees an instance of TCustomAction.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
V	ExecuteTarget (see page 20540)	Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.
V	ExecuteTarget (see page 20732)	Launches the associated dialog.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
V	HandlesTarget (see page 20733)	Indicates whether the action can execute its dialog.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Search (see page 20733)	Selects the next occurrence of the search string in the target edit control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 20734)	Enables or disables the action, depending on the currently active control in the form.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	BeforeExecute (see page 20745)	Occurs immediately before the dialog appears.
	OnAccept (see page 20745)	This is OnAccept, a member of class TSearchFind.
	OnCancel (see page 20745)	This is OnCancel, a member of class TSearchFind.
	OnHint (see page 20745)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20746)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 20740)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
R	Dialog (see page 20740)	Provides access the find dialog that the action executes.
	Enabled (see page 20741)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20741)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20742)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20742)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20743)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20743)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 20743)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20744)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 20744)	Specifies the Visible property for client controls and menu items.

152.1.27.2 TSearchFind Methods

The methods of the TSearchFind class are listed here.

Protected Methods

	Name	Description
V	GetDialogClass (see page 20740)	This is GetDialogClass, a member of class TSearchFind.

152.1.27.2.1 TSearchFind.GetDialogClass Method

Pascal

```
function GetDialogClass: TCommonDialogClass; override;
```

C++

```
virtual __fastcall TCommonDialogClass GetDialogClass();
```

Description

This is GetDialogClass, a member of class TSearchFind.

152.1.27.3 TSearchFind Properties

The properties of the TSearchFind class are listed here.

Published Properties

	Name	Description
	Caption (see page 20740)	Represents the caption of client controls and menu items.
R	Dialog (see page 20740)	Provides access the find dialog that the action executes.
	Enabled (see page 20741)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20741)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20742)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20742)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20743)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20743)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 20743)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20744)	Specifies the ShortCut property for client menu items.
	Visible (see page 20744)	Specifies the Visible property for client controls and menu items.

152.1.27.3.1 TSearchFind.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

152.1.27.3.2 TSearchFind.Dialog Property

Provides access the find dialog that the action executes.

Pascal

```
property Dialog: TFindDialog;
```

C++

```
__property TFindDialog Dialog;
```

Description

Use Dialog to configure the find dialog before the action fires or to close the modeless dialog programmatically. For example, you can set the find dialog's options at design time using the Object Inspector or call the dialog's CloseDialog method to close it.

When using a search-find action, you do not place a TFindDialog component on the form or data module at design time. Instead, you add the TSearchFind (see page 20734) action to your action list and then use the Dialog property. The find dialog component is created by the TSearchFind (see page 20734) constructor.

See Also

ExecuteTarget (see page 20732)

CloseDialog (see page 11381)

152.1.27.3.3 TSearchFind.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

152.1.27.3.4 TSearchFind.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

152.1.27.3.5 TSearchFind.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

152.1.27.3.6 TSearchFind.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

152.1.27.3.7 TSearchFind.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

152.1.27.3.8 TSearchFind.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

152.1.27.3.9 TSearchFind.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key

combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

152.1.27.3.10 TSearchFind.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

152.1.27.3.11 TSearchFind.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

152.1.27.4 TSearchFind Events

The events of the TSearchFind class are listed here.

Published Events

	Name	Description
	BeforeExecute (see page 20745)	Occurs immediately before the dialog appears.
	OnAccept (see page 20745)	This is OnAccept, a member of class TSearchFind.

	OnCancel (see page 20745)	This is OnCancel, a member of class TSearchFind.
	OnHint (see page 20745)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20746)	Occurs when the application is idle or when the action list updates.

152.1.27.4.1 TSearchFind.BeforeExecute Event

Occurs immediately before the dialog appears.

Pascal

```
property BeforeExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to initialize the dialog immediately before it executes. When the action fires, it generates a BeforeExecute event, and then executes its associated dialog.

See Also

ExecuteTarget (see page 20540)

Execute (see page 11283)

PropertyName

152.1.27.4.2 TSearchFind.OnAccept Event

Pascal

```
property OnAccept: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAccept;
```

Description

This is OnAccept, a member of class TSearchFind.

152.1.27.4.3 TSearchFind.OnCancel Event

Pascal

```
property OnCancel: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCancel;
```

Description

This is OnCancel, a member of class TSearchFind.

152.1.27.4.4 TSearchFind.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

152.1.27.4.5 TSearchFind.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
```

```
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

UpdateAction (see page 2790)

152.1.28 TSearchFindFirst Class

TSearchFindFirst is the standard action for displaying a find dialog that looks for the first occurrence of a string.

Class Hierarchy

Pascal

```
TSearchFindFirst = class(TSearchFind);
```

C++

```
class TSearchFindFirst : public TSearchFind;
```

File

StdActns

Description

Add TSearchFindFirst to an action list to add a modeless find dialog to your application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to display the find dialog or bring it to the fore.

TSearchFindFirst is designed to work with an edit control (TCustomEdit descendant) as a target. It automatically disables itself if the active control in a form is not an edit control.

Search (see page 20733) actions represent a modeless dialog. As a result, the OnAccept (see page 20745) event occurs not when the user exits the dialog, but when the dialog first appears or comes into focus. When the user directs the dialog to search for a string, TSearchFindFirst automatically performs that search, selecting the specified text in the target edit control. Unlike the TSearchFind (see page 20734) action, which locates the first occurrence of the search string following the cursor position in the edit control, TSearchFindFirst locates the first occurrence of the search string, regardless of the cursor position.

152.1.28.1 TSearchFindFirst Members

The following tables list the members exposed by TSearchFindFirst.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FControl (see page 20731)	This is FControl, a member of class TSearchAction.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FFindFirst (see page 20731)	This is FFindFirst, a member of class TSearchAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
V	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDialogClass (see page 20541)	This is GetDialogClass, a member of class TCommonDialogAction.
V	GetDialogClass (see page 20740)	This is GetDialogClass, a member of class TSearchFind.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20541)	Responds when components are created or destroyed.
	Notification (see page 20733)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	BeforeExecute (see page 20543)	Occurs immediately before the dialog appears.
	OnAccept (see page 20543)	This is OnAccept, a member of class TCommonDialogAction.
	OnCancel (see page 20543)	This is OnCancel, a member of class TCommonDialogAction.
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.

	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 20752)	Creates and initializes an instance of TSearchFindFirst (see page 20747).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20538)	Frees an instance of TCustomAction.
	Destroy (see page 20731)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	ExecuteTarget (see page 20540)	Executes the associated dialog and generates an OnAccept (see page 20543) or OnCancel (see page 20543) event.
	ExecuteTarget (see page 20732)	Launches the associated dialog.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
	HandlesTarget (see page 20733)	Indicates whether the action can execute its dialog.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.

	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Search (see page 20733)	Selects the next occurrence of the search string in the target edit control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 20734)	Enables or disables the action, depending on the currently active control in the form.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.

	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	BeforeExecute (see page 20745)	Occurs immediately before the dialog appears.
	OnAccept (see page 20745)	This is OnAccept, a member of class TSearchFind.
	OnCancel (see page 20745)	This is OnCancel, a member of class TSearchFind.
	OnHint (see page 20745)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20746)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 20740)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
R	Dialog (see page 20740)	Provides access the find dialog that the action executes.
	Enabled (see page 20741)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20741)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20742)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20742)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20743)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20743)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 20743)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20744)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 20744)	Specifies the Visible property for client controls and menu items.

152.1.28.2 TSearchFindFirst.Create Constructor

Creates and initializes an instance of TSearchFindFirst (see page 20747).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSearchFindFirst(TComponent * AOwner);
```

Description

Most applications do not need to call the TSearchFindFirst (see page 20747) constructor because actions are added at design time to an action manager or action list.

The TSearchFindFirst (see page 20747) constructor creates an instance of its associated dialog and assigns that component as the value of the Dialog (see page 20740) property. It then assigns the Search (see page 20733) method as an event handler for the dialog's OnFind event, so that the action responds automatically when user's direct the dialog to search for a

specified text string.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TSearchFindFirst (see page 20747) instance.

See Also

Dialog (see page 20740)

Owner (see page 2807)

Search (see page 20733)

OnFind (see page 11392)

152.1.29 TSearchFindNext Class

TSearchFindNext is the standard action for locating the next instance of a string in an edit control.

Class Hierarchy

Pascal

```
TSearchFindNext = class(TCustomAction);
```

C++

```
class TSearchFindNext : public TCustomAction;
```

File

StdActns

Description

Add TSearchFindNext to an action list to add the ability to repeat a search initiated by a TSearchFind (see page 20734) or TSearchFindFirst (see page 20747) action. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to repeat the search initiated by the TSearchFind (see page 20734) action's dialog.

TSearchFindNext objects must be associated with a TSearchFind (see page 20734) action by setting the SearchFind (see page 20762) property.

See Also

TSearchFind (see page 20734)

TSearchFindFirst (see page 20747)

152.1.29.1 TSearchFindNext Members

The following tables list the members exposed by TSearchFindNext.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 20757)	Creates an instance of TSearchFindNext (see page 20753).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 20758)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 20758)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 20759)	Enables or disables the action, depending on the currently active control in the form.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnHint (see page 20764)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20764)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 20759)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Enabled (see page 20760)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20760)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20761)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20761)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20762)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20762)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SearchFind (see page 20762)	Associates the TSearchFindNext (see page 20753) action with a TSearchFind (see page 20734) action that initiates the search.
	SecondaryShortCuts (see page 20763)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20763)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 20763)	Specifies the Visible property for client controls and menu items.

152.1.29.2 TSearchFindNext.Create Constructor

Creates an instance of TSearchFindNext (see page 20753).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TSearchFindNext(TComponent * AOwner);
```

Description

Most applications do not need to call the TSearchFindNext (see page 20753) constructor because actions are added at design time to an action manager or action list.

AOwner specifies the Owner for the action. This is the component that is responsible for freeing the TSearchFindNext (see page 20753) instance.

See Also

Owner (see page 2807)

Actions (see page 325)

152.1.29.3 TSearchFindNext Methods

The methods of the TSearchFindNext class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 20758)	Introduces an interface for invoking an action on a target client component or control.
	HandlesTarget (see page 20758)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	UpdateTarget (see page 20759)	Enables or disables the action, depending on the currently active control in the form.

152.1.29.3.1 TSearchFindNext.ExecuteTarget Method

Introduces an interface for invoking an action on a target client component or control.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

ExecuteTarget does nothing in TBasicAction. ExecuteTarget was introduced in TBasicAction so that descendants can override it to initiate the action on the target. For example, an edit action that performs copying might copy the contents of an edit control to the clipboard.

See Also

OnExecute (see page 2716)

HandlesTarget (see page 2713)

152.1.29.3.2 TSearchFindNext.HandlesTarget Method

Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

HandlesTarget does nothing in TBasicAction. HandlesTarget was introduced in TBasicAction so that descendants can override it to check the type and state of a target. Handles target can verify any information about a target that is relevant for the action. HandlesTarget returns true if the target meets the specified criteria, false otherwise.

See Also

ExecuteTarget (see page 2712)

152.1.29.3.3 TSearchFindNext.UpdateTarget Method

Enables or disables the action, depending on the currently active control in the form.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically when the potential target changes so that actions can update themselves accordingly.

In TSearchFindNext (see page 20753), UpdateTarget ignores the current target object (specified by the Target parameter). Instead, it checks the associated TSearchFind (see page 20734) action (the SearchFind (see page 20762) property), and sets Enabled (see page 20760) to true if the search dialog has already specified a search string. If SearchFind (see page 20762) is not set, or if there is no search string in its associated dialog, UpdateTarget sets Enabled (see page 20760) to false.

See Also

Enabled (see page 310)

SearchFind (see page 20762)

FindText (see page 11384)

152.1.29.4 TSearchFindNext Properties

The properties of the TSearchFindNext class are listed here.

Published Properties

	Name	Description
	Caption (see page 20759)	Represents the caption of client controls and menu items.
	Enabled (see page 20760)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20760)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20761)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20761)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20762)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20762)	Indicates the ImageIndex property for client controls and menu items.
	SearchFind (see page 20762)	Associates the TSearchFindNext (see page 20753) action with a TSearchFind (see page 20734) action that initiates the search.
	SecondaryShortCuts (see page 20763)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20763)	Specifies the ShortCut property for client menu items.
	Visible (see page 20763)	Specifies the Visible property for client controls and menu items.

152.1.29.4.1 TSearchFindNext.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

152.1.29.4.2 TSearchFindNext.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

152.1.29.4.3 TSearchFindNext.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

152.1.29.4.4 TSearchFindNext.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

152.1.29.4.5 TSearchFindNext.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

152.1.29.4.6 TSearchFindNext.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

152.1.29.4.7 TSearchFindNext.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

152.1.29.4.8 TSearchFindNext.SearchFind Property

Associates the TSearchFindNext (see page 20753) action with a TSearchFind (see page 20734) action that initiates the search.

Pascal

```
property SearchFind: TSearchFind;
```

C++

```
__property TSearchFind SearchFind;
```

Description

SearchFind is the TSearchFind (see page 20734) action that displays the modeless search dialog whose current search should be repeated. If SearchFind is not set, then the TSearchFindNext (see page 20753) action remains disabled.

TSearchFindNext (see page 20753) uses the SearchFind property to obtain a search string from its associated dialog and to

search its associated control.

See Also

executetarget (see page 20758)

Enabled (see page 310)

Search (see page 20733)

152.1.29.4.9 TSearchFindNext.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

152.1.29.4.10 TSearchFindNext.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

152.1.29.4.11 TSearchFindNext.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

152.1.29.5 TSearchFindNext Events

The events of the TSearchFindNext class are listed here.

Published Events

	Name	Description
	OnHint (see page 20764)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20764)	Occurs when the application is idle or when the action list updates.

152.1.29.5.1 TSearchFindNext.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

152.1.29.5.2 TSearchFindNext.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
```

```
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;

152.1.30 TSearchReplace Class

TSearchReplace is the standard action for displaying a find-and-replace dialog.

Class Hierarchy

Pascal

```
TSearchReplace = class(TSearchAction);
```

C++

```
class TSearchReplace : public TSearchAction;
```

File

StdActns

Description

Add TSearchReplace to an action list to add a modeless find-and-replace dialog to your application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to display the find-and-replace dialog or bring it to the fore.

TSearchReplace is designed to work with an edit control (TCustomEdit descendant) as a target. It automatically disables itself if the active control in a form is not an edit control.

Search (see page 20733)/replace actions represent a modeless dialog. As a result, the OnAccept (see page 20777) event occurs not when the user exits the dialog, but when the dialog first appears or comes into focus. When the user directs the dialog to replace one or all instances of a string, TSearchReplace automatically performs the search and replaces the specified text in the target edit control.

152.1.30.1 TSearchReplace Members

The following tables list the members exposed by TSearchReplace.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FControl (see page 20731)	This is FControl, a member of class TSearchAction.
	FDialog (see page 20539)	This is FDialog, a member of class TCommonDialogAction.
	FFindFirst (see page 20731)	This is FFindFirst, a member of class TSearchAction.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAccept (see page 20540)	This is DoAccept, a member of class TCommonDialogAction.
V	DoCancel (see page 20540)	This is DoCancel, a member of class TCommonDialogAction.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDialogClass (see page 20771)	This is GetDialogClass, a member of class TSearchReplace.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20541)	Responds when components are created or destroyed.
V	Notification (see page 20733)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetupDialog (see page 20542)	This is SetupDialog, a member of class TCommonDialogAction.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20538)	Creates an instance of TCommonDialogAction.
	Create (see page 20730)	Creates and initializes an instance of TSearchAction (see page 20725).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 20538)	Frees an instance of TCustomAction.
	Destroy (see page 20731)	Frees an instance of TCustomAction.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.

	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 20771)	Launches the associated dialog and assigns an event handler to replace found text.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 20541)	Indicates whether the action can execute its dialog.
	HandlesTarget (see page 20733)	Indicates whether the action can execute its dialog.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Search (see page 20733)	Selects the next occurrence of the search string in the target edit control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
	Update (see page 295)	Indicates whether the action updates itself.
	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
